LEARN SALESFORCE BASICS

Welcome, Salesforce Users

Welcome to Salesforce! This documentation, designed for users and administrators, introduces Salesforce and its key concepts, provides an overview of products and editions, and guides you through setting yourself up as a user. You'll also find information about common tasks you'll perform in Salesforce—like using basic Chatter features, running reports, or searching Salesforce for the information or records you need.

To learn how to log in and personalize Salesforce, see [Getting Started as a New User](#).

Salesforce Overview

Welcome to the award-winning cloud-computing service—designed to help you manage your customer relationships, integrate with other systems, and build your own applications. Salesforce includes the following products and services.

Salesforce Applications

Salesforce includes prebuilt applications (or “apps”) for customer relationship management (CRM) ranging from sales force automation to partner relationship management, marketing, and customer service.

Force.com Platform

The Force.com platform is the first platform as a service (PaaS), enabling developers to create and deliver any kind of business application entirely on demand and without software. The platform also includes easy to use point-and-click customization tools to help you create solutions for your unique business requirements, without any programming experience.

EDITIONS

Available in: Salesforce Classic

Your Salesforce edition determines which features and functionality you can access. To find out which edition you're using, look at the browser tab or title.

Database.com

Database.com is a multitenant cloud database service that's designed to store data for mobile, social enterprise applications. You can use Database.com as the back-end database for applications that are written in any language and run on any platform or mobile device. Database.com's built-in social computing infrastructure and native support for building sophisticated REST-based APIs enable you to create employee-facing, native mobile and social apps.

AppExchange

AppExchange is a marketplace featuring hundreds of cloud applications created by Salesforce customers, developers, and partners. Many of the applications are free and all of them are pre-integrated with Salesforce, enabling you to easily and efficiently add functionality.

Salesforce.com Community

Salesforce provides training, support, consulting, events, best practices, and discussion boards to help you be successful. Visit [Salesforce.com Community](#).

Key Concepts and Terms

As you're getting up to speed with Salesforce, it's helpful to learn some key concepts and terms. They'll come up frequently as you interact with the product, our documentation, and our service professionals. The concepts here will help you understand how Salesforce works. And the terms will help you understand some of its main components.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions**

Concepts

Concept	Definition
Cloud	A Salesforce name for a loose federation of features that help you accomplish certain types activities, such as selling products, supporting your customers, or collaborating with your coworkers. Two common examples you'll come across are <i>Service Cloud</i> and <i>Sales Cloud</i> .
Cloud Computing	Technology that enables Internet-based services that let you sign up and log in through a browser. Salesforce delivers its service in the cloud. Other familiar cloud computing services include Google Apps and Amazon.com.
Software as a Service (SaaS)	Software delivered not by traditional means (such as on disk) but in the cloud, as a service. There's nothing to download or install, and updates are automatic.
Trust	<p>A Salesforce term for its company-wide commitment to building and delivering the most secure, fast, and reliable cloud-based service available.</p> <p>Created to enhance customer success, <code>trust.salesforce.com</code> is a systems status website giving Salesforce customers and the community access to real-time and historical system performance information and updates, incident reports and maintenance schedules across all its key system components.</p> <p><code>trust.salesforce.com</code> is free to all members of the Salesforce community.</p>

Terms

Term	Definition
App	Short for <i>application</i> . A collection of components such as tabs, reports, dashboards, and Visualforce pages that address specific business needs. Salesforce provides standard apps, which you can customize, such as Sales and Call Center. You can customize the standard apps to match the way you work.
Edition	One of several bundles of Salesforce products and services, each geared toward a different set of business needs. All Salesforce editions share the same look and feel, but they vary by feature, functionality, and pricing.
Object	A definition of a specific type of information you can store in Salesforce. For example, the Case object lets you store information about customer inquiries. For each object, your organization will have multiple, specific records. Salesforce comes with lots of standard objects, but you can create custom objects, as well.
Organization	A deployment of Salesforce that has a defined set of licensed users. Your organization includes all of your data and applications.
Record	A collection of fields that store information about a specific item of a specific type (represented by an object), such as a contact, an account, or an opportunity. For example, you might have a contact record to store information about Joe Smith, and a case record store information about his training inquiry.
Release	Salesforce releases new products and features three times per year, and releases are identified by season—Winter, Spring, and Summer—along with the calendar year. <i>Example:</i> Winter '15. For every Salesforce release, the Salesforce release notes include new features and products that are generally available or in beta release, plus all changes to existing features and products. You can find the release notes when you search for “Release Notes” in the Salesforce Help.
Salesforce	The name of the Salesforce cloud computing CRM service.
Salesforce	The company name.

Editions

Salesforce Edition Overview

Salesforce offers several bundles of its products and services, each geared toward a different set of business needs.

These bundles, called *editions*, all share the same look and feel, but they vary by feature, functionality, and pricing. For example, a feature that is available in Professional Edition for an additional fee may be included in Enterprise Edition. You might choose to start with a more basic edition, then upgrade later as you grow your business.

For a comparison chart of editions and their features, see the [Salesforce Pricing and Editions page](#).

EDITIONS

Available in: Salesforce Classic

Your Salesforce edition determines which features and functionality you can access. To find out which edition you're using, look at the browser tab or title.

 **Note:** The Salesforce Help describes all generally available features, including those that are not available in all editions. To find out whether a feature is available in your edition: search for the feature in the help, then check out the “Available in:” table at the top of any topic you find for that feature.

SEE ALSO:

[Salesforce Mobile Products Overview](#)

Contact Manager Edition

Salesforce Contact Manager is designed for small businesses and provides access to key contact management features including accounts, contacts, activities, calendars, notes and attachments, and reports. Contact Manager also provides straightforward and easy-to-use customization options. For more information about Contact Manager features, visit the [Salesforce Pricing & Editions page](#).

 **Note:** Lightning Experience isn't available in the Contact Manager Edition.

SEE ALSO:

[Salesforce Edition Overview](#)

Group Edition

Salesforce Group Edition is designed for small businesses and workgroups with a limited number of users. Group Edition users can manage their customers from the start of the sales cycle through closing the deal to providing customer support and service. Group Edition offers access to accounts, contacts, opportunities, leads, cases, dashboards (read only), and reports. For more information about Group Edition features, visit the [Salesforce Pricing & Editions page](#).

SEE ALSO:

[Salesforce Edition Overview](#)

Developer Edition

Developer Edition provides access to the Force.com platform and API. It allows developers to extend the Salesforce system, integrate with other applications, and develop new tools and applications. Developer Edition provides access to many of the features available with [Enterprise Edition](#).

Salesforce does not provide technical support for Developer Edition. You can solicit help from the developer community message boards available to registered users via the Force.com developer website - developer.salesforce.com. Documentation for Developer Edition is available from the [Technical Library](#).

SEE ALSO:

[Salesforce Edition Overview](#)

Personal Edition

 **Note:** Personal Edition isn't available to new organizations. Existing organizations that have already set up Personal Edition continue to have access. In addition, Personal Edition organizations that signed up after June 2009 don't have access to opportunities.

Personal Edition is a CRM solution designed for an individual sales representative or other single user. Personal Edition provides access to key contact management features such as accounts, contacts, and synchronization with Microsoft Outlook®. It also provides sales representatives with sales tools such as opportunities.

 **Note:** Lightning Experience isn't available in the Personal Edition.

SEE ALSO:

[Salesforce Edition Overview](#)

Professional Edition

Salesforce Professional Edition is designed for businesses who need full-featured CRM functionality. Professional Edition includes straightforward and easy-to-use customization, integration, and administration tools to facilitate any small- to mid-sized deployment. For more information about Professional Edition features, visit the [Salesforce Pricing & Editions page](#).

SEE ALSO:

[Salesforce Edition Overview](#)

[Expansion Pack and Unlimited Apps Pack](#)

Enterprise Edition

Salesforce Enterprise Edition is designed to meet the needs of large and complex businesses. In addition to all of the functionality available in Professional Edition, Enterprise Edition organizations get advanced customization and administration tools that can support large-scale deployments. Enterprise Edition also includes access to the Web services API so you can easily integrate with back-office systems. For more information about Enterprise Edition features, visit the [Salesforce Pricing & Editions page](#).

SEE ALSO:

[Salesforce Edition Overview](#)

[Expansion Pack and Unlimited Apps Pack](#)

Unlimited Edition

Salesforce Unlimited Edition is Salesforce's solution for maximizing your success and extending that success across the entire enterprise through the Force.com platform. Unlimited Edition customers benefit from new levels of platform flexibility for managing and sharing all of their information on demand.

Unlimited Edition includes all Enterprise Edition functionality plus Premier Support, full mobile access, unlimited custom apps, increased storage limits, and more. For more information about Unlimited Edition features, visit the [Salesforce Pricing & Editions page](#).

SEE ALSO:

[Salesforce Edition Overview](#)

Performance Edition

Performance Edition is Salesforce's solution that combines CRM and the Force.com platform with Data.com, Work.com, Identity, Live Agent, Salesforce Knowledge, and additional sandbox functionality.

Performance Edition is designed for customers that need to drive amazing growth, achieve new levels of customer satisfaction, and maximize sales and service success in the social and mobile world. Performance Edition includes all Unlimited Edition functionality plus clean, targeted lead and customer data from Data.com, coaching and feedback tools from Work.com, trusted identity services from Identity, and more. For customers in Japan, Singapore, and South Korea, we offer Performance Edition Limited, which includes all Performance Edition functionality except Data.com. For more information about Performance Edition features, visit the [Salesforce Pricing & Editions page](#).

SEE ALSO:

[Salesforce Edition Overview](#)

Database.com Edition

Database.com Edition

Database.com is a multitenant cloud database service that's designed to store data for mobile, social enterprise applications. You can use Database.com as the back-end database for applications that are written in any language and run on any platform or mobile device. Database.com's built-in social computing infrastructure and native support for building sophisticated REST-based APIs enable you to create employee-facing, native mobile and social apps.

As a Salesforce user, you're already using Database.com when you're performing tasks such as creating custom objects, managing security, or importing data with the Force.com platform and API.

A standalone version of Database.com is available for developers who want to create applications that leverage other languages, platforms, and devices.

There is no Database.com-specific documentation. Instead, you use the Salesforce documentation and a [list of features](#) that Database.com supports. This list identifies the Salesforce documentation subjects that apply to Database.com. Also, every feature's Edition Table includes Database.com if the feature is available in Database.com. Use the Salesforce online help, release notes, workbooks, and developer guides for APIs, Apex, SOQL, and SOSL.

Note: Lightning Experience isn't available in the Database.com Edition.

Expansion Pack and Unlimited Apps Pack

Expansion Pack for Professional Edition

For Professional Edition, you can purchase Expansion Pack units to increase app, tab, and object limits. Each Expansion Pack unit corresponds to a user license in your organization.

Unlimited Apps Pack for Enterprise Edition

For Enterprise Edition, you can purchase Unlimited Apps Pack units to increase app, tab, and object limits, as well as the maximum number of API calls and data storage capacity. Each Unlimited Apps Pack unit corresponds to a user license in your organization.

Adding Pack Units

Expansion pack and Unlimited Apps Pack units are available for Sales Cloud, Service Cloud, Force.com, and Site.com-Only users. An organization can be upgraded only once with Expansion Pack or Unlimited Apps Pack. If your organization needs higher app limits than what the pack provides, we recommend upgrading your organization's edition. To add Expansion Pack or Unlimited Apps Pack units, contact your Salesforce representative.

Security Basics

Security FAQ

- [How can I be sure my data is secure in Salesforce?](#)
- [How can I be sure my data won't be lost?](#)
- [How can I be assured my data will be kept private?](#)
- [Can I automatically back up my data in Salesforce?](#)
- [Does Salesforce use my data for internal purposes?](#)
- [What happens when the system goes down?](#)

How can I be sure my data is secure in Salesforce?

When you log in, the URLs used to access your data are all preceded with https:// instead of http://, which indicates that a secure connection has been established. Furthermore, whenever your password is changed or reset, or when you log in from a computer you have not used to access Salesforce before, you may have to activate your computer to successfully log in to Salesforce. Activating your computer allows Salesforce to verify your identity and prevent unauthorized access.

How can I be sure my data won't be lost?

We back up your data with a variety of methods to ensure that your organization does not experience any data loss. Every transaction is stored to RAID disks in real-time with archive mode enabled, allowing the database to recover all transactions prior to any system failure. Every night all data is backed up to a separate backup server and high speed automatic tape library. The backup tapes are cloned as an additional precautionary measure, and the cloned tapes are transported to an off-site, fireproof vault twice a month. In addition, the facility that stores our servers is architecturally designed to withstand catastrophic events and earthquakes up to 8.0 on the Richter scale.

How can I be assured my data will be kept private?

We are committed to keeping your data private and secure. For a greater understanding of the legal obligations Salesforce adheres to regarding data privacy, refer to the Privacy Statement, as well as the Terms of Use agreement. You can view both items by clicking the relevant link below the copyright at the bottom of any page.

Can I automatically back up my data in Salesforce?

Yes, weekly export service provides you with .CSV files of all objects and attachments within Salesforce. You can set up this service to automatically perform a data export each week.

Does Salesforce use my data for internal purposes?

No. As outlined in the Privacy Statement, Salesforce does not review, share, distribute, print, or reference your data except as provided in the Salesforce Terms of Use, or as may be required by law. For exact information, refer to the Privacy Statement, as well as the Terms of Use agreement. You can view both items by clicking their links below the copyright at the bottom of any page.

What happens when the system goes down?

Salesforce builds redundancy into all systems to minimize system failures that could be perceived as customer outages. All components are proactively monitored and managed so faults are detected before system outages. While there may occasionally be system outages due to issues beyond our control, we employ numerous escalation procedures to notify the proper personnel in the event of a system outage, and remedy issues as quickly as possible.

What Is Read-Only Mode?

At Salesforce, we recognize that you may want to access your data at a moment's notice—even during our planned maintenance windows. To minimize interruption to your business, Salesforce gives users read-only access during splits, instance migrations, instance switches, and certain other maintenance events.

EDITIONS

Available in: **All Editions**

What to Expect in Read-Only Mode

When Salesforce is in read-only mode, you can navigate within the application and view and report on your business data.

During read-only mode, you **can't**:

- Add, edit, or delete data
- Perform any actions in Salesforce that modify your Salesforce data. For example:
 - Post on Chatter

- Use LiveAgent
- Refresh dashboards
- Perform API write or edit actions
- Perform bulk API read actions
- Save new or edited reports

 **Note:** You can still run existing reports.

Activity reminders don't occur, and Recent Items lists don't update. Login history is still recorded for compliance purposes, but it isn't reflected in your organization until a few minutes after the organization exits read-only mode.

When your organization is in read-only mode, desktop and mobile browser users see a banner at the top of their browser window:

When to Expect Read-Only Mode

The maintenance schedule posted on trust.salesforce.com indicates whether each upcoming maintenance window includes read-only access. Planned maintenance windows vary in length depending on the level of maintenance needed. In addition, when users are notified two weeks before a planned maintenance window, the notification specifies whether the maintenance includes read-only access.

If you'd like to see how your organization works in read-only mode, contact Salesforce to have the testing option enabled in your sandbox organization.

Updates

Check for Desktop Client Updates

Desktop clients such as Salesforce for Outlook and Connect Offline integrate Salesforce with your PC. Your administrator controls which desktop clients you are allowed to install.

If you have access to see Home tab alerts, and you've logged in to a client in the past, you'll see an alert banner on your Home tab when a new version of a client is available.

You can also see which clients are installed on your computer and check for updates on your own. Just follow these steps.

1. From your personal settings, enter *Check for Updates* in the **Quick Find** box, then select **Check for Updates**.
2. From the table, review the names and version numbers of available desktop clients.
3. If you are using Internet Explorer, click the correct desktop client and then click **Install Now** to install a client. If you are using another browser such as Mozilla Firefox, click **Download Now** to save the installer file to your computer. Then double-click the saved file to run the installer program.

After you install the update, you'll continue to see the alert banner on your Home tab until you log in through the newly updated client.

Log In for the First Time

When your administrator sets you up as a new user, you receive an email that includes your username and a link to your organization's Salesforce site.

Here's how to log in for the first time.

1. Check your email for your login information.
2. Click the link provided in the email.
The link logs you in to the site automatically.
3. The site prompts you to set a password and choose a security question and answer to verify your identity in case you forget your password.

If you haven't received your login information, contact the Salesforce administrator at your organization.

Setting Up Your Chatter Profile

Your Chatter profile communicates who you are to your coworkers and any customers you communicate with. It features your photo and basic information like your professional title and contact details.

Set up your Chatter profile soon after you begin using Salesforce, and update it often.

 **Note:** If your organization doesn't use Chatter, you can still [add and edit personal information](#).

1. Click the **Chatter** tab and find the placeholder profile image on the left side of the page. Click *Your Name* next to the placeholder image.
2. To update your profile photo, hover over the placeholder image and click **Add Photo**.
 -  **Tip:** Use a photo of you and not a group of people or a pet. Chatter is a business tool, so choose a photo you don't mind showing to your boss and CEO.
3. To update your contact information, click  under your profile photo. In the **Edit Profile** box, complete the fields on the Contact tab and the About tab.

 **Tip:** Complete your profile with details about the department you work in, your past experience, or projects you are currently working on.

4. Click **Save All**.

Understanding How Salesforce Organizes Your Information

Salesforce groups your data into logical categories called objects. An object is a collection of fields named for the kind of information those fields capture. Commonly-used Salesforce objects include Contacts, Accounts, Cases, and Reports. For example, the Contacts object contains fields with information describing the people you do business with, such as their first names, last names, phone numbers, business titles, and the companies they work for.

There are two types of Salesforce objects.

- *Standard* objects are included with the Salesforce license your company purchases. These are the most commonly-used objects.
- *Custom* objects are created to meet your company's business needs.

Your organization's administrator can customize standard objects or create custom objects to support the type of work your company does or the industry you're in. For example, your organization may choose to create a custom object called "Bugs" to track their known product issues, or rename the standard object "Accounts" to "Clients" because this is how your organization refers to your customers.

In the Salesforce interface, you generally work with objects from their tabs. For example, the Opportunity object has an Opportunities tab. If you learn about an object from the Salesforce documentation but can't find it in the user interface, contact your administrator to find out whether the object is available to you. If your edition features objects and related tabs that you can't find documentation for, it may be because the object is custom. Contact your administrator to learn how to use it.

SEE ALSO:

[Navigating Object Home Pages](#)

Understanding Salesforce Pages

Salesforce apps are made up of tabs and pages. Standard objects such as Accounts, Contacts, and Leads, and other features such as Chatter typically have tabs, and from a tab, you navigate through pages to interact with the features you're using. For example, if you want to create an account record, you'll click the Accounts Tab, and land on the Accounts Home page. Click **New** to open the Account Edit page where you'll enter information for the account. Click **Save**, and you'll see the Account's Detail page. Return to the Accounts Home page and the new account is listed.

Salesforce tabs can have multiple types of pages, including Home, Edit, and Detail pages, and you can create list views for some objects. Chatter has one primary page type: a feed. And Data.com has a search interface. Dashboards and reports have their own page styles, as well.

Your system administrator typically sets up page layouts for standard objects and enables the navigation features your organization can use, but interacting with Salesforce is easier if you understand the most common page elements for the most frequently used objects. They include:

1. A *tag* bar, where you can view and add tags for a record.
2. A *feed*, where you can add and view comments about a record.
3. A *sidebar*, where you can do things like search and quickly create new records.
4. *Sections* for the record, with key fields and links.
5. *Related lists*, which group and display links to other records associated with the one you're viewing. You can change the order of related lists on your page.
6. Various *links* that help you move around the page or go to different pages or external sites.

Let's look at these elements on an account detail page.

SEE ALSO:

- [Tags Overview](#)
- [Understanding the Salesforce Sidebar](#)
- [Navigating Object Home Pages](#)
- [Home Tab Overview](#)

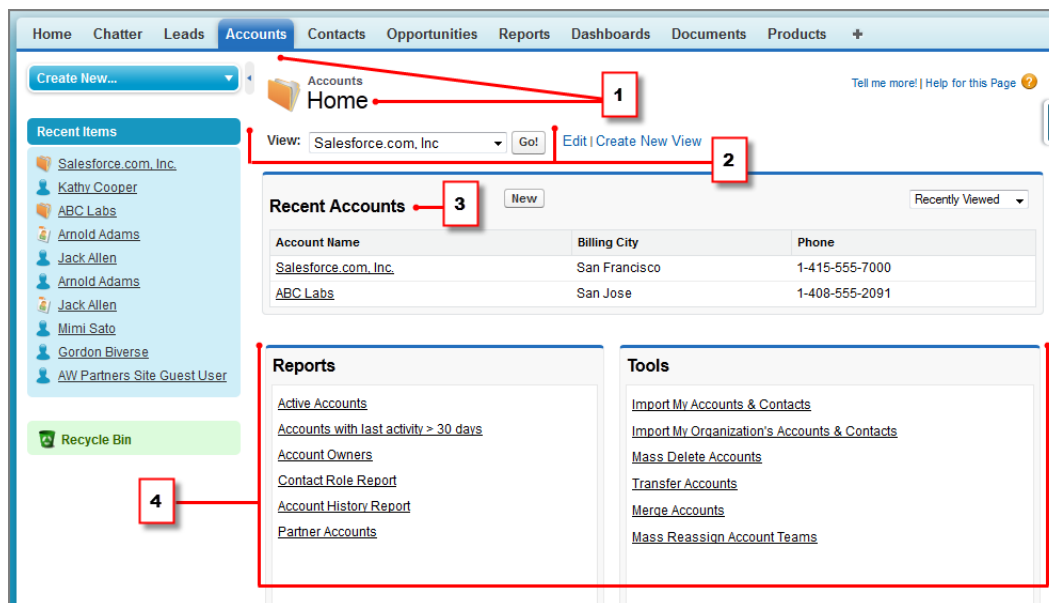

Navigating Object Home Pages

In the desktop application, commonly-used objects are found by clicking on their tabs, which appear at the top of your screen. Other Salesforce features, such as Home and Chatter, also have tabs.

To work with your data, click an object's tab. For instance, to access account information for the customers you work with, click the Accounts tab. Here you find:

1. The name of the object and type of data you are viewing. In this case, Accounts.
2. *List View* options. A list view narrows your accounts to a specific set (for example, you can choose to view All Accounts or just Recently Viewed Accounts).
3. A list of recently-accessed records. Here, Recent Accounts. This list is visible for every standard and custom object and can't be customized.
4. Links to other features you may want to use next.

Home Tab Overview

From the Home tab, you can:

- Create a Chatter post (if your organization uses Chatter)
- View dashboard snapshots
- View your tasks and calendar
- Search the feed (🔍)

You can also use the sidebar components, such as Create New, Recent Items, and Custom Links, that you'll also see on other Salesforce pages. Your Home tab layout, sidebar components, and links are enabled and configured by your administrator.

Alert banners may appear on the Home tab to let you know when updates are available for desktop clients such as Connect Offline.

Find Setup

How you find Setup depends on which Salesforce experience you're using and on your organization's user interface settings.

Salesforce includes many options for setting up, maintaining, and customizing your organization. Some organizations also have options for building, packaging, and distributing their own apps. These options are all available from the Setup menu. If you're a Salesforce administrator or developer, you use the Setup menu frequently. Your organization's user interface settings determine how everyone in your organization accesses this menu.

1. Look at the top of any Salesforce page.

- If you're using Lightning Experience, click , then select **Setup Home**.
- If you're using Salesforce Classic and you see **Setup** in the user interface header, click it.
- If you're using Salesforce Classic and you don't see **Setup** in the header, click your name, then select **Setup**.

2. Enter the name of the page that you want in the `Quick Find` box, then select the appropriate page from the menu.

-  **Tip:** Type the first few characters of a page's name in the `Quick Find` box. As you type, pages that match your search terms appear in the menu. For example, to find the Language Settings page, type `lang` in the `Quick Find` box, then select **Language Settings**.

- [Create new records](#)
- [Open items you've recently viewed](#)
- [Deleting your records](#)
- [New user tips](#)

Now that you've learned how to work with your records, you might want to explore more advanced Salesforce features. We recommend reviewing the **Downloadable User Guides, Tip Sheets and User Guides**, and **Online Training** videos found on the [Salesforce Success Communities Help & Training](#) site.

EDITIONS

Available in: Salesforce Classic

Available in all editions

Finding and Viewing Records and Data

Use tabs, search, or lists to look at your data.

Much of your Salesforce data is stored in individual *records*, and organized within objects. For example, the Account object presents all of your account records. If the Acme company is one of your accounts, you'll have an account record for Acme.

When you're working with records, it's important to remember that the types of records you can create, view, edit, and delete are determined by administrator settings, such as a user profile or permission set. Your access to individual records may be determined by other configurations, such as sharing settings. And your access to fields on types of records may be controlled by field-level security. Work with your administrator to make sure you have access to the records and data you need.

There are a few easy ways to find and view your records.

- From a tab, such as Accounts or Contacts, start from the default view and click **Go!** or select a different view.

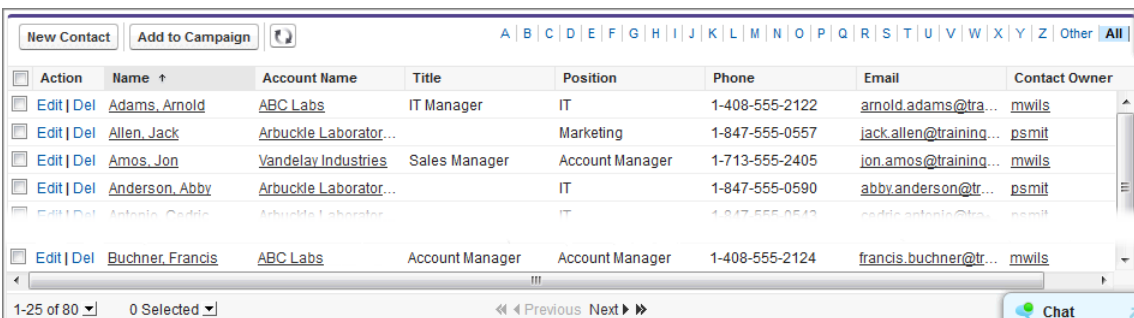

EDITIONS

Available in: Salesforce Classic

Available in: All Editions

The resulting page you see is called a *list view*.

- Search for a record using keywords, such as a name or address stored in the record. Use the search bar in the banner displayed on most pages.
- On many records, below the main page sections, look for related lists, which identify records that are associated with the record you're currently viewing. For example, an account record probably has a related list of contacts at that account.

SEE ALSO:[Understanding Salesforce Pages](#)[Get to Know Your Salesforce Admin](#)[Overview of Sharing Settings](#)

Create Records

Creating records is standard procedure for most Salesforce users. Some objects (such as Account) have special *guidelines and considerations* you need to be aware of, but the *process* of creating a record is similar for all.

IN THIS SECTION:[Create a Record in Salesforce Lightning Experience](#)

Create new Salesforce records for opportunities, leads, tasks, notes, accounts, and contacts. Some objects (such as Account) have special *guidelines and considerations* for you to be aware of, but the *process* of creating a record is similar for all.

[Create a Record in Salesforce Classic](#)

Create new Salesforce records for opportunities, leads, tasks, notes, accounts, and contacts. Some objects (such as Account) have special *guidelines and considerations* for you to be aware of, but the *process* of creating a record is similar for all.

Tips for New Users

Learn the tips you need to be a fast, productive Salesforce user on day one.

New users should keep these tips in mind:

- When you click on an object to find your data, you won't see a full list of your existing records—Salesforce keeps those tucked out of view until you manually recall them, in case you want to choose a subset of the full list. Choose an option within *View*, and click **Go!**

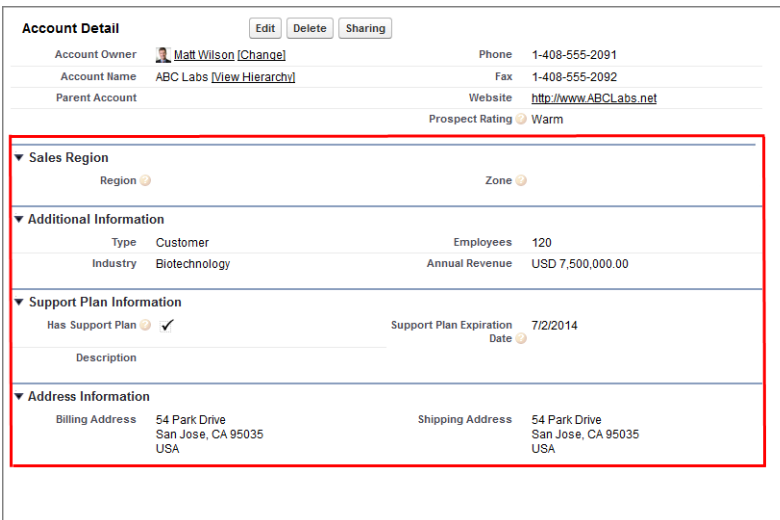

EDITIONS

Available in: Salesforce Classic

Available in: All Editions

- Related lists* are links featured at the bottom of object pages. Related lists provide quick access to other related objects that you might want to visit next. This feature adds a lot of value, because it gives you fast access to information you likely need next. It means less navigation and can speed up your workflow. In the Accounts object, your related lists might look like this:

Salesforce delivers the application with some standard related lists, but administrators can also customize some related list items.

- If you read or hear about a feature that you don't see in your own interface, don't worry. Your administrator can customize it to meet your organization's needs. If your administrator hasn't enabled help for the customization, contact them.
- Our help and training materials might mention a feature that your company hasn't enabled, or that your permissions profile doesn't allow you to see. If you believe this feature should be in your interface, or might help you in your job, contact the Salesforce administrator at your company. Not sure who that is? Reach out to the person at your company who introduced you to Salesforce.
- Save your work! It's easy to spend a lot of time updating the fields in a record and then to navigate away from that screen without saving. Make a habit of seeking out the save button before clicking away through another page element.

SEE ALSO:

[Why Can't I See Some Features?](#)

[Get to Know Your Salesforce Admin](#)

Why Can't I See Some Features?

Because Salesforce is highly customizable, you might not have access to all of the product features.

You might learn about new Salesforce features in our help documentation and training videos. However, sometimes you'll find you can't access these through your interface. This might happen for several reasons.

- You may need to adjust your custom page views or install external apps to enable the feature.
- Your permissions and access settings for some features are limited.
- Your company customized Salesforce so that some standard objects and fields have different names, or created their own custom objects and fields.
- The feature you're looking for isn't offered in the Salesforce edition or the Salesforce experience that your company uses.

[Get to Know Your Salesforce Admin](#)

Get to Know Your Salesforce Admin

Your Salesforce administrator—or “admin” as you may choose to call them—is a Salesforce user with system administration duties and other super powers. Admins are responsible for setting up Salesforce for their organizations and making sure it runs smoothly. Admins have a special profile, which lets them add users and specify what they can see and do in Salesforce. Admins can make everyone more productive by creating custom Salesforce objects, workflows, validation rules, reports, and more. Admins are planners, problem-solvers, and heroes.

All Salesforce organizations have at least one administrator, but larger ones may have more. Your administrator's role can be as simple or as complex as your company's size and structure. In smaller organizations, the admin might be someone who also uses Salesforce the way other users do: to sell products or provide customer service, for example. Many hats, one big brain.

Salesforce offers lots of features and items (such as those detailed in the *Learn Salesforce Basics* guide) that you can set up and configure yourself. It's quite satisfying! For some things, though, you should partner with your trusty admin. They'll help you get the best of what Salesforce has to offer and make sure you have a successful and productive experience.

Here are a few examples of the kinds of things your admin can help you with or do for you.

- Find or use an object, field, or feature you heard about during training.
- Create a custom workflow to find out when a case is closed.
- Create a custom approval process to sign off on employee expenses.

- Create a custom report for your sales region.
- Give you a user permission that's not granted as part of your user profile.
- Answer questions about your own or others' access to records.
- Address those cursed error messages that ask you to contact your administrator for help or more information.

How you contact your administrator, and when and why, depends on your company's internal business policies and practices. Need to find out exactly what those are? Ask your administrator!

Define Personal Information and Preferences

Activate Your Computer

Verify your identity and help prevent unauthorized access by activating your computer with Salesforce.

[Watch a Demo](#) (1:29 minutes)

Sometimes you're prompted to enter a code when you log in to Salesforce to verify your identity. When you verify your identity, you also "activate" your computer. Computer activation allows Salesforce to associate your identity with your computer's network IP address. The activation helps prevent unauthorized access to the service whenever your password is changed or reset, or when you use your computer to log in from an unauthenticated network IP address.

1. When instructed to verify your identity, follow the on-screen prompts to retrieve a verification code. Salesforce automatically selects the highest-priority verification method available to you, in the following order of priority.

One-Time Password Generator App

If you connected an authenticator app (such as Salesforce Authenticator or Google Authenticator) to your account, use the app on your mobile device to generate the verification code. This type of code is sometimes called a "time-based one-time password." The code value changes periodically. Use the current value.

Note: Some accounts require two-factor authentication to log in. Your admin enables two-factor authentication for your account. If your account has this requirement, you have to use a mobile authenticator app to generate your verification code.

SMS Text Message

You receive a verification code in the body of a text message sent to your verified mobile phone. If you don't have a verified mobile number associated with your account, you're prompted to register it when you log in to Salesforce. Registering your phone number verifies your mobile number and enables this method when you're challenged in the future. If your mobile number isn't current, you don't receive the text message. In this case, contact your Salesforce admin.

Email

Salesforce sends the code in an email to the email address specified on your user detail page. The code expires after 24 hours.

2. Enter the verification code in your open identity verification page.

EDITIONS

[Identity Confirmation Activations](#)

[Connect a One-Time Password Generator App or Device](#)

Connect a One-Time Password Generator App or Device

You can connect a one-time password generator app, such as Salesforce Authenticator or Google Authenticator, to your account. If your administrator requires a verification code when you log in for increased security (called “two-factor authentication”), use the code generated by the app. You can also use a code generated by the app whenever we have to verify your identity.

This additional level of security is a second “factor” of authentication. If your administrator has set this requirement, you have to configure this additional factor (usually an authenticator app that displays a code, such as Salesforce Authenticator or Google Authenticator) for your account. This additional factor of authentication generates your verification code, also called a “time-based one-time password” (usually a numeric code). Once you connect the one-time password generator to your account, you’re prompted to enter the code from the authenticator app whenever you log in to Salesforce.

1. Download the supported authenticator app for the type of device you use. You can use any authenticator app that supports the time-based one-time password (TOTP) algorithm ([IETF RFC 6238](#)), such as [Salesforce Authenticator for iOS](#), [Salesforce Authenticator for Android](#), and Google Authenticator.
2. From your personal settings, enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
3. Find **App Registration: One-Time Password Generator** and click **Connect**.
4. For security purposes, you’re prompted to log in to your account.
5. Scan the QR code with the authenticator app on your mobile device.
Alternatively, you can manually enter your username and the key displayed when you click **I Can’t Scan the QR Code** into the app.
6. Enter the code generated by the authenticator app into the **Verification Code** field in Salesforce.
The authenticator app generates a new verification code, periodically. Enter the current code.
7. Click **Connect**.

[Find Your Personal Settings](#)

Set Record Type Preferences

Set an option to automatically insert your default record type when creating new records. Using this setting, you can bypass the page prompting you to select a record type. If you have several different record types available to you, you may prefer to be prompted to select a record type every time you create a new record.

1. From your personal settings, enter *Record Type* in the *Quick Find* box, then select **Set Default Record Types** or **Record Type Selection**—whichever one appears.
2. Check any box to automatically select the default record type when creating records of that type.
Any unchecked boxes indicate that you prefer to be prompted to select a record type.
3. Click **Save**.

 **Note:** The Record Type Selection option may not be available because your organization is not using record types or multiple record types are not available for a particular tab.

Individual checkboxes are only offered when you have more than one record type available for a tab.

If your organization uses person accounts, note that checking the *Account* box on this page causes one default record type selection for all types of accounts. It is not possible to set separate default record type selections for business accounts and person accounts. If you work with both types of accounts, leave the box blank.

Get Set up for the Way You Work

Browsers

Supported Browsers

Supported browsers for Salesforce vary depending on whether you use Salesforce Classic or Lightning Experience.

- [Supported Browsers for Salesforce Classic](#)
- [Supported Browsers for Lightning Experience](#)

Supported Browsers for Salesforce Classic

Salesforce Classic is supported with Microsoft® Internet Explorer® versions 9, 10, and 11 and Apple® Safari® versions 5.x, 6.x and 7.x on Mac OS X. The most recent stable versions of Mozilla® Firefox® and Google Chrome™ are also supported. The following limitations apply.

EDITIONS

Salesforce Classic available in: **All Editions**

 **Note:** Salesforce Classic support for Microsoft® Internet Explorer® versions 7 and 8 is discontinued as of Summer '15.

Using Salesforce Classic in a mobile browser isn't supported. Instead, we recommend using the Salesforce1 app when you're working on a mobile device. To see the mobile browsers that are supported for Salesforce1, check out [Requirements for the Salesforce1 Mobile App](#) on page 187.

Microsoft Internet Explorer versions 9, 10, and 11

If you use Internet Explorer, we recommend using the latest version that Salesforce supports. Apply all Microsoft software updates. Note these restrictions.

- The full Salesforce site is not supported in Internet Explorer on touch-enabled devices for Windows. Use the Salesforce1 mobile browser app instead.
- The HTML solution editor in Internet Explorer 11 is not supported in Salesforce Knowledge.
- The Compatibility View feature in Internet Explorer isn't supported.
- Changing the compatibility parsing mode of the browser, for example, by using the `X-UA-Compatibility` header, isn't supported.
- The Metro version of Internet Explorer 10 isn't supported.
- Internet Explorer 11 isn't supported for the Developer Console.
- Internet Explorer 11 isn't supported for Salesforce CRM Call Center built with CTI Toolkit version 4.0 or higher.
- Community Templates for Self-Service supports Internet Explorer 9 and above for desktop users and Internet Explorer 11 and above for mobile users.
- Internet Explorer 9 isn't supported for Salesforce Wave Analytics.
- Internet Explorer 9 and 10 aren't supported for the Lightning App Builder.

For configuration recommendations, see [Configuring Internet Explorer](#) on page 38.

Mozilla Firefox, most recent stable version

Salesforce makes every effort to test and support the most recent version of Firefox.

- Mozilla Firefox is supported for desktop users only for Community Templates for Self-Service.

For configuration recommendations, see [Configuring Firefox](#) on page 39.

Google Chrome, most recent stable version

Chrome applies updates automatically. Salesforce makes every effort to test and support the most recent version. There are no configuration recommendations for Chrome.

Chrome isn't supported for:

- The **Add Google Doc to Salesforce** browser button
- The Console tab (The Salesforce console is supported.)

Apple Safari versions 5.x, 6.x and 7.x on Mac OS X

There are no configuration recommendations for Safari. Apple Safari on iOS isn't supported for the full Salesforce site.

Safari isn't supported for:

- The Salesforce console
- Salesforce CRM Call Center built with CTI Toolkit versions below 4.0

- Salesforce Wave Analytics

Wave Analytics Supported Browsers

Browser support is available for Microsoft Internet Explorer version 11 and the most recent stable versions of Mozilla Firefox and Google Chrome.

Recommendations and Requirements for All Browsers

- For all browsers, enable JavaScript, cookies, and TLS 1.2. If TLS 1.2 isn't available, enable TLS 1.1. Browsers that don't support TLS 1.1 or TLS 1.2 won't be able to access Salesforce after we deactivate TLS 1.0. Deactivation is scheduled, but not guaranteed, for the first and second quarters of 2016.
- The minimum screen resolution required to support all Salesforce features is 1024 x 768. Lower screen resolutions don't always properly display Salesforce features such as Report Builder and Page Layout Editor.
- For Mac OS users on Apple Safari or Chrome, make sure the system setting `Show scroll bars` is set to **Always**.
- Some third-party Web browser plug-ins and extensions can interfere with the functionality of Chatter. If you experience malfunctions or inconsistent behavior with Chatter, disable the Web browser's plug-ins and extensions and try again.

Some features in Salesforce—and some desktop clients, toolkits, and adapters—have their own browser requirements. For example:

- Internet Explorer is the only supported browser for:
 - Standard mail merge
 - Installing Salesforce Classic Mobile on a Windows Mobile device
 - Connect Offline
- For the best experience with the enhanced page layout editor, use Firefox.
- For the best experience on machines with 8 GB of RAM in the Salesforce console, use Chrome.
- Browser requirements also apply for uploading multiple files on Chatter.

Supported Browsers for Lightning Experience

Lightning Experience is supported with Microsoft® Internet Explorer® version 11, Apple® Safari® version 8.x on Mac OS X. The most recent stable versions of Mozilla® Firefox® and Google Chrome™ are also supported. If you're using Microsoft® Internet Explorer® versions 7–10, you're redirected to Salesforce Classic. The following limitations apply.

You can't access Lightning Experience in a mobile browser. Instead, we recommend using the Salesforce1 app when you're working on a mobile device. For a list of supported mobile browsers on Salesforce1, see [Requirements for the Salesforce1 Mobile App](#) on page 187.

Microsoft Internet Explorer version 11

Note these restrictions.

- The full Salesforce site is not supported in Internet Explorer on touch-enabled devices for Windows. Use the Salesforce1 mobile browser app instead.
- The HTML solution editor in Internet Explorer 11 is not supported in Salesforce Knowledge.
- The Compatibility View feature in Internet Explorer isn't supported.
- Changing the compatibility parsing mode of the browser, for example, by using the `X-UA-Compatibility` header, isn't supported.

EDITIONS

Lightning Experience available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

- Internet Explorer 11 isn't supported for the Developer Console.

For configuration recommendations, see [Configuring Internet Explorer](#) on page 38.

Mozilla® Firefox®, most recent stable version

Salesforce makes every effort to test and support the most recent version of Firefox. For configuration recommendations, see [Configuring Firefox](#) on page 39.

Google Chrome™, most recent stable version

Chrome applies updates automatically. Salesforce makes every effort to test and support the most recent version. There are no configuration recommendations for Chrome.

Chrome isn't supported for the Add Google Doc to Salesforce browser button.

 **Note:** The latest stable version of Google Chromium™ is supported.

Apple® Safari® version 8.x on Mac OS X

There are no configuration recommendations for Safari.

Safari isn't supported for:

- Salesforce CRM Call Center built with CTI Toolkit versions earlier than 4.0
- Salesforce Wave Analytics

Wave Analytics Supported Browsers

Browser support is available for Microsoft Internet Explorer version 11 and the most recent stable versions of Mozilla Firefox and Google Chrome.

Recommendations and Requirements for All Browsers

- For all browsers, enable JavaScript, cookies, and TLS 1.2. If TLS 1.2 isn't available, enable TLS 1.1. Browsers that don't support TLS 1.1 or TLS 1.2 won't be able to access Salesforce after we deactivate TLS 1.0. Deactivation is scheduled, but not guaranteed, for the first and second quarters of 2016.
- The minimum screen resolution required to support all Salesforce features is 1024 x 768. Lower screen resolutions don't always properly display Salesforce features such as Report Builder and Page Layout Editor.
- For Mac OS users on Apple Safari or Google Chrome, make sure that the system setting `Show scroll bars` is set to **Always**.
- Some third-party Web browser plug-ins and extensions can interfere with the functionality of Chatter. If you experience malfunctions or inconsistent behavior with Chatter, disable the Web browser's plug-ins and extensions and try again.

Getting Plug-ins for Viewing Documentation and Online Training Courses

Download the plug-ins you need to view Salesforce PDF documentation and online training courses.

- **Adobe Reader**—For viewing PDF documentation. Go to the [Adobe Reader download page](#) to download a free copy.
- **Macromedia Flash Player**—For taking online training courses. Go to the [Adobe Flash Player download page](#) to download a free copy.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Learning Keyboard Shortcuts

Use keyboard shortcuts to work efficiently in Salesforce.

In addition to the standard keyboard shortcuts available with your Web browser, Salesforce supports these keyboard shortcuts.

- Press ALT plus any number between 0 and 9 to highlight an item in the Recent Items list in the sidebar. For example, press ALT+1 to highlight the first item in the list, ALT+2 to highlight the second item, and so on. Pressing ALT+0 highlights the tenth item in the list.
 -  **Note:** If you're using Mozilla® Firefox®, press SHIFT+ALT plus a number to automatically display the item you highlighted. If you're using Mozilla Firefox on a Mac, press CTRL plus a number. If you're using Microsoft® Internet Explorer®, press ALT plus a number and then press Enter to display the highlighted item.
- If your organization has enabled the collapsible sidebar, press ALT+S to open or close the sidebar. Opening the sidebar using ALT+S automatically places your cursor in the Search box.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Configuring Internet Explorer

If you use Internet Explorer, we recommend using the latest version that Salesforce supports. Apply all Microsoft software updates.

To maximize the performance of Internet Explorer, set the following in the Internet Options dialog box via your browser's settings:

General Tab

1. From the General tab, click **Settings** under Browsing History.
2. For the `Check for newer versions of stored pages` option, select **Automatically**.
3. For the `Disk space to use` option, enter at least 50 MB.

Security Tab

1. From the Security tab, click **Custom Level** under Internet and scroll to the Scripting section.
2. Make sure the `Active Scripting` option is enabled. JavaScript depends on this setting being enabled.

Privacy Tab

1. From the Privacy tab, click **Advanced**.
2. Select the **Override automatic cookie handling** option.
3. Select the **Always allow session cookies** option.
4. For the **Third-party Cookies** option, select **Accept**.

Advanced Tab

From the Advanced tab, scroll to the Security section and do the following:

- Do not select the `Do not save encrypted pages to disk` option.
- Select `Use TLS 1.0`, `Use TLS 1.1`, and `Use TLS 1.2`. Make sure to *deselect* `Use SSL 2.0` and `Use SSL 3.0`. SSL is no longer supported by Salesforce. TLS 1.0 won't be supported after we deactivate it, currently scheduled for the first and second quarter of 2016.

EDITIONS

Available in: Salesforce Classic

Available in all editions

 **Tip:** The `Empty Temporary Internet Files folder when browser is closed` option causes the cache to clear when Internet Explorer is shut down. This increases privacy, but sometimes decrease performance.

SEE ALSO:

[Supported Browsers](#)

Configuring Firefox

To ensure Salesforce works optimally with Firefox, you'll need to do a few configurations to the browser.

Salesforce makes every effort to test and support the most recent version of Firefox.

Required Settings

Make sure Firefox can accept cookies.

1. Click **Tools > Options**.
2. Go to the Privacy panel.
3. For the `Firefox will` option, select **Use custom settings for history**
4. Select the **Accept cookies from sites** option.
5. Select the **Accept third-party cookies** option.
6. For the `Keep until` option, select **they expire**.
7. Click **OK**.

Advanced Settings

Optionally, configure advanced caching preferences to maximize performance.

1. Type `about:config` in the browser's location bar, and then press Enter.
2. If a warning displays, click **I'll be careful, I promise!**
3. Search for the following preferences and set them to the recommended value by double-clicking the preference name. Changes take effect immediately.
4. Change how the browser retains common resources across requests by setting the following caching preferences.

Preference	Recommended Value	Default Value
<code>browser.cache.check_doc_frequency</code>	3	3
<code>browser.cache.disk.capacity</code>	50,000 or more; increase to use more hard disk space	50,000
<code>browser.cache.disk.enable</code>	True	True
<code>browser.cache.disk_cache_ssl</code>	True	False
<code>browser.cache.memory.enable</code>	True	True
<code>network.http.use-cache</code>	True	True

EDITIONS

Available in: Salesforce Classic

Available in all editions

 **Note:** You can set some of these preferences by clicking **Tools > Options** in the Firefox browser. Refer to [Firefox Help](#) for details.

 **Tip:** Setting `privacy.sanitize.sanitizeOnShutdown` to "True" causes the cache to clear when Firefox shuts down. This increases privacy, but may decrease performance.

To view the contents of your cache, type `about:cache` in the Firefox location bar and press Enter.

Refer to [MozillaZine Knowledge Base](#) and [Firefox Support Home Page](#) for more information on these and other preferences.

Understanding Your Access to UI Elements, Records, and Fields

Your administrator can customize many different areas to secure your company's data. Additionally, users in Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations can control the access that other users have to their data by sharing records individually with colleagues.

To determine whether you can access data, review this table:

Action	Access Needed
To view a tab:	<ul style="list-style-type: none"> You must have the "Read" permission on the records within that tab. Make sure you have customized your personal display to show the tab.
To view a record:	<ul style="list-style-type: none"> Make sure you have the "Read" permission on the type of record you want to view. Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations can set a sharing model that determines the access users have to records they do not own. Depending on your sharing model, the owner may need to share the record with you if you are not the owner of the record or above the owner in the role hierarchy. Enterprise, Unlimited, Performance, and Developer Edition organizations can use territory management to grant access to accounts, opportunities, and cases.
To view a field:	<ul style="list-style-type: none"> Make sure you have the "Read" permission on the type of record for the field. For Enterprise, Unlimited, and Performance Edition organizations, check the field-level

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Action	Access Needed
	<p>security; your field-level security settings may prevent you from seeing the field.</p> <ul style="list-style-type: none"> • Check your page layout; depending on your page layout settings, you may see some fields and not others.
To edit a field:	<ul style="list-style-type: none"> • Make sure you have the “Edit” permission on the type of record for the field. • For Enterprise, Unlimited, and Performance Edition organizations, check the field-level security; your field-level security settings may set a field to “Read-Only.” • Check your page layout; page layouts can set fields to read only.
To view a related list:	<ul style="list-style-type: none"> • Make sure you have the “Read” permission on the type of records displayed in the related list. • Check your page layout; depending on your page layout settings, you may see some fields and not others.
To view a button or link:	<ul style="list-style-type: none"> • Make sure you have the necessary permission to perform the action. Buttons and links only display for users who have the appropriate user permissions to use them.

- [Customize what displays on your pages](#)

EDITIONS

Available in: Salesforce Classic

Available in: **All** Editions except for **Database.com**

Customize Your Tabs

Specify which tabs display when you log in, or if you have multiple apps, which tabs display in each app.

1. From your personal settings, enter *Customize My* in the **Quick Find** box, then select **Customize My Tabs**. No results? Enter *Display* in the **Quick Find** box, then select **Change My Display**.
2. If you have access to multiple apps, select the app whose tabs you want to customize from the **Custom Apps** drop-down list.
By default, you'll see the tabs for the selected custom app that are set for your profile.

 **Note:** The first tab that displays when you select an app may change if your administrator changes the app's default landing tab.

3. If desired, add each tab you want to display and change the display order of the tabs you've selected.
4. Save your changes.

SEE ALSO:

[Customize Your Pages](#)

[Find Your Personal Settings](#)

Customize Your Pages

Specify the related lists that appear in detail pages.

1. From your personal settings, enter *Customize My* in the **Quick Find** box, then select **Customize My Pages**. No results? Enter *Display* in the **Quick Find** box, then select **Change My Display**.

For your Home tab, select the dashboard snapshot to display on the Home tab. The link to customize your Home tab is available only if your administrator has customized your home page layout to include a dashboard.

For all other tabs, specify which related lists display on your detail pages.

- To add or remove related lists, select a related list and click the **Add** or **Remove** arrow.

 **Note:** This setting may change if your administrator changes the page layout for a particular tab.

- To change the order of the related lists, select a related list title in the Selected List box, and click the **Up** or **Down** arrow.
2. Save your changes.

Adding Tabs for Frequently Used Items

The Salesforce user interface is composed of tabs, which serve as starting points for viewing, adding, and editing information for an object. Different apps can have different sets of tabs. Add tabs for items you use frequently in any app.

1. Click the Plus icon (**+**) that appears to the right of your current tabs.
The All Tabs page appears. By default, it shows all the tabs you have available to view or add.
2. If you want to see a list of just the tabs for a specific app, select that app from the **View** drop-down.
3. Click **Customize My Tabs**.
4. In the **Custom App** dropdown, select the app where you want the tab to appear.
For example, if you want the Ideas tab to appear in your Marketing app, select *Marketing* and the Ideas tab will appear in that app only.
5. Use the **Add** and **Remove** arrows to move tabs from the Available Tabs list to the Selected Tabs list. Use the **Up** and **Down** arrows to change the order of the tabs.
6. Click **Save**.
7. If you added a tab to an app you're not actively using, open that app to see your new tab.

SEE ALSO:

[Viewing Available Salesforce Tabs](#)

Viewing Available Salesforce Tabs

To view all the tabs available to you in Salesforce, click the plus icon (+) next to the main tabs.

Using this page, you can:

- Click any of the tab names to quickly jump to that tab.
- If you have multiple apps, use the **View** drop-down list to see each app's logo and included tabs.
- Click **Customize My Tabs** to change how tabs display on your screen.

Accessibility

Accessibility Standards Overview

Learn about the standards Salesforce follows to design applications with accessibility in mind.

Salesforce is committed to providing on-demand enterprise applications accessible to all individuals, including users working with assistive devices, such as speech recognition software and screen readers. To help meet our goal of universal design, Salesforce follows the internationally recognized best practices in Section 508 of the Rehabilitation Act and the Web Content Accessibility Guidelines (WCAG) 2.0 Level AA to the extent possible.

Our [Voluntary Product Accessibility Template \(VPAT\)](#) is a tool used to document a product's conformance with the accessibility standards under Section 508 of the Rehabilitation Act and includes an accessibility assessment of our products.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

General Accessibility Requirements

Consider these requirements when using Salesforce.

- JavaScript support must be available and turned on.
- After a specified period of inactivity, a session timeout popup window automatically displays, prompting you to log out or continue working. Your administrator can set this time interval or disable it altogether. Your browser must allow pop-ups in Salesforce; otherwise you won't receive a warning about the upcoming timeout.
- Pilot and Beta features may not be accessible.

Recommended Browsers

For general accessibility testing, Salesforce uses the most current version of Mozilla® Firefox® and Microsoft® Internet Explorer® on Windows®, and Apple® Safari® on OS X®.

Contacting Salesforce with Accessibility Concerns

To access documentation and knowledge base articles or to contact customer support, click the **Help & Training** link at the top of any page.

To report any accessibility concerns or to request an alternate format of any document, send an email to accessibility@salesforce.com.

 **Note:** Customer support is not available for Personal and Developer Edition users. In addition, knowledge base access is not available for Developer Edition users. All users are welcome to contact accessibility@salesforce.com in English with any accessibility-related queries.

Accessibility Mode Overview

Learn how accessibility mode changes your experience using Salesforce.

Salesforce includes an alternate user interface mode that lets users with assistive devices, such as speech recognition software and screen readers, work with Salesforce more effectively. Most new features are designed with accessibility in mind and are inherently accessible in the standard mode. However, you may find that accessibility mode better suits your needs, particularly when using speech recognition or screen reading software to create reports and dashboards or interact with list views.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Accessibility mode includes the full functionality of Salesforce with the modifications detailed here to create a better experience for users with assistive devices.

Accessibility Mode Features that Enhance Usability

- Access setup pages from a Setup link at the top of the page.
- Drop-down menus include a **Go** button that you select to navigate to the option you choose in the drop-down list.
- Menu buttons are rendered as a drop-down list with a **Go** button.
- Overlay pages are rendered as separate pop-up windows.
- The HTML editor is replaced with a text box. This text box only accepts HTML and does not recognize plain text entries like carriage returns. To separate content, you must use paragraph or line break HTML tags.
- When viewing a dashboard, the `View Dashboard` auto-complete filter is replaced with a standard drop-down menu.
- The **Edit Columns** link on the Manage Members page, accessible via the Manage Members drop-down on a campaign detail page, becomes a drop-down button. The Edit Columns overlay is replaced by a standard setup page.
- Clicking a requested meeting in the Open Activities related list and in some list views doesn't open the meeting detail page. Instead, a dialog opens that instructs you to contact the meeting organizer for details about the requested meeting.
- The **Turn My Email On** drop-down list on a Chatter group displays as a **Chatter Email Settings** link that opens your settings for receiving Chatter email.

Disabled Calendar Features

- Event detail overlays in the calendar view
- Drag-and-drop editing
- Drag-and-drop scheduling
- Click-and-create events
- The **New Meeting Request** button on the Open Activities related list

Note: As a result, you can't request a meeting in accessibility mode, and the Requested Meetings subtab in the Calendar section of the Home tab doesn't display any meetings.

Disabled Report and Dashboard Features

- Drag-and-drop editing in the dashboard builder
- Creating and editing reports in report builder

Note: Report builder is required to create or edit joined reports and reports containing cross filters or buckets. Users with accessibility mode enabled can run those reports, but can't create or edit them. To create reports in accessibility mode, you must use the report wizard.

- Drag-and-drop to move reports and dashboards between folders

Disabled List View Features

- Related list hover links
- These enhanced list features:
 - Inline editing
 - Rearranging and adjusting the width of columns

- Editing, deleting, or refreshing the current list view
- Changing the number of records displayed per page
- Jumping to a specific page of results

Other Disabled Features

- The **Check Spelling** button for solutions
- The latest Manage Members page
- The **Recent Tags** drop-down menu when you add the tag component to the sidebar
- When finding similar opportunities, the Match Criteria sidebar on the search results page
- The list of similar questions as you type a question in an answers community

Tip: Users with accessibility mode enabled should use the search box on the Answers tab to see if their question has already been asked before they post their question.

Enable Accessibility Mode

Optimize your experience using Salesforce with assistive devices, such as speech recognition software and screen readers, by enabling accessibility mode.

1. From your personal settings, enter *Accessibility* in the **Quick Find** box, then select **Accessibility**. No matching results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
2. Select **Accessibility Mode**.
3. Click **Save**.

Available in: **All Editions** except **Database.com**

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Sighted Keyboard Users

These Salesforce features help ensure an accessible experience.

- Accessibility Mode helps you work more effectively with Salesforce, particularly reports, dashboards, and list views. See [Accessibility Mode Overview](#) on page 44 for more information.
- Selected areas on the screen include highlights to give you an on-screen visual indication of focus.
- These elements are identified in our page markup to help you interact with them.
 - Headings are marked up as headings rather than field set and legend elements for grouping form controls.
 - The main heading for the page (typically at the start of the main content area) is a level 1 heading. You can shift to this heading with a shortcut key.
 - Data tables have data table markup (except enhanced listviews in Standard Mode only) to aid identification of headers for each cell.
 - Lists provided in the main content area are marked up as lists.
- A skip link (the first keyboard-focusable link on each page) allows you to shift the focus to the start of the main content area. This generally bypasses the navigational menus before the main content area, greatly reducing the number of tab presses that would otherwise be required to reach the main content area of the page.
- Keyboard focus is placed inside of dialog boxes when they open and will remain locked there until the dialog is closed.
- On edit pages, the keyboard focus defaults to the first editable field on the page. When creating or editing a task or event, the keyboard focus defaults to the Subject field, regardless of its location on the page.
- Buttons, links, and fields that aren't currently active are labeled with a “disabled” attribute. For example, when using a wizard with multiple steps, some buttons may be disabled until you select a specific option.

Screen Reader Users

Salesforce on-demand applications are designed to take advantage of the latest features of the most widely used screen reading software. Although you might find that many browser and screen reader combinations work well, we recommend you use the most current versions of Mozilla® Firefox® and JAWS® or NVDA with Salesforce.

These Salesforce features help ensure an accessible experience:

- Accessibility Mode helps you work more effectively with Salesforce, particularly reports, dashboards, and list views. See [Accessibility Mode Overview](#) on page 44 for more information.
- Important images have text alternatives equivalent to the purpose of the image; non-important images have empty text equivalents or are implemented through CSS. Images showing detailed information are also links to source data. For example, Dashboards contain charts and graphs that are visual in nature. To access the report data used to generate the chart or graph, simply select the dashboard component.
 -  **Note:** The underlying report may contain additional data than what is represented in the dashboard component. In addition, the underlying report may contain some data that you don't have access to view due to sharing settings.
- These elements are identified in our page markup to help you interact with them.
 - Headings are marked up as headings rather than field set and legend elements for grouping form controls.
 - The main heading for the page (typically at the start of the main content area) is a level 1 heading. You can shift to this heading with a shortcut key.
 - Data tables have data table markup (except enhanced listviews in Standard Mode only) to aid identification of headers for each cell.
 - Lists provided in the main content area are marked up as lists.

- A skip link (the first keyboard-focusable link on each page) allows you to shift the focus to the start of the main content area. This generally bypasses the navigational menus before the main content area, greatly reducing the number of tab presses that would otherwise be required to reach the main content area of the page.
- Keyboard focus is placed inside of dialog boxes when they open and will remain locked there until the dialog is closed.
- On edit pages, the keyboard focus defaults to the first editable field on the page. When creating or editing a task or event, the keyboard focus defaults to the Subject field, regardless of its location on the page.
- Buttons, links, and fields that aren't currently active are labeled with a “disabled” attribute. For example, when using a wizard with multiple steps, some buttons may be disabled until you select a specific option.

In addition, we recommend you enable these personalized web settings in your screen reader:

- Set pages to refresh automatically.
- Turn on live region update announcements.
- Set text links to show titles. This setting ensures the screen reader announces information provided through a link's title attribute, such as a warning that a new window will open.
- Set headings to announce Headings and Levels. Heading markup is used to provide context as well as navigation.
- Add common signs, such the @ (at) sign for mentioning people in Chatter posts and comments, to your screen reader dictionary to customize how they're announced by default.

Deaf or Hearing Impaired Users

Salesforce provides video demos hosted on YouTube. To view synchronized captions for videos, click `watch` on `YouTube.com` in the bottom-right corner of embedded videos.

Specific Color Users

Browser and operating system settings don't change the colors displayed within images, and Salesforce implements many images as background images (which aren't displayed when browser and operating system settings for color display are in effect). If you rely on browser settings and your operating system to change your display to a particular color combination, you may need to:

- Display image text alternatives to access information provided by important images.
- Override our CSS for these classes: `assistiveText`, `zen-assistiveText`. Then set your browser settings according to your preferences.

In addition:

- Some charts (for example, in reports and dashboards) rely on color to display information. If you have trouble interpreting the information in charts, select `Color-Blind Palette on Charts` from your personal detail page. This option sets an alternate color palette for charts that has been optimized for use by color-blind users. Dashboard emails don't use the alternate palette. You can also click a chart to view its source report.
- Dashboards contain charts and graphs that are visual in nature. To access the report data used to generate the chart or graph, simply select the dashboard component.

Note: The underlying report may contain additional data than what is represented in the dashboard component. In addition, the underlying report may contain some data that you don't have access to view due to sharing settings.

Low-Vision Users Who Need Magnification

Salesforce supports standard OS-level, browser, and third-party magnification tools. Adjust the zoom setting to suit your needs.

These elements are identified in our page markup. You can alter the styles for these elements to help you identify them.

- Headings are marked up as headings rather than field set and legend elements for grouping form controls.

- The main heading for the page (typically at the start of the main content area) is a level 1 heading. You can shift to this heading with a shortcut key.
- Data tables have data table markup (except enhanced listviews in Standard Mode only) to aid identification of headers for each cell.
- Lists provided in the main content area are marked up as lists.

Setup FAQs

View and Display FAQ

- [Which Languages Does Salesforce Support?](#)
- [Why can't I see some buttons and links?](#)
- [Why can't I view Salesforce popup windows such as lookup dialogs and the Help & Training window?](#)
- [Why did my data disappear when I pressed the Backspace key while editing a record?](#)
- [Can I change or delete the drop-down list of entries that appears when I edit a text field?](#)

Which Languages Does Salesforce Support?

Salesforce offers three levels of language support: [fully supported languages](#), [end-user languages](#), and [platform-only languages](#). Each language is identified by a two-character language code, such as `en`, or a five-character locale code, such as `en_AU`.

 **Note:** Setting a default locale is different from setting a default language.

In addition to the Salesforce language support, you can localize your organizations in two ways. The Translation Workbench lets you specify languages you want to translate, assign translators to languages, create translations for customizations you've made to your Salesforce organization, and override labels and translations from managed packages. Everything from custom picklist values to custom fields can be translated so your global users can use all of Salesforce in their language.

The second option is to rename tabs and fields in Salesforce. If your custom application uses only a few standard Salesforce tabs and fields, you can translate them.

Fully Supported Languages

You can change the language for all features, including Help, to one of the following fully supported languages from Setup by entering *Company Information* in the **Quick Find** box, selecting **Company Information**, then selecting **Edit**.

- Chinese (Simplified): `zh_CN`
- Chinese (Traditional): `zh_TW`
- Danish: `da`
- Dutch: `n1_NL`
- English: `en_US`
- Finnish: `fi`
- French: `fr`
- German: `de`
- Italian: `it`
- Japanese: `ja`
- Korean: `ko`

- Norwegian: no
- Portuguese (Brazil): pt_BR
- Russian: ru
- Spanish: es
- Spanish (Mexico): es_MX
- Swedish: sv
- Thai: th

 **Note:**

- Spanish (Mexico) falls back to Spanish for customer-defined translations.
- Even though the Salesforce user interface is fully translated to Thai, Help remains in English.

End-User Languages

End-user languages are useful if you have a multilingual organization or partners who speak languages other than your company's default language. For end-user languages, Salesforce provides translated labels for all standard objects and pages, *except* administrative pages, Setup, and Help. When you specify an end-user language, labels and Help that aren't translated appear in English. End-user languages are intended only for personal use by end users. Don't use end-user languages as corporate languages. Salesforce doesn't provide customer support in end-user languages.

End-user languages include:

- Arabic: ar
- Bulgarian: bg
- Croatian: hr
- Czech: cs
- English (UK): en_GB
- Greek: el
- Hebrew: iw
- Hungarian: hu
- Indonesian: in
- Polish: pl
- Portuguese (Portugal): pt_PT
- Romanian: ro
- Slovak: sk
- Slovenian: sl
- Turkish: tr
- Ukrainian: uk
- Vietnamese: vi

 **Note:** Salesforce provides limited support for right-to-left languages—Arabic and Hebrew—for the following features.

- Live Agent
- Cases
- Accounts

These features are not supported in Lightning Experience, the Salesforce1 mobile app, any other mobile app or mobile browser, or any user interface except Salesforce Classic. There is no guarantee that right-to-left languages function correctly with any other Salesforce features. There are no plans to expand the list of supported features.

Features that aren't supported for right-to-left languages include, but are not limited to, the following.

- Report Builder
- Generating quote PDFs
- Customizable forecasting
- Emails
- Salesforce Knowledge
- Feeds
- Communities

The absence of a feature from this list does not imply support. Only Live Agent, Cases, and Accounts are supported with right-to-left languages.

Platform-Only Languages

In situations where Salesforce doesn't provide default translations, use platform-only languages to localize apps and custom functionality that you've built on the Salesforce App Cloud. You can translate items such as custom labels, custom objects, and field names. You can also rename most standard objects, labels, and fields. Informative text and non-field label text aren't translatable.

Platform-only languages are available in all places where you can select a language in the application. However, when you select a platform-only language, all standard Salesforce labels default to English or, in select cases, to an end-user or fully supported language.

When you specify a platform-only language, labels for standard objects and fields fall back to English, except:

- English (Australia), English (India), English (Malaysia), and English (Philippines) fall back to English (UK).
- German (Austria) and German (Switzerland) fall back to German.
- French (Canada) falls back to French.
- Romanian (Moldova) falls back to Romanian.
- Montenegrin falls back to Serbian (Latin).
- Portuguese (Portugal) falls back to Portuguese (Brazil).

The following platform-only languages are currently supported.

- Albanian: `sq`
- Arabic (Algeria): `ar_DZ`
- Arabic (Bahrain): `ar_BH`
- Arabic (Egypt): `ar_EG`
- Arabic (Iraq): `ar_IQ`
- Arabic (Jordan): `ar_JO`
- Arabic (Kuwait): `ar_KW`
- Arabic (Lebanon): `ar_LB`
- Arabic (Libya): `ar_LY`
- Arabic (Morocco): `ar_MA`
- Arabic (Oman): `ar_OM`
- Arabic (Qatar): `ar_QA`

- Arabic (Saudi Arabia): `ar_SA`
- Arabic (Sudan): `ar_SD`
- Arabic (Syria): `ar_SY`
- Arabic (Tunisia): `ar_TN`
- Arabic (United Arab Emirates): `ar_AE`
- Arabic (Yemen): `ar_YE`
- Armenian: `hy`
- Basque: `eu`
- Bosnian: `bs`
- Bengali: `bn`
- Chinese (Simplified—Singapore): `zh_SG`
- Chinese (Traditional—Hong Kong): `zh_HK`
- English (Australia): `en_AU`
- English (Canada): `en_CA`
- English (Hong Kong): `en_HK`
- English (India): `en_IN`
- English (Ireland): `en_IE`
- English (Malaysia): `en_MY`
- English (Philippines): `en_PH`
- English (Singapore): `en_SG`
- English (South Africa): `en_ZA`
- Estonian: `et`
- French (Belgium): `fr_BE`
- French (Canada): `fr_CA`
- French (Luxembourg): `fr_LU`
- French (Switzerland): `fr_CH`
- Georgian: `ka`
- German (Austria): `de_AT`
- German (Luxembourg): `de_LU`
- German (Switzerland): `de_CH`
- Hindi: `hi`
- Icelandic: `is`
- Irish: `ga`
- Italian (Switzerland): `it_CH`
- Latvian: `lv`
- Lithuanian: `lt`
- Luxembourgish: `lb`
- Macedonian: `mk`
- Malay: `ms`
- Maltese: `mt`

- Romanian (Moldova): `ro_MD`
- Montenegrin: `sh_ME`
- Romansh: `rm`
- Serbian (Cyrillic): `sr`
- Serbian (Latin): `sh`
- Spanish (Argentina): `es_AR`
- Spanish (Bolivia): `es_BO`
- Spanish (Chile): `es_CL`
- Spanish (Colombia): `es_CO`
- Spanish (Costa Rica): `es_CR`
- Spanish (Dominican Republic): `es_DO`
- Spanish (Ecuador): `es_EC`
- Spanish (El Salvador): `es_SV`
- Spanish (Guatemala): `es_GT`
- Spanish (Honduras): `es_HN`
- Spanish (Nicaragua): `es_NI`
- Spanish (Panama): `es_PA`
- Spanish (Paraguay): `es_PY`
- Spanish (Peru): `es_PE`
- Spanish (Puerto Rico): `es_PR`
- Spanish (United States): `es_US`
- Spanish (Uruguay): `es_UY`
- Spanish (Venezuela): `es_VE`
- Tagalog: `tl`
- Tamil: `ta`
- Urdu: `ur`
- Welsh: `cy`

Why can't I see some buttons and links?

Buttons and links only display for users who have the appropriate permissions to use them. For example, users who do not have the "Delete" permission on opportunities do not see the **Delete** button on an opportunity detail page nor do they see the **Del** link on an opportunity related list.

Why can't I view Salesforce popup windows such as lookup dialogs and the Help & Training window?

If your browser's popup blocker settings are configured for maximum security, you won't be able to view any popup windows within Salesforce—even those that provide necessary functionality such as the calendar popup for choosing a date on an activity, lookup dialogs for selecting a record, the Help & Training window, and more.

To test your popup settings:

1. From your personal settings, enter *Reminders* in the **Quick Find** box, then select **Reminders & Alerts**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
2. Click **Preview Reminder Alert**.

To allow popup windows for Salesforce, add Salesforce as a trusted site within your browser's popup blocker settings. Consult the online help for your browser for specific instructions.

Some browser add-ons, like the Google toolbar, also have popup blocking. Consult your software documentation on those products for details on how to configure them to allow popup windows from Salesforce.

SEE ALSO:

[Find Your Personal Settings](#)

Why did my data disappear when I pressed the Backspace key while editing a record?

Some versions of Internet Explorer use the Backspace key as a keyboard shortcut for the browser's Back button. When you press the Backspace key and your cursor is not within a text field, the browser goes back to the previous page, making it appear that your data has been lost. To retrieve your data and return to the page you were working on, click your browser's Forward button.

Can I change or delete the drop-down list of entries that appears when I edit a text field?

No. These auto-complete entries that appear when you are editing certain text fields are a feature of Internet Explorer. The browser remembers text you have entered previously and provides a list of those entries for you to automatically complete the field. If you would like to turn this feature off, click **Tools** on your browser's menu bar, select **Internet Options**, click the **Content** tab, and then choose the **AutoComplete** button to change your browser's settings.

Navigate Salesforce

Open a Different App

Not finding the feature you need to use? Maybe it's in another app. Check out the drop-down menu to see all the apps available to you, and select the one you need.

To use features available in a different Salesforce app than the one you have open, you need to open the other app. Other apps include the Salesforce Marketing app, the Call Center app, and any custom apps for your organization.

Your organization may also use connected apps. Connected apps include productivity apps such as Gmail™ and Microsoft Office 365™, or other apps to help you get your work done. If your administrator has added these apps to your organization, they appear in the App Launcher.

Understanding Salesforce Pages

Salesforce apps are made up of tabs and pages. Standard objects such as Accounts, Contacts, and Leads, and other features such as Chatter typically have tabs, and from a tab, you navigate through pages to interact with the features you're using. For example, if you want to create an account record, you'll click the Accounts Tab, and land on the Accounts Home page. Click **New** to open the Account Edit page where you'll enter information for the account. Click **Save**, and you'll see the Account's Detail page. Return to the Accounts Home page and the new account is listed.

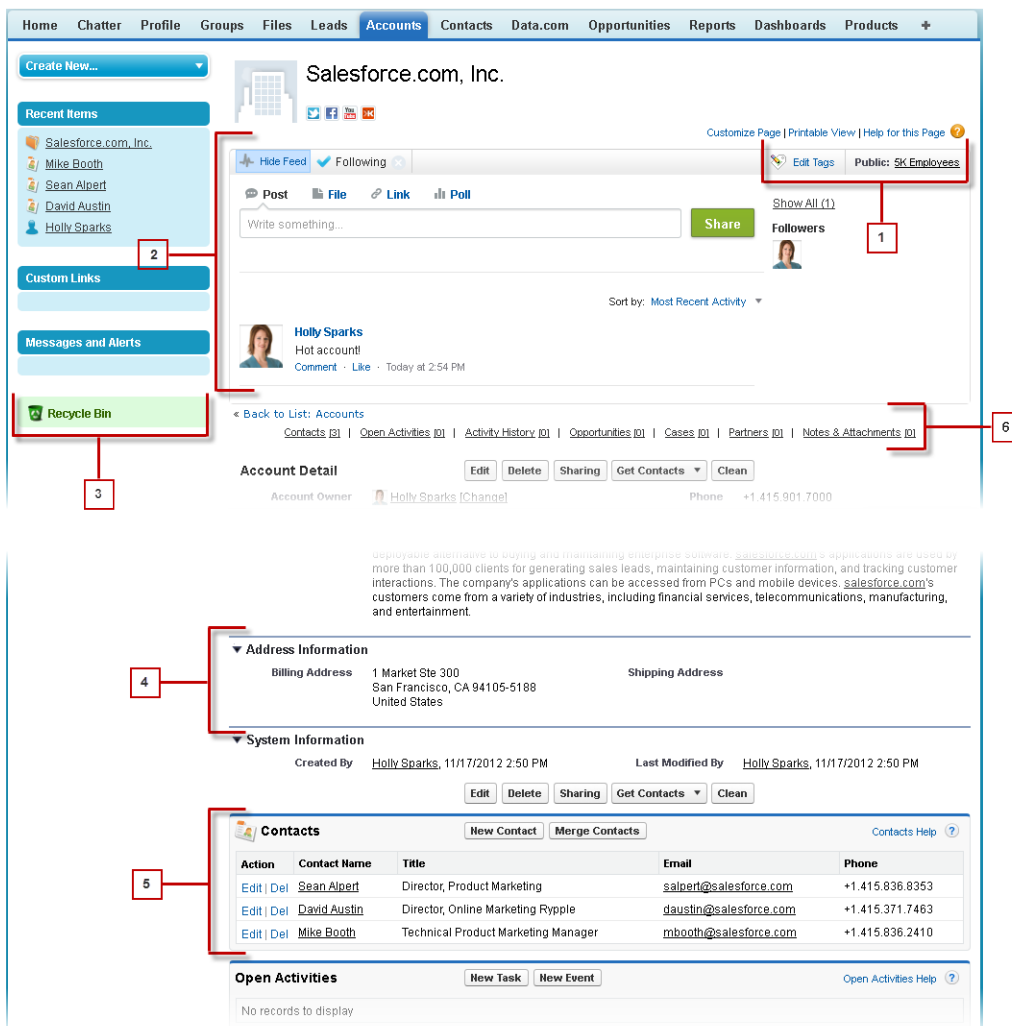

Salesforce tabs can have multiple types of pages, including Home, Edit, and Detail pages, and you can create list views for some objects. Chatter has one primary page type: a feed. And Data.com has a search interface. Dashboards and reports have their own page styles, as well.

Your system administrator typically sets up page layouts for standard objects and enables the navigation features your organization can use, but interacting with Salesforce is easier if you understand the most common page elements for the most frequently used objects. They include:

1. A *tag* bar, where you can view and add tags for a record.
2. A *feed*, where you can add and view comments about a record.
3. A *sidebar*, where you can do things like search and quickly create new records.

4. *Sections* for the record, with key fields and links.
5. *Related lists*, which group and display links to other records associated with the one you're viewing. You can change the order of related lists on your page.
6. Various *links* that help you move around the page or go to different pages or external sites.

Let's look at these elements on an account detail page.

Understanding the Salesforce Sidebar

The sidebar column that appears on the left side of most Salesforce pages provides convenient access to the following links and commands.

- Search
Use the header search box, if you don't have sidebar search.
- The [Tags](#) link and Recent Tags drop-down list
- The [Divisions](#) drop-down list
- The [Create New](#) drop-down list
- A Calendar shortcut to your last used calendar view
- The [Recent Items](#) list
- [Messages and Alerts](#)
- [Custom Links](#)
- A shortcut to the [Recycle Bin](#)

The options in your sidebar vary depending on the features you have enabled and whether your administrator has customized the page layout.

Available in: **All** Editions except **Database.com**

Showing and Hiding the Collapsible Sidebar

If your administrator has enabled the Collapsible Sidebar, you can show or hide the sidebar as needed.

 **Note:** Call center users won't see incoming calls if they collapse the sidebar.

Click the edge of the sidebar to open or close the sidebar as needed.

EDITIONS

Available in: Salesforce Classic

Available in: **All** editions except **Database.com**

Working with Related Items Directly from the Record You're Viewing

On Salesforce records, links and details for associated records are grouped within related lists. Some related lists let you perform common tasks for the related object, like creating new records or attaching files.

For example, the Lead record offers a number of related lists, including Open Activities, which lists open activities and key activity fields. On this related list, you can create a new task, a new activity, or a new meeting request. When a task related to the lead is closed, a link to that task appears in the Lead record's Activity History related list, which displays the same key fields as Open Activities, and offers other common tasks.

The related lists you can view and use are determined by:

- Your user permissions

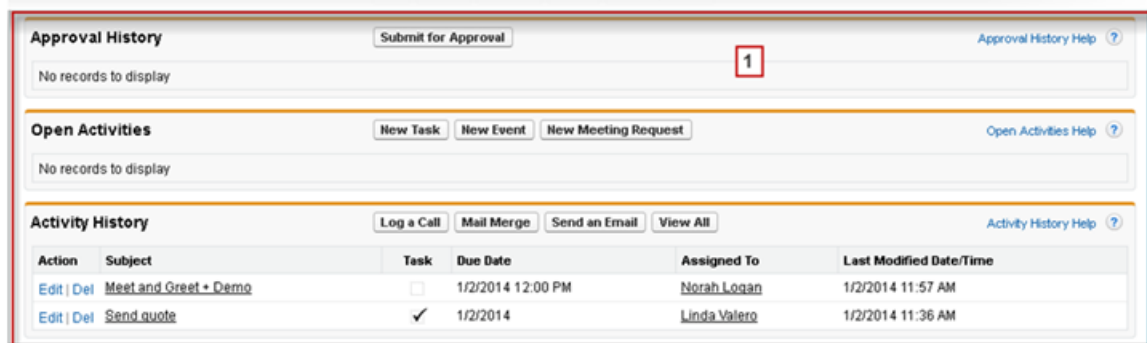

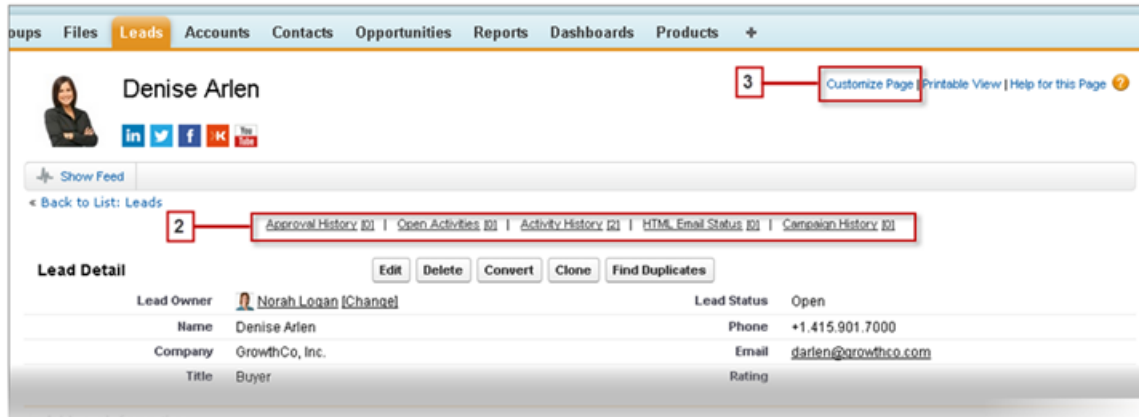

EDITIONS

Available in: Salesforce Classic

Available in: All editions

- User interface and page layout customizations made by your Salesforce administrator
- Personal customizations you can make

It's easy to arrange and access related lists. Here's how.

1. Scroll the page to find the related list you need.
2. If related list hover links are enabled in your organization, click a link to view the list in a pop-up.
3. Click **Customize Page** to select and arrange the available related lists you want to see.

Opening Items You've Recently Viewed

In the Recent Items section of the Salesforce sidebar, you'll find a list of up to 10 items (records, documents, custom objects, and the like) you've most recently added, edited, or viewed.

To open any item's detail or edit page, just click its link.

-  **Tip:** If your organization has enabled hover details, you can hover your mouse over any item in the Recent Items list to view key information about the record before clicking into that record's detail or edit page.
-  **Note:** Your Recent Items may show fewer than 10 items if you have recently deleted any of your recently viewed items. Likewise, the Recent lists on the tab home pages (for example, the Recent Leads list) may show fewer than 10 or 25 items if you have recently deleted items.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** Editions

Working with Enhanced Lists

Enhanced lists give you the ability to quickly view, customize, and edit list data to speed up your daily productivity. They must first be enabled by your administrator for you to take advantage of them.

Enhanced lists allow you to:

- Navigate through the list results by clicking the first page icon (<<), **Previous**, **Next**, or the last page icon (>>) at the bottom of the list.
- Jump to a specific page of results by entering a number in the text box in the lower right corner, and then pressing ENTER.
- Create a new view by clicking **Create New View**. Edit, delete or refresh the current view by clicking **Edit**, **Delete**, or , respectively.
- Change the number of records displayed per page. Click ▼ in the lower left corner of the list and select the desired setting. You can view 10, 25, 50, 100, or 200 records at a time. When you change this setting, you return to the first page of list results.

Changing your preference for the number of records displayed per page applies to all lists in all Salesforce apps, not just the one currently displayed. In addition, if you change your preference to 200, a message warns you of possible performance degradation.

- Change the width of a column by dragging the right side of the column heading with your mouse. Any changes you make to column widths are specific to that list only, and are preserved when you next view the list.

If you add or remove columns from a list, any column width customizations for that list are discarded automatically.

- Change the order in which a column is displayed by dragging the entire column heading with your mouse to the desired position. If you have permission to edit the list definition, your changes are automatically saved for all users who see the list. If you do not have permission to edit the list definition, your changes are discarded when you navigate away from the page.
- Change the number and order of columns displayed by clicking **Edit** next to the list drop-down in the upper left corner.
- If your administrator has enabled inline editing for your organization, edit single records directly from the list by double-clicking on individual field values. If your administrator has granted you the “Mass Edit from Lists” permission, you can also edit up to 200 records at a time.
- On account, contact, and lead list views, click the  **Open Calendar** link at the bottom of the page to display a weekly view of a calendar underneath the list. Then, you can drag a record from the list to a time slot on the calendar to quickly create an event associated with the record. Note that your administrator controls the availability of the Drag-and-Drop Scheduling feature.

Navigating Long Lists

Many list pages in Salesforce include the following tools for managing a large amount of data:

- To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views.

To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.

- At the top of a list, click a letter to show items that correspond to that letter, or click **Other** to show items whose names begin with numbers or symbols. Click **All** to display all items that match the criteria of the current view.
- To sort list view items by the data in a particular column, click that column’s heading. This sorts text data alphabetically and numerical data in ascending order. Dates are sorted with the most recent date first. To reverse the sort order, click the column heading a second time.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To use inline editing in an enhanced list:

- “Mass Edit from Lists”

EDITIONS

Available in: Salesforce Classic

Available in all editions

 **Note:** You can sort by any custom field except multi-select picklists. User list views are not sorted for organizations with more than two million users. Organizations with more than 2 million users can contact Salesforce to re-enable sorting.

- Click the **Previous Page** or **Next Page** link to go to the previous or next set of items in the current view.
- At the bottom of a list, click the **fewer** or **more** link to decrease or increase the number of items per page.

In some related lists with many items, the following links are available:

- Click **Show [number] more** to increase the number of items in the list.
- Click **Go to list** to display a secondary page of the entire related list.

Changing Your Working Division

You can change which records you are viewing by selecting the division you are currently working in.

You can change the division you are working in at any time and override the default division you were originally assigned for some searches and reports.

- From the Divisions field in the sidebar, select the division you want to work in.

 **Note:** Records you create are assigned to your default division, not to your working division. You can explicitly set a division other than your default division when you create the record.

Using Your Tasks and Calendar on the Home Page

 **Note:** The My Tasks and Calendar sections display on the Home page if they are included as components on your Home page layout.

From the Home page, you can view, create, and edit tasks and events. If you have Salesforce for Outlook installed, you may be able to sync your Outlook items with Salesforce so they appear in the My Tasks and Calendar sections.

In the My Tasks section, you can:

- Click **New** to create a task.
- View a list of tasks assigned to you. Up to fifteen tasks can be displayed; to view all your tasks, click **View More**.
 -  identifies tasks that are part of a recurring series.
- Choose a time frame from the drop-down list to change which tasks display.
- Assign unresolved emails to related records; to view all your unassigned emails, click **My Unresolved Items**.
- If your organization has enabled hover links for the My Tasks list, hover your mouse over the subject of a task to see the details of the task in an overlay. Alternatively, click the subject of a task to open the detail page of that task.
- Click **X** to close a task.

In the Calendar section, you can:

- Click **New Event** to create a new event.
- Click the Scheduled Meetings subtab to view a list of the events you have scheduled for the next seven days. This tab displays a maximum of 50 events per day.
 -  identifies events that are part of a recurring series.
 -  identifies events with invitees. Events owned by multiple people aren't available in Personal Edition.
 - If your organization has enabled home page hover links for events, hover your mouse over the subject of an event to display the details of the event in an interactive overlay. Alternatively, click the subject of an event to open the detail page of that event.
- Click the Requested Meetings subtab to view meetings you have requested but not confirmed. This tab displays a maximum of 100 requested meetings.
 - Click the subject of the meeting to open its detail page where you can cancel and reschedule the meeting.
 - The Responses column shows the number of invitees that have responded to your meeting request.
 - Once you confirm a meeting, it appears on the Scheduled Meetings subtab.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

If the Requested Meetings subtab doesn't appear, ask your Salesforce administrator to add it to the Calendar section.

- View a small calendar of the current month. To change which month appears, click  and .
- Navigate to different views of your calendar and click the icons underneath the small monthly calendar as appropriate.

Viewing Custom Links on the Home Tab

This section appears on the Home tab depending on your customized home page layout.

The Custom Links section of the Home tab contains links to websites or Salesforce pages that are useful for everyone in your organization. Your administrator sets which links appear in this section.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Viewing Messages and Alerts

The Messages and Alerts section of the Home tab sidebar displays announcements customized by your organization's administrator. The Messages and Alerts section is not available in Personal Edition.

Performance Chart

Use the performance chart on the Home page in Lightning Experience to track your sales performance or the performance of your sales team against a customizable sales goal.

The performance chart displays data based on your sales team's opportunities if you have an associated team. Otherwise, the chart displays opportunities you own. Only opportunities for the current sales quarter that are closed or open with a probability over 70% are displayed.

- Closed—The sum of your closed opportunities.
- Open (>70%)—The sum of your open opportunities with a probability over 70%. The blue line in the chart is the combined total of the closed opportunities and open opportunities with a probability over 70%.
- Goal—Your customizable sales goal for the quarter. This field is specific to the performance chart and has no impact on forecast quotas or any other type of goal. Click  to set the goal.

The screenshot shows the Salesforce Assistant interface with five notification cards:

- Overdue Task from Yesterday:** A card with a green checkmark icon. It contains a checkbox and the text "Meet to Discuss Oppty" with the date "8/25/2015".
- Open Task Due Today:** A card with a green checkmark icon. It contains a checkbox and the text "Schedule Demo for Client" with the date "8/26/2015".
- New Lead Assigned to You Today:** A card with a red star icon. It displays the name "Dan Perkins" and the role "Account Executive - Acme".
- This Opportunity Has Overdue Tasks:** A card with a crown icon. It displays "Acme - 200 Routers" and "Acme - 8/28/2015 - USD 10,000.00". A small orange warning triangle is in the bottom right corner.
- This Opportunity Has No Open Activities:** A card with a crown icon. It displays "AW Computing - 300 Widgets" and "Global Media - 9/3/2015 - USD 9,000.00". A small orange warning triangle is in the bottom right corner.

Items in the Assistant appear in the following order:

- Tasks that are overdue
 - Tasks due today
 - Leads assigned to you today
 - Opportunities with overdue tasks
 - Opportunities with no activity in 30 days
 - Opportunities with no open activity
-  **Note:** If you don't have access to activities on opportunities or if the opportunity pipeline is off, you instead see items for opportunities that have close dates over the next 90 days.

Manage Relationships and Data with Records

View and Share Records

Finding and Viewing Records and Data

Use tabs, search, or lists to look at your data.

Much of your Salesforce data is stored in individual *records*, and organized within objects. For example, the Account object presents all of your account records. If the Acme company is one of your accounts, you'll have an account record for Acme.

When you're working with records, it's important to remember that the types of records you can create, view, edit, and delete are determined by administrator settings, such as a user profile or permission set. Your access to individual records may be determined by other configurations, such as sharing settings. And your access to fields on types of records may be controlled by field-level security. Work with your administrator to make sure you have access to the records and data you need.

There are a few easy ways to find and view your records.

- From a tab, such as Accounts or Contacts, start from the default view and click **Go!** or select a different view.

The resulting page you see is called a *list view*.

Action	Name ↑	Account Name	Title	Position	Phone	Email	Contact Owner
Edit Del	Adams, Arnold	ABC Labs	IT Manager	IT	1-408-555-2122	arnold.adams@tra...	mwils
Edit Del	Allen, Jack	Arbuckle Laborator...		Marketing	1-847-555-0557	jack.allen@training...	psmit
Edit Del	Amos, Jon	Vandelay Industries	Sales Manager	Account Manager	1-713-555-2405	jon.amos@training...	mwils
Edit Del	Anderson, Abby	Arbuckle Laborator...		IT	1-847-555-0590	abby.anderson@tr...	psmit
Edit Del	Buchner, Francis	ABC Labs	Account Manager	Account Manager	1-408-555-2124	francis.buchner@tr...	mwils

- Search for a record using keywords, such as a name or address stored in the record. Use the search bar in the banner displayed on most pages.
- On many records, below the main page sections, look for related lists, which identify records that are associated with the record you're currently viewing. For example, an account record probably has a related list of contacts at that account.

Granting Access to Records

You can use manual sharing to give specific other users access to certain types of records, including accounts, contacts, and leads. In some cases, granting access to one record includes access to all its associated records.

For example, if you grant another user access to an account, the user will automatically have access to all the opportunities and cases associated with that account.

To grant access to a record, you must be one of the following users.

- The record owner
- A user in a role above the owner in the hierarchy (if your organization's sharing settings control access through hierarchies)
- Any user granted "Full Access" to the record
- An administrator

[Walk Through It: grant users access to your account](#)

To grant access to a record using a manual share:

1. Click **Sharing** on the record you want to share.
2. Click **Add**.
3. From the **Search** drop-down list, select the type of group, user, role, or territory to add.

Depending on the data in your organization, your options can include:

Type	Description
Managers Groups	All direct and indirect managers of a user.
Manager Subordinates Groups	A manager and all direct and indirect reports who he or she manages.
Public Groups	All public groups defined by your administrator.
Personal Groups	All personal groups defined by the record owner. Only the record owner can share with his or her personal groups.
Users	All users in your organization. Does not include portal users.
Roles	All roles defined for your organization. This includes all of the users in each role.
Roles and Subordinates	All of the users in the role plus all of the users in roles below that role in the hierarchy. Only available when no portals are enabled for your organization.
Roles and Internal Subordinates	All roles defined for your organization. This includes all of the users in the specified role plus all of the users in roles below that role, excluding partner portal and Customer Portal roles.
Roles and Internal and Portal Subordinates	Adds a role and its subordinate roles. Includes all of the users in that role plus all of the users in roles below that role. Only

EDITIONS

Available in: Salesforce Classic

Sharing for accounts and contacts is available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Sharing for campaigns, cases, custom object records, leads, and opportunities is available in **Enterprise, Performance, Unlimited, and Developer** Editions

Type	Description
	available when a partner or Customer Portal is enabled for your organization. Includes portal roles and users.
Territories	For organizations that use territory management, all territories defined for your organization, including all users in each territory.
Territories and Subordinates	For organizations that use territory management, all users in the territory plus the users below that territory.

 **Note:** In organizations with more than 2,000 users, roles, and groups, if your query doesn't match any items in a particular category that category won't show up in the Search drop-down menu. For example, if none of your group names contain the string "CEO," after searching for "CEO" you'll notice the Groups option no longer appears in the drop-down. If you enter a new search term, all of the categories will still be searched even if they don't appear in the list. You can repopulate the drop-down by clearing your search terms and pressing **Find**.

- Choose the specific groups, users, roles, or territories who should have access by adding their names to the Share With list. Use the **Add** and **Remove** arrows to move the items from the Available list to the Share With list.
- Choose the [access level](#) for the record you are sharing and any associated records that you own.

 **Note:**

- If you're sharing an opportunity or case, those you share it with must also have at least "Read" access to the associated account (unless you are sharing a case via a case team). If you also have privileges to share the account itself, those you share it with are automatically given "Read" access to the account. If you do not have privileges to share the account, you must ask the account owner to give others "Read" access to it.
 - `Contact Access` is not available when the organization-wide default for contacts is set to Controlled by Parent.
 - For sharing rules that specify access for associated object records, the given access level applies to that sharing rule only. For example, if an account sharing rule specifies Private as the access level for associated contacts, a user may still have access to associated contacts via other means, such as organization-wide defaults, the "Modify All Data" or "View All Data" permission, or the "Modify All" or "View All" permission for contacts.
- When sharing a forecast, select `Submit Allowed` to enable the user, group, or role to submit the forecast.
 - Select the reason you're sharing the record so users and administrators can understand.
 - Click **Save**.

[Editing or Deleting Record Access](#)

[Understanding Your Access to UI Elements, Records, and Fields](#)

[Viewing Which Users Have Access to Your Records](#)

[Record Access Levels](#)

[Why can't I see the Sharing button on a record?](#)

Editing or Deleting Record Access

Edit or remove access to a record.

Manual shares are deleted automatically if the record owner is changed or if they are no longer needed, such as when the organization-wide defaults or sharing rules grant a similar or wider access than the manual share.

To edit or delete access to a record:

1. Open the record for which you want to edit or delete.
2. Click **Sharing** on the record.
3. Click **Edit** or **Del** next to the group, user, role, or territory whose access you want to modify or remove.

SEE ALSO:

[Granting Access to Records](#)

[Why can't I see the Sharing button on a record?](#)

[Record Access Levels](#)

Viewing Which Users Have Access to Your Records

After you have granted access to a record you own, you can view a list of users who have access to the record and its related information and records, including their access level and an explanation. The list shows every user who has access that is greater than the organization-wide default settings.

For forecast sharing, the list shows whether the user can submit a forecast (in forecasting versions where sharing is available). High-volume portal users and Customer Portal super users are excluded from this list.

 **Note:** For sharing rules that specify access for associated object records, the given access level applies to that sharing rule only. For example, if an account sharing rule specifies Private as the access level for associated contacts, a user may still have access to associated contacts via other means, such as organization-wide defaults, the “Modify All Data” or “View All Data” permission, or the “Modify All” or “View All” permission for contacts.

1. Click **Sharing** on the desired record.
2. Click **Expand List**.
3. Click **Why?** next to a user’s name to see the reason the user has access to the record.

If there are multiple reasons with different access levels, the user is always granted the most permissive access level.

The possible reasons are:

Reason	Description
Account Sharing Rule	The user has access via an account sharing rule created by the administrator.

EDITIONS

Available in: Salesforce Classic

Sharing for accounts and contacts is available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Sharing for campaigns, cases, custom object records, leads, and opportunities is available in **Enterprise, Performance, Unlimited, and Developer** Editions

Sharing for custom objects is available in **Database.com**

EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Reason	Description
Account Sharing	The user was granted access via the Sharing button on the associated account.
Account Team	The user is a member of the account team.
Account Territory	The account has been assigned to a territory to which the user has access.
Account Territory Rule	The user has access via an account territory sharing rule created by the administrator.
Administrator	The user has the "Modify All Data" or "View All Data" administrative permission, or the "Modify All" or "View All" object permission.
Associated Portal User or Role	The portal user or any role above the portal user's role has access to the account for which the portal user is a contact.
Associated Record Owner or Sharing	The user owns or has sharing access to a contact or contract associated with the account. Click the link to view which associated records the user owns or has been given sharing access to.
Associated Record Sharing	The user is a member of a share group that has access to a contact or contract that's associated with the account owned by high-volume portal users.
Campaign Sharing Rule	The user has access via a campaign sharing rule created by the administrator.
Case Sharing Rule	The user has access via a case sharing rule created by the administrator.
Contact Sharing Rule	The user has access via a contact sharing rule created by the administrator.
Delegated Forecast Manager	A user has access to forecast data that was granted via the Sharing button on the forecast (in forecasting versions where sharing is available).
Forecast Manager	A user has access due to being a forecast manager in the forecast hierarchy.
Group Member	The user has access via a group, such as a Managers Group or Manager Subordinates Group.
Lead Sharing Rule	The user has access via a lead sharing rule created by the administrator.
Manager of Territory Member	The user has a subordinate in the role hierarchy who is assigned to the territory with which the account is associated.
Manual Sharing	The user has access that was granted via the Sharing button on the record.

Reason	Description
Manual Territory Sharing	The account has been manually assigned to a territory to which the user has access.
Opportunity Sharing Rule	The user has access via an opportunity sharing rule created by the administrator.
Owner	The user owns the record, or the user is a member of the queue that owns the record or above the queue member in the role hierarchy.
Portal Share Group	The user is a member of a share group that has access to records owned by high-volume portal users.
Related Portal User	The portal user is a contact on the case.
Role Above Owner or Shared User (Portal Only)	The user's role is above the role of a portal user who has access to the record via ownership or sharing.
Sales Team	The user is a member of the opportunity sales team.
View All Forecasts Permission	The user has the "View All Forecasts" permission.

[Viewing Which Users Have Access to Your Records](#)

List Views

List views give you quick access to your important records. You can find preconfigured views, such as a list of recently viewed records, for every standard and custom object. In Salesforce Classic, create customized list views to display records that meet your own criteria. In Lightning Experience, scroll through preconfigured views and list views you created in Salesforce Classic, and use list view charts to see a graphical display of your list view data.

IN THIS SECTION:

[Create a List View](#)

Create a list view to see a specific set of records. You can create and save views for opportunities, contacts, leads, and other standard and custom objects. You determine which records display by setting filters. All records that meet your filter criteria appear in your list view.

[Edit List View Filters](#)

Refine or update your list views to make sure that you're seeing the most relevant records. To change which records display in a list view, edit the list view filters.

[Sort List Views](#)

Lots of objects let you view records in lists, also called "list views." If your list is long, you can sort the records by one of the field columns. For example, you can sort the All Accounts list view by the `Account Name` field column, `Billing State/Province` field column, and others. You can also sort custom list views. Sorting is alphanumeric.

[Print a List View in Salesforce Classic](#)

[Delete a List View](#)

Delete a list view when you no longer need it to keep your workspace up to date.

[Relative Date Values for Filter Criteria](#)

When you create a list view that includes a filter for a range of dates, such as `Create Date` or `Last Update Date`, use one or more of the relative date values provided to specify the range.

[Visualize List View Data with Charts in Lightning Experience](#)

See a graphic display of list view data with list view charts. There are three types of charts: vertical bar, horizontal bar, and donut. For any list view, select from available standard and custom list view charts. You can change the data display to another type, if desired.

[Create a List View Chart in Lightning Experience](#)

Create a chart to visualize list view data. There are three types of charts: vertical bar, horizontal bar, and donut. For any list view chart, you can change the data display to another type, if desired. When you create a list view chart for an object, such as Opportunities or Leads, the chart is associated with the object. The chart is available for any list view that you have permission to see for that object, except the Recently Viewed list.

[Edit a List View Chart in Lightning Experience](#)

Refine or update your custom list view charts to make sure that you're seeing the most meaningful data visualizations. There are three types of charts: vertical bar, horizontal bar, and donut. For any list view chart, you can change the data display to another type, if desired.

Create a List View

Create a list view to see a specific set of records. You can create and save views for opportunities, contacts, leads, and other standard and custom objects. You determine which records display by setting filters. All records that meet your filter criteria appear in your list view.

IN THIS SECTION:

[Create a List View in Lightning Experience \(Pilot\)](#)

Create a view to see an infinitely scrollable list of records that meet your filter criteria.

[Create Custom List Views in Salesforce Classic](#)

Create a list view to see a specific set of contacts, documents, or other object records. For example, you can create a list view of accounts in your state, leads with a specific lead source, or opportunities above a particular amount. You can also create views of contacts, leads, users, or cases to use for mass email recipient lists.

Create a List View in Lightning Experience (Pilot)

Create a view to see an infinitely scrollable list of records that meet your filter criteria.

 **Important:** Creation of list views in Lightning Experience is currently available only in Trial orgs. We provide this feature to selected customers through a pilot program that requires agreement to specific terms and conditions. To be nominated to participate in the program, contact Salesforce. Because pilot programs are subject to change, we can't guarantee acceptance. This pilot feature isn't generally available, as referenced in this document or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available features.

 **Note:** These steps work in Lightning Experience. If you see a navigation bar on the left side of your screen, you're in Lightning Experience. If you see a row of tabs across the top of the screen, you're in Salesforce Classic.

Actions you can take for list views are available in the List View Controls menu, accessed by clicking

next to the list view name.

1. From List View Controls, select **New**. A dialog box appears.
2. Enter a name for your list.
3. Choose who can see this list view: just you, or all users, including Partner and Customer Portal users.
4. Click **Save**. The Filters panel appears.

EDITIONS

Available in: Lightning Experience

Available in: Trial orgs

USER PERMISSIONS

To create list views:

- "Read" on the type of record included in the list AND "Create and Customize List Views"

To create, edit, or delete public list views:

- "Manage Public List Views"

5. Click **Show me**, then select **All objects** or **My objects**.
6. Click **Done**.
7. Add and set filters to view only the records that meet your criteria. You have different options depending on the field you want to filter and the operator you choose.
 - a. From the New Filter drop-down menu, select the field to filter.
 - b. Click **Done**.
 - c. From the Filter by ... drop-down menu, select an operator. For example, choose **equals**, **starts with**, or **excludes**.
 - d. In Value, make a selection or enter a value.
 - e. Click **Done**.
 - f. To set another filter, click **Add Filter**.
 - g. To remove a filter, click  near the filter name.
8. Click **Save**. The view appears in the list view drop-down list so you can access it later.
9. Optionally, choose and order the columns in your list view.
 - a. From the List View Controls menu, select **Select Fields to Display**.
 - b. To add columns, select one or more fields from Available Fields and use the arrow to move them to Visible Fields.
 - c. To remove columns, select one or more fields from Visible Fields and use the arrow to move them to Available Fields.
 - d. Order columns by selecting one or more fields from Visible Fields and using the arrows to move them up or down.
 - e. Click **Save**.

 **Example:** You're planning a trip to San Francisco, and you want to see a list of your accounts to visit while you're there. In Accounts, create a list view that shows My Accounts. Add a filter for `Billing City equals San Francisco`.

 **Note:** The information you see in list views is only the data to which you have access—either records you own or have read or read/write access to, records that have been shared with you, or records owned by or shared with users in roles below you in the role hierarchy. You can view only those fields that are visible in your page layout and field-level security settings.

SEE ALSO:

- [Create Custom List Views in Salesforce Classic](#)

Create Custom List Views in Salesforce Classic

Create a list view to see a specific set of contacts, documents, or other object records. For example, you can create a list view of accounts in your state, leads with a specific lead source, or opportunities above a particular amount. You can also create views of contacts, leads, users, or cases to use for mass email recipient lists.

 **Note:** These steps work in Salesforce Classic. If you see a row of tabs across the top of your screen, you're in Salesforce Classic. If you see a navigation bar on the left, you're in Lightning Experience.

To create a new view, click **Create New View** at the top of any list page or in the Views section of any tab home page.

 **Note:** If you don't see **Create New View**, you don't have the "Create and Customize List Views" permission. Contact your Salesforce administrator to request it.

1. Enter **View Name**

Enter the name to appear in the View drop-down list.

2. If you have the "Customize Application" permission, enter a unique name to be used by the API and managed packages.

3. **Specify Filter Criteria**

Filter by Owner

These options vary depending on the kind of record. In general, select **All . . .** or **My . . .** to specify the set of records to search. There may be additional options:

- Lead and case list views can be restricted by queue.
- Price book list views can be restricted by price book.
- Activity list views have several options.
- If your organization has territory management, account and opportunity list views can be restricted by **My Territories** or **My Territory Teams**. **My Territories** means records associated with territories to which you belong. **My Territory Teams** means records associated with either territories to which you belong or territories below you in the territory hierarchy.
- If your organization has case teams, case list views can be restricted by **My Case Teams**.
- If your organization has account teams, account list views can be restricted by **My Account Teams**.
- If your organization has opportunity teams, opportunity list views can be restricted by **My Opportunity Teams**.

Filter by Campaign

This option is available on these list views:

- Contacts home
- Leads home
- Mass email contacts
- Mass email leads
- Mass add campaign members wizard
- Mass update campaign members wizard

If you are editing a list view that is filtered by campaign, and do not have at least read access to the campaign, you will receive an error when attempting to save the list view.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To create custom list views:

- "Read" on the type of record included in the list AND "Create and Customize List Views"

To create, edit, or delete public list views:

- "Manage Public List Views"

Filter by Division

If your organization uses divisions to segment data and you have the “Affected by Divisions” permission, select the division that records in the list view must match. This option is disabled if you are not searching all records.

Select --Current-- to show records in your current working division.

Filter by Additional Fields

Optionally, enter filter criteria to specify conditions that the selected items must match, for example, *Lead Source equals web*. You can also use special date values in your filter criteria.

 **Note:** When you select the `Created Date` field in a list view filter, the value you specify can only be a date and not a time. This restriction does not apply to other filters.

4. Select Fields to Display

The default fields are automatically selected. You can choose up to 15 different fields to display in your view. You can display only the fields that are available in your page layout. When you select a long text area field, up to 255 characters are displayed in the list view.

- a. To add or remove fields, select a field name, and click the **Add** or **Remove** arrow.
- b. Use the arrows to arrange the fields in the proper sequence.

5. Restrict Visibility

If you are an administrator or a user with the “Manage Public List Views” permission, specify whether everyone or just you can see the custom view. This option is not available in Personal Edition. To see a list view, users must also have the appropriate “Read” permission on the type of records within the list view.

Alternatively, Enterprise, Unlimited, Performance, and Developer Edition users can specify a public group, role, or role including all users below that role to see the custom view. To share the list view, select `visible to certain groups of users`, choose the type of group or role from the drop-down list, select the group or role from the list below it, and click **Add**.

 **Note:** List views are visible to your customers in the Salesforce Customer Portal if the `visible to all users` radio button is selected for views on objects assigned to Customer Portal users' profiles. To create list views that only your Salesforce users can see, select `visible to certain groups of users`, and then share it with the All Internal Users group or a selected set of internal groups and roles.

When implementing a Customer Portal, create custom views that contain only relevant information for Customer Portal users, and then make those views visible to Customer Portal users by sharing them with the All Customer Portal Users group or a selected set of portal groups and roles.

6. Click **Save**. The view appears in the View drop-down list so you can access it later.

You can rename an existing list view and click **Save As** to save the criteria of the list view without altering the original view.

To navigate back to the last list page you viewed, click **Back to list** at the top of any detail page.

 **Note:** The information you see in list views is only the data to which you have access—either records you own or have read or read/write access to, records that have been shared with you, or records owned by or shared with users in roles below you in the role hierarchy. You can view only those fields that are visible in your page layout and field-level security settings.

In addition, archived activities are not included in activity list views. You can use the Activity History related list to view these activities.

Edit List View Filters

Refine or update your list views to make sure that you're seeing the most relevant records. To change which records display in a list view, edit the list view filters.

IN THIS SECTION:

[Edit List View Filters in Lightning Experience \(Pilot\)](#)

Edit filters on a list view from List View Controls, or click  to access the Filters panel.

Available in: Lightning Experience

Available in: Trial orgs

USER PERMISSIONS

To edit list views:

- "Read" on the type of record included in the list AND "Create and Customize List Views"

To edit, create, edit, or delete public list views:

- "Read" on the type of record included in the list AND "Create and Customize List Views"

- f. To set another filter, click **Add Filter**.
- g. To remove a filter, click  near the filter name.

3. To apply the edited filters and update the list, click **Save**.

Everyone with access to the list sees the results of your saved changes.

 **Example:** You want to display a set of opportunities on a board rather than in a grid, but the list view includes records with different record types. The Opportunities board can only display list views with records of a single record type. To make the view displayable on a board, edit the filters on your list view. On the Filters panel, select **Add Filter**. Choose **Opportunity Record Type** and the **equals** operator, then input the value of the record type you want. Your edited list view can now be displayed on the board.

 **Note:** The information you see in list views is only the data to which you have access—either records you own or have read or read/write access to, records that have been shared with you, or records owned by or shared with users in roles below you in the role hierarchy. You can view only those fields that are visible in your page layout and field-level security settings.

Edit List View Filters in Salesforce Classic

To change a list view's filters, edit the list.

 **Note:** These steps work in Salesforce Classic. If you see a row of tabs across the top of your screen, you're in Salesforce Classic. If you see a navigation bar on the left, you're in Lightning Experience.

1. Click **Edit** next to the list view name. Users without the "Manage Public List Views" permission see **Clone** instead of **Edit** so they can clone a public or standard view.
2. In Specify Filter Criteria, change your **Filter By Owner** selection, if desired. Add or change the **Field**, **Operator**, or **Value** selections in Filter By Additional Fields, if desired.
3. Click **Save** to apply your edited filters to the list view.

All users with access to the list view see the results of your saved changes.

 **Note:** The information you see in list views is only the data to which you have access—either records you own or have read or read/write access to, records that have been shared with you, or records owned by or shared with users in roles below you in the role hierarchy. You can view only those fields that are visible in your page layout and field-level security settings.

Sort List Views

Lots of objects let you view records in lists, also called "list views." If your list is long, you can sort the records by one of the field columns. For example, you can sort the All Accounts list view by the **Account Name** field column, **Billing State/Province** field column, and others. You can also sort custom list views. Sorting is alphanumeric.

1. Open the list view.
2. Click the header for the field column you want to sort by. An arrow appears indicating how the list is sorted: from the column's first record () (alphanumerically) or its last ()

 **Note:** Starting in Spring '13, you can't sort list views for the Users object in Salesforce orgs that have more than two million users.

EDITIONS

Available in all editions

USER PERMISSIONS

To edit list views:

- "Read" on the type of record included in the list AND "Create and Customize List Views"

To edit create, edit, or delete public list views:

Print a List View in Salesforce Classic

 **Note:** These steps work in Salesforce Classic. If you see a row of tabs across the top of your screen, you're in Salesforce Classic. If you see a navigation bar on the left, you're in Lightning Experience.

If printable list views are enabled for your organization, you can print standard list views and custom list views.

1. Go to the list view you want to print. For example: All Accounts on the Accounts tab.
2. Sort the contents of the list view if you want to.
3. Click .
4. In the new window, select the number of records you want to print—up to 1,000. (To print more than 1,000 records, run a report and then click **Printable View** on the report.)
5. Click **Print This Page**.

Delete a List View

Delete a list view when you no longer need it to keep your workspace up to date.

IN THIS SECTION:

[Delete a List View in Lightning Experience \(Pilot\)](#)

You can delete a list view when you no longer need it.

[Delete a List View in Salesforce Classic](#)

You can delete a custom view when you no longer need it.

Delete a List View in Lightning Experience (Pilot)

You can delete a list view when you no longer need it.

 **Important:** Creation and deletion of list views in Lightning Experience is currently available only in Trial orgs. We provide this feature to selected customers through a pilot program that requires agreement to specific terms and conditions. To be nominated to participate in the program, contact Salesforce. Because pilot programs are subject to change, we can't guarantee acceptance. This pilot feature isn't generally available, as referenced in this document or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available features.

 **Note:** These steps work in Lightning Experience. If you see a navigation bar on the left side of your screen, you're in Lightning Experience. If you see a row of tabs across the top of the screen, you're in Salesforce Classic.

1. Select a list view.
2. Click  to access List View Controls.
3. Select **Delete**.

[Create Custom List Views in Salesforce Classic](#)

Relative Date Values for Filter Criteria

When you create a list view that includes a filter for a range of dates, such as `Create Date` or `Last Update Date`, use one or more of the relative date values provided to specify the range.

 **Important:** Creation and filtering of list views in Lightning Experience is currently available only in Trial orgs. We provide this feature to selected customers through a pilot program that requires agreement to specific terms and conditions. To be nominated to participate in the program, contact Salesforce. Because pilot programs are subject to change, we can't guarantee acceptance. This pilot feature isn't generally available, as referenced in this document or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available features.

For example, to create a custom view or report of accounts created the previous week, enter `Create Date equals LAST WEEK`. For relative date values with variables, such as "NEXT *N* DAYS", substitute *N* with any number greater than zero.

Relative date values are not case-sensitive. You can use "LAST WEEK" or "last week."

You can use multiple range values in a single field, separated by commas.

 **Note:** For Enterprise, Unlimited, Performance, Professional, and Developer Editions, the week is defined by the Locale drop-down list on your personal information page. For Contact Manager, Group, and Personal Editions, the week is defined by the Locale setting in the company profile. For example, when the locale is US English, a week runs Sunday to Saturday, whereas with UK English, a week spans Monday to Sunday.

 **Note:** In the table, the relative date values marked with an asterisk (*) aren't available in Lightning Experience.

Relative Date Value	Range
YESTERDAY	Starts at 12:00:00 AM on the day before the current day and continues for 24 hours.
TODAY	Starts at 12:00:00 AM on the current day and continues for 24 hours.
TOMORROW	Starts at 12:00:00 AM. on the day after the current day and continues for 24 hours.
LAST WEEK	Starts at 12:00:00 AM on the first day of the week before the current week and continues for seven days.

Visualize List View Data with Charts in Lightning Experience

See a graphic display of list view data with list view charts. There are three types of charts: vertical bar, horizontal bar, and donut. For any list view, select from available standard and custom list view charts. You can change the data display to another type, if desired.

 **Note:** These steps work in Lightning Experience. If you see a navigation bar on the left side of your screen, you're in Lightning Experience. If you see a row of tabs across the top of the screen, you're in Salesforce Classic.

1. On an object home page, select a list view with data you want to visualize.
2. Click  .
The Charts panel appears.
3. To select a different chart, click  next to the chart name.
4. To change the graphical display of data, click  in the Charts panel and choose a new chart type.
Your data changes to the new display.

Create a List View Chart in Lightning Experience

Create a chart to visualize list view data. There are three types of charts: vertical bar, horizontal bar, and donut. For any list view chart, you can change the data display to another type, if desired. When you create a list view chart for an object, such as Opportunities or Leads, the chart is associated with the object. The chart is available for any list view that you have permission to see for that object, except the Recently Viewed list.

 **Note:** These steps work in Lightning Experience. If you see a navigation bar on the left side of your screen, you're in Lightning Experience. If you see a row of tabs across the top of the screen, you're in Salesforce Classic.

1. On an object home page, select a list view with data you want to visualize.
2. Click  .
3. In the Charts panel that appears, click  .
4. Select **New Chart**.
A dialog box appears.
5. Enter a chart name.
6. Select a chart type: vertical bar, horizontal bar, or donut.
7. Select the aggregate type, aggregate field, and grouping field.

The aggregate type specifies how the field data is calculated: by sum, count, or average. The aggregate field specifies the type of data to calculate. The grouping field labels the chart segments.

8. To view your chart, click **Save**.

EDITIONS

View and Share FAQ

How does the sharing model work?

In Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, the administrator can define the default sharing model for your organization by setting organization-wide defaults. Organization-wide defaults specify the default level of access to records. For most objects, organization-wide defaults can be set to Private, Public Read Only, or Public Read/Write.

In environments where the sharing model for an object has been set to Private or Public Read Only, an administrator can grant users additional access to records by setting up a role hierarchy and defining sharing rules. Role hierarchies and sharing rules can only be used

To edit list view charts:

- "Read" on the type of record included in the list AND "Create and Customize List Views"

to grant additional access—they cannot be used to restrict access to records beyond what was originally specified with the sharing model through organization-wide defaults.

After restricting access using organization-wide defaults, users typically get access through one or more of these methods:

- Role hierarchy
- Sharing rules
- Manual sharing
- Implicit access (Accounts and associated child records)
- Teams (Account, Case, and Opportunity)

[Creating Records with Quick Create](#)

Creating Records from Object Tabs

Before you create a record, make sure you're aware of any guidelines for the kind of record you're creating.

1. Click the tab for the kind of record you want to create. You'll start from that object's Home page. For example, click the Accounts tab if you want to create an account record.
2. Click **New**.
3. Select a record type if you're prompted to.
4. Enter values in the fields. Required fields are identified with a red bar (|).
 -  **Tip:** Most objects have field definitions in the Salesforce help. Just search the help for the object name + "fields". For example, if you're creating or editing an account record and want to know more about your options in the `INDUSTRY` drop-down list, look up "Account Fields" in the help.
5. When you finish entering values for your new record, click **Save**, or click **Save & New** to save the current record and create another. If you navigate away from the page before clicking **Save**, you may lose your changes.

SEE ALSO:

[Creating Records in Feeds](#)

[Creating Records with Quick Create](#)

[Create Records](#)

Creating Records in Feeds

Depending on how your administrator has set up Salesforce, you may be able to create records in the feed on the home page, the Chatter tab, and record detail pages. Publishers on different feeds may have different actions available; check with your administrator for information on what you can do in each feed. Before you create a record, make sure you're aware of any guidelines for the kind of record you're creating.

1. In the feed in which you want to create a record, click the quick action that corresponds to the kind of record you want to create.
2. Enter values in the fields. Required fields are identified with a red bar (|). Most objects have field definitions in the Salesforce help. Just search the help for the object name + "fields". For example, if you're creating or editing an account record and want to know more about your options in the `INDUSTRY` drop-down list, look up "Account Fields" in the help.
3. When you finish entering values for your new record, click **Create**.

A feed item for the record you've created appears:

- In the feed in which you created the record.
- As the first item in the feed for the new record itself.
- In your Chatter feed.

Creating Records Using the Create New Drop-Down List

The Create New drop-down list, available in the sidebar, provides options to create new records. To create a new record using the drop-down list:

1. Select the type of record you want to create. The new record page immediately displays in the appropriate tab or the Upload a File dialog box displays if you selected **File**.
2. Fill in the fields.
3. Click **Save** or **Upload to My Files** if you selected **File**.

Creating Records with Quick Create

If your administrator has enabled Quick Create, you can create records from the home pages for leads, accounts, contacts, and opportunities. You can also create accounts from the Account lookup field results list on the Quick Create form on contacts, leads, and opportunities. Validation rules don't apply when you create new records with Quick Create.

1. Click the tab for the kind of record you want to create. To create an account while you create a contact, lead or opportunity, click the  icon next to the Account field in the Quick Create form you're using.
2. Enter values in the fields. Required fields are identified with a red bar (|). Most objects have field definitions in the Salesforce help. Just search the help for the object name + "fields". For example, if you're creating or editing an account record and want to know more about your options in the `INDUSTRY` drop-down list, look up "Account Fields" in the help.
3. Click **Save**.

Available in: Salesforce Classic

Available in all editions

Guidelines for Entering Currency, Dates, Times, and Phone Numbers

Creating and editing records is easier if you understand a few guidelines and tips for the currency, date, time, and phone number fields you'll find in various records.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Currency

In most Salesforce editions, the format and currency type you can use for currency fields, such as `Quota` or `Annual Revenue`, are determined by the `Currency Locale` setting for your company. In Group, Professional, Enterprise, Unlimited, and Performance Edition organizations that use multiple currencies, the format and currency type are determined by the `Currency` field in the record you're creating or editing.

 **Tip:** When you enter a monetary amount (or any other type of number), you can use the shortcuts **k**, **m**, or **b** to indicate thousands, millions, or billions. For example, when you enter `50k` it appears as `50,000`. However, these shortcuts do not work for filter criteria.

Dates and Times

Many fields allow you to enter a date or a time in the format specified by your personal `Locale` setting.

When entering dates, you can choose a date from the calendar, or manually enter a date.

Only dates within a certain range are valid. The earliest valid date is `1700-01-01T00:00:00Z GMT`, or just after midnight on January 1, 1700. The latest valid date is `4000-12-31T00:00:00Z GMT`, or just after midnight on December 31, 4000. These values are offset by your time zone. For example, in the Pacific time zone, the earliest valid date is `1699-12-31T16:00:00`, or 4:00 PM on December 31, 1699.

 **Tip:**

- Years appear and are saved as four digits, but you can enter the final two digits and Salesforce will determine the first two. Entries `60` through `99` are assumed to be in the 20th century (for example: `1964`), and entries `00` to `59` are assumed to be in the 21st century (for example: `2012`).
- If you enter numbers for month and day only (example: `01/15`), Salesforce supplies the *current* year.
- If your locale and language are English, you can enter words like *Yesterday*, *Today*, and *Tomorrow*, or any day of the week, and Salesforce figures it out. Weekday names (such as *Monday*) are always considered to be in the following week.

Phone Numbers

When you enter phone numbers in various phone fields, Salesforce preserves whatever phone number format you enter. However, if your `Locale` is set to English (United States) or English (Canada), ten-digit phone numbers and eleven-digit numbers that start with "1" are automatically formatted as `(800) 555-1212` when you save the record..

 **Tip:**

- If you do not want the parentheses-space-hyphen formatting ((800) 555-1212) for a ten- or eleven-digit number, enter a "+" before the number. For example: `+49 8178 94 07-0`.
- If your ten- and eleven-digit phone numbers have Salesforce's automatic format, you may need to enter the parentheses when specifying filter conditions. For example: `Phone starts with (415)`.

Selecting Picklist Values

In Salesforce, you may encounter a few different types of picklist fields.

- Standard picklists - Click the down arrow to select a single value.
- Multi-select picklists - Double click on any available value in one scrolling box to add that value to the selected scrolling box on the right. You can choose a single value or multiple values. To select values within a range, select the first value and click the last value in the range while holding down the SHIFT key; then, click the arrow to add selections to the chosen box.
- Dependent and controlling picklists work in conjunction with each other. The value chosen in the controlling picklist affects the values available in its dependent picklist. Both controlling and dependent picklists are indicated on edit pages by an  icon. Hover your mouse over the icon to display the name of the controlling or dependent picklist.

Edit Records

Editing Records

1. Make sure you're aware of any guidelines for the kind of record you're editing. The Salesforce help will tell you.
2. Find and open the record you want to edit.
3. Click **Edit**.
4. Enter or edit values in the fields.

 **Tip:** Most objects have field definitions in the Salesforce help. Just search the help for the object name + "fields". For example, if you're creating or editing an account record and want to know more about your options in the `INDUSTRY` drop-down list, look up "Account Fields" in the help.

5. When you finish entering or editing values, click **Save**.

USER PERMISSIONS

To edit records:

- "Edit" on the object for the kind of record you're editing

Changing a Record's Record Type

Record types determine the picklist values that are available when you create or edit a record. When creating a record, you can choose the record type if you have different record types available and if you have not set your record type preferences to bypass the record type selection page.

 **Note:** If your organization uses person accounts, your administrator has configured two different kinds of record types for your organization's accounts: one for business accounts, and another for person accounts. You can change an account's record type only to another record type of the same kind. For example, you cannot change a person account record type to one designated for business accounts.

Editing Record Fields With the Inline Editor

Many Salesforce objects, including custom objects, offer the convenience of inline editing for records.

 **Tip:** Not all fields on all objects can be edited inline. To find out whether a field supports inline editing, hover over it and look for a pencil icon ().

1. Within a record you're creating or editing, double-click within the field you want to define or edit. If the field offers Lookup to help you find the value you want, you'll see a magnifying glass icon ().
2. Enter your text in the field or use Lookup to find the value you want. Click the undo icon () or delete your entry if you need to.
3. Click **Save**.

Guidelines for Editing Records with the Inline Editor

Tips for Saving Inline Edits

- Press **Enter** while your cursor is in a field's edit box to confirm the change for that field.
- Press **Enter** when no fields are in edit mode to save all edits to the record.

Limitations

- Inline editing isn't available in:
 - Accessibility mode
 - Setup pages
 - Dashboards
 - Customer Portal
 - Descriptions for HTML solutions
- The following standard checkboxes on case and lead edit pages are not inline editable:
 - Case Assignment (Assign using active assignment rules)
 - Case Email Notification (Send notification email to contact)
 - Lead Assignment (Assign using active assignment rule)

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To edit records:

- "Edit" on the object for the kind of record you're editing

EDITIONS

Available in: Salesforce Classic

Inline editing settings available in: **All** Editions except **Database.com**

USER PERMISSIONS

To use inline editing:

- "Edit" on the object

- The fields in the following standard objects are not inline editable.
 - All fields in Documents and Price Books
 - All fields in Tasks except for `Subject` and `Comment`
 - All fields in Events except for `Subject`, `Description`, and `Location`
 - Full name fields of Person Accounts, Contacts, and Leads. However, their component fields are, for example, `First Name` and `Last Name`.
- You can use inline editing to change the values of fields on records for which you have read-only access, either via field-level security or your organization's sharing model; however, Salesforce doesn't let you save your changes, and displays an insufficient privileges error message when you try to save the record.

Special Cases

- Inline editing is available on detail pages for all editable fields on edit pages, except for some fields on tasks, events, price books, and documents. To edit any of these, navigate to the edit page of a record, change the value of the field desired, and then click **Save**. The following table lists the objects that have inline editing restrictions on some of their fields. You may need special permissions to view some of these fields:

Object	Fields
All Objects	All fields are editable except long text area fields.
Opportunities	All fields are editable, except the following fields are only editable on detail pages (not on list views): <ul style="list-style-type: none"> – Amount – Stage – Forecast Category – Quantity
Leads	All fields are editable, except <code>Lead Status</code> is only editable on detail pages (not on list views).
Cases	All fields are editable, except <code>Case Status</code> is only editable on detail pages (not on list views).
Contracts	All fields are editable, except <code>Contract Status</code> is only editable on detail pages (not on list views).
Events	Only the following fields are editable: <ul style="list-style-type: none"> – Description – Location – Subject – Type – Custom fields
Tasks	Only the following fields are editable: <ul style="list-style-type: none"> – Call Type – Description – Subject

Object	Fields
	<ul style="list-style-type: none"> - Type - Custom fields
Documents	No fields are editable.
Price Books	No fields are editable.

Editing Records Directly From Enhanced Lists

If both inline editing and enhanced lists are enabled for your organization, you can edit records directly in a list. Editable cells display a pencil icon (✎) when you hover over the cell, while non-editable cells display a lock icon (🔒).

Warning: In enhanced list views, when different users make inline edits to the same fields on a record simultaneously, records are updated with the most recent edit, but we don't identify the conflict with a message.

If you have the "Mass Edit from Lists" permission, you can change the value for a common field in up to 200 records at a time for most kinds of records. Products must be edited one at a time.

To edit a single record from a list:

1. From the list, double-click the editable cell.
2. Enter the value you want.
3. Click **OK**.

To mass edit records from a list:

1. Select the checkbox next to each record you want to edit. You can select records on multiple pages.
2. Double-click one of the cells you want to edit. Apply your edit to just one record or to every record you selected.

If you encounter any errors when trying to update records, a console window appears, showing the name of each record in error (if known), as well as an explanation. Click a record in the console window to open its detail page in a new window.

Note: To view the error console, you must have pop-up blockers disabled for the Salesforce domain.

Tips for Using Inline Editing with Lists

- Some standard fields don't support inline editing. For example, `Case Status`, `Opportunity Stage`, `Opportunity Amount`, `Opportunity Quantity` and `Lead Status`, and most `Task` and `Event` fields can only be edited from a record's edit page. For more information, see [Guidelines for Editing Records with the Inline Editor](#) on page 94.
- If your organization uses record types, inline editing with lists is only available when all of the records in the list are of the same record type. Therefore, you must specify a filter of `Record Type equals X`, where `X` is the name of a single record type (or blank for the master record type).
- You can't use inline editing on an enhanced list if your list view filter criteria contain an OR clause.
- For lists of activities, you must specify an additional filter of either `Task equals True` (for tasks) or `Task equals False` (for events) for inline editing to be available.
- If your organization is using Person Accounts:

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To use inline editing in an enhanced list:

- "Mass Edit from Lists"

- You can't use inline editing to change Person Accounts from a Contact list. You can only inline edit them from an Account list.
- You can only use inline editing on contacts associated to business accounts by specifying an additional filter of *Is Person Account EQUALS False* in your list criteria.

Delete Records

Deleting Records

Deleting records is standard procedure for most Salesforce users. For some kinds of objects, deleting one record affects other, related records. For example, if you delete an account or contact, all associated assets are also deleted.

1. Make sure you're aware of the effects (if any) of deleting the kind of record you want to delete. The Salesforce help will tell you.
2. Find and open the record you want to delete.
3. Click **Delete**.

Increase Productivity with Notes and Attachments to Records

Notes

Notes is an enhanced version of the Salesforce note-taking tool that lets your users take better notes faster. Use Notes to streamline your workflow, increase productivity, and get the most out of Salesforce.

Notes is built on top of Salesforce Files, so you can do many of the same things with notes that you can do with files, such as report on notes and use Chatter to share notes.

For more information on what you can do with Notes, check out the video:  [How to Use Notes](#) (1:34).

IN THIS SECTION:

[Create Notes and Add Them to Records](#)

Use Notes, our enhanced note-taking tool in Salesforce, to add important information to your records.

[Create a Report on Your Notes](#)

View and analyze details about all your notes using reports. You can only report on notes taken with Notes, our enhanced note-taking tool.

Create Notes and Add Them to Records in Salesforce Lightning Experience

Notes lets you add important information to your records so you can stay organized.

 **Note:** These steps work in Lightning Experience. If you see a navigation bar on the left side of your screen, you're in Lightning Experience. If you see a row of tabs across the top of the screen, you're in Salesforce Classic.

1. From the record's Notes related list, click **New**. Or, to create a private, stand-only note that's not related to a record, click the Notes icon from the navigation menu.
2. Enter a title and body text.
3. Relate the note to other records, if needed.
Notes taken with the enhanced version of Notes appear in the record's Notes related list, while notes taken with the old note-taking tool appear in the record's Notes & Attachments related list.

Create a Report on Your Notes

View and analyze details about all your notes using reports. You can only report on notes taken with Notes, our enhanced note-taking tool.

1. Make sure you're familiar with standard reports and how to customize them.
2. Create a new report with the following criteria.

Report type	File and Content Report
Fields	File Name Published Date Created By Last Revised Date Last Revised By File Type
Filters	File Type equals <i>SNOTE</i>

3. Be sure to save your report so you can run it again later.
4. If you'd like to share the report with others, create a report folder and save the report to it. Then, use the sharing settings for the folder to add individuals or groups of users.

Watch a video:  [How to Use Notes](#) (1:34)

Your administrator will need to set up Notes for your organization. Then, you can start using Notes in Salesforce1. Here are some guidelines to help you out.

- Create notes by tapping  in the action bar.
- Add bulleted and numbered lists to notes using the icons in the Notes toolbar.
- Relate notes to multiple records by tapping **Relate Records**. To change the related records, tap the names of the related records (3).
- Create a task by swiping a line in a note. Alternatively, tap on a line or highlight some text, and then tap  in the toolbar.
- Work with related tasks directly from a note.
- View and search all their notes by selecting **Notes** in the Salesforce1 navigation menu.
- If you or your administrator has added the Notes related list to object page layouts, you can:
 - Quickly access related notes directly from records instead of having to switch away to the navigation menu to open the Notes item.
 - Create notes from the related list.

Attach Files to Records

You can attach files—such as Microsoft® Office documents, Adobe® PDFs, and images and videos—to most kinds of Salesforce records. The size limit for an attached file is 25 MB when attached directly to the related list, including a file attached to a solution. The size limit for multiple files attached to the same email is 25 MB, with a maximum size of 5 MB per file.

1. Open the record
2. Click **Attach File**.
3. Click **Browse** and find the file you want to attach
4. Click **Attach File** to upload the file.
5. Click **Done** when the upload is finished

 **Note:**

- When a file is attached to a record's Chatter feed it's added to the Notes and Attachments related list as a feed attachment. The file size limit for Chatter feed attachments is 2 GB.
- If the `Don't allow HTML uploads as attachments or document records` security setting is enabled for your organization, you cannot upload files with the following file extensions: `.htm`, `.html`, `.htt`, `.htx`, `.mhtm`, `.mhtml`, `.shtm`, `.shtml`, `.acgi`, `.svg`.

USER PERMISSIONS

To attach files to records:

- "Edit" on the object

Considerations for Managing Files and Notes Attached to Records

When working with attachments, Google docs, or notes created with the old note-taking tool, there are a number of things to keep in mind.

- If Chatter is enabled for your organization, files posted to a feed on a record are added to the record's Notes & Attachments related list as feed attachments. You can preview (if available), download, and delete feed attachments from the Notes & Attachments related list, but you can't edit them.
- You can't edit a note or attachment unless you also have access to edit the record associated with it.
- To delete a note or attachment, you must be the owner of the note or attachment or an administrator with the "Modify all Data" permission. Note ownership is determined by the owner field. Attachment ownership is determined by the created by field.
- Record owners can delete attachments on records even if they did not add the attachment.
- Portal users can download attachments, but can't preview, edit, or delete them.
- Notes and attachments marked as private via the `Private` checkbox are accessible only to the person who attached them and administrators. For administrators to view private notes and attachments, they need the "View All Data" permission; to edit or delete them, they need the "Modify All Data" permission.
- If the Add Google Docs to Salesforce service is enabled in your organization, the Notes & Attachments related list is entitled Google Docs, Notes & Attachments. The Attachments related list is entitled Google Docs & Attachments.
- To access a Google doc from a record detail page, the doc must be shared with your Google Apps account.
- The Notes and Attachments related list includes files from Salesforce CRM Content when they are posted to a Chatter feed on a record. However, the Notes and Attachments related list does not include Salesforce CRM Content files that only exist in Salesforce CRM Content. If your organization has Salesforce CRM Content enabled, you can add the Related Content related list to the detail pages for accounts, contacts, leads, opportunities, cases, products, or custom objects.
- If you publish notes to external contacts via Salesforce to Salesforce, all public notes are automatically shared with a connection when you share the parent object. Attachments are automatically shared if the `Share With Connections` checkbox on the attachment is selected. To stop sharing a note or attachment, select `Private`.
- Not all files can be previewed, such as encrypted files, password-protected files, copy-protected PDFs, unknown file types, and any file larger than 25 MB. For files that can't be previewed, the **Preview** option isn't available on feeds or list views, and files appear as generic file type icons in the feed. Some Microsoft Office 2007 features don't display correctly in previews. If a file can be previewed, but a preview doesn't exist, contact your Salesforce administrator who may be able to regenerate the preview.
- All notes and attachments added to contacts and opportunities roll up under the associated account as well.

Note and Attachment Fields

Fields for Notes

In Summer '15, we introduced Notes, an enhanced version of the Salesforce note-taking tool. This table lists the fields available when you create a note using Notes. There's also a toolbar with icons for adding bulleted and numbered lists to notes.

 **Note:** In Salesforce1 and Lightning Experience, there are additional fields for relating multiple records to the note.

Field	Description
Body	Text of the note. Can hold up to 50 MB of data.
Title	Subject of note. Maximum of 200 characters.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Fields for the Old Note-Taking Tool

Field	Description
Body	Text of the note. Can hold up to 32 KB of data.
Private	Checkbox to indicate that note is only accessible to the owner and administrators. For administrators to view private notes, they need the "View All Data" permission; to edit them, they need the "Modify All Data" permission.
Title	Short description of note. Maximum of 80 characters.

Fields for Attachments

Attachment Fields	
Field	Description
Description	Description of the uploaded file.
File Name	Name of the uploaded file.
Private	Checkbox to indicate that the attachment is only accessible to the owner and administrators. For administrators to view private attachments, they need the "View All Data" permission; to edit them, they need the "Modify All Data" permission.
Share With Connections	Checkbox to indicate that the attachment is shared with connections when the parent record is shared. This checkbox is only available if Salesforce to Salesforce is enabled, the parent record is shared, and the attachment is public.
Size	Size of the uploaded file.

Delete Notes and Attachments from Records

To delete a note or attachment, click **Del** next to the note or attachment in the Notes and Attachments related list or Attachments related list of a record. Deleted notes and attachments can be restored from the Recycle Bin.

To delete a file that was attached from a Chatter feed, click **Del** next to the feed attachment. This removes the file from all Chatter feeds where it's been shared and deletes the file from the Notes and Attachments related list. Restore the file by clicking on the Recycle Bin, selecting the file, and clicking **Undelete**. If the file was attached from your computer, a Chatter feed, group, or a Salesforce CRM Content library, deleting it from the Notes and Attachments related list also removes it from the post, but doesn't delete it from its original location.

Records FAQ

Why is the record I'm trying to save being flagged as a duplicate? What can I do?

Your organization uses duplicate rules, which prevent users from creating duplicate records. Read the message to decide how to proceed.

Here's what you'll see if the record you're trying to save is flagged as a possible duplicate.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Title:

1. A system-generated message tells you how many possible duplicates were found. The number includes only the records you have access to. If you don't have access to any of the records that are identified as possible duplicates, then this message won't include a number but will include a list of record owners so you can request access to the existing duplicates.
2. A custom alert written by whoever created the duplicate rule. Ideally, the alert should explain why you can't save the record and what you should do.
3. If the duplicate rule allows you to save a record despite it being a possible duplicate, the **Save (Ignore Alert)** button is present. If the duplicate rule blocks you from saving a record that is a possible duplicate, the **Save** button is present but the record cannot be saved successfully until you make the necessary changes to the record so it's no longer flagged as a possible duplicate.
4. The list of possible duplicates includes only records you have access to. The fields shown in the list include only fields you have access to (up to the first 7 fields that were compared and determined to match). A maximum of 5 records are displayed in this list, but if more than 5 duplicates were found, click **Show All >>** to see full list of records, up to 100. Records are listed in the order they were last modified. Go directly to one of the records in the list by clicking on its link.
5. The highlighted fields are the fields that were compared and determined to match.

What formats should I use for dates, times, and names in Salesforce?

The format used for dates, times, and names of people in Salesforce is determined by your `Locale` setting.

To find out what date/time format your `Locale` setting uses:

1. From your personal settings, enter *Advanced User Details* in the `Quick Find` box, then select **Advanced User Details**. No results? Enter *Personal Information* in the `Quick Find` box, then select **Personal Information**.

2. View the date/time format used in the read-only `Created By` field. This is the format you should use for entering dates and times in Salesforce fields.

[Find Your Personal Settings](#)

How do I allow only certain users to share data?

If your Professional, Enterprise, Unlimited, Performance, or Developer Edition organization has a Private or Public Read Only sharing model, your administrator can still allow certain users to share information. Your administrator can create public groups and then set up sharing rules to specify that users in certain roles or groups will always share their data with users in another role or public group. Individual users can also create personal groups to give access to their own accounts, contacts, and opportunities.

Can an individual user control the sharing of records they own?

Yes. In Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, all account owners are empowered to further extend the sharing on an account-by-account basis. For example, if the organization has a Private model, the Acme account owner can share this account and its related data to selected groups, or to individual users.

In Enterprise, Unlimited, Performance, and Developer Editions, opportunity owners can also extend the sharing for individual opportunities separately from account sharing.

You can use account, lead, case, and opportunity sharing to increase access to your data; you cannot restrict access beyond your organization's default access levels.

This type of sharing is called manual sharing, and is done by the **Sharing** button on the record detail page.

Can I transfer records to other users?

In most editions, you can transfer ownership of records using one of these methods. When you change a record's owner, Salesforce also transfers ownership of certain related records.

Transferring ownership of a single record you own

Click **Change Owner** on the record's detail page. For more information, see [Changing Ownership](#) and [Transfer of Associated Items](#).

Transferring ownership of multiple cases, leads, or custom object records that you own

Click the object's tab and view a list view. Select the records to be transferred, and click **Change Owner**.

Transferring ownership of multiple records owned by other users

Use the Mass Transfer feature. For more information about using Mass Transfer and which related records are transferred, see [Mass Transferring Records](#).

Transferring record ownership using workflow rules

When a record owner is changed by a workflow rule, Salesforce does not change the ownership of any related records.

How do I print Salesforce records?

To print the details of a Salesforce record:

1. Click the **Printable View** link located in the upper right corner of most detail pages. A new browser window opens with the record displayed in a simple, print-ready format.
2. Optionally, collapse and expand individual sections in the printable view by clicking the triangles next to the section headings.

- Optionally, click **Expand All** or **Collapse All** to show or hide all of the collapsible sections on the page. Related lists, such as the list of opportunities related to an account, are not collapsible.
- Click **Print This Page** or use your browser's print function to send the page to a printer.

 **Note:** On the Console tab, you can click the print icon () to open a record's printable view.

Monitor and Analyze Your Data

Run a Report

To run a report, find it on the Reports tab and click the report name. Most reports run automatically when you click the name. If you're already viewing a report, click **Run Report** to run it immediately or schedule a future run. In Lightning Experience, the **Run Report** button only appears after you save a report.

If you don't see any results, check the report for one of these conditions:

- The report didn't return any data. Check your filter criteria to make sure some data is returned.
- Due to field-level security, you don't have access to one of the groupings you selected.
- Your custom summary formula's context didn't match the chart settings. For example, if the formula is calculated for Industry, but the chart doesn't include Industry, no results are returned.
- Your values are out of the range of acceptable values. The maximum value allowed is 9999999999999999. The minimum value allowed is -9999999999999999.

If your report returns more than 2,000 records, only the first 2,000 records are displayed. To see a complete view of your report results, click **Export Details**.

If your report takes longer than 10 minutes to complete, Salesforce cancels the report. Try the following techniques to reduce the amount of data in your report:

- Filter for your own records, rather than all records.
- Limit the scope of the data to a specific date range.
- Exclude unnecessary columns from your report.
- Hide the report details.

Add Filter Logic

Filter logic lets you specify conditions for your filters using logical operators.

To change the default AND relationship between each filter:

1. Click **Add > Filter Logic**.
2. Enter each filter line number, separated by an operator:

Operator	Definition
AND	Finds records that match both values.
OR	Finds records that match either value.
NOT	Finds records that exclude values.

SEE ALSO:

[Filter Operators](#)

[Filter on Blank Values](#)

[Filtering on Special Picklist Values](#)

[Build Effective Filters](#)

[Enter Filter Criteria](#)

Filter Operators

The operator in a filter is like the verb in a sentence. When you choose filter criteria, use an operator to specify the action you want the filter to take.

You can use the following operators when entering filter criteria on list views, reports, dashboards, and some custom fields:

Operator	Uses
equals	Use for an exact match. For example, "Created equals today."
less than	Use for results that are less than the value you enter. For example, "Quota less than 20k" returns records where the quota field ranges from 0 to 19,999.99.
greater than	Use when you want results that exceed the value you enter; for example, "Quota greater than 20k" returns records where the quota amount begins at 20,000.01.
less or equal	Use for results that match or are less than the value you enter.
greater or equal	Use for results that match or exceed the value you enter.
not equal to	Shows results that don't have the value you enter. This operator is especially useful for eliminating empty fields. For example, "Email not equal to <blank>."

EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"

AND

"Report Builder"

To create custom list views:

- "Read" on the type of record included in the list

To create, edit, or delete public list views:

- "Manage Public List Views"

Operator	Uses
contains	Use for fields that include your search string, but sometimes also include other information. For example, "Account contains california" would find California Travel, California Pro Shop, and Surf California. Keep in mind that if you enter a short search string, it can match a longer word. For example, "Account contains pro" would find California Pro Shop and Promotions Corporation. This operator is not case-sensitive.
does not contain	<p>Eliminates records that don't contain the value you enter. For example, "Mailing Address Line 2 does not contain P. O. Box."</p> <p> Note: When specifying filter criteria on roll-up summary fields, <code>does not contain</code> uses "or" logic on comma-separated values. On list views, reports, and dashboards, <code>does not contain</code> uses "and" logic.</p> <p>This operator is not case-sensitive.</p>
starts with	Use when you know what your value starts with, but not the exact text. This operator is a narrower search term than "contains." For example, if you enter "Account starts with california," you find California Travel and California Pro Shop, but not Surf California.
includes	<p>Available when you choose a multi-select picklist as the selected field. Use this operator to find records that include one or more of the values you enter.</p> <p>For example, if you enter "Interests includes hockey, football, baseball," you find records that have only hockey selected, and records that have two or three of the values entered. Results do not include partial matches of values.</p>
excludes	<p>Available when you choose a multi-select picklist as the selected field. Use this operator to find records that do not contain any values that match the ones entered.</p> <p>For example, if you enter "Interests exclude wine, golf," your report lists records that contain any other values from that picklist, including values that are blank. Results do not include partial matches of values.</p>
between	<p>Available for dashboard filters only. Use to filter on ranges of values. For each range, the filter returns results that are greater than or equal to the minimum value and less than the maximum value.</p> <p>For example, if you enter "Number of Employees from 100 through 500," your results include accounts with 100 employees up to those with 499 employees. Accounts with 500 employees aren't included in the results.</p>
within	Available when you create list views based on a Geolocation custom field. Shows results that are within the specified radius from a fixed latitude and longitude. For example, if you enter "Warehouse location within 50 miles 37.775° -122.418°," your list view includes all warehouses within a 50-mile radius of San Francisco, California.

SEE ALSO:

[Filter Your Report Data](#)[Enter Filter Criteria](#)

Filter on Blank Values

Tips on filtering using blank values.

- When you use the “less than,” “greater than,” “less or equal,” or “greater or equal” operators on fields that have numeric values, records with blank or “null” values are returned as if their value is zero (0). For example, if you create a workflow rule or a lead assignment rule for accounts with the criteria *Annual Revenue less than 100000*, account records match if their `Annual Revenue` is blank.

However, records with blank field values are not considered matches in report filters, custom list views, and account assignment rules (which assign accounts to territories).

- To limit results to records that are blank or contain “null” values for a particular field, choose the field and the “equals” or “not equal to” operators, leaving the third field blank. For example, *Amount equals* returns records with blank amount fields. You can search for blank values or other specified values at the same time. For example, *Amount equals 1,,2* returns records where the `Amount` is blank or contains the value “1” or “2”.

Filtering on Special Picklist Values

When creating filter criteria, you can use special picklist values for your search criteria. These are special picklists with values of either `True` or `False`.

For example, to show all opportunities you have won, enter *Won equals True* as your search criteria. To show all closed/lost opportunities, enter *Closed equals True* and *Won equals False*.

-  **Note:** If you are creating filter criteria for a report or list view, the lookup icon automatically displays when you choose to filter on one of the special picklists. Click the lookup icon to choose the value `True` or `False`. Alternatively, you can manually enter *True* or *False* in the filter criteria.

These are the available fields and their values:

Special Picklist Field	Value	Description
Accounts and contacts: <code>Is Person Account</code>	<code>True</code>	The account is a person account. Note that your administrator may have customized the name of this field. This field displays as the person account icon ().
	<code>False</code>	The account is a business account.
Accounts, leads, and opportunities: <code>Partner Account</code>	<code>True</code>	The account is a partner account, or the lead or opportunity owner is a partner user.
	<code>False</code>	The account is not a partner account or the lead or opportunity owner is not a partner user.
Activities: <code>All-day</code>	<code>True</code>	Applies only to events, not tasks. The event is marked as an all day event.

EDITIONS

Available in: Salesforce Classic

The available fields vary according to which Salesforce Edition you have.

Special Picklist Field	Value	Description
	False	The event has a specific time.
Activities: Closed	True	Applies only to tasks, not events. The task has been closed, that is, the task <code>Status</code> field has a "Closed" value.
	False	Task is still open.
Activities: Event Invitation (Only for reports)	True	Applies only to events, not tasks. The event is the meeting invite sent to another user for a multi-person event.
	False	The event is the original multi-person event assigned to the event host.
	False	Activity does not have a green sheet.
Activities: Task	True	Activity is a task, not an event.
	False	Activity is an event.
Campaigns: Active	True	Campaign is active and can be chosen from various campaign picklists, for example, in the campaign import wizards.
	False	Campaign is inactive.
Cases: Closed	True	The case is closed, that is, the case <code>Status</code> field has a "Closed" value.
	False	Case is still open.
Cases: Escalated	True	Case has been automatically escalated via your organization's escalation rule.
	False	Case has not been escalated.
Cases: New Self-Service Comment	True	Case has a new comment added by a Self-Service user.
	False	Case does not have a new Self-Service comment.
Cases: Open (Only for reports)	True	The case is open, that is, the case <code>Status</code> has a value that is not equivalent to "Closed."
	False	Case has been closed.
Cases: Self-Service Commented	True	Case has a comment added by a Self-Service user.
	False	Case does not have a Self-Service comment.
Contacts: Email Opt Out	True	The contact cannot be included in a mass email recipient list.
	False	The contact may receive mass email.
Contacts: Self-Service Active (Only for reports)	True	The contact is enabled to log in to your Self-Service portal.
	False	The contact is not enabled for Self-Service.
Leads: Converted (Only for reports)	True	The lead has been converted.
	False	The lead has not been converted.

Special Picklist Field	Value	Description
Leads: Email Opt Out	True	The lead cannot be included in a mass email recipient list.
	False	The lead may receive mass email.
Leads: Unread	True	The lead has not yet been viewed or edited by the owner since it was assigned to that user.
	False	The lead has been viewed or edited at least once by the owner since it was assigned.
Opportunities: Closed	True	The opportunity is closed, that is, the <code>Stage</code> field has a value of the type Closed/Won or Closed/Lost.
	False	The opportunity is still open.
Opportunities: Primary (Only for Partner Opportunities report)	True	The partner for the opportunity has been marked as the primary partner.
	False	The partner for the opportunity has not been marked as the primary partner.
Opportunities: Private	True	The opportunity owner has checked the <code>Private</code> box on the opportunity edit page.
	False	The <code>Private</code> box on the opportunity is not checked.
Opportunities: Won	True	The opportunity is closed and won, that is, the <code>Stage</code> field has a value of the type Closed/Won.
	False	The opportunity has not been won. The <code>Stage</code> field may have a value of the type Open or Closed/Lost.
Products: Active	True	Product is active and can be added to opportunities in Enterprise, Unlimited, and Performance Edition organizations.
	False	Product is inactive and cannot be added to opportunities.
Product: Has Quantity Schedule	True	Product has a default quantity schedule.
	False	Product does not have a default quantity schedule.
Product: Has Revenue Schedule	True	Product has a default revenue schedule.
	False	Product does not have a default revenue schedule.
Solutions: Visible in Self-Service Portal	True	The solution has been marked <code>Visible in Self-Service Portal</code> and is visible to Self-Service portal users.
	False	Solution is not marked <code>Visible in Self-Service Portal</code> and is not visible to Self-Service portal users.
Solutions: Reviewed	True	The solution has been reviewed, that is, the solution <code>Status</code> field has a "Reviewed" value.
	False	Solution is not reviewed.

Special Picklist Field	Value	Description
Solutions Out of Date	True	The translated solution has not been updated to match the master solution with which it is associated.
	False	The translated solution has been updated to match the master solution with which it is associated.
Users: Active	True	User is active and can log in.
	False	User is inactive and cannot log in.
Users: Offline User	True	User has access to use Connect Offline.
	False	User is not enabled for Connect Offline use.
Users: Marketing User	True	User can manage campaigns.
	False	User is not enabled to manage campaigns.
User: Is Partner	True	User is a partner user.
	False	User is not a partner user.

 **Note:** The special picklists you can view are only those that are visible in your page layout and field-level security settings.

Sort Report Results

Sort a report by the data in a particular column by clicking that column's heading. Clicking a column header sorts data according to that column's ascending order: text is sorted from A to Z, numerical data is sorted from lowest to highest, and time/date data is sorted from earliest to latest.

- To reverse the sort order, click the column heading a second time.
- If the floating report header is enabled for your organization, sort behavior is slightly different. When users sort data by clicking a floating report heading, the report refreshes and redirects users to the beginning of report results.
- In a report with multiple grouping levels, you can sort by the summary value that defines each grouping. For example, take an Opportunities report that's grouped by type of business. Each `Type` grouping is in turn grouped by `Stage`, and each `Stage` grouping is grouped by `Lead Source`. Now you can sort the `Type` groupings by amount, the `Stage` grouping by stage, and the `Lead Source` grouping by record count.

Visualizing Data with Dashboards

A *dashboard* shows data from source reports as visual components, which can be charts, gauges, tables, metrics, or Visualforce pages. The components provide a snapshot of key metrics and performance indicators for your organization. Each dashboard can have up to 20 components.

Clicking the Dashboards tab displays the dashboard you viewed most recently. The top of the page shows the time the dashboard was refreshed last and the user whose permissions determine what data is visible on the dashboard.

Each component in a dashboard shows data from an underlying report. If you have access to the folder for the underlying source report, you can see the related dashboard component. Click a dashboard component or its elements to drill down to the source report, filtered report, record detail page, or other URL. If you drill down on a filtered component, the dashboard filters are applied to the source report.

Click **Go to Dashboard List** to view your dashboards. Find a dashboard using dashboard finder. Type a name in the `View Dashboard` field and choose a dashboard from the list of results. You can only see dashboards in folders you can access.

Follow a dashboard to get updates about the dashboard posted to your Chatter feed.

Find and Organize Information

Search

When you search for your information in Salesforce, the search engine efficiently finds and displays relevant results you have access to through a complex search process. This is whether from the full Salesforce site, a Salesforce1 mobile app, or a custom search implementation built on the Salesforce platform.

Salesforce provides a search engine that effectively finds information such as accounts, contacts, files, articles, and products in your organization. Each time you create a new record, the search engine breaks up the searchable information into pieces it easily recognizes and stores them in an

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

index. When you enter your search, it efficiently finds relevant results for you by breaking apart your search terms and finding matches for them from that index. The search engine returns results you have permission to view.

Check out the video:

[How Does Search Work?](#)

Here's an overview of the search process.

When you create or update a record (1), the search engine breaks up the record's searchable text into smaller terms (2). Then, it stores those smaller terms in the search index (3).

Note: After a searchable object's record is created or updated, it could take about 15 minutes or more for the updated text to become searchable. An object's records are only searchable after they're stored in the search index.

When you enter a search term in the search field (1), the search engine breaks up your search term into smaller terms (2). It matches those smaller terms to the record information stored in the index (3), ranks the associated records by relevancy (4), and returns the results you have access to (5).

For more information on what you can do with Search, check out these videos.

[Search in Salesforce Classic](#)[Search in Salesforce Lightning Experience](#)**IN THIS SECTION:**[How Does Search Break Up Information?](#)

Each time you create a new record, the search engine breaks up the searchable information into pieces it easily recognizes and stores them in an index.

[How Is Search Different Between Lightning Experience, Salesforce Classic, and Salesforce1?](#)

Global search in the full Salesforce site (whether Lightning Experience or Salesforce Classic) and Salesforce1 mobile app uses the same search index, so you're always searching the same data. You see the same set of recently accessed records in instant results, and search results are influenced by the same search scope (the list of objects you use the most). But remember that some standard objects aren't available in Salesforce1 and Lightning Experience, so you won't always see the exact same search results. And the global search interface is different between all of these experiences, so there are visual and navigational differences to consider.

[How Do I Search in Lookup Fields?](#)

Use lookup dialog search to associate two records together.

[Which Fields Are Searchable?](#)

Salesforce searches a unique set of fields for each object.

How Does Search Break Up Information?

Each time you create a new record, the search engine breaks up the searchable information into pieces it easily recognizes and stores them in an index.

The search engine breaks down searchable text into smaller pieces, called *tokens*, and stores them in the search index. When you search, the search engine breaks down your search terms into tokens so it can find matching tokens in the index. It returns the records associated with the matching tokens.

The search engine splits record information that contains letters, numbers, spaces, and punctuation into separate tokens.

Here are some examples of the tokens created from the given record information. You could find the record with a search using any of the indexed tokens listed.

SEE ALSO:

[Search](#)

How Search Handles Terms in Chinese, Japanese, Korean, and Thai

Search finds relevant results for searches in East Asian languages such as Chinese, Japanese, Korean, and Thai by breaking up information to store in the search index.

The search engine returns accurate search results from searches in East Asian languages that don't include spaces between words, such as Chinese, Japanese, Korean, and Thai (CJKT), using morphological tokenization.

Consider the problem of indexing the term *Tokyo Prefecture* and a subsequent search for Kyoto in Japanese.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Indexed Term	Search Term
東京都	京都
Tokyo Prefecture	Kyoto

Morphological tokenization segments the term 東京都 (Tokyo Prefecture) into two tokens.

Indexed Term	Search Term
東京	都
Tokyo	Prefecture

This form of tokenization ensures that a search for 京都 (Kyoto) returns only results that include 京都 (Kyoto) and not 東京都 (Tokyo Prefecture).

In Chinese, Japanese, Korean, and Thai (CJKT) you can find a person by entering the last name before the first name. Searching for 佐々木律子 returns any person who has both the last name 佐々木 and first name 律子.

How Is Search Different Between Lightning Experience, Salesforce Classic, and Salesforce1?

Global search in the full Salesforce site (whether Lightning Experience or Salesforce Classic) and Salesforce1 mobile app uses the same search index, so you're always searching the same data. You see the same set of recently accessed records in instant results, and search results are influenced by the same search scope (the list of objects you use the most). But remember that some standard objects aren't available in Salesforce1 and Lightning Experience, so you won't always see the exact same search results. And the global search interface is different between all of these experiences, so there are visual and navigational differences to consider.

Salesforce objects often include *lookup fields* that allow you to associate two records together in a relationship. For example, a contact record includes an `ACCOUNT` lookup field that associates the contact with its account.

[Tips for Using Standard and Enhanced Lookups](#)

Consider these tips when using standard and enhanced lookups.

[Lookup Auto-Completion](#)

If enabled by your administrator, lookups support auto-complete.

EDITIONS

Available in: Salesforce Classic

Available in all editions

Lookup Dialog Search

Salesforce objects often include *lookup fields* that allow you to associate two records together in a relationship. For example, a contact record includes an `ACCOUNT` lookup field that associates the contact with its account.

Lookup fields appear with the  button on record edit pages. Clicking  opens a lookup search dialog that allows you to search for the record that you want to associate with the record you're editing. A *blank lookup* is performed when you click the lookup icon without entering a search term.

Salesforce provides two types of lookups.

Standard Lookups

All lookup fields use standard lookup search by default. In standard lookup searches, Salesforce queries a limited set of [searchable fields for each object](#). Search results contain up to 50 records at a time. Standard objects are listed in ascending alphabetical order. Custom objects are listed in descending order by the date when you most recently accessed them. You can't sort, filter, or customize the columns in the search results.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions**

Enhanced Lookups

If enabled by your administrator, Salesforce uses enhanced lookup search for account, contact, opportunity, user, and custom object lookup fields. Enhanced lookups offer more search capabilities compared to standard lookups:

- By default, enhanced lookups query a limited set of fields, known as *Name* fields for each object. If your search for a record returns a large number of matches, such as a contact with a widely used name, you can instead query all searchable fields for that record to narrow your results. If available in the enhanced lookup search dialog, select **All Fields** and enter other search terms unique to the record, such as the contact's email address.
- Enhanced lookup search queries are broken into separate search terms at alphabetic, numeric, and special character boundaries. For example, if you enter *ALL4ONE* in an enhanced lookup field, the resulting query searches for *ALL* and *4* and *ONE*. Consequently, entering *ALL and 4 and ONE* returns matches for *ALL4ONE*. Also, searching for *S&* returns fields containing both *S&* and *&S*.
- You can [sort and filter](#) the results of enhanced lookup searches. You can also hide and organize the columns that are displayed in the results window.

 **Note:** In addition to user-controlled filters, administrators can create lookup filters on fields that are in a lookup, master-detail, or hierarchical relationship to limit the valid values in lookup dialog results for the field.

- Enhanced lookups return all records that match your search criteria and allow you to page through large sets of search results.

 **Note:** Salesforce only returns matches for a custom object if your administrator has associated a custom tab with it. You don't have to add the tab for display.

When you perform a *blank lookup*, a list of all recently used records displays. Search results vary for some object types:

- For standard lookups of products and queues, the dialog shows an alphabetical listing of the first 50 records.
- For standard lookups of campaigns, the dialog shows the first 100 active campaigns.
- For the asset standard lookup on a case, the dialog shows all the assets tied to the contact on the case, if any.
- For standard or enhanced lookups of users, the dialog shows a list of recently accessed user records from across your organization.

Tips for Using Standard and Enhanced Lookups

Consider these tips when using standard and enhanced lookups.

- In standard lookup searches, a wildcard is automatically appended to each of your search terms. For example, a search for *bob jo* is really a search for *bob* jo** and returns items with *bob jones*, *bobbyjones*, or *bob johnson*. You can also explicitly use an asterisk (*) wildcard in your search string.
- For enhanced lookups in particular, the wildcard can't be the first character in the search term or phrase, and search results may include more records than you expect if your search terms contain a combination of letters, numbers, and special characters.
- If you enter a value in the lookup text box and save the record without clicking the lookup icon () , Salesforce automatically performs a standard lookup search. If it finds an exact match, it saves that value to the lookup field, even if it finds other partial matches. If it doesn't find an exact match and finds one or more partial matches, Salesforce requires you to select a value from a drop-down list of matches. If no results match the text you entered, an error displays instead.
- To search for contacts, leads, users, or other individuals that include spaces in the `First Name` or `Last Name` fields, enter quotes around the terms.

For example, to search for someone with the last name *von hausen*, enter *"von hausen"*.

- In organizations where the Salesforce Customer Portal or partner portal is enabled, you can filter the results that appear on the user lookup dialog by selecting either a queue or group of users from the `Owner` or `Assigned To` drop-down list.

EDITIONS

Available in: **Salesforce Classic**

Available in: **All Editions**

- If your organization uses divisions and you have the “Affected by Divisions” permission, your lookup dialog search results include records in the division you select in the lookup dialog window.

Lookup Auto-Completion

If enabled by your administrator, lookups support auto-complete.

Both standard lookups and enhanced lookups can display a dynamic list of matching recently used records when a lookup field is edited. This list is restricted to objects of the appropriate type and, with the exception of lookups of users, is populated from recently used items. For example, while editing an Account lookup, you can see recently used accounts with names that match the prefix you have entered. Recently used contacts don't appear in this list.

Lookup auto-completion is subject to the following restrictions:

- You must have recently visited records of the appropriate type for the lookup's auto-completion list to be populated.
- You must be editing the lookup field on a record's edit page.

Hover details are displayed only for lookup fields on object types that are included in lists of recently used records. For example, products aren't included in lists of recently used records, so hover details aren't displayed for a lookup field on products.

Lookup Dialog Search in Lightning Experience

Lookup fields allow you to associate two records together in a relationship. For example, a contact record includes an account lookup field that associates the contact with its account. In the lookup search for searchable objects, terms are matched against all searchable fields within a record, not just the name of the record. Lookups have similar instant result and record indexing behavior as global search. If you don't see a record in the auto-suggested instant results, perform a full search. If you don't see a new record in search results, wait 15 minutes and try again. Check out some more answers to frequently asked questions about lookups.

EDITIONS

Available in: **Lightning Experience**

Available in: **All Editions** except **Personal Edition, Contact Manager Edition, Corporate Social Network Edition**

IN THIS SECTION:

[Why Can't I See Any Results in the Picklist?](#)

If an object hasn't been made searchable in your org or if you haven't previously viewed the record, the drop-down menu is empty.

[Can I Use a Partially Matching Search?](#)

To find the correct record, enter the full search term. The lookup search does not use automatic partially matching searches with trailing wildcards. This is to avoid returning unwanted results to you.

[What Determines the Secondary Field Under the Record Name?](#)

In lookups, there's a secondary, smaller field displayed under the primary record name in lookups. For example, the location San Francisco appears under the company Acme, Inc. to help you distinguish similar record names. Your administrator customizes secondary fields when setting which record fields display and in which order.

[Which Fields are Searched in Lookup Dialog Search?](#)

When you start typing in the lookup field, you see a list of auto-suggested results. These instant results are matches for the search term to the name type field of the record. However, if you perform a full search, the returned results match the search term to all searchable fields for the object. This behavior is similar to global search results.

Which Fields Are Searchable?

Salesforce searches a unique set of fields for each object.

 **Note:** When you search for a value in a field that's hidden from you by field-level security, your results include the record that contains the field. However, you can't see the field.

IN THIS SECTION:

[Searchable Fields by Object in Salesforce Classic](#)

Each search type—sidebar, advanced, global, and lookup—searches a unique set of fields for each object. Your search results for a particular object depend on two factors: the type of search and the searchable fields for that object.

[Searchable Fields by Object in Lightning Experience](#)

The records included in search results depend on whether the record's object type and its fields are searchable. If you search for an object with a value that's stored in a field that isn't searchable, you won't see your desired object in your search results.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

The types of records you can search vary according to the edition you have.

Searchable Fields by Object in Salesforce Classic

Each search type—sidebar, advanced, global, and lookup—searches a unique set of fields for each object. Your search results for a particular object depend on two factors: the type of search and the searchable fields for that object.

For example, consider an account that contains "Acme" in its `Description` field. The `Description` field isn't queried by standard lookup search, but is queried by global search and enhanced lookup search when **All Fields** is selected. So a search for Acme returns this account record only if you use either global search or enhanced lookup search with **All Fields** selected.

A few things to note about searchable fields:

- Global search finds more fields per object compared to other search types.
- By default, enhanced lookups query a limited set of fields, known as *Name* fields for each object. If your search for a record returns a large number of matches, such as a contact with a widely used name, you can instead query all searchable fields for that record to narrow your results. If available in the enhanced lookup search dialog, select **All Fields** and enter other search terms unique to the record, such as the contact's email address.
- You can't search encrypted, formula, and lookup fields.
- You can't find some objects with sidebar search or advanced search. Use global search or the search on the object's tab to find:
 - Articles

EDITIONS

Available in: Salesforce Classic

The types of records you can search vary according to the edition you have.

- Chatter groups, files, topics, and people
- Salesforce CRM Content
- Documents
- Price books
- Products
- Solutions

 **Note:** When you search for a value in a field that's hidden from you by field-level security, your results include the record that contains the field. However, you can't see the field.

This table shows the types of search supported for each object. Follow the links to see the list of searchable fields for each object.

Searchable Fields: External Object

An external object accesses data that's stored outside your Salesforce organization. Which external object fields are searched depends on how the external system handles searches. If the search results aren't as you expected, use case-sensitive search strings that contain only alphanumeric characters. If the results still aren't as expected, contact your administrator for recommendations on searching your specific external system.

Searchable Fields by Object in Lightning Experience

The records included in search results depend on whether the record's object type and its fields are searchable. If you search for an object with a value that's stored in a field that isn't searchable, you won't see your desired object in your search results.

 **Note:** When you search for a value in a field that's hidden from you by field-level security, your results include the record that contains the field. However, you can't see the field.

Reference the table to determine which objects you can find with a search. If an object has custom fields, you can find records of that object with the custom field values.

EDITIONS

Available in: Lightning Experience

The types of records you can search vary according to the edition you have.

Search Results

Search results are ordered by relevancy for the user. In many cases, you can quickly find the record you searched for by just reviewing the top results. We've included our guidelines for users who navigate around the search results page. Check out some more answers to frequently asked questions about search results.

IN THIS SECTION:

[How Are Search Results Ordered?](#)

The search engine sorts results most relevant to the user based on search term frequency, order, and uniqueness, record and user activity, and access permissions. Search result relevancy can vary for each user.

[How Do I Refine Search Results?](#)

Use these guidelines to quickly find records on the search result page.

[Are Nicknames Included in the Search Results?](#)

When searching for an account, a contact, a lead, or a user, search returns results that include alternative versions of the name used in the search.

[Are Different Forms of the Search Term Included in the Search Results?](#)

Searches expand to match different forms of a search term with a process called lemmatization.

[What Are the Results I See As I Type in the Search Bar?](#)

As you type in the global search box, a list of auto-suggested records appears. These instant results let you quickly access a record before performing a full search.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

How Are Search Results Ordered?

The search engine sorts results most relevant to the user based on search term frequency, order, and uniqueness, record and user activity, and access permissions. Search result relevancy can vary for each user.

Priority Boosts and Filters

The search engine uses various types of priority boosts and filters to prioritize records that are most relevant to the user performing the search. Boosts and filters aren't listed in the order they are applied or by importance.

Frequency

Prioritizes records that include more occurrences of the search terms. In addition, records that contain all or more of multiple search terms entered are prioritized higher.

Uniqueness

Prioritizes records that contain unique terms, under the assumption that uniqueness increases the likelihood of a relevant match.

Location

Prioritizes records with the search term in the name, title, or subject type fields.

Proximity

Prioritizes records with the search terms closer together with few or no intervening words. Records that contain the same sequence of terms are prioritized higher. Similarly, if a single alphanumeric string is indexed with multiple tokens, exact matches are prioritized over matches with intervening words.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Ownership

Prioritizes records that you own.

Length

Normalizes the number of instances of a term in a record so that longer documents aren't given undue priority over shorter ones. This boost applies to Salesforce Knowledge records only.

Record Activity

Prioritizes records frequently viewed or edited and records having more associated records, such as related lists. The creation date of the data doesn't affect result priority.

User Activity

Prioritizes records that you recently edited or viewed.

Access

Returns only the records that you have access to view.

Why do different users see different results?

Searches are configured for the user who performs the search, including:

- Access permissions are based on the users' profiles. If you don't have access to a record, but someone else does, it appears for them but not you.
- Record ownership boosts records in results. If you own the record, it appears higher in the search results.
- View or edit record history boosts records in results. If you recently viewed or edited a record, the record is prioritized higher in the search than someone else viewing it for the first time.
- Object history boosts records in results. Records from object types that you use more frequently have higher priority in your search results.

How Do I Refine Search Results?

Use these guidelines to quickly find records on the search result page.

IN THIS SECTION:

[How Do I Refine Search Results in Salesforce Classic?](#)

Use our guidelines for sorting and filtering your results to quickly find records.

[How Do I Refine Search Results in Lightning Experience?](#)

Use our guidelines for navigating the search results page to quickly find records.

Available in all editions

How Do I Refine Search Results in Salesforce Classic?

Use our guidelines for sorting and filtering your results to quickly find records.

When you use the global search bar, you search through all objects and multiple fields types, including custom and long text fields, within a record. If you enter multiple terms, results containing all the search terms are returned, which can be a lot of records! Here are some strategies to find the record that you're looking for after performing a full search.

EDITIONS

Available in: Salesforce Classic

Available in all editions

Searching All

Search defaults to return results for the objects that you use most frequently. To expand the search to other objects, use **Search All**. If you don't have a **Search All** option, global search doesn't have enough information about which objects you use. Your results include all objects until it has more information.

Pinning

Hover over and pin important objects to the top of the search results object list. You can always unpin or reorder objects later. Pinning is helpful for objects that you don't use frequently.

Filtering

- Use **Options...** to restrict your search to records you own, if available, to exact phrase searches, and to divisions, if your organization uses them.
- Use **Show Filters**, if available, to filter your search results. You can click My Columns to customize how the columns display.

More Guidelines

- Make sure that you are on the right object scope. You can change the scope in the left navigation.
- Check your spelling and that you entered the full search term.
- If you recently created the record or the record was changed multiple times, you will not see the record in the search results right away. The process for making a record searchable, called indexing, can take 15 minutes.

[Search in Salesforce Classic](#)

SEE ALSO:

[Why Can't I See Some Features?](#)

How Do I Refine Search Results in Lightning Experience?

Use our guidelines for navigating the search results page to quickly find records.

Top Results: Most Relevant Results on One Page

The Top Results search results page lists the most relevant record results for each of your most frequently used objects.

This is a good choice when you want to review results for a search term but you aren't looking for a specific object type. For example, you search for Acme Inc. and look at the Top Results page for accounts, leads, and opportunities. Each person's Top Results page is different based on which objects they use the most. There's a **View More** link in case you want to see more results for an object.

Feeds for All Company Posts

If enabled by your administrator, the Feeds search results page lists posts from the All Company Feed that include matches on the search term entered.

Using Feeds is helpful when searching for a post that you want to review again. For example, you saw a post about a new training video, but you don't remember who posted the information.

Your Most Frequently Used Objects Are Front and Center

The search scope bar beneath the global search box lets you quickly click through filtered results by object. Click the object name to see the results for that object.

Let's say that you search for a contact from the Accounts homepage and landed on the Account search results page. You can click the Contacts object to see results for contacts.

EDITIONS

Available in: Lightning Experience

Available in: **All Editions** except **Personal Edition, Contact Manager Edition, Corporate Social Network Edition**

More Lists all Available Objects

You commonly use a few objects for most of your day-to-day tasks, but you may want to find results for an object that you don't usually work with. If you don't see that object in the search scope bar, select **More** to see a list of all objects that are available to you. If frequently used objects don't fit on the search scope bar, they appear at the top of the **More** object list. Scroll down the alphabetical list to find objects.

More Guidelines

- Check your spelling and that you entered the full search term.
- If you recently created the record or the record was changed multiple times, you will not see the record in the search results right away. The process for making a record searchable, called indexing, can take 15 minutes.

[Search in Salesforce Lightning Experience](#)

SEE ALSO:

[Why Can't I See Some Features?](#)

Are Nicknames Included in the Search Results?

When searching for an account, a contact, a lead, or a user, search returns results that include alternative versions of the name used in the search.

Can't remember if someone goes by Mike or Michael? You can look for a name and the returned results include matches for associated nicknames. For example, you search for *Mike Smith* and see results for *Michael Smith*. Nickname search is available for the English language only in the Account, Contact, Lead, and User objects.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Are Different Forms of the Search Term Included in the Search Results?

Searches expand to match different forms of a search term with a process called lemmatization.

As part of the search process, a word is reduced to its root form. Search then returns matches for the expanded forms. This behavior applies to the type of word for which you're searching; a search for a noun matches variants of the noun form, a search for a verb matches variants of the verb form. For example, a search for *run* matches items that contain *run*, *running*, and *ran*.

Matches on forms of a search term rank lower than matches on the exact term in search results.

What Are the Results I See As I Type in the Search Bar?

As you type in the global search box, a list of auto-suggested records appears. These instant results let you quickly access a record before performing a full search.

Instant results appear when you're looking for records within searchable objects.

The suggested records displayed are those that you recently viewed or that include the search term you entered. If you don't see the record you're looking for in the instant results, perform a full search for more results.

Stopwords, such as *how* and *to*, are included in the instant results for these objects.

Limitations for Search in Salesforce Classic

When using global search, sidebar search, advanced search, structured queries, list views, and filters, certain restrictions apply.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

EDITIONS

Available in: Salesforce Classic

Available in all editions

Chatter and Global Search

When Chatter is enabled, global search and feed search are enabled, but sidebar search and advanced search are disabled. Your organization's administrator must have Chatter enabled to use global search. Search options aren't available to Chatter Free users.

Chatter feed searches aren't affected by your search scope; Chatter feed search results include matches for posts across all objects.

Sidebar and Advanced Search

The table outlines the main differences between the sidebar and advanced search.

Feature	Sidebar	Advanced
Location	If made available, located to the left of the page. The sidebar panel can be customized to be collapsible.	Link to advanced search within the sidebar search.
Record Fields	Searches all fields except long text fields and attachments.	Searches all fields.
Multiple Object Searches	Choose one object by which to limit your search. Select Search All to search across all objects.	Choose one or more objects by which to limit your search. Select Search All to search across all objects.
Search Terms	Uses a phrase search and matches terms in the exact sequence that they appear. For example, searching for <i>bob jones</i> returns items with <i>Bob Jones</i> , but not <i>Bobby Jones</i> or <i>Bob T Jones</i> . In addition, a trailing wildcard is added at the end of the search terms. For example, <i>Bob T Jones*</i> .	Uses separate word search for searchable fields within a record. For example, searching for <i>bob jones</i> returns items with <i>Bob Jones</i> , and a contact named Bob Smith because his email address is <i>bsmith@jones.com</i> .
Nickname Search	Doesn't include results for nicknames (abbreviated names associated with the entered search name).	Includes results for nicknames.

Structured Queries Based on Multiple Criteria

To look for records based on a structured query, such as accounts in a certain area or open opportunities within a company, use a list view, report, or dashboard.

Limit to Items I Own

When **Limit to items I own** is selected, the search results don't return asset, idea, invoice, order, question, quote, reply, and user records because these records don't have owners.

Filters

Your administrator determines the available filter fields in a search layout. Search filters aren't available in Customer Portals or partner portals.

When filtering search results, the operator is selected automatically based on the field type. Except as noted, all fields use the contains operator. Auto number and phone fields use the contains operator because they can contain non-numeric characters. The = (equals) operator is used with these types of fields.

- Dates
- Numbers, except auto number or phone fields
- Record IDs

Explicitly using the OR operator is only supported in number fields. Except for number fields, commas are used as OR operators in search results filters. For example, if you enter acme, california in the Account Name filter field, your results include account names with either acme or california. For number fields (where a comma can be part of a number) commas aren't treated as OR operators and you must explicitly enter the OR operator.

If you specify more than one criterion, the result includes only records that match all the criteria. For example, if you enter acme california in the Account Name filter field, your results include account names with both acme and california.

Don't include http:// or https:// in URL filter criteria because you may not get the results that you expect. When you enter values in URL fields and save records, Salesforce adds http:// to any URL that doesn't start with http:// or https://. The added http:// isn't stored in the database. For example, if you enter salesforce.com in the Website field and save the record, the Website field displays http://Salesforce, but the value stored is Salesforce. Therefore, if you enter http://salesforce.com in the Website filter field, your results don't include your record.

IN THIS SECTION:

[Using the Recycle Bin](#)

Using the Recycle Bin

The **Recycle Bin** link in the sidebar lets you view and restore recently deleted records for 15 days before they are permanently deleted. Your Recycle Bin record limit is 25 times the Megabytes (MBs) in your storage. For example, if your organization has 1 GB of storage then your limit is 25 times 1000 MB or 25,000 records. If your organization reaches its Recycle Bin limit, Salesforce automatically removes the oldest records if they have been in the Recycle Bin for at least two hours.

Viewing Items in the Recycle Bin

Choose **My Recycle Bin** from the drop-down list to view just the items you deleted. Administrators, and users with the "Modify All Data" permission, can choose **All Recycle Bin** to view all data that has been deleted for the entire organization. In Personal Edition, the **All Recycle Bin** option shows all of your deleted items.

Searching for Items in the Recycle Bin

1. Choose **My Recycle Bin** or **All Recycle Bin** from the drop-down list. Choosing **My Recycle Bin** searches for matches only in the items you deleted.
2. Enter your search terms. Search terms are treated as separate words with an implied AND between them. For example, searching for *bob jones* returns items with *bob* and *jones* together but not *bob smith* whose email address is *bsmith@jones.com*. An implied wildcard is appended to your search terms so searching for *bob* returns any *bob* or *bobby*. Searches look for matches in the field displayed in the Name column of the Recycle Bin such as lead Name, Case Number, Contract Number, or Product Name.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except for **Database.com**

USER PERMISSIONS

To view and recover your deleted records:

- "Read" on the records in the Recycle Bin

To view and recover records deleted by other users:

- "Modify All Data"

To recover deleted public tags:

- "Tag Manager"

To purge the Recycle Bin:

- "Modify All Data"

 **Note:** Some search features, including stemming and synonyms, are not available in the Recycle Bin search.

3. Click **Search**.

Restoring Items in the Recycle Bin

You can restore items by checking the box next to those items and clicking **Undelete**. To restore all deleted items, check the box in the column header and then click **Undelete**.

When you undelete a record, Salesforce restores the record associations for the following types of relationships:

- Parent accounts (as specified in the `Parent Account` field on an account)
- Parent cases (as specified in the `Parent Case` field on a case)
- Master solutions for translated solutions (as specified in the `Master Solution` field on a solution)
- Managers of contacts (as specified in the `Reports To` field on a contact)
- Products related to assets (as specified in the `Product` field on an asset)
- Opportunities related to quotes (as specified in the `Opportunity` field on a quote)
- All custom lookup relationships
- Relationship group members on accounts and relationship groups, with some exceptions
- Tags
- An article's categories, publication state, and assignments

 **Note:** Salesforce only restores lookup relationships that have not been replaced. For example, if an asset is related to a different product prior to the original product record being undeleted, that asset-product relationship is not restored.

Purging the Recycle Bin

To permanently remove your deleted items prior to the 15 day period, administrators, and users with the “Modify All Data” permission, can click **Empty your Recycle Bin** or **Empty your organization’s Recycle Bin**.

[Deleting Records](#)

Topics

Topics on Records Overview

Topics are words or phrases that you can associate with Salesforce records to organize them around common themes.

Use topics to group records by a common theme, and then use those topics to filter list views. If Chatter is enabled, you can also see records on a topic in one central place—the Records tab of the topic detail page. For example, if a number of accounts are participating in a conference, you might add the topic *User Conference 2014* to their records. You could then use that topic to filter an accounts list view, or (with Chatter) view the accounts together on the Records tab of the *User Conference 2014* topic page.

EDITIONS

Available in: **Salesforce Classic**

Available in all editions

Here's an example topic detail page, with the Records tab showing accounts on the topic. (If you don't see a Records tab like this for a particular topic, the topic hasn't been added to any records.)

Administrators can enable topics for accounts, assets, campaigns, cases, contacts, contracts, leads, opportunities, orders, solutions, custom objects, and English articles. Topics can also be enabled for tasks and events, they aren't accessible via list views or the Records tab.

 **Note:** Topics are only supported on English Knowledge articles.

SEE ALSO:

[Add Topics to Records](#)

Add Topics to Records

Add topics to quickly organize records around common themes, retrieve them in list views, and (with Chatter) view them on topic detail pages.

Topics for objects must be enabled before you can add topics to records of that object type.

 **Note:** All topic names are public and appear in search results, but this doesn't affect the visibility of records that have topics.

1. On the top of the record detail page under the record name, click **Click to add topics**. If the record already has topics, click **Topics**.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To add topics to a record:

- "Read" and "Edit" on the record

AND

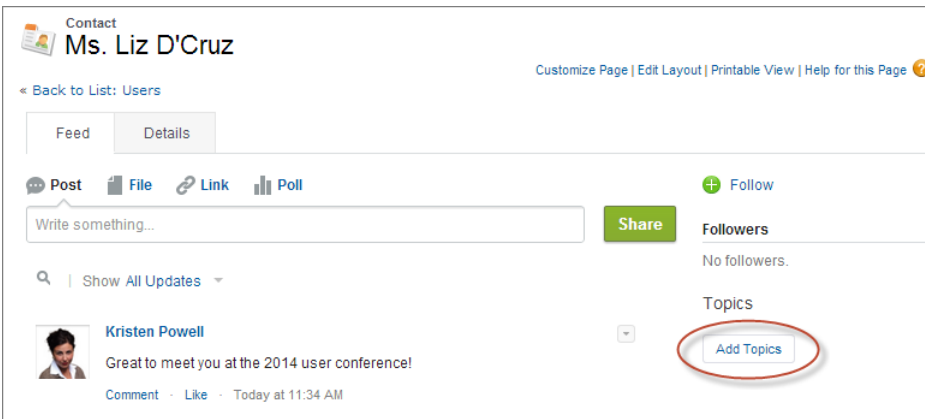

"Assign Topics" to add existing topics

OR

"Create Topics" to add new topics

If your administrator enabled feed-based layouts, click **Add Topics** in the sidebar of the feed view.

2. In the topic editor, start typing your text. As you type, you can pick a topic from the list of suggestions, or keep typing to create your own unique topic. To add more than one topic, type a comma after each topic.

Commas (,) and closing square brackets (]) automatically end a topic. Other punctuation, symbols, and separators are supported in topic names.

Records can have up to 100 topics.

3. When you're done adding topics, click **Done** or press **Enter**.

You can now use topics you add to records to filter your list views. And if your administrator enabled Chatter, topics added to records become links to topic detail pages, where associated records appear on the Records tab for easy access. (Note that Chatter posts on a record aren't automatically added to a record's topics; you must add the topics to the posts.)

SEE ALSO:

[Create Custom List Views in Salesforce Classic](#)

[Remove Topics from Records](#)

Remove Topics from Records

Remove a topic from a record if it no longer applies.

Removing topics doesn't delete them. Before you remove a topic from a record, consider whether someone else added it; they may be using the topic to track the record.

1. On the top of the record detail page, click **Topics**.
2. Click  next to the topic you want removed from the record.
3. Click **Done** or press ENTER.

Removing a topic from a record removes the record from any list views using that topic as a filter. If Chatter is enabled, the record is also removed from the Records tab of the topic detail page.

Tags

Tags Overview

Tags are words or short phrases that you can associate with most Salesforce records to describe and organize their data in a personalized way. Use tags to group records from various objects by a common theme or use, and then use those tags in search to make finding information fast and intuitive.

For example, if you met a number of contacts and leads at a conference, you might tag them all with the phrase *User Conference 2011*. You could then search for the *User Conference 2011* tag and click that tag in search results to retrieve those records.

Salesforce supports two types of tags.

- *Personal tags* are private. Only you can view any personal tags that you add to a record.
- *Public tags* are shared among all users in an organization. Any user with access to the record can view the public tags that you add.

Administrators can enable personal and public tags for accounts, activities, assets, campaigns, cases, contacts, contracts, dashboards, documents, events, leads, notes, opportunities, reports, solutions, tasks, and any custom objects (except relationship group members), allowing you to:

- [Tag records](#)
- [Remove tags from a record](#)
- [Browse, search, and manage tags](#)

 **Note:** If your administrator enables [topics](#) for an object, public tags are disabled for that object. Personal tags aren't affected.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To remove topics from a record:

- "Read" and "Edit" on the record
- AND
- "Assign Topics"

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Tagging Records

1. On the top right corner of the record detail page, click **Add Tags**. If the record already has associated tags, click **Edit Tags**.
2. In the `Personal Tags` or `Public Tags` text boxes, enter comma-separated lists of the [tags](#) that you want to associate with the record. Tags can only contain letters, numbers, spaces, dashes, and underscores, and must contain at least one letter or number.

As you enter new tags, up to 10 tags that have already been defined are displayed as auto-complete suggestions. As you type, the list of suggestions changes to show only those tags that match the prefix you have entered. To choose a suggestion, click it or use your keyboard arrow keys to select it and press the TAB or ENTER key.

3. Click **Save**.

 **Tip:** When you create or edit tags, you can press the ENTER key to save your changes or the ESC key to discard them.

-  **Note:** There are limits on the number of personal and public tags you can create and apply to records. For all editions, if you attempt to tag a record with a new tag that exceeds one or more of these limits, the tag isn't saved. If you reach a limit, you can go to the Tags page and delete infrequently used tags.

SEE ALSO:

[Tags Overview](#)

[Removing Tags from Records](#)

Removing Tags from Records

1. On the top right corner of the record detail page, click **Edit Tags**.
2. Next to the `Personal Tags` or `Public Tags` text boxes, click **[X]** next to the tag that you want to remove.
3. Click **Save**.

 **Tip:** When you create or edit tags, you can press the ENTER key to save your changes or the ESC key to discard them.

If the tag that you removed is the last instance of the tag, the tag is deleted from your organization completely. If other records use the tag, the tag still appears in search results and the Tags page.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To edit tags on a record:

- "Read" on the record

To rename or delete public tags:

- "Tag Manager"

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To edit tags on a record:

- "Read" on the record

Browsing, Searching, and Managing Tags

To access the [Tags](#) page, click the name of any tag on a detail page, or if your administrator added tags to the sidebar, click **Tags** in the sidebar.

From this page, you can:

- [View and browse tags](#)
- [Find records with tags](#)
- [Search tags](#)
- [Rename and delete tags](#)
- [Review personal tag statistics](#)

Viewing and Browsing Tags

Use the `Personal Tags` and `Public Tags` checkboxes to limit or expand your view. Because personal tags are private, you can only see the personal tags that you have defined. You can see all public tags that are defined in your organization.

Click a letter at the top of the tag browsing area to view only tags that begin with that letter or click **Next Page** or **Previous Page**.

By default, tags are listed in alphabetical order. From the `Sort` picklist, choose **By Number of Uses** to sort tags by the number of records that are tagged by them, or choose **By Most Recently Used** to sort tags by how recently they were added to a record.

Finding Records with Tags

Click a tag to see the list of records organized by object. The number of records associated with the tag is displayed next to the tag. You can narrow your results further by clicking additional tags. When more than one tag is selected, only records that match all selected tags are displayed in the list of results. Click **[X]** next to a tag to deselect it and remove it from the filter. Click **Clear Selected Tag(s)** to deselect all tags and start over.

Note:

- The number of records associated with a tag can sometimes be greater than the number of records displayed when you click that tag in the Tags page. This situation occurs if you tagged a record and then lost permission to view it because of a change in sharing, or if a record that you don't have access to has one or more public tags.
- Search results and the Tags page don't display custom objects without an associated tab, even if tags are enabled for the custom object.

You can customize columns and filter the search results.

Searching Tags

Enter terms in the Search Tags text box and click **Search**. Only tags that meet your search criteria are listed in the tag browsing area. You can then click any tag to view records associated with that tag.

Search strings must include at least two characters and can include wildcards and operators.

The most recent search result is saved in the tag browsing area next to the alphabet at the top of the page. Click the search string to return to your results.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To rename or delete public tags:

- "Tag Manager"

Renaming and Deleting Tags

- To rename a tag, hover over the tag and select **Rename** from the drop-down list that appears around the tag. Enter a new name for the tag in the text box that appears and click **Save**.
- To delete a tag, hover over the tag and select **Delete** from the drop-down list that appears around the tag. The tag is removed from every record in your organization and is placed in the Recycle Bin.

If you restore a tag from the Recycle Bin, it is automatically reassociated with the records from which it was removed. For more information, see [Using the Recycle Bin](#) on page 170.

You can rename or delete any personal tag, but you must have the “Tag Manager” permission to rename or delete a public tag.

Reviewing Personal Tag Statistics

Click **Personal Tag Usage** on the right side. This page displays your current number of unique personal tags and personal tag applications. You can have a maximum of:

- 500 unique personal tags
- 5,000 instances of personal tags applied to records

If you are approaching your personal tag limits, consider merging similar tags into a single tag by renaming. For example, if you have tags for Bicycling, Cycling, and Biking, you can rename Cycling and Biking to Bicycling to reduce your number of unique personal tags.

To reduce the number of instances of tags applied to records, delete personal tags that you no longer use.

Viewing Recently Used Tags

The **Tags** link and Recent Tags drop-down list, available in the sidebar, allow you to browse tags and access your most recently used tags, respectively.

- Click **Tags** to browse, search, and manage your entire tag collection.
- Select a tag in the Recent Tags drop-down list to view all records that have been marked with that tag. The tags that appear in this list are those you have most recently used to tag records.

Collaborate Within Salesforce

Update Your Contact Information

Update your contact information at any time on your profile page. Your contact information is visible to everybody in your company.

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager**, and **Developer** Editions

To update your contact information, click your name or your profile picture. You can update all fields on your profile, except the Manager field. Only your Salesforce admin can update the Manager field.

In Communities, you can also control the visibility of your contact information within communities on a field-by-field basis. You can choose to expose fields to employees only, members of the community from outside your company, or guest users who aren't required to log in. Some fields are always visible to everyone accessing the community.

SEE ALSO:

[Change Your Profile or Group Photo](#)

Change Your Profile or Group Photo

Upload a photo to your profile so people can see who you are, or upload a photo for groups that you own or manage.

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager**, and **Developer** Editions

1. Go to your profile or the group's page.
2. Hover over the photo and click **Add Photo** or **Update**.
3. Browse for the photo you want to upload and open the file. You can upload photos in .jpg, .gif, or .png format up to 8 MB.
4. Create a thumbnail image by dragging the dotted lines across the photo.

If the photo is for your profile and you're a member of any communities, you can select `Show in communities with publicly accessible pages`. This option makes the photo visible to guest users viewing publicly accessible sites or pages that don't require login.

5. Save your changes.

Follow People

Follow people to see their updates in your feed, including posts, comments, and likes.

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager**, and **Developer** Editions

To follow a person, click **Follow** on a person's profile page.

Once you follow people, you see their posts, comments, and likes in your feed. You can follow a maximum combined total of 500 people, topics, and records. To see how many items you're following, view the Following list on your profile.

To stop following a person, click **x**. When you stop following a person, you don't see future updates from that person in your feed.

SEE ALSO:

[Follow Records](#)

Follow Records

Follow records so you can see updates in your feed, including field changes, posts, tasks, and comments on records.

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To view a record:

- "Read" on the record

The field changes you see in your feed depend on which of the fields your administrator configured for feed tracking. Updates to encrypted custom fields don't display in feeds.

To follow a record, click **Follow** on the record page.

When you follow a record, you see updates to the record in your feed. You can follow a maximum combined total of 500 people, topics, and records. To see how many items you're following, view the Following list on your profile.

If you want to automatically follow the records you create, enable this feature from your personal settings. Enter *My Feeds* in the *Quick Find* box, select **My Feeds**, and then select **Automatically follow records I create**. However, you don't auto-follow events, tasks, or dashboards after you create them.

To stop following a record, click  on the record page. After you stop following a record, you don't see future updates to the record in your feed.

SEE ALSO:

[Follow People](#)

[Find Your Personal Settings](#)

Join or Leave Groups

Join groups to collaborate with other people on projects or common areas of interest. Share project-related files and information with the group.

1. Go to group's detail page.
2. To join a public group, click **Join** or **Join Group**. To join a private group, click **Ask to Join**. Your request is sent to the private group's owner and managers, who accept or decline your request.

You can join up to 100 groups. All groups count toward this limit, except archived groups. For example, if you're a member of 100 groups, of which 10 are archived, you can join 10 more groups.

To leave a group you joined or withdraw your request to join a private group, go to the group detail page and click  or **Leave Group**.

Search Across Your Feeds

Looking for people, groups, or files? Use search to quickly find information across your feeds.

IN THIS SECTION:

[Search Your Feeds in Lightning Experience](#)

Search for people, groups, and files across your feeds.

[Search Your Feeds in Salesforce Classic](#)

Search feeds, people, groups, topics, and files across Chatter.

Search Your Feeds in Lightning Experience

Search for people, groups, and files across your feeds.

1. Enter your search term in the header search box.
2. On the search result page, click **FEEDS** to see posts from the All Company feed that include matches on your search term.

Search Your Feeds in Salesforce Classic

Search feeds, people, groups, topics, and files across Chatter.

1. Enter your search term in the header search box.
2. Click **Search**.

The search results page shows matches across Salesforce, including Chatter. From the search results page, you can further refine your search. For example, to see search results across all Chatter feeds, click **Search Feeds**.

You can also search specific feeds. For example, to find where a person is mentioned in a group, type the person's name in the search box above the group feed.

Use Salesforce on Mobile Devices

Salesforce1 Mobile App

The Salesforce1 mobile app is Salesforce on the go! This enterprise-class mobile experience gives you real-time access to the same information you see in the office, but organized for getting work done faster between customer meetings, waiting for a flight, even when you're in line for coffee. The intuitive interface makes it easy to navigate and interact with data on a touchscreen, so you can review and update information with just a few taps. And Salesforce1 includes many of your organization's customizations, so the app is tailored to your business needs.

 **Note:** This release of Salesforce1 doesn't have all of the functionality of the full Salesforce site. To see data or do actions that aren't supported in Salesforce1, use the full site instead.

Salesforce1 Mobile App Features: What's Available in Each Version

Salesforce1 is available as a downloadable app on iOS and Android devices, as well as browser-based app. In most cases the downloadable and mobile browser apps include the same features. But there are some differences between the experiences, often related to differences in the mobile platforms on which Salesforce1 is supported.

Requirements for the Salesforce1 Mobile App

Salesforce1 is available for most Salesforce editions and many user license types. The app is supported on a variety of mobile platforms, with some device, operating system, and mobile browser requirements. An Internet connection is necessary to communicate with Salesforce.

Data That's Available in the Salesforce1 Mobile App on page 189

Salesforce1 uses your organization's Salesforce edition, your user license type, and your assigned user profile and permission sets to determine the data that's available to you. In most cases you see the same objects, record types, fields, and page layouts that you do when working in the full Salesforce site. Not all Salesforce data or functionality is supported in Salesforce1, however.

Get the Salesforce1 Mobile App

The way you access Salesforce1 depends on how you want to work: using an app installed on your device or using a mobile browser. It's possible that some of the Salesforce1 versions are disabled for your organization—ask your Salesforce administrator about your options.

Why Can't I Log in to the Salesforce1 Mobile App?

You're certain that you're using your correct Salesforce credentials but you can't log in to Salesforce1? There are several common reasons why you might be having trouble.

Find Help in the Salesforce1 Mobile App

Salesforce1 includes a **Help** link that you can use to learn about the mobile app.

SEE ALSO:

[Help Resources for the Salesforce1 Mobile App](#)

Requirements for the Salesforce1 Mobile App

Salesforce1 is available for most Salesforce editions and many user license types. The app is supported on a variety of mobile platforms, with some device, operating system, and mobile browser requirements. An Internet connection is necessary to communicate with Salesforce.

Supported Devices and Browsers

Salesforce1 is supported in portrait orientation in these environments.

EDITIONS

Salesforce1 available in: **All** editions except Database.com

Salesforce1 App	Supported Devices	Supported Mobile OS	Supported Mobile Browser
Downloadable app for iOS, v7.3 or later	iPhone 5 or later models iPad 4 or later models (including iPad Air 2 and iPad Pro) iPad mini 2 or later models Apple Watch (<i>push notifications only</i>)	iOS 8 or later	Not applicable
Downloadable app for Android, v7.3 or later	Android phones	Android 4.2 or later	Not applicable
Mobile browser app	iPhone 5 or later models iPad 4 or later models iPad mini 2 or later models	iOS 8 or later	Apple Safari Good Access
	Android phones Android tablets	Android 4.4 or later	Google Chrome Good Access
	Nokia Lumia 1020 and HTC 8X phones	Windows 8.1 Update	Microsoft Internet Explorer 11
	BlackBerry Z10 phones	BlackBerry OS 10.2 or later	BlackBerry Browser

Salesforce1 App	Supported Devices	Supported Mobile OS	Supported Mobile Browser
	BlackBerry Z30 phones	BlackBerry OS 10.2.1.3175 or later	BlackBerry Browser

For optimal Salesforce1 performance, we recommend keeping your mobile devices' operating systems updated and upgrading to late model devices as allowed by your mobile plan. Future Salesforce1 versions may require removing support for older operating systems and sometimes newer operating system releases don't perform well on older devices.

When using the mobile browser app, we recommend turning off Incognito Mode in Chrome, InPrivate Browsing in Internet Explorer, or Private Browsing in Safari or BlackBerry Browser.

Salesforce Editions and Licenses

These Salesforce editions and user license types allow the use of Salesforce1.

Salesforce Editions		
These Salesforce editions allow the use of Salesforce1.	<ul style="list-style-type: none"> • Personal Edition • Group Edition • Professional Edition • Enterprise Edition • Performance Edition • Unlimited Edition • Developer Edition • Contact Manager Edition 	Database.com Edition isn't supported.
User License Types		
These user license types can access Salesforce1. A special Salesforce1 or mobile license isn't required.	<ul style="list-style-type: none"> • Salesforce users • Salesforce Platform and Force.com users • Chatter Plus users (also known as Chatter Only), Chatter Free users, and Chatter External users* • Customer Community, Customer Community Plus, and Partner Community external users • Portal users who are a member of a Salesforce community 	These user license types aren't supported: portal users (unless a member of a Salesforce community), Database.com users, Sites and Site.com users, Data.com users, and Work.com users.

 **Note:** You can access the same data and functionality that's available to you in the full site, as determined by your organization's Salesforce edition, your user license type, and your assigned user profile and permission sets.

* Chatter Plus, Chatter Free, and Chatter External users must have the "API Enabled" profile permission turned on to use any of the Salesforce1 downloadable apps. Chatter External users who have API access can't access Groups or People list views when using a downloadable app.

Wireless Connection

A Wi-Fi® or cellular network connection is needed to communicate with Salesforce. For cellular connections, a 3G network or faster is required. For the best performance, we recommend using Wi-Fi or LTE.

If you're using one of the Salesforce1 downloadable apps, you can view your most recently accessed records when your device is offline.

SEE ALSO:

[Locale and Language Support for the Salesforce1 App](#)

[Salesforce1 Mobile App Accessibility Considerations](#)

[Data That's Available in the Salesforce1 Mobile App](#)

Locale and Language Support for the Salesforce1 App

Salesforce1 works with almost all Salesforce-supported locales and the fully supported and end-user languages. (The Salesforce Help includes a complete list of supported locales and languages.)

Languages that are read right to left, including Arabic and Hebrew, aren't supported in this release.

 **Note:** The Salesforce1 downloadable apps use the language and locale settings from both your Salesforce user profile and the locale settings on your mobile device. If your device uses different locale settings than are specified for your user profile, you may see different languages displayed throughout the app. For example, the navigation menu might display in English while records display in French.

Salesforce1 includes multi-currency support, but advanced currency management isn't available.

SEE ALSO:

[Requirements for the Salesforce1 Mobile App](#)

Salesforce1 Mobile App Accessibility Considerations

Salesforce1 is designed with accessibility in mind and delivers a fully-accessible mobile experience for all individuals, including users working with screen readers.

Unlike the full Salesforce site, Salesforce1 doesn't require accessibility mode to give users working with assistive devices a fully accessible experience.

Check your mobile device's documentation for more information about using a screen reader.

SEE ALSO:

[Requirements for the Salesforce1 Mobile App](#)

Data That's Available in the Salesforce1 Mobile App

Salesforce1 uses your organization's Salesforce edition, your user license type, and your assigned user profile and permission sets to determine the data that's available to you. In most cases you see the same objects, record types, fields, and page layouts that you do when working in the full Salesforce site. Not all Salesforce data or functionality is supported in Salesforce1, however.

EDITIONS

Salesforce1 available in: **All** editions except Database.com

EDITIONS

Salesforce1 available in: **All** editions except Database.com

EDITIONS

Salesforce1 available in: **All** editions except Database.com

These objects are available in Salesforce1. Unless noted otherwise, you can view, edit, or create records for these objects.

- Accounts and Person Accounts
- Campaigns
- Cases
- Contacts
- Contracts
- D&B Company (*view only, for Data.com Premium Prospector and Data.com Premium Clean customers*)
- Dashboards (*view only*)
- Events
- Leads
- Live Chat Transcripts
- Opportunities
- Orders (*view or edit only*)
- Reports (*view only*)
- Salesforce Knowledge Articles (*view only; mobile browser app only*)
- Tasks
- Work.com Coaching, Goals, Thanks, Rewards, and Skills (*Skills not available in the iOS downloadable app*)
- External objects via Lightning Connect (*view only; not available in the Android downloadable app*)
- Custom objects that have a tab you can access

You can access all of these objects from the Salesforce1 navigation menu. The navigation menu helps you focus on the objects you work with most frequently. Tap **More** at the bottom of the Recent section to see the full list of all objects available to you in Salesforce1.

With some exceptions, all of the standard and custom fields are available on these records. And you can work with most of the related lists for supported objects.

 **Tip:** If you're new to Salesforce and don't yet have a history of recent items, you initially see these objects in the Recent section of the Salesforce1 navigation menu: Accounts, Cases, Contacts, Files, Groups (unless added directly to the navigation menu), Leads, Opportunities, and People (unless added directly to the navigation menu).

As you spend time working in Salesforce1 and the full Salesforce site, the objects that you use the most eventually replace the default ones in the Recent section and become the objects that are available for global searches in Salesforce1.

It can take up to 15 days for the objects that you work with regularly to appear in the Recent section. To make objects appear under Recent immediately, pin them from your search results in the full site.

When doing a global search in Salesforce1, you can find records for the objects that appear in the Recent section only. To find records for the other objects that are in the full object list when the Recent section is expanded, search from the object's home page.

If Chatter is enabled, you can access feeds, user profiles, groups, and files. You can access user profiles even if Chatter is disabled.

If you're using a Salesforce1 downloadable app, you can use Salesforce Today to prepare for meetings, stay in touch with customers, quickly join conference calls, and generally manage your day.

Get the Salesforce1 Mobile App

The way you access Salesforce1 depends on how you want to work: using an app installed on your device or using a mobile browser. It's possible that some of the Salesforce1 versions are disabled for your organization—ask your Salesforce administrator about your options.

Install a Downloadable App

Salesforce1 downloadable apps are available for Android phones and iPad and iPhone devices. You can download and install the app from Google Play or the App Store.

You can download and install the Salesforce1 downloadable apps from Google Play or the App Store to supported Android and iOS devices.

Once the app is installed, launch it from your home screen and log in to your Salesforce account. You may be prompted to create a security PIN. By default, you're connected to your production environment.

 **Note:** If you're not able to log in, verify with your administrator that you're enabled to use the downloadable app.

Use the Mobile Browser App

The Salesforce1 mobile browser app runs in a mobile browser. The mobile browser app is a great option if your organization prevents installing apps on your corporate-issued device.

If the mobile browser app is enabled for your organization, you're automatically redirected to Salesforce1 when you log in to Salesforce from a supported mobile browser.

If Salesforce1 doesn't automatically start for you, make sure you didn't turn off the redirection to the mobile browser app and that you're using a supported browser.

SEE ALSO:

[Why Can't I Log in to the Salesforce1 Mobile App?](#)

[Requirements for the Salesforce1 Mobile App](#)

[Turn the Salesforce1 Mobile Browser App Off or On](#)

Why Can't I Log in to the Salesforce1 Mobile App?

You're certain that you're using your correct Salesforce credentials but you can't log in to Salesforce1? There are several common reasons why you might be having trouble.

- Make sure that you actually have permission to use Salesforce1. Salesforce administrators can control who's able to use the Salesforce1 downloadable apps and can also disable access to the mobile browser app, for you or your entire company. If you're not sure that you have access, check with your administrator.
- If you're using a downloadable app, make sure you're logging in to the correct instance—production, sandbox, or a custom domain. By default, Salesforce1 connects to your production environment. If your organization uses single sign-on, configure the app to point to a different page during login. The same is true to connect Salesforce1 to a sandbox environment for testing purposes or to log in using a Community URL.

A custom domain is in the form of `https://universalcontainers.my.salesforce.com`, where `universalcontainers` is a name selected by your administrator. Your administrator can provide you with the domain name to use.

- To connect the downloadable app for iOS to a different instance, use [these steps](#).
- To connect the downloadable app for Android to a different instance, use [these steps](#).

EDITIONS

Salesforce1 available in: **All** editions except Database.com

Salesforce1 available in: **All** editions except Database.com

EDITIONS

Salesforce1 available in: **All** editions except Database.com

If you're still unable to log in, ask your administrator for help.

SEE ALSO:

[Get the Salesforce1 Mobile App](#)

[Requirements for the Salesforce1 Mobile App](#)

Find Help in the Salesforce1 Mobile App

Salesforce1 includes a **Help** link that you can use to learn about the mobile app.

The **Help** link is located at the bottom of the Salesforce1 navigation menu. Tap  to open the navigation menu.

And there are a lot of other resources that can help you get started with Salesforce1. Check out [Help Resources for the Salesforce1 Mobile App](#) on page 181.

Turn the Salesforce1 Mobile Browser App Off or On

When the Salesforce1 mobile browser app is enabled for your organization, you automatically redirect to this experience when you log in to Salesforce from a supported mobile browser. Using the full Salesforce site in a mobile browser isn't supported. But it is possible to turn off the mobile browser app if you need to access Salesforce Classic from your mobile device for awhile.

 **Note:** If you disable automatic redirection to the Salesforce1 mobile browser app, you're turning off automatic access for any supported browser, on any of your mobile devices. For example, if you turn off the mobile browser app from your tablet, you won't be able to use the mobile browser app on your mobile phone either.

These steps don't affect the Salesforce1 downloadable apps which always display the Salesforce1 interface.

To turn off the mobile browser app from within the app:

1. Tap .
2. Tap **Full Site**.

You switch immediately to the Salesforce Classic full site. It's not possible to access Lightning Experience from any mobile browser.

The full site is now your default environment whenever you log in from a mobile browser. You can switch back to the Salesforce1 app using the **Go to Salesforce1** link in the full site footer, after which the mobile browser app becomes your new default environment.

To turn off the mobile browser app from the full site:

1. From your personal settings, enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
2. Deselect **Salesforce1 User**.
3. Save your changes.

EDITIONS

Salesforce1 available in: **All** editions except Database.com

EDITIONS

Salesforce1 available in: **All** editions except Database.com

To turn the Salesforce1 mobile browser app back on from the full site, repeat the previous steps and select the `Salesforce1 User` checkbox.

Get Started With Chatter Mobile for BlackBerry

Chatter Mobile for BlackBerry Overview

! **Important:** As of Summer '14, the Chatter Mobile for BlackBerry app is no longer supported. You can continue to use the app, but Salesforce no longer provides support in the form of bug fixes or enhancements for any issues you may encounter. Talk to your Salesforce administrator about migrating to the Salesforce1 app, the new Salesforce mobile experience.

The Chatter Mobile for BlackBerry app lets you collaborate in Chatter from your mobile device as follows:

- Receive updates about the people and records you follow and your groups.
- View and create posts and comments.
- Post photos from your device.
- Find and follow people in your organization.
- Find and join groups in your organization.
- View your coworkers' profiles to see their contact information, bio, who they're following, and who's following them.
- Email, call, or text people directly from their Chatter profiles.

Chatter Mobile for BlackBerry is free and available for BlackBerry devices with OS 5 or later. Download the app from BlackBerry World. Customers that manage BlackBerry devices with a BlackBerry Enterprise Server can use Application Push to remotely deliver the Chatter Mobile for BlackBerry app to users. Navigate to downloads.salesforce.com and click **BESpush** under Chatter Files and Tools to download the Application Push package.

Chatter Mobile for BlackBerry is enabled for use in most organizations by default. If it is not enabled in your organization or you want to change the default settings, contact your administrator.

SEE ALSO:

- [Using Chatter Desktop](#)

What are push notifications? How do I enable or disable them for Chatter Mobile for BlackBerry?

Push notifications are alerts that apps send to your mobile device's home screen when you're not using the app. These alerts can consist of text, icons, and sounds, depending on your device type. The Chatter Mobile for BlackBerry mobile app uses push notifications to keep you aware of important Chatter activity without requiring you to return to the app. A setting controls whether or not you receive Chatter push notifications; however, you can't enable push notifications if they were disabled by your administrator.

EDITIONS

Available in: **Salesforce Classic**

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Contact Manager
- Developer
- Database.com

To learn about enabling or disabling push notifications, visit the Chatter mobile app help site from your device.

Can Chatter customers from Customer Groups use Chatter Mobile for BlackBerry?

Chatter customers can download the Chatter Mobile for BlackBerry mobile app to use Chatter from their BlackBerry device. Chatter Mobile for BlackBerry applies the same restrictions to customer users as Chatter on the Web.

Chatter Customers are users outside of your company's email domains, who have access to private groups with customers. In Chatter Mobile for BlackBerry, the names and profiles of customer users can be viewed by people inside your company's domain.

SEE ALSO:

[About Chatter Customers in Private Groups](#)

Get Started With Salesforce Classic

Salesforce Classic Mobile Overview

The Salesforce Classic Mobile app provides mobile access to your Salesforce data from Android™, BlackBerry® and iPhone® devices. If you have a license to use the full version of Salesforce Classic Mobile, you can view, create, edit, and delete records, keep track of your activities, view your dashboards, run simple reports, and log calls and emails. Any Salesforce user who doesn't have a mobile license can download a free, restricted version of Salesforce Classic Mobile. With the free version, you can view, create, edit, and delete only accounts, assets, contacts, leads, opportunities, events, tasks, cases, and solutions. You can also access your dashboards.

Note: Supported features may vary depending on your mobile operating system and device model.

Salesforce Classic Mobile stores your Salesforce records in a local database on your mobile device, which means you can use the Salesforce Classic Mobile app even when a data connection is unavailable. Salesforce Classic Mobile periodically polls Salesforce for new and updated records, saving you from the hassle of manually synchronizing your data.

In the free version of Salesforce Classic Mobile, only records you recently accessed in Salesforce automatically synchronize to your device. However, you can search for and download records that are not automatically delivered to your device. Items you download from Salesforce become a permanent part of your mobile data set. In addition to recently accessed records, the default configuration synchronizes activities closed in the past five days and open activities due in the next 30 days.

Check the [list of supported mobile devices](#) to see if you can use the Salesforce Classic Mobile app on your smartphone.

Full version available in: **Performance, Unlimited, and Developer** Editions, and for an extra cost in: **Professional and Enterprise** Editions

Requirements for Using Salesforce Classic Mobile

The Salesforce Classic Mobile app can run on Android, BlackBerry, and iOS operating systems. It's also supported by wireless carriers—if the device can establish a data connection to the Internet, it can typically run the mobile app. [Verify that your device is supported](#) before installing the mobile app. Recently released mobile devices aren't immediately supported because every device goes through the official certification and quality assurance process.

Notes About BlackBerry Smartphones

- Even if your device meets the minimum operating system requirement, you can improve its performance by upgrading to the latest supported version of the operating system offered by your mobile carrier.
- Mobile users running versions 4.0 - 4.3 of the BlackBerry operating system can still download and install the Salesforce Classic Mobile app; however, the mobile server will detect the older operating system and send version 11.6 of Salesforce Classic Mobile, which was the last release that supported BlackBerry operating system versions 4.0 - 4.3. Users on version 11.6 of Salesforce Classic Mobile can't use any of the new features included in the current release or future releases.
- Starting in Winter '09, Salesforce Classic Mobile no longer officially supports the BlackBerry 8700 series, although the mobile app may continue to run on those device models.
- BlackBerry touchscreen devices use the same Salesforce Classic Mobile app as other BlackBerry devices, so some aspects of Salesforce Classic Mobile aren't optimized for the touchscreen interface.

Notes About iOS Devices

Use of the Salesforce Classic Mobile app for Apple products is subject to certain limitations:

- Third parties (including, but not limited to, Apple Inc. and your network connectivity provider) may at any time restrict, interrupt or prevent use of Salesforce Classic Mobile for the iPhone and iPod touch devices, or delete the Salesforce Classic Mobile app from iPhone or iPod touch devices, or require Salesforce to do any of the foregoing, without entitling the customer to any refund, credit or other compensation from such third-party or Salesforce.
- Service level agreements don't apply to the Salesforce Classic Mobile for iPhone product. Additional limitations are described in the Order Form Supplement for Salesforce Classic Mobile for iPhone, which users are required to accept upon download or installation of the Salesforce Classic Mobile for iPhone product.

Installing the Salesforce Classic Mobile App

You can install the Salesforce Classic Mobile app on any [supported](#) Android, BlackBerry, or iPhone device.

The easiest way to install Salesforce Classic Mobile is to visit <http://mobile.salesforce.com> from your mobile device and follow the on-screen instructions.

Or, you can use the installation steps for your type of device:

Android Installation

Salesforce Classic Mobile is available for download from Google Play. To access Google Play, your Android device must be connected to the network. You also need a Google account to download applications. If you don't already have a Google account, go to <https://accounts.google.com> and select **Sign up** to set one up.

To install Salesforce Classic Mobile from Google Play:

1. From the Apps screen of your Android device, select the Google Play Store.
2. Select the **Search** field, and type *salesforce*.
3. Select Salesforce Classic Mobile from the search results.
4. Select **Download**.
5. Tap **Accept and Download** if you agree to the terms.
6. Select **Open** to launch the application.
7. The first time you launch the Salesforce Classic Mobile app on your device, you must activate the app for your device by logging in and downloading data. Verify that your phone is connected to a network.
 - a. Select **I Accept**.
 - b. On the activation screen, enter your Salesforce username and password.
 - c. Select **Activate**.

Depending on your organization's setup, you might need to set up a passcode before accessing the app.

BlackBerry Installation

Salesforce Classic Mobile is available for download from BlackBerry World. You need a BlackBerry World account to download apps on your BlackBerry, but you can create an account from your device if you don't already have one. To install Salesforce Classic Mobile from BlackBerry World:

1. Select the BlackBerry World icon.

If you can't find the icon on your device, you might need to [download BlackBerry World](#). BlackBerry World can't run on all BlackBerry smartphones, so be sure to review Research in Motion's system requirements before trying to install BlackBerry World on your device.
2. Select the **Search** icon.
3. Enter *salesforce* in the *Search* field.
4. In the search results, select Salesforce Classic Mobile.
5. Click **Download**.
6. After the installation completes, select **OK**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Free version available in: **All** editions except **Database.com**

Full version available in: **Performance, Unlimited, and Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

7. When prompted whether to permit the app to access the phone, select **Allow**.
8. When prompted whether to permit the app to access `tp.mobile.salesforce.com`, select **Yes**.
9. Close BlackBerry World.
10. Select the app icon, which resides on the home page of your device or in the Applications folder. On newer phones, the icon may be in the Downloads folder.
11. The first time you launch the Salesforce Classic Mobile app on your device, you must activate the app for your device by logging in and downloading data. Verify that your device is connected to a network.
 - a. Read the license agreement and select **I Accept**.
 - b. Enter your Salesforce username and password.

Because many passwords contain special characters that are difficult to enter on the device, the `Show Password` checkbox is selected by default. To protect your password, you can deselect the option.
 - c. Select **Activate**.

After your username and password are confirmed by Salesforce, the data downloads. The initial data download may last a few minutes. Future updates to the data occur automatically.

Depending on your organization's setup, you might need to set up a passcode before accessing the app.

 **Note:** If you're unable to download the Salesforce Classic Mobile app from BlackBerry World, you can [install the app over-the-air directly from Salesforce](#) instead.

iPhone Installation

Salesforce Classic Mobile is available for download from Apple's App Store. To use the App Store, your iPhone or iPod touch must be connected to the network. You also need an iTunes™ Store account to download applications. If you don't already have an iTunes Store account, open iTunes on your computer and select **Store > Account** to set one up.

To install Salesforce Classic Mobile from [the App Store](#):

1. From the Home screen of your iPhone or iPod touch, select the App Store icon.
2. Tap **Search**.
3. Tap within the `Search` field to open the keyboard. Type `salesforce`.
4. Select Salesforce Classic Mobile in the list of search results to view information about the application.
5. Tap **Free**, and then tap **Install**.

 **Note:** There's no charge to download the app from the App Store. Enterprise, Professional, Unlimited, Performance, and Developer Edition users with mobile licenses run the full version of Salesforce Classic Mobile. Any Salesforce user who doesn't have a mobile license can download a free, restricted version of Salesforce Classic Mobile.
6. Enter your iTunes Store account and password and tap **OK**.
7. The first time you launch Salesforce Classic Mobile, you must activate the app for your device by logging in and downloading data. Verify that your device is connected to a network.
 - a. Tap the Salesforce icon on the Home screen.
 - b. Tap **I Accept**.
 - c. On the activation screen, enter your Salesforce username and password.
 - d. Tap **Activate**.

 **Warning:** If the application closes or the device locks during the activation process, the iPhone operating system pauses the download process but it will resume the next time you open the app.

Depending on your organization's setup, you might need to set up a passcode before accessing the app.

Downloading Salesforce Classic Mobile Over-the-Air from Salesforce

The BlackBerry World is the preferred place for downloading the Salesforce Classic Mobile app because users are automatically notified as upgrades become available. However, some BlackBerry administrators restrict users from downloading and using the BlackBerry World on their devices. BlackBerry users can install Salesforce Classic Mobile over-the-air directly from Salesforce if they are unable to access BlackBerry World.

To download Salesforce Classic Mobile over-the-air:

1. Point your mobile browser to `mobile.salesforce.com/bb`.
2. Highlight the **Download the application** link and select **Get Link** from the menu.
3. Select **Download**. If prompted to replace an older version of the client application, select **Yes**.

 **Note:** The minimum BlackBerry operating system requirement for the mobile application is 4.3. If you're running versions 4.0–4.3 of the operating system, you can still download and install the mobile application; however, the mobile server will detect the older operating system and send version 11.6 of the mobile application, which was the last release that supported operating system versions 4.0–4.3. You can't use any of the new features included in the current release or future releases until you upgrade to the most recent BlackBerry operating system for your phone.

4. Select **Reboot** to restart your device.
5. When prompted to allow an HTTP connection, select the `tp.mobile.salesforce.com` checkbox. Scroll down and select **Allow this connection**.
6. Select the Salesforce Classic Mobile icon, which resides on the home page of your device or in the Applications folder. On newer phones, the icon may be in the Downloads folder.
7. Read the license agreement and select **I Accept**.
8. Enter your Salesforce username and password.

Because many passwords contain special characters that are difficult to enter on the device, the `Show Password` checkbox is selected by default. To protect your password, you can deselect the option.

9. Select **Activate**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Free version available in: **All** editions except **Database.com**

Full version available in: **Performance, Unlimited, and Developer** Editions, and for an extra cost in: **Professional and Enterprise** Editions

After your username and password are confirmed by Salesforce, the data downloads. The initial data download may last a few minutes. Future updates to the data automatically occur behind the scenes.

Mobile FAQ

Using Salesforce Classic Mobile FAQ

- [Do I need a license to use Salesforce Classic Mobile?](#)
- [Is my phone compatible with the Salesforce Classic Mobile app?](#)
- [What Salesforce data is stored on my device when I use the Salesforce Classic Mobile app?](#)
- [How do I use the Salesforce Classic Mobile app to access records that aren't on my mobile device?](#)
- [How frequently does the Salesforce Classic Mobile app update my data?](#)
- [Can I see records in the Salesforce Classic Mobile app that I can't access in Salesforce?](#)
- [When I receive a call on my mobile device, will the Salesforce Classic Mobile app open the associated contact record?](#)

Do I need a license to use Salesforce Classic Mobile?

You need a mobile license to use the full version of Salesforce Classic Mobile. Any Salesforce user who doesn't have a mobile license can download a free, restricted version of Salesforce Classic Mobile.

With the free version, you can view, create, edit, and delete only accounts, assets, contacts, leads, opportunities, events, tasks, cases, and solutions. You can also access your dashboards. The free version synchronizes records you recently accessed on the Salesforce website, and you can search for records that were not automatically downloaded to your device. Starting with Summer '13, the free version of Salesforce Classic Mobile is disabled by default in all new organizations. You can enable it to give users access to Salesforce on their mobile devices.

If you've been assigned a mobile license but your administrator hasn't set up your mobile configuration yet, you can activate Salesforce Classic Mobile with the default mobile configuration. The default configuration automatically synchronizes the records you most recently accessed in Salesforce to your mobile device. You can also search for and download any records from Salesforce that aren't available locally on your device.

To find out if your user account has been assigned a mobile license to access the full version of Salesforce Classic Mobile, review your personal setup.

- If the **Mobile User** checkbox is selected, you can install and run Salesforce Classic Mobile. If the **Mobile User** checkbox is selected but the `Mobile Configuration` field is blank, you can activate Salesforce Classic Mobile using the default mobile configuration.
- If the **Mobile User** checkbox isn't selected and you're an Enterprise, Professional, Unlimited, Performance, or Developer Edition customer, you may have access to the free version of Salesforce Classic Mobile. Ask your administrator whether you have access to the free version of Salesforce Classic Mobile.

 **Note:** The `Mobile User` checkbox is disabled by default for new Unlimited and Performance Edition users.

Is my phone compatible with the Salesforce Classic Mobile app?

The Salesforce Classic Mobile app can run on iPhones, iPod touch devices, and most BlackBerry and Android devices. To find out if your phone can run the app, see the [list of supported mobile devices](#).

 **Note:** Supported features may vary depending on your mobile operating system and device model.

What Salesforce data is stored on my device when I use the Salesforce Classic Mobile app?

Using the Salesforce Classic Mobile app to access Salesforce on a mobile device is much different from using the full Salesforce application on your computer. Mobile devices have a minimal amount of memory and a small screen, and don't always maintain a constant network connection. To work with these limitations, a subset of your Salesforce data is stored in a local database on your phone.

The following types of tabs are available in the Salesforce Classic Mobile app:

- All custom object tabs and these standard object tabs:
 - Accounts
 - Assets
 - Attachments
 - Cases
 - Contacts
 - Content
 - Events
 - Groups
 - Group Members
 - Leads
 - Notes
 - Opportunities
 - Price Books
 - Products
 - Solutions
 - Tasks
 - Users
 - Dashboards
 - Reports

- Web and Visualforce tabs

 **Note:** The tabs and objects that you see in the app are determined by your mobile configuration and might not include all the tabs and objects listed here.

Additionally, the iPhone and Android apps don't support reports.

When you open the tab for an object, you probably won't see all of your Salesforce records. For each mobilized object, your administrator can create filter criteria to limit the number of records on your device. For example, in a large organization, sending all open and closed opportunities to your mobile device could consume too much memory or potentially crash it. Instead of sending all opportunities, your administrator might send a subset of them, such as open opportunities that you own that are scheduled to close this month.

Can I see records in the Salesforce Classic Mobile app that I can't access in Salesforce?

No. User permissions, sharing rules, and field-level security are inherited from Salesforce—the mobile application enforces all the restrictions set up in Salesforce.

How frequently does the Salesforce Classic Mobile app update my data?

The Salesforce Classic Mobile app checks for data changes every 20 minutes. During this incremental update, the server retrieves any newly created Salesforce records that you own, and then sends that data to your device. It also sends modifications to any records already stored on the device.

 **Note:** Note the following about data synchronization:

- The Android and BlackBerry client apps adjust their data polling time based on app usage. If the app isn't in use, the polling time interval increases in an exponential fashion, until it reaches eight hours. From that point forward, the device polls for data every eight hours. This prevents the Salesforce Classic Mobile app from draining the device battery when the app is rarely used.
- Because only one app can run on the iPhone at a time, the Salesforce Classic Mobile app can't request a data update unless the app is open. When you launch the app on the iPhone, it performs an incremental update unless a data synchronization has occurred in the past 20 minutes.

How do I use the Salesforce Classic Mobile app to access records that aren't on my mobile device?

The Salesforce data available on your device is defined by your mobile configuration. You can easily search for records that aren't automatically downloaded to your device. A search box is available on each object tab in the Salesforce Classic Mobile app, as well as on the app's home page.

When I receive a call on my mobile device, will the Salesforce Classic Mobile app open the associated contact record?

The Salesforce Classic Mobile app can't open a Salesforce contact when you receive incoming calls. However, if you place a call from Salesforce Classic Mobile, you're automatically prompted to log the call.

Chatter

Video Title	For End Users	For Administrators
 Tips for Rolling Out Chatter Not sure how to rollout Chatter in your organization or drive adoption among users? Watch this short video to see your options and come up with a plan unique to your business needs.		✓

Video Title	For End Users	For Administrators
 Collaborate in Chatter Groups Chatter groups offer collaboration spaces with different degrees of privacy that allow group members to work as a team, share resources, and even invite customers. Watch this video to plan your organization's group strategy and make the most of out of the group feed, group search, files, announcements, and other powerful features.	✓	✓
 Discover and Organize with Chatter Topics Use Chatter topics to see what people are talking about, organize the conversations you want to be a part of, and discover people and groups that are interested and knowledgeable in the same areas.	✓	
 Getting the Most Out of Chatter Feeds Use Salesforce Chatter to create posts, polls, and bookmarks to collaborate effectively with your coworkers in Chatter. You learn how to post to your followers or a group, bookmark a post so you can find it later, and how to create a poll on the fly so you can gather results fast!	✓	
 Enhancing Your Chatter Posts Learn how to use @mentions and hashtag topics to enhance your Chatter posts. Mentions alert others to your posts, and topics help you organize and search Chatter so you can find relevant content and conversations.	✓	
Get Started with Salesforce Files Sync  Learn how to sync files between your computer or mobile device and Salesforce so you always have the latest version of every file. Salesforce Files Sync makes it easy to share files and collaborate with your colleagues.	✓	

Sales

Video Title	For End Users	For Administrators
 Use Tasks in Lightning Experience to Boost Sales Productivity Managing tasks in Salesforce is the ideal way for sales teams to stay on top of customer relationships. Learn three powerful ways to manage tasks in Lightning Experience.	✓	
 Take Your Tasks from Desktop to Mobile	✓	

Video Title	For End Users	For Administrators
<p>Stay on top of your tasks when you're on the go by using the Salesforce1 app for phones and tablets.</p>		
<p> Accounts and Contacts on the Go Combine desktop and mobile data with the Salesforce1 app for phones and tablets.</p>	✓	
<p> Splitting Credit across Your Sales Team Learn how to add revenue and overlay splits to opportunities.</p>	✓	
<p> Connecting Social Networks to Accounts, Contacts, and Leads Gain insights to your current and prospective customers by adding social data to your Salesforce accounts, contacts, and leads.</p>	✓	
<p> Editing Role-Based Category Group Visibility Allows certain roles to view information, such as questions in an answers community or articles in a knowledge base, according to specific data categories.</p>		✓
<p> Forecast Accurately With Collaborative Forecasts See how to maneuver around Collaborative Forecasts so that you can reach your sales goals.</p>	✓	
<p> How to Manage Leads and Opportunities Learn how Salesforce can help you track your leads and opportunities through the sales funnel, and automatically incorporates updates into management forecasts.</p>	✓	
<p> Sending Mass Email This demo shows you how to leverage the mass email tool in Salesforce, so you can quickly contact your customers and keep track of these emails within the Salesforce app.</p>	✓	
<p> Setting Up Data Categories Data categories let you classify your data based on your business needs.</p>		✓
<p> Using Quote Templates (1:42 minutes) Quote templates let you design, preview, and activate templates for the quote PDFs you send to your customers.</p>	✓	

Video Title	For End Users	For Administrators
 Entitlements Management Setup Learn how to set up the Entitlement Management feature. Entitlement Management helps your support reps determine which customers are eligible for certain kinds of support. This video covers Entitlement Management Milestones, Entitlement Processes, Entitlements, and Service Contracts.		✓
 How to Merge Contacts in Salesforce Learn how you can merge duplicate contact records in Salesforce.	✓	
Exchange Sync Videos		
 Set Up an Exchange Sync Service Account from the Exchange Admin Center Shows your Exchange administrator how to set up your company's server to sync your sales reps' contacts and events using Exchange Sync. This video demonstrates how to navigate set up using the Microsoft® Exchange admin center.		✓
 Set Up an Exchange Sync Service Account at the Command Line Shows your Exchange administrator how to set up your company's server to sync your sales reps' contacts and events using Exchange Sync. This video demonstrates how to set up Microsoft® Exchange for Exchange Sync using Microsoft® Exchange Management Shell.		✓
Salesforce for Outlook Videos		
 Getting Ready to Integrate Microsoft® Outlook® and Salesforce If you want to sync contacts, events, and tasks between Microsoft® Outlook® and Salesforce, as well as add emails and events to Salesforce records, you'll use Salesforce for Outlook. Learn how to download and install it.	✓	
 Learning about Sync Directions Learn how to view your sync direction settings in Salesforce for Outlook, and find out whether you have permissions to change them.	✓	
 Using the Salesforce Side Panel to Work with Records in Microsoft® Outlook® Learn how you can work with Salesforce records directly in Outlook. In addition, learn about adding Outlook emails and events to the Salesforce records of your choice.	✓	
 How to Use Notes (1:34)	✓	

Video Title	For End Users	For Administrators
Learn how to use Notes, the enhanced note-taking tool in Salesforce1.		
How to Track Calls, Emails, and Meetings Learn how to track different events such as calls, emails, and meetings in Salesforce.	✓	
Merging Duplicate Accounts: Tips and Gotchas Do you have multiple records for the same account? Duplicate account records wreak havoc on your data. Reporting becomes inaccurate and keeping track of activities and tasks is impossible. Merge Accounts tool lets you merge all the account records into one, and let you choose which data to keep from each record. This video guides you through the process so you can get clean, useful data, quickly.	✓	

Service

Video Title	For End Users	For Administrators
 Encourage Collaboration with Idea Themes Idea Themes lets you invite community members to post ideas about specific topics so that members can solve problems or propose innovations for your company.	✓	
 Introducing the Salesforce Console The Salesforce console uses tabs to help you find and update records quickly.	✓	
 Prepare to Set up a Salesforce Console How to set up a Service Cloud console for support agents.		✓
 Supporting Multiple Languages with Salesforce Knowledge Learn how to translate knowledge base articles with Salesforce Knowledge.		✓
 Updating Entitlement Processes with Entitlement Versioning Learn how to create a new version of an entitlement process, change the milestone in the new version of the entitlement process, and apply the new version of the entitlement process to an entitlement and its associated cases.		✓
 How Organization Sync Works Learn about Organization Sync, a high-availability feature that lets you set up a secondary, synced Salesforce organization which your users can access when the primary organization		✓

Video Title	For End Users	For Administrators
experiences downtime or maintenance. Find out how the feature works, what the setup process looks like, and whether it's right for you.		
 Support Your Customers on Their Social Networks Learn how to get started with Social Customer Service.		✓

Analytics

Video Title	For End Users	For Administrators
 Create the Sales Wave App, Part 1: Using the Configuration Wizard The Sales Wave Analytics app is an end-to-end analytics app that brings the power of Wave Analytics to Sales Cloud. Salesforce makes it easy to create, share, and delete the Sales Wave app. We show you how in this video.		✓
 Create the Sales Wave App, Part 2: Upload the Quota CSV File and Schedule a Dataflow When you create the Sales Wave app, if you track quotas for sales reps in Salesforce, you also need to upload a quota CSV file. You also need to schedule a dataflow to keep data in the app up to date. This video shows you how to do both.		✓
 Make Data-Driven Decisions with Reports and Dashboards Join us for a feature overview of Reports and Dashboards in Lightning Experience. See an example of how to gain insight and inspire action using your Salesforce data.	✓	
 Building Matrix Reports This video shows you how easy it is to create matrix reports using report builder.	✓	
 Using Cross Filters in Reports Use a cross filter to find just the records you need in a report. Cross filters let you fine-tune your results by including or excluding records from related objects, without having to write formulas or code.	✓	
 Getting Started with Buckets	✓	

Video Title	For End Users	For Administrators
Learn how to group your data without having to create custom fields! Buckets help you sort, organize, and understand large amounts of data in Salesforce quickly and easily. Create your own categories on the fly, without formulas or custom fields.		
 Getting Started with Report Builder This video introduces you to the report builder, a powerful drag-and-drop interface for building reports.	✓	
 Introducing Joined Reports in Salesforce With joined reports, you create different types of information in a single report. Our example creates open and closed opportunities and active support cases.	✓	
 An Overview of Dashboards This demo covers some key dashboard features, such as changing the visual display, changing drill down options, and creating dynamic dashboards, so sales managers and team members can use one dashboard to track their team's or individual performance.	✓	
 Tips for Scheduling Reports Learn how to schedule reports with an active running user, send them during off-peak hours without impacting performance, and email them to the right users.		✓
 Making Your Reports Run Faster Get tips to make your reports run faster. Learn how to remove unnecessary columns, set the scope for relevant data, and use efficient filters with operators.	✓	
 Report Notifications Learn how to subscribe to reports to receive report notifications periodically, when the metrics you care about most meet certain conditions. You can receive your alerts via Salesforce1 notifications, Chatter, or email.	✓	

Data.com

Video Title	For End Users	For Administrators
 Finding Data.com Accounts and Contacts and Adding Them to Salesforce	✓	

Video Title	For End Users	For Administrators
Learn how to find Data.com accounts and contacts and add them to Salesforce. Check out the Account Card.		
 How Do I Set Up Data.com Clean? This video shows Salesforce administrators how to set up and maintain Data.com Clean. It covers the clean features available with the Data.com Corporate and Premium products, plus the additional features available with the Data.com Clean product.		✓
 Select a Data.com Match for your Salesforce Account Record		
 Using the Data.com Industry Selector Learn how to use the Data.com Industry Selector to navigate easily through extensive industry lists and add industry criteria to your search for accounts or contacts.	✓	
 Managing Duplicate Records in Salesforce with Duplicate Rules (3:12) Learn how to create a duplicate rule so you can control whether and when users are allowed to save records that are identified as duplicates.		✓
 Identifying Duplicate Records with Matching Rules (3:12) Learn how to create a matching rule so you can control how duplicate records are identified.		✓
 Understanding Matching Rules (4:32) Learn how matching rules work to identify duplicate records.		✓

Force.com

Video Title	For End Users	For Administrators
 How to Change the Look and Feel of Salesforce for Your Company Quick demo of how to customize the way Salesforce looks for your organization.		✓
 Search in Salesforce Classic	✓	

Video Title	For End Users	For Administrators
Salesforce helps you keep track of, organize, and store so much information - how do you search through it all? This video walks you through searching in Salesforce, and within Chatter, so you can locate files, posts, records, and topics quickly.		
 Search in Salesforce Lightning Experience Need to quickly find a record in Salesforce? This video guides you through searching in Salesforce Lightning Experience and navigating search results.	✓	
 How Does Search Work? Ever wonder how search finds information in your org? This video guides you through the search process, including how your search terms are broken up and matched against the search index.	✓	✓
 How to Search In Help Our Help portal is extensive, with everything from documentation, to troubleshooting-type knowledge articles, videos, and more. Fine tune your search settings and learn to use the filters so that you can find exactly what you need, every time.	✓	
 Creating a Workflow Rule Quick demo of how to create a workflow rule in Salesforce.		✓
 Visual Workflow Cloud Flow Designer Overview This demo gives you an overview of Visual Workflow's Cloud Flow Designer, the tool for creating flows. With the Salesforce Cloud Flow Designer, you can configure screens and define branching logic for your flows, completely within Salesforce, without writing any code.		✓
 Building a Simple Flow Follow along as we create a simple two-screen pledge flow using user input fields and choices. We'll collect users' information, ask them to choose a pledge level, then thank them for their donation.		✓
 Troubleshooting Workflow Learn how to investigate and troubleshoot the most common issues that occasionally arise with Workflow.		✓
 Avoid Unwanted Actions in Your Process		✓

Video Title	For End Users	For Administrators
<p>This video shows you how to set options in the Process Builder so you can, for example, avoid sending a bunch of emails to the VP every time a high-value opportunity is updated.</p>		
<p> How to Create a Custom Field in Salesforce</p> <p>Want to customize Salesforce so it captures all your business data? This short video walks you through how to create a custom picklist field, from choosing the correct field type to applying field level security.</p>		✓
<p> Custom Fields: Picklists</p> <p>Picklists are a great way to save your users time and ensure that data is entered consistently, without spelling errors, or variations. This video walks you through creating a picklist field as well as adding new values to the field, and deleting old values. We even cover how to add your values to the correct page layouts, so your users see choices that are relevant to their work.</p>		✓
<p> Accessing the Email Field from a Lookup Object</p> <p>Have you ever wanted to use a field from a lookup object on its child object? For example, accessing the email field on a lookup object in a workflow that is based on the child object? This video walks you through just such a scenario.</p>		✓
<p> Getting Started With Formulas</p> <p>This video gives a brief introduction to Salesforce formulas, accessing the formulas editor in the app, and how to use the editor tools to create formulas.</p>		✓
<p> How to Calculate the Number of Days a Case is Open</p> <p>This video walks you through constructing a formula that will calculate the number of days it took to close a case, or if the case is still open, how many days have passed since it was first opened.</p>		✓
<p> How to Build an Image Formula</p> <p>This video explains how to create a quick and easy formula that adds graphics to the ratings field on a lead—five stars for hot, three stars for warm, and one star for cold—so that salespeople can see at a glance which leads are the most important.</p>		✓
<p> Formulas: Tips and Gotchas</p> <p>Formulas are a powerhouse and can be used in fields and reports. This video walks you through a few pro tips on how to get started, and how to avoid some common pitfalls. We use best practices such as writing your formula in plain language, and using formatting</p>		✓

Video Title	For End Users	For Administrators
to organize the formula so its easy to read. We also cover how to handle blank fields in both addition or subtraction, and division.		
 Release Management: Overview Learn how to use Force.com point-and-click tools, a developer sandbox, and change sets to manage releases for your organization.		✓
 Release Management: Developing and Testing on Sandbox Learn about the four types of sandboxes that Salesforce provides, and discover how to create sandboxes to develop and test your applications.		✓
 Release Management: Deploying Changes Using Change Sets Learn how to use change sets to move configuration changes, such as applications, objects, and permission sets, between your organizations.		✓
 Creating Custom Links and Buttons Learn how to create a link on the Account object that maps the company's address onto Yahoo Maps. We'll also show you where you could turn that link into a button. Custom links and buttons are a fast and easy way to customize Salesforce.		✓
 Using and Building List Views Do you need to work with several records at once? Sort them alphabetically or by amount? Or even edit several of them at once? List views are the way to go! This video walks you through creating two different views. In the first view you'll sort by amount, then filter, and then mass edit. In the second view, you'll use filter logic to create a view that shows your records and those of a teammate.	✓	
 Custom Fields: Tips and Gotchas Are you creating custom fields? Watch this video first and learn from the experts some best practices, details about deleting fields, field usage limits, field history tracking and more. We also provide some caveats when changing field types, and advice on choosing the appropriate type of text field.		✓
 Force.com Quick Access Menu As an admin have you ever wanted to view or create fields, or view or create record types in context, from an object tab, rather than having to go through the Setup menus? This video shows you how to use the Force.com Quick Access Menu. It's a handy tool that Admins can use to make changes to an object's configuration or import data for that object without having to go to Setup pages.		✓

Site.com

Video Title	For End Users	For Administrators
 Building a Website with Site.com Learn how to import assets to use in your site, create page templates, apply CSS styles, and add and duplicate site pages in Site.com Studio.	✓	

Security

Get More Done Faster with Walkthroughs

Interactive walkthroughs guide you step-by-step through a task or feature. Salesforce creates walkthroughs to help you be successful with Salesforce.

Before you click a walkthrough link, make sure you have the correct user permissions and license associated with the feature so you can access the proper pages in Salesforce. Then, click the link to open the walkthrough. If you're not already logged in, you'll be prompted to log into your account.

The walkthrough guides you through a series of steps to help you complete a task or review a feature directly within your own Salesforce account.

 **Note:** Keep in mind that walkthroughs guide you through your own Salesforce account rather than a demo environment. So you're actually making changes to the data in your org as you follow along through the steps. If you're concerned about making these changes, follow the walkthrough in a sandbox account or other test environment first.

Troubleshooting

Troubleshoot Login Issues

Salesforce makes it easy to log on to the service, but you can experience issues if you forget your username or password. You can also get locked out if you attempt to log in too many times with the wrong credentials. Following are some solutions you can try if you're having login problems.

The password policies set up by your administrator determine how many failed logins are allowed, how long lockout periods last, and what password requirements are.

To protect the privacy of your data, change your password periodically. If your administrator expires user passwords on a periodic basis, you're prompted to change your password at the end of each period.

- Forgot your password? [Retrieve it](#).
- Locked out? Wait until the lockout period expires and try again, or contact your Salesforce administrator.
- Password expired? We prompt you to change your password.
- Accessing Salesforce from a new location? You might need to [activate your computer](#).
- What does Use Custom Domain on the login page mean? If your Salesforce administrator created a custom domain for your organization, click **Use Custom Domain** to provide the existing domain name and log in.

A custom domain is in the form `https://universalcontainers.my.salesforce.com`, where `universalcontainers` is a name provided by your administrator.

[Reset Your Security Token](#)

[Reset Your Forgotten Password](#)

Reset Your Security Token

When you access Salesforce from outside of your company's trusted network using a desktop client or the API, you use a security token to log in. A security token is a case-sensitive generated key that you use with your password or in a separate field in your client application.

Your security token isn't displayed in your settings or profile.

If your administrator assigned you the "Two-Factor Authentication for API Logins" permission, use the value generated by your authenticator app, such as Salesforce Authenticator or Google Authenticator, for the security token value.

Get or Reset Your Token

A new security token is emailed to you when you reset your password. Or you can reset your token manually.

1. From your personal settings, enter *Reset* in the **Quick Find** box, then select **Reset My Security Token**.
2. Click **Reset Security Token**. The new security token is sent via email to the email address in your Salesforce personal settings.

Tip: Before you access Salesforce from a new IP address, we recommend that you get your security token from a trusted network using **Reset My Security Token**.

Update Your Token in Salesforce Outlook Edition

1. In Outlook, go to **Tools > Salesforce Options**.
2. In the password window, enter your password and security token, with the security token added to the end of your password. For example, *passwordXXXXX*.
3. To test that you correctly entered your password and token, click **Verify**.
4. Click **OK**.

Update Your Token in Connect Offline, Connect for Office, and Data Loader

When you log in, add the security token value to the end of your password, such as *passwordXXXXX*.

Note: If you get an invalid password error when you log in, your IP address might have already been authenticated or added to the Trusted IP Range by your administrator. In this case, try logging in with your password only.

Connect Offline and Connect for Office aren't available in **Database.com**

Grant Login Access

To assist you, your administrator or a customer support representative can log in to the application using your login. By default, your company's administrators can access your account without any action from you. If your organization requires users to grant login access to administrators, you can grant access for a specified duration. You can also grant access to representatives of support organizations.

Watch a Demo:  [Letting Your Salesforce Administrator Access Your Account](#)

For security reasons, the maximum period for granting access is one year. During the time you granted access, administrators or support representatives can use your login and access your data to help you resolve problems.

1. From your personal settings, enter *Login Access* in the **Quick Find** box, then select the option to grant login access.
2. Set the access expiration date by choosing a value from the picklist.
3. Click **Save**.

If an administrator, support representative, or publisher makes setup changes using your login, the setup audit trail lists the changes and the username. In some organizations, records of clicks made by an administrator logged in as you are also kept for auditing purposes.

 **Note:** You can't grant access to certain support organizations if your administrator set up restrictions, or if a packaged application's license prevents it.

SEE ALSO:

- [Get to Know Your Salesforce Admin](#)
- [Find Your Personal Settings](#)

Reset Your Forgotten Password

If you forgot your password, you can easily reset it using the forgot password link on the login page. All you need is your username.

 [Watch a Demo](#) (33 seconds)

1. On the login page, click the forgot password link.
2. Enter your username and click **Continue**. An email containing instructions to reset your password is sent to the address specified in your Salesforce personal settings.
3. Within 24 hours, click the link provided in the email, answer your security question, and click **Continue**. (The link in the email can be used only once, and expires after 24 hours.)
4. When prompted, enter a new password.

Sometimes you're prompted to enter a code when you log in to Salesforce to verify your identity. When you verify your identity, you also "activate" your computer. Computer activation allows Salesforce to associate your identity with your computer's network IP address.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions**

Granting administrator access available in: **Enterprise, Performance, Unlimited, Developer, and Database.com Editions**

USER PERMISSIONS

To view setup audit trail history:

- "View Setup and Configuration"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

The activation helps prevent unauthorized access to the service whenever your password is changed or reset, or when you use your computer to log in from an unauthenticated network IP address.

EVALUATE LIGHTNING EXPERIENCE FOR YOUR ORGANIZATION

Welcome to Lightning Experience, Salesforce Administrators

It's here ... the new Salesforce user experience! Lightning Experience is a completely reimagined interface. Even better, it's built on our UI platform, so the experience can grow and evolve with your needs.

As your company's trusted advisor for all things Salesforce, you'll help your company decide when to roll out Lightning Experience. This guide contains the details you need to evaluate the new interface and decide if it meets the needs of some or all of your users. When you're ready, you'll be prepared to act on your rollout plan and make the switch to Lightning Experience.

What Makes Lightning Experience So Special?

Welcome to Lightning Experience, the new, fast, beautiful user experience from Salesforce. With a sales-centric mindset, our initial release focuses on reinventing the desktop environment to better support your sales process. The result is an intuitive, intelligent interface that helps sales reps work more naturally and close more deals faster. Let's take a peek at some of the key features of the new interface, so you can decide if Lightning Experience is right for some or all of your users.

EDITIONS

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Feature	Why It's Cool
Home	Start the day on the new, intelligent home page. Monitor performance to goal, and get insights on key accounts. And stay on track by seeing exactly what needs doing in the Assistant.
Opportunity Workspace	Drive the right behaviors at every stage of your sales process from this action-optimized workspace. You can customize coaching scripts for each step. And reps can work their deals more efficiently using the handy composer to quickly log calls, create tasks, send emails, and more.
Opportunity Board	Visually review the status of deals, organized by each stage in the pipeline. Users can drag deals from one stage to another, and get alerts when an action is needed on a key deal.
Accounts and Contacts	Find information and gather insights at a glance from the new layout. Get the latest news about customers with integrated Twitter and Account Insights for customers, review upcoming and completed activities, and keep data clean with field-level duplicate matching.
Activity Timeline and Task List	See open tasks, planned meetings, and accomplishments in the activity timeline on each opportunity, lead, account, and contact. Or use the task list to see the details of specific tasks alongside the full list of open tasks, tasks due today, and closed tasks. Managers can use the Delegated view to see tasks assigned to people below them in the role hierarchy.
Enhanced Notes	Take better notes with auto-save, rich text capabilities, and the ability to relate a note to multiple records.
File Preview Player	Enjoy a richer file preview experience that doesn't require Adobe Flash Player. Vector-based preview images render in higher quality and don't degrade on hi-resolution screens, plus they load faster. New controls allow scrolling through multi-page documents, previewing animated GIFs, giving full-screen presentations, and accessing file actions.

Feature	Why It's Cool
Reports and Dashboards	Get more from your data. The new report run page is easier to read and filter. Animated, interactive charts bring your organization's data to life. And a new dashboard editor supports flexible layouts and components that span columns and rows.
List Views	See data faster with more intuitive list views. Visualize data with handy list view charts.
Search	Find records faster with improved search, which includes recent records and top results.
Setup Tree and Object Manager	Navigate setup pages with a simplified organization and a cleaner look and feel. Use the new Object Manager, which combines all standard and custom objects into a single list that is more easily searchable.

Is Lightning Experience Right for My Org?

So you're intrigued and excited about Lightning Experience! The new interface clearly offers numerous benefits for sales teams. But Salesforce is a deep well and we can't rebuild everything at once. This initial release doesn't have complete parity with Salesforce Classic, the full-featured Salesforce predecessor. Let's look at some use cases and see how Lightning Experience compares to Salesforce Classic to help you decide if now is the right time to switch.

Lightning Experience is currently geared toward sales teams, so most features from other Clouds aren't available yet. And some Sales features aren't available either. Although Lightning Experience will expand to include more features over upcoming releases, you should evaluate how important these upcoming features are to your business needs right now.

Keep in mind that you can enable Lightning Experience for a subset of your users. This flexibility means you can move your Sales team to the new interface now, but have your Service organization continue using Salesforce Classic. Or you can opt to run a Lightning Experience pilot with a small group of users without disrupting everyone else until you know that the new experience provides what you need.

Saying Hello to Lightning Experience Doesn't Mean Saying Goodbye to Salesforce Classic

Salesforce Classic is still here, and we've made it easy for Lightning Experience users to move between the old and the new. So even if Lightning Experience isn't a perfect fit yet, you and your users can try it on for size without losing out.

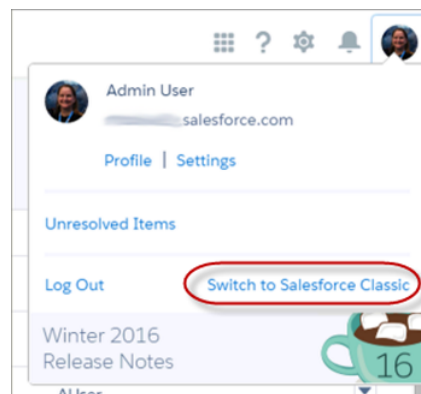

When users are first enabled for Lightning Experience, the new interface is their default, *preferred* experience. Ideally, your Lightning Experience users find that the new interface meets all of their needs. But if there's an important feature or tool back in the classic interface, they can switch to Salesforce Classic at any time, without assistance from you.

To head back to Salesforce Classic, use the Switcher. In the Lightning Experience header, click the profile picture and select **Switch to Salesforce Classic**.

EDITIONS

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

The Switcher changes the default preference to Salesforce Classic. The user remains in the classic interface until using the Switcher to return to Lightning Experience. And then the new interface becomes the default preference. You get the idea.

To find the Switcher in Salesforce Classic, click the name in the upper right corner, then select **Switch to Lightning Experience**.

The fact that your users have the power to move themselves between interfaces will probably shape your decision about when to start using Lightning Experience. If Lightning Experience is missing only a few features that your team uses occasionally, asking users to switch between interfaces can be an acceptable trade-off given the benefits of the new experience. But it could be best to keep users who need daily access to unsupported sales features, or who work regularly with service features, in Salesforce Classic—at least for now.

SEE ALSO:

[Gotchas If Users Switch Between Lightning Experience and Salesforce Classic](#)

Supported Editions and User Licenses for Lightning Experience

Take a look at the supported editions and user licenses to see if your organization can enable and use Lightning Experience.

Note: Person accounts aren't supported in Lightning Experience. If your Salesforce implementation uses person accounts, you can't enable Lightning Experience for your production organization, regardless of your edition. But to give you an opportunity to try out the new interface, you can enable Lightning Experience in your sandbox environments. This option will be available beginning October 24, 2015. And rest assured, adding person account support in the future is a top priority.

- Site.com Only

Best Use Cases for Lightning Experience

Let's look at the types of organizations that are a good fit for this release of Lightning Experience. And also some uses cases that might not be suitable just yet.

Consider using Lightning Experience for some or all of your organization if:

- Your sales team does business-to-business sales using accounts, contacts, leads, opportunities, custom objects, and the other sales features supported in the new user interface.
- You want to pilot the new user interface with a group of sales reps.
- You're looking to reboot your Salesforce implementation. This is a great opportunity to introduce new features because you're doing change management anyway.

Consider sticking with Salesforce Classic if:

- Your sales team makes regular use of features that aren't yet available in Lightning Experience, such as campaigns, quotes, forecasting, or territory management.
- You're using person accounts.
- You primarily use customer service tools or other non-sales features.
- You want a single experience for your sales and service teams.

What's the Fate of Existing Salesforce Customizations?

We've worked hard to respect your existing configurations and customizations in Lightning Experience. Many of your point-and-click and programmatic implementations also work seamlessly in the new interface. However, some customizations don't apply in the new interface or may need to be updated to take advantage of all that Lightning Experience has to offer. Here are some issues to consider.

Navigation Menu

Lightning Experience replaces the Salesforce Classic tab bar with a collapsible navigation menu along the left side of the page. In this release, customizations made to the tab bar in the classic interface aren't reflected in the navigation menu. Neither administrators nor users can modify the contents or arrangement of the navigation menu. But rest assured, we know this isn't ideal and making the navigation menu customizable in the future is a top priority for us.

Use the navigation menu to access the standard Salesforce objects that are available in Lightning Experience, as well as Home, Chatter items (the main feed, people, and groups), files, dashboards, reports, and the user's task list and calendar. Custom objects and apps are also available in Lightning Experience but access them from the App Launcher by clicking  in the header.

Page Layouts and Compact Layouts

Record page customizations made in Salesforce Classic—for custom and standard objects—also affect record pages in Lightning Experience. However, some page elements display differently in Lightning Experience, and some aren't supported.

Compact layouts play the same role in Lightning Experience that they do for the Salesforce1 mobile app: displaying a record's key fields in the highlights panel on a record page. In Lightning Experience, the highlights panel shows the first five fields from your current compact layouts.

Actions and Buttons

If you've already created and used actions in Salesforce Classic, you know that they appear in the Chatter publisher, while standard and custom buttons appear above the details on a record page. And if you use Salesforce1, you know that all action types and buttons are co-mingled on the Salesforce1 action bar. In Lightning Experience, we continue to blur the line between actions and buttons. But instead of displaying in a single place, actions and buttons are grouped by type in several different areas on the record page.

By default, Lightning Experience includes the actions and buttons defined in the global publisher layout. Or you can customize what's available using the Salesforce1 and Lightning Experience Actions section on object page layouts. Here's the logic that determines where on the record page an action or button appears:

- Most quick actions, productivity actions, standard buttons, and supported custom buttons are added to the page-level action menu
- Activities-related actions, such as Log a Call, New Event, New Task, and Email, display in the composer on the Activity tab.
- Standard Chatter actions appear in the composer on the Collaborate tab.

The order of actions in each of these areas is based on the order in which they've been added to the global publisher or object page layout.

Custom Buttons

Custom buttons that use a URL or JavaScript content source aren't supported in Lightning Experience. You can replace some of the functions covered by these buttons by using point-and-click tools like Process Builder, Visual Workflow, or code-driven approaches.

Visualforce

Yes, Lightning Experience is an all new user interface, but that doesn't mean your Visualforce pages stop working. This release includes beta support for Visualforce in Lightning Experience. Your existing Visualforce pages work in Lightning Experience, many without needing any revisions. Because things have moved around in the new interface, there are some chores you'll want to complete to make sure your Visualforce pages work the way you expect. And at this point, there are a few Visualforce features that don't work yet in Lightning Experience.

Here are a few basic details to consider.

- If your Visualforce pages use JavaScript, there are things you need to check. Visualforce doesn't "own" the whole page when shown in Lightning Experience, and because of that your JavaScript code needs to play by some new rules.
- If your Visualforce pages use the built-in standard components, their look-and-feel matches Salesforce Classic, whether users access them in the new or old interface. There's some work to do if you want your pages to match the Lightning Experience styling.

To help with this effort, we're publishing the Salesforce Lightning Design System (SLDS), a collection of design patterns, components, and guidelines for creating interfaces that fit in with Lightning Experience. The SLDS is available today as a public beta at www.lightningdesignsystem.com.

For the complete skinny on what works and doesn't work, see the "Visualforce & Lightning Experience" module in the [Developer Trail - Lightning Experience](#) Trailhead trail.

What about new UI customization? The Lightning Component framework is our new UI framework for developing dynamic web apps for both desktop and mobile devices. You can use it or Visualforce in your new projects. To learn more about UI development, see "User Interface Development Considerations" in the [Lightning Experience Development](#) Trailhead module. To learn more about Lightning Components, see the "Lightning Components" module in the [Developer Trail - Lightning Experience](#) Trailhead trail.

Force.com Canvas

Force.com Canvas allows you to easily integrate third-party applications in Salesforce. Canvas functionality in Lightning Experience is the same as in Salesforce Classic. You can still embed Canvas apps in Visualforce pages and everywhere else they're supported—with the added bonus that you can expose Canvas apps in Lightning Components.

Salesforce APIs and Apex

Most of the programmatic tools and processes you've used to are largely unaffected by Lightning Experience. We've kept our promise that our new releases won't ever break your dependencies on Salesforce APIs. Tools like Workbench haven't changed. Your development environment is the same as ever.

While your Apex classes and API calls work fine, there are some features that aren't yet supported in Lightning Experience. If a user is in the new interface and executes some Apex code that interacts with an unsupported feature, the user can't complete the task. To address this scenario, we've added capabilities to determine a user's interface preference from both the API and Apex. You can use this functionality to add logic to your existing code so that your users don't encounter errors. See "[Understanding Changes to Other Development Tools](#)" in the [Lightning Experience Development](#) Trailhead module for full details.

AppExchange Apps

Many apps from the AppExchange feature customizations, including custom objects, custom buttons, Visualforce pages, and more. In preparation for the Lightning Experience release, Salesforce partners are testing their apps and applying for *Lightning Ready* certification. Apps that are Lightning Ready will work in Lightning Experience and offer a more consistent experience with other Lightning Pages. If an app is supported in Lightning Experience, a "Lightning Ready" sash appears on its AppExchange listing. If an app isn't supported in Lightning Experience, use it in Salesforce Classic instead.

 **Note:** Apps without Lightning Ready certification can be used in Lightning Experience, but some features may not be available or work as expected. These apps may also appear visually inconsistent with Lightning Experience because they use Salesforce Classic styling. For the best experience, use Salesforce Classic for apps that aren't certified as Lightning Ready.

[How Actions Are Ordered in Lightning Experience](#)

Transition to Lightning Experience: Let's Do This!

Great! You've decided you're ready to switch to Lightning Experience. First, we recommend that you develop a strategy to guide your rollout. Then, when the time is right, here's how to enable the new user interface.

IN THIS SECTION:

[Develop Your Rollout Strategy for Lightning Experience](#)

One of the best investments you can make in your Lightning Experience rollout is to have a clear plan. A plan helps you do things in the right order, identify key resources, communicate with everyone, and have a clear end date in mind.

[Enable Lightning Experience](#)

Turning on Lightning Experience is a very simple task—just flip the switch! But we recommend that you set up a few other features first so your users get the full power of the new interface when you enable Lightning Experience. Then you need to set up the appropriate users to access Lightning Experience. You can choose to start slow and roll out the new interface to a small pilot group of users, or jump in and turn it on for everyone in your organization.

Develop Your Rollout Strategy for Lightning Experience

One of the best investments you can make in your Lightning Experience rollout is to have a clear plan. A plan helps you do things in the right order, identify key resources, communicate with everyone, and have a clear end date in mind.

Depending on the size of your organization, you could be working with a Change Management department or have a project manager assigned to the rollout. Or perhaps you're the one charged with organizing and executing the rollout from start to finish. However the work gets divvied up, use the [Lightning Experience Rollout](#) module in the *Admin Trail - Migrating to Lightning Experience* Trailhead trail to help with this process.

Your rollout will likely fall into these phases.

Learn

- Learn about Lightning Experience
- Identify stakeholders and an executive sponsor
- Educate your company with presentations and demos
- Review [Compare Lightning Experience and Salesforce Classic](#) and [Lightning Experience Considerations](#)
- Conduct a gap analysis to confirm you're getting what you need

Launch

- Identify users for a pilot of Lightning Experience
- Identify and activate super users
- Create the project schedule
- Define measures for success
- Create and execute your marketing and training strategies
- Customize and test, ideally in a sandbox environment
- Go live!

Iterate

- Evaluate how things are working to see if you're hitting your success metrics
- Survey your users for satisfaction and pain points
- Use reports and dashboards to track metrics and feedback
- Deliver an executive summary

To jump-start your planning, download the [Lightning Experience Customer Enablement Pack](#) that's part of the [Lightning Experience Rollout](#) Trailhead module. The Enablement Pack is chock-full of valuable resources, like a presentation deck, a risk severity matrix, a project schedule template, a sample email drip campaign, and a rollout checklist to keep you focused and on track.

Enable Lightning Experience

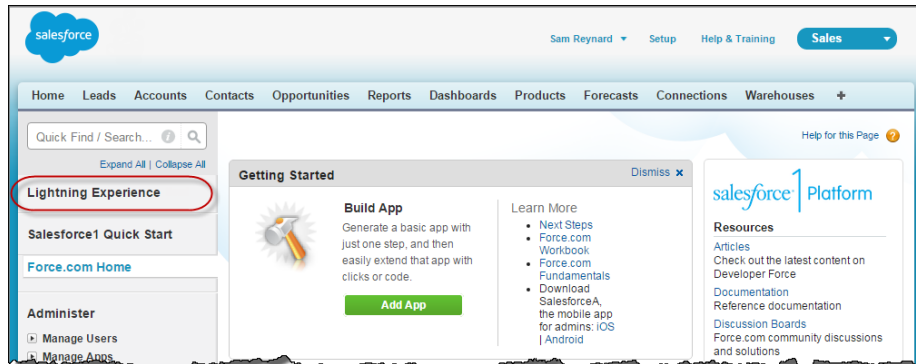

Turning on Lightning Experience is a very simple task—just flip the switch! But we recommend that you set up a few other features first so your users get the full power of the new interface when you enable Lightning Experience. Then you need to set up the appropriate users to access Lightning Experience. You can choose to start slow and roll out the new interface to a small pilot group of users, or jump in and turn it on for everyone in your organization.

Use the Lightning Experience setup page as your control center for tackling these steps. From Setup in Salesforce Classic, click **Lightning Experience** in the Setup menu.

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

IN THIS SECTION:

[Recommended Features for Lightning Experience](#)

If you haven't already, consider enabling and setting up several "supporting" features before turning on Lightning Experience. These features ensure that the new user interface is fully optimized to help your sales reps sell faster and smarter.

[Set Up Users for Lightning Experience](#)

Next up, make sure that the desired users get access to Lightning Experience. By default, the "Lightning Experience User" permission is automatically enabled for all users with a standard Salesforce profile. But you can fine-tune access to Lightning Experience with custom profiles or permission sets. Meaning you can do a limited rollout to a pilot group or enable a specific team of users who can benefit from the new interface or go for it and set your entire organization loose. The power is yours.

[Turn on Lightning Experience](#)

Are you ready? It's easy to turn on Lightning Experience using the Lightning Experience setup page.

SEE ALSO:

[Supported Editions and User Licenses for Lightning Experience](#)

Recommended Features for Lightning Experience

If you haven't already, consider enabling and setting up several "supporting" features before turning on Lightning Experience. These features ensure that the new user interface is fully optimized to help your sales reps sell faster and smarter.

Related Files

Leverage the rich features and flexibility of Salesforce Files from standard Salesforce objects and your custom objects. Add the new Files related list to page layouts, so users can upload files to records, see files associated with records, and quickly page through files in the modern, visually rich preview player.

Notes

Helps your users stay organized with our enhanced note-taking tool. It's a breeze to create rich-text notes and quickly relate them to specific records. When you turn on Notes, remember to add the new Notes related list to page layouts so your users can create and read notes directly from their records.

Sales Path

Make it easy for sales reps to follow your organization's sales process and get deals to closed. Customize your opportunity stages and lead statuses, and the order you want them to appear in the Sales Path on opportunity and lead workspaces. Then take it up another notch and add your own coaching steps for each stage or status in the Sales Path.

Duplicate Management

Create duplicate rules so users are alerted if they're about to create a duplicate record. Craft your duplicate rules to control whether and when users can create duplicate records in Salesforce.

Lead Conversion

Keep your sales process moving by allowing your sales reps to convert qualified leads to contacts, accounts, or opportunities. Add the **Convert** button to the Lead page layout.

Account Insights

Give your reps instant access to relevant, timely news articles about their accounts. This feature is available in English only, so if your organization uses a different primary language, you may not want this option. (For information about privacy issue with this feature, see Account Insights information in the Salesforce Help.)

Social Accounts, Contacts, and Leads

Keep the team up to date by letting reps link their accounts, contacts, and leads to matching Twitter profiles. Users can see Twitter user profiles and people in common in Salesforce and quickly access tweets.

Shared Activities

Represent activity relationships more accurately by letting your sales reps relate multiple contacts to individual events and tasks. Shared Activities are forever. After they're enabled, they can't be disabled.

Set Up Users for Lightning Experience

Next up, make sure that the desired users get access to Lightning Experience. By default, the “Lightning Experience User” permission is automatically enabled for all users with a standard Salesforce profile. But you can fine-tune access to Lightning Experience with custom profiles or permission sets. Meaning you can do a limited rollout to a pilot group or enable a specific team of users who can benefit from the new interface or go for it and set your entire organization loose. The power is yours.

 **Note:** You don’t have to worry about this step if you use Group Edition or Professional Edition. All of your users are automatically switched to the new interface when you turn on Lightning Experience. Users who prefer to remain in Salesforce Classic can switch themselves back via the Switcher.

It’s a different story if you have Professional Edition with Profiles enabled—read on.

First things first, do you have users with standard profiles who shouldn’t get Lightning Experience yet? Move these users to custom profiles that don’t include the “Lightning Experience User” permission.

For users with custom profiles, decide who you want to move over to Lightning Experience. Consider these options.

- Want to test Lightning Experience with a small group of users? Create a permission set that includes the Lightning Experience user permission. Then apply the permission set to each of your pilot users. When you turn on Lightning Experience, only these custom profile users see the new interface.

Are you new to permission sets? Check out this walkthrough!

[Walk Through It: create, edit, and assign a permission set](#)

- Interested in rolling out Lightning Experience to specific custom profiles? Or ready to enable all your custom profile users? Adding the “Lightning Experience User” permission to profiles is the fastest way to mass-enable the new user interface.

If you’re dealing with many profiles, you can tackle them at the same time with the Data Loader. But remember, with great power comes great responsibility. Take care you don’t inadvertently enable or disable other features.

If you’re going to limit Lightning Experience to a subset of your users, we recommend that you keep all members of a functional team on the same experience. If you have team members who often share links and work closely together, include them all in your pilot. See [Gotchas If Users Switch Between Lightning Experience and Salesforce Classic](#) for more details.

- "Modify All Data"

On the Lightning Experience setup page, slide the **Lightning Experience** button to **Enable**.

That's it! The next time the users you've enabled log in, they automatically start enjoying Lightning Experience.

Find Your Way Around Lightning Experience

Feeling a little discombobulated by all the Lightning Experience newness? Perfectly understandable. Diving in to a redesigned app can be disorienting—especially when you're able to work in the original interface with your eyes closed. To hone your Lightning Experience chops, let's look at where some of the most common Salesforce features landed in the new interface.

IN THIS SECTION:

[Find Profile and Personal Settings in Lightning Experience](#)

In Salesforce Classic, your profile and personal settings are located in the menu with your name. It's not too different in Lightning Experience. Find links to both of these options by clicking your profile picture. Want to switch between Lightning Experience and Salesforce Classic? Find links for that, too.

[Find Your Stuff in Lightning Experience](#)

In Salesforce Classic, you use tabs to access objects, like accounts or leads. Tabs also serve up other features, such as your Home page or Chatter. Lightning Experience replaces the tab bar with a collapsible navigation menu that houses standard objects and other goodies. Looking for custom objects or connected apps? In Lightning Experience, those items are in the App Launcher.

[Find Your Way Around Records in Lightning Experience](#)

In Salesforce Classic, record details, related lists, and the record feed display on the same page. This layout can make for a lot of scrolling, especially in records with a lot of data. In Lightning Experience, find record details, related information, and the record feed in dedicated tabs that are easy to switch between.

[Find Actions and Buttons in Lightning Experience](#)

While Salesforce Classic displays actions in the Chatter publisher, and buttons with a record's details, Lightning Experience blurs the distinction between these elements. The new interface intermingles actions and buttons, locating them in different areas on the record home page, based on function.

[Find Related Lists in Lightning Experience](#)

Records in Salesforce include details and links to other, related records. Salesforce Classic displays related records in lists that appear near the bottom of the page. In Lightning Experience, related information appears in related list cards. For leads and opportunities—the objects that include a workspace—access related list cards from the Related tab. For reference objects like accounts and contacts, and on groups and people, related list cards display on the right side of the page.

[Find Chatter Features in Lightning Experience](#)

With Lightning Experience, you can connect with people and groups and share business information securely and in real time, just like you're used to in Salesforce Classic. The way you access Chatter feeds, groups, and profiles is a bit different in the new interface. But with this quick overview, you'll feel right at home.

[Find Help in Lightning Experience](#)

Help is here! And it's better than ever in Lightning Experience, where the contextual Help menu serves up targeted content like videos, walkthroughs, help topics, and trails. Bonanza!

In Lightning Experience, use the navigation menu to access your home page, standard Salesforce objects, the Chatter feed, groups, and people, dashboards and reports, and other productivity tools. Simply click the icon for the item you want (1). Scroll down to see everything in the menu. Click the navigation menu icon (2) to expand the menu and show item names. Collapse it once you're familiar with the items' icons.

You use the App Launcher Force.com menu (1) in Salesforce Classic to access available apps. In Lightning Experience, hover over the App Launcher icon (1), watch it go all *rainbow*, then click to find your apps on the App Launcher page (2).

Looking for a feature that's not yet supported in Lightning Experience? Click the tile for the feature's cloud, then scroll down for links to that feature and others. Clicking a link opens the feature in Salesforce Classic in a separate browser tab. For example, if you want to use Collaborative Forecasts, click **Sales**, then scroll down for the **Forecasts** link. Click it to show the Forecasts tab in a separate browser tab Salesforce Classic.

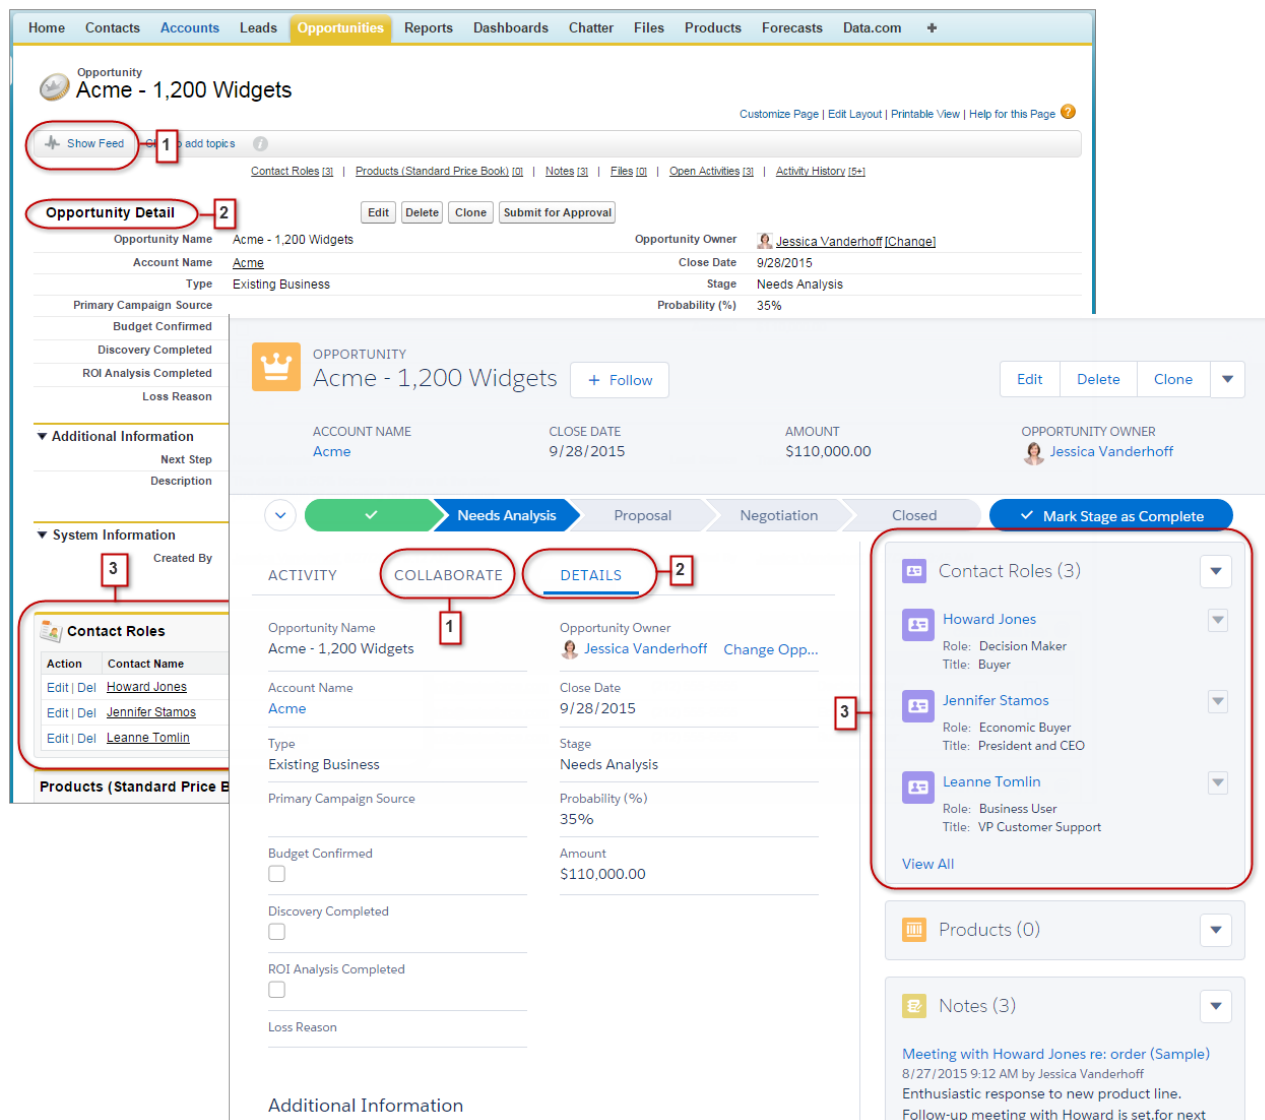

Find Your Way Around Records in Lightning Experience

In Salesforce Classic, record details, related lists, and the record feed display on the same page. This layout can make for a lot of scrolling, especially in records with a lot of data. In Lightning Experience, find record details, related information, and the record feed in dedicated tabs that are easy to switch between.

- Related list buttons (1) are located in the upper-right corner of each related list card. If there are multiple buttons, use the pull-down menu to access them.
- Each item in a related list card includes a link (2) that opens the related record.
- Record-specific actions (3) are located in the pull-down menus next to each related record.
- When related list cards are displayed on the right side of the page, each card shows up to three records. On reference objects, related list cards show up to six records. In both cases, drill in (4) to see the full list of related records.

 **Note:** In Lightning Experience, the first eight related list cards on a record appear as discussed here. For any additional related lists, only the name of the object is displayed in the card. Clicking the name opens the full related list, which includes related list buttons and record-specific actions.

Find Chatter Features in Lightning Experience

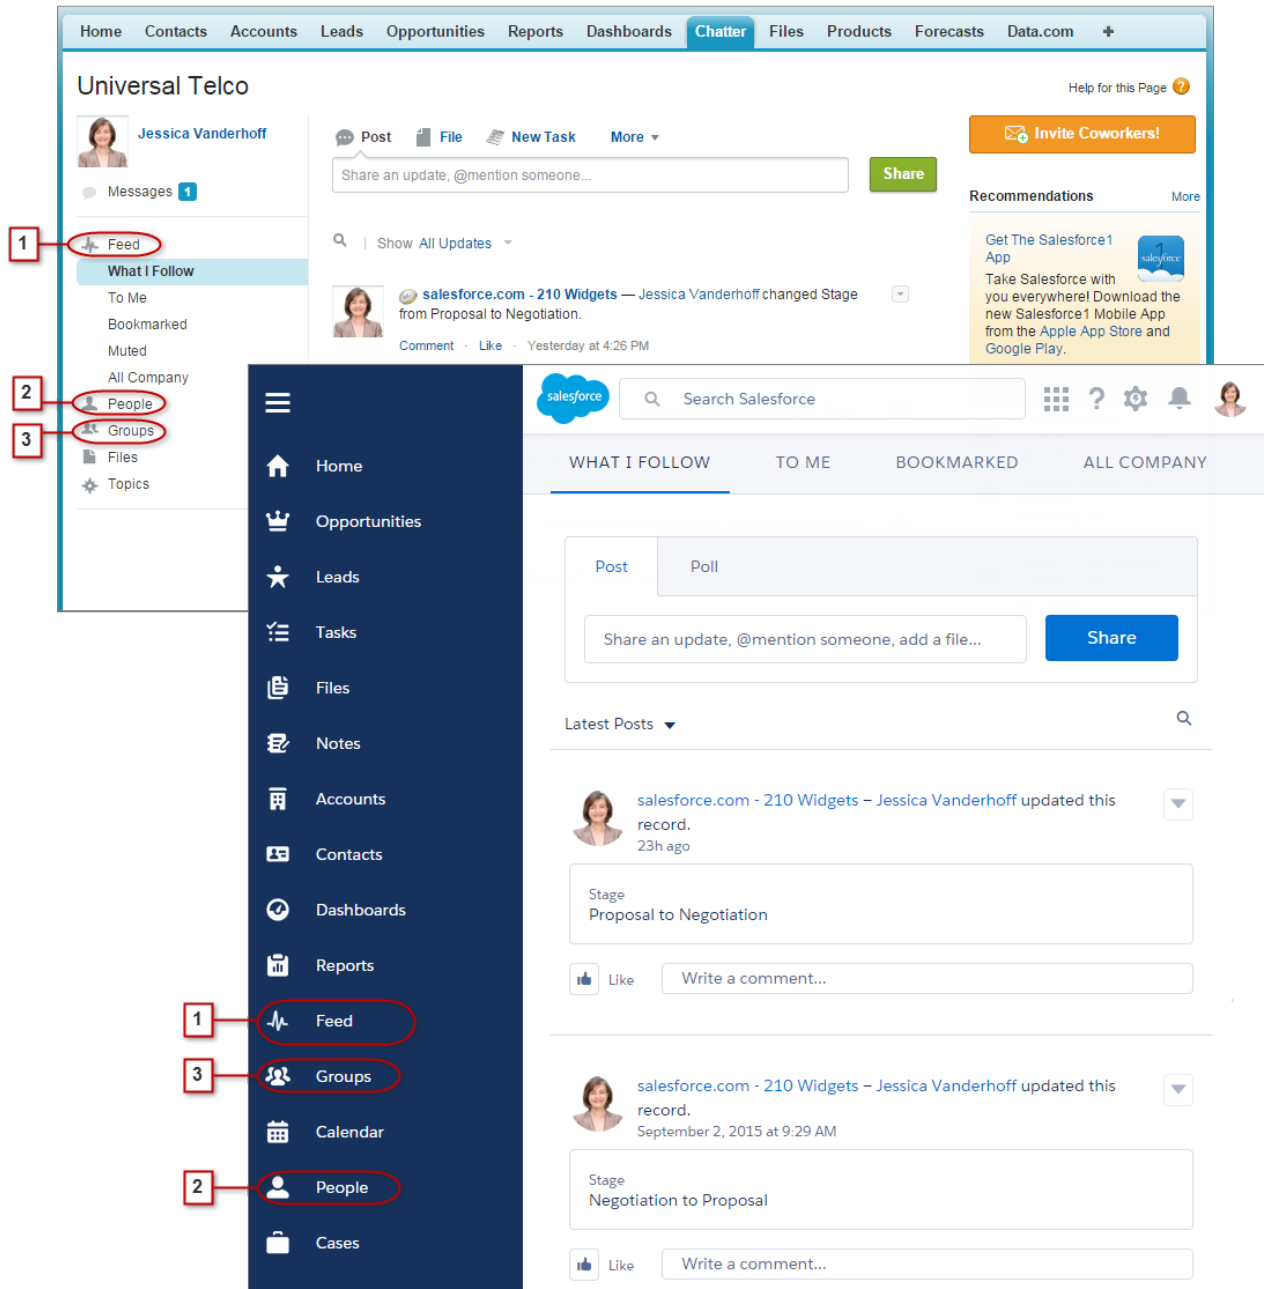

With Lightning Experience, you can connect with people and groups and share business information securely and in real time, just like you're used to in Salesforce Classic. The way you access Chatter feeds, groups, and profiles is a bit different in the new interface. But with this quick overview, you'll feel right at home.

In Salesforce Classic, you typically access Chatter features from the sidebar on the Chatter tab. In Lightning Experience, access the main feed (1), colleagues' profiles (2) and groups (3) directly from the navigation menu.

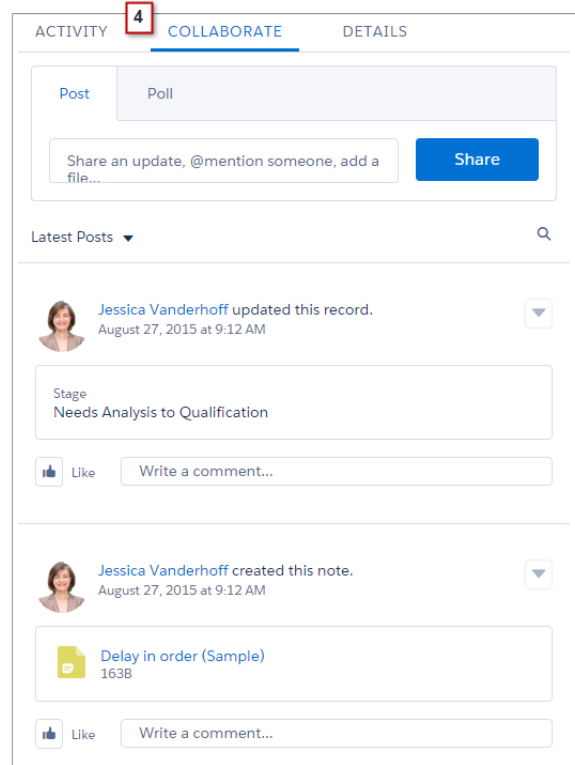

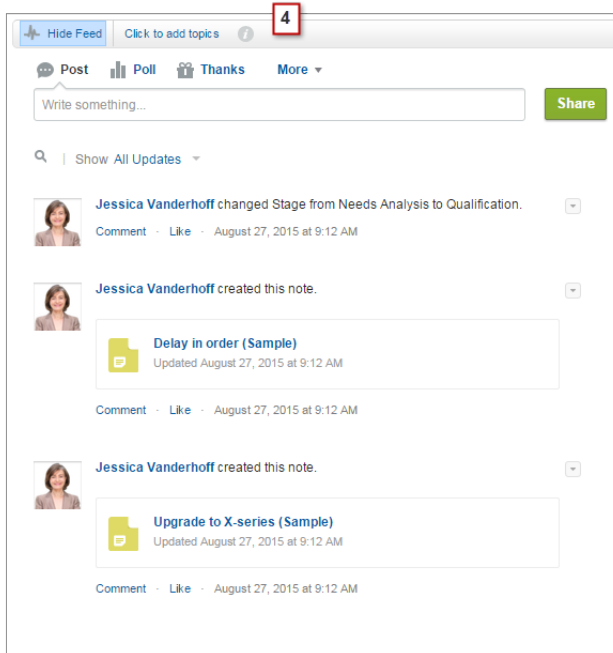

EDITIONS

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

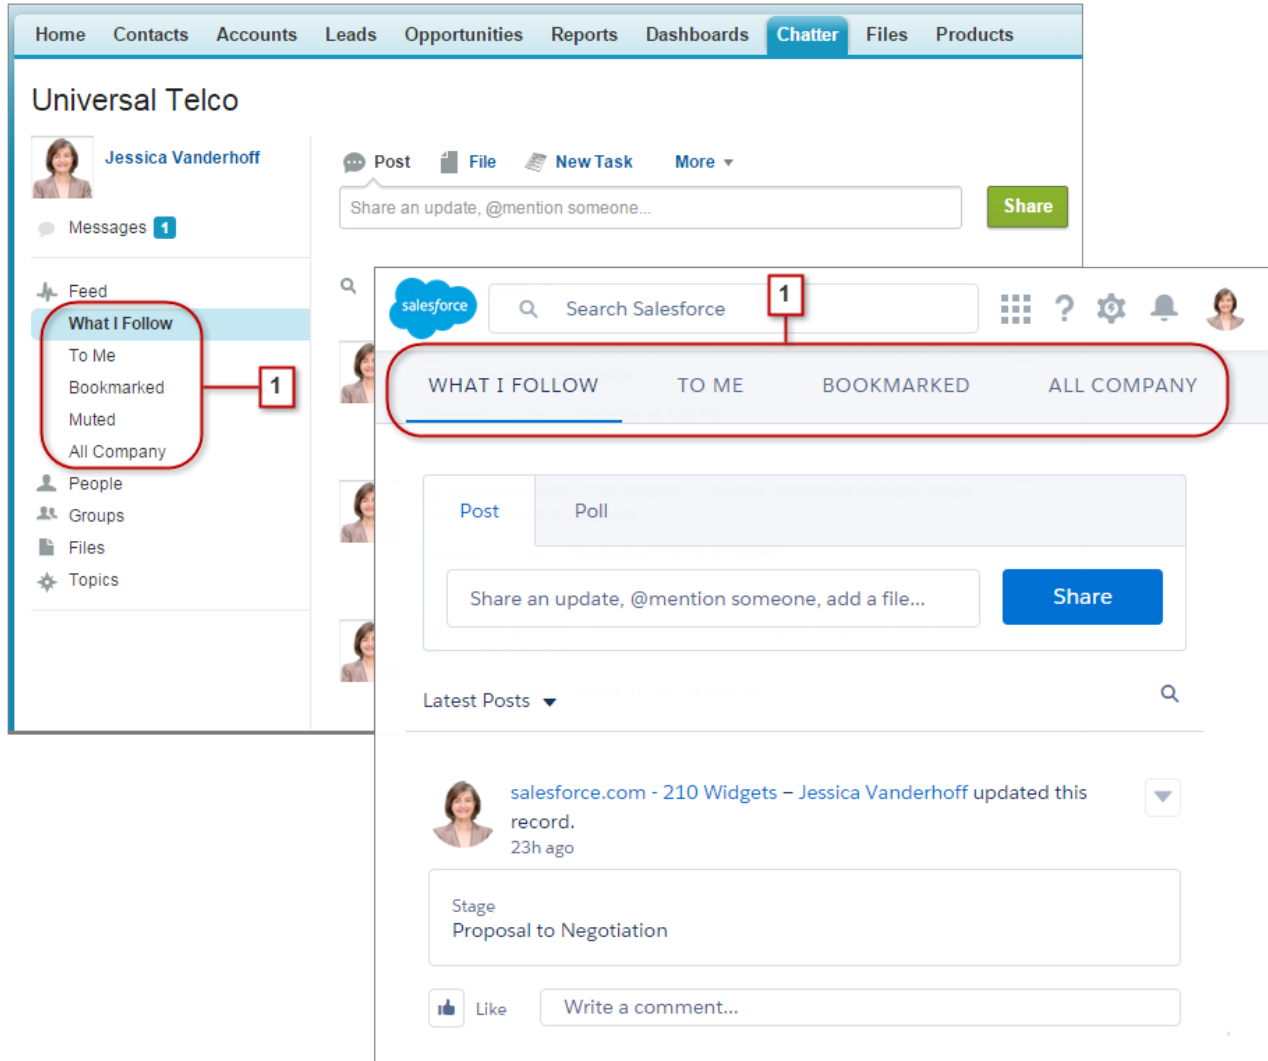

To collaborate on records (4), look for the Collaborate tab in Lightning Experience. You can post updates, create polls, and share files, just like in Salesforce Classic. But now there's no more fussing with the **Hide Feed** and **Show Feed** links.

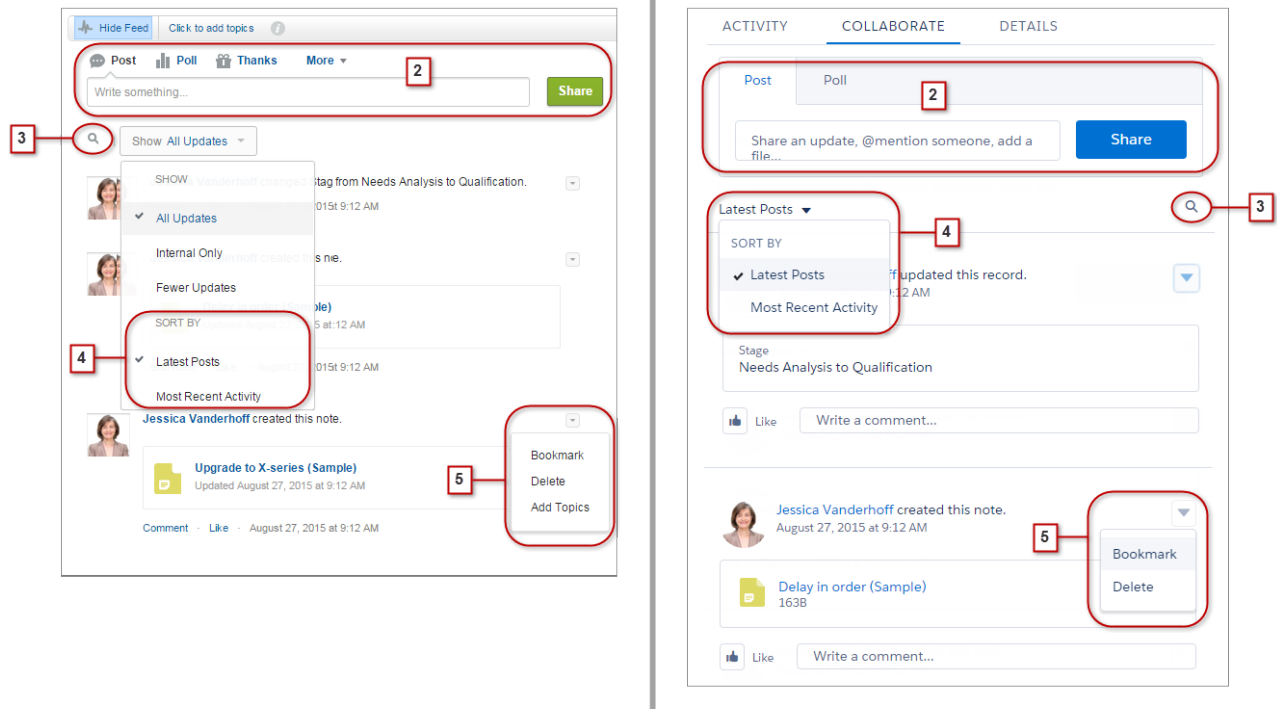

Work with Feeds

You can change the main Chatter feed to show a particular subset of posts (1). In Lightning Experience, use the tabs at the top of the page. The What I Follow feed continues to be the default feed.

Feeds in Lightning Experience include many of the options that are available in Salesforce Classic.

- The Post and Poll action are available in the composer (2) on the Collaborate tab. Click the composer to access buttons for uploading a file or mentioning people. Other standard Chatter actions that appear in the publisher in Salesforce Classic, including Thanks and Links, aren't available in Lightning Experience.
- Locate information in a specific feed with feed search (3).
- Sort the feed (4) by most recent posts or comments. Options to filter a feed aren't available in Lightning Experience.
- Acting on a post (5) is the same in both interfaces. But topics aren't available in Lightning Experience.

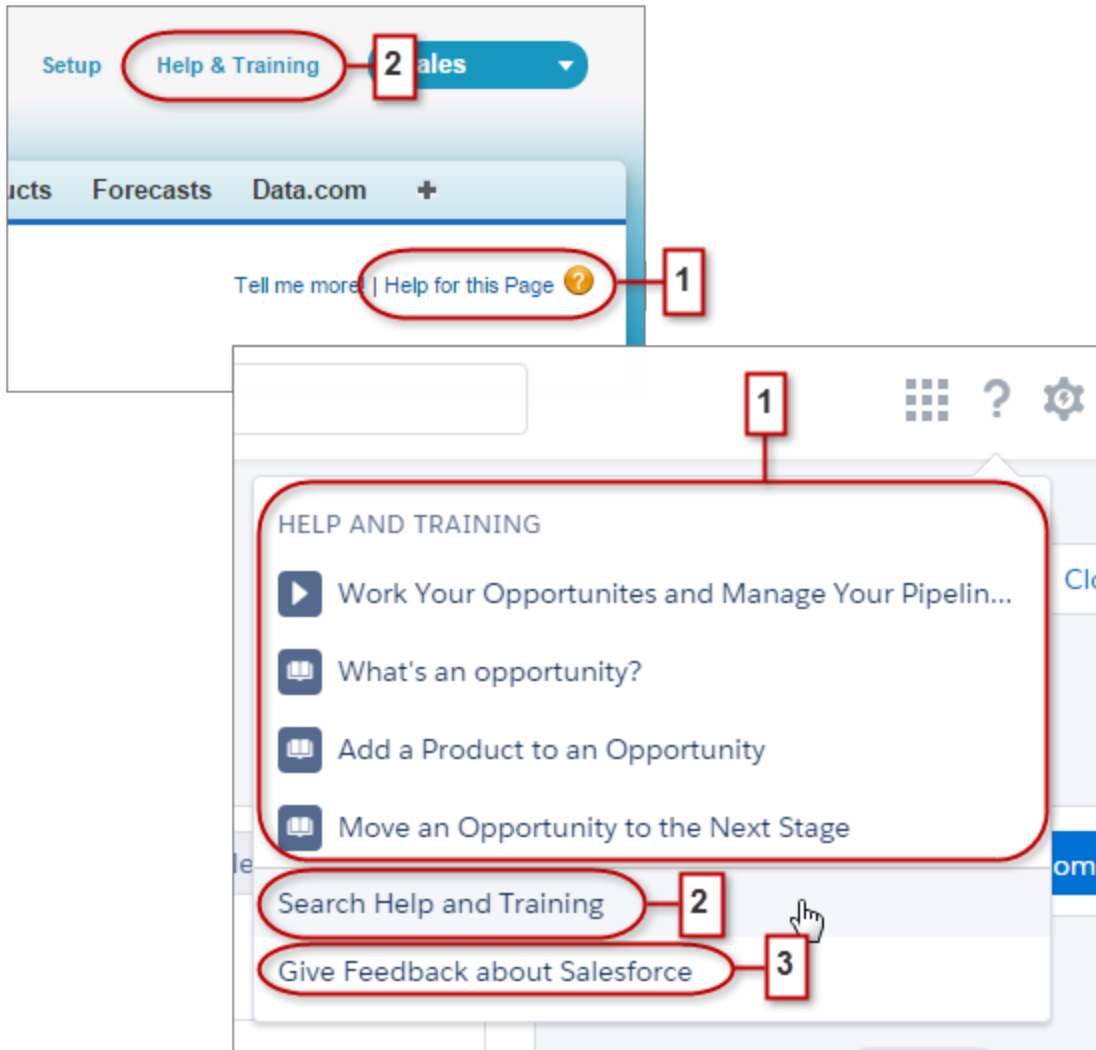

Find Help in Lightning Experience

Help is here! And it's better than ever in Lightning Experience, where the contextual Help menu serves up targeted content like videos, walkthroughs, help topics, and trails. Bonanza!

EDITIONS

Available in:

- Group
- Professional

In Salesforce Classic, most pages and related lists link to a single contextual help topic. With the Lightning Experience Help menu (1), we provide lots more options, with links to videos, walkthroughs, help topics, and trails—whatever is most relevant to what you're working on.

Both interfaces include links to the main Help & Training portal (2). But the link in Lightning Experience saves time, taking you right to the search page so you can quickly find the help you need.

We need your feedback! Just click the **Give Feedback** link (3) to share your comments about Lightning Experience or anything else Salesforce. Thanks!

Lightning Experience Considerations

This release of Lightning Experience doesn't include everything that's available in Salesforce Classic. Review these topics to see if any functionality that's critical to your business is limited or unavailable in this release. This information can also help you train users about what to expect when you do switch to Lightning Experience.

IN THIS SECTION:

[Gotchas If Users Switch Between Lightning Experience and Salesforce Classic](#)

Switching between Lightning Experience and Salesforce Classic is fast and easy. But switching between interfaces affects the underlying URL routing logic and can lead to some unexpected results when links are resolved. Be aware of the impact on bookmarks and links in emails or Chatter posts, especially if your organization has a subset of users authorized for Lightning Experience while others are still using Salesforce Classic.

[What's Not Available in Lightning Experience](#)

Gotchas If Users Switch Between Lightning Experience and Salesforce Classic

Switching between Lightning Experience and Salesforce Classic is fast and easy. But switching between interfaces affects the underlying URL routing logic and can lead to some unexpected results when links are resolved. Be aware of the impact on bookmarks and links in emails or Chatter posts, especially if your organization has a subset of users authorized for Lightning Experience while others are still using Salesforce Classic.

When users are first enabled for Lightning Experience, the new interface is their default, *preferred* experience. Every time a user switches interfaces via the Switcher, the user's default preference resets to the current environment. With this behavior in mind, here are the typical link routing interactions your users can encounter.

EDITIONS

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

User Has the "Lightning Experience" Permission?	User's Default Experience	Where Links Open
Yes	Lightning Experience	<p>For pages supported in Lightning Experience, links open in the new interface (even for links generated in Salesforce Classic).</p> <p>Links to unsupported pages are directed to Salesforce Classic, which opens in a new tab. This temporary redirection doesn't change the</p>

User Has the "Lightning Experience" Permission?	User's Default Experience	Where Links Open
		user's default preference to Salesforce Classic. The next time the user selects a link that is supported in the new interface, the Salesforce Classic tab is reloaded to open the link in Lightning Experience.
Yes	Salesforce Classic	Links generally open in Salesforce Classic. If a link was generated in Lightning Experience (meaning it includes <code>/one/one.app</code> in the URL), the link opens in Lightning Experience. The user's default preference isn't changed to Lightning Experience.
No	Salesforce Classic	Links open in Salesforce Classic only. If a link was generated in Lightning Experience (meaning it includes <code>/one/one.app</code> in the URL), the link doesn't open, because the user can't access Lightning Experience.

Given these routing behaviors, you can see the potential for confusion if users share Lightning Experience links, typically via Chatter posts or email, with Salesforce Classic users. To avoid this problem, we recommend enabling the new interface for all users who work closely together.

We also recommend training your Lightning Experience users to understand how links and bookmarks work across the two experiences.

Data Access and Views: Lightning Experience Limitations

Learn about the issues to expect when accessing data in Lightning Experience. Some Salesforce data and features aren't available in the new user interface. And some features don't have full parity with what's available in Salesforce Classic.

Objects

These Salesforce objects are available in Lightning Experience. None of the other standard objects are supported in this release.

- Accounts
- Cases
- Contacts
- Dashboards
- Events
- Files
- Leads
- Notes
- Opportunities
- Price books
- Products
- Reports
- Tasks
- Custom objects

Fields

- Fields for unsupported objects display in Lightning Experience, but they are read-only and don't include links to associated records.
- Formula fields with hyperlinks aren't supported.
- Formula fields with images aren't supported in list views, related lists, or search results. The field name displays but the field itself is empty.

- Field-level help isn't widely available in this release. You can't define custom help text or add field-level help for fields in custom objects.

Related Lists

- Related lists for supported standard objects and your custom objects are available in Lightning Experience.
Related lists for objects that aren't supported in Lightning Experience don't appear anywhere in the interface, even if they're included on an object's page layout.
- In Lightning Experience, related lists appear in related list cards on record home pages. The first eight related lists show related list buttons, the first several records from the list, and a link to open the full list of records. For any additional related lists, only the list name appears in the card. Users can still work with these related lists—simply click the related list name to access the full list. Here, users can see records in the list and use related list buttons (such as **New**) or row-level record actions.
- Lightning Experience includes new Files and Notes related lists, as well as the classic Notes & Attachments related list. If you're using Salesforce Files or the enhanced Notes feature, you'll want to include all of these related lists on your object page layouts.
 - Files and attachments are two different types of objects, and always have been. Files uploaded via the Notes & Attachments related list are simply files in Lightning Experience, but are attachments in Salesforce Classic. For existing organizations, this means that the Notes & Attachments list can contain a mix of attachments that were uploaded in Salesforce Classic and files added in Lightning Experience. Files added in Lightning Experience have the functionality of Salesforce Files, while attachments are associated only with the particular record and can't be shared further.

In the API, any existing integrations that retrieve attachments from the Notes & Attachments list don't include any files uploaded to the list in Lightning Experience. A new API call is necessary to retrieve files as well as attachments.
 - Notes created with the old note-taking tool in Salesforce Classic are available from the Notes & Attachments related list only. Any notes created with the enhanced version of Notes appear in the Notes related list only.
- For Group Edition users, the Contacts related list doesn't display on accounts.
- Product details include a single Price Books related list, unlike Salesforce Classic, which includes related lists for Standard Prices and Price Books.
- On the detail page for objects that support activities, Lightning Experience doesn't display Open Activities or Activity History along with other related lists. It displays the activity timeline instead. Objects that support activities include opportunities, leads, accounts, contacts, and any custom objects on which you enable activities.

If you delete either activity related list from page layouts, Salesforce doesn't display the corresponding timeline sections—Next Steps or Past Activity—on those pages.

Object Home

These features aren't available on object home pages in Lightning Experience.

- Quick Create tool
- Access to object-specific reports
- Any of the tools in the Tools section
- Summary report tool

List Views

These list view features aren't available in Lightning Experience.

- Inline editing of fields

- Following records directly from a list
- Sharing list views with groups
- Clone list views
- Mass actions, custom actions, or custom buttons
- Advanced filter logic
- Drag-and-drop scheduling for account, contact, and lead list views
- Feeds
- The  icon to create a printable view of a list

Creation and editing of list views in Lightning Experience is currently in pilot and available only in Trial orgs. Contact Salesforce to get a Trial org, where you can try out writeable list views with integrated filtering capability. We provide this feature to selected customers through a pilot program that requires agreement to specific terms and conditions. To be nominated to participate in the program, contact Salesforce. Because pilot programs are subject to change, we can't guarantee acceptance. This pilot feature isn't generally available, as referenced in this document or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available features.

List views display and behave differently in Lightning Experience.

- Navigation through list views has changed. Because list views have infinite scrolling, you can't specify the number of records to show per page. Also, you can't navigate through pages with arrow buttons, and you can't jump to a specific page of results. Jumping to records with names that start with a particular letter isn't available.
- The drop-down menu shows up to 200 views. Recently viewed lists are displayed first, followed by other list views in alphabetical order. Although only 200 views are displayed in the menu, you can search up to 2,000. If you have more than 2,000 list views, some views aren't returned in the search results. You can switch back to Salesforce Classic to find all your list views.
- You can't change the width of a column by dragging the right side of the column heading. To adjust the column widths, switch to Salesforce Classic. The new widths are then reflected in Lightning Experience.
- You can't change the order of columns by dragging the column heading to a new position in the table. Instead, you change the columns that appear and their order by choosing **Select Fields to Display** from the List View Controls drop-down menu. If you add or remove a column in Lightning Experience, all custom column widths are deleted. You can switch back to Salesforce Classic to adjust column widths.
- Limited row-level actions are available. For most objects, available actions are Edit and Delete. For leads, two more actions are available: Convert and Clone. For files, available actions are Edit, Delete, and Download.
- The name of the recent records list that displays on the home page for every standard and custom object is different in Lightning Experience. It's called Recently Viewed. This view isn't deletable, filterable, or editable. Salesforce admins can use the Object Manager in Setup to select and order columns for this view. Your users can sort items in the view by clicking inside a column header. An arrow in the column header shows if the list items are sorted in ascending or descending order.
- Another list view is available for most standard objects via the drop-down list with a name similar to Recently Viewed. The name of this view includes the name of the object. For example, this list view for accounts is called Recently Viewed Accounts. These two list views, Recently Viewed and Recently Viewed *Objects*, show the same records. The Recently Viewed *Objects* list view isn't deletable, filterable, or editable. Your users can sort the records and chart this list view's data. They can switch to Salesforce Classic to reorder the columns displayed in the list view. The columns appear in the new order when the user switches back to Lightning Experience.
- Formula fields with images aren't supported in list views in Lightning Experience. The field name displays but the field itself is empty.

Working with Data

These features aren't available in Lightning Experience.

- Inline editing on lists or records
- Editing multi-line layouts

- Printing a page
- Generating a PDF file

The Salesforce sidebar that appears on the left side of most pages in Salesforce Classic isn't replicated in Lightning Experience. Items from the sidebar aren't included either, including:

- The Tags link and Recent Tags drop-down list
- The Create New drop-down list; use the **New** button on object home pages
- The Calendar shortcut; access the Calendar from the navigation menu
- The Recent Items list; see recent items on the Home page or on object home pages
- Messages and Alerts
- Custom Links

The Recycle Bin isn't available. Records deleted in Lightning Experience still go to the Recycle Bin, but users have to switch to Salesforce Classic to view or restore recently deleted records.

Accessibility

- Accessibility mode isn't provided because it's not needed in Lightning Experience. The interface is designed according to the latest accessibility standards, so screen readers are supported natively.
- The color-blind palette isn't needed either. If it's enabled for your organization, it affects only the report builder.

SEE ALSO:

[Productivity Features: Lightning Experience Limitations](#)

[Files and Content: Lightning Experience Limitations](#)

Sales Features: Lightning Experience Limitations

Learn about the issues to that your Sales team can encounter in Lightning Experience. Some Salesforce data and features aren't available in the new user interface. And some features don't have full parity with what's available in Salesforce Classic.

Sales Features

Opportunities, Leads, Accounts, and Contacts

- Twitter is the only social network available in Lightning Experience.
- Twitter is styled as its own card, visible directly on the record home page.

Sales Path for Opportunities and Leads

- You can include a maximum of five fields and 1,000 characters of rich text in each sales stage.
- You cannot require fields in any particular stage. You can, however, set up a validation rule based on the stage and then include the fields in the sales path.
- If you set fields to the Read-Only or Required permissions in page layouts, Sales Path doesn't enforce those permissions.
- Fields included in sales paths, but not in page layouts, appear as read-only fields.
- Although not a limitation, keep in mind that deleting a record type that has a corresponding sales path also deletes the sales path.
- Validation rules appear as page-level messages, even if you configure the rules to appear near the fields.
- For lead sales paths, we recommend you place Unqualified statuses at the beginning of the sales paths.

Features Not Available in Lightning Experience

- Assets
- Campaigns and Campaign Members
- Contracts
- Forecasts (including Collaborative Forecasts and Customizable Forecasts)
- Orders
- Quotes
- Person Accounts
- Divisions
- Mass Division Transfer

Accounts

Organizations Using Person Accounts Can't Enable Lightning Experience

Person accounts aren't supported in Lightning Experience.

If your Salesforce implementation uses person accounts, you can't enable Lightning Experience for your production organization, regardless of your edition. But to give you an opportunity to try out the new interface, you can enable Lightning Experience in your sandbox environments. This option will be available beginning October 24, 2015. And rest assured, adding person account support in the future is a top priority.

When testing Lightning Experience in a sandbox, be aware of these known issues. These issues will be resolved when person accounts are supported in a future release.

- Editing person accounts on the contact detail view in Lightning Experience can introduce errors. This is because person accounts don't appear as accounts, like they do in Salesforce Classic. Instead, person accounts appear as both accounts and contacts.
- Person accounts aren't accessible from Setup.
- For contacts, the Account Name field lookup results include both business and person accounts. The results incorrectly include person accounts.
- The contact page layout appears for person accounts from the contact list view, search results, and lookups.
- On person account details, the page title incorrectly appears as *Account* instead of *Person Account*.

Contacts Related List on Accounts

- When a contact is created from the Contacts related list on an account, the contact's mailing address isn't populated with the account's billing address.
- For Group Edition users, the Contacts related list doesn't display on accounts.

Features Not Available in Lightning Experience

- Account Hierarchy
- Account History
- Account Merge
- Account Partners
- Account Teams
- Account Territories
- Contact Roles on Accounts

Contacts

Opportunities Related List on Contacts

- When you click **New** on the Opportunity related list on a contact, Salesforce adds the contact to the contact field for a new or existing opportunity.

Features Not Available in Lightning Experience

- Contact Hierarchy
- Contact Merge
- Contact Roles on Accounts
- Contact Roles on Cases
- Stay-in-Touch fields

Leads

Features Not Available in Lightning Experience

- Lead campaign history
- Assign leads to campaigns
- Assignment rules when manually creating leads
- Change lead owners to queues
- Identify and merge duplicate records from the lead workspace (but you can set up Duplicate Management to prevent the creation of duplicate leads)
- Automatic field population for accounts created during lead conversion

Opportunities

Sales reps can add only:

- One product to an opportunity or a price book at a time
- One contact role to an opportunity at a time

When you add a product to an opportunity in Lightning Experience or Salesforce1, and the product has default schedules, Salesforce doesn't create the schedules.

Opportunity Board

- The Board is not available from the Recently Viewed list view. Users need to select another list view before they can switch to the Board.
- The Board shows the opportunities for only one sales path at a time. If your organization uses multiple sales paths, create a separate list view for each and filter it by record type. Make the new list views public so your users can access them.
- The Board doesn't let users specify a reason when they change an opportunity's stage to Closed Lost. If your organization requires users to include a reason, they can still move opportunities to Closed Lost from the Board; however, when they switch back to Salesforce Classic, they'll be prompted for a reason.
- Users receive alerts on opportunities with overdue tasks, no open activities, or no activity in the last 30 days. The alert isn't customizable in Winter '16.
- Validation rules still apply when changing the stage of an opportunity using the Board view, but users need to navigate to the opportunity workspace to address any validation rules.
- Dependent fields are ignored when using the Board view. Users need to navigate to the opportunity workspace to address any dependent fields.

Features Not Available in Lightning Experience

- Big deal alerts
- Opportunity Splits
- Opportunity Teams
- Similar Opportunities
- Multi-line layout editing

You can't edit the `Probability` or `Forecast Category` fields. However, field values are automatically populated, based on the value of the `Stage Opportunities` field, when you save the record. You can manually edit the values for these fields in Salesforce Classic.

Products and Price Books

Products and Price Books

- Product details include a single Price Books related list, unlike Salesforce Classic, which includes related lists for Standard Prices and Price Books.
- For organizations already activated, the Add to Price Book page doesn't include the `Use Standard Price` option by default. To make `Use Standard Price` available, add it to your Price Book Entry page layouts.
- For organizations already activated, the Price Books home page doesn't include an `All Price Books` list view by default.

Features Not Available in Lightning Experience

- Archiving products and price books
 -  **Note:** As an alternative, deactivating products and price books preserves all the records related to them.
- Product revenue and quantity schedules

Territory Management and Enterprise Territory Management

Territory Management

Original Territory Management appears in the Lightning Experience Setup tree. From there, you can enable, configure, and maintain the feature. Territory information, assignments, and reports are available and viewable in Salesforce Classic only.

Enterprise Territory Management

Enterprise Territory Management is available in Salesforce Classic only.

Productivity Features: Lightning Experience Limitations

Learn about the issues to expect when using Salesforce productivity tools in Lightning Experience. Some Salesforce features aren't available in the new user interface. And some features don't have full parity with what's available in Salesforce Classic.

Home

The Salesforce home page is reimagined in Lightning Experience. Home now focuses on top sales user priorities, including the sales reps' quarterly sales performance and notifications about tasks, leads, and opportunities.

Home Features Not Available in Lightning Experience

- Alert banners
- Chatter feed and publisher

- Recommendations
- Custom components, such as dashboard snapshots
- Calendar

Customization Not Supported

Lightning Experience doesn't support:

- Adding any standard or custom components
- Removing components already on the page
- Creating custom buttons or links
- Changing the page layout

It's a top priority to make the home page customizable, and we're working on this functionality for a future release.

Activities

Differences in Lightning Experience Compared to Salesforce Classic

Activity Timeline and Activities Related Lists

On the detail page for objects that support activities, Lightning Experience doesn't display Open Activities or Activity History along with other related lists. It displays the activity timeline instead. Objects that support activities include opportunities, leads, accounts, contacts, and any custom objects on which you enable activities.

If you delete either activity related list from page layouts, Salesforce doesn't display the corresponding timeline sections—Next Steps or Past Activity—on those pages.

To represent all activities from future to past, the activity timeline displays open activities in the opposite order from the Open Activities related list. Under Next Steps, the timeline displays open activities in chronological order from top to bottom. Undated tasks appear at the top and overdue tasks appear last.

Actions Missing from Activity Composer Unless Custom Record Types Selected

Suppose that you've created custom record types for calls, events, or tasks. As long as the default record type remains selected in each global action layout, the activity composer omits that activity's tab. To display the tabs, edit each global action layout and change the record type from the default to a custom record type.

Customization of Display and Order of Fields in Activity Timeline

In the activity timeline, you can customize the display and order of fields for events, tasks, and logged calls using event and task compact layouts. However, even if you remove certain fields from a layout, they remain in the timeline because they contain critical activity information. For example, suppose that you remove the due date, the date and time, or the task status fields from the compact layouts. The event start date and time, the task checkbox, the task due date, and the call logging date still appear on activities in the timeline. The description field on events and the comments field on tasks also always appear in the timeline, although they aren't available in the compact layout. The remaining fields visible in the timeline reflect the fields you include in the compact layout.

Customization of Display and Order of Fields in Task List

In the task list, you can customize the display and order of fields for individual tasks using task compact layouts. However, even if you remove certain fields from a layout, they remain in the task list because they contain critical task information. For example, suppose that you remove the status and due date fields from a compact layout. The task checkbox and the due date still appear on tasks in the list. The remaining fields visible in the list reflect the fields you include in the compact layout.

No Customization Support for Activity Timeline Icons

You can't customize the icons for activity types (events, tasks, calls, and email) in the timeline.

Overdue Tasks

Lightning Experience doesn't display any overdue tasks when a user has more than 1,000 tasks that are overdue. A user can switch to Salesforce Classic to view overdue tasks and close them, postpone them, or delete their due dates.

Task Assignment Notifications

Lightning Experience displays no option to send an email when a user assigns a task. It also displays no personal setting to receive an email when someone assigns a task. However, suppose that a user switches from Lightning Experience to Salesforce Classic. In that case, users can receive emails for tasks that they assign to themselves or tasks created with a status of Completed. These options depend on how you set up your Salesforce org.

Access to Records Related to Activities

Suppose that a user is looking at an event or a task related to a contact, Janita Smith. If the user doesn't have access to the contact Janita Smith in particular or to contacts in general, Salesforce displays the field as follows.

- In Salesforce Classic, the field is empty (as if there were no data).
- In Salesforce1, the field displays the record name. A user can delete the record or add others, subject to normal validation.
- In Lightning Experience, the field displays "No access" in place of the record name. A user can delete the record or add others, subject to normal validation.

Follow-Up Activities

Lightning Experience doesn't display the **Create Follow-Up Event** or **Create Follow-Up Task** buttons for creating an event or a task on a record. Instead, the composer on a record for an opportunity, a lead, an account, or a contact prefills the `Name` and `Related To` fields on events and tasks.

Calendar Views

The calendar displays only a day view or a week view. It has no month view or activity list view. You can't hide weekends.

Calendar Shortcut

Lightning Experience doesn't offer the option to add a calendar shortcut to the sidebar. Instead, the navigation menu includes a **Calendar** link by default.

Features Not Available in Lightning Experience

- Event invitations aren't supported. Users can't invite others to events, update invitations to events, accept or decline invitations, or view a related list of invitees to an event.
- Users can't create recurring events or tasks, and they can't edit a recurring event or task that was created in Salesforce Classic. However, they can view and edit individual occurrences of a recurring event created in Salesforce Classic.
- Users can't create a Microsoft® Outlook® appointment from a Salesforce event.
- Users can't assign copies of a task (group tasks) to coworkers.
- Users can't spell-check the `Description` field on events or the `Comments` field on tasks.
- Users can't set or view activity reminders (reminders of upcoming events or tasks due).
- You can't create public calendars or resource calendars. Users can't view public calendars or resource calendars created in Salesforce Classic.
- Lightning Experience has no **My Team's Activities** list view, and users can't edit tasks owned by people below them in the role hierarchy. Users can view events and tasks owned by people below them in the role hierarchy in reports. They can also view tasks that they've reassigned to people below them in the role hierarchy by choosing the Delegated view in the task list.
- Users can't share their calendars, and Lightning Experience can't display multiple people's calendars.
- Lightning Experience doesn't display a task list alongside the calendar.
- Lightning Experience doesn't display a mini calendar on the event detail page for an account or an opportunity.
- Users can't add an event in the calendar by double-clicking a time slot or clicking **+**.
- Users can't create events in a list view by dragging a record such as a lead, a contact, or an account from the list to the calendar at the bottom of the page.
- Lightning Experience doesn't support Cloud Scheduler meeting requests.
- Lightning Experience has no print view for the calendar.

Notes

Notes created with the old note-taking tool in Salesforce Classic are available from the Notes & Attachments related list only. Any notes created with the enhanced version of Notes appear in the Notes related list only.

Integrated Email

Supported Objects

Integrated Email is supported for accounts, contacts, leads, and opportunities only, and not for cases, campaigns, custom objects, or person accounts. Email can be sent to contacts, leads, and users. Fields available for templates are based on the object from which the template is created, plus User fields. For example, if you have an opportunity record open and create a template, you can only add Opportunity fields and User fields to your template. Similarly, email templates created for one object are not available for use from other objects. For example, templates created for use with leads are not available for emails sent from opportunities.

Mass Email

Mass Email is not supported.

Mass Mail Merge

Mass Mail Merge is not supported. However, you can use merge fields on individual emails and add merge fields to templates.

Hyperlink Fields in Mail Merge

Hyperlink formula fields are not supported.

Email Activity

After you send an email, a task record is created. If you sent the email to a contact or lead, the task link is added to the Recent Activity feed for that record. If you sent the email to another email address (not a contact or lead), a link to the email is added to the Recent Activity feed of the record that was open when you sent the email. The task record doesn't include a link to access attachments sent with the email.

Email Templates

Email templates are available for administrators and users. Templates created in Salesforce Classic can't be used in Lightning Experience and vice versa.

Email templates in Lightning Experience use custom HTML. The other types (text, HTML with letterhead, and Visualforce) aren't supported.

All templates created in Lightning Experience are public. Any attachment in an email becomes public when that email is sent. Users no longer have to share the templates they create.

Email Attachments

If you don't have access to a file, you can't attach that file to an email or a template. If you select a template that has attached files, you need access to those files to send them. A file attached to an email is publicly available via a hyperlink when the email is sent.

Unresolved Items

The Unresolved Items link isn't available in Lightning Experience. After users add items to Salesforce using Email Connect, Salesforce for Outlook, or Email to Salesforce, items that can't be automatically assigned to Salesforce records are still sent to Unresolved Items. However, to assign those items to records or delete them, users must be prompted with a link by Salesforce for Outlook in Microsoft® Windows®, or switch to Salesforce Classic.

Work.com

Work.com sales-management and service-management tools aren't available in Lightning Experience. But Lightning Experience users can see thanks badges and skills endorsements that they've received in the feed.

Customer Service Features: Lightning Experience Limitations

Learn about the issues to expect if your organization uses customer service tools. In general, Service Cloud data and features aren't supported in this release of Lightning Experience. Cases are supported but don't have full parity with what's available in Salesforce Classic.

Cases

Case Layout

Cases look a little bit different than other records. Cases display a feed first rather than record details or related information, because support agents mainly collaborate and work with activities in a feed. Details appear next to the feed. You don't see the Activity or Collaboration tabs because this information displays directly in the feed.

If you turn off Case Feed, cases look like other records. Activities and collaboration appear, but the feed-first design disappears and adds more clicks and context-switching to cases. You can use collaboration (Chatter) instead of feed, but collaboration doesn't include useful case feed publishers, such as email, log a call, or change status.

Case Comments

Now you add comments to the feed instead of the Case Comments related list. You can't add comments to the related list in Lightning Experience. The comments that appear there are from Salesforce Classic users.

Case Related Lists

These related lists aren't available on cases: Case History, Case Milestones, Case Team, Contact Roles, External Sharing, Content Deliveries, Live Chat Transcripts, Related Content, and SOS Sessions.

Case Setup

To fully benefit from the new feed-first design on cases, re-create the standard case feed publishers. The standard publishers aren't available, but you can quickly re-create them as quick actions on the Case object. One benefit of re-creating the publishers as quick actions is that they appear on mobile devices, whereas standard case feed publishers don't.

Features Not Available in Lightning Experience

- Salesforce Call Center
- Knowledge Articles
- Omni-Channel
- Entitlements
- Milestones
- Macros

Unsupported Service Cloud Features

Except for basic Cases, Lightning Experience doesn't support any Service Cloud features, including the Salesforce Console.

For existing Salesforce to Salesforce customers, records shared by connections are available in the new user interface as long as their object type is supported in Lightning Experience.

Reports and Dashboards: Lightning Experience Limitations

Learn about the issues to expect when using reports and dashboards in Lightning Experience. Some Salesforce data and features aren't available in the new user interface. And some features don't have full parity with what's available in Salesforce Classic.

Reports

Features Not Available in Lightning Experience

Feature	Notes about Lightning Experience Availability
Joined Reports	
Schedule Report Refreshes	Users can't schedule report refreshes in Lightning Experience, but scheduled report refreshes from Salesforce Classic continue to work in Lightning Experience.
Print Reports	Lightning Experience doesn't offer a print option, but users can still print reports using their browser's print function.
Export Reports	
Row-Level Actions (Edit and Delete)	Although row-level actions aren't available in Lightning Experience, users can edit or delete a report when viewing it.
Subscribe to Reports	
Chatter Feed on Reports	
Show Details in Matrix Reports	
Add to Campaign	
Accessibility Mode for the Report Builder	Users with Accessibility Mode turned on must switch to Salesforce Classic to create and edit reports.

Features Available with Limitations in Lightning Experience

Feature	Notes about Lightning Experience Availability
Historical Trend Reporting	Historical trend reporting with charts is supported in Lightning Experience, but tabular views of historical trend reports aren't available.
Filters	<p>These filters are available when building or editing a report, but are not shown in the filter panel when viewing a report. Even though the filters are not shown, they still filter the report.</p> <ul style="list-style-type: none"> • Top N filters • Cross filters • Historical field filters • Standard filters (except for scope and date filters)

Other Notes about Using Reports in Lightning Experience

In the Lightning Experience Report Builder, save your report before running it or risk losing some changes. Specifically, be sure to save after adding:

- Formula fields

- Bucket fields
- Top N filters
- Cross filters

Dashboards

Features Not Available in Lightning Experience

Feature	Notes about Lightning Experience Availability
Create Filtered Dashboards	Users can view filtered dashboards, but they aren't filtered.
Create Dynamic Dashboards	Users can view dynamic dashboards, but must switch to Salesforce Classic to edit them.
Change a Dashboard's Running User	
Schedule Dashboard Refreshes	Users can't schedule dashboard refreshes in Lightning Experience, but scheduled dashboard refreshes from Salesforce Classic continue to work in Lightning Experience.
Row-Level Actions in List Views (Edit and Delete)	Although row-level actions aren't available in Lightning Experience, users can edit or delete a dashboard when viewing it.
Chatter Feed on Dashboards	
Post a Dashboard Component to Chatter	
Visualforce Components on Dashboards	
Accessibility Mode for the Dashboard Editor	Users with accessibility mode turned on can still create and edit Lightning Experience dashboards, but for a fully accessible experience they must switch to Salesforce Classic.

Other Notes about Using Dashboards in Lightning Experience

- After saving a dashboard in Lightning Experience, you can't edit it in Salesforce Classic. Instead of editing a Salesforce Classic dashboard in Lightning Experience, consider cloning the dashboard and editing the clone. That way, you can still edit the original dashboard in Salesforce Classic.

Folders

Features Not Available in Lightning Experience

Feature	Notes about Lightning Experience Availability
Standard Folders	
Move Reports and Dashboards between Folders	
Create and Delete Report and Dashboard Folders	Folders created in Salesforce Classic and their contents are available in Lightning Experience. Users can save inside these folders when creating or cloning a report or dashboard.

Feature	Notes about Lightning Experience Availability
Share Report and Dashboard Folders	Sharing permissions set on folders in Salesforce Classic are obeyed in Lightning Experience, but sharing permissions can't be set nor changed.
Search for Report and Dashboard Folders	Users can't search for report and dashboard folders in Lightning Experience. Global search results include reports and dashboards, but not report and dashboard folders.

Charts

Features Not Available in Lightning Experience

Feature	Notes about Lightning Experience Availability
Funnel Charts	Funnel charts from Salesforce Classic display as Bar Charts in Lightning Experience.
Scatter Charts	Scatter charts from Salesforce Classic display as Bar Charts in Lightning Experience.
Table Charts	Table charts from Salesforce Classic display as Bar Charts in Lightning Experience.
Multimetric Charts	Multimetric charts from Salesforce Classic show only one metric when viewed in Lightning Experience. For example, line bar charts (a type of multimetric chart) display as bar charts.
Pie Charts	Pie charts from Salesforce Classic display as donut charts in Lightning Experience.
Gauge Charts	Breakpoints in gauge charts only accept whole numbers. For example, 5 is a valid breakpoint, but 5.1 isn't.
Cumulative Line Charts	Cumulative line charts from Salesforce Classic display as Line Charts which aren't cumulative in Lightning Experience.
Chart Editor	In the chart editor, users can't: <ul style="list-style-type: none"> • Limit the set of report data drawn on the chart • Change sorting direction • Change measurement units (for example, from meters to centimeters) • Add more than two aggregates • Use charts from source reports

Other Notes about Using Charts in Lightning Experience

Feature	Notes about Lightning Experience Availability
Charts with More than 100 Dimensions	<p>In Lightning Experience, if there are more than 100 dimensions, then:</p> <ul style="list-style-type: none"> • Only the first 100 dimensions are drawn on the chart • Custom sorting set in Salesforce Classic is lost <p>To avoid these limitations, consider setting report filters that return 100 or fewer dimensions.</p>
Chart Colors	The standard Lightning Experience color palette replaces custom colors that users set in Salesforce Classic.

[Dashboard Limits](#)

Files and Content: Lightning Experience Limitations

Learn about the issues to expect when using Salesforce Files and other content features in Lightning Experience. Some data and features aren't available in the new user interface. And some features don't have full parity with what's available in Salesforce Classic.

Salesforce Files

- Sharing Settings, Share with People, and Share with Groups aren't available in Lightning Experience. However, users can share files with people and groups by posting in feeds and @mentioning them. They can also view sharing settings for a file in the Shared With card in File Details.
- Sharing files with libraries isn't possible in Lightning Experience, but files in libraries are listed in Files home in Lightning Experience and when selecting a Salesforce file to attach to a feed post.
- Files and attachments are two different types of objects, and always have been. Files uploaded via the Notes & Attachments related list are simply files in Lightning Experience, but are attachments in Salesforce Classic. For existing organizations, this means that the Notes & Attachments list can contain a mix of attachments that were uploaded in Salesforce Classic and files added in Lightning Experience. Files added in Lightning Experience have the functionality of Salesforce Files, while attachments are associated only with the particular record and can't be shared further.

In the API, any existing integrations that retrieve attachments from the Notes & Attachments list don't include any files uploaded to the list in Lightning Experience. A new API call is necessary to retrieve files as well as attachments.

- In Lightning Experience, the new Files related list allows users to upload files directly to the record; this isn't an option when accessing the Files related list in Salesforce Classic. Salesforce Classic users can see files in the related list that were uploaded from the list in Lightning Experience.

Files Connect

Users can't browse content in external data sources in Lightning Experience, but they can access external file references that were created in Salesforce Classic.

Features Not Available in Lightning Experience

- Documents
- Salesforce CRM Content, including creating and managing libraries, content deliveries, and sharing files with libraries

- File sharing with people and groups (except by posting to feeds)
- File syncing
- Freeze sharing (a new feature available only in Salesforce Classic in the Winter '16 release)

Chatter: Lightning Experience Limitations

Learn about the issues to expect when your users collaborate in Lightning Experience. Some Chatter features aren't supported. And some features don't have full parity with what's available in Salesforce Classic.

Feeds

Chatter Publisher

Users can compose these post types in Lightning Experience:

- Text posts, with or without a file attachment
- Polls
- Announcement posts in group feeds

Other post types, like Links and Thanks, aren't currently supported.

Sharing Posts

Users can't share posts with groups or followers.

Post and Comment Editing

Users can't edit posts or comments.

Rich Text Editor

The rich text editor isn't available in Lightning Experience. However, posts that users compose or edit with the rich text editor in Salesforce Classic display as formatted posts and comments in Lightning Experience.

Chatter Topics

Chatter Topics aren't available.

Chatter Questions

The Question action isn't available in Chatter, but existing questions do appear in the feed when viewed in Lightning Experience. Users still see best answers on a question and can select a best answer or post an answer.

Emoticons

Emoticons aren't available.

Highlighted Search Results

When a user runs a search on a feed, the keywords aren't highlighted in the search results.

Global Search Result Filters

Users can't filter global search results by feed.

Chatter Messages

Chatter Messages aren't available.

Chatter Settings in Setup

Salesforce admins using Lightning Experience have access to all settings on the Chatter Settings page in Setup. However, not all Chatter features are available in Lightning Experience. Changes to features that aren't available in Lightning Experience take effect only for users in Salesforce Classic.

People and Profiles

Unlike in Salesforce Classic, user profile pages display a banner photo at the top of the page. The photo is not currently editable.

These features aren't available when using people and profiles in Lightning Experience.

- All User list
- Chatter Influence
- Restrict visibility of Contact and About fields to employees, external users, or public (guest) users
- Add or reorder tabs on user profiles
- Moderator badge on profile photos
- Administrators can't add new actions to User Profile pages. Only Edit and User Detail options appear.

Groups

These features aren't available when using groups in Lightning Experience.

- View group recommendations on the group list view pages.
- Add records to groups using the Add Record action in customer groups, even if you or another administrator included the action in the group publisher.
- Create groups that allow customers (external users without licenses).
- Add customers to existing customer groups that were created in Salesforce Classic.
- View the group email address or the Post by email link.

Users can still email the group to post to the group via email if they know or have saved the group email address from Salesforce Classic.

- Access Chatter-wide notification settings from the group notification settings.
- Remove files from the group files list.

Other Salesforce Products: Lightning Experience Limitations

These Salesforce products aren't available in this release of Lightning Experience.

- Salesforce Communities (however, communities use the Lightning Experience login experience)
- Community Builder
- Pardot
- RelateIQ

Navigation and Actions: Lightning Experience Limitations

Learn about the issues to expect when navigating and using actions in Lightning Experience. Some Salesforce features aren't available in the new user interface. And some features don't have full parity with what's available in Salesforce Classic.

Navigation

Navigation Menu Replaces the Tab Bar

The concept of *tabs* to represent objects doesn't exist in Lightning Experience. The new interface updates the old Salesforce Classic tab bar with a collapsible navigation menu that's located along the left side of the page. Use the navigation menu to access the

standard Salesforce objects that are available in Lightning Experience, as well as Home, Chatter items (the main feed, people, and groups), files, dashboards, reports, and the user's task list and calendar.

Apps and Custom Objects Available from the App Launcher Only

Apps (sometimes called *tabset apps*) and custom objects are available in Lightning Experience, but they aren't included in the navigation menu for this release. Instead, use the App Launcher by clicking  in the header. Custom objects appear in the list of **Other Items**.

Even though Lightning Experience doesn't use the Salesforce Classic tab paradigm, you still need to create custom object tabs to ensure that your custom objects are available in the new interface.

Open Links in New Browser Windows or Tabs

In general, Lightning Experience supports right-click and Windows or Mac keyboard shortcuts to open links in new browser windows or tabs. But there are some areas of the app where these options aren't supported, including:

- Links in the Top Deals and Recent Records cards on Home
- Action icons, buttons, and menu items on records
- Links to Notes
- View Report links on dashboards
- Links on the Lightning Experience Setup page

Actions and Buttons

These actions and buttons aren't available in Lightning Experience.

- Deep Clone
- Mass Delete
- Mass actions on object home pages and list views
- Data import tools on object home pages
- Sharing buttons
- Custom buttons that define the content source as `URL` or `OnClick JavaScript`
- Custom links with parameters for filling in form fields

SEE ALSO:

[What's the Fate of Existing Salesforce Customizations?](#)

[Point-and-Click Customization: Lightning Experience Limitations](#)

Search: Lightning Experience Limitations

Learn about the issues to expect when searching in Lightning Experience. Some search-related features aren't available in the new user interface. And some features don't have full parity with what's available in Salesforce Classic.

Searchable Objects

Only the following objects can be found in search results: Account, Attachment, Case, Chatter Feed, Chatter Groups, Contact, Custom Objects, Dashboard, Document, File, Lead, Note, Opportunity, People, Price Book, Product, and Report. Task and Event items aren't searchable.

Search Results Can't Be Filtered or Sorted

The "exact phrase" and "limit to items I own" filter options aren't available on search results pages. In addition, you can't sort or filter search results. If a text field in the search results is too long for the column width, you can't see the full text in the search results. You can't expand the column widths.

For lookups, user-defined lookup filter fields and admin-defined dependent lookup filters aren't supported.

Top Results Instead of Search All

There isn't a **Search All** option in search results. Top Results displays the most relevant records grouped by your most frequently used objects. If an object isn't visible on the Top Results page, use the More drop-down menu, which alphabetically lists all available objects.

No Sidebar or Advanced Search

To search, use the global search bar in the header in Lightning Experience.

No Pinning on the Search Scope Bar

You can't pin or change the order of the objects listed on the search scope bar beneath the global search box. The search scope bar automatically lists your most frequently used objects. Objects pinned in Salesforce Classic affect the search scope bar in Lightning Experience.

Lookup Dialog Search Requires 2 Characters

To perform a full search, enter a minimum of 2 characters.

External Object Search Results Limited to 25 Items

When you perform a search for an external object, search only displays the top 25 results.

Applications Doesn't Support Wildcard Searches

You can't use wildcards to perform a partially matching search for Applications, or when searching from the App Launcher.

Search Results Used for Global and Lookup Dialog Search Layouts

To change the fields shown as columns in the global search and lookup dialog search results, use the **Search Results** search layout on an object detail page within the Object Manager. The other search layouts (Lookup Dialogs, Lookup Phone Dialogs, Tab, List Views, and Search Filter Fields) aren't applicable in Lightning Experience.

New Button in Lookup Dialog Search Doesn't Support All Objects

In Lightning Experience, you can create these objects from lookup dialog search windows: accounts, cases, contacts, events, leads, notes, opportunities, tasks, price books, and products. For other objects, including custom objects, create the desired object or record before using the lookup dialog search to associate records.

Salesforce Setup: Lightning Experience Limitations

Lightning Experience doesn't support a few aspects of your basic Salesforce setup. And the Setup tree in Lightning Experience doesn't include all of the setup pages that are available in Salesforce Classic.

- Information about an org's Salesforce edition isn't visible in Lightning Experience.
- Advanced currency management, or dated exchange rates, isn't supported in general. But opportunities display the correct amount if the `Close Date` field is on a page layout for opportunities. Because page layouts control who sees what on object records, only users who have this page layout assigned to them see the correct amount.
- Languages that are read right to left, including Arabic and Hebrew, aren't supported. All other Salesforce-supported locales and languages are supported.

Setup Tree

The Setup tree in Lightning Experience is limited to:

- Pages that support Lightning Experience features

- Administration pages that apply across your organization, such as company settings, security, user management, and mobile app setup

To access other setup pages, such as those for Service Cloud features, use the Setup tree in Salesforce Classic.

Advanced setup search isn't available in Lightning Experience.

[Point-and-Click Customization: Lightning Experience Limitations](#)

[Programmatic Customization: Lightning Experience Limitations](#)

Data Import and Management: Lightning Experience Limitations

Learn about the issues to expect when importing and managing data in Lightning Experience. Some Salesforce features aren't available in the new user interface. And some features don't have full parity with what's available in Salesforce Classic.

Data Import

These legacy data import tools aren't available in Lightning Experience:

- Accounts & Contacts
- Leads
- Solutions
- Custom Objects

Use the Data Import Wizard if you're importing fewer than 50,000 records. Use the Data Loader if you're importing more than 50,000 records.

Data Management

- With the exception of Duplicate Management, Data.com features aren't supported in Lightning Experience.
- Field Audit Trail isn't supported.

Process Automation: Lightning Experience Limitations

Learn about the issues to expect when using process automation features in Lightning Experience. Process Builder and Workflow are fully supported. Visual Workflow and Approvals are also supported but have some limitations.

Pending Approval Requests

Users can see approval requests from either their notifications or through the Approval History related list on the record that needs to be approved.

To see the complete list of requests that are waiting for a user's approval, the user must switch to Salesforce Classic (or use the Salesforce 1 mobile app).

Paused Flow Interviews

To resume paused flow interviews, your users must switch to Salesforce Classic or use Salesforce 1.

Flow Distribution

How you distribute flows to your users depends on whether the relevant feature is available in Lightning Experience. For example, URL-based custom buttons aren't supported, but Visualforce pages are.

Security: Lightning Experience Limitations

Learn about the issues to expect for Salesforce security features in Lightning Experience. Some features aren't available in the new user interface. And some features don't have full parity with what's available in Salesforce Classic.

Sharing Settings

Lightning Experience respects your organization's sharing rules. The Sharing Settings page is available in Setup in Lightning Experience, but some options don't apply in Lightning Experience.

Community User Visibility

This checkbox enables community users to be visible to other users in the community or only to those users above them in the role hierarchy. Communities are available in Salesforce Classic only.

Manager Groups

This checkbox enables or disables record sharing with managers and manager subordinates groups which is available via sharing rules, manual sharing, and Apex managed sharing. Manual sharing via the **Sharing** button is available in Salesforce Classic only.

Manual User Record Sharing

This checkbox enables or disables manual sharing on user records via the **Sharing** button. This button is available in Salesforce Classic only.

Portal User Visibility

This checkbox enables portal users to be visible to other portal users in the same account or only to those users above them in the role hierarchy. Portals are available in Salesforce Classic only.

Session Security Levels

If your org sets a policy that requires a high-assurance session to access reports and dashboards, users with a standard assurance session are blocked from reports and dashboards in Lightning Experience. Also, the Reports and Dashboards items don't appear in the navigation menu. In Lightning Experience, you can't raise the session level to high assurance by redirecting the user to complete two-factor authentication.

As a workaround, users with a standard assurance session can log out and log in again using an authentication method that is defined as high assurance by your organization. They then have access to reports and dashboards. Alternatively, they can switch to Salesforce Classic, where they are prompted to raise the session level when they attempt to access reports and dashboards.

Point-and-Click Customization: Lightning Experience Limitations

Many of your point-and-click customizations work seamlessly in Lightning Experience. But some customizations don't apply or aren't supported in the new interface.

- The Force.com Quick Access menu, with shortcuts to various app and object customization features, isn't available.
- You can't apply custom branding, including custom logos or colors, to the new interface.
- You can't add items to or delete items from the navigation menu, or rearrange the default set of items. The Lightning Experience navigation menu isn't controlled or affected by any customizations that you make to the Salesforce1 mobile app's navigation menu.
- Custom buttons that use a URL or JavaScript content source aren't supported in Lightning Experience. You can replace some of the functions covered by these buttons by using point-and-click tools like Process Builder, Visual Workflow, or code-driven approaches.

- Custom links with parameters for filling in form fields aren't supported.
- You can't define custom field-level help text or add field-level help for fields in custom objects.
- You can't customize items in the help menus on Lightning Experience pages. However, if you created custom help for "Help for this Page" links in Salesforce Classic, these links continue to display your help when classic pages are embedded in the new user interface, such as in the Setup tree.

Object-Specific Customizations

An object-specific customization is something that you create for a given object. Examples include fields, page layouts, record types, and Apex triggers. Most object-specific customizations are available in the Object Manager instead of directly from the Setup tree. From Setup, enter *Object Manager* in the **Quick Find** box, then select **Object Manager**.

 **Note:** Objects don't appear in the Object Manager—or anywhere in Setup—if they're related to features that aren't supported in Lightning Experience, such as case milestones.

Standard Fields

To edit standard fields, click the field name, and then click **Edit**. Unlike in Salesforce Classic, you can't edit standard fields directly from the object detail page.

Page Layouts

Record page customizations made in Salesforce Classic—for custom and standard objects—also affect record pages in Lightning Experience. However, some page elements display differently in Lightning Experience, and some aren't supported.

You can't access page layouts for user profiles from Lightning Experience.

Cases have a special related list dedicated to case close page layouts.

These page layout elements aren't supported in Lightning Experience:

- Blank spaces
- Expanded lookups
- Mobile cards
- S-controls
- Sections
- Tags

You can't use the enhanced page layout editor to customize the layout of record pages when viewed in Lightning Experience. All Lightning Experience users see the same record layout, regardless of profile or record type.

Triggers

Triggers appear in the Object Manager only if you have the "Author Apex" user permission.

Triggers for some standard objects don't appear in the Object Manager. Access those triggers directly from the Setup Quick Find box.

Field Sets

Field sets aren't available in Lightning Experience. If you or someone in your organization created a field set while using Salesforce Classic, you see the global variable for field sets in places such as formula fields and Visualforce pages, but you can't manage them in Lightning Experience.

Apex Sharing Rules

Not available in Lightning Experience.

Apex Sharing Recalculations

Not available in Lightning Experience.

[Object Customizations That Aren't in the Object Manager](#)

[What's the Fate of Existing Salesforce Customizations?](#)

Object Customizations That Aren't in the Object Manager

The Object Manager doesn't include some object customizations for standard objects, such as triggers for case comments. Access these object customizations via the `Quick Find` box. For example, from Setup, enter `Case Comment` in the `Quick Find` box, then select **Case Comment Triggers**.

- Case Comment Triggers
- Email Message Triggers
- FeedComment Triggers
- FeedItem Triggers
- Feed Item Layouts
- Group Layouts
- Group Triggers
- Group Member Triggers
- Group Record Triggers
- Publisher Layouts
- Topic Triggers
- TopicAssignment Triggers

Programmatic Customization: Lightning Experience Limitations

Many of your programmatic customizations work in Lightning Experience. But the new interface affects the way some features, such as Lightning Pages and Visualforce, behave.

Lightning Pages

Lightning Page tabs and custom Lightning Pages are currently available for the Salesforce1 mobile app only and aren't available in Lightning Experience.

Visualforce

This release contains a beta version of Visualforce for Lightning Experience that is production quality but has known limitations. Here are some of the most important considerations for organizations that have customized Salesforce with Visualforce. For complete details, score yourself a new developer badge by completing [Visualforce & Lightning Experience](#) in Trailhead.

Visualforce Is Wrapped in an iframe in Lightning Experience

In Salesforce Classic, Visualforce owns the entire page. In Lightning Experience, it's wrapped in an embedded iframe instead. This wrapper has a number of effects, and it's the main reason why a whole Trailhead module is devoted to covering the details.

`sfForce.one` No Longer Used Just for Salesforce1

The `sfForce.one` JavaScript utility object used to be available only on Visualforce pages when running in Salesforce1. If your organization enables Lightning Experience, it's also added to pages when running in Lightning Experience. If you've written code that makes assumptions about what the presence of `sfForce.one` means, you might need to update it.

You Can't Set `window.location`

A common technique in JavaScript to navigate to a new page is to manipulate the `window.location` value. This technique isn't possible in Lightning Experience. Use the `sfForce.one` navigation methods instead.

Object List Action Override Isn't Accessible

The object list action, one of the six standard actions you can override with a Visualforce page, isn't accessible in Lightning Experience. You can still override it, but your users can't access it.

Lightning Experience App User Interface Is Always Visible

When running in Lightning Experience, Visualforce pages ignore the `<apex:page>` `showHeader` and `showSidebar` attributes. You can't suppress the Lightning Experience header and sidebar.

Page Title Can't Be Set

The `<apex:page>` `title` attribute has no effect.

Home Doesn't Support Visualforce

The new Home in Lightning Experience can't be customized, so you can't add Visualforce elements to it.

Navigation Menu Doesn't Support Visualforce

You can't customize the navigation menu, so you can't add Visualforce items to it. Use the App Launcher instead.

SEE ALSO:

[What's the Fate of Existing Salesforce Customizations?](#)

Apps and Packaging: Lightning Experience Limitations

Apps on the AppExchange that are certified as Lightning Ready are supported in Lightning Experience. You can install and manage packages in Lightning Experience, but other packaging features aren't supported. ISVforce apps aren't supported either.

AppExchange

Some apps on the AppExchange are supported in Lightning Experience. If an app is supported, a *Lightning Ready* sash appears on its AppExchange listing. If an app isn't supported, use it in Salesforce Classic instead.

Apps without Lightning Ready certification can be used in Lightning Experience, but some features may not be available or work as expected. These apps may also appear visually inconsistent with Lightning Experience because they use Salesforce Classic styling. For the best experience, use Salesforce Classic for apps that aren't certified as Lightning Ready.

Packaging

You can install packages in Lightning Experience. But for packages that are already installed, you can't assign licenses to users from Lightning Experience. If you need to assign a license, switch to Salesforce Classic.

These packaging features aren't supported in Lightning Experience.

- Create a package
- Upload a package
- Upgrade a package
- Deprecate a package version
- Create branch or patch organizations

ISVforce Apps

Unsupported Features for ISVforce

These ISVforce features aren't supported in Lightning Experience.

- Channel Order App
- Environment Hub
- License Management App
- Trialforce
- Usage Metrics Visualization App

What to Expect in Lightning Experience When Chatter Is Turned Off

If your organization doesn't use Chatter, several useful aspects of the Lightning Experience interface aren't available. Learn how Lightning Experience changes, and see if you're losing functionality that you'd rather not live without.

If you turn off Chatter for a subset of users via permission sets or for your entire organization:

- Feeds and groups aren't available.
- User profiles are still available, but feeds, groups, and files aren't available on profiles.
- The Collaboration tab isn't available on records.
- Users can't follow records or other users.
- Users can't add attachments in the email composer, from Salesforce Files or a local drive.
- Salesforce Files isn't available.
- The enhanced Notes tool isn't available.
- Salesforce Files Connect and related external data sources aren't available.

SET UP AND MAINTAIN YOUR SALESFORCE ORGANIZATION

Welcome, Salesforce Administrators

As a Salesforce administrator—that is, a user assigned to the Administrator profile—you're responsible for setting up your online organization, which means adding users and configuring the system for your needs.

This guide contains the details you need to set up and maintain a Salesforce organization.

We hope this guide provides the complete content you need to get your organization up and running with Salesforce. If you need further support, contact the Support team at Salesforce.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: All Editions

Salesforce Trials

Trial Overview

During your trial, you can evaluate Salesforce before you subscribe. Your trial includes:

- Sample data. You can [delete sample data](#) or [start a new trial](#).
- Administrator privileges. The person who signed up automatically becomes the administrator. You can add another administrator when you [add more users](#).
- A variety of Salesforce features.
- The ability to [subscribe](#) to Salesforce.

Note: Features included in your trial may not be available in the Edition you choose to purchase.

If you set up multiple users in your trial and later choose to convert to Personal Edition, all users except the original system administrator will be deactivated.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Starting a New Trial

When you sign up for Salesforce, you can choose an industry-specific template with sample data. During your trial period, you can start a new trial with a blank template. To start a new trial, you must abandon your current trial, including all data and customizations.

You can start a new trial if you have:

- Less than 1000 rows of data
- No additional user licenses added by Salesforce
- No additional functionality enabled by Salesforce

To start a new trial:

1. From Setup, enter *Start a New Trial* in the **Quick Find** box, then select **Start a New Trial**. This link is available only during your trial period.
2. Select your language and template preferences.
3. Enter the requested text stating that you want to abandon your current trial organization and all of its data. This includes both sample data and data you have entered.
4. Check the box to confirm that all of your current trial data will be lost.
5. Click **Submit**.
6. When the confirmation page appears, click **Submit**.

 **Note:** By choosing to start a new trial, you are abandoning your current trial organization including all existing data and customizations. You will no longer be able to access the trial or data. Only usernames will be preserved.

Converting a Trial Using Checkout

Users with a Checkout account can convert a Salesforce trial into an Edition subscription. If your organization doesn't have self-service access to Checkout, submit a request to your Salesforce representative.

To convert your trial Edition into a subscription using Checkout, you must create a quote.

 **Note:** At any point during the quote creation process, you can click **Request Assistance** to contact your Salesforce account representative.

To convert your trial Edition into a subscription:

1. To create a quote, click **Subscribe Now** or select Checkout from the Force.com Apps drop-down list. Note that the Edition and products used in your trial organization are preselected in Checkout.

 **Important:** If at any point during quote creation you close the window, you lose all changes. If you are creating a new quote, you lose the entire quote. You can click **Save for Later** on any page if you want to save your changes and continue editing it later.

2. If you are a new user, or creating or editing a quote from a trial, enter and confirm the information on the Subscription Information tab.
3. If you are creating or editing a quote from a trial of a larger Edition, enter and confirm the information on the Products page, review your billing information, and click **Jump to Order Review**.

EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited

USER PERMISSIONS

User Permissions Needed

To start a new trial:

- "Modify All Data"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Personal
- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited

- If you want to create a quote for another Edition, click **Editions and Pricing**. Enter and confirm the subscription, product, and billing information, then click **Jump to Order Review**. The Order Review page displays the information you entered, as well as complete pricing for all products on the quote.

 **Note:** If you convert a trial organization to a lesser Edition, such as moving from a Professional Edition trial to a Group Edition subscription, some features and data from your trial are deleted. To accept the deletions, select the **Acknowledgment** checkbox. Click **Review this** to see a list of features not supported in your chosen Edition. If you want to back up all of your data before converting, log into your Salesforce organization and from Setup, enter *Data Export* in the **Quick Find** box, then select **Data Export**.

- Verify your purchase and click **Place Order**.

As a trial user, if you create a quote and don't follow through with placing an order, the quote is saved in Checkout. Once you complete a quote and place an order for an Edition subscription, any other Edition quotes you have open are closed.

SEE ALSO:

[Checkout User Guide](#)

Delete Trial Data

When you sign up for Salesforce, your organization is initially populated with some sample data. During your trial period, administrators can delete the sample data plus all your organization's data by using the Delete All Data link.

 **Note:** The Delete All Data link is visible only when all the following conditions are met.

- The user has the "Modify All Data" user permission.
- The organization is in a trial state.
- The organization doesn't have portals enabled.
- The user isn't a Partner Administrator, acting on another user's behalf.

- From Setup, enter *Delete All Data* in the **Quick Find** box, then select **Delete All Data**.
- Enter the requested text stating that you understand that all the data in your organization will be deleted. This includes both sample data and data you have entered. Your user and administration setup is not affected.
- Click **Submit**.

 **Note:** If data storage limits prevent you from deleting all your trial data this way, use Mass Delete Records to delete your accounts. Then use Delete All Data to delete your remaining trial data. For instructions for using Mass Delete Records, see [Deleting Multiple Records and Reports](#) on page 690.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To delete trial data:

- "Modify All Data"

Set Up Your Organization

Find Company Information

Find the information that's provided when your company signed up with Salesforce on the Company Information page in Setup.

From the Company Information page, you can:

- [Edit your company's information](#).
- View the [user licenses](#), [feature licenses](#), [permission set licenses](#), and [usage-based entitlements](#) that your organization has access to.
- [Add or remove licenses](#).
- (Sandbox organizations only) Match provisioned licenses in production to your sandbox organization. The matching process updates your sandbox organization with licenses from production and deletes any licenses in sandbox that aren't in production.

SEE ALSO:

[Company Information Fields](#)

[Enable Multiple Currencies](#)

[Sandbox Setup Tips and Considerations](#)

Company Information Fields

The Company Information page has the following fields (listed in alphabetical order), including the user and feature licenses purchased for your organization.

Field	Description
Address	Street address of the organization. Up to 255 characters are allowed in this field.
Admin Newsletter	Allow administrators in your organization to choose whether they want to receive administrator-targeted promotional emails from Salesforce.
API Requests, Last 24 Hours	The total number of API requests issued by the organization in the last 24 hours. The maximum number of requests depends on your Edition.
City	City in which organization is located. Up to 40 characters are allowed in this field.
Corporate Currency	The currency in which the organization's corporate headquarters reports revenue. Serves as the basis for all currency conversion rates. Only for organizations that use multiple currencies.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To view company information:

- "View Setup and Configuration"

To change company information:

- "Modify All Data"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

The available fields vary according to which Salesforce Edition you have.

Field	Description
Country	Country portion of user's address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Created By	User who signed up the organization, including creation date and time. (Read only)
Currency Locale	The country or geographic region in which the organization is located. The setting affects the format of currency amounts. For single currency organizations only.
Default Language	<p>The default language that is selected for new users in the organization. This setting determines the language used for the user interface text and help. In all editions except Personal Edition and Database.com, individual users can separately set the language for their own login, which will override the organization setting. In Group Edition, this field is called <code>Display Language</code>.</p> <p>This setting also determines the language in which all customizations—such as custom fields, tabs, and user interface options—are stored. For customizations, individual users' language settings do not override this setting.</p> <p>If you edit or clone existing filter criteria, make sure this setting matches the default language that was configured when the filter criteria was originally set. Otherwise, the filter criteria may not be evaluated as expected.</p>
Default Locale	The default country or geographic region that is selected for new users in the organization. This setting determines the format of dates, times, and names in Salesforce. In Contact Manager, Group, Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, individual users can set their personal locale, which overrides the organization setting. In Group Edition, this field is called <code>Locale</code> .
Default Time Zone	<p>Primary time zone in which the organization is located. A user's individual <code>Time Zone</code> setting overrides the organization's <code>Default Time Zone</code> setting.</p> <p>Note: Organizations in Arizona should select "Mountain Standard Time," and organizations in parts of Indiana that do not follow Daylight Savings Time should select "Eastern Standard Time."</p>
Division	Group or division that uses the service, for example, PC Sales Group. Up to 40 characters are allowed in this field.
Fax	Fax number. Up to 40 characters are allowed in this field.
Fiscal Year Starts In	If using a standard fiscal year, the starting month and year for the organization's fiscal year. If using a custom fiscal year, the value will be "Custom Fiscal Year."

Field	Description
Hide Notices About System Downtime	Select this checkbox to prevent advance notices about planned system downtime from displaying to users when they log in to Salesforce.
Hide Notices About System Maintenance	Select this checkbox to prevent advance notices about planned system maintenance from displaying to users when they log in to Salesforce.
Modified By	User who last changed the company information, including modification date and time. (Read only)
Newsletter	Allow users in your organization to choose whether they want to receive user-targeted promotional emails from Salesforce.
Organization Name	Name of the organization. Up to 80 characters are allowed in this field.
Phone	Main phone number at organization. Up to 40 characters are allowed in this field.
Primary Contact	Person who is main contact or administrator at the organization. You can enter a name, or select a name from a list of previously defined users. Up to 80 characters are allowed in this field.
Restricted Logins, Current Month	Number of restricted login users who have logged in during the current month. This value resets to zero at the beginning of each month. The maximum number of restricted login users for the organization is in parentheses.
Salesforce Licenses	Number of Salesforce user accounts that can be defined for access to the service. This is the number of Salesforce user licenses for which the organization is billed, if charges apply.
Salesforce Organization ID	Code that uniquely identifies your organization to Salesforce.
State/Province	State or province portion of user's address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Streaming API Events, Last 24 Hours	The total number of Streaming API events used by the organization in the last 24 hours. The maximum number of events depends on your edition.
Zip	Zip or postal code of the organization. Up to 20 characters are allowed in this field.
Used Data Space	Amount of data storage in use; the value is expressed as a measurement (for example, 500 MB) and as a percentage of the total amount of data storage available (for example, 10%).

Field	Description
Used File Space	Amount of file storage in use; the value is expressed as a measurement (for example, 500 MB) and as a percentage of the total amount of file storage available (for example, 10%).

The Setup Menu

Improved Setup User Interface in Salesforce Classic

The improved Setup user interface provides a streamlined experience for viewing and managing personal and administrative setup tasks.

When the improved Setup user interface is enabled in an organization, you might notice several differences from the original user interface.

- The Setup menu is accessed from the Setup link on the upper-right corner of any Salesforce page.
- The Setup menu is organized into goal-based categories: Administer, Build, Deploy, Monitor, and Checkout.
- Personal settings, which all Salesforce users can edit, are available from a separate My Settings menu.

To access My Settings, click your name in the upper-right corner of any Salesforce page, then click **My Settings**. You can also access My Settings from your Chatter profile page: in the right pane, click **My Settings**.

- The My Settings home page includes quick links for easily accessing the most commonly used personal settings tools and tasks.

! **Important:** When enabled, the improved Setup user interface is activated for every user in an organization. Be sure to notify your organization before enabling or disabling this setting.

To enable the improved Setup user interface, from Setup, enter *User Interface* in the **Quick Find** box, then select **User Interface**, then select **Enable Improved Setup User Interface**.

EDITIONS

Available in: Salesforce Classic

Available in: **All** editions except **Database.com**

 **Note:** The improved Setup user interface:

- Is not supported in Internet Explorer version 6
- Is available only when the new user interface theme is enabled

SEE ALSO:

[Find Your Personal Settings](#)

[Find Setup](#)

Searching Setup with Advanced Setup Search (Beta)

With Advanced Setup Search, users can search for many types of items in Setup, including approval items, custom objects and fields, custom profiles, permission sets, workflow items, users, and so on.

 **Note:** Advanced Setup Search is in beta. It is production quality but has known limitations.

To use Advanced Setup Search, be sure the Advanced Setup Search user interface setting is enabled. From Setup, enter *User Interface* in the *Quick Find* box, then select **User Interface**, then scroll to *Enable Advanced Setup Search (Beta)*. If Advanced Setup Search is disabled, the Setup search box returns only the titles of pages in the Setup menu, not individual items that you might have created or edited in Setup.

Advanced Setup Search is multipurpose, allowing you to use it in different ways.

- To find Setup pages, type part or all of a Setup page name in the Setup Search box. As you type in this box, you'll immediately see Setup pages whose names match what you're typing. Click the name of the page to open it.
- To find Setup metadata, enter at least two consecutive characters of the item you want and click  or press Enter. In the Setup Search Results page that appears, select the item you want from the list.

 **Note:** Some searchable items (such as permission sets) aren't available in some editions. Users can't search for items that aren't included in their edition.

 **Example:** For example, let's say you want to see all the installed packages in your organization. Enter *inst*. As you enter letters, the Setup menu shrinks to include only the menus and pages that match your search terms. You'll quickly see the link for the page you want (**Installed Packages**).

Next, perhaps you want to change the password for one of your users, Jane Smith. Enter *smi t* and click . From the Setup Search Results page, click the Jane Smith result to go directly to her user detail page.

SEE ALSO:

[Setup Search Results Page \(Beta\)](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To enable Advanced Setup Search:

- "Customize Application"

To search Setup:

- "View Setup and Configuration"

Setup Search Results Page (Beta)

The Setup Search Results page displays various types of items in Setup that match your search terms, including approval items, custom objects and fields, custom profiles, permission sets, workflow items, users, and so on.

 **Note:** Advanced Setup Search is in beta. It is production quality but has known limitations.

In the Setup Search Results page:

- The left pane shows each category with the number of results in parentheses.
 - Click any category to see only that category’s results.
 - If you’ve filtered your results by category, click **All Results** to show all search results.
- Click a result name to open it or click **Edit**.
- Use the search box at the top of the page to search Setup again.

 **Note:** Search terms that match a user’s name or community nickname (the `Nickname` field in the user detail page) return results that show the user’s name only. If the nickname doesn’t match the username, the result might not be obvious. For example, if a user who’s named Margaret Smith has the nickname Peggy, a search for `peg` returns Margaret Smith.

 **Tip:** When viewing setup search results, bookmark the results page in your Web browser to easily perform the same search in the future. For example, if you often search for “smit”, you can bookmark the results page to perform the same search again. The URL for this bookmark would be something like

`https://MyCompany.salesforce.com/ui/setup/SetupSearchResultsPage?setupSearch=smit.`

SEE ALSO:

Understanding Language, Locale, and Currency

The Salesforce settings for language, locale, time zone, and currency can affect how objects (Accounts, Leads, Opportunities, etc.) are displayed. In a single currency organization, the Salesforce administrators set the currency locale, default language, default locale, and default time zone for their organizations and the users can set their individual language, locale, and time zone on their personal settings pages. In a multiple currency organization, the Salesforce administrators set the corporate currency, default language, default locale, and default time zone for their organizations and the users can set their individual currency, language, locale, and time zone on their personal settings pages.

 **Note:** Single language organizations cannot change their language, although they can change their locale.

Setting	Who can edit the setting
Currency	User in a multiple currency organization
Corporate Currency	Administrator in a multiple currency organization
Currency Locale	Administrator in a single currency organization

- [Supported Currencies](#)
- [Which Languages Does Salesforce Support?](#)
- [Supported Locales](#)
- [Supported Time Zones](#)
- [Set Your Personal or Organization-Wide Currency](#)

Language Settings Overview

The Salesforce Web user interface, Salesforce for Outlook, Connect Offline, and Connect for Office are available in [multiple languages](#).

The Salesforce Web user interface has two language settings:

- Personal language—All on-screen text, images, buttons, and online help display in this language. Edit your personal information to change this setting.
- Default organization language—This applies to all new users until they select their personal language. This setting also determines the language in which all customizations—such as custom fields, tabs, and user interface options—are stored. For customizations, users' personal language settings don't override this default setting. Some setup items that are manually entered by an administrator can be translated in the Translation Workbench.

Administrators can change this setting by editing the company information.

Text entered by users remains in the language in which it was entered.

SEE ALSO:

- [Understanding Language, Locale, and Currency](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Which Languages Does Salesforce Support?

Salesforce offers three levels of language support: [fully supported languages](#), [end-user languages](#), and [platform-only languages](#). Each language is identified by a two-character language code, such as `en`, or a five-character locale code, such as `en_AU`.

 **Note:** Setting a default locale is different from setting a default language.

In addition to the Salesforce language support, you can localize your organizations in two ways. The Translation Workbench lets you specify languages you want to translate, assign translators to languages, create translations for customizations you've made to your Salesforce organization, and override labels and translations from managed packages. Everything from custom picklist values to custom fields can be translated so your global users can use all of Salesforce in their language.

The second option is to rename tabs and fields in Salesforce. If your custom application uses only a few standard Salesforce tabs and fields, you can translate them.

Fully Supported Languages

You can change the language for all features, including Help, to one of the following fully supported languages from Setup by entering *Company Information* in the `Quick Find` box, selecting **Company Information**, then selecting **Edit**.

- Chinese (Simplified): `zh_CN`
- Chinese (Traditional): `zh_TW`
- Danish: `da`
- Dutch: `n1_NL`
- English: `en_US`
- Finnish: `fi`
- French: `fr`
- German: `de`
- Italian: `it`
- Japanese: `ja`
- Korean: `ko`
- Norwegian: `no`
- Portuguese (Brazil): `pt_BR`
- Russian: `ru`
- Spanish: `es`
- Spanish (Mexico): `es_MX`
- Swedish: `sv`
- Thai: `th`

 **Note:**

- Spanish (Mexico) falls back to Spanish for customer-defined translations.
- Even though the Salesforce user interface is fully translated to Thai, Help remains in English.

End-User Languages

End-user languages are useful if you have a multilingual organization or partners who speak languages other than your company's default language. For end-user languages, Salesforce provides translated labels for all standard objects and pages, *except* administrative

pages, Setup, and Help. When you specify an end-user language, labels and Help that aren't translated appear in English. End-user languages are intended only for personal use by end users. Don't use end-user languages as corporate languages. Salesforce doesn't provide customer support in end-user languages.

End-user languages include:

- Arabic: ar
- Bulgarian: bg
- Croatian: hr
- Czech: cs
- English (UK): en_GB
- Greek: el
- Hebrew: iw
- Hungarian: hu
- Indonesian: in
- Polish: pl
- Portuguese (Portugal): pt_PT
- Romanian: ro
- Slovak: sk
- Slovenian: sl
- Turkish: tr
- Ukrainian: uk
- Vietnamese: vi

 **Note:** Salesforce provides limited support for right-to-left languages—Arabic and Hebrew—for the following features.

- Live Agent
- Cases
- Accounts

These features are not supported in Lightning Experience, the Salesforce1 mobile app, any other mobile app or mobile browser, or any user interface except Salesforce Classic. There is no guarantee that right-to-left languages function correctly with any other Salesforce features. There are no plans to expand the list of supported features.

Features that aren't supported for right-to-left languages include, but are not limited to, the following.

- Report Builder
- Generating quote PDFs
- Customizable forecasting
- Emails
- Salesforce Knowledge
- Feeds
- Communities

The absence of a feature from this list does not imply support. Only Live Agent, Cases, and Accounts are supported with right-to-left languages.

Platform-Only Languages

In situations where Salesforce doesn't provide default translations, use platform-only languages to localize apps and custom functionality that you've built on the Salesforce App Cloud. You can translate items such as custom labels, custom objects, and field names. You can also rename most standard objects, labels, and fields. Informative text and non-field label text aren't translatable.

Platform-only languages are available in all places where you can select a language in the application. However, when you select a platform-only language, all standard Salesforce labels default to English or, in select cases, to an end-user or fully supported language.

When you specify a platform-only language, labels for standard objects and fields fall back to English, except:

- English (Australia), English (India), English (Malaysia), and English (Philippines) fall back to English (UK).
- German (Austria) and German (Switzerland) fall back to German.
- French (Canada) falls back to French.
- Romanian (Moldova) falls back to Romanian.
- Montenegrin falls back to Serbian (Latin).
- Portuguese (Portugal) falls back to Portuguese (Brazil).

The following platform-only languages are currently supported.

- Albanian: `sq`
- Arabic (Algeria): `ar_DZ`
- Arabic (Bahrain): `ar_BH`
- Arabic (Egypt): `ar_EG`
- Arabic (Iraq): `ar_IQ`
- Arabic (Jordan): `ar_JO`
- Arabic (Kuwait): `ar_KW`
- Arabic (Lebanon): `ar_LB`
- Arabic (Libya): `ar_LY`
- Arabic (Morocco): `ar_MA`
- Arabic (Oman): `ar_OM`
- Arabic (Qatar): `ar_QA`
- Arabic (Saudi Arabia): `ar_SA`
- Arabic (Sudan): `ar_SD`
- Arabic (Syria): `ar_SY`
- Arabic (Tunisia): `ar_TN`
- Arabic (United Arab Emirates): `ar_AE`
- Arabic (Yemen): `ar_YE`
- Armenian: `hy`
- Basque: `eu`
- Bosnian: `bs`
- Bengali: `bn`
- Chinese (Simplified—Singapore): `zh_SG`
- Chinese (Traditional—Hong Kong): `zh_HK`
- English (Australia): `en_AU`

[Understanding Language, Locale, and Currency](#)

[Setting Up the Translation Workbench](#)

Supported Locales

The Salesforce locale settings determine the display formats for date and time, users' names, addresses, and commas and periods in numbers. For single-currency organizations, locales also set the default currency for the organization when you select them in the `Currency Locale` picklist on the Company Information page.

Name	Code	Default currency	Date and time format	Time format	Number format	Name format	Address format

Supported Time Zones

You can find a list of Salesforce supported times zones and codes for your organization under your personal settings.

1. From your personal settings, enter *Time Zone* in the *Quick Find* box, then select **Language and Time Zone**. No results? Enter *Personal Information* in the *Quick Find* box, then select **Personal Information**. Then click **Edit**.
2. Click the Time Zone drop-down list for a list of supported time zones.

For reference, the Salesforce supported times zones and codes (in chronological order) are as follows:

Time Zone Code	Time Zone Name
GMT+14:00	Line Is. Time (Pacific/Kiritimati)
GMT+13:00	Phoenix Is. Time (Pacific/Enderbury)
GMT+13:00	Tonga Time (Pacific/Tongatapu)
GMT+12:45	Chatham Standard Time (Pacific/Chatham)
GMT+12:00	New Zealand Standard Time (Pacific/Auckland)
GMT+12:00	Fiji Time (Pacific/Fiji)
GMT+12:00	Petropavlovsk-Kamchatski Time (Asia/Kamchatka)
GMT+11:30	Norfolk Time (Pacific/Norfolk)
GMT+11:00	Lord Howe Standard Time (Australia/Lord_Howe)
GMT+11:00	Solomon Is. Time (Pacific/Guadalcanal)
GMT+10:30	Australian Central Standard Time ((South Australia) Australia/Adelaide)
GMT+10:00	Australian Eastern Standard Time (New South Wales) (Australia/Sydney)

The available personal setup options vary according to which Salesforce Edition you have.

Edit Conversion Rates

You can manage static exchange rates between your active and inactive currencies and the corporate currency by editing the conversion rates. These exchange rates apply to all currency fields used in your organization. In addition to these conversion rates, some organizations use dated exchange rates for opportunities and opportunity products.

1. Search Setup for Manage Currencies.
2. If you use advanced currency management, click **Manage Currencies**.
3. In the Active Currencies or Inactive Currencies list, click **Edit Rates**.
4. Enter the conversion rate between each currency and your corporate currency.
5. Click **Save**.

When you change the conversion rates, currency amounts are updated using the new rates. Previous conversion rates are not stored. All conversions within opportunities, forecasts, and other amounts use the current conversion rate.

If your organization uses advanced currency management, you can also manage dated exchange rates for currency fields on opportunities and opportunity products.

Note:

- You cannot track revenue gain or loss based on currency fluctuations.
- Changing conversion rates causes a mass recalculation of roll-up summary fields. This recalculation can take up to 30 minutes, depending on the number of records affected.
- You can also change a conversion rate via the API. However, if another roll-up summary recalculation for the same currency field is in progress, the age of that job affects the recalculation job that you triggered. Here's what happens when you request a currency rate change via the API, and a related job is in progress.
 - If the other recalculation for the same currency field was kicked off less than 24 hours ago, your currency rate change isn't saved. You can try again later or instead change the currency rate from Manage Currencies in Setup. Initiating the change from Setup stops the old job and triggers your recalculation to run.
 - If the other recalculation job was kicked off more than 24 hours ago, you can save your currency rate change and your job starts.

To check the status of your recalculation job, see the Background Jobs page in Setup.

About Fiscal Years

Not all businesses use the Gregorian year for their fiscal year. Salesforce makes it easy for you to define a fiscal year that fits your business needs.

If your fiscal year follows the Gregorian calendar, but does not start in January, you can simply and easily set your fiscal year by defining a standard fiscal year. If your fiscal year follows a different structure, you can define a custom fiscal year that meets your needs.

Whether you use a standard fiscal year or a custom fiscal year, you can define individual fiscal years once for your entire organization. These fiscal year definitions allow you to use these fiscal periods throughout Salesforce including in reporting, opportunities, and forecasting.

 **Tip:** As a best practice, define your custom fiscal years after your current forecast. Also, update product schedules and forecasts whenever a custom fiscal year is created or changed.

Standard Fiscal Years

Standard fiscal years are periods that follow the Gregorian calendar, but can start on the first day of any month of the year. Unlike custom fiscal year, standard fiscal years can be used by organizations that do not have customizable forecasting enabled.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except for **Database.com**.

USER PERMISSIONS

To define or edit fiscal years:

- "Customize Application"

To view fiscal years:

- "View Setup and Configuration"

Custom Fiscal Years

For companies that break down their fiscal years, quarters, and weeks into custom fiscal periods based on their financial planning requirements, Salesforce allows you to flexibly define these periods using custom fiscal years. For example, as part of a custom fiscal year, you can create a 13-week quarter represented by three periods of 4, 4, and 5 weeks, rather than calendar months.

If you use a common fiscal year structure, such as 4-4-5 or a 13-period structure, you can rapidly define a fiscal year by simply specifying a start date and an included template. If your fiscal year structure is not included in the templates, you can easily modify a template. For example, if you use three fiscal quarters per year (a trimester) rather than four, delete or modify quarters and periods to meet your needs.

Custom fiscal periods can be named based on your standards. For example, a fiscal period could be called "P2" or "February."

Fiscal years can be modified any time that you need to change their definition. For example, an extra week could be added to synchronize a custom fiscal year with a standard calendar in a leap year. Changes to fiscal year structure take effect immediately upon being saved.

Considerations When Enabling Custom Fiscal Years

Before enabling custom fiscal year, consider these issues:

- Once you enable custom fiscal years, you cannot disable it. However, you can define custom fiscal years that follow the same Gregorian calendar structure as the Salesforce standard fiscal years.
- Fiscal years will not be automatically created. The only fiscal years available are those that your organization defines.
- Custom fiscal years can be enabled only with customizable forecasting, *not* with collaborative forecasting.
- Enabling or defining custom fiscal years impacts your forecasts, reports, and quotas.
 - When you define a new custom fiscal year, or when you change the length of any fiscal period, all quotas for that year will be lost.
 - When you define a new custom fiscal year, or when you change the length of any fiscal period, forecasts, forecast history, and forecast overrides are lost. Changing the length of a period may also affect the previous or next fiscal year and reports associated with it. Forecasts for periods before the first custom fiscal year will be saved and can be accessed as usual.
 - Forecast reports for a period after the last defined fiscal year cannot be grouped by period, only by date.
 - To ensure your forecast reports have the most updated amounts, view the forecast for the period included in the report before running a forecast report.
- Your organization will not be able to use fiscal period columns in opportunity, opportunity with product, or opportunity with schedule reports.
- Opportunity list views will not include a fiscal period columns.
- When custom fiscal years are enabled, you can't use the `FISCAL_MONTH()`, `FISCAL_QUARTER()`, or `FISCAL_YEAR()` date functions in SOQL.

[Set the Fiscal Year](#)

[Customizing the Fiscal Year Structure](#)

[Customizing the Fiscal Year Labels](#)

[Choosing a Custom Fiscal Year Template](#)

[Defining a Custom Fiscal Year](#)

Set the Fiscal Year

You can set one of two types of fiscal years: standard fiscal years or custom fiscal years. For specific information on both types of fiscal years, see [About Fiscal Years](#) on page 346.

Setting a Standard Fiscal Year

If your organization follows the Gregorian calendar year, but you want to change the fiscal year start month, use standard fiscal years. A standard fiscal year can start on the first day of any month, and you specify whether it is named for the starting or ending year. For example, if your fiscal year starts in April 2015 and ends in March 2016, your fiscal year setting can be either 2015 or 2016. If your fiscal year is more complicated, see [Enabling Custom Fiscal Years](#) on page 348.

Warning:

- Users of Customizable Forecasting: If you change your fiscal start month, you can lose all quotas, forecast history, and overrides. To preserve your data, change to a month previously used as the first month in a quarter. For example, if your start month is April and you change it to May, which isn't a month that starts a fiscal quarter, you lose data. If you change it to July, which is a month that starts a fiscal quarter, you preserve your data.
- Users of Collaborative Forecasts: If you change your fiscal year start month, quota and adjustment information is purged.

To set a standard fiscal year:

1. Back up your current data and export it into a set of comma-separated values (CSV) files.
We suggest you run a data backup export because changing the fiscal year causes fiscal periods to shift. This change affects opportunities and forecasts organization-wide.
2. From Setup, enter *Fiscal Year* in the **Quick Find** box, then select **Fiscal Year**.
3. Select **Standard Fiscal Year**.
4. Choose the start month.
5. Specify whether the fiscal year name is based on the year it begins or ends.
6. Optionally, select **Apply to All Forecasts and Quotas** if you want to apply the new fiscal year settings to your existing forecasts and quotas. This option might not be available depending on your forecast settings.
7. Click **Save**.

Enabling Custom Fiscal Years

If your organization does not observe a standard fiscal year, you can enable custom fiscal years, which flexibly define a more complex fiscal year structure.

To enable custom fiscal years:

 **Note:** Before enabling custom fiscal years, make sure that you have exported any data related to fiscal periods. For specific details about the effects of enabling custom fiscal years, see [About Fiscal Years](#) on page 346.

1. Back up your current data and export it into a set of comma-separated values (CSV) files.

We suggest you run a data backup export because changing the fiscal year causes fiscal periods to shift. This change affects opportunities and forecasts organization-wide.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except for **Database.com**.

USER PERMISSIONS

To view fiscal year:

- "View Setup and Configuration"

To change fiscal year:

- "Customize Application"

- From Setup, enter *Fiscal Year* in the **Quick Find** box, then select **Fiscal Year**.
- Select **Custom Fiscal Year**.
- Click **Enable Custom Fiscal Years**.
- If you understand the effects of enabling custom fiscal years and you have all your data exported, click **OK**.

 **Warning:** Custom fiscal years cannot be disabled once enabled. Enabling custom fiscal years has impacts on your reports, forecasts, quotas, and other date-sensitive material. Do not enable custom fiscal years unless you understand and are prepared for all the implications.

- Once you have enabled custom fiscal years, define your fiscal year. See [Defining a Custom Fiscal Year](#) on page 353.

Customizing the Fiscal Year Structure

If your custom fiscal year needs a different structure than one available from the [templates](#), you can use advanced customization to modify the details of your custom fiscal year definition. Custom fiscal years allow you to:

- [Customize the period labels](#)
- [Reset the fiscal year to a template](#)
- [Add or remove fiscal periods](#)
- [Change the length of a fiscal week](#)

 **Warning:** Changing the length of a fiscal year has an impact on forecasting and reporting. For detailed information on the impact, see [About Fiscal Years](#) on page 347.

Customizing the Period Labels

The fiscal year period labels for forecasting and reporting are set by the default label values for the fiscal year periods. To change them, see [Customizing the Fiscal Year Labels](#) on page 350.

Resetting the Fiscal Year to a Template

During customization, if you want to return to a fiscal year template, select a template from the **Reset Fiscal Year Structure** drop-down list.

 **Note:** Resetting the fiscal year structure to a template removes all the customizations you made to the fiscal year.

Adding or Removing Fiscal Periods

You can easily add or remove fiscal periods (such as quarters, periods, or weeks) from the fiscal year structure.

To add fiscal periods:

- From Setup, enter *Fiscal Year* in the **Quick Find** box, then select **Fiscal Year**.
- Click **Edit** for the fiscal year you want to edit.
- If it is not already expanded, expand the **Advanced Customization** section.
- Select the checkbox for the period before the new period. For example, if you want to add a new quarter, and you want it to be the second quarter, select the checkbox for the first quarter.
- Click **Insert**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except for **Database.com**.

USER PERMISSIONS

To define or edit fiscal years:

- “Customize Application”

To view fiscal years:

- “View Setup and Configuration”

 **Note:** The maximum number of fiscal periods is 250.

To remove a fiscal period:

1. From Setup, enter *Fiscal Year* in the **Quick Find** box, then select **Fiscal Year**.
2. Click **Edit** for the fiscal year you want to edit.
3. If it is not already expanded, expand the **Advanced Customization** section.
4. Select the checkbox for the period you want to delete.
5. Click **Delete**.

 **Note:** You must have at least one quarter, one period, and one week.

Changing the Length of a Fiscal Week

To change the length of fiscal periods:

1. From Setup, enter *Fiscal Year* in the **Quick Find** box, then select **Fiscal Year**.
2. Click **Edit** for the fiscal year you want to edit.
3. If it is not already expanded, expand the **Advanced Customization** section.
4. Choose the length from the **Duration** drop-down list for the fiscal week.

 **Note:** To change the duration of a fiscal period or quarter, insert or delete weeks, or change the length of weeks that compose the period or quarter.

Once you have customized your fiscal year, preview the fiscal year definition. If it is correct, close the preview and click **Save** to save your fiscal year.

Customizing the Fiscal Year Labels

There are two ways to customize the labeling of your fiscal year:

1. Naming schemes and prefix choices
2. Fiscal year picklist customization

Fiscal Year Naming Schemes and Prefix Choices

When defining a custom fiscal year, you can choose the labeling scheme to use for your custom fiscal year. Each fiscal period type (quarter, period, and week) has a list of labeling schemes that you can select.

Quarter Name Scheme

Numbered by Year

This option allows you to add the quarter number to the quarter label. The quarter label is a combination of the label for the quarter prefix and the quarter number. For example, if the quarter prefix is “Q”, the label for the third quarter Q3. To customize the quarter prefix, see [Quarter Prefix](#) on page 351. By default the number for each quarter is set by their order (the first quarter is labeled “1”), but you can customize it by selecting a different value from the quarter detail drop-down list.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** Editions except Database.com.

USER PERMISSIONS

To define or edit fiscal years:

- “Customize Application”

To view fiscal years:

- “View Setup and Configuration”

Custom Quarter Names

This option allows you to set the quarter label to any name. The quarter label is set to the name you select from [Quarter Name](#). By default the order of the quarter names is the same as the picklist order, but you can customize it by selecting a different value from the quarter detail drop-down list.

Period Name Scheme

Numbered By Year

This option allows you to set the period label based on its position in the year. The period label is a combination of the period prefix and the period number. Period numbers do not reset in each quarter. For example, if the period prefix is "P," the label for the sixth period is P6. To customize the `Period Prefix`, see [Period Prefix](#) on page 351. By default the number for each period is set by their order (the first period is labeled "1"), but you can customize it by selecting a different value from the period detail drop-down list.

Numbered By Quarter

This option allows you to set the period label based on its position in the quarter. The period label is a combination of the period prefix and the period number. Period numbers reset in each quarter. For example, if the period prefix is "P," and the sixth period is the second period in the second quarter, its label is P2. To customize the period prefix, see [Period Prefix](#) on page 351. By default the number for each period is set by their order within the quarter (the first period in a quarter is labeled "1"), but you can customize it by selecting a different value from the period detail drop-down list.

Standard Month Names

This option allows you to set the period label to the month name of the start of the period. For example, if a period started on October 12 and ends on November 10, the period label would be October.

Custom Period Names

This option allows you to set the period label to any string. The period label is set to the string you select from [Period Name](#). By default the order of the period names is the same as the picklist order, which you can customize by selecting a different value from the period detail drop-down list.

Fiscal Year Picklists

Review these custom picklists to customize the labels for your custom fiscal year.

Quarter Prefix

The quarter prefix picklist is a list of options for the text that prefixes the quarter number or name if your fiscal year uses the **Numbered By Year** quarter naming scheme. For example, if the fiscal quarter is called "Q4," the "Q" is the quarter prefix.

Period Prefix

The period prefix picklist is a list of options for the text that prefixes the period number or name if your fiscal year uses the **Numbered By Year** period naming scheme. For example, if the fiscal quarter is called "P4," the "P" is the period prefix.

Quarter Name

The quarter name picklist is a list of options for the quarter name if your fiscal year uses the **Custom Quarter Names** quarter naming scheme. For example, if you want to name your quarters for the seasons (Spring, Summer, Fall, and Winter), you could set the quarter name list to those values.

Period Name

The period name picklist is a list of options for the quarter name if your fiscal year uses the **Custom Period Names** quarter naming scheme. Similar to the quarter name picklist, you can choose meaningful names for the period name picklist.

Customizing Fiscal Year Names

To customize one of these picklists:

1. From Setup, enter *Fiscal Year* in the `Quick Find` box, then select **Fiscal Year**.

2. Click **Edit** next to the appropriate picklist.

SEE ALSO:

[About Fiscal Years](#)

Choosing a Custom Fiscal Year Template

When defining a new custom fiscal year, your first step is to choose a custom fiscal year template. These templates are available to make it easier for you to define your custom fiscal year. They create a simple custom fiscal year that you can customize to meet your exact needs.

 **Note:** If you choose a template and realize that it is not the best one for your fiscal year definition, you can reset it at any time using the **Reset Fiscal Year Structure** option.

Choose one of three types of templates:

4 Quarters per Year, 13 Weeks per Quarter

Choose one of these templates for your fiscal year if you want each quarter to have the same number of weeks per quarter. These templates all have 4 quarters, 12 periods, and 52 weeks per year. Each quarter is 13 weeks long and is composed of three periods. Two of the periods in each quarter are 4 weeks, and one is 5 weeks. In a 4-4-5 template, for example, the first and second period of a quarter are 4 weeks long, and the third period is 5 weeks long. Weeks are always 7 days long. A typical customization for these templates is to add extra weeks for leap years.

4-4-5

Within each quarter, period 1 has 4 weeks, period 2 has 4 weeks, and period 3 has 5 weeks

4-5-4

Within each quarter, period 1 has 4 weeks, period 2 has 5 weeks, and period 3 has 4 weeks

5-4-4

Within each quarter, period 1 has 5 weeks, period 2 has 4 weeks, and period 3 has 4 weeks

13 Periods per Year, 4 Weeks per Period

Choose one of these templates if your fiscal year has more than 12 periods and if one quarter is longer than the other quarters. These templates all have 4 quarters per year, 13 periods per year, 3 or 4 periods per quarter, 53 weeks per year, and 4 weeks per period (5 weeks in the final period). Weeks generally have 7 days, but will include a short week at the end of a year. The most common customization for this type of template is to create or change the length of a short week.

3-3-3-4

Quarter 1 has 3 periods, quarter 2 has 3 periods, quarter 3 has 3 periods, and quarter 4 has 4 periods

3-3-4-3

Quarter 1 has 3 periods, quarter 2 has 3 periods, quarter 3 has 4 periods, and quarter 4 has 3 periods

3-4-3-3

Quarter 1 has 3 periods, quarter 2 has 4 periods, quarter 3 has 3 periods, and quarter 4 has 3 periods

4-3-3-3

Quarter 1 has 4 periods, quarter 2 has 3 periods, quarter 3 has 3 periods, and quarter 4 has 3 periods

Gregorian Calendar

12 months/year, standard Gregorian calendar.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**.

USER PERMISSIONS

To change your fiscal year:

- "Customize Application"

Unlike the other template styles, you cannot do advanced customization of a fiscal year that has been created from a Gregorian calendar template. You should only use this template if you want to create a fiscal year that follows the Gregorian calendar. This template mimics the functionality of standard fiscal years.

SEE ALSO:

[About Fiscal Years](#)

Defining a Custom Fiscal Year

Before defining a custom fiscal year, enable custom fiscal years for your organization. See [Enabling Custom Fiscal Years](#) on page 348 for more information.

Enabling custom fiscal years does not automatically define them. You must define all of your company's custom fiscal years so that they fit your company's calendar.

If you have defined a custom fiscal year and you need to change it, you can edit the existing fiscal year definition. Custom fiscal years cannot be deleted. Instead of deleting an existing fiscal year, edit it until it meets your needs.

Before defining or editing any custom fiscal years, be aware of its impact on forecasting, reports, and other objects by reviewing [About Fiscal Years](#) on page 346.

Defining a New Custom Fiscal Year

To define a new custom fiscal year:

1. From Setup, enter *Fiscal Year* in the **Quick Find** box, then select **Fiscal Year**.
2. Click **New**. The Custom Fiscal Year template dialog opens.
3. Choose a template and click **Continue** to close the Custom Fiscal Year template dialog. For more information on the templates, see [Choosing a Custom Fiscal Year Template](#) on page 352.
4. Set the fiscal year start date, the fiscal year name, and choose the week start day. You can also add a description for the fiscal year.

Note: If this is the first custom fiscal year you have defined, the **Fiscal Year Start Date** and the **Week Start Date** are set to today's date and day of week. If you have already defined a custom fiscal year, they will be set to the day after the last end date of your custom fiscal years.

If you need to make changes other than the start date, year name, or week start day, see [Customizing the Fiscal Year Structure](#) on page 349.

5. Optionally, review the fiscal year definition by clicking on **Preview**.

If it is correct, close the preview and click **Save** to save your fiscal year, or **Save & New** to save your fiscal year and define another fiscal year.

Editing a Custom Fiscal Year

To edit an existing custom fiscal year definition:

1. From Setup, enter *Fiscal Year* in the **Quick Find** box, then select **Fiscal Year**.
2. Click a defined fiscal year name to review the details. Close the fiscal year preview to continue.
3. Click **Edit** for the fiscal year you want to edit.
4. Change the **Fiscal Year Start Date**, the **Fiscal Year Name**, **Description**, or **Week Start Day**.

EDITIONS

Available in: **Salesforce Classic**

Available in: **All Editions** except for **Database.com**.

USER PERMISSIONS

To view fiscal year:

- "View Setup and Configuration"

To change your fiscal year:

- "Customize Application"

If changing the `Fiscal Year Start Date` causes this fiscal year to overlap with the previous fiscal year, or if it creates a gap between the fiscal years, the end date of the previous fiscal year will be changed to the day before the start of this fiscal year.

If changing the end date will cause this fiscal year to overlap the next fiscal year, or if it creates a gap between the fiscal years, the start date of the next fiscal year will be changed to the day after the end of this fiscal year.

 **Note:** You cannot change the start or end date of a fiscal year that causes it to overlap with a fiscal year that is defined using a Gregorian year template.

 **Warning:** If you change the start or end date of any quarter, period, or week, all forecast data (including quotas, forecast history, and forecast overrides) that are within that date range, and all forecasts for date ranges automatically adjusted as a result of that change, will be lost. This includes end or start date changes resulting from inserting or deleting periods.

5. Click **Preview**.

6. Review the fiscal year definition. If it is correct, close the preview and click **Save** to save your fiscal year. If you need to make more detailed edits, see [Customizing the Fiscal Year Structure](#) on page 349.

 **Note:** Unless you specify them, the fiscal year period labels for forecasting and reporting will be set by the default label values for the fiscal year periods. If you would like to change them, see [Customizing the Fiscal Year Labels](#) on page 350.

Set Up Search

Customize Search Settings

To change your organization's search settings:

1. From Setup, enter `Search Settings` in the `Quick Find` box, then select **Search Settings**.
2. Modify the search settings for your organization.
3. Click **Save**.

Search Settings

The search settings are:

Enable Drop-Down List for Sidebar Search

The drop-down list for sidebar search allows you to limit users' searches by object. When you select `Enable Drop-Down List for Sidebar Search`, a drop-down list appears in the Search section. From this list, users can select to search within tags, within a specific object, or across all objects.

Enable "Limit to Items I Own" Search Checkbox

The `Limit to Items I Own` checkbox allows your users to include only records for which they are the record owner when entering search queries in the sidebar.

 **Note:** The `Limit to Items I Own` checkbox that appears in advanced search is always available to users, regardless of this setting.

Enable Document Content Search

Enabling `Document Content Search` allows you to perform a full-text document search. When a new document is uploaded or an old one is replaced, its contents are available as search terms to retrieve the document.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To modify search settings:

- "Customize Application"

Enable Search Optimization if your Content is Mostly in Japanese, Chinese, or Korean

Enabling this checkbox optimizes search for the Japanese, Chinese, and Korean languages. It affects sidebar search and the account search for **Find Duplicates** on a lead record in sidebar search and global search. Enable this option if users are searching mostly in Japanese, Chinese, or Korean, and if the text in searchable fields is mostly in those languages.

Don't check this option if you expect content and searches to be mostly in other languages.

Use Recently Viewed User Records for Blank and Auto-Complete Lookups

If this setting is enabled, the list of records that are returned from a user auto-complete lookup and from a blank user lookup is taken from the user's recently viewed user records. This setting applies only to user object lookups and not to lookups for other objects.

If this setting isn't enabled, the dialog box shows a list of recently accessed user records from across your organization.

Enable English-Only Spell Correction for Knowledge Search (Beta)

If this setting is enabled, search suggests and searches alternate spellings for English search terms:

- On the Articles and Article Management tabs
- In the articles tool in Case Feed
- In the Salesforce Knowledge sidebar in the Salesforce console

This setting applies to article searches via the API but not to article searches in global search.

Enable Sidebar Search Auto-Complete

If this setting is enabled, when users start typing search terms, sidebar search displays a matching list of recently viewed records.

Note: Global search includes auto-complete and doesn't require a search setting.

Enable Single-Search-Result Shortcut

If this setting is enabled, users skip the search results page and go directly to the record's detail page when their search returns only a single item.

This setting doesn't apply to tags, case comments (in advanced search), and global search. If the search result is a single tag, case comment, or item in global search, the search results page still appears.

Number of Search Results Displayed Per Object

The Number of Search Results Displayed Per Object area allows you to configure the number of items that are returned for each object in the Search Results page. The current setting is in parentheses next to each object. To change this setting, select one or more objects, enter the new number of results per page, and then click **Save**. The new value must be from 5 and 50.

Lookup Settings

The Lookup Settings area allows you to enable enhanced lookups and lookup auto-completion for account, contact, user, and any custom object lookups.

SEE ALSO:

[Guidelines for Making Search Faster](#)

Customize Users' Search Results Filters

1. On the Search Results page, in an object's related list, click **Customize...** > **Filters for All Users**.
Alternatively, from the management settings for an object, go to Search Layouts, and then click **Edit** for **Search Filter Fields**.

2. To choose columns, use **Add** and **Remove**.

3. To reorder columns, use **Up** and **Down**.

4. Click **Save**.

 **Note:** Search result filters defined for an object in the internal organization also apply for search results for that object in communities.

SEE ALSO:

[Find Object Management Settings](#)

Configure Lookup Dialog Search

Customize which columns appear to users in the lookup search results.

IN THIS SECTION:

[Configure Lookup Dialog Search in Salesforce Classic](#)

Enable enhanced lookups and lookup auto-completion and customize lookup filter fields.

[Configure Lookup Dialog Search in Lightning Experience](#)

Customize which columns appear to users in the lookup dialog search results using the Search Results search layout customization setting. Users aren't able to sort and filter using these columns. They are intended to provide contextual help for determining which record to associate.

Configure Lookup Dialog Search in Salesforce Classic

Enable enhanced lookups and lookup auto-completion and customize lookup filter fields.

Administrators can configure lookups by:

- [Enabling enhanced lookups](#)
- [Specifying lookup filter fields](#)
- [Enabling lookup auto-completion](#)

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To change search layouts:

- "Customize Application"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Enabling Enhanced Lookups

Enable enhanced lookups so users can use wildcards in their lookups and sort, filter, and page through their results. Enhanced lookups are supported for accounts, contacts, users, opportunities, and custom objects.

 **Note:** Custom object records are searchable in the Salesforce user interface only if the custom object is associated with a custom tab. Users aren't required to add the tab for display.

1. From Setup, enter *Search Settings* in the *Quick Find* box, then select **Search Settings**.
2. In the Lookup Settings area, select the objects for which you want to enable enhanced lookup functionality. Currently, only account, contact, user, and custom object lookups can use this feature.
3. Click **Save**.

After enabling enhanced lookups, specify which fields users can use to filter lookup search results. If you don't specify any fields, your users can't use filters in enhanced lookup dialogs. Fields configured to use enhanced lookups don't support single character searches (except for searches in Chinese, Japanese, Korean, and Thai) or wildcards at the beginning of search terms.

 **Note:** If you enable enhanced lookups in your organization, it is also enabled for any Visualforce pages you create.

SEE ALSO:

[Configure Lookup Dialog Search in Salesforce Classic](#)

Specify Lookup Filter Fields

After enabling enhanced lookups, specify which fields users can use to filter lookup search results. If you don't specify any fields, your users can't use filters in enhanced lookup dialogs.

1. From the management settings for accounts, contacts, opportunities, users, or custom objects, go to Search Layouts.
2. For the Lookup Filter Fields layout, click **Edit**.
3. Use the arrows to add or remove fields from the layout and to define the order in which the fields should display. You can add up to six filter fields to the Selected Fields list. To select more than one field, use CTRL+click, or SHIFT+click to select multiple items in a range.
4. Click **Save**.

SEE ALSO:

[Configure Lookup Dialog Search in Salesforce Classic](#)

[Find Object Management Settings](#)

To enable enhanced lookups:

- "Customize Application"

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To specify lookup filter fields:

- "Customize Application"

Enabling Lookup Auto-Completion

Enable lookup auto-completion so users can select items from a dynamic list of matching, recently used records when editing a lookup field. It's supported for account, contact, user, opportunity, and custom object lookups.

1. From Setup, enter *Search Settings* in the *Quick Find* box, then select **Search Settings**.
2. In the Search Settings area, select the object lookups for which you want to enable auto-completion. Currently, only account, contact, opportunity, user, and custom object lookups can use this feature.
3. Click **Save**.

SEE ALSO:

[Configure Lookup Dialog Search in Salesforce Classic](#)

Configure Lookup Dialog Search in Lightning Experience

Customize which columns appear to users in the lookup dialog search results using the Search Results search layout customization setting. Users aren't able to sort and filter using these columns. They are intended to provide contextual help for determining which record to associate.

Use **Search Results** under the **Search Layouts** customization setting to change which fields appear in the search results for both global search and lookup dialog search. You don't need to separately update **Lookup Dialogs**.

The order of fields in the search layout also affects the secondary field displayed in instant results. The second usable field as chosen in this step appears as the secondary field in instant results. Examples of unusable fields are HTML-formatted fields, inline image fields, or long-text fields.

SEE ALSO:

[Find Object Management Settings in Lightning Experience](#)

Guidelines for Making Search Faster

Follow these guidelines to help your users find information faster.

Records are included in search results only if the object's field that contains the information matching the search term is searchable.

After a searchable object's record is created or updated, it could take about 15 minutes or more for the updated text to become searchable.

To make searches faster across your org:

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To enable lookup auto-completion:

- "Customize Application"

To use lookup auto-completion:

- "Edit" on the record that includes the lookup field

EDITIONS

Available in: Lightning Experience

Available in: **All Editions** except **Personal Edition**, **Contact Manager Edition**, **Corporate Social Network Edition**

USER PERMISSIONS

To specify lookup filter fields:

- "Customize Application"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Disable search for custom objects that your users aren't actively searching

Choose which custom objects your users can search by enabling the **Allow Search** setting on the custom object setup page. If you don't need a custom object's records to be searchable, disable search for that custom object. Making a custom object searchable when you don't need your users to find its records slows down searches across your org.

By default, search is disabled for new custom objects.

 **Note:** Custom object records are searchable in the Salesforce user interface only if the custom object is associated with a custom tab. Users aren't required to add the tab for display.

Avoid making significant changes to your org at once

Creating or updating many records at the same time, such as via Data Loader, increases the amount of time required for each record to become searchable. If you have a large org with many users who frequently make simultaneous updates, schedule bulk uploads and background processes to run during non-peak hours.

State and Country Picklists

State and Country Picklists

State and country picklists allow users to select states and countries from predefined, standardized lists, instead of entering state and country data into text fields. State and country picklists offer faster and easier data entry. They help to ensure cleaner data that can be leveraged for other uses—in reports and dashboards, for example. They protect data integrity by preventing typos, alternate spellings, and junk data—even in records updated through the API. The states and countries in the picklists are based on ISO-3166 standard values, making them compatible with other applications.

State and country picklists are available in the shipping, billing, mailing, and “other” address fields in the account, campaign members, contact, contract, lead, person accounts, quotes, and service contracts standard objects. The picklists are also available for managing users and companies in Administration Setup. To use the picklists, first choose the country and then choose from the options that automatically populate the state or province picklist.

You can use the state and country picklists in most places that state and country fields are available in Salesforce, including:

- Record edit and detail pages
- List views, reports, and dashboards
- Filters, functions, rules, and assignments

State and country picklists can also be searched, and they're supported in Translation Workbench.

State and Country Picklist Limitations

State and country picklists include 239 countries by default. They also include the states and provinces of the United States, Canada, Australia, Brazil, China, India, Ireland, Italy, and Mexico. State and country picklists that contain more than 1,000 states or countries can cause degraded performance. State and country picklists do not work with:

- Salesforce to Salesforce
- Salesforce Classic Mobile
- Connect Offline
- Visual Workflow or change sets
- Custom indexes or outbound messages

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except Database.com

If your organization uses Data.com, the Data.com records can contain states and countries not included in the standard state and country picklists. You need to add these states and countries to the picklist before Data.com users can add or clean these records. The states and countries that you need to add to the picklist, if your organization uses them, are:

- American Samoa (AS)
- Guam (GU)
- Hong Kong (HK)
- Marshall Islands (MH)
- Netherlands Antilles (AN)
- Northern Mariana Islands (MP)
- Serbia and Montenegro (CS)
- United States Minor Outlying Islands (UM)

Picklist labels, not code values, are displayed in reports on state and country fields. To display code value abbreviations wherever your users see state or country names, manually change your State Name or Country Name labels to your code values. (For editing instructions, see [Configure State and Country Picklists](#) on page 362.) You can access your records' state and country code values by using the `StateCode` and `CountryCode` fields in Workbench or the Data Loader.

Implementing State and Country Picklists

The process of transitioning from text-based state and country fields to state and country picklists involves five steps.

1. [Configure the state and country values you want to use in your organization.](#)

This step is strongly recommended because it gives you the opportunity to customize state and country values. It ensures that state and country data continues to work with the third-party systems you have integrated with Salesforce.

2. [Scan your organization's data and customizations to see how they'll be affected by the switch.](#)

Convert data and update customizations, such as list views, reports, and workflow rules, so that they continue to work with the new field type.

3. [Convert existing data.](#)

The conversion process lets you map the various values in your organization to standard picklist values. For example, you might want to map U.S., USA, and United States to US.

4. [Turn on the picklists for your users.](#)

If you turn on state and country picklists without configuring values, scanning your organization, and converting existing data, users can use the picklists in new records. However, all existing data is incompatible with the new format, which could compromise data consistency and integrity across the two field formats.

5. Optionally, rescan and fix customizations or records that have been created or edited since your first scan.

For a step-by-step guide to implementing state and country picklists, see [Implementing State and Country Picklists](#).

Integration Values for State and Country Picklists

An integration value is a customizable text value that is linked to a state or country code. Integration values for standard states and countries default to the full ISO-standard state and country names. Integration values function similarly to the API names of custom fields and objects. Configuring integration values allows integrations that you set up before enabling state and country picklists to continue to work.

When you enable state and country picklists, your text-typed `State/Province` and `Country` fields are repurposed as `Integration Value` fields. In reports and list views, your `Integration Value` fields are called `State/Province (text only)` and `Country (text only)`. In addition, for each of your `State/Province (text only)` and `Country (text only)` fields, a picklist-typed `State Code` or `Country Code` field is created. The state and country picklist values set up in your organization determine the available values on these code fields.

Among the fields on each state or country picklist value are `Active`, `Visible`, `Name`, `Code`, and `Integration Value`. All of your state and country picklists—for `Billing Address`, `Shipping Address`, and so on—can access the state and country picklist values you create. Storing a state or country code allows your records to access other information about your states and countries.

By default, `Name` and `Integration Value` fields for your states and countries contain identical values. The value in the `Name` field displays to users who interact with your picklist. `Integration Value` is used by:

- Apex classes and triggers
- Visualforce pages
- SOQL queries
- API queries and integrations
- Rules for assignment, AutoResponse, validation, and escalation
- Workflow rules
- Email templates
- Custom buttons and links
- Field set customizations
- Reports and list views

When you update a code value on a record, that record's `State/Province (text only)` or `Country (text only)` column is populated with the corresponding integration value. Likewise, when you update a state or country `(text only)` column with a valid integration value, we keep the corresponding state or country code column in sync. You can change your organization's integration values after you enable state and country picklists. However, when you update your picklists' state and country integration values, the integration values on your records aren't updated. Name values aren't stored on records. Instead, they're retrieved from Salesforce based on a record's `State Code` or `Country Code` value. If the states or countries in your picklists have different field values for `Name` and `Integration Value`, make sure your report or list view filters use the correct values. Use names in `State` and `Country` filters, and use integration values in `State (text only)` and `Country (text only)` filters. Otherwise, your reports can fail to capture all relevant records.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except Database.com

Edit your integration values in Setup or using the Metadata API. States' and countries' Name fields are editable only in Setup. In the Metadata API, Name and Integration Value fields are called `label` and `integrationValue`, respectively.

[State and Country Picklist Field-Syncing Logic](#)

[State and Country Picklist Error Messages](#)

Configure State and Country Picklists

Configuring state and country picklists means choosing which states and countries you want to be available in your Salesforce organization. It allows you to make state and country picklists available for such purposes as importing data, working with external systems, and being available in the Metadata API. Configuring picklists is not required for you to actually enable state and country picklists for users, but it is highly recommended. Configuring picklists helps ensure continuity and data integrity with existing state and country data and customizations.

When configuring states and countries, you start with countries and drill down to their states or provinces. State and country picklists include 239 countries by default. They also include the states and provinces of the United States, Canada, Australia, Brazil, China, India, Ireland, Italy, and Mexico. State and country picklists that contain more than 1,000 states or countries can cause degraded performance. For the complete list of default countries, see [Standard Countries for Address Picklists](#).

Note:

- Integration values for state and country picklists can also be configured through the Metadata API. For more information, read about the `AddressSettings` component in the *Metadata API Developer's Guide*.
- State and country picklists are not supported in Salesforce change sets or packages. However, you can move integration value changes for state and country picklists between sandbox and production organizations by using the Metadata API. First, configure your state and country picklists in your sandbox organization. Then, use the Metadata API to retrieve the sandbox configurations, and deploy them to your production organization.

1. From Setup, enter *State and Country Picklists* in the `Quick Find` box, then select **State and Country Picklists**.
2. On the State and Country Picklists setup page, click **Configure states and countries**.
3. Select from the following options:

Active

Makes the country available in the Metadata API so that records that contain the country can be imported. However, unless you also set it as visible, the country isn't available to users in Salesforce.

Visible

Makes the country available to users in Salesforce. A country has to be active before you can make it visible.

4. Click **Edit** to view and edit details for the country, including to configure its states or provinces.
5. (Optional) Under Picklist Settings, select a `Default Country`. The Default Country automatically populates country picklists for new records in your organization, but users can select a different country. Default countries must be both active and visible.
6. Click **Save** to save your configuration.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except Database.com

USER PERMISSIONS

To configure state and country picklists:

- "Modify All Data"

 **Note:** Active states and countries not marked `visible` are still valid filter lookup values. You can use invisible states and countries when creating filters in reports, list views, workflows, and so on.

Edit State and Country Details

You can add states and countries to your organization or edit the values of existing states and countries on a state or country's detail page. To add or edit a state or province, navigate to its detail page through the detail page of its associated country.

1. From Setup, enter *State* in the Quick Find box, then select **State and Country Picklists**.
2. Click **Configure states and countries**.
3. Click **New Country** to add a country or click **Edit** for a listed country.
4. Under Country Information, specify your options.

Country Name

By default, the ISO-standard name. The name is what users see in the Salesforce user interface.

Country Code

By default, the two-letter ISO-standard code. If you change an ISO code, the new value must be unique. Codes are case insensitive and must contain only ASCII characters and numbers. You can't edit the ISO codes of standard states or countries. You can edit the country codes of custom states and countries only before you enable those states and countries for your users.

Integration Value

A customizable text value that is linked to a state or country code. Integration values for standard states and countries default to the full ISO-standard state and country names. Integration values function similarly to the API names of custom fields and objects. Configuring integration values allows integrations that you set up before enabling state and country picklists to continue to work.

You can edit integration values to match values that you use elsewhere in your organization. For example, let's say that you have a workflow rule that uses *USA* instead of the default *United States* as the country name. If you manually set the integration value for country code *US* to *USA*, the workflow rule doesn't break when you enable state and country picklists.

When you update a code value on a record, that record's *State/Province (text only)* or *Country (text only)* column is populated with the corresponding integration value. Likewise, when you update a state or country (*text only*) column with a valid integration value, we keep the corresponding state or country code column in sync. You can change your organization's integration values after you enable state and country picklists. However, when you update your picklists'

EDITIONS

Available in: **All Editions** except Database.com

USER PERMISSIONS

To add or edit state or country details:

- "Modify All Data"

state and country integration values, the integration values on your records aren't updated. Name values aren't stored on records. Instead, they're retrieved from Salesforce based on a record's `State Code` or `Country Code` value. If the states or countries in your picklists have different field values for `Name` and `Integration Value`, make sure your report or list view filters use the correct values. Use names in `State` and `Country` filters, and use integration values in `State (text only)` and `Country (text only)` filters. Otherwise, your reports can fail to capture all relevant records.

Active

Makes the country available in the Metadata API so that records can be imported that contain the country. However, unless you also set it as visible, the country isn't available to users in Salesforce.

Visible

Makes the country available to users in Salesforce. A country must be active before you can make it visible.

5. If you're adding a country, click **Add**.
6. If you're editing a country, specify the options for States:

Active

Makes the state available in the Metadata API so that records can be imported that contain the state. However, unless you also set it as visible, the state isn't available to users in Salesforce.

Visible

Makes the state available to users in Salesforce. A state must be active before you can make it visible.

7. Click either of the following, if desired.
 - **New State** to add a custom state or province. On the New State page, specify a `State Name`, `State Code`, and `Integration Value`, and select whether the new state is `Active` or `Visible`. To save the new state, click **Add**.
 - **Edit** to view and edit state or province details, including the `State Name`, `State Code`, and `Integration Value`.
8. Click **Save**.

Prepare to Scan State and Country Data and Customizations

Before switching from text-based state and country fields to standardized state and country picklists, scan your organization to see how the change will affect it. This discovery process shows you where and how state and country data appears in your organization. The discovery process also shows where this data is used in customizations, such as list views and reports. After you've analyzed the findings of the scan, you can plan to convert your data, update your customizations, and turn on state and country picklists.

Every organization's discovery process is unique. For some organizations, transitioning from state and country text fields to standardized picklists is straightforward and manageable. However, if state and country metadata is used extensively throughout an organization, the transition can be a complicated and time-consuming process. Salesforce recommends that you scan your organization early and often so that you can transition smoothly to the new lists. Keep these best practices and considerations in mind.

- Scanning doesn't convert data or fix your customizations. Convert your data separately, and update your customizations individually.
- You can continue to work normally in your organization during the scan.
- The scanning process identifies affected managed packages but doesn't provide a mechanism for addressing packaging issues.
- Scanning doesn't find formulas that include state and country metadata.
- You can't use display values in validation rules or workflow rules that use comparison formula functions. If your validation or workflow rules on state or country fields use `BEGINS`, `CONTAINS`, `ISCHANGED`, or `REGEX`, use `ISPICKVAL` with state and country code values in your comparison functions.
- Scanning doesn't find personal list views and reports that use state and country metadata. Individual users must update those customizations themselves.
- Converted leads aren't scanned. State and country values aren't updated on converted lead records when you enable state and country picklists.
- Scan your organization multiple times. After you update a customization, rescan to make sure that your changes fixed the problem and didn't create new ones.

Scan State and Country Data and Customizations

Scanning an organization for text-based state and country values reveals where and how text-based state and country data appears in existing records. For example, you can see all the ways United States is saved as a text value, such as U.S., US, America, Estados Unidos, and even misspelled entries like Untied States. In addition, scanning shows you where state and country data is used in customizations, including:

- List views
- Reports
- Validation rules
- Custom buttons and links
- Workflow rules
- Email templates
- Field sets
- Apex classes and triggers
- Visualforce pages

When the scan is complete, you receive two emails with links to detailed reports: one on address data and one on customizations. After analyzing the reports, begin the tasks of converting existing data to picklist values and updating customizations so that they work with the new picklist fields.

1. From Setup, enter *State and Country Picklists* in the **Quick Find** box, then select **State and Country Picklists**.
2. On the State and Country Picklists setup page, click **Scan Now** and then click **Scan**.

3. Wait for an email that contains the results.

Depending on the size and complexity of your organization, the results take anywhere between a few minutes and a few hours to generate.

 **Note:** The emails are sent from noreply@salesforce.com. They have the subject line, “Salesforce Address Data Scan” or “Salesforce Address Customization Scan.” If you don’t receive the emails, make sure that they weren’t caught in a spam filter.

4. Click the link in each email to go to a document that contains the report of affected data or customizations.
5. On the Document detail page, click **View file**.

[State and Country Picklists](#)

Prepare to Convert State and Country Data

If your Salesforce organization includes text-based state and country values, you can convert that data to standardized picklist values. Converting existing data allows you to keep working with the data after you switch to picklists. Say, for example, you have a report that culls all of your sales reps' leads in Washington state, and the report is generated from state picklist value Washington. To ensure that records with text-based state values such as Wash., WA, and Washington are included in the report, convert text-based state data to standardized picklist values.

Converting existing state and country text data into standardized picklist values helps ensure data integrity after you enable picklists in your organization. Your users encounter validation errors when saving records that contain state or country values not in your picklists. Also, reports become unreliable when records created before you enable state and country picklists contain different state and country values than records created using picklists.

When you convert data, Salesforce starts with countries, then goes on to states. As you go through the conversion process, here are a few things to keep in mind:

- Save frequently. You can exit the conversion tool and return to it at any time.
- You can continue to work normally in your organization while converting data.
- You can't convert data while you're scanning for affected data and customizations, or while state or country picklists are being deployed.
- Steps can be repeated and undone at any time until you enable the picklists for users. After the picklists are enabled, you can't undo the conversion.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** Editions except Database.com

- If you use Data.com Clean, we recommend that you suspend Clean jobs until the conversion is finished.

SEE ALSO:

[Convert State and Country Data](#)
[State and Country Picklists](#)

Convert State and Country Data

Before you convert state and country values in the State and Country Picklists setup, [configure the picklists for your organization](#). That way, when picklists are enabled, all new and updated record use your specified integration value, helping to ensure consistent and accurate data in your organization.

When converting text-based state and country data to picklist-compatible values, you select specific text values and choose the standard values you want to map them to. For example, you can select all occurrences of “USA” and change them to “United States.”

Convert countries first, and then states and provinces.

You can convert up to 2,000 country values and up to 2,000 state values, but state and country picklists that contain more than 1,000 states or countries can cause degraded performance.

1. From Setup, enter *State and Country Picklists* in the Quick Find box, then select **State and Country Picklists**.
2. On the State and Country Picklists setup page, click **Convert now**. Salesforce opens the Convert Countries page. This page displays all the country text values that appear in your organization and the number of times each value is used.
3. Select **Change** for one or more values you want to convert. For example, select **Change** for all the iterations of United States.
4. In the **Change To** area, choose the country you want to convert the text values to and click **Save to Changelist**.
 -  **Note:** If you map states or countries to `Unknown` value, users see states and countries in their records. However, your users encounter errors when they save records, unless they change each state or country to a valid value before saving.
5. Repeat Steps 3 and 4 for other country values, such as for Canada. Salesforce tracks planned changes in the Changelist area.
6. When all of the countries are mapped, click **Next** to convert state values. Use the Country of Origin column to identify the country associated with that state or province.
7. On the Confirm Changes page, click **Finish** to return to the setup overview page or **Finish and Enable Picklists** to convert the values and turn on state and country picklists in your organization.

A few words about undo:

- On the Convert Countries or Convert States page, click **Undo** at any time to revert values in the changelist.
- On the Convert States page, click **Previous** to return to the Convert Countries page and change country mappings.
- You can convert state and country values even after clicking **Finish**. After picklists are enabled, however, you can no longer edit your conversion mappings.

SEE ALSO:

[State and Country Picklists](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except Database.com

USER PERMISSIONS

To convert text-based state and country data:

- “Modify All Data”

Enable and Disable State and Country Picklists

When you enable state and country picklists, the picklists are immediately available to users. However, it can take some time for Salesforce to populate the ISO code fields on existing records. If users try to edit the state or country on a record before the code field is populated, they are prompted to select a code value.

1. From Setup, enter *State and Country Picklists* in the **Quick Find** box, then select **State and Country Picklists**.
2. On the State and Country Picklists setup page, click **Enable** to turn on the picklists.

Note:

- You can also enable state and country picklists when you finish converting existing, text-based data to picklist values. See [Convert State and Country Data](#).

3. To turn off state and country picklists, click **Disable** on the State and Country Picklists setup page.

Important:

- Be aware that if you disable state and country picklists:
- For records that you haven't saved since enabling picklists, state and country values revert to their original text values.
 - For records that you have saved since enabling picklists, state and country integration values replace original text values.
 - References to state and country picklists in customizations—such as workflow field updates, email templates, and Visualforce pages—become invalid.
 - Columns and filters that refer to picklist fields in reports and list views disappear.

SEE ALSO:

[State and Country Picklists](#)

State and Country Picklist Field-Syncing Logic

When you save records with state and country picklist values, Salesforce syncs the records' integration and code values for states and countries. You can't directly edit state or country integration values on record detail pages. You can directly edit records' state or country integration values only with workflows, Apex code, API integrations, and so on.

Your Change	Result
You update a record's state or country code to a valid value.	Salesforce updates the record's state or country integration value to match the code.
You update a record's state or country integration value to a valid value.	Salesforce updates the record's state or country code to match the integration value.
You remove a record's country code, but don't remove the corresponding state code.	Salesforce removes the record's state code, as well as the state and country integration values.

EDITIONS

Available in: **All** Editions except Database.com

Your Change	Result
You create or update a record with state and country values. The new state isn't in the new country.	No changes are saved. You get an error message.
You update the state or country integration and code values on an existing record. The new integration and code values don't match.	No changes are saved. You get an error message.
You create a record with mismatched state or country integration and code values.	Salesforce updates your new record's integration value to match the code value.

SEE ALSO:

[State and Country Picklists](#)

[Integration Values for State and Country Picklists](#)

[State and Country Picklist Error Messages](#)

State and Country Picklist Error Messages

When you try to save records with mismatched code and text values for states or countries, various errors can occur. This information demystifies those error messages.

Error	Cause
Invalid country specified for field	Your country code doesn't match an existing country.
There's a problem with this country, even though it may appear correct. Please select a country from the list of valid countries.	Your country integration value doesn't match an existing country. Or, the country value was mapped to <code>UNKNOWN</code> value during data conversion.
Mismatched integration value and ISO code for field	Your code and integration values match different states or countries.
A country must be specified before specifying a state value for field	Your record has a state code or integration value but no country code. You can't save a state without a corresponding country.
The existing country doesn't recognize the state value for field	Your state code and integration values belong to a state in a different country.
Invalid state specified for field	Your state code doesn't match an existing state.

Customizing User Interface Settings

1. From Setup, enter *User Interface* in the **Quick Find** box, then select **User Interface**.
2. Select or deselect each checkbox to modify the settings for your organization.
3. Save your changes.

User Interface Settings

Enable Collapsible Sections

Collapsible sections give users the option to collapse or expand sections on their record detail pages using the arrow icon next to the section heading. When enabling collapsible sections, make sure your section headings are displayed for each page layout. Sections remain expanded or collapsed until the user changes his or her settings for that tab. If your organization has enabled record types, Salesforce remembers a different setting for each record type.

Show Quick Create

The Quick Create area on a tab home page allows users to create a new record quickly with minimal information. It displays, by default, on the tab home pages for leads, accounts, contacts, forecasts, and opportunities. You can control whether the Quick Create area is displayed on all relevant tab home pages.

 **Note:** The **Show Quick Create** setting also affects whether or not users can create new records from within the lookup dialog. For example, with the setting enabled, users can create a new account within the account lookup dialog while creating or editing a contact. Creating new records in the lookup dialog is available only if Quick Create is available for your chosen record type. In addition, users always need the appropriate “Create” permission to use Quick Create even though it will be displayed for all users.

Enable Hover Details

Hover details display an interactive overlay containing detailed information about a record when users hover the mouse over a link to that record in the Recent Items list on the sidebar or in a lookup field on a record detail page. Users can quickly view information about a record before clicking **View** for the record’s detail page or **Edit** for the edit page. The fields displayed in the hover details are determined by the record’s mini page layout. The fields that display in document hover details are not customizable. This option is enabled by default.

 **Note:** To view the hover details for a record, users must have the appropriate sharing access to that record, as well as the necessary field-level security for the fields in the mini page layout.

Enable Related List Hover Links

Related list hover links display at the top of record detail pages and custom object detail pages in Setup. Users can hover the mouse over a related list hover link to display the corresponding related list and its number of records in an interactive overlay that allows users to quickly view and manage the related list items. Users can also click a related list hover link to jump down to the content of the related list without having to scroll down the page. The **Enable Related List Hover Links** checkbox is the default selection.

Enable Separate Loading of Related Lists

When enabled, users see primary record details immediately. As the related list data loads, users see a progress indicator. Separate loading can improve performance on record detail pages for organizations with large numbers of related lists. This option is disabled by default. The options for separately loading related lists don’t apply to Visualforce pages, the Self-Service portal, or other pages for which you can’t control the layout.

Enable Separate Loading of Related Lists of External Objects

When enabled, related lists of external objects are loaded separately from primary record details and related lists of standard and custom objects. External objects behave similarly to custom objects, except that they map to data that’s stored outside your Salesforce

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

The available user interface settings vary according to which Salesforce Edition you have.

USER PERMISSIONS

To modify user interface settings:

- “Customize Application”

organization. It can take a while to retrieve data from an external system, depending on the network latency and availability of the external system. Therefore, the `Enable Separate Loading of Related Lists of External Objects` option is selected by default. The options for separately loading related lists don't apply to Visualforce pages, the Self-Service portal, or other pages for which you can't control the layout.

Enable Inline Editing

Inline editing lets users quickly edit field values, right on a record's detail page. This option is enabled by default and applies to all users in your organization.

 **Note:** This doesn't enable inline editing for profiles. Select `Enable Enhanced Profile List Views` under Setup.

Enable Enhanced Lists

Enhanced lists give you the ability to quickly view, customize, and edit list data to speed up your daily productivity. When enabled with the `Enable Inline Editing` setting, users can also edit records directly from the list, without navigating away from the page. This option is enabled by default.

 **Note:** This doesn't enable enhanced lists for profiles. Select `Enable Enhanced Profile List Views` under Setup.

Enable New User Interface Theme

This option is not related to Lightning Experience. In this case, "new user interface theme" refers to Salesforce Classic, the interface that immediately preceded Lightning Experience. Enabling this option turns on the Salesforce Classic look and feel. Disabling it turns on the user interface theme that predates Salesforce Classic—the *classic, classic* Salesforce interface.

Only users with supported browsers see the new user interface theme.

The new user interface theme is not supported in Portals or the Console tab.

Enable Tab Bar Organizer

The Tab Bar Organizer automatically arranges tabs in the main tab bar to prevent horizontal scrolling of the page. It dynamically determines how many tabs can display based on the width of the browser window and puts tabs that extend beyond the browser's viewable area into a drop-down list.

 **Note:** Note the following limitations:

- The Tab Bar Organizer isn't available with the partner portal or Customer Portal.
- The Tab Bar Organizer is only available with the new user interface theme. Organizations using the old user interface theme can enable the feature, but it won't be available for users until the new theme is also enabled.
- The Tab Bar Organizer isn't available on Internet Explorer 6.

Enable Printable List Views

Printable list views allow users to easily print list views. If enabled, users can click the **Printable View** link from any list view to open a new browser window, displaying the current list view in a simple, print-ready format. The link is located next to the **Help for this Page** link in the colored title bar of the page.

Enable Spell Checker

Available in all Editions. When enabled, the **Check Spelling** button appears in certain areas of the application where text is entered, such as sending an email, or when creating events, tasks, cases, notes, and solutions. Clicking the button checks the spelling of your text. Spell Checker does not support all the languages that Salesforce supports. For example, Spell Checker doesn't support Thai, Russian, and double-byte languages, such as Japanese, Korean, or Chinese.

Enable Spell Checker on Tasks and Events

Available in all Editions. Enables the **Check Spelling** button when users create or edit tasks or events. The spell checker analyzes the `Description` field on events and the `Comments` field on tasks.

Enable Customization of Chatter User Profile Pages

Enables administrators to customize the tabs on the Chatter user profile page. This includes adding custom tabs or removing default tabs. If disabled, users see the Feed and Overview tabs only.

Sidebar Settings

Enable Collapsible Sidebar

The collapsible sidebar gives users the ability to show or hide the sidebar on every page that normally includes the sidebar. When enabled, the collapsible sidebar becomes available to all users in your organization, but each user can choose his or her own preference for displaying the sidebar. Users can leave the sidebar visible at all times, or they can collapse the sidebar and only show it when needed by clicking the edge of the collapsed sidebar.

 **Note:** Call center users won't see incoming calls if they collapse the sidebar.

 **Tip:** If your organization uses divisions, we recommend that you keep the sidebar pinned and visible at all times so you always have access to the Divisions drop-down list.

Show Custom Sidebar Components on All Pages

If you have custom home page layouts that include components in the sidebar, this option makes the sidebar components available on all pages for all users in your organization. If you only want certain users to view sidebar components on all pages, grant those users the "Show Custom Sidebar On All Pages" permission.

 **Note:** If the `Show Custom Sidebar Componentson All Pages` user interface setting is selected, the "ShowCustom Sidebar On All Pages" permission is not available.

Calendar Settings

Enable Home Page Hover Links for Events

Enables hover links in the calendar section of the Home tab. On the Home tab, users can hover the mouse over the subject of an event to see the details of the event in an interactive overlay. This option is enabled by default. Note that this checkbox only controls the Home tab; hover links are always available on other calendar views.

The fields available in the event detail and edit overlays are defined in a mini page layout.

 **Note:** If you create all day events, we recommend adding the `All Day Event` field to the events mini page layout.

Enable Drag-and-Drop Editing on Calendar Views

Enables the dragging of events on single user daily and weekly calendar views. This allows users to reschedule events without leaving the page. This option is enabled by default.

 **Note:** Calendar views might load less quickly when this checkbox is enabled.

Enable Click-and-Create Events on Calendar Views

Allows users to create events on day and weekly calendar views by double-clicking a specific time slot and entering the details of the event in an interactive overlay. The fields available in the event detail and edit overlays are defined in a mini page layout.

Note that recurring events and multi-person events are not supported for click-and-create events on calendar views.

Enable Drag-and-Drop Scheduling on List Views

Allows users to create events associated with records by dragging records from list views on to weekly calendar views and entering the details of the event in an interactive overlay. This option is disabled by default. The fields available in the event detail and edit overlays are defined in a mini page layout.

Enable Hover Links for My Tasks List

Enables hover links for tasks in the My Tasks section of the Home tab and on the calendar day view. This option is enabled by default. Users can hover the mouse over the subject of a task to see the details of that task in an interactive overlay.

The information presented on these overlays is configured by your administrator.

Name Settings

 **Note:** These name settings can be enabled by contacting Salesforce Customer Support.

Enable Middle Names for Person Names

This option lets you show the `Middle Name` field for person objects so that you can better represent the name of a person associated with a record.

Enable Name Suffixes for Person Names

This option lets you show the `Suffix` field for person objects so that you can better represent the name of a person associated with a record.

Setup Settings

Enable Enhanced Page Layout Editor

When enabled, the enhanced page layout editor replaces the current interface for editing page layouts with a feature-rich WYSIWYG editor that contains all of the functionality of the original page layout editor as well as several improvements.

Enable Enhanced Profile List Views

Enables enhanced list views and inline editing on the profiles list page. With inline editing in enhanced profile list views, you can manage multiple profiles at once.

Enable Enhanced Profile User Interface

Enables the enhanced profile user interface, which allows you to easily navigate, search, and modify settings for a single profile.

Enable Streaming API

Enables Streaming API, which allows you to receive notifications for changes to data that match a SOQL query that you define, in a secure and scalable way. This field is selected by default. If you don't see this checkbox, first verify that your Salesforce edition has API access. If your Salesforce edition has API access and you don't see the checkbox, contact Salesforce.

Enable Custom Object Truncate

Enables truncating custom objects, which permanently removes all of the records from a custom object while keeping the object and its metadata intact for future use.

Enable Improved Setup User Interface

When disabled, users with Salesforce Classic access their personal settings from the Setup menu. When enabled, users with Salesforce Classic access their personal settings from the My Settings menu, accessible from the username menu. Additionally, the Setup link is moved from the username menu to the Force.com App Menu. If you change this setting, be sure to notify all users in your organization.

Enable Advanced Setup Search (Beta)

When enabled, users can search for Setup pages, custom profiles, permission sets, public groups, roles, and users from the sidebar in Setup. When disabled, users can search for Setup pages only.

 **Note:**

- Advanced Setup Search is in beta; it is production quality but has known limitations.
- Some searchable items (such as permission sets) aren't available in some editions. Users can't search for items that aren't included in their edition.

Advanced Settings

Activate Extended Mail Merge

Enables Extended Mail Merge for your organization. When selected, the **Mass Mail Merge** link is available in the Tools area on the home pages for accounts, contacts, and leads. Also, single mail merges requested from the Activity History related list on a record are performed using Extended Mail Merge functionality.

Extended Mail Merge is available by request only. Contact Salesforce Customer Support if you are interested in this feature.

Always save Extended Mail Merge documents to the Documents tab

When enabled, all mail merge documents generated using Extended Mail Merge are added to the user's personal documents folder on the Documents tab, rather than delivered as email attachments. Users are sent confirmation emails when their mail merge requests have completed. Those emails include links for retrieving generated documents from the Documents tab. Note that these documents count against your organization's storage limits.

Maps and Location Services

Maps and location services uses Google Maps to display maps on standard address fields, enable creation of Visualforce maps, and helps users enter new addresses with autocomplete.

To generate a map image, an address must include the street and city fields and either the state, postal code, or the country. If an address field is missing any of the required information, a map won't display on the detail page of a record.

The map image on the address is static, but clicking the map image opens Google Maps in a new browser tab on the desktop, and opens a map app on a mobile device.

If your organization has Salesforce1 offline access enabled, a map doesn't display when a user's device is offline.

To enable your organization's map and location services:

1. From Setup, enter *Maps* in the *Quick Find* box, select **Maps and Location Settings**, then click **Edit**.
2. Check *Enable Maps and Location Services*.
3. Click **Save**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

- Enterprise
- Performance
- Unlimited

USER PERMISSIONS

To modify maps and location settings:

- "Customize Application"

Autocomplete on Standard Addresses

You can enable autocomplete on standard addresses for all Salesforce1 users. This allows users to enter text on standard address fields and see possible matching addresses in a picklist.

Autocomplete on standard address picklist results are optimized for these countries:

- USA
- Japan
- United Kingdom
- Canada
- Australia
- Germany
- France
- Netherlands
- Brazil
- Spain
- Russia
- Sweden

To enable autocomplete on standard address fields:

1. From Setup, enter *Maps* in the *Quick Find* box, select **Maps and Location Settings**, then click **Edit**.
2. Check **Enable autocomplete on standard address fields**.
3. Click **Save**.

Note:

- Autocomplete on standard address fields is available for all versions of Salesforce1 and the Lightning Experience.

Customize Reports and Dashboards

Set up reports and dashboards to deliver information to your users in the ways that work best for them.

To get to this page, from Setup, enter *Reports* in the *Quick Find* box, then select **Reports and Dashboards Settings**.

IN THIS SECTION:

[Provide Convenience Features for Your Report and Dashboard Users](#)

You can enable or disable several user interface features that may help your users get more out of reports and dashboards. These settings are for convenience and ease of use; they don't affect the data returned in your reports and dashboards.

[Let Users Subscribe to Report Notifications](#)

Allow users to subscribe to reports to be notified whenever certain metrics meet conditions they specify.

[Customize Report and Dashboard Email Notifications](#)

Choose how users are notified when information changes in the reports and dashboards they use.

To modify report and dashboard settings:

- "Customize Application"

[Set Up a Custom Report Type](#)

A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type.

[Turn On Enhanced Sharing for Reports and Dashboards](#)

When you enable analytics sharing, Salesforce converts your users' existing folder access levels to use new, more detailed access levels.

[Set Up Historical Trend Reporting](#)

To make historical trend reports available to your users, use filters to configure the amount of data that's captured for historical trend reporting. Then select the fields needed for historical reports.

SEE ALSO:

[Upgrade the Report Wizard](#)

Provide Convenience Features for Your Report and Dashboard Users

You can enable or disable several user interface features that may help your users get more out of reports and dashboards. These settings are for convenience and ease of use; they don't affect the data returned in your reports and dashboards.

IN THIS SECTION:

[Let Users See Report Headers While Scrolling](#)

Floating report headers keep column and row headings in sight no matter how far users scroll in report results.

[Help Users Find Dashboards Quickly](#)

Dashboard finder uses auto-complete to help users quickly find dashboards in the Dashboards tab, just by entering the first few letters of its name in the search filter.

[Let Users Post Dashboard Components in Chatter](#)

Dashboard component snapshots let users post static images of dashboard components to Chatter feeds, making the snapshot visible to all users.

[Exclude the Confidential Information Disclaimer from Reports](#)

By default, report footers include a disclaimer that reads "Confidential Information - Do Not Distribute". The disclaimer reminds users to be mindful of who they share reports with, helping to ensure that third parties don't view your reports. At your discretion, exclude the disclaimer from your reports.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To modify report and dashboard settings:

- "Customize Application"

Let Users See Report Headers While Scrolling

Floating report headers keep column and row headings in sight no matter how far users scroll in report results.

With floating report headers, users can scroll to the bottom of lengthy reports without having to scroll back to the top to view the names of the column headings.

Users can also click floating report headers to sort data in a specific column. When users sort data by clicking a floating report heading, the report refreshes and redirects users to the beginning of report results.

Floating headers are available for tabular, summary, and matrix reports.

1. From Setup, enter *Reports* in the **Quick Find** box, then select **Reports and Dashboards Settings**.
2. Select or deselect **Enable Floating Report Headers**.
3. Click **Save**.

Help Users Find Dashboards Quickly

Dashboard finder uses auto-complete to help users quickly find dashboards in the Dashboards tab, just by entering the first few letters of its name in the search filter.

All dashboards matching that text are dynamically displayed in the drop-down list. The list first shows dashboards the user viewed recently, and then other dashboards appear in alphabetical order by folder. The first 1000 results are shown in a single list; above 1000, results are shown 500 per page. Users only see dashboards in folders they can access. Disable this option to use the static drop-down list instead.

This option is enabled by default.

1. From Setup, enter *Reports* in the **Quick Find** box, then select **Reports and Dashboards Settings**.
2. Select or deselect **Enable Dashboard Finder**.
3. Click **Save**.

Let Users Post Dashboard Components in Chatter

Dashboard component snapshots let users post static images of dashboard components to Chatter feeds, making the snapshot visible to all users.

1. Make sure Chatter feed tracking for dashboards is enabled.
2. From Setup, enter *Reports* in the **Quick Find** box, then select **Reports and Dashboards Settings**.
3. Select or deselect **Enable Dashboard Component Snapshots**.

 **Important:** This option lets users override dashboard visibility settings, making snapshots visible to all Chatter users. Though this makes it easy to share time-specific data without having to add people to dashboard folders, be aware that users can inadvertently post sensitive or confidential information.

Customize Report and Dashboard Email Notifications

Choose how users are notified when information changes in the reports and dashboards they use.

1. From Setup, enter *Email Notifications* in the **Quick Find** box, then select **Email Notifications**.
2. Select or clear the following options to modify the notifications for your organization:

Allow Reports and Dashboards to Be Sent to Portal Users

If you enable this option, all internal and portal users specified as recipients receive reports and dashboards. If this option isn't enabled, only internal Salesforce users can receive reports and dashboard refresh notifications.

This option, disabled by default, is available to Enterprise, Unlimited, and Performance Edition organizations that have a Customer Portal or partner portal set up.

Use Images Compatible with Lotus Notes in Dashboard Emails

Dashboard refresh notifications can be sent to specified users when a scheduled dashboard refresh completes. By default, Salesforce sends images in dashboard emails as `.png` (Portable Network Graphic) files, which are not supported in Lotus Notes. When you enable the `Use Images Compatible with Lotus Notes in Dashboard Emails` > option, Salesforce uses `.jpg` images, which Lotus Notes supports, when sending dashboard emails. The "Schedule Dashboard" permission is required to view this option.

 **Note:** Dashboard emails that contain images compatible with Lotus Notes are substantially larger and the image quality may be lower.

3. Click **Save**.

Set Up a Custom Report Type

A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type.

For example, an administrator can create a report type that shows only job applications that have an associated resume; applications without resumes won't show up in reports using that type. An administrator can also show records that *may* have related records—for example, applications with or without resumes. In this case, all applications, whether or not they have resumes, are available to reports using that type.

You can create custom report types from which users can report on your organization's reports and dashboards. When defining a custom report type, select Reports or Dashboards from the `Primary Object` drop-down list on the New Custom Report Type page.

 **Tip:** When you're done creating your report type, consider ways you can do more with it:

- Add the custom report type to apps you upload to Force.com AppExchange.
- Users designated as a translator with the "View Setup and Configuration" permission can translate custom report types using the Translation Workbench.

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To delete custom report types:

- "Modify All Data"

IN THIS SECTION:

1. [Create a Custom Report Type](#)

Choose the primary object you'd like your new report type to support, then give it a name and a useful description. Mark it as "in development" until you're ready to make it available for users to create reports.

2. [Add Child Objects To Your Custom Report Type](#)

To enable reports to pull data from more than just the primary object, consider adding one or more related objects to your report type.

3. [Design the Field Layout for Reports Created From Your Custom Report Type](#)

After you define a custom report type and choose its object relationships, you can specify the standard and custom fields a report can display when created or run from a custom report type.

4. [Manage Custom Report Types](#)

After you create a custom report type, you can customize, edit, and delete it.

5. [Limits on Report Types](#)

Custom report types are subject to some limits to ensure high performance and usability.

Create a Custom Report Type

Choose the primary object you'd like your new report type to support, then give it a name and a useful description. Mark it as "in development" until you're ready to make it available for users to create reports.

1. From Setup, enter *Report Types* in the *Quick Find* box, then select **Report Types**.
2. Click **New Custom Report Type**.
3. Select the *Primary Object* for your custom report type.

 **Tip:**

- You can choose from all objects—even those you don't have permission to view. This lets you build report types for a variety of users.
- Once you save a report type, you can't change the primary object.
- If the primary object on a report type is a custom object, and the custom object is deleted, then the report type and any reports created from it are automatically deleted.
- If you remove an object from a report type, all references to that object and its associated objects are automatically removed from reports and dashboards based on that type.

4. Enter the *Report Type Label* and the *Report Type Name*.
The label can be up to 50 characters long. The name is used by the SOAP API.
5. Enter a description for your custom report type, up to 255 characters long.

Note: Provide a meaningful description so users have a good idea of which data is available for reports. For example: *Accounts with Contacts. Report on accounts and their contacts. Accounts without contacts are not shown..*

6. Select the category in which you want to store the custom report type.
7. Select a *Deployment Status*:

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To delete custom report types:

- "Modify All Data"

- Choose `In Development` during design and testing as well as editing. The report type and its reports are hidden from all users except those with the “Manage Custom Report Types” permission. Only users with that permission can create and run reports using report types in development.
- Choose `Deployed` when you’re ready to let all users access the report type.

 **Note:** A custom report type’s `Deployment Status` changes from `Deployed` to `In Development` if its primary object is a custom object whose `Deployment Status` similarly changes.

8. Click **Next**.

 **Note:** A developer can edit a custom report type in a managed package after it’s released, and can add new fields. Subscribers automatically receive these changes when they install a new version of the managed package. However, developers can’t remove objects from the report type after the package is released. If you delete a field in a custom report type that’s part of a managed package, and the deleted field is part of bucketing or used in grouping, you receive an error message.

SEE ALSO:

[Add Child Objects To Your Custom Report Type](#)

Add Child Objects To Your Custom Report Type

To enable reports to pull data from more than just the primary object, consider adding one or more related objects to your report type.

1. Click the box under the primary object.
2. Select a child object.

Only related objects are shown.

 **Tip:** Type in the search box to find objects quickly.

3. For each child object, select one of the following criteria:
 - Each “A” record must have at least one related “B” record. Only parent records with child records are shown in the report.
 - “A” records may or may not have related “B” records. Parent records are shown, whether or not they have child records.

When Users are the primary object, select child objects by field—for example, Accounts (Account Owner) or Accounts (Created By).

4. Add up to three child objects.
The number of children depends on the objects you choose.

5. Click **Save**.

Example:

- If you select that object A may or may not have object B, then all subsequent objects automatically include the may-or-may-not association on the custom report type. For example, if accounts are the primary object and contacts are the secondary object, and you choose that accounts may or may not have contacts, then any tertiary and quaternary objects included on the custom report type default to may-or-may-not associations.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create or update custom report types:

- “Manage Custom Report Types”

To delete custom report types:

- “Modify All Data”

- Blank fields display on report results for object B when object A does not have object B. For example, if a user runs a report on accounts with or without contacts, then contact fields display as blank for accounts without contacts.
- On reports where object A may or may not have object B, you can't use the OR condition to filter across multiple objects. For example, if you enter filter criteria *Account Name starts with M OR Contact First Name starts with M*, an error message displays informing you that your filter criteria is incorrect.
- The **Row Limit** option on tabular reports shows only fields from the primary object on reports created from custom report types where object A may or may not have object B. For example, in an accounts with or without contacts report, only fields from accounts are shown. Fields from objects after a may-or-may-not association on custom report types aren't shown. For example, in an accounts with contacts with or without cases report, only fields from accounts and contacts are available to use. Also, existing reports may not run or disregard the **Row Limit** settings if they were created from custom report types where object associations changed from object A with object B to object A with or without object B.

Design the Field Layout for Reports Created From Your Custom Report Type

After you define a custom report type and choose its object relationships, you can specify the standard and custom fields a report can display when created or run from a custom report type.

 **Note:** Custom fields appear in custom report types only if they've been added to that report type's page layout.

1. From Setup, enter *Report Types* in the **Quick Find** box, then select **Report Types** to display the All Custom Report Types page.
2. Select the custom report type you want to edit and click **Edit Layout** on the Fields Available for Reports section.

You can click **Preview Layout** to preview which fields will display on the Select Columns page of a report customized or run from this report type.

 **Note:** When previewing the layout, all fields and objects are displayed, including fields and objects you may not have permission to access. However, you cannot access any data stored in the fields or objects that you do not have permission to access.

3. Select fields from the right-hand box and drag them to a section on the left.

 **Tip:** You can view a specific object's fields by selecting an object from the **View** drop-down list.

4. Optionally, click **Add fields related via lookup** to display the Add Fields Via Lookup overlay.

From here you can add fields via the lookup relationship the object selected in the **View** drop-down list has to other objects.

- A lookup field is a field on an object that displays information from another object. For example, the **Contact Name** field on an account.
- A custom report type can contain fields available via lookup through four levels of lookup relationships. For example, for an account, you can get the account owner, the account owner's manager, the manager's role, and that role's parent role.
- You can only add fields via lookup that are associated with objects included in the custom report type. For example, if you add the accounts object to the custom report type, then you can add fields from objects to which accounts have a lookup relationship.
- Selecting a lookup field on the Add Fields Via Lookup overlay may allow you to access additional lookup fields from other objects to which there is a lookup relationship. For example, if you select the **Contact Name** field from cases, you can then select the **Account** field from contacts because accounts have a lookup relationship to contacts which have a lookup relationship to cases.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To delete custom report types:

- "Modify All Data"

- The fields displayed in the Add Fields Via Lookup overlay do not include lookup fields to primary objects. For example, if accounts are the primary object on your custom report type, and contacts are the secondary object, then the Add Fields Via Lookup overlay does not display lookup fields from contacts to accounts.
 - Fields added to the layout via the **Add fields related via lookup** link are automatically included in the section of the object from which they are a lookup field. For example, if you add the `CONTACT` field as a lookup from accounts, then the `CONTACT` field is automatically included in the Accounts section. However, you can drag a field to any section.
 - Fields added via lookup automatically display the lookup icon on the field layout of the custom report type.
 - Reduce the amount of time it takes a user to find fields to report on by grouping similar fields together on custom report types' field layouts. You can create new page sections in which to group fields that are related to one another, and you can group fields to match specific detail pages and record types.
 - If you include activities as the primary object on a custom report type, then you can only add lookup fields from activities to accounts on the select column layout of the custom report type.
5. Arrange fields on sections as they should appear to users.
Fields not dragged onto a section will be unavailable to users when they generate reports from this report type.
 6. Click **Preview Layout** and use the legend to determine which fields are included on the layout, added to the report by default, and added to the layout via a lookup relationship.
 -  **Warning:** Users can view roll-up summary fields on reports that include data from fields they do not have access to view. For example, a user that does not have access to view the `PRICE` field on an opportunity product can view the `TOTAL PRICE` field on opportunity reports if he or she has access to the `TOTAL PRICE` field.
 7. To rename or set which fields are selected by default for users, select one or more fields and click **Edit Properties**.
 - Click the `Checked by Default` checkbox next to one or more fields.
Fields selected by default automatically display the checkbox icon (✓) on the field layout of the custom report type.
 - Change the text in the `Display As` field next to the field you want to rename.
 -  **Note:** Renamed fields from standard objects, as well as renamed standard objects, do not display as such on the field layout of the custom report type. However, renamed fields from standard objects and renamed standard objects do display their new names on the report and the preview page, which you can access by clicking **Preview Layout**.
 8. To rename the sections, click **Edit** next to an existing section, or create a new section by clicking **Create New Section**.
 9. Click **Save**.

SEE ALSO:

[Create a Custom Report Type](#)

Manage Custom Report Types

After you create a custom report type, you can customize, edit, and delete it.

From Setup, enter *Report Types* in the *Quick Find* box, then select **Report Types** to display the All Custom Report Types page, which shows the list of custom report types defined for your organization.

- Select a list view from the *View* drop-down list to go directly to that list page, or click **Create New View** to define your own custom view.
- Define a new custom report type by clicking **New Custom Report Type**.
- Update a custom report type's name, description, report type category, and deployment status by clicking **Edit** next to a custom report type's name.
- Delete a custom report type by clicking **Del** next to the custom report type's name. All the data stored in the custom report type will be deleted and cannot be restored from the Recycle Bin.

Important: When you delete a custom report type, any reports based on it are also deleted. Any dashboard components created from a report based on a deleted custom report type display an error message when viewed.

- Display detailed information about a custom report type and customize it further by clicking a custom report type's name.

After you click a custom report type name you can:

- Update which object relationships a report can display when run from the custom report type.
- Edit the page layout of the custom report type to specify which standard and custom fields a report can display when created or run from the custom report type.
- See how the fields display to users in reports run from the custom report type by clicking **Preview Layout** on the Fields Exposed for Reporting section.
- Create a new custom report type with the same object relationships and fields as the selected custom report type by clicking **Clone**.
- Rename fields in the report.
- Set which fields are selected by default.

When you edit a report, you can see the report type displayed above the report name in report builder. The report type isn't displayed on the report run page.

1. Report type
2. Report name

Note: If the Translation Workbench is enabled for your organization, you can translate custom report types for international users.

Limits on Report Types

Custom report types are subject to some limits to ensure high performance and usability.

To create or update custom report types:

- "Manage Custom Report Types"

To delete custom report types:

- "Modify All Data"

- You can add up to 1000 fields to each custom report type. A counter at the top of the Page Layout step shows the current number of fields included. If you have too many fields, you can't save the layout.
- You can't add the following fields to custom report types:
 - Product schedule fields
 - History fields
 - Person account fields
 - The `Age` field on cases and opportunities
- A custom report type can contain up to 60 object references. For example, if you select the maximum limit of four object relationships for a report type, then you could select fields via lookup from an additional 56 objects. However, users will receive an error message if they run a report from a custom report type and the report contains columns from more than 20 different objects.
- Object references can be used as the main four objects, as sources of fields via lookup, or as objects used to traverse relationships. Each referenced object counts toward the maximum limit even if no fields are chosen from it. For example, if you do a lookup from account to account owner to account owner's role, but select no fields from account owner, all the referenced objects still count toward the limit of 60.
- Reports run from custom report types that include cases do not display the `Units` drop-down list, which allows users to view the time values of certain case fields by hours, minutes, or days.
- You can't add forecasts to custom report types.
- Report types associated with custom objects in the Deleted Custom Objects list count against the maximum number of custom report types you can create.

Turn On Enhanced Sharing for Reports and Dashboards

When you enable analytics sharing, Salesforce converts your users' existing folder access levels to use new, more detailed access levels.

-  **Note:** If your organization was created after the Summer '13 Salesforce release, you already have analytics folder sharing. If your organization existed before the Summer '13 release, follow these steps to make folder sharing available to your users.

When analytics sharing is in effect, all users in the organization get Viewer access by default to report and dashboard folders that are shared with them. Users might have more access if they are Managers or Editors on a given folder, or if they have more administrative user permissions. Each user's access to folders under the new capability is based on the combination of folder access and user permissions they had before enhanced folder sharing was enabled.

1. From Setup, enter *Folder Sharing* in the `Quick Find` box, then select **Folder Sharing**.
2. Select **Enable access levels for sharing report and dashboard folders**.
3. Click **Report and Dashboard Folder Sharing**.

-  **Important:** If you go back to the old folder sharing model, existing report and dashboard folders go back to the state they were in before.
- If a folder existed before analytics folder sharing was enabled, its properties and sharing settings are rolled back to their previous state.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To view the analytics folder sharing setting:

- "View Setup and Configuration"

To modify the analytics folder sharing setting:

- "Customize Application"

- If a folder was created while enhanced analytics folder sharing was in effect, it is hidden from the folder list and all its sharing settings are removed. Administrative user permissions are still in effect.

Set Up Historical Trend Reporting

To make historical trend reports available to your users, use filters to configure the amount of data that's captured for historical trend reporting. Then select the fields needed for historical reports.

Shape your historical trend data to have enough for users to exploit but doesn't exceed the space limits. Consider which fields contain useful historical data and which fields contain data you can leave out.

 **Important:** Retaining historical data increases the amount of data you store. The effect depends on the ways your organization works. Say that someone updates the status of a typical opportunity record every day or two. Historical trending data for the Status field on the Opportunity object takes up more space than if the record changes once or twice a month. If any of your trended objects is in danger of exceeding the data limit, you receive an email alert.

1. From Setup, enter *Historical Trending* in the **Quick Find** box, then select **Historical Trending**.

2. Select the object that you want to do historical trend reporting on.

You can select Opportunities, Cases, Forecasting Item, and up to three custom objects.

 **Note:** Historical trend reporting is available on only Collaborative forecasting, not Customizable forecasting.

3. Select **Enable Historical Trending**.

4. Use the filters under **Configure Data** to specify the total amount of data you can use to create historical trend reports.

 **Note:** You can narrow down historical data for Opportunities, Cases, and custom objects. For Forecasting Items, the available data is selected for you.

For example, to reduce the data stored for Opportunities reports, drop out the least likely deals by setting `Stage not equal to Prospecting`.

5. Under **Select Fields**, choose up to eight fields to make available for historical trend reporting.

These fields can be selected when creating historical trending reports.

 **Note:**

- For Opportunities reporting, five fields are preselected: Amount, Close Date, Forecast Category, Probability, and Stage. You can add three more.
- For Forecasting, all eight available fields are pre-selected.

After you enable historical trending, a new custom report type is available when you create future reports. If you enable historical trending on a new field, that field is automatically added to the historical trending report layout.

When you turn off historical trending, keep these points in mind.

- Turning off historical trending for a field hides the historical data for that field. If you re-enable historical trending, historical data for the field can be viewed again, including data created after historical trending was turned off.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"
AND
"Report Builder"

- Turning off historical trending for an object causes all historical data and configuration settings to be deleted for that object. This includes the object's historical trending report type and any reports that have been created with it.
- If you turn off historical trending for a field and delete it, the field's historical data is no longer available even if you re-enable historical trending.

 **Note:**

- The historical fields available to each user depend on the fields that user can access. If your permissions change and you can no longer see a given field, that field's historical data also becomes invisible.
- Each historical field has the same field-level security as its parent field. If the field permissions for the parent field change, the historical field's permissions change accordingly.

SEE ALSO:

[Tip Sheet: Historical Trend Reporting for Opportunities](#)

Upgrade the Report Wizard

Report builder, a powerful drag-and-drop editor, is the standard tool for creating and editing reports. If your organization is still using the old report wizard, you should upgrade to report builder.

- All profiles get access to the report builder by default. (You may continue to see the "Report Builder" permission in permission sets and profiles and the PermissionSet and Profile objects in the API, though the upgrade overrides those settings.)
- The old report wizard is available only to users in Accessibility Mode.
- Group and Professional Edition organizations can use report builder.
- You get scatter charts, a new chart type for reports.

New organizations automatically get the latest version of report builder. If you don't see the Report Builder Upgrade section on the User Interface Settings page, the upgrade has already been enabled for your organization.

Assigning the "Report Builder" permission to all users through profiles or permission sets isn't the same thing as enabling report builder for your entire organization. To enable report builder for your organization, follow these steps.

 **Important:** Upgrading **does not affect** any of your existing reports. However, once you upgrade, you can't return to the old report wizard.

1. From Setup, enter *Reports* in the *Quick Find* box, then select **Reports and Dashboards Settings**.
2. Review the Report Builder Upgrade section of the page and click **Enable**. If you don't see the button, report builder has already been enabled for your entire organization.
3. Confirm your choice by clicking **Yes, Enable Report Builder for All Users**.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To modify report and dashboard settings:

- "Customize Application"

Managing Billing and Licenses

Checkout contains details about your organization's Salesforce account, including your licenses, billing information, orders, invoices, and statements.

To access Checkout, from Setup, enter *Checkout* in the **Quick Find** box, select **Checkout**, then choose **Proceed to Checkout**.

 **Note:** Users with the "Manage Billing" permission have automatic access to Checkout. These users can also grant access to others within the organization [Granting Checkout Access](#) on page 400.

From Checkout, you can:

- [Order more licenses and products](#).
- [Change your billing information](#) for an active contract.
- [Change credit card information](#) associated with an active contract.
- [View your organization's orders and invoices](#).
- View your previously saved quotes—both quotes you created from Salesforce and quotes created by a sales representative.
- Place orders to purchase new products.
- Contact Salesforce to request sales assistance.
- Log a case for any Checkout related questions, issues, or concerns.

For detailed instructions on using Checkout, see the [Checkout User Guide](#).

Purchase More Licenses for Your Users

Users with Checkout enabled can add licenses for your organization at any time while a contract is in effect. If your organization doesn't have self-service access to Checkout, submit a request to your Salesforce representative.

 **Note:** At any point during the quote creation process, you can click **Request Assistance** to contact your Salesforce account representative.

1. From Setup, enter *Checkout* in the **Quick Find** box, then select **Checkout** and click **Proceed to Checkout**.
2. Click **Add More Products**.
3. To see all products that your organization supports, click **All Available Products**.
4. Enter the number of license subscriptions you want to purchase.
If licenses are purchased in the middle of a billing cycle, the subscription is prorated based on the number of days left in that billing cycle. **Total Price** reflects **Monthly/Unit Price** for the order term, which is specified above the products. For example, if an order's subscriptions start on 5/14/2013 and end on 5/7/2014, **Total Price** will reflect **Monthly/Unit Price** for 11.8 months.
5. Click **Proceed to Place Order**.
6. Review your order and payment information. Click the pencil if you need to make changes.
7. Read and confirm that you accept the Master Subscription Agreement and any other required terms and agreements.

Granting Checkout Access

Users with the “Manage Billing” permission have access to Checkout when it is enabled for your organization. These users can also grant access to other users within your organization. Users with Checkout access can purchase Salesforce licenses, AppExchange app licenses, and other related products. Additionally, within Checkout, users can view the organization’s quotes, installed products, orders, invoices, payments, and contracts.

To give a user access to Checkout:

1. From Setup, enter *Users* in the *Quick Find* box, then select **Users**.
2. Click on the appropriate user's name to open the user detail page.
3. Click **Edit**.
4. Select the *Checkout Enabled* checkbox. The user is notified by email when his or her Checkout account is activated and available for login.

Critical Updates Overview

Salesforce periodically releases updates that improve the performance, logic, and usability of Salesforce, but may affect your existing customizations. When these updates become available, Salesforce lists them in Setup at **Critical Updates** and displays a message when administrators go to Setup.

To ensure a smooth transition, each update has an opt-in period during which you can manually activate and deactivate the update an unlimited number of times to evaluate its impact on your organization and modify affected customizations as necessary. The opt-in period ends on the auto-activation date, at which time Salesforce permanently activates the update.

 **Warning:** Salesforce recommends testing each update by activating it in either your Developer Sandbox or your production environment during off-peak hours.

To manage critical updates, from Setup, click **Critical Updates**. From this page, you can view the summary, status, and auto-activation date for any update that Salesforce has not permanently activated. To view more details about the update, including a list of customizations in your organization that the update might affect, click **Review**.

If an update has an **Activate** link, click it to test the update in your sandbox or production environment before Salesforce automatically activates it.

Notes on Critical Updates

- Salesforce analyzes your organization to determine if a critical update potentially affects your customizations. If your customizations are not affected, Salesforce automatically activates the update in your organization.

- On the scheduled auto-activation date, Salesforce permanently activates the update. After auto-activation, you cannot deactivate the update.
- Each update detail page describes how your customizations might be affected and how you can correct any unintended functionality.
- Salesforce displays a message the first time you access the setup menu after a critical update becomes available. The message lets you choose to have Salesforce display the updates immediately or remind you about the updates later.

Divisions Overview

Divisions let you segment your organization's data into logical sections, making searches, reports, and list views more meaningful to users. For example, you can create a report to show the opportunities for just the North American division, allowing you to get accurate sales numbers for the North American sales team. Divisions are useful for organizations with extremely large amounts of data.

 **Note:** Divisions do not restrict users' access to data and are not meant for security purposes.

Divisions can be assigned to users and to other records.

- **Record-level division**—Division is a field on individual records that marks the record as belonging to a particular division. A record can belong to a division created by the administrator, or it can belong to the standard “global” division, which is created automatically when your organization enables divisions. A record can belong to only one division at a time.
- **Default division**—Users are assigned a default division that applies to their newly created accounts, leads, and custom objects that are enabled for divisions.
- **Working division**—If you have the “Affected by Divisions” permission, you can set the division using a drop-down list in the sidebar. Then, searches will show only the data for the current working division. You can change your working division at any time. If you don't have the “Affected by Divisions” permission, you'll always see records in all divisions.

The following table shows how using divisions affects different areas.

Area	Description
Search	<p>If you have the “Affected by Divisions” permission:</p> <ul style="list-style-type: none"> • In sidebar search, you can select a single division, or all divisions. • In advanced search, you can select a single division or all divisions. • In global search, you can search a single division or all divisions. • For searches in lookup dialogs, the results include records in the division you select from the drop-down list in the lookup dialog window. <p> Note: All searches within a specific division also include the global division. For example, if you search within a division called Western Division, your results will include records found in both the Western Division and the global division.</p> <p>If you do not have the “Affected by Divisions” permission, your search results always include records in all divisions.</p>

EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance

- Developer

Area	Description
List views	<p>If you have the “Affected by Divisions” permission, list views include only the records in the division you specify when creating or editing the list view. List views that don’t include all records (such as My Open Cases) include records in all divisions.</p> <p>If you do not have the “Affected by Divisions” permission, your list views always include records in all divisions.</p>
Chatter	Chatter doesn’t support divisions. For example, you can’t use separate Chatter feeds for different divisions.
Reports	<p>If you have the “Affected by Divisions” permission, you can set your report options to include records in just one division or all divisions. Reports that use standard filters (such as My Cases or My team’s accounts) show records in all divisions, and can’t further limited to a specific division.</p> <p>If you do not have the “Affected by Divisions” permission, your reports always include records in all divisions.</p>
Viewing records and related lists	When viewing the detail page of a record, the related lists show all associated records that you have access to, regardless of division.
Creating new records	<p>When you create new accounts, leads, or custom objects that are enabled for divisions, the division is automatically set to your default division, unless you override this setting.</p> <p>When you create new records related to an account or other record that already has a division, the new record is assigned to the existing record’s division. For example, if you create a custom object record that is on the detail side of a master-detail relationship with a custom object that has divisions enabled, it is assigned the master record’s division.</p> <p>When you create records that are not related to other records, such as private opportunities or contacts not related to an account, the division is automatically set to the global division.</p>
Editing records	<p>When editing accounts, leads, or custom objects that are enabled for divisions, you can change the division. All records that are associated through a master-detail relationship are automatically transferred to the new division as well. For example, contacts and opportunities are transferred to the new division of their associated account, and detail custom objects are transferred to their master record’s new division.</p> <p>When editing other types of records, you can’t change the division setting.</p>

Area	Description
Custom objects	<p>When you enable divisions for a custom object, Salesforce initially assigns each record for that custom object to the global division.</p> <p>When you create a custom object record:</p> <ul style="list-style-type: none">• If the custom object is enabled for divisions, the record adopts your default division.• If the custom object is on the detail side of a master-detail relationship with a divisions-enabled custom object, the record adopts the division of the master record.
Relationships	<p>If you convert a lookup relationship to a master-detail relationship, detail records lose their current division and inherit the division of their master record.</p> <p>If you convert a master-detail relationship to a lookup relationship, the division for any detail records is determined by the previous master record.</p> <p>If you delete a master-detail relationship, the division for any detail records is determined by the previous master record.</p>

Setting Up Divisions

When setting up divisions, you must create divisions and assign records to divisions to make sure that your data is categorized effectively.

Before you can use the divisions feature for your organization, you must enable divisions. If you are using a standard object, contact Salesforce to enable divisions for your organization. For custom objects, select **Enable Divisions** on the custom object definition page to enable divisions.

1. Plan which divisions you need based on how you want to segment your data.
For example, you may want one division for all the records belonging to your North American sales team and one division for your European sales team.
100
2. [Create divisions](#) for your organization. All existing records are assigned to the “Global” division by default. You can change the default division name, create additional divisions, and move user and data records between divisions.
3. [Transfer leads, accounts, and custom objects into relevant divisions](#). When records are assigned to a division, associated records are assigned the same division.
For example, when you change the division assigned to an account, related records such as contacts and opportunities are assigned to the same division.
4. Add division fields to page layouts.
5. Add divisions to field-level security.
6. [Set the default division for all users](#). New accounts and leads are assigned to the user’s default division unless the user explicitly assigns a different division. New records related to existing records are assigned to the existing record’s division.
7. Enable the “Affected by Divisions” permission for users who should be able to limit list views by division, search within a division, or report within a division.
Users who don’t have the “Affected by Divisions” permission still have a default user-level division, can view division fields, change the division for a record, and specify a division when creating records.

Creating and Editing Divisions

Creating logical divisions for your organization helps you segment your records to make searching and reporting easier.

Divisions must be enabled for the organization.

All records are initially assigned to the default “Global” division until the user defines the division. You can create up to 100 divisions, including any inactive ones.

1. From Setup, enter *Manage Divisions* in the **Quick Find** box, then select **Manage Divisions**.
2. Click **New** to create a divisions, or **Edit** change an existing division.
3. Enter the division name.
4. Select the checkbox to make the division active.

 **Note:** You cannot deactivate a division if users or lead queues are assigned to that division.

5. Click **Save**.
6. If you want to change the order that divisions appears in the Divisions picklist, click **Sort**, then to use the arrow buttons to move divisions higher or lower in the list.

SEE ALSO:

[Divisions Overview](#)

[Setting Up Divisions](#)

[Change the Default Division for Users](#)

Transferring Multiple Records Between Divisions

Select groups of records to move into or between divisions.

To reassign the divisions for multiple records at one time, transfer groups of accounts, leads, or users between divisions.

1. From Setup, enter *Mass Division Transfer* in the **Quick Find** box, then select **Mass Division Transfer**.
2. Select the type of record you want transferred, then click **Next**. When you change the division assigned to an account, related records such as contacts and opportunities are assigned to the same division. When you change the division assigned to a custom object, other custom objects belonging to it are also transferred to the new division.
3. Select search conditions that records must match and click **Next**.
4. Select the division you want to transfer the records to.
5. If you’re transferring user records, you can select *Change the division...* to also transfer the users’ records to the new division.

To mass transfer records:

- “Modify All Data”

6. Click **Transfer**. You'll receive an email notification when the transfer is complete. If 5,000 or more records are being transferred, the request will be placed in a queue for processing.

SEE ALSO:

[Divisions Overview](#)[Setting Up Divisions](#)[Creating and Editing Divisions](#)[Change the Default Division for Users](#)

Change the Default Division for Users

If you can manage user settings, you can change a user's default division.

If your organization uses divisions to segment data, a default division is assigned to all users and is applied to new accounts, leads, and appropriate custom objects. The default division doesn't prevent users from viewing or creating records in other divisions. If, however, the new record is related to an existing record, the new record is assigned the same division as the existing record.

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
2. Click the name, alias, or username of the user whose default division you want to change.
3. Next to the **Default Division** field, click **Change**.
4. Select a new default division.
5. Select an action to be applied to records the user already owns.
6. Click **Save**.

If you are changing your own default division, skip step 1 and go to your personal settings. Enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.

Manage Users

User Management Overview

In Salesforce, every user is identified by a username, a password, and a single profile. Together with other settings, the profile determines what tasks users can perform, what data they see, and what they can do with the data.

Depending on your organization's Salesforce edition and the additional features your company has purchased, you may have feature licenses—such as Marketing, Connect Offline, and Sales Anywhere—that give users the ability to access features that are not included in their user licenses. One or more of these licenses can be assigned to each user. You can also set up accounts for users outside your organization who need to access a limited set of fields and objects. You can also grant access to Customer Portal, partner portal, or Self-Service through user licenses. Finally, using Salesforce to Salesforce, you can create connections to share records with other Salesforce users outside of your organization.

 **Note:** Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

As an administrator, you perform user management tasks such as creating and editing users, resetting passwords, and creating Google Apps accounts. You also grant permissions, create and manage other types of users, create custom fields, set custom links, run reports on users, and delegate user administration tasks to other users.

SEE ALSO:

[View and Manage Users](#)[Licenses Overview](#)

EDITIONS

The available user management options vary according to which Salesforce Edition you have.

View and Manage Users

To view and manage the users in your organization, from Setup, enter *users* in the **Quick Find** box, then select **Users**.

The user list shows all the users in your organization, partner portal, and Salesforce Customer Portal. From the user list, you can:

- [Create one user](#).
- [Create multiple users](#).
- [Reset passwords for selected users](#).
- [Edit a user](#).
- View a user's detail page by clicking the name, alias, or username.
- View or edit a profile by clicking the profile name.
- If Google Apps™ is enabled in your organization, export users to Google and create Google Apps accounts by clicking **Export to Google Apps**

 **Tip:** You can perform many of these tasks from the SalesforceA mobile app.

Tips for Managing Users

- You can create custom fields for users and set custom links to display on the user detail page. To access these options, go to the object management settings for users.
- You can use the sidebar search to search for any user in your organization, regardless of the user's status. However, when using a lookup dialog from fields within records, the search results return only active users. You can also run user reports in the Reports tab.
- To simplify user management in organizations with large numbers of users, delegate aspects of user administration to non-administrator users.

 **Note:** You cannot delegate administrative duties related to your organization to partner portal or Customer Portal users. However, you can delegate some portal administrative duties to portal users.

Guidelines for Adding Users

Understand important options for adding users. Learn what to communicate to users about passwords and logging in.

- Your *username* must be unique across all Salesforce organizations. The username must be in the format of an email address, for example, jane@salesforce.com. But the actual email in the username doesn't need to work. You *can* have the same functioning email address associated with your account across organizations—only the *username in the form of an email address* must remain unique.
- If your name includes non-English characters, add the specified language to the mail format settings within Outlook if viewing email in Outlook.
- Temporary passwords for new users expire in six months, and users must change their password the first time they log in. The login link in the email can only be used once. A user who follows the link without setting a password must have an administrator reset their password before they can log in.
- You can change a Salesforce license to a Force.com license, but you can't change a Force.com license to a Salesforce license.
- Not all options are available for all license types. For example, the `Marketing User` and `Allow Forecasting` options are not available for Force.com user licenses because the `Forecasts` and `Campaigns` tabs are not available to users with a Force.com license. Force.com user licenses are not available for Professional, Group, or Contact Manager Editions.
- In Performance, Unlimited, Enterprise, and Developer Edition organizations, you can select `Send Apex Warning Emails` to send email to the user when an application that invokes Apex uses more than half of the resources specified by the governor limits. This feature can be used during Apex code development to test the amount of resources being used at runtime.
- Temporary passwords for new users expire in six months, and users must change their password the first time they log in. The login link in the email can only be used once. A user who follows the link without setting a password must have an administrator reset their password before they can log in.

[Add a Single User](#)

Add a Single User

Depending on the size of your organization or your new hire onboarding process, you may choose to add users one at a time. The maximum number of users you can add is determined by your Salesforce edition.

1. Read the guidelines for adding users.
2. From Setup, enter `Users` in the `Quick Find` box, then select **Users**.
3. Click **New User**.
4. Enter the user's name and email address and a unique username in the form of a email address. By default, the username is the same as the email address.

 **Important:** Your *username* must be unique across all Salesforce organizations. The username must be in the format of an email address, for example, `jane@salesforce.com`. But the actual email in the username doesn't need to work. You *can* have the same functioning email address associated with your account across organizations—only the *username in the form of an email address* must remain unique.

5. In Professional, Enterprise, Unlimited, Performance, and Developer Editions, select a `Role`.
6. Select a `User License`. The user license determines which profiles are available for the user.
7. Select a profile, which specifies the user's minimum permissions and access settings.
8. If your organization has Approvals enabled, you can set the user's approver settings, such as delegated approver, manager, and preference for receiving approval request emails.
9. Check `Generate new password and notify user immediately` to have the user's login name and a temporary password emailed to the new user.

USER PERMISSIONS

To create users:

- "Manage Internal Users"

Add Multiple Users

You can quickly add up to 10 users at a time to your organization. Your Salesforce edition determines the maximum number of users that you can add.

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
2. Click **Add Multiple Users**.
3. If multiple user license types are available in your organization, select the user license to associate with the users you plan to create. The user license determines the available profiles.
4. Specify the information for each user.
5. To email a login name and temporary password to each new user, select **Generate passwords and notify user via email**.
6. Click **Save**.
7. To specify more details for the users that you've created with this method, edit individual users as needed.

SEE ALSO:

Edit Users

To change user details—such as a user's profile, role, or contact information—edit the user account.

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
2. Click **Edit** next to a user's name.
3. Change the settings as needed.
4. Click **Save**.

Tip: You can perform this and other administration tasks from the SalesforceA mobile app.

USER PERMISSIONS

To edit users:

- "Manage Internal Users"

Considerations for Editing Users

Be aware of the following behaviors when editing users.

Username

A username must be unique across all Salesforce organizations. It must use the format of an email address (such as xyz@abc.org), but doesn't need to be a real email address. While users can have the same email address across organizations, usernames must be unique.

If you change a username, a confirmation email with a login link is sent to the email address associated with that user account. If an organization has multiple login servers, sometimes users can't log in immediately after you've changed their usernames. The change can take up to 24 hours to replicate to all servers.

Changing email addresses

If `Generate new password and notify user immediately` is disabled when you change a user's email address, Salesforce sends a confirmation message to the email address that you entered. Users must click the link provided in that message for the new email address to take effect. This process ensures system security.

Personal information

Users can change their personal information after they log in.

User sharing

If the organization-wide default for the user object is Private, users must have Read or Write access to the target user to access that user's information.

Domain names

You can restrict the domain names of users' email addresses to a list of specific domains. Any attempt to set an email address with another domain results in an error message. To enable this functionality for your organization, contact Salesforce.

Unlock Users

Users can be locked out of an organization if they enter incorrect login credentials too many times. Unlock users to restore their access.

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
2. Select the locked user.
3. Click **Unlock**.

This button appears only when a user is locked out.

Tip: You can perform this and other administration tasks from the SalesforceA mobile app.

USER PERMISSIONS

To deactivate users:

- "Manage Internal Users"

Considerations for Deactivating Users

Be aware of the following behaviors when deactivating users.

User licenses and billing

A deactivated user doesn't count against your organization's available user licenses. However, deactivating a user doesn't reduce the number of licenses for which your organization is billed. To change your billing, you must change your organization's license count.

Users in custom hierarchy fields

You can't deactivate a user that's selected in a custom hierarchy field even if you delete the field. To deactivate a user in a custom hierarchy field, delete and permanently erase the field first.

Workflow email alert recipients

You can't deactivate a user that's assigned as the sole recipient of a workflow email alert.

Customer Portal Administrator users

You can't deactivate a user that's selected as a Customer Portal Administrator.

Record access

Deactivated users lose access to any records that were manually shared with them, or records that were shared with them as team members. Users higher in the role hierarchy relative to the deactivated users also lose access to those records. However, you can still transfer their data to other users and view their names on the Users page.

Note: If your organization has Asynchronous Deletion of Obsolete Shares (Pilot) enabled, removal of manual and team shares is run during off-peak hours between 6 PM and 4 AM based on your organization's default time zone. For account records, manual and team shares are deleted right after user deactivation.

Deactivated users lose access to shared records immediately. Users higher in the role hierarchy continue to have access until that access is deleted asynchronously. If that visibility is a concern, remove the record access that's granted to the deactivated users before deactivation.

Chatter

If you deactivate users in an organization where Chatter is enabled, they're removed from Following and Followers lists. If you reactivate the users, the subscription information in the Following and Followers lists is restored.

If you deactivate multiple users, subscription information isn't restored for users that follow each other. For example, user A follows user B and user B follows user A. If you deactivate users A and B, their subscriptions to each other are deleted from Following and Followers lists. If user A and user B are then reactivated, their subscriptions to each other aren't restored.

Created By fields

It's possible for inactive users to be listed in `Created By` fields even when they're no longer active in an organization. This happens because some system operations create records and toggle preferences, acting as an arbitrary administrator user to complete the task. This user can be active or inactive.

Accounts and opportunities owned by deactivated users

Deactivated users continue to own opportunities and appear in forecasts and territories. When users are deactivated, their opportunity forecast overrides, adjusted total overrides, and manager's choice overrides on subordinates' forecasts are frozen. However, the manager of a deactivated user can apply manager's choice overrides to that user's forecasts. Rollup amounts are kept current. If a deactivated user is later reactivated, the user can resume normal work as before. If "Allow Forecasting" is disabled for a user who is deactivated, the user is removed from any territories her or she is assigned to.

You can create and edit accounts, opportunities, and custom object records that are owned by inactive users. For example, you can edit the `Account Name` field on an opportunity record that's owned by an inactive user. To enable this feature, contact Salesforce.

EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

Opportunity and account teams

Deactivated users are removed from the default opportunity and account teams of other users. The deactivated users' default opportunity and account teams are not removed.

Account teams

If a user on an account team has Read/Write access (**Account Access, Contact Access, Opportunity Access, and Case Access**) and is deactivated, the access will default to Read Only if the user is reactivated.

Opportunity teams

If you deactivate users in an organization where opportunity splitting is enabled, they aren't removed from any opportunity teams where they're assigned a split percentage. To remove a user from an opportunity team, first reassign the split percentage.

Delegated external user administrators

When a delegated external user administrator deactivates a portal user, the administrator doesn't have the option to remove the portal user from any teams that user is a member of.

SEE ALSO:

[Deactivate \(Delete\) Users](#)

Freeze or Unfreeze User Accounts

In some cases, you can't immediately deactivate an account, such as when a user is selected in a custom hierarchy field. To prevent users from logging in to your organization while you perform the steps to deactivate them, you can freeze user accounts.

Let's say a user just left your company. You want to deactivate the account, but the user is selected in a custom hierarchy field. Because you can't immediately deactivate the account, you can freeze it in the meantime.

 **Tip:** You can perform this and other administration tasks from the SalesforceA mobile app.

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
2. Click the username of the account you want to freeze.
3. Click **Freeze** to block access to the account or **Unfreeze** to allow access to the account again.

 **Note:** Freezing user accounts doesn't make their user licenses available for use in your organization. To make their user licenses available, deactivate the accounts.

- Database.com

USER PERMISSIONS

To freeze or unfreeze user accounts:

- "Manage Users"

Restrict User Email Domains

You can define a whitelist to restrict the email domains allowed in a user's `Email` field.

1. From Setup, enter *Allowed Email Domains* in the `Quick Find` box, then select **Allowed Email Domains**.

 **Note:** If you don't see this page, contact your Salesforce representative to enable it.

2. Click **New Allowed Email Domain**.

3. Enter a `Domain`.

You can enter a top-level domain, such as *sampledoc.org*, or a subdomain, such as *emea.sampledoc.org*.

4. Click **Save**.

You can repeat the steps to add more email domains to the whitelist.

Once you've added one or more whitelisted email domains, the `Email` field for each new user must match a whitelisted domain.

The `Email` field for existing users doesn't have to comply with the whitelist. However, if you edit an existing user, update the `Email` field to match a whitelisted email domain.

 **Note:** The email domain whitelist doesn't apply to users external to your organization, such as portal, Communities, or Chatter External users.

User Fields

The fields that comprise the Personal Information and other personal settings pages help to describe a user.

The visibility of fields depends on the specific page, your organization's permissions, and which edition you have.

Field	Description
<code>Accessibility Mode</code>	When selected, enables a user interface mode designed for visually impaired users.
<code>Active</code>	Administrative checkbox that enables or disables user login to the service.
<code>Address</code>	Street address for user. Up to 255 characters are allowed in this field.
<code>Admin newsletter</code>	Opt in to receive administrator-targeted promotional emails from Salesforce. This field is

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To restrict user email domains:

- "Manage Users"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

The available fields vary according to which Salesforce Edition you have.

Field	Description
	not available if your organization has disabled your choice to receive emails from Salesforce.
Alias	Short name to identify user on list pages, reports, and other pages where the entire name does not fit. Up to eight characters are allowed in this field.
Allow Forecasting	Indicates whether the user can use customizable forecasting.
Api Token	Indicates whether an API token has been reset. If issues occur, Salesforce uses this field to help you troubleshoot issues related to API tokens.
Call Center	The name of the call center to which this user is assigned.
Checkout Enabled	Indicates whether the user is notified by email when his or her Checkout account is activated and available for login. Enabling this option requires the "Manage Billing" permission.
City	City portion of user's address. Up to 40 characters are allowed in this field.
Color-Blind Palette on Charts	Indicates whether the option to set an alternate color palette for charts has been enabled. The alternate palette has been optimized for use by color-blind users. For dashboard emails, the alternate palette is not used.
Company	Company name where user works. Up to 40 characters are allowed in this field.
Contact	Name of the associated contact if the user is a partner user.
Country	Country portion of user's address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Created By	User who created the user including creation date and time. (Read only)
Currency	User's default currency for quotas, forecasts, and reports. Shown only in organizations using multiple currencies. This currency must be one of the active currencies for the organization.
Custom Links	Listing of custom links for users as set up by your administrator.
Data.com User Type	Enables a user to find contact and lead records from Data.com and add them to Salesforce. Also indicates the type of Data.com user. Data.com Users get a limited number of account, contact, and lead records to add or export per month, and their unused additions expire at the end of each month. Data.com List Users get a limited number of account, contact, and lead records to add or export per month, and their unused additions expire at the end of each month. After the monthly limit is used, List Users draw record additions

Field	Description
	from a pool that is shared by all List Users in the organization. Unused pool additions expire one year from purchase.
Default Currency ISO Code	User's default currency setting for new records. Available only for organizations that use multiple currencies.
Default Division	<p>Division that is applied, by default, to all new accounts and leads created by the user, unless the user explicitly sets a different division. When users create records related to an account or other record that already has a division, the new record is assigned to the existing record's division. The default division is not used.</p> <p>This setting does not restrict the user from viewing or creating records in other divisions. Users can override change their default division at any time by setting a working division.</p> <p>Available only in organizations that use divisions to segment their data.</p>
Delegated Approver	User lookup field used to select a delegate approver for approval requests. Depending on the approval process settings, this user can also approve approval requests for the user.
Department	Group that user works for, for example, Customer Support. Up to 80 characters are allowed in this field.
Development Mode	<p>Enables development mode for creating and editing Visualforce pages.</p> <p>This field is visible only to organizations that have Visualforce enabled.</p>
Disable Auto Subscription For Feeds	Disables automatic feed subscriptions to records owned by a user. Only available in organizations with Chatter enabled.
Division	Company division to which user belongs for example, PC Sales Group. Up to 40 characters are allowed in this field.
Email	Email address of user. Must be a valid email address in the form: jsmith@acme.com. Up to 80 characters are allowed in this field.
Email Encoding	Character set and encoding for outbound email sent by user from within Salesforce. English-speaking users use ISO-8859-1, which represents all Latin characters. UTF-8 (Unicode) represents characters for all languages, however some older email software doesn't support it. Shift_JIS, EUC-JP, and ISO-2022-JP are useful for Japanese users.
Employee Number	Identifying number for a user.
End of day	Time of day that user generally stops working. Used to define the times that display in the user's calendar.
Fax	Fax number for user.

Field	Description
Federation ID	The value used to identify a user for federated authentication single sign-on.
First Name	First name of user, as displayed on the user edit page. Up to 40 characters are allowed in this field.
Force.com Flow User	Grants the ability to run flows. Available in Developer (with limitations), Enterprise, Unlimited, and Performance Editions. Enabling this option requires the “Manage Force.com Flow” permission. If the user has the “Run Flows” permission, don’t enable this field.
Force.com Quick Access Menu	Enables the Force.com quick access menu, which appears in object list view and record detail pages. The menu provides shortcuts to customization features for apps and objects.
Information Currency	The default currency for all currency amount fields in the user record. Available only for organizations that use multiple currencies.
Knowledge User	Grants access to Salesforce Knowledge. The user’s profile determines whether the user has access to the Article Management tab or Articles tab. Available in Professional, Enterprise, Unlimited, and Performance Editions.
Language	The primary language for the user. All text and online help is displayed in this language. In Professional, Enterprise, Unlimited, and Performance Edition organizations, a user’s individual <code>Language</code> setting overrides the organization’s <code>Default Language</code> . Not available in Personal Edition, Contact Manager, or Group Edition™. The organization’s <code>Display Language</code> applies to all users.
Last Login	The date and time when the user last successfully logged in. This value is updated if 60 seconds have elapsed since the user’s last login. (Read only)
Last Name	Last name of user, as displayed on the user edit page. Up to 80 characters are allowed in this field.
Last Password Change or Reset	The date and time of this user’s last password change or reset. This read-only field appears only for users with the “Manage Users” permission.
Locale	Country or geographic region in which user is located. The <code>Locale</code> setting affects the format of date, date/time, and number fields, and the calendar. For example, dates in the English (United States) locale display as 06/30/2000 and as 30/06/2000 in the English (United Kingdom) locale. Times in the English (United

Field	Description
	<p>States) locale display using a twelve-hour clock with AM and PM (for example, 2:00 PM), whereas in the English (United Kingdom) locale, they display using a twenty-four-hour clock (for example, 14:00).</p> <p>The <code>Locale</code> setting also affects the first and last name order on <code>Name</code> fields for users, leads, and contacts. For example, Bob Johnson in the English (United States) locale displays as Bob Johnson, whereas the Chinese (China) locale displays the name as Johnson Bob.</p> <p>For Personal Edition users, the locale is set at the organization level (from Setup, enter <i>Company Information</i> in the <code>Quick Find</code> box, then select Company Information). For all other users, their personal locale, available at their personal information page, overrides the organization setting.</p>
Make Setup My Default Landing Page	<p>When this option is enabled, users land in the Setup page when they log in.</p>
Manager	<p>Lookup field used to select the user's manager. This field:</p> <ul style="list-style-type: none"> • Establishes a hierarchical relationship, preventing you from selecting a user that directly or indirectly reports to itself. • Allows Chatter to recommend people and records to follow based on your organization's reporting structure. <p>This field is especially useful for creating hierarchical workflow rules and approval processes without creating more hierarchy fields.</p> <p> Note: Unlike other hierarchy fields, you can inactivate users referenced in the <code>Manager</code> field.</p>
Marketing User	<p>When enabled, the user can create, edit, and delete campaigns, configure advanced campaign setup, import leads, and update campaign history via the member import wizards. Available in Professional, Enterprise, Unlimited, and Performance Editions.</p> <p>To use the campaign import wizards, Marketing Users must also have the Marketing User profile (or the "Import Leads" permission and the "Edit" permission on campaigns in Enterprise, Unlimited, and Performance Edition organizations).</p> <p>If this option isn't selected, the user can only view campaigns and advanced campaign setup, edit the Campaign History for a single lead or contact, and run campaign reports.</p>
Middle Name	<p>Middle name of the user, as displayed on the user edit page. Up to 40 characters are allowed for this field.</p> <p> Note: To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in</p>

Field	Description
Mobile	<p data-bbox="875 264 1438 327">the <code>Quick Find</code> box, then select User Interface. Then select Enable Name Suffixes for Person Names.</p> <p data-bbox="820 369 1446 432">Cellular or mobile phone number. Up to 40 characters are allowed in this field.</p> <p data-bbox="820 449 1446 617">This number is used for SMS-based identity confirmation. Administrators enable SMS-based identity confirmation from Setup by entering <code>Session Settings</code> in the <code>Quick Find</code> box, then selecting Session Settings, and then selecting the Enable the SMS method of identity confirmation option.</p> <p data-bbox="820 634 1446 802">After the SMS method of identity confirmation is enabled, users without a verified mobile number in their profiles are asked after logging in to register for mobile verification. This process applies to users without mobile numbers. Users can take one of the following actions.</p> <ul data-bbox="820 819 1446 1104" style="list-style-type: none"> <li data-bbox="820 819 1446 882">• Enter a mobile phone number and then have it verified with a text message containing a verification code. <li data-bbox="820 898 1446 961">• Skip entering a mobile number now, but be asked again at the next login. <li data-bbox="820 978 1446 1104">• Opt out of mobile verification. Users who select this action can register a mobile number later in their personal information. Chatter Free and Chatter External license users who select this action need an administrator to set the mobile number. <p data-bbox="820 1121 1446 1226">After a user's mobile phone number is verified, Salesforce uses it to authenticate the user when necessary. For example, verification occurs when a user logs in from an unknown IP address.</p> <p data-bbox="820 1243 1446 1472">Administrators can also enter users' mobile numbers and pre-verify them. If Enable the SMS method of identity confirmation is enabled when an administrator enters a mobile number for a user, or when a mobile number is set from an API using the <code>User</code> object, the mobile number is considered verified. If Enable the SMS method of identity confirmation is not enabled, the new mobile phone number is not considered verified.</p>
Mobile Configuration	<p data-bbox="820 1514 1446 1608">The mobile configuration assigned to the user. If no mobile configuration is specified, this field defaults to the mobile configuration assigned to the user's profile.</p> <p data-bbox="820 1625 1446 1682">This field is visible to organizations that use Salesforce to manage mobile configurations.</p>
Mobile User	<p data-bbox="820 1724 1446 1892">Allocates one Salesforce Classic Mobile license to the user, granting the user access to Salesforce Classic Mobile app. The number of user records enabled by this checkbox can't exceed the total number of mobile licenses your organization has. Available in Professional, Enterprise, Unlimited, and Performance Editions.</p>

Field	Description
	<p>The Mobile User option is enabled by default for Unlimited, Performance, and Developer Edition users. To prevent users from activating the Salesforce Classic Mobile app on their mobile devices before you're ready to deploy it, disable this option for all users.</p> <p>If users have already activated their Salesforce Classic Mobile account, deselecting the Mobile User option revokes the user's mobile license. The next time the user's device synchronizes with Salesforce, all the Salesforce data is deleted from the device, and the device is no longer associated with the user.</p> <p> Note: The Mobile User checkbox doesn't apply to the free version of Salesforce Classic Mobile because users of the free app can access Salesforce from their device without a mobile license.</p>
Modified By	User who last changed the user fields, including modification date and time. (Read only)
Monthly Contact and Lead Limit	<p>If the user's <code>Data.com User Type</code> is Data.com User, the number of Data.com contact and lead records the user can add each month.</p> <p>The default number of records per license is 300, but you can assign more or fewer, up to the organization limit.</p>
Name	Combined first name, middle name (beta), last name, and suffix (beta) of user, as displayed on the user detail page.
Newsletter	Opt in to receive user-targeted promotional emails from Salesforce. This field is not available if your organization has disabled your choice to receive emails from Salesforce.
Nickname	A nickname is the name used to identify this user in a community. Up to 40 alphanumeric characters are allowed. Standard users can edit this field.
Offline User	Administrative checkbox that grants the user access to Connect Offline. Available in Professional, Enterprise, Unlimited, and Performance Editions.
Partner Super User	Denotes whether a partner portal user is a super user.
Phone	Phone number of user. Up to 40 characters are allowed in this field.
Profile	Administrative field that specifies the user's base-level permissions to perform different functions within the application. You can grant more permissions to a user through permission sets.
Receive Approval Request Emails	<p>Preference for receiving approval request emails.</p> <p>This preference also affects whether the user receives approval request notifications in Salesforce1.</p>

Field	Description
Receive Salesforce CRM Content Daily Digest	Specifies that non-portal users with a <code>Salesforce CRM Content User</code> license and Salesforce CRM Content subscription receive a daily email summary if activity occurs on their subscribed content, libraries, tags, or authors. To receive email, you must also select the <code>Receive Salesforce CRM Content Email Alerts</code> option. Portal users do not need the <code>Salesforce CRM Content User</code> license. They only need the <code>View Content in Portals</code> user permission.
Receive Salesforce CRM Content Email Alerts	Specifies that non-portal users with a <code>Salesforce CRM Content User</code> license and Salesforce CRM Content subscription receive email notifications if activity occurs on their subscribed content, libraries, tags, or authors. To receive real-time email alerts, select this option and do not select the <code>Receive Salesforce CRM Content Daily Digest</code> option. Portal users do not need the <code>Salesforce CRM Content User</code> license. They only need the <code>View Content in Portals</code> user permission.
Role	Administrative field that specifies position of user within an organization, for example, <code>Western Region Support Manager</code> . Roles are selected from a picklist of available roles, which can be changed by an administrator. Not available in Personal Edition, Contact Manager, or Group Edition.
Salesforce CRM Content User	Indicates whether a user can use Salesforce CRM Content. Available in Professional, Enterprise, Unlimited, and Performance Editions.
Salesforce1 User	Turns on automatic redirection to the Salesforce1 mobile browser app when a user logs in to Salesforce from a supported mobile Web browser. The <code>Salesforce1 mobile browser app</code> option must be enabled for your organization.
Self-Registered via Customer Portal	When enabled, specifies that the user was created via self-registration to a Customer Portal. Available in Enterprise, Unlimited, and Performance Editions.
Send Apex Warning Emails	Specifies that users receive an email notification whenever they execute Apex that surpasses more than 50 percent of allocated governor limits. Available in Developer, Enterprise, Unlimited, and Performance Editions only.
Show View State in Development Mode	Enables the View State tab in the development mode footer for Visualforce pages. This field is only visible to organizations that have Visualforce enabled, and <code>Development Mode</code> selected.

Field	Description
Site.com Contributor User	<p>Allocates one Site.com Contributor license to the user, granting the user limited access to Site.com Studio. Users with a Contributor license can use Site.com Studio to edit site content only.</p> <p>The number of user records with this checkbox enabled can't exceed the total number of Site.com Contributor licenses your organization has.</p> <p>Available in Developer, Enterprise, Unlimited, and Performance Editions, only if Site.com is enabled for your organization.</p>
Site.com Publisher User	<p>Allocates one Site.com Publisher license to the user, granting the user full access to Site.com Studio. Users with a Publisher license can build and style websites, control the layout and functionality of pages and page elements, and add and edit content.</p> <p>The number of user records with this checkbox enabled can't exceed the total number of Site.com Publisher licenses your organization has.</p> <p>Available in Developer, Enterprise, Unlimited, and Performance Editions, only if Site.com is enabled for your organization.</p>
Start of day	Time of day that user generally starts working. Used to define the times that display in the user's calendar.
State/Province	State or province portion of user's address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Suffix	<p>Name suffix of the user, as displayed on the user edit page. Up to 40 characters are allowed for this field.</p> <p> Note: To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select User Interface. Then select Enable Name Suffixes for Person Names.</p>
Time Zone	<p>Primary time zone in which user works.</p> <p>Users in Arizona should select the setting with "America/Phoenix," and users in parts of Indiana that do not follow Daylight Savings Time should select the setting with "America/Indianapolis."</p>
Time-Based Token	<p>When added, can be used to confirm the user's identity when necessary, such as when logging in from an unknown IP address.</p> <p>If the user has "Two-Factor Authentication for User Interface Logins" permission, the user is prompted to enter this token when logging in to Salesforce through the user interface.</p>

Field	Description
	If the user has “Two-Factor Authentication for API Logins” permission and adds a time-based token, the user must enter this token instead of the standard security token to access the service.
Title	Job title of user. Up to 80 characters are allowed in this field.
Used Space	Amount of disk storage space the user is using.
User License	Indicates the type of user license.
Username	Administrative field that defines the user’s login. Up to 80 characters are allowed in this field.
Zip/Postal Code	Zip code or postal code portion of user’s address. Up to 20 characters are allowed in this field.

Salesforce Adoption Manager FAQ

What kind of results can I expect from the Salesforce Adoption Manager?

With customized tips and feedback, this program is designed to help you and your users get more out of Salesforce. This program is about making your users more effective with Salesforce.

For example, here are some amazing results from our customers when effectively using the Salesforce1 mobile app:

- 40% increase in employee satisfaction
- 29% faster time to find information
- 26% increase in sales productivity

What happens after I activate Salesforce Adoption Manager for my users?

Once you activate the program, it will start with a personalized invite to users to download the Salesforce1 mobile app. All emails are optimized for desktop and mobile devices. Users not on mobile devices will have the option to text a download link to themselves.

After users have downloaded the app, they will receive emails based on their actual usage of the app. These emails will suggest top actions to take and keep track of actions already taken. The goal is to get users up to speed with the Salesforce1 mobile app so your company can start realizing more benefits from the product.

In the future, we will expand this program to help users become more effective with all Salesforce products.

By enabling Salesforce Adoption Manager, what will my user data be used for?

The only change when you enable Salesforce Adoption Manager is that your users will receive messages and notifications from this program based on their usage of the app. You can review our [privacy statement](#) for more detail.

If I choose to participate, can I opt out later?

Yes. You can go to Setup in the full Salesforce site, enter *Adoption* in the *Quick Find* box, select **Adoption Manager**, and then deselect **Enable Salesforce Adoption Manager**. Your users will also have the option to opt out using the footer in all communications that come from the program.

Will my users get any messages or notifications in addition to emails?

Initially, Salesforce Adoption Manager will only include emails. We plan to add app notifications in later releases so users can get the tips they need immediately while using the app.

Licenses Overview

To enable specific Salesforce functionality for your users, you must choose one user license for each user. To enable additional functionality, you can assign permission set licenses and feature licenses to your users or purchase usage-based entitlements for your organization.

Specific features in Salesforce require specific permissions. For example, to view cases, a user must have the “Read” permission on cases. However, you can’t assign permissions to any user you choose. Like the features that it enables, each permission has a requirement of its own. To assign a given permission to a user, that user’s license (or licenses) must support the permission. A single permission can be supported by more than one license.

Think of permissions as locks, and think of licenses as rings of keys. Before you can assign users a specific permission, they must have a license that includes the key to unlock that permission. Although every user must have exactly one user license, you can assign one or more permission set licenses or feature licenses to incrementally unlock more permissions.

Continuing our example, the Salesforce user license includes the key to unlock the “Read” permission on cases, but the Force.com—App Subscription user license doesn’t. If you try to assign that permission to a Force.com—App Subscription user, you get an error message. However, if that Force.com—App Subscription user is also assigned a Company Community for Force.com permission set license, you can assign “Read” on cases to that user.

Salesforce provides the following types of licenses and usage-based entitlements.

EDITIONS

Available in: Salesforce Classic

Edition requirements vary for each user, permission set, and feature license type.

IN THIS SECTION:

[User Licenses Overview](#)

A user license determines the baseline of features that the user can access. Every user must have exactly one user license. You assign user permissions for data access through a profile and optionally one or more permission sets.

[Permission Set Licenses](#)

A permission set is a convenient way to assign users specific settings and permissions to use various tools and functions.

[Feature Licenses Overview](#)

A feature license entitles a user to access an additional feature that is not included with his or her user license, such as Marketing or Work.com. Users can be assigned any number of feature licenses.

[Usage-based Entitlements Overview](#)

A usage-based entitlement is a limited resource that your organization can use on a periodic basis—such as the allowed number of monthly logins to a Partner Community or the record limit for Data.com list users.

User Licenses Overview

A user license determines the baseline of features that the user can access. Every user must have exactly one user license. You assign user permissions for data access through a profile and optionally one or more permission sets.

 **Example:** For example, if you assign a Force.com user license to Employee A and a Salesforce user license to Employee B, you can give “Read” access on cases only to Employee B. Employee A’s user license doesn’t support standard object permissions for anything but accounts and contacts.

Salesforce offers these license types.

- [Standard User Licenses](#)
- [Chatter User Licenses](#)
- [Communities User Licenses](#)
- [Service Cloud Portal User Licenses](#)
- [Sites and Site.com User Licenses](#)
- [Authenticated Website User Licenses](#)

 **Note:** You might see other types of licenses listed if your company has purchased custom user licenses for different types of functionality. Your organization might also have other licenses that are still supported but no longer available for purchase. Contact Salesforce for more information.

The following license types are available only for organizations currently using a Customer Portal or partner portal. If you don’t have a Customer Portal or partner portal but want to easily share information with your customers or partners, see [Communities User Licenses](#) on page 434.

- [Customer Portal User Licenses](#)
- [Customer Portal—Enterprise Administration User Licenses](#)
- [Partner Portal User Licenses](#)

IN THIS SECTION:

[Authenticated Website User Licenses](#)

Platform portal users have the Authenticated Website license, which is designed to be used with Force.com Sites. It gives named sites users unlimited logins to your Platform Portal to access customer support information.

EDITIONS

Available in: Salesforce Classic

Edition requirements vary for each user license type.

License Type	Description	Available in
Identity	<p>Grants users access to Salesforce Identity features. Salesforce Identity connects Salesforce users with external applications and services, while giving administrators control over authentication and authorization for these users.</p> <p>For more information, see the Salesforce Identity Implementation Guide.</p>	<p>Enterprise, Unlimited, Performance, and Developer Editions</p> <p>Ten free Identity user licenses are included with each new Developer Edition organization.</p>
External Identity	<p>Provides Identity features for users outside of your organization's user base (such as non-employees). Store and manage these users, choose how they authenticate (username/password, or Single Sign-On social sign-on through Facebook, Google+, LinkedIn, and others), and allow self-registration.</p>	<p>Enterprise, Unlimited, Performance, and Developer Editions</p> <p>Five free External Identity user licenses are included with each new Developer Edition organization.</p>
Work.com Only User	<p>Designed for users who don't have a Salesforce license and need access to Work.com.</p> <p> Note: Chatter must be enabled for Work.com features to fully function.</p>	<p>Professional, Enterprise, Unlimited, Performance, and Developer Editions</p>

Force.com User License Types

License type	Description	Available in
Salesforce Platform	<p>Designed for users who need access to custom apps but not to standard CRM functionality. Users with this user license are entitled to use custom apps developed in your organization or installed from Force.com AppExchange. In addition, they are entitled to use core platform functionality such as accounts, contacts, reports, dashboards, documents, and custom tabs. However, these users are not entitled to some user permissions and standard apps, including standard tabs and objects such as forecasts and opportunities. Users with this license can also use Connect Offline.</p> <p> Note: Users with this license can only view dashboards if the running user also has the same license.</p> <p>Users with a Salesforce Platform user license can access all the custom apps in your organization.</p> <p>Each license provides additional storage for Enterprise, Unlimited, and Performance Edition users.</p>	<p>Enterprise, Unlimited, Performance, and Developer Editions</p>
Force.com - One App	<p> Note: This license is not available for new customers.</p>	<p>Enterprise and Unlimited Editions</p>

License type	Description	Available in
	<p>Designed for users who need access to one custom app but not to standard CRM functionality. Force.com - One App users are entitled to the same rights as Salesforce Platform users, plus they have access to an unlimited number of custom tabs. However, they are limited to the use of one custom app, which is defined as up to 10 custom objects, and they are limited to read-only access to the Accounts and Contacts objects.</p> <p> Note: Users with this license can only view dashboards if the running user also has the same license.</p> <p>Each license provides an additional 20 MB of data storage and 100 MB of file storage, regardless of the Salesforce edition.</p>	
Force.com App Subscription	<p>Grants users access to a Force.com Light App or Force.com Enterprise App, neither of which include CRM functionality.</p> <p>A Force.com Light App has up to 10 custom objects and 10 custom tabs, has read-only access to accounts and contacts, and supports object-level and field-level security. A Force.com Light App can't use the Bulk API or Streaming API.</p> <p>A Force.com Enterprise App has up to 10 custom objects and 10 custom tabs. In addition to the permissions of a Force.com Light App, a Force.com Enterprise App supports record-level sharing, can use the Bulk API and Streaming API, and has read/write access to accounts and contacts.</p> <p> Note: Users with this license can only view dashboards if the running user also has the same license.</p> <p>Each Force.com App Subscription license provides an additional 20 MB of data storage per user for Enterprise Edition and 120 MB of data storage per user for Unlimited and Performance Editions, as well as 2 GB of file storage regardless of the edition.</p>	Enterprise, Unlimited, and Performance Editions
Employee Community User	<p>This is an internal user license. It's designed for users to access Force.com Light application custom objects, custom tabs, Chatter (people, groups, feeds, files), and a Community that includes a Site.com site.</p> <p>Company Community users have read-only access to Salesforce Knowledge articles and limited access to cases for creating and reading their own cases. They can also:</p> <ul style="list-style-type: none"> • Access up to 10 custom objects and 10 custom tabs • Use Content, Ideas, and Answers • Use activities, tasks, calendar, and events • Have read-only access to accounts and contacts 	Enterprise, Unlimited, Performance, and Developer Editions

[User Licenses Overview](#)

Chatter User Licenses

All standard Salesforce licenses allow free Chatter access for everyone in your organization. Salesforce also offers Chatter-specific licenses: Chatter External, Chatter Free, and Chatter Only (also known as Chatter Plus).

Chatter External

This license is for users who are outside of your company's email domain. These external users, also called customers, can be invited to Chatter groups that allow customers. Customers can access information and interact with users only in the groups they're invited to. They have no access to Chatter objects or data.

Chatter Free

The Chatter Free license is for users who don't have Salesforce licenses but need access to Chatter. These users can access standard Chatter items such as people, profiles, groups, and files, but they can't access any Salesforce objects or data. Chatter Free users can also be Chatter moderators.

Chatter Free users don't see tabs like other Salesforce users. Chatter Free users access feeds, people, groups, and files using the links in the sidebar of the page.

Salesforce administrators can upgrade a Chatter Free license to a standard Salesforce or Chatter Only license at any time. You can't convert a standard Salesforce or Chatter Only license to a Chatter Free license.

Chatter Only (Chatter Plus)

The Chatter Only license is also known as the Chatter Plus license. It is for users that don't have Salesforce licenses but need access to some Salesforce objects in addition to Chatter. Chatter Plus users can be Chatter moderators and have access to standard Chatter people, profiles, groups, and files pages. They also can

- View Salesforce accounts and contacts
- Use Salesforce CRM Content, Ideas, and Answers
- Access dashboards and reports
- Use and approve workflows
- Use the calendar to create and track activities
- View and modify up to ten custom objects
- Add records to groups

By default, the tabs for standard Salesforce objects are hidden from Chatter Plus users. Expose these tabs, if you want to make them available to Chatter Plus users. For more information on Chatter Plus users, see [Chatter Plus Frequently Asked Questions](#)

Chatter License Overview

This table shows the list of features that are available for Chatter External, Chatter Free, and Chatter Only licenses.

EDITIONS

Available in: Salesforce Classic

Chatter External and Chatter Free licenses are available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, and Developer** Editions

Chatter Only (also known as Chatter Plus) licenses are available in: **Professional, Enterprise Unlimited, and Performance** Editions

Using and approving workflows

Communities User Licenses

There are three Communities licenses for external users: Customer Community, Customer Community Plus, and Partner Community.

The Customer Community license is similar to a High Volume Customer Portal license and is well-suited for business-to-consumer communities with large numbers of external users. The Customer Community Plus license is similar to a Customer Portal — Enterprise Administration license and is well-suited for business-to-consumer communities whose users need unlimited logins to manage customer support. The Partner Community license is similar to a Gold Partner license and is well-suited for business-to-business communities, such as a partner community.

In addition to the new licenses, Communities supports all internal and portal licenses including existing Customer Portal, Authenticated Website, and partner portal licenses. Communities doesn't support the Chatter External license.

Communities licenses are associated with users, not a specific community. If needed, you can move users with these licenses between communities. Additionally, if you have unused licenses, you can assign them to users in any community in your organization.

Customer Community, Customer Community Plus, and Partner Community licenses are also available as monthly login-based licenses. These licenses are called Customer Community Login License, Customer Community Plus Login License, and Partner Community Login License. This means that a license is consumed each time a user logs in to a community, but not when a logged-in user switches between their communities. Unused licenses expire at the end of the month. If a user with a login-based community license accesses their communities through Salesforce1, they consume a login the first time they log in or if their session times out.

To avoid deployment problems and any degradation in service quality, we recommend that the number of users in your community not exceed the limits listed below. If you require additional users beyond these limits, contact your Salesforce account executive. Exceeding these limits may result in additional charges and a decrease in functionality.

EDITIONS

Available in: Salesforce Classic

Available in:

- Performance
- Unlimited
- Developer
- Enterprise

Type of Community	Number of Users
Partner or Customer Community Plus	300,000
Customer	10 million

Each community has one associated Site.com site that lets you add custom, branded pages to your community. Communities users with the "Create and Set Up Communities" permission automatically have full site administrator access to a community's Site.com site. To let Communities users without the permission edit the site, you must purchase and assign either a Site.com Publisher or a Site.com Contributor feature license, and assign a user role at the site level.

This table shows which features are available to users with Customer Community, Customer Community Plus, or Partner Community licenses.

	Customer Community	Customer Community Plus	Partner Community
Salesforce Standard Objects			
Accounts	 Read and Edit	 Read, Create, Edit	 Read, Create, Edit
Assets	 Read, Create, Edit	 Read, Create, Edit	 Read, Create, Edit
Campaigns			 Read, Create and Edit (requires "Marketing User" permission) ¹
Cases	 Read, Create, Edit ²	 Read, Create, Edit	 Read, Create, Edit Disabled by default
Contacts	 	 	
Contracts	 	 	
Entitlements	 Read, Create, Edit	 Read, Create, Edit	 Read, Create, Edit
Events & Calendar			
Ideas	 Read, Create, Edit	 Read, Create, Edit	 Read, Create, Edit

Notes and Attachments	 Not available on accounts and contacts ³	 Only on the Attachments related list on cases ⁴	
Opportunities			
Orders ⁵	 	 	
Price Books	 Read Only	 Read Only	 Read Only
Products	 Read Only	 Read Only	 Read Only
Quotes			

	Customer Community	Customer Community Plus	Partner Community
Reports & Dashboards		 Read Only (by default) Create and Edit (requires user permissions) ⁶	 Read Only (by default) Create and Edit (requires user permissions) ⁶
Service Contracts		 Read, Create, Edit	 Read, Create, Edit
Tasks	 Read Only	 Read, Create, Edit	 Read, Create, Edit
Salesforce Features, Capability, and Custom Objects			
Additional Storage		2 MB per member (member-based license) 1 MB per member (login-based license)	5 MB per member (member-based license) 1 MB per member (login-based license)
Chatter (People, Groups, Feeds, Files, Private Messages)			
 Note: Salesforce Files Sync is not available in Communities.			
Chatter Answers			
Content (with a Salesforce CRM Content feature license)		 View and Upload	 View and Upload
Content (without a Salesforce CRM Content feature license)		 View Only	 View Only
Custom Objects	 10 custom objects per license (custom objects in managed packages don't count towards this limit)	 10 custom objects per license (custom objects in managed packages don't count towards this limit)	 10 custom objects per license (custom objects in managed packages don't count towards this limit)
Delegated Administration			
Knowledge	 Read Only	 Read Only	 Read Only
Roles and Sharing			

	Customer Community	Customer Community Plus	Partner Community
Salesforce1 Mobile App	✓	✓	✓
Send Email			✓
Workflow Approvals		✓	✓

 **Note:**

- ¹ For the Partner Community license, to read, create, and edit campaigns in the user interface, the partner user also needs the “Marketing User” permission. With these permissions, a partner user can: search for and add their contacts or leads as campaign members, access reports on their campaigns, and mass-email or mass-assign their contacts and leads on a campaign.
- ² For the Customer Community license, cases can’t be created on behalf of someone else.
- ³ For the Customer Community license, the Notes and Attachments related list is not available on Accounts and Contacts.
- ⁴ For the Customer Community Plus license, attachments are available only through the Attachments related list on Cases. Notes aren’t supported.
- ⁵ Once orders are enabled, standard profiles automatically include all object permissions for orders, as well as read access for products and price books. If your external users are assigned to a standard profile and these object permissions aren’t appropriate for them, consider creating custom profiles that don’t include these object permissions.
- ⁶ For the Customer Community Plus and Partner Community licenses to create and edit reports, the user also needs the “Create and Customize Reports,” “Report Builder,” and “Edit My Reports” permissions. For more information see, [Set Up Report Management for External Users—Create and Edit Reports](#).

Service Cloud Portal User Licenses

Service Cloud Portal users have the High Volume Customer Portal license. This license gives contacts unlimited logins to your Service Cloud Portal to access customer support information. Users with this license can access accounts, assets, cases, contacts, custom objects, documents, ideas, and questions, depending on their permission settings.

The Overage High Volume Customer Portal license is the same as the High Volume Customer Portal license, except that users do not have unlimited logins. Contact Salesforce for information about the number of Customer Portal licenses you can activate.

This table lists the permissions that can be assigned to Service Cloud portal users.

Sites and Site.com User Licenses

Sites and Site.com users can have Guest User or Site.com Only user licenses.

Guest User Designed for public users who access your Site.com or Force.com sites. If Communities is enabled, these users also have access to public pages in your communities. Site visitors have access to any information made available in an active public site. For each Guest User license, you can develop one site for your organization.

For Site.com, **Developer**, **Enterprise**, **Unlimited**, and **Performance** Editions each come with unlimited Guest User licenses.

For Force.com sites, **Enterprise**, **Unlimited**, and **Performance** Editions come with 25 Guest User licenses. **Developer** Edition comes with one Guest User license.

Note:

- You can't purchase additional Guest User licenses for Force.com sites.
- The Authenticated Website high-volume portal user license is specifically designed to be used with Force.com sites. Because it's designed for high volumes, it should be a cost-effective option to use with Force.com sites.

Site.com Only Designed for **Performance**, **Unlimited**, and **Enterprise** Edition users who need access to Site.com but not to standard CRM functionality. Site.com Only users are entitled to the same rights as Force.com - One App users, plus they have access to the Content app. However, they don't have access to the Accounts and Contacts objects. Users have access to an unlimited number of custom tabs but are limited to the use of one custom app, which is defined as up to 20 custom objects.

EDITIONS

Available in: Salesforce Classic

Edition requirements vary by user license type.

Each Site.com Only user also needs either a Site.com Contributor or Site.com Publisher feature license to access Site.com.

SEE ALSO:

[User Licenses Overview](#)

Authenticated Website User Licenses

Platform portal users have the Authenticated Website license, which is designed to be used with Force.com Sites. It gives named sites users unlimited logins to your Platform Portal to access customer support information.

The Overage Authenticated Website license is the same as the Authenticated Website license, except that users do not have unlimited logins.

 **Note:** Once orders are enabled, standard profiles automatically include all object permissions for orders, as well as read access for products and price books. If your external users are assigned to a standard profile and these object permissions aren't appropriate for them, consider creating custom profiles that don't include these object permissions.

This table lists the permissions that can be given to Authenticated Website users.

[User Licenses Overview](#)

Customer Portal User Licenses

Users of a Customer Portal site have the Customer Portal Manager Standard license.

 **Note:** Starting with Summer '13, these licenses are only available for organizations that already have a Customer Portal. If you don't have a Customer Portal but want to easily share information with your customers, see [Communities User Licenses](#) on page 434.

It allows contacts to log in to your Customer Portal to manage customer support. You can associate users who have a Customer Portal Manager Standard license with the Customer Portal User profile or a profile cloned and customized from the Customer Portal User profile. This standard profile lets users view and edit data they directly own or data owned by or shared with users below them in the Customer Portal role hierarchy. These users can also view and edit cases where they are listed in the `Contact Name` field.

Users with the Customer Portal Manager Standard license can:

- View contacts, price books, and products.
- View and edit accounts and cases.
- Create and edit assets.
- Create, view, edit, and delete custom objects.
- Access custom objects depending on their permissions.
- Receive the "Portal Super User" permission.
- Access Salesforce CRM Content if they have a Salesforce CRM Content feature license or the appropriate permissions.

The Overage Customer Portal Manager Standard license is the same as the Customer Portal Manager Standard license, except that users are limited to one login per month.

 **Note:** Once orders are enabled, standard profiles automatically include all object permissions for orders, as well as read access for products and price books. If your external users are assigned to a standard profile and these object permissions aren't appropriate for them, consider creating custom profiles that don't include these object permissions.

This table lists the permissions that can be given to Customer Portal users.

[User Licenses Overview](#)

Customer Portal—Enterprise Administration User Licenses

Customer Portal—Enterprise Administration users have the Customer Portal Manager Custom license. This license gives contacts unlimited logins to your Salesforce Customer Portal to manage customer support.

 **Note:** Starting with Summer '13, these licenses are only available for organizations that already have a Customer Portal. If you don't have a Customer Portal but want to easily share information with your customers, see [Communities User Licenses](#) on page 434.

You can associate users who have a Customer Portal Manager Custom license with the Customer Portal User profile or a profile cloned and customized from the Customer Portal User profile, which lets them view and edit data they directly own and view, create, and edit cases where they're listed in the `Contact Name` field.

Users with this license can:

- Create, read, or update accounts, assets, and cases.
- View contacts.
- View custom objects and run reports depending on their permissions.
- Receive the "Portal Super User" and "Delegated External User Administrator" permissions.
- Access Salesforce CRM Content if they have a Salesforce CRM Content feature license or the appropriate permissions.

The Overage Customer Portal Manager Custom license is the same as the Customer Portal Manager Custom license, except that users do not have unlimited logins. Contact Salesforce for information about the number of Customer Portal licenses you can activate.

 **Note:** Once orders are enabled, standard profiles automatically include all object permissions for orders, as well as read access for products and price books. If your external users are assigned to a standard profile and these object permissions aren't appropriate for them, consider creating custom profiles that don't include these object permissions.

This table lists the permissions that can be given to Customer Portal—Enterprise Administration users.

Partner Portal User Licenses

Partner Portal users have the Gold Partner user license. They can only access Salesforce using the partner portal.

Note:

- Starting in Summer '13, this license is no longer available for organizations that aren't currently using the partner portal. If you don't have a partner portal but want to easily share information with your partners, see [Communities User Licenses](#) on page 434.
- Once orders are enabled, standard profiles automatically include all object permissions for orders, as well as read access for products and price books. If your external users are assigned to a standard profile and these object permissions aren't appropriate for them, consider creating custom profiles that don't include these object permissions.

¹ A partner portal user can create and edit campaigns in a community but not in a legacy portal. For the Partner Community license, to read, create, and edit campaigns in the user interface, the partner user also needs the “Marketing User” permission. With these permissions, a partner user can: search for and add their contacts or leads as campaign members, access reports on their campaigns, and mass-email or mass-assign their contacts and leads on a campaign.

Permission Set Licenses

A permission set is a convenient way to assign users specific settings and permissions to use various tools and functions.

IN THIS SECTION:

[What Are Permission Set Licenses?](#)

Permission set licenses incrementally entitle users to access features that are not included in their user licenses. Users can be assigned any number of permission set licenses.

[Available Permission Set Licenses](#)

For each permission set license available for purchase, see which permissions it enables you to assign to your users.

[View Your Organization’s Permission Set Licenses](#)

View the permission set licenses your organization has purchased to know what you have available to assign to your users.

[Assign a Permission Set License to a User](#)

Some permissions require you to assign a permission set license to the user and then add the permissions to permission sets.

EDITIONS

Available in: Salesforce Classic

The availability of each permission set license depends on the edition requirements for permission sets and the related feature.

[Remove a Permission Set License from a User](#)

First remove or modify the relevant assigned permission sets that require the license, and then remove the assigned permission set license.

SEE ALSO:

[Find Company Information](#)

What Are Permission Set Licenses?

Permission set licenses incrementally entitle users to access features that are not included in their user licenses. Users can be assigned any number of permission set licenses.

As additive licenses, permission set licenses don't limit functionality. With permission set licenses, you can assign more permissions to users than their user license supports.

After you assign a permission set license to a user, assign the appropriate permissions to that user through a permission set—not a profile.

 **Example:**

- Before you can assign a permission set with the “Use Identity Connect” permission to a user, assign an Identity Connect permission set license to that user.
- Before you can assign a permission set with “Read” or “Edit” on orders to a user with a Force.com user license, assign an Orders Platform permission set license to that user. You can assign those permissions to a user with a Salesforce user license without a permission set license, because it's already enabled as part of the user license.

SEE ALSO:

[Permission Set Licenses](#)

Available Permission Set Licenses

For each permission set license available for purchase, see which permissions it enables you to assign to your users.

Permission Set License	User Permissions Included	Object Permissions Included
Employee Community User for Force.com	“Allow View Knowledge”	“Create” and “Read” on Cases
Files Connect for on-premises external data sources	“Files Connect On-premises”	
Identity Connect	“Use Identity Connect”

Usage-based Entitlements Overview

A usage-based entitlement is a limited resource that your organization can use on a periodic basis—such as the allowed number of monthly logins to a Partner Community or the record limit for Data.com list users.

Some entitlements are persistent. These entitlements give your organization a set number of the resource, and the amount allowed doesn't change unless your contract is changed. For example, if your company purchases monthly subscriptions for 50 members to access a Partner Community, you can assign up to 50 individuals the ability to log into the community as many times as they want.

Other entitlements are not persistent; these work like credit. Your organization can use up to the amount allowed of that entitlement over the time indicated by the resource's frequency. If the entitlement has a frequency of Once, your organization will have to purchase more of the resource to replenish the allowance. If the entitlement has a frequency of Monthly, the start and end of the month is determined by your contract, rather than the calendar month.

For example:

- Company A purchases 50 monthly logins for a Partner Community, and on January 15 that organization has a pool of 50 logins. Each time someone logs in, one login is used. On February 15, no matter how many were used in the previous month, the pool is refreshed and 50 logins are available through March 14.
- Company B purchases 2,000 records for Data.com list users with an end date of May 15. That organization's list users can add or export up to 2,000 records until that date. If the organization reaches that limit before May 15, the Data.com list users won't be able to add or export additional records. To unblock users, Company B can purchase additional allowance for that resource.

 **Note:** If your organization has multiple contracts with the same `Resource` and the `Resource ID is (tenant)`, you will still only see one row for that entitlement, but the data in that row will reflect your combined contracts. In this case, `Start Date` reflects the earliest start date among those contracts, and `End Date` reflects the latest end date among those contracts.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited

Like feature licenses, usage-based entitlements don't limit what you can do in Salesforce; they add to your functionality. If your usage exceeds the allowance, Salesforce will contact you to discuss additions to your contract.

Passwords

As an administrator, you can configure several settings to ensure that your users' passwords are strong and secure.

- Password policies—Set various password and login policies, such as specifying an amount of time before all users' passwords expire and the level of complexity required for passwords. See [Set Password Policies](#) on page 453.
- User password expiration—Expire the passwords for all users in your organization, except for users with "Password Never Expires" permission. See [Expire Passwords for Your Users](#) on page 457.
- User password resets—Reset the password for specified users. See [Reset Passwords for Your Users](#) on page 456.
- Login attempts and lockout periods—If a user is locked out of Salesforce because of too many failed login attempts, you can unlock them. See [Edit Users](#) on page 412.

Password Requirements

A password can't contain a user's username and can't match a user's first or last name. Passwords also can't be too simple. For example, a user can't change their password to *password*.

For all editions, a new organization has the following default password requirements. You can change these password policies in all editions, except for Personal Edition.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Password policies available in: **All** Editions

USER PERMISSIONS

To set password policies:

- "Manage Password Policies"

To reset user passwords and unlock users:

- "Reset User Passwords and Unlock Users"

- A password must contain at least eight characters, including one alphabetic character and one number.
- The security question's answer can't contain the user's password.
- When users change their password, they can't reuse their last three passwords.

SEE ALSO:

[Change Your Password](#)

Set Password Policies

For your organization's security, you can set various password and login policies.

 **Note:** User passwords cannot exceed 16,000 bytes.

Logins are limited to 3,600 per hour per user. This limit applies to organizations created after Summer '08.

1. From Setup, enter *Password Policies* in the Quick Find box, then select **Password Policies**.
2. Customize the password settings.

Field	Description
User passwords expire in	The length of time until user passwords expire and must be changed. The default is 90 days. This setting isn't available for Self-Service portals. This setting doesn't apply to users with the "Password Never Expires" permission.
Enforce password history	Save users' previous passwords so that they must always reset their password to a new, unique password. Password history is not saved until you set this value. The default is 3 passwords remembered. You cannot select No passwords remembered unless you select Never expires for the User passwords expire in field. This setting isn't available for Self-Service portals.
Minimum password length	The minimum number of characters required for a password. When you set this value, existing users aren't affected until the next time they change their passwords. The default is 8 characters.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance

USER PERMISSIONS

To set password policies:

- "Manage Password Policies"

Field	Description
Password complexity requirement	<p>The requirement for which types of characters must be used in a user's password.</p> <p>Complexity levels:</p> <ul style="list-style-type: none"> • No restriction—allows any password value and is the least secure option. • Must mix alpha and numeric characters—requires at least one alphabetic character and one number, which is the default. • Must mix alpha, numeric, and special characters—requires at least one alphabetic character, one number, and one of the following characters: ! # \$ % - _ = + < >. • Must mix numbers and uppercase and lowercase letters—requires at least one number, one uppercase letter, and one lowercase letter. • Must mix numbers, uppercase and lowercase letters, and special characters—requires at least one number, one uppercase letter, and one lowercase letter, and one of the following characters: ! # \$ % - _ = + < >.
Password question requirement	<p>The values are <code>Cannot contain password</code>, meaning that the answer to the password hint question cannot contain the password itself; or <code>None</code>, the default, for no restrictions on the answer. The user's answer to the password hint question is required. This setting is not available for Self-Service portals, Customer Portals, or partner portals.</p>
Maximum invalid login attempts	<p>The number of login failures allowed for a user before they become locked out. This setting isn't available for Self-Service portals.</p>
Lockout effective period	<p>The duration of the login lockout. The default is 15 minutes. This setting isn't available for Self-Service portals.</p> <p> Note: If users are locked out, they must wait until the lockout period expires. Alternatively, a user with the "Reset User Passwords and Unlock Users" permission can unlock them from Setup by entering <code>Users</code> in the Quick Find box, then selecting Users, selecting the user, then clicking Unlock. This button is only available when a user is locked out.</p>

Field	Description
Obscure secret answer for password resets	<p>This feature hides answers to security questions as you type. The default is to show the answer in plain text.</p> <p> Note: If your organization uses the Microsoft Input Method Editor (IME) with the input mode set to Hiragana, when you type ASCII characters they're converted into Japanese characters in normal text fields. However, the IME does not work properly in fields with obscured text. If your organization's users cannot properly enter their passwords or other values after enabling this feature, disable the feature.</p>
Require a minimum 1 day password lifetime	When you select this option, a password can't be changed more than once in a 24-hour period.

3. Customize the forgotten password and locked account assistance information.

 **Note:** This setting is not available for Self-Service portals, Customer Portals, or partner portals.

Field	Description
Message	<p>If set, this message appears in the "We can't reset your password" email that users receive when they lock themselves out by trying to reset their password too many times. The text also appears at the bottom of the Answer Your Security Question page when users reset their passwords.</p> <p>You can tailor the text to your organization by adding the name of your internal help desk or a system administrator. For the email, the message appears only for accounts that need an administrator to reset them. Lockouts due to time restrictions get a different system email message.</p>
Help link	<p>If set, this link displays with the text defined in the <code>Message</code> field. In the "We can't reset your password" email, the URL displays just as it is typed in the <code>Help link</code> field, so the user can see where the link goes. This URL display format is a security feature, because the user is not within a Salesforce organization.</p> <p>On the Answer Your Security Question page, the <code>Help link</code> URL combines with the text in the <code>Message</code> field to make a clickable link. Security isn't an issue, because the user is in a Salesforce organization when changing passwords.</p> <p>Valid protocols:</p> <ul style="list-style-type: none"> • http • https • mailto

4. Specify an alternative home page for users with the “API Only User” permission. After completing user management tasks such as resetting a password, API-only users are redirected to the URL specified here, rather than to the login page.
5. Click **Save**.

SEE ALSO:

[Passwords](#)

Reset Passwords for Your Users

As an administrator, you can reset a user’s password for better protection or to unlock a user if the user is locked out.

To reset a user’s password:

1. From Setup, enter *Users* in the *Quick Find* box, then select **Users**.
2. Select the checkbox next to the user’s name. Optionally, to change the passwords for all currently displayed users, check the box in the column header to select all rows.
3. Click **Reset Password**. The user receives an email that contains a link and instructions to reset the password.

A password created this way doesn’t expire, but users must change the password the first time they log in.

 **Tip:** You can perform this and other administration tasks from the SalesforceA mobile app.

Considerations for Resetting Passwords

- Only an administrator can reset single sign-on user passwords. Single sign-on users can’t reset their own passwords.
- After resetting a password, users might be required to activate their computers to successfully log in to Salesforce.
- Resetting a locked-out user’s password automatically unlocks the user’s account.
- When a user loses a password, the user can click the forgot password link on the login page to receive an email with steps to reset a password. The user must correctly answer the security question to reset the password. In Password Policies, you can customize the security question page that the user sees with information about where to go to for help.

 **Note:** If the user hasn’t set a security question, or doesn’t answer the security question correctly, the password isn’t reset.

A user can request to reset a password through the forgot password link a maximum of five times in a 24-hour period. Administrators can reset a user’s password as often as needed.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

USER PERMISSIONS

To reset passwords:

- “Reset User Passwords and Unlock Users”

- Resetting a password also resets the user's security token.

SEE ALSO:

[Reset Your Forgotten Password](#)[Change Your Password](#)[Reset Your Security Token](#)[Passwords](#)[SalesforceA](#)

Expire Passwords for Your Users

As an administrator, you can expire passwords for all users any time you want to enforce extra security for your organization.

To expire passwords for all users, except those users with the "Password Never Expires" permission:

1. From Setup, enter *Expire All Passwords* in the **Quick Find** box, then select **Expire All Passwords**.
2. Select **Expire all user passwords**.
3. Click **Save**.

The next time users log in, they are prompted to reset their password.

Considerations When Expiring Passwords

- Users might need to activate their computers to log in to Salesforce.
- `Expire all user passwords` doesn't affect Self-Service portal users, because they aren't direct Salesforce users.

SEE ALSO:

[Passwords](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

USER PERMISSIONS

To expire all passwords:

- "Manage Internal Users"

Control Login Access

1. From Setup, enter *Login Access Policies* in the **Quick Find** box, then select **Login Access Policies**.
2. To allow administrators to log in as any user in the organization without first asking them to grant access, enable **Administrators Can Log in as Any User**. This option could already be enabled by default. To disable the option, deselect the **Enabled** checkbox.

To have this feature removed from your organization, contact Salesforce.
3. To prevent users from granting access to a publisher (to comply with regulatory or privacy concerns, for example), click **Available to Administrators Only** for that publisher.
4. Click **Save**.

Consider these implementation restrictions.

- Users can't grant login access to managed packages that are licensed to your entire organization. Only administrators with the "Manage Users" permission enabled on their profile can grant access to these publishers.
- Login access is only available for certain managed packages. If the package isn't listed, it's not available for granting login access.
- If you disable **Administrators Can Log in as Any User** or have Salesforce remove the feature from your organization, a user must grant login access before an administrator can log in to that user's account for troubleshooting.

SEE ALSO:

- [Log In as Another User](#)
- [Grant Login Access](#)

Log In as Another User

To assist other users, administrators can log in to Salesforce as another user. Depending on your organization settings, individual users might need to grant login access to administrators.

-  **Note:** As a security measure, when administrators are logged in as another user, they can't authorize OAuth data access for that user. For example, admins can't authorize OAuth access to user accounts, including single sign-on to third-party applications.
1. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
 2. Click the **Login** link next to the username. This link is available only for users who have granted login access to an administrator or in organizations where administrators can log in as any user.
 3. To return to your administrator account, click *User's Name* > **Logout**.

Delegate Administrative Duties

Use delegated administration to assign limited administrative privileges to users in your organization who aren't administrators.

Delegated administrators can:

- Create and edit users in specified roles and all subordinate roles. User editing tasks include resetting passwords, setting quotas, creating default opportunity teams, and creating personal groups for those users
- Unlock users
- Assign users to specified profiles and permission sets
- Create public groups and manage membership in specified public groups
- Log in as users who have granted login access to their administrator
- Manage custom objects

For example, let's say you want the Customer Support team manager to manage users in the Support Manager role and all subordinate roles. Creating a delegated administrator for this purpose allows the system administrator to focus on other administration tasks.

To create delegated groups, from Setup, enter *Delegated Administration* in the **Quick Find** box, then select **Delegated Administration**, then click **New**.

Note:

- When delegated administrators are assigned to multiple delegated groups, they can administer users across all of those delegated groups. For example, let's say Sam Smith is specified as a delegated administrator in two delegated groups, Group A and Group B. Sam can assign a permission set or public group from Group A to users in Group B.
- To delegate administration of particular objects, use object permissions, such as "View All" and "Modify All."

Define Delegated Administrators

A delegated administration group is a group of users who have the same administrative privileges. These groups are not related to public groups used for sharing.

1. From Setup, enter *Delegated Administration* in the **Quick Find** box, then select **Delegated Administration**.
2. Click **New**.
3. Enter a group name.
4. To allow the users in this group to log in as users in the role hierarchy that they administer, select **Enable Group for Login Access**. Depending on your organization settings, individual users need to grant login access to allow their administrators to log in as them.
5. Click **Save**.
6. To specify the users in this delegated group, in the Delegated Administrators related list, click **Add**.
7. Click  to find and add users to the group. The users must have the "View Setup and Configuration" permission.
8. Click **Save**.

SEE ALSO:

[Delegate Administrative Duties](#)

Delegate User Administration

Enable delegated administrators to manage users in specified roles and all subordinate roles, assign specified profiles to those users, and log in as users who have granted login access to administrators.

1. From Setup, enter *Delegated Administration* in the **Quick Find** box, then select **Delegated Administration**.
2. Select or create a delegated group.
3. Click **Add** in the User Administration related list.
4. Click  to find and add roles. Delegated administrators can create and edit users in these roles and all subordinate roles.
5. Click **Save**.
6. Click **Add** in the Assignable Profiles related list.
7. Click  to find and add profiles. Delegated administrators can assign these profiles to the users they create and edit.

Note:

- Delegated administrators can't assign profiles or permission sets with the "Modify All Data" permission.
- Delegated administrators who are members of multiple delegated administration groups can assign any assignable profiles to any of the users in roles that they can manage.

Delegate Public Group Management

Enable delegated administrators to create public groups and to add and remove users in specified public groups.

1. From Setup, enter *Delegated Administration* in the **Quick Find** box, then select **Delegated Administration**.
2. Select a delegated administration group, or create one.
3. From the detail page of the delegated administration group, in the Assignable Public Groups related list, click **Edit**.
4. Specify the public groups that delegated administrators of this group can manage.
For the public groups that you specify, delegated administrators can add and remove users in their specified roles and subordinate roles.
5. Click **Save**.

SEE ALSO:

[Delegate Administrative Duties](#)

Delegate Custom Object Administration

Enable delegated administrators to manage custom objects.

1. From Setup, enter *Delegated Administration* in the **Quick Find** box, then select **Delegated Administration**.
2. Select the name of an existing delegated administration group.
3. From the detail page of the delegated administration group, click **Add** in the Custom Object Administration related list.
4. Use the magnifying glass lookup icon to find and add custom objects. Delegated administrators can customize nearly every aspect of a custom object, including creating a custom tab for it.
5. Click **Save**. Click **Save & More** to add additional custom objects.

To remove a custom object from the list of items the delegated administrators can manage, click **Remove** next to the custom object.

Notes on Delegated Administration of Custom Objects

- Delegated administrators can customize nearly every aspect of the custom object, including creating a custom tab for it. However, they cannot create or modify relationships on the object or set organization-wide sharing defaults.

Topics and Tags Settings

With or without Chatter enabled, administrators can enable topics for objects, letting users add topics to records so they can quickly retrieve related items using list views. With Chatter enabled, users can also see related items on the Records tab of each topic detail page. Enabling topics for an object disables public tags on records of that object type. Personal tags aren't affected.

To use topics to organize records, [enable topics](#) for accounts, assets, campaigns, cases, contacts, contracts, leads, opportunities, orders, solutions, custom objects, and English articles.

Administrators set up and manage personal and public tags by:

- [Enabling tags](#) for accounts, activities, assets, campaigns, cases, contacts, contracts, dashboards, documents, events, leads, notes, opportunities, reports, solutions, tasks, and any custom objects (except relationship group members)
- [Adding tags to the sidebar](#) for their users
- [Deleting personal tags](#) for deactivated users

Enable and Configure Topics for Objects

Enable topics for objects so users can add topics to records and organize them by common themes. This powerful feature is available with or without Chatter.

Administrators can enable topics for accounts, assets, campaigns, cases, contacts, contracts, leads, opportunities, orders, solutions, custom objects, and English articles. For each object type, administrators specify which fields to use for topic suggestions.

 **Note:** Topics are only supported on English Knowledge articles.

 **Warning:** When topics are enabled for an object, public tags are disabled for records of that object type.

1. From Setup, enter *Topics for Objects* in the Quick Find box, then select **Topics for Objects**.
2. Select an object.
3. At the right, select **Enable Topics**.
4. Select the text fields that you want to use for topic suggestions. (From a combination of the selected fields, up to 3 suggestions are made from the first 2,000 characters.)
5. Click **Save** to save changes for all objects.

Now, users with access to the enabled objects and appropriate topics permissions can:

- See topic assignments and suggestions on records of that object type
- Add and remove topics from records of that object type
- Use topics on records of that object type to filter their list views

EDITIONS

Available in: Salesforce Classic

Topic and tag settings are available in: **All Editions**

USER PERMISSIONS

To modify topic and tag settings:

Enabling Tags

1. From Setup, enter *Tag Settings* in the Quick Find box, then select **Tag Settings**.
2. Select **Enable Personal Tags** and **Enable Public Tags** to allow users to add personal and public tags to records. Deselect both options to disable tags.
3. Specify which objects and page layouts should display tags in a tag section at the top of record detail pages. The tag section is the only way that a user can add tags to a record.

For example, if you only select account page layouts, users in your organization can only tag account records. Additionally, if you only select account page layouts for personal tags and not public tags, users can only tag account records with personal tags.

4. Click **Save**.

When enabling tags, keep these guidelines in mind

- You can also add them to page layouts by editing a layout directly. Note, however, that tags can't be added to feed-based page layouts.
- Search results and the Tags page don't display custom objects without an associated tab, even if tags are enabled for the custom object. If you want custom object records to appear, create an associated tab. The tab doesn't have to be visible to users.
- Customer Portal users can't view the tags section of a page, even if it is included in a page layout.
- When Chatter is disabled, joined reports can't be tagged.

Adding Tags to the Sidebar

When you [enable tags](#) for your organization, you can add the Tags component to your users' sidebar. This component allows users to navigate to the Tags page where they can browse, search, and manage their tags. It also lists each user's most recently used tags. To add this component:

1. From Setup, enter *Home Page Layouts* in the **Quick Find** box, then select **Home Page Layouts**.
2. Next to a home page layout that you want to modify, click **Edit**.
3. Select the **Tags** checkbox and click **Next**.
4. Arrange the Tags component on your page layout as desired, and click **Save**.

 **Tip:** If you want the Tags component to appear on all pages and not just the Home tab, from Setup, enter *User Interface* in the **Quick Find** box, then select **User Interface**, and select **Show Custom Sidebar Components on All Pages**.

Manage User Access to Data

Securing Data Access

Choosing the data set that each user or group of users can see is one of the key decisions that affects data security. You need to find a balance between limiting access to data, thereby limiting risk of stolen or misused data, versus the convenience of data access for your users.

Note:  [Who Sees What: Overview](#)

Watch a demo on controlling access to and visibility of your data.

To enable users to do their job without exposing data that they do not need to see, Salesforce provides a flexible, layered sharing design that allows you to expose different data sets to different sets of users.

- To specify the objects that users can access, you can assign permission sets and profiles.
- To specify the fields that users can access, you can use field-level security.
- To specify the individual records that users can view and edit, you can set your organization-wide sharing settings, define a role hierarchy, and create sharing rules.

Tip: When implementing security and sharing rules for your organization, make a table of the various types of users in your organization. In the table, specify the level of access to data that each type of user needs for each object and for fields and records within the object. You can refer to this table as you set up your security model.

The following describes these security and sharing settings:

Object-Level Security (Permission Sets and Profiles)

Object-level security—or object permissions—provide the bluntest way to control data. Using object permissions you can prevent a user from seeing, creating, editing, or deleting any instance of a particular type of object, such as a lead or opportunity. Object permissions let you hide whole tabs and objects from particular users, so that they don't even know that type of data exists.

You specify object permissions in permission sets and profiles. *Permission sets* and *profiles* are collections of settings and permissions that determine what a user can do in the application, similar to a group in a Windows network, where all of the members of the group have the same folder permissions and access to the same software.

Profiles are typically defined by a user's job function (for example, system administrator or sales representative). A profile can be assigned to many users, but a user can be assigned to only one profile. You can use permission sets to grant additional permissions and access settings to users. It's easy to manage users' permissions and access with permission sets, because you can assign multiple permission sets to a single user.

Field-Level Security (Permission Sets and Profiles)

In some cases, you may want users to have access to an object, but limit their access to individual fields in that object. Field-level security—or field permissions—control whether a user can see, edit, and delete the value for a particular field on an object. They let you protect sensitive fields without having to hide the whole object from users. Field permissions are also controlled in permission sets and profiles.

Unlike page layouts, which only control the visibility of fields on detail and edit pages, field permissions control the visibility of fields in any part of the app, including related lists, list views, reports, and search results. To ensure that a user can't access a particular field, use field permissions. No other settings provide the same level of protection for a field.

Note: Field-level security doesn't prevent searching on the values in a field. When search terms match on field values protected by field-level security, the associated records are returned in the search results without the protected fields and their values.

EDITIONS

Available in: Salesforce Classic

The available data management options vary according to which Salesforce Edition you have.

Record-Level Security (Sharing)

After setting object- and field-level access permissions, you may want to configure access settings for the actual records themselves. Record-level security lets you give users access to some object records, but not others. Every record is owned by a user or a queue. The owner has full access to the record. In a hierarchy, users higher in the hierarchy always have the same access to users below them in the hierarchy. This access applies to records owned by users, as well as records shared with them.

To specify record-level security, set your organization-wide sharing settings, define a hierarchy, and create sharing rules.

- **Organization-wide sharing settings**—The first step in record-level security is to determine the organization-wide sharing settings for each object. Organization-wide sharing settings specify the default level of access users have to each others' records.

You use organization-wide sharing settings to lock down your data to the most restrictive level, and then use the other record-level security and sharing tools to selectively give access to other users. For example, let's say users have object-level permissions to read and edit opportunities, and the organization-wide sharing setting is Read-Only. By default, those users can read all opportunity records, but can't edit any unless they own the record or are granted additional permissions.

- **Role hierarchy**—Once you've specified organization-wide sharing settings, the first way you can give wider access to records is with a role hierarchy. Similar to an organization chart, a role hierarchy represents a level of data access that a user or group of users needs. The role hierarchy ensures that users higher in the hierarchy always have access to the same data as people lower in their hierarchy, regardless of the organization-wide default settings. Role hierarchies don't have to match your organization chart exactly. Instead, each role in the hierarchy should represent a level of data access that a user or group of users needs.

You can also use a territory hierarchy to share access to records. A territory hierarchy grants users access to records based on criteria such as zip code, industry, revenue, or a custom field that is relevant to your business. For example, you could create a territory hierarchy in which a user with the "North America" role has access to different data than users with the "Canada" and "United States" roles.

Note: Although it's easy to confuse permission sets and profiles with roles, they control two very different things. Permission sets and profiles control a user's object and field access permissions. Roles primarily control a user's record-level access through role hierarchy and sharing rules.

- **Sharing rules**—Sharing rules let you make automatic exceptions to organization-wide sharing settings for particular sets of users, to give them access to records they don't own or can't normally see. Sharing rules, like role hierarchies, are only used to give additional users access to records—they can't be stricter than your organization-wide default settings.
- **Manual sharing**—Sometimes it's impossible to define a consistent group of users who need access to a particular set of records. In those situations, record owners can use manual sharing to give read and edit permissions to users who would not have access to the record any other way. Although manual sharing isn't automated like organization-wide sharing settings, role hierarchies, or sharing rules, it gives record owners the flexibility to share particular records with users that need to see them.
- **Apex managed sharing**—If sharing rules and manual sharing don't give you the control you need, you can use Apex managed sharing. Apex managed sharing allows developers to programmatically share custom objects. When you use Apex managed sharing to share a custom object, only users with the "Modify All Data" permission can add or change the sharing on the custom object's record, and the sharing access is maintained across record owner changes.

User Permissions and Access

User Permissions and Access

User permissions and access settings are specified in profiles and permission sets. It's important to understand the differences between profiles and permission sets so you can use them effectively.

User permissions and access settings specify what users can do within an organization. For example, permissions determine a user's ability to edit an object record, view the Setup menu, empty the organizational Recycle Bin, or reset a user's password. Access settings determine other functions, such as access to Apex classes, app visibility, and the hours when users can log in.

Every user is assigned only one profile, but can also have multiple permission sets.

When determining access for your users, use profiles to assign the minimum permissions and access settings for specific groups of users. Then use permission sets to grant additional permissions as needed.

The following table shows the types of permissions and access settings that are specified in profiles and permission sets.

Permission or Setting Type	In Profiles?	In Permission Sets?
Assigned apps	✓	✓
Tab settings	✓	✓
Record type assignments	✓	✓
Page layout assignments	✓	
Object permissions	✓	✓
Field permissions	✓	✓
User permissions (app and system)	✓	✓
Apex class access	✓	✓
Visualforce page access	✓	✓
External data source access	✓	✓
Service provider access (if Salesforce is enabled as an identity provider)	✓	✓
Custom permissions	✓	✓
Desktop client access	✓	
Login hours	✓	

EDITIONS

Available in: Salesforce Classic

The available permissions and settings vary according to which Salesforce edition you have.

[Revoking Permissions and Access](#)

Profiles

When you create users, you assign a profile to each one. Profiles define how users access objects and data, and what they can do within the application.

Watch how you can grant users access to objects using profiles.

[Who Sees What: Object Access](#)

Your organization includes several standard profiles, in which you can edit a limited number of settings. In Enterprise, Performance, Unlimited, and Developer Edition organizations, you can use standard profiles or create custom profiles. In custom profiles, you can edit all permissions and settings except the user license. In Contact Manager, Group, and Professional Edition organizations, you can assign standard profiles to your users, but you can't view or edit the standard profiles and you can't create custom profiles.

Every profile belongs to exactly one user license type.

Salesforce has two profile interfaces. Depending on which profile user interface is enabled in your organization, you can:

- [View and edit profiles in the enhanced profile user interface](#)
- [View and edit profiles in the original profile user interface](#)

Standard Profiles

Every organization includes standard profiles that you can assign to users. In standard profiles, you can edit some settings.

Every organization includes standard profiles. In Enterprise, Unlimited, Performance, and Developer Edition, you can use standard profiles or create, edit, and delete custom profiles. In organizations where you can't create custom profiles (such as Contact Manager, Group, and Professional Edition), you can assign standard profiles to your users, but you can't view or edit them.

The following table lists commonly used permissions in standard profiles.

Profile Name	Available Permissions
System Administrator	Can configure and customize the application. Has access to all functionality that does not require an additional license. For example, administrators cannot manage campaigns unless they also have a Marketing User license. Can manage price books and products. Can edit any quota, override forecasts, and view any forecast.
Standard Platform User	Can use custom Force.com AppExchange apps developed in your organization or installed from AppExchange. In addition, can use core platform functionality such as accounts, contacts, reports, dashboards, and custom tabs.
Standard Platform One App User	Can use one custom AppExchange app developed in your organization or installed from AppExchange. The custom app is limited to five tabs. In addition, can use core platform functionality such as accounts, contacts, reports, dashboards, and custom tabs.
Standard User	Can create and edit most major types of records, run reports, and view the organization's setup. Can view, but not manage, campaigns. Can create, but not review, solutions. Can edit personal quota and override forecasts.
Customer Community User	Can log in via a community. Your community settings and sharing model determine their access to tabs, objects, and other features. For more information, see Communities User Licenses .
Customer Community Plus User	
Partner Community User	
Customer Portal User	Can log in via a Customer Portal or a community. Can view and edit data they directly own or data owned by or shared with users below them in the Customer Portal role hierarchy; and they can view and edit cases where they are listed in the <code>Contact Name</code> field.

EDITIONS

Available in: Salesforce Classic

Your edition determines which standard profiles are available.

Profile Name	Available Permissions
High Volume Customer Portal	Can log in via a Customer Portal or a community.
Authenticated Website	The High Volume Customer Portal and Authenticated Website profiles are high-volume portal users.
Customer Portal Manager	Can log in via a Customer Portal or a community. Can view and edit data they directly own or data owned by or shared with users below them in the Customer Portal role hierarchy; and they can view and edit cases where they are listed in the <code>Contact</code> Name field.
Partner User	Can log in via a partner portal or a community.
Solution Manager	Can review and publish solutions. Also has access to the same functionality as the Standard User.
Marketing User	Can manage campaigns, import leads, create letterheads, create HTML email templates, manage public documents, and update campaign history via the import wizards. Also has access to the same functionality as the Standard User.
Contract Manager	Can create, edit, activate, and approve contracts. This profile can also delete contracts as long as they are not activated. Can edit personal quota and override forecasts.
Read Only	Can view the organization's setup, run and export reports, and view, but not edit, other records.
Chatter Only User	<p>Can only log in to Chatter. Can access all standard Chatter people, profiles, groups, and files. Additionally, they can:</p> <ul style="list-style-type: none"> • View Salesforce accounts and contacts • Use Salesforce CRM Content, Ideas, and Answers • Access dashboards and reports • Use and approve workflows • Use the calendar to create and track activities • View and modify up to ten custom objects • Add records to groups <p> Note: You must expose the tabs for the standard Salesforce objects that the Chatter Only user profile can access, as they are hidden by default for these users.</p> <p>Professional Edition organizations must have Profiles enabled to perform these tasks. Contact your Salesforce representative for more information.</p> <p>Only available with the Chatter Only user license.</p> <p>For more information on Chatter Plus users, see Chatter Plus Frequently Asked Questions.</p>

Profile Name	Available Permissions
Chatter Free User	<p>Can only log in to Chatter. Can access all standard Chatter people, profiles, groups, and files.</p> <p>Only available with the Chatter Free user license.</p>
Chatter External User	<p>Can only log in to Chatter and access groups they've been invited to and interact with members of those groups. Only available with the Chatter External user license.</p>
Chatter Moderator User	<p>Can only log in to Chatter. Can access all standard Chatter people, profiles, groups, and files. Additionally, this user can:</p> <ul style="list-style-type: none"> • Activate and deactivate other Chatter Free users and moderators • Grant and revoke moderator privileges • Delete posts and comments that they can see <p> Note: Changing a user's profile from Chatter Moderator User to Chatter Free User removes moderator privileges in Chatter.</p> <p>Only available with the Chatter Free user license.</p>
Site.com Only User	<p>Can only log in to the Site.com app. Each Site.com Only user also needs a Site.com Publisher feature license to create and publish sites, or a Site.com Contributor feature license to edit the site's content.</p> <p>Additionally, this user can:</p> <ul style="list-style-type: none"> • Use one custom app with up to 20 custom objects • Access the Content app, but not the Accounts and Contacts objects • Create unlimited custom tabs <p>Only available with the Site.com Only user license.</p>

Creating and Editing Profile List Views

If [enhanced profile list views](#) are enabled for your organization, you can create profile list views to show a set of profiles with the fields you choose. For example, you could create a list view of all profiles in which “Modify All Data” is enabled.

1. In the Profiles page, click **Create New View**, or select a view and click **Edit**.
2. Enter the view name.
3. Under Specify Filter Criteria, specify the conditions that the list items must match, such as *Modify All Data equals True*.
 - a. Type a setting name, or click the lookup icon  to search for and select the setting you want.
 - b. Choose a filter operator.
 - c. Enter the value that you want to match.
 - d. To specify another filter condition, click **Add New**. You can specify up to 25 filter condition rows.
To remove a filter condition row and clear its values, click the remove row icon .
4. Under Select Columns to Display, specify the profile settings that you want to appear as columns in the list view.
 - a. From the Search drop-down list, select the type of setting you want to search for.
 - b. Enter part or all of a word in the setting you want to add and click **Find**.

 **Note:** If the search finds more than 500 values, no results appear. Use the preceding steps to refine your search criteria and show fewer results.
 - c. To add or remove columns, select one or more column names and click the **Add** or **Remove** arrow.
 - d. Use the **Top**, **Up**, **Down**, and **Bottom** arrows to arrange the columns in the sequence you want.
You can add up to 15 columns in a single list view.
5. Click **Save**, or if you're cloning an existing view, rename it and click **Save As**.

USER PERMISSIONS

To create, edit, and delete profile list views:

- “Manage Profiles and Permission Sets”

Editing Multiple Profiles with Profile List Views

If [enhanced profile list views](#) are enabled for your organization, you can change permissions in up to 200 profiles directly from the list view, without accessing individual profile pages. Editable cells display a pencil icon (✎) when you hover over the cell, while non-editable cells display a lock icon (🔒). In some cases, such as in standard profiles, the pencil icon appears but the setting is not actually editable.

 **Warning:** Use care when editing profiles with this method. Because profiles affect a user's fundamental access, making mass changes may have a widespread effect on users in your organization.

To change permissions in one or more profiles:

1. Select or [create](#) a list view that includes the profiles and permissions you want to edit.
2. To edit multiple profiles, select the checkbox next to each profile you want to edit. If you select profiles on multiple pages, Salesforce remembers which profiles are selected.
3. Double-click the permission you want to edit. For multiple profiles, double-click the permission in any of the selected profiles.
4. In the dialog box that appears, enable or disable the permission. In some cases, changing a permission may also change other permissions. For example, if "Customize Application" and "View Setup and Configuration" are disabled and you enable "Customize Application," then "View Setup and Configuration" is also enabled. In this case, the dialog box lists the affected permissions.
5. To change multiple profiles, select **All n selected records** (where n is the number of profiles you selected).
6. Click **Save**.

Note:

- For standard profiles, inline editing is available only for the "Single Sign-On" and "Affected By Divisions" permissions.
- If you edit multiple profiles, only those profiles that support the permission you are changing will change. For example, if you use inline editing to add "Modify All Data" to multiple profiles, but because of its user license the profile doesn't have "Modify All Data," the profile won't change.

If any errors occur, an error message appears, listing each profile in error and a description of the error. Click the profile name to open the profile detail page. The profiles you've clicked appear in the error window in gray, strike-through text.

 **Note:** To view the error console, you must have pop-up blockers disabled for the Salesforce domain.

Any changes you make are recorded in the setup audit trail.

Clone Profiles

Instead of creating new profiles, save time by cloning existing profiles and customizing them.

 **Tip:** If you clone profiles to enable certain permissions or access settings, consider enabling them using permission sets. For more information, see [Permission Sets](#).

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. In the Profiles list page, do one of the following:
 - Click **New Profile**, then select an existing profile that's similar to the one you want to create.
 - If enhanced profile list views are enabled, click **Clone** next to a profile that's similar to the one you want to create.
 - Click the name of a profile that's similar to the one you want to create, then in the profile page, click **Clone**.

A new profile uses the same [user license](#) as the profile it was cloned from.

3. Enter a profile name.
4. Click **Save**.

Edit Object Permissions in Profiles

Object permissions specify the type of access that users have to objects.

1. From Setup, either:
 - Enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**, or
 - Enter *Profiles* in the **Quick Find** box, then select **Profiles**
2. Select a permission set or profile.
3. Depending on which interface you're using, do one of the following:
 - Permission sets or enhanced profile user interface—In the **Find Settings...** box, enter the name of the object and select it from the list. Click **Edit**, then scroll to the Object Permissions section.
 - Original profile user interface—Click **Edit**, then scroll to the Standard Object Permissions, Custom Object Permissions, or External Object Permissions section.
4. Specify the object permissions.
5. Click **Save**.

View and Edit Tab Settings in Permission Sets and Profiles

Tab settings specify whether a tab appears in the All Tabs page or is visible in a tab set.

- From Setup, either:
 - Enter *Permission Sets* in the Quick Find box, then select **Permission Sets**, or
 - Enter *Profiles* in the Quick Find box, then select **Profiles**
- Select a permission set or profile.
- Do one of the following:
 - Permission sets or enhanced profile user interface—In the **Find Settings...** box, enter the name of the tab you want and select it from the list, then click **Edit**.
 - Original profile user interface—Click **Edit**, then scroll to the Tab Settings section.
- [Specify the tab settings.](#)
- (Original profile user interface only) To reset users' tab customizations to the tab visibility settings that you specify, select **Overwrite users' personal tab customizations**.
- Click **Save**.

 **Note:** If Salesforce CRM Content is enabled for your organization but the **Salesforce CRM Content User** checkbox isn't enabled on the user detail page, the Salesforce CRM Content app has no tabs.

SEE ALSO:

[Profiles](#)

Tab Settings

Tab settings specify whether a tab appears in the All Tabs page or is visible in its associated app. Tab settings labels in permission sets differ from the labels in profiles.

Enabled Settings in Permission Sets	Enabled Setting in Profiles	Description
Available	Default Off	The tab is available on the All Tabs page. Individual users can customize their display to make the tab visible in any app.
Available and Visible	Default On	The tab is available on the All Tabs page and appears in the visible tabs for its associated app. Individual users can customize their display to hide the tab or make it visible in other apps.
None	Tab Hidden	The tab isn't available on the All Tabs page or visible in any apps.

Enhanced Profile User Interface Overview

The enhanced profile user interface provides a streamlined experience for managing profiles. With it, you can easily navigate, search, and modify settings for a profile.

To enable the enhanced profile user interface, from Setup, enter *User Interface* in the `Quick Find` box, then select **User Interface**, then select **Enable Enhanced Profile User Interface** and click **Save**. Your organization can only use one profile user interface at a time.

-  **Note:** You can't use the enhanced profile user interface if:
- You use Microsoft® Internet Explorer® 6 or earlier to manage your profiles (unless you've installed the Google Chrome Frame™ plug-in for Internet Explorer).
 - Your organization uses category groups on guest profiles used for sites.
 - Your organization delegates partner portal administration to portal users.

Work in the Enhanced Profile User Interface Overview Page

In the enhanced profile user interface, the profile overview page provides an entry point for all settings and permissions for a profile.

To open the profile overview page, from Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles** and click the profile you want to view.

From the profile overview page, you can:

- [Search for an object, permission, or setting](#)
- [Clone the profile](#)
- If it's a custom profile, delete the profile by clicking **Delete**

 **Note:** You can't delete a profile that's assigned to a user, even if the user is inactive.

- Change the profile name or description by clicking **Edit Properties**
- [View a list of users who are assigned to the profile](#)
- Under Apps and System, click any of the links to view or edit permissions and settings.

SEE ALSO:

[Enhanced Profile User Interface Overview](#)

App and System Settings in the Enhanced Profile User Interface

In the enhanced profile user interface, administrators can easily navigate, search, and modify settings for a single profile. Permissions and settings are organized into pages under app and system categories, which reflect the rights users need to administer and use app and system resources.

App Settings

Apps are sets of tabs that users can change by selecting the drop-down menu in the header. All underlying objects, components, data, and configurations remain the same, regardless of the selected app. In selecting an app, users navigate in a set of tabs that allows them to efficiently use the underlying functionality for app-specific tasks. For example, let's say you do most of your work in the sales app, which includes tabs like Accounts and Opportunities. To track a new marketing campaign, rather than adding the Campaigns tab to the sales app, you select Marketing from the app drop-down to view your campaigns and campaign members.

In the enhanced profile user interface, the Apps section of the overview page contains settings that are directly associated with the business processes that the apps enable. For example, customer service agents may need to manage cases, so the "Manage Cases" permission is in the Call Center section of the App Permissions page. Some app settings aren't related to app permissions. For example, to enable the Time-Off Manager app from the AppExchange, users need access to the appropriate Apex classes and Visualforce pages, as well as the object and field permissions that allow them to create new time-off requests.

 **Note:** Regardless of the currently selected app, all of a user's permissions are respected. For example, although the "Import Leads" permission is under the Sales category, a user can import leads even while in the Call Center app.

System Settings

Some system functions apply to an organization and not to any single app. For example, login hours and login IP ranges control a user's ability to log in, regardless of which app the user accesses. Other system functions apply to all apps. For example, the "Run Reports" and "Manage Dashboards" permissions allow managers to create and manage reports in all apps. In some cases, such as with "Modify All Data," a permission applies to all apps, but also includes non-app functions, like the ability to download the Data Loader.

[Enhanced Profile User Interface Overview](#)

Search in the Enhanced Profile User Interface

To locate an object, tab, permission, or setting name on a profile page, type at least three consecutive letters in the  **Find Settings** box. As you type, suggestions for results that match your search terms appear in a list. Click an item in the list to go to its settings page.

Search terms aren't case-sensitive. For some categories, you can search for the specific permission or setting name. For other categories, search for the category name.

Item	Search for	Example
Assigned apps	App name	Type <code>sales</code> in the Find Settings box, then select <code>Sales</code> from the list.
Objects	Object name	Let's say you have an Albums custom object. Type <code>albu</code> , then select <code>Albums</code> .
<ul style="list-style-type: none"> Fields Record types Page layout assignments 	Parent object name	Let's say your Albums object contains a Description field. To find the <code>Description</code> field for albums, type <code>albu</code> , select <code>Albums</code> , and scroll down to <code>Description</code> under Field Permissions.
Tabs	Tab or parent object name	Type <code>rep</code> , then select <code>Reports</code> .
App and system permissions	Permission name	Type <code>api</code> , then select <code>API Enabled</code> .
All other categories	Category name	To find Apex class access settings, type <code>apex</code> , then select <code>Apex Class Access</code> . To find custom permissions, type <code>cust</code> , then select <code>Custom Permissions</code> . And so on.

If no results appear in a search:

- Check if the permission, object, tab, or setting you're searching for is available in the current organization.
- Verify that the item you're searching for is available for the user license that's associated with the current profile. For example, a profile with the High Volume Customer Portal license doesn't include the "Modify All Data" permission.
- Ensure that your search term contains at least three consecutive characters that match the name of the item you want to find.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

The available profile permissions and settings vary according to which Salesforce edition you have.

USER PERMISSIONS

To find permissions and settings in a profile:

- "View Setup and Configuration"

- Make sure that you spelled the search term correctly.

[Enhanced Profile User Interface Overview](#)

Assigning Record Types and Page Layouts in the Enhanced Profile User Interface

In the enhanced profile user interface, Record Types and Page Layout Assignments settings determine the record type and page layout assignment mappings that are used when users view records. They also determine which record types are available when users create or edit records.

To specify record types and page layout assignments:

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Select a profile.
3. In the **Find Settings...** box, enter the name of the object you want and select it from the list.
4. Click **Edit**.
5. In the Record Types and Page Layout Assignments section, make changes to the settings as needed.

Setting	Description
Record Types	Lists all existing record types for the object. --Master-- is a system-generated record type that's used when a record has no custom record type associated with it. When --Master-- is assigned, users can't set a record type to a record, such as during record creation. All other record types are custom record types.
Page Layout Assignment	The page layout to use for each record type. The page layout determines the buttons, fields, related lists, and other elements that users with this profile see when creating records with the associated record type. Since all users can access all record types, every record type must have a page layout assignment, even if the record type isn't specified as an assigned record type in the profile.
Assigned Record Types	Record types that are checked in this column are available when users with this profile create records for the object. If --Master-- is selected, you can't select any custom record types; and if any custom record types are selected, you can't select --Master--.
Default Record Type	The default record type to use when users with this profile create records for the object.

The Record Types and Page Layout Assignments settings have some variations for the following objects or tabs.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To edit record type and page layout access settings:

- "Manage Profiles and Permission Sets"

Object or Tab	Variation
Accounts	If your organization uses person accounts, the accounts object additionally includes Business Account Default Record Type and Person Account Default Record Type settings, which specify the default record type to use when the profile's users create business or person account records from converted leads.
Cases	The cases object additionally includes Case Close settings, which show the page layout assignments to use for each record type on closed cases. That is, the same record type may have different page layouts for open and closed cases. With this additional setting, when users close a case, the case may have a different page layout that exposes how it was closed.
Home	You can't specify custom record types for the home tab. You can only select a page layout assignment for the --Master-- record type.

6. Click **Save**.

[How is record type access specified?](#)

[Assigning Custom Record Types in Permission Sets](#)

[Work in the Enhanced Profile User Interface Overview Page](#)

View and Edit Login Hours in the Enhanced Profile User Interface

For each profile, you can specify the hours when users can log in.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Select a profile and click its name.
3. In the profile overview page, scroll down to Login Hours and click **Edit**.
4. Set the days and hours when users with this profile can log in to the organization.

To allow users to log in at any time, click **Clear all times**. To prohibit users from using the system on a specific day, set the start and end times to the same value.

If users are logged in when their login hours end, they can continue to view their current page, but they can't take any further action.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

USER PERMISSIONS

To view login hour settings:

- "View Setup and Configuration"

To edit login hour settings:

- "Manage Profiles and Permission Sets"

 **Note:** The first time login hours are set for a profile, the hours are based on the organization's `Default Time Zone` as specified on the Company Information page in Setup. After that, any changes to the organization's `Default Time Zone` won't change the time zone for the profile's login hours. As a result, the login hours are always applied at those exact times even if a user is in a different time zone or if the organization's default time zone is changed.

Depending on whether you're viewing or editing login hours, the hours may appear differently. On the Login Hours edit page, hours are shown in your specified time zone. On the profile overview page, they appear in the organization's original default time zone.

[Enhanced Profile User Interface Overview](#)

Restricting Login IP Ranges in the Enhanced Profile User Interface

You can control login access on a user's profile by specifying a range of IP addresses. When you define IP address restrictions for a profile, any login from a restricted IP address is denied.

1. From Setup, enter *Profiles* in the `Quick Find` box, then select **Profiles**.
2. Select a profile and click its name.
3. In the profile overview page, click **Login IP Ranges**.
4. Use any of these methods to change login IP address ranges for the profile.
 - If you want to add ranges, click **Add IP Ranges**. Enter a valid IP address in the `IP Start Address` and a higher IP address in the `IP End Address` field. The start and end addresses define the range of allowable IP addresses from which users can log in. To allow logins from a single IP address, enter the same address in both fields. For example, to allow logins from only 125.12.3.0, enter 125.12.3.0 as both the start and end addresses.
 - If you want to edit or remove ranges, click **Edit** or **Delete** for that range.
 - Optionally, enter a description for the range. If you maintain multiple ranges, use the `Description` field to provide details, such as which part of your network corresponds to this range.

Both IP addresses in a range must be either IPv4 or IPv6. In ranges, IPv4 addresses exist in the IPv4-mapped IPv6 address space `::ffff:0:0 to ::ffff:ffff:ffff`, where `::ffff:0:0` is `0.0.0.0` and `::ffff:ffff:ffff` is `255.255.255.255`. A range can't include IP addresses inside of the IPv4-mapped IPv6 address space if it also includes IP addresses outside of the IPv4-mapped IPv6 address space. Ranges such as `255.255.255.255 to ::1:0:0:0` or `:: to ::1:0:0:0` are not allowed. You can set up IPv6 addresses in all organizations, but IPv6 is only enabled for login in sandbox organizations from the Spring '12 release and later.

Important:

- Partner User profiles are limited to five IP addresses. If you want to increase this limit, contact Salesforce.
- The Salesforce Classic Mobile app can bypass IP range definitions set up for profiles. Salesforce Classic Mobile initiates a secure connection to Salesforce over the mobile carrier's network, but the mobile carrier's IP addresses might be outside of the IP ranges allowed on the user's profile. To prevent bypassing IP definitions set on a user's profile, [disable Salesforce Classic Mobile](#) on page 945 for that user.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

- Unlimited
- Developer
- Database.com

USER PERMISSIONS

To view login IP ranges:

- "View Setup and Configuration"

To edit and delete login IP ranges:

- "Manage Profiles and Permission Sets"

-  **Note:** You can limit all access to Salesforce to only those IPs in Login IP Ranges. For example, suppose a user logs in successfully from an IP address defined in Login IP Ranges. The user then moves to a different location and has a new IP address that is outside of Login IP Ranges. When the user tries to access Salesforce, including access from a client application, the user is denied. To enable this option, in Setup, enter *Session Settings* in the Quick Find box, then select **Session Settings** and select **Enforce login IP ranges on every request**. This option affects all user profiles that have login IP restrictions.

Working with Profiles in the Original Profile Interface

To view a profile, from Setup, enter *Profiles* in the Quick Find box, then select **Profiles**, then select the profile you want.

On the profile detail page, you can:

- [Edit the profile](#)
- [Create a profile based on this profile](#)
- For custom profiles only, click **Delete** to delete the profile

 **Note:** You can't delete a profile that's assigned to a user, even if the user is inactive.

- [View the users who are assigned to this profile](#)

Edit Profiles in the Original Profile Interface

Profiles define how users access objects and data and what they can do within the application. In standard profiles, you can edit a limited number of settings. In custom profiles, you can edit all available permissions and settings, except the user license.

-  **Note:** Editing some permissions can result in enabling or disabling other ones. For example, enabling "View All Data" enables "Read" for all objects. Likewise, enabling "Transfer Leads" enables "Read" and "Create" on leads.

 **Tip:** If enhanced profile list views are enabled for your organization, you can change permissions for multiple profiles from the list view.

1. From Setup, enter *Profiles* in the Quick Find box, then select **Profiles**.
2. Select the profile you want to change.
3. On the profile detail page, click **Edit**.

Viewing and Editing Desktop Client Access in the Original Profile User Interface

Connect Offline and Connect for Office are desktop clients that integrate Salesforce with your PC. As an administrator, you can control which desktop clients your users can access as well as whether users are automatically notified when updates are available.

 **Note:** To access desktop clients, users must also have the “API Enabled” permission.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Click **Edit** next to a profile name, and scroll to the Desktop Integration Clients section at the bottom of the page.

SEE ALSO:

[Working with Profiles in the Original Profile Interface](#)

Assign Record Types to Profiles in the Original Profile User Interface

After you create record types and include picklist values in them, add record types to user profiles. If you assign a default record type to a profile, users with that profile can assign the record type to records that they create or edit.

 **Note:** Users can view records of any record type, even if the record type is not associated with their profile.

You can associate several record types with a profile. For example, a user needs to create hardware and software sales opportunities. In this case, you can create and add both “Hardware” and “Software” record types to the user’s profile.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Select a profile. The record types available for that profile are listed in the Record Type Settings section.
3. Click **Edit** next to the appropriate type of record.
4. Select a record type from the Available Record Types list and add it to the Selected Record Types list.

Master is a system-generated record type that’s used when a record has no custom record type associated with it. When you assign **Master**, users can’t set a record type to a record, such as during record creation. All other record types are custom record types.

5. From **Default**, choose a default record type.

If your organization uses person accounts, this setting also controls which account fields display in the **Quick Create** area of the accounts home page.

USER PERMISSIONS

To assign record types to profiles:

- “Customize Application”

6. If your organization uses person accounts, set default record type options for both person accounts and business accounts. From the `Business Account Default Record Type` and then the `Person Account Default Record Type` drop-down list, choose a default record type.

These settings are used when defaults are needed for both kinds of accounts, such as when converting leads.

7. Click **Save**.

Options in the Record Type Settings section are blank wherever no record types exist. For example, if you have two record types for opportunities but no record types for accounts, the **Edit** link only displays for opportunities. In this example, the picklist values and default value for the master are available in all accounts.

-  **Note:** If your organization uses person accounts, you can view the record type defaults for business accounts and person accounts. Go to Account Record Type Settings in the profile detail page. Clicking **Edit** in the Account Record Type Settings is another way to begin setting record type defaults for accounts.

View and Edit Login Hours in the Original Profile User Interface

Specify the hours when users can log in based on the user profile.

1. From Setup, enter `Profiles` in the `Quick Find` box, then select **Profiles**, and select a profile.
2. Click **Edit** in the Login Hours related list.
3. Set the days and hours when users with this profile can use the system.

To allow users to log in at any time, click **Clear All Times**. To prohibit users from using the system on a specific day, set the start and end times to the same value.

If users are logged in when their login hours end, they can continue to view their current page, but they can't take any further action.

4. Click **Save**.

-  **Note:** The first time login hours are set for a profile, the hours are based on the organization's `Default Time Zone` as specified on the Company Information page in Setup. After that, any changes to the organization's `Default Time Zone` won't change the time zone for the profile's login hours. As a result, the login hours are always applied at those exact times even if a user is in a different time zone or if the organization's default time zone is changed.

Depending on whether you're viewing or editing login hours, the hours appear differently. On the profile detail page, hours are shown in your specified time zone. On the Login Hours edit page, they appear in the organization's default time zone.

Restrict Login IP Addresses in the Original Profile User Interface

You can control login access on a user's profile by specifying a range of IP addresses. When you define IP address restrictions for a profile, any login from a restricted IP address is denied.

1. The procedure you use to restrict the range of valid IP addresses on profiles depends on your Edition.
 - If you're using Enterprise, Unlimited, Performance, or Developer editions, from Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**, and select a profile.
 - If you're using Professional, Group, or Personal editions, from Setup, enter *Session Settings* in the **Quick Find** box, then select **Session Settings**.
2. Click **New** in the Login IP Ranges related list.
3. Enter a valid IP address in the **IP Start Address** and a higher IP address in the **IP End Address** field.

The start and end addresses define the range of allowable IP addresses from which users can log in. To allow logins from a single IP address, enter the same address in both fields. For example, to allow logins from only 125.12.3.0, enter 125.12.3.0 as both the start and end addresses.

- Partner User profiles are limited to five IP addresses. If you want to increase this limit, contact Salesforce.
 - The Salesforce Classic Mobile app can bypass IP range definitions set up for profiles. Salesforce Classic Mobile initiates a secure connection to Salesforce over the mobile carrier's network, but the mobile carrier's IP addresses might be outside of the IP ranges allowed on the user's profile. To prevent bypassing IP definitions set on a user's profile, [disable Salesforce Classic Mobile](#) on page 945 for that user.
4. Optionally, enter a description for the range. If you maintain multiple ranges, use the Description field to provide details, such as which part of your network corresponds to this range.
 5. Click **Save**.

Both IP addresses in a range must be either IPv4 or IPv6. In ranges, IPv4 addresses exist in the IPv4-mapped IPv6 address space `::ffff:0:0` to `::ffff:ffff:ffff`, where `::ffff:0:0` is 0.0.0.0 and `::ffff:ffff:ffff` is 255.255.255.255. A range can't include IP addresses inside of the IPv4-mapped IPv6 address space if it also includes IP addresses outside of the IPv4-mapped IPv6 address space. Ranges such as 255.255.255.255 to `::1:0:0:0` or `::` to `::1:0:0:0` are not allowed. You can set up IPv6 addresses in all organizations, but IPv6 is only enabled for login in sandbox organizations from the Spring '12 release and later.

-  **Note:** Cache settings on static resources are set to private when accessed via a Force.com site whose guest user's profile has restrictions based on IP range or login hours. Sites with guest user profile restrictions cache static resources only within the browser. Also, if a previously unrestricted site becomes restricted, it can take up to 45 days for the static resources to expire from the Salesforce cache and any intermediate caches.
-  **Note:** You can limit all access to Salesforce to only those IPs in Login IP Ranges. For example, suppose a user logs in successfully from an IP address defined in Login IP Ranges. The user then moves to a different location and has a new IP address that is outside of Login IP Ranges. When the user tries to access Salesforce, including access from a client application, the user is denied. To enable

View and Edit Assigned Apps in Profiles

Assigned app settings specify the apps that users can select in the Force.com app menu.

Every profile must have at least one visible app, except profiles associated with Customer Portal users because apps are not available to them.

To specify app visibility:

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Select a profile.
3. Depending on which user interface you're using, do one of the following:
 - Enhanced profile user interface—Click **Assigned Apps**, then click **Edit**.
 - Original profile user interface—Click **Edit**, then scroll to the Custom App Settings section.
4. Select one default app. The default app appears when users log in for the first time.
5. Select **Visible** for any other apps you want to make visible.

Enable Custom Permissions in Profiles

Custom permissions give you a way to provide access to custom processes or apps. After you've created a custom permission and associated it with a process or app, you can enable the permission in profiles.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Select a profile.
3. Depending on which user interface you're using, do one of the following.
 - Enhanced profile user interface: Click **Custom Permissions**, and then click **Edit**.
 - Original profile user interface: In the Enabled Custom Permissions related list, click **Edit**.
4. To enable custom permissions, select them from the Available Custom Permissions list and click **Add**. To remove custom permissions from the profile, select them from the Enabled Custom Permissions list and click **Remove**.
5. Click **Save**.

SEE ALSO:

[Custom Permissions](#)

View and Edit Session Timeout Value in Profiles

Use Session Timeout to set a time limit for how long a user's authentication session lasts. At the end of the session, the user will need to log in, again.

Until you set the Session Timeout on a profile, the organization-wide `Timeout value` in the Session Settings applies to users of the profile. Once set, the Session Timeout on a profile overrides the organization-wide `Timeout value` for users of that profile. Changes to the organization-wide `Timeout value` will not apply to users of a profile with its own Session Timeout value.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Select a profile.
3. Depending on which user interface you're using, do one of the following:
 - Enhanced profile user interface—Click **Session Timeout**, then click **Edit**.
 - Original profile user interface—Click **Edit**, then scroll to the Session Timeout section.
4. Select a timeout value from the drop-down list.
5. Click **Save**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

In Group and Professional Edition organizations, you can't create or edit custom permissions, but you can install them as part of a managed package.

USER PERMISSIONS

[Password Policy Fields in Profiles](#)

Password Policy Fields in Profiles

Specify password requirements with Password Policies settings. Refer to these field descriptions to understand how each one impacts a profile's password requirements.

Changes to the organization-wide password policies don't apply to users of a profile with its own password policies.

Field	Description
User passwords expire in	The length of time until user passwords expire and must be changed. The default is 90 days. This setting isn't available for Self-Service portals. This setting doesn't apply to users with the "Password Never Expires" permission.
Enforce password history	Save users' previous passwords so that they must always reset their password to a new, unique password. Password history is not saved until you set this value. The default is 3 passwords remembered. You cannot select No passwords remembered unless you select Never expires for the User passwords expire in field. This setting isn't available for Self-Service portals.
Minimum password length	The minimum number of characters required for a password. When you set this value, existing users aren't affected until the next time they change their passwords. The default is 8 characters.

[View and Edit Password Policies in Profiles](#)

Permission Sets

A permission set is a collection of settings and permissions that give users access to various tools and functions. The settings and permissions in permission sets are also found in profiles, but permission sets extend users' functional access without changing their profiles.

Watch a Video Tutorial:  [Who Sees What: Permission Sets](#)

Users can have only one profile, but they can have multiple permission sets. You can assign permission sets to various types of users, regardless of their profiles.

 **Note:** In Contact Manager, Group, and Professional Editions, you can create one permission set.

If a permission isn't enabled in a profile but is enabled in a permission set, users with that profile and permission set have the permission. For example, if "Manage Password Policies" isn't enabled in Jane Smith's profile, but is enabled in one of her permission sets, she can manage password policies.

Use permission sets to grant access among logical groupings of users, regardless of their primary job function. For example, let's say you have an Inventory custom object in your organization. Many users need "Read" access to this object and a smaller number of users need "Edit" access. To address this requirement, you can create a permission set that grants "Read" access and assign it to the appropriate users. You can then create another permission set that gives "Edit" access to the Inventory object and assign it to the smaller group of users.

[Create a Tenant Secret](#)

Create Permission Sets

You can clone a permission set or create a new one. A cloned permission set starts with the same user license and enabled permissions as the permission set that it's cloned from. A new permission set starts with no user license selected and no permissions enabled.

[Walk Through It: create, edit, and assign a permission set](#)

- Database.com

USER PERMISSIONS

To create permission sets:

- "Manage Profiles and Permission Sets"

User Licenses in Permission Sets

When creating a permission set, you can select a specific user license or **--None--**.

If you're selecting a specific license, select the license that matches the users who use the permission set. For example, if you plan to assign this permission set to users with the Salesforce license, select Salesforce.

If you plan to assign this permission set to multiple users with different licenses, select **--None--** for no user license. With this option, you can assign the permission set to any users whose license allows the enabled permissions. For example, if you plan to assign the permission set to users with the Salesforce license as well as users with the Salesforce Platform license, select **--None--**.

Note:

- Permission sets with no user license don't include all possible permissions and settings.
- You can only assign a permission set with no license to users whose licenses allow the enabled permissions and settings. For example, if you create a permission set with no user license and enable "Author Apex," you can't assign that permission set to users with the Salesforce Platform user license because the license doesn't allow that permission.

Permission Sets Considerations

Be aware of these considerations and special behaviors for permission sets.

Differences between new and cloned permission sets

A new permission set starts with no user license selected and no permissions enabled. A cloned permission set has the same user license and enabled permissions as the permission set that it's cloned from. You can't change the user license in a cloned permission set. Clone a permission set only if the new one requires the same user license as the original.

Limits

In Enterprise, Performance, Unlimited, Developer, and Database.com editions, you can create up to 1,000 permission sets. In Contact Manager, Group, and Professional Editions, you can create one permission set.

In Group, Professional, Enterprise, Performance, Unlimited, Developer, and Database.com editions, organizations can have more permission sets if they're added as part of an installed managed package that's publicly listed on AppExchange. In this case, organizations can have up to 1,500 permission sets.

User license restrictions

Some user licenses restrict the number of custom apps or tabs that a user can access. In this case, you can assign only the allotted number through the user's assigned profile and permission sets. For example, a user with the Force.com App Subscription user license with access to one Force.com Light App can access only that app's custom tabs.

Assigned apps

Assigned app settings specify the apps that users can select in the Force.com app menu. Unlike profiles, you can't assign a default app in permission sets. You can only specify whether apps are visible.

Apex class access

You can specify which methods in a top-level Apex class are executable for a permission set. Apex class access settings apply only to:

- Apex class methods, such as Web service methods
- Any method used in a custom Visualforce controller or controller extension applied to a Visualforce page

Create and Edit Permission Set List Views

You can create and edit permission set list views to show a list of permission sets with specific fields and permissions. For example, you could create a list view of all permission sets in which “Modify All Data” is enabled.

1. In the Permission Sets page, click **Create New View**, or select a view and click **Edit**.
2. Enter the view name.
3. Under Specify Filter Criteria, specify the conditions that the list items must match, such as *Modify All Data equals True*.
 - a. Type a setting name, or click  to search for and select the setting you want.
 - b. Choose a filter operator.
 - c. Enter the value that you want to match.

 **Tip:** To show only permission sets with no user license, enter *User License* for the **Setting**, set the **Operator** to *equals*, and enter *""* in the **Value** field.
 - d. To specify another filter condition, click **Add Row**. You can specify up to 25 filter condition rows.
4. Under Select Columns to Display, specify the settings that you want to appear as columns in the list view. You can add up to 15 columns.
 - a. From the Search drop-down list, select a setting type.
 - b. Enter the first few letters of the setting you want to add and click **Find**.

 **Note:** If the search finds more than 500 values, no results appear. Refine your search criteria to show fewer results.
5. Click **Save**, or if you're cloning an existing view, rename it and click **Save As**.

USER PERMISSIONS

To create, edit, and delete permission set list views:

- “Manage Profiles and Permission Sets”

Edit Permission Sets from a List View

You can change permissions in up to 200 permission sets directly from the list view, without accessing individual permission sets.

 **Note:** Use care when editing permission sets with this method. Making mass changes can have a widespread effect on users in your organization.

1. Select or [create a list view](#) that includes the permission sets and permissions you want to edit.
2. To edit multiple permission sets, select the checkbox next to each one you want to edit. If you select permission sets on multiple pages, the selections on each page are remembered.
3. Double-click the permission you want to edit. For multiple permission sets, double-click the permission in any of the selected permission sets.
4. In the dialog box that appears, enable or disable the permission. In some cases, changing a permission can also change other permissions. For example, if “Manage Cases” and “Transfer Cases” are enabled in a permission set and you disable “Transfer Cases,” then “Manage Cases” is also disabled. In this case, the dialog box lists the affected permissions.
5. To change multiple permission sets, select **All *n* selected records** (where *n* is the number of permission sets you selected).
6. Click **Save**.

If you edit multiple permission sets, only the permission sets that support the permission you are editing change. For example, let’s say you use inline editing to enable “Modify All Data” in ten permission sets, but one permission set doesn’t have “Modify All Data.” In this case, “Modify All Data” is enabled in all the permission sets, except the one without “Modify All Data.”

Any changes you make are recorded in the setup audit trail.

Permission Set Overview Page

A permission set's overview page provides an entry point for all of the permissions in a permission set. To open a permission set overview page, from Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets** and select the permission set you want to view.

[Walk Through It: create, edit, and assign a permission set](#)

About App and System Settings in Permission Sets

In permission sets, permissions and settings are organized into app and system categories, which reflect the rights users need to administer and use system and app resources.

App Settings

Apps are sets of tabs that users can change by selecting the drop-down menu in the header. All underlying objects, components, data, and configurations remain the same, regardless of the selected app. In selecting an app, users navigate in a set of tabs that allows them to efficiently use the underlying functionality for app-specific tasks. For example, let's say you do most of your work in the sales app, which includes tabs like Accounts and Opportunities. To track a new marketing campaign, rather than adding the Campaigns tab to the sales app, you select Marketing from the app drop-down to view your campaigns and campaign members.

The Apps section of the permission sets overview page contains settings that are directly associated with the business processes the apps enable. For example, customer service agents might need to manage cases, so the "Manage Cases" permission is in the Call Center section of the App Permissions page. Some app settings aren't related to app permissions. For example, to enable the Time-Off Manager app from the AppExchange, users need access to the appropriate Apex classes and Visualforce pages, as well as the object and field permissions that allow them to create new time-off requests.

System Settings

Some system functions apply to an organization and not to any single app. For example, "View Setup and Configuration" allows users to view setup and administrative settings pages. Other system functions apply to all apps. For example, the "Run Reports" and "Manage

Dashboards" permissions allow managers to create and manage reports in all apps. In some cases, such as with "Modify All Data," a permission applies to all apps, but also includes non-app functions, like the ability to download the Data Loader.

Search Permission Sets

To quickly navigate to other pages in a permission set, you can enter search terms in any permission set detail page.

On any of the permission sets detail pages, type at least three consecutive letters of an object, setting, or permission name in the  **Find Settings...** box. The search terms aren't case-sensitive. As you type, suggestions for results that match your search terms appear in a list. Click an item in the list to go to its settings page.

For some categories, you can search for the specific permission or setting name. For other categories, search for the category name.

Item	Search for	Example
Assigned apps	App name	Type <i>sales</i> in the Find Settings box, then select <i>Sales</i> from the list.
Objects	Object name	Let's say you have an Albums custom object. Type <i>albu</i> , then select <i>Albums</i> .
<ul style="list-style-type: none"> Fields Record types 	Parent object name	Let's say your Albums object contains a Description field. To find the <i>Description</i> field for albums, type <i>albu</i> , select <i>Albums</i> , and scroll down to <i>Description</i> under Field Permissions.
Tabs	Tab or parent object name	Type <i>rep</i> , then select <i>Reports</i> .
App and system permissions	Permission name	Type <i>api</i> , then select <i>API Enabled</i> .
All other categories	Category name	To find Apex class access settings, type <i>apex</i> , then select <i>Apex Class Access</i> . To find custom permissions, type <i>cust</i> , then select <i>Custom Permissions</i> . And so on.

If no results appear in a search:

- Be sure that the search term has at least three consecutive characters that match the object, setting, or permission name.
- Be sure that the search term is spelled correctly.
- The permission, object, or setting you're searching for may not be available in the current organization.
- The item you're searching for may not be available for the user license that's associated with the current permission set. For example, a permission set with the Standard Platform User license doesn't include the "Modify All Data" permission.

To assign record types in permission sets:

- "Manage Profiles and Permission Sets"

How is record type access specified?

You can assign record types to users in their profile or permission sets, or a combination of both. Record type assignment behaves differently in profiles and permission sets.

- A user's default record type is specified in the user's personal settings. You can't specify a default record type in permission sets.
- You can assign the `--Master--` record type in profiles. In permission sets, you can assign only custom record types. The behavior for record creation depends on which record types are assigned in profiles and permission sets.

If users have this record type on their profile...	And this total number of custom record types in their permission sets...	When they create a record...
<code>--Master--</code>	None	The new record is associated with the Master record type
<code>--Master--</code>	One	The new record is associated with the custom record type. Users can't select the Master record type.
<code>--Master--</code>	Multiple	Users are prompted to select a record type.
Custom	One or more	Users are prompted to select a record type. In their personal settings, users can set an option to use their default record type and not be prompted to choose a record type.

- Page layout assignments are specified in profiles only—they're not available in permission sets. When a permission set specifies a custom record type, users with that permission set get the page layout assignment that's specified for that record type in their profile. (In profiles, page layout assignments are specified for every record type, even when record types aren't assigned.)
- For lead conversion, the default record type specified in a user's profile is used for the converted records.
- Users can view records assigned to any record type. As a result, a page layout is assigned to every record type on a user's profile. A record type assignment on a user's profile or permission set doesn't determine whether a user can view a record with that record type. The record type assignment simply specifies that the user can use that record type when creating or editing a record.
- Record types in permission sets aren't supported in packages and change sets. As a result, any record type assignments in permission sets in a sandbox organization must be manually reproduced in a production organization.

Enable Custom Permissions in Permission Sets

Custom permissions give you a way to provide access to custom processes or apps. After you've created a custom permission and associated it with a process or app, you can enable the permission in permission sets.

1. From Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets**.
2. Select a permission set, or create one.
3. On the permission set overview page, click **Custom Permissions**.
4. Click **Edit**.
5. To enable custom permissions, select them from the Available Custom Permissions list and then click **Add**. To remove custom permissions from the permission set, select them from the Enabled Custom Permissions list and then click **Remove**.
6. Click **Save**.

SEE ALSO:

[Custom Permissions](#)

Manage Permission Set Assignments

You can assign permission sets to a single user from the user detail page or assign multiple users to a permission set from any permission set page.

- [Assign Permission Sets to a Single User](#)
- [Assign a Permission Set to Multiple Users](#)
- [Remove User Assignments from a Permission Set](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

In Group and Professional Edition organizations, you can't create or edit custom permissions, but you can install them as part of a managed package.

USER PERMISSIONS

To enable custom permissions in permission sets:

- "Manage Profiles and Permission Sets"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Permission Set Assigned Users Page

From the Assigned Users page, you can view all users who are assigned to a permission set, assign additional users, and remove user assignments.

To view all users that are assigned to a permission set, from any permission set page, click **Manage Assignments**. From the Assigned Users page, you can:

- [Assign users to the permission set](#)
- [Remove user assignments from the permission set](#)
- [Edit a user](#)
- View a user's detail page by clicking the name, alias, or username
- View a profile by clicking the profile name

SEE ALSO:

[Assign Permission Sets to a Single User](#)

Assign Permission Sets to a Single User

You can assign permission sets or remove permission set assignments for a single user from the user detail page.

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
2. Select a user.
3. In the Permission Set Assignments related list, click **Edit Assignments**.
4. To assign a permission set, select it from the Available Permission Sets box and click **Add**. To remove a permission set assignment, select it from the Enabled Permission Sets box and click **Remove**.

Note:

- The Permission Set Assignments page shows permission sets with no associated license and permission sets that match the user's license. For example, if a user's license is Chatter Only, you can assign permission sets with the Chatter Only license and permission sets with no associated license to that user.

If you assign a permission set with no associated user license, all of its enabled settings and permissions must be allowed by the user's license, or the assignment will fail.

- Some permissions require users to have *permission set licenses* before the user can have those permissions. For example, if you add the "Use Identity Connect" permission to the "Identity" permission set, only users with the Identity Connect permission set license can be assigned the "Identity" permission set.

Remove User Assignments from a Permission Set

From any permission set page, you can remove the permission set assignment from one or more users.

1. From Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**.
2. Select a permission set.
3. In the permission set toolbar, click **Manage Assignments**.
4. Select the users to remove from this permission set.
You can remove up to 1000 users at a time.
5. Click **Remove Assignments**.
This button is only available when one or more users are selected.
6. To return to a list of all users assigned to the permission set, click **Done**.

SEE ALSO:

[Assign a Permission Set to Multiple Users](#)

Revoking Permissions and Access

You can use profiles and permission sets to grant access, but not to deny access. Any permission granted from either a profile or permission set is honored. For example, if "Transfer Record" isn't enabled in Jane Smith's profile, but is enabled in two of her permission sets, she can transfer records regardless of whether she owns them. To revoke a permission, you must remove all instances of the permission from the user. You can do this with the following actions—each has possible consequences.

Action	Consequence
Disable a permission or remove an access setting in the profile and any permission sets that are assigned to the user.	The permission or access setting is disabled for all other users assigned to the profile or permission sets.
If a permission or access setting is enabled in the user's profile, assign a different profile to the user.	The user may lose other permissions or access settings associated with the profile or permission sets.
AND If the permission or access setting is enabled in any permission sets that are assigned to the user, remove the permission set assignments from the user.

To resolve the consequence in either case, consider all possible options. For example, you can clone the assigned profile or any assigned permission sets where the permission or access setting is enabled, disable the permission or access setting, and assign the cloned profile or permission sets to the user. Another option is to create a base profile with the least number of permissions and settings that represents the largest number of users possible, then create permission sets that layer additional access.

Field Access

Field Accessibility

Several factors help control whether users can view and edit specific fields in Salesforce.

- **Page layouts**—You can set whether fields are visible, required, editable, or read only.
- **Field-level security**—You can further restrict users' access to fields by setting whether those fields are visible, editable, or read only. These settings override any field properties set in the page layout if the field-level security setting is more restrictive.
 - 📌 **Note:** Field-level security doesn't prevent searching on the values in a field. When search terms match on field values protected by field-level security, the associated records are returned in the search results without the protected fields and their values.
- **Permissions**—Some user permissions override both page layouts and field-level security settings. For example, users with the "Edit Read Only Fields" permission can always edit read-only fields regardless of any other settings.
- **Universally required fields**—A custom field can be made universally required, which overrides any less-restrictive settings on page layouts or field-level security.

After setting these items, you can confirm users' access to specific fields using the [field accessibility grid](#).

Page layouts are not available in **Database.com**

Checking Field Accessibility for a Particular Field

1. Navigate to the fields area of the appropriate object:
 - For Knowledge validation status picklists, from Setup, enter *Validation Statuses* in the **Quick Find** box, then select **Validation Statuses**.
2. Select a field and click **View Field Accessibility**.
3. Confirm that the field access is correct for different profiles and record types.
4. Hover your mouse over any field access setting to see whether the field is required, editable, hidden, or read only based on the page layout or field-level security.
5. Click any field access setting to change the field's accessibility.

For advanced options to check field accessibility by a specific profile, record type, or field, from Setup, enter *Field Accessibility* in the **Quick Find** box, then select **Field Accessibility**. From this page, you need to choose a particular tab to view and then select whether you want to check access by profiles, record types, or fields.

 **Note:** In this user interface, you can't check access for permission sets.

Field-level security doesn't prevent searching on the values in a field. To set up your organization to prevent users from searching and retrieving records that match a value in a field hidden by field-level security, contact Customer Support.

Modifying Field Access Settings

From the field accessibility grid, you can click any field access setting to change the field's accessibility in the page layout or in field-level security. The Access Settings page then lets you modify the field access settings.

- In the Field-Level Security section of the page, specify the field's access level for the profile.

Access Level	Enabled Settings
Users can read and edit the field.	Visible
Users can read but not edit the field.	Visible and Read-Only
Users can't read or edit the field.	None

We recommend that you use field-level security to control users' access to fields rather than creating multiple page layouts to control field access.

- In the Page Layout section of the page, you can:
 - Select the `Remove or change editability` radio button and then change the field access properties for the page layout. These changes will affect all profile and record type combinations that currently use this page layout.
 - Alternatively, you can select the `Choose a different page layout` radio button to assign a different page layout to the profile and record type combination.

- Imported data

The fields that users see on detail and edit pages are a combination of page layouts and field-level security settings. The most restrictive field access settings of the two always apply. For example, if a field is required in the page layout and read-only in the field-level security settings, the field-level security overrides the page layout and the field will be read-only for the user.

 **Important:** Field-level security doesn't prevent searching on the values in a field. When search terms match on field values protected by field-level security, the associated records are returned in the search results without the protected fields and their values.

You can define field-level security in any of the following ways:

- [For multiple fields on a single permission set or profile](#)
- [For a single field on all profiles](#)

After setting field-level security for users, you can:

- Create page layouts to organize the fields on detail and edit pages.

 **Tip:** Use field-level security as the means to restrict users' access to fields; then use page layouts primarily to organize detail and edit pages within tabs. This reduces the number of page layouts for you to maintain.

- Verify users' access to fields by checking the field accessibility.
- Customize search layouts to set the fields that display in search results, in lookup dialog search results, and in the key lists on tab home pages.

 **Note:** Roll-up summary and formula fields are always read-only on detail pages and not available on edit pages. They may also be visible to users even though they reference fields that your users cannot see. Universally required fields always display on edit pages regardless of field-level security.

The relationship group wizard allows you to create and edit relationship groups regardless of field-level security.

Set Field Permissions in Permission Sets and Profiles

Field permissions specify the access level for each field in an object.

- From Setup, either:
 - Enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**, or
 - Enter *Profiles* in the **Quick Find** box, then select **Profiles**
- Select a permission set or profile.
- Depending on which interface you're using, do one of the following:
 - Permission sets or enhanced profile user interface—In the **Find Settings...** box, enter the name of the object you want and select it from the list. Click **Edit**, then scroll to the Field Permissions section.
 - Original profile user interface—In the Field-Level Security section, click **View** next to the object you want to modify, and then click **Edit**.
- Specify the field's access level.
- Click **Save**.

Setting Field-Level Security for a Single Field on All Profiles

- From the management settings for the field's object, go to the fields area.
- Select the field you want to modify.
- Click **View Field Accessibility**.
- Specify the field's access level.
- Click **Save**.

Permissions Reference

User Permissions

User permissions specify what tasks users can perform and what features users can access. For example, users with the “View Setup and Configuration” permission can view Setup pages, and users with the “API Enabled” permission can access any Salesforce API. You can enable user permissions in permission sets and custom profiles. In permission sets and the enhanced profile user interface, these permissions—as well as their descriptions—are listed in the App Permissions or System Permissions pages. In the original profile user interface, user permissions are listed under Administrative Permissions and General User Permissions.

To view permissions and their descriptions, from Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**, then select or create a permission set. Then from the Permission Set Overview page, click **App Permissions** or **System Permissions**.

SEE ALSO:

- [Profiles](#)
- [Permission Sets](#)
- [Standard Profiles](#)

Object Permissions

Object permissions specify the base-level access users have to create, read, edit, and delete records for each object. You can manage object permissions in permission sets and profiles.

Object permissions either respect or override sharing rules and settings. The following permissions specify the access that users have to objects.

Permission	Description	Respects or Overrides Sharing?
Read	Users can only view records of this type.	Respects sharing
Create	Users can read and create records.	Respects sharing
Edit	Users can read and update records.	Respects sharing
Delete	Users can read, edit, and delete records.	Respects sharing
View All	Users can view all records associated with this object, regardless of sharing settings.	Overrides sharing

EDITIONS

Available in: Salesforce Classic

The user permissions available vary according to which edition you have.

EDITIONS

Permission	Description	Respects or Overrides Sharing?
Modify All	<p>Users can read, edit, delete, transfer, and approve all records associated with this object, regardless of sharing settings.</p> <p> Note: “Modify All” on documents allows access to all shared and public folders, but not the ability to edit folder properties or create new folders. To edit folder properties and create new folders, users must have the “Manage Public Documents” permission.</p>	Overrides sharing

SEE ALSO:

[“View All” and “Modify All” Permissions Overview](#)
[Comparing Security Models](#)
[Field Permissions](#)

“View All” and “Modify All” Permissions Overview

The “View All” and “Modify All” permissions ignore sharing rules and settings, allowing administrators to quickly grant access to records associated with a given object across the organization. “View All” and “Modify All” may be preferable alternatives to the “View All Data” and “Modify All Data” permissions. Be aware of the following distinctions between the permission types.

Permissions	Used for	Users who Need them
View All Modify All	Delegation of object permissions	Delegated administrators who need to manage records for specific objects
View All Data Modify All Data	Managing all data in an organization; for example, data cleansing, deduplication, mass deletion, mass transferring, and managing record approvals	Administrators of an entire organization
View All Users	Viewing all users in the organization. This permission grants you Read access to all users, so that you can see their user record details, see them in searches, list views, and so on.	Users who need to view all users in the organization, especially if the organization-wide default for the user object is Private. Administrators with the “Manage Users” permission are automatically granted the “View All Users” permission.

EDITIONS

Available in: Salesforce Classic

Available in all editions

“View All” and “Modify All” are not available for ideas, price books, article types, and products.

“View All” and “Modify All” allow for delegation of object permissions only. To delegate user administration and custom object administration duties, [define delegated administrators](#).

“View All Users” is available if your organization has User Sharing, which controls user visibility in the organization. To learn about User Sharing, see [User Sharing Overview](#).

SEE ALSO:

[Object Permissions](#)

Comparing Security Models

Salesforce user security is an intersection of [sharing](#), and [user](#) and [object](#) permissions. In some cases, such as in end-user record level access, it is advantageous to use sharing to provide access to records. In other cases, such as when delegating record administration tasks like transferring records, cleansing data, deduplicating records, mass deleting records, and delegating workflow approval processes, it is advantageous to override sharing and use permissions to provide access to records.

The “Read,” “Create,” “Edit,” and “Delete” permissions respect sharing settings, which control access to data at the record level. The “View All” and “Modify All” permissions override sharing settings for specific objects. Additionally, the “View All Data” and “Modify All Data” permissions override sharing settings for *all* objects.

The following table describes the differences between the security models.

	Permissions that Respect Sharing	Permissions that Override Sharing
Target audience	End-users	Delegated data administrators
Where managed	“Read,” “Create,” “Edit,” and “Delete” object permissions; Sharing settings	“View All” and “Modify All”
Record access levels	Private, Read-Only, Read/Write, Read/Write/Transfer/Full Access	“View All” and “Modify All”
Ability to transfer	Respects sharing settings, which vary by object	Available on all objects with “Modify All”
Ability to approve records, or edit and unlock records in an approval process	None	Available on all objects with “Modify All”
Ability to report on all records	Available with a sharing rule that states: the records owned by the public group “Entire Organization” are shared with a specified group, with Read-Only access	Available on all objects with “View All”
Object support	Available on all objects except products, documents, solutions, ideas, notes, and attachments	Available on most objects via object permissions  Note: “View All” and “Modify All” are not

EDITIONS

[Object Permissions](#)

Sharing

Overview of Sharing Settings

Note:  [Who Sees What: Overview](#)

Watch how you can control who sees what data in your organization.

In Salesforce, you can control access to data at many different levels. For example, you can control the access your users have to objects with object permissions. Within objects, you can control the access users have to fields using field-level security. To control access to data at the record level, use sharing settings.

Organization-Wide Defaults

Your organization-wide default sharing settings give you a baseline level of access for each object and enable you to extend that level of access using hierarchies or sharing rules. For example, you can set the organization-wide default for leads to Private if you only want users to view and edit the leads they own. Then, you can create lead sharing rules to extend access of leads to particular users or groups.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Teams are not available in **Database.com**

Sharing Rules

Sharing rules represent the exceptions to your organization-wide default settings. If you have organization-wide sharing defaults of Public Read Only or Private, you can define rules that give additional users access to records they do not own. You can create sharing rules based on record owner or field values in the record.

Tip: Sometimes it's impossible to define a consistent group of users who need access to a particular set of records. In those situations, record owners can use manual sharing to give read and edit permissions to users who would not have access to the record any other way. Although manual sharing isn't automated like organization-wide sharing settings, role hierarchies, or sharing rules, it gives record owners the flexibility to share particular records with users that need to see them.

Apex Managed Sharing

Apex managed sharing allows developers to programmatically share custom objects. When you use Apex managed sharing to share a custom object, only users with the "Modify All Data" permission can add or change the sharing on the custom object's record, and the sharing access is maintained across record owner changes.

Other Methods for Allowing Access to Records

In addition to sharing settings, there are a few other ways to allow multiple users access to given records:

Map category groups to roles

Control access to data categories by mapping them to user roles.

Queues

Queues help your teams manage leads, orders, cases, service contracts, and custom objects. Once records are placed in a queue manually or through an automatic case or lead assignment rule, records remain there until they're assigned to a user or taken by one of the queue members. Any queue member or users above them in the role hierarchy can take ownership of records in a queue. Use queues to route lead, order, case, and custom object records to a group.

Teams

For accounts, opportunities, and cases, record owners can use teams to allow other users access to their records. A *team* is a group of users that work together on an account, sales opportunity, or case. Record owners can build a team for each record that they own. The record owner adds team members and specifies the level of access each team member has to the record, so that some team members can have read-only access and others can have read/write access. The record owner can also specify a role for each team member, such as “Executive Sponsor.” In account teams, team members also have access to any contacts, opportunities, and cases associated with an account.

 **Note:** A team member may have a higher level of access to a record for other reasons, such as a role or sharing rule. In this case, the team member has the highest access level granted, regardless of the access level specified in the team.

SEE ALSO:

[About Organization-Wide Sharing Defaults](#)

[Sharing Rules Overview](#)

[Roles](#)

[Sharing Considerations](#)

About Organization-Wide Sharing Defaults

Administrators can use organization-wide sharing settings to define the default sharing settings for an organization. Organization-wide sharing settings specify the default level of access to records and can be set separately for accounts (including contracts), activities, assets, contacts, campaigns, cases, leads, opportunities, calendars, price books, orders, and custom objects.

For most objects, organization-wide sharing settings can be set to Private, Public Read Only, or Public Read/Write. In environments where the organization-wide sharing setting for an object is Private or Public Read Only, an administrator can grant users additional access to records by setting up a role hierarchy or defining sharing rules. However, sharing rules can only be used to grant additional access—they cannot be used to restrict access to records beyond what was originally specified with the organization-wide sharing defaults.

 **Important:** If your organization uses a Customer Portal, before you enable contacts to access the portal, set the organization-wide sharing defaults on accounts, contacts, contracts, assets, and cases to Private. This ensures that by default your customers can view only their own data. You can still grant your Salesforce users Public Read/Write access by creating sharing rules in which all internal users share with all internal users.

By default, Salesforce uses hierarchies, like the role or territory hierarchy, to automatically grant access of records to users above the record owner in the hierarchy.

Setting an object to Private makes those records visible only to record owners and those above them in the role hierarchy. Use the **Grant Access Using Hierarchies** checkbox to disable access to records to users above the record owner in the hierarchy for custom objects in Professional, Enterprise, Unlimited, Performance, and Developer Edition. If you deselect this checkbox for a custom object, only the record owner and users granted access by the organization-wide defaults receive access to the records.

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions.

Customer Portal is not available in **Database.com**

Set Your Organization-Wide Sharing Defaults

Organization-wide sharing defaults set the baseline access for your records. You can set the defaults separately for different objects.

Note:  [Who Sees What: Organization-Wide Defaults](#)

Watch how you can restrict access to records owned by other users.

1. From Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**.
2. Click **Edit** in the Organization-Wide Defaults area.
3. For each object, select the default access you want to use. If you have external organization-wide defaults, see [External Organization-Wide Defaults Overview](#).
4. To disable automatic access using your hierarchies, deselect **Grant Access Using Hierarchies** for any custom object that does not have a default access of Controlled by Parent.

Note: If **Grant Access Using Hierarchies** is deselected, users that are higher in the role or territory hierarchy don't receive automatic access. However, some users—such as those with the “View All” and “Modify All” object permissions and the “View All Data” and “Modify All Data” system permissions—can still access records they don't own.

When you update organization-wide defaults, sharing recalculation applies the access changes to your records. If you have a lot of data, the update can take longer.

- If you are increasing the default access, such as from Public Read Only to Public Read/Write, your changes take effect immediately. All users get access based on the updated default access. Sharing recalculation is then run asynchronously to ensure that all redundant access from manual or sharing rules are removed.

Note: When the default access for contacts is Controlled by Parent and you increase the default access for accounts, opportunities, or cases, the changes take effect after recalculation is run.

- If you are decreasing the default access, such as from Public Read/Write to Public Read Only, your changes take effect after recalculation is run.

You'll receive a notification email when the recalculation completes. Refresh the Sharing Settings page to see your changes. To view the update status, from Setup, enter *View Setup Audit Trail* in the **Quick Find** box, then select **View Setup Audit Trail**.

Limitations

The organization-wide sharing default setting can't be changed for some objects:

- Service contracts are always Private.
- User provisioning requests are always Private.
- The ability to view or edit a document, report, or dashboard is based on a user's access to the folder in which it's stored.
- Users can only view the forecasts of other users who are placed below them in the role hierarchy, unless forecast sharing is enabled.
- When a custom object is on the detail side of a master-detail relationship with a standard object, its organization-wide default is set to Controlled by Parent and it is not editable.
- The organization-wide default settings can't be changed from private to public for a custom object if Apex code uses the sharing entries associated with that object. For example, if Apex code retrieves the users and groups who have sharing access on a custom

[About Organization-Wide Sharing Defaults](#)

Sharing Default Access Settings

You can use organization-wide defaults to set the default level of record access for the following objects.

- Accounts and their associated contracts
- Activities
- Calendars
- Campaigns
- Cases
- Contacts
- Custom objects
- Leads
- Opportunities
- Orders
- Price books
- Service contracts
- Users

You can assign the following access levels to accounts, campaigns, cases, contacts, contracts, leads, opportunities, orders, users, and custom objects.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Only Custom Objects are available in **Database.com**

USER PERMISSIONS

To set default sharing access:

- "Manage Sharing"

Field	Description
Controlled by Parent	<p>A user can perform an action (such as view, edit, or delete) on a contact or order based on whether he or she can perform that same action on the record associated with it.</p> <p>For example, if a contact is associated with the Acme account, then a user can only edit that contact if he or she can also edit the Acme account.</p>
Private	<p>Only the record owner, and users above that role in the hierarchy, can view, edit, and report on those records.</p> <p>For example, if Tom is the owner of an account, and he is assigned to the role of Western Sales, reporting to Carol (who is in the role of VP of Western Region Sales), then Carol can also view, edit, and report on Tom's accounts.</p>

Field	Description
Public Read Only	<p>All users can view and report on records but not edit them. Only the owner, and users above that role in the hierarchy, can edit those records.</p> <p>For example, Sara is the owner of ABC Corp. Sara is also in the role Western Sales, reporting to Carol, who is in the role of VP of Western Region Sales. Sara and Carol have full read/write access to ABC Corp. Tom (another Western Sales Rep) can also view and report on ABC Corp, but cannot edit it.</p>
Public Read/Write	<p>All users can view, edit, and report on all records.</p> <p>For example, if Tom is the owner of Trident Inc., all other users can view, edit, and report on the Trident account. However, only Tom can alter the sharing settings or delete the Trident account.</p>
Public Read/Write/Transfer	<p>All users can view, edit, transfer, and report on all records. Only available for cases or leads.</p> <p>For example, if Alice is the owner of ACME case number 100, all other users can view, edit, transfer ownership, and report on that case. But only Alice can delete or change the sharing on case 100.</p>
Public Full Access	<p>All users can view, edit, transfer, delete, and report on all records. Only available for campaigns.</p> <p>For example, if Ben is the owner of a campaign, all other users can view, edit, transfer, or delete that campaign.</p>

 **Note:** To use cases effectively, set the organization-wide default for Account, Contact, Contract, and Asset to Public Read/Write.

You can assign the following access levels to personal calendars.

Field	Description
Hide Details	Others can see whether the user is available at given times, but can not see any other information about the nature of events in the user's calendar.
Hide Details and Add Events	In addition to the sharing levels set by Hide Details, users can insert events in other users' calendars.
Show Details	Users can see detailed information about events in other users' calendars.
Show Details and Add Events	In addition to the sharing levels set by Show Details, users can insert events in other users' calendars.
Full Access	Users can see detailed information about events in other users' calendars, insert events in other users' calendars, and edit existing events in other users' calendars.

 **Note:** Regardless of the organization-wide defaults that have been set for calendars, all users can invite all other users to events.

You can assign the following access levels to price books.

Field	Description
Use	All users can view price books and add them to opportunities. Users can add any product within that price book to an opportunity.
View Only	All users can view and report on price books but only users with the "Edit" permission on opportunities or users that have been manually granted use access to the price book can add them to opportunities.
No Access	Users cannot see price books or add them to opportunities. Use this access level in your organization-wide default if you want only selected users to access selected price books. Then, manually share the appropriate price books with the appropriate users.

You can assign the following access levels to activities.

Field	Description
Private	Only the activity owner, and users above the activity owner in the role hierarchy, can edit and delete the activity; users with read access to the record to which the activity is associated can view and report on the activity.
Controlled by Parent	A user can perform an action (such as view, edit, transfer, and delete) on an activity based on whether he or she can perform that same action on the records associated with the activity. For example, if a task is associated with the Acme account and the John Smith contact, then a user can only edit that task if he or she can also edit the Acme account and the John Smith record.

You can assign the following access levels to users.

Field	Description
Private	All users have read access to their own user record and those below them in the role hierarchy.
Public Read Only	All users have read access on one another. You can see all users' detail pages. You can also see all users in lookups, list views, ownership changes, user operations, and search.

Default Organization-Wide Sharing Settings

The default organization-wide sharing settings are:

Object	Default Access
Account	Public Read/Write
Activity	Private
Asset	Controlled by Parent
Calendar	Hide Details and Add Events
Campaign	Public Full Access
Case	Public Read/Write/Transfer
Contact	Controlled by Parent
Contract	Public Read/Write
Custom Object	Public Read/Write
Lead	Public Read/Write/Transfer
Opportunity	Public Read Only
Price Book	Use
Service Contract	Private
Users	Public Read Only Private for external users

SEE ALSO:

- [About Organization-Wide Sharing Defaults](#)

External Organization-Wide Defaults Overview

External organization-wide defaults provide separate organization-wide defaults for internal and external users. They simplify your sharing rules configuration and improve recalculation performance. Additionally, administrators can easily see which information is being shared to portals and other external users.

The following objects support external organization-wide defaults.

- Accounts and their associated contracts and assets
- Cases
- Contacts
- Opportunities
- Custom Objects
- Users

EDITIONS

Accounts, cases, contacts, leads, opportunities, and custom objects available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions.

Except for Custom Objects, all object types are not available in **Database.com**

EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

External users include:

- Authenticated website users
- Chatter external users
- Community users
- Customer Portal users
- Guest users
- High-volume portal users
- Partner Portal users
- Service Cloud Portal users

 **Note:** Chatter external users have access to the User object only.

Previously, if your organization wanted Public Read Only or Public Read/Write access for internal users but Private for external users, you would have to set the default access to Private and create a sharing rule to share records with all internal users.

With separate organization-wide defaults, you can achieve similar behavior by setting the default internal access to Public Read Only or Public Read/Write and the default external access to Private. These settings also speed up performance for reports, list views, searches, and API queries.

SEE ALSO:

[About Organization-Wide Sharing Defaults](#)

[Setting the External Organization-Wide Defaults](#)

[Sharing Default Access Settings](#)

Setting the External Organization-Wide Defaults

External Organization-Wide Defaults enable you to set a different default access level for external users.

Before you set the external organization-wide defaults, make sure that it is enabled. From Setup, enter *Sharing Settings* in the Quick Find box, then select **Sharing Settings**, and click the **Enable External Sharing Model** button.

When you first enable external organization-wide defaults, the default internal access and default external access are set to the original default access level. For example, if your organization-wide default for contacts is Private, the default internal access and default external access will be Private as well.

To set the external organization-wide default for an object:

1. From Setup, enter *Sharing Settings* in the Quick Find box, then select **Sharing Settings**
2. Click **Edit** in the Organization-Wide Defaults area.
3. For each object, select the default access you want to use.

You can assign the following access levels.

EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To set default sharing access:

- "Manage Sharing"

Access Level	Description
Controlled by Parent	Users can perform actions (such as view, edit, delete) on a record on the detail side of a master-detail relationship if they can perform the same action on all associated master records.  Note: For contacts, <code>Controlled by Parent</code> must be set for both the default internal and external access.
Private	Only users who are granted access by ownership, permissions, role hierarchy, manual sharing, or sharing rules can access the records.
Public Read Only	All users can view all records for the object.
Public Read/Write	All users can view and edit all records for the object.

 **Note:** The default external access level must be more restrictive or equal to the default internal access level. For example, you can have a custom object with default external access set to Private and default internal access set to Public Read Only.

4. Click **Save**.

SEE ALSO:

[External Organization-Wide Defaults Overview](#)

Disabling External Organization-Wide Defaults

Disabling External Organization-Wide Defaults results in one organization-wide default for each object.

Before disabling this feature, set **Default External Access** and **Default Internal Access** to the same access level for each object.

To disable the external organization-wide defaults:

1. From Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**.
2. Click **Disable External Sharing Model** in the Organization-Wide Defaults area.

After disabling the external organization-wide defaults, you'll see the **Default Access** setting instead of the **Default External Access** and **Default Internal Access** settings in the organization-wide defaults area. If you have User Sharing, the **Default External Access** settings for the account, contact, case, and opportunity objects remain visible but they are disabled.

Controlling Access Using Hierarchies

Determine whether users have access to records they don't own, including records to which they don't have sharing access, but someone below them in the hierarchy does.

Beyond setting the organization-wide sharing defaults for each object, you can specify whether users have access to the data owned by or shared with their subordinates in the hierarchy. For example, the role hierarchy automatically grants record access to users above the record owner in the hierarchy. By default, the `Grant Access Using Hierarchies` option is enabled for all objects, and it can only be changed for custom objects.

To control sharing access using hierarchies for any custom object, from Setup, enter *Sharing Settings* in the `Quick Find` box, then select **Sharing Settings**. Next, click **Edit** in the Organization Wide Defaults section. Deselect `Grant Access Using Hierarchies` if you want to prevent users from gaining automatic access to data owned by or shared with their subordinates in the hierarchies.

Implementation Notes

- Regardless of your organization's sharing settings, users can gain access to records they do not own through other means such as user permissions like "View All Data," sharing rules, or manual sharing of individual records.
- The `Grant Access Using Hierarchies` option is always selected on standard objects and is not editable.
- If you disable the `Grant Access Using Hierarchies` option, sharing with a role or territory and subordinates only shares with the users directly associated with the role or territory selected. Users in roles or territories above them in the hierarchies will not gain access.
- If your organization disables the `Grant Access Using Hierarchies` option, activities associated with a custom object are still visible to users above the activity's assignee in the role hierarchy.
- If a master-detail relationship is broken by deleting the relationship, the former detail custom object's default setting is automatically reverted to Public Read/Write and `Grant Access Using Hierarchies` is selected by default.
- The `Grant Access Using Hierarchies` option affects which users gain access to data when something is shared with public groups, personal groups, queues, roles, or territories. For example, the **View All Users** option displays group members and people above them in the hierarchies when a record is shared with them using a sharing rule or manual sharing and the `Grant Access Using Hierarchies` option is selected. When the `Grant Access Using Hierarchies` option is not selected, some users in these groups no longer have access. The following list covers the access reasons that depend on the `Grant Access Using Hierarchies` option.

These reasons always gain access:

- Group Member
- Queue Member
- Role Member
- Member of Subordinate Role
- Territory Member
- Member of Subordinate Territory

These reasons only gain access when using hierarchies:

- Manager of Group Member
- Manager of Queue Member

Territories are not available in **Database.com**

USER PERMISSIONS

To set default sharing access and change the `Grant Access Using Hierarchies` option:

- "Manage Sharing"

Manager of Role

Manager of Territory

User Role Manager of Territory

Best Practices

- When you deselect `Grant Access Using Hierarchies`, notify users of the changes in report results that they can expect due to losing visibility of their subordinates' data. For example, selecting `My team's...` in the `View` drop-down list returns records owned by the user; it will not include records owned by their subordinates. To be included in this type of report view, records from subordinates must be explicitly shared with that user by some other means such as a sharing rule or a manual share. So, if no records are shared with you manually, the `My...` and `My team's...` options in the `View` drop-down list return the same results. However, choosing the `Activities with...` any custom object report type when creating a custom report returns activities assigned to you as well as your subordinates in the role hierarchy.

SEE ALSO:

[Roles](#)

Roles

Salesforce offers a user role hierarchy that you can use together with sharing settings to determine the levels of access users have to your organization's data. Roles within the hierarchy affect access on key components like records and reports.

Watch how you can open up access to records using the role hierarchy if your organization-wide defaults are more restrictive than Public Read/Write.

[Who Sees What: Record Access via the Role Hierarchy](#)

Users at any given role level can view, edit, and report on all data owned by or shared with users below them in the role hierarchy. The exception is when your organization's sharing model for an object specifies otherwise. Specifically, in the `Organization-Wide Defaults` related list, you can disable the **Grant Access Using Hierarchies** option for a custom object. When disabled, only the record owner and users granted access by the organization-wide defaults receive access to the object's records.

Roles also determine user access to cases, contacts, and opportunities, regardless of who owns those records. The access level is specified on the `Role Edit` page. For example, you can set the contact access so that users in a role can edit all contacts associated with accounts they own, regardless of who owns the contacts. Similarly, you can set the opportunity access so that users in a role can edit all opportunities associated with accounts they own, regardless of who owns the opportunities.

Guidelines for Success with Roles

Understand key rule behaviors and apply best practices for success with roles.

For best practices on designing record access in a large organization, see [Designing Record Access for Enterprise Scale](#).

- To simplify user management in organizations with large numbers of users, enable delegated administrators to manage users in specified roles and all subordinate roles.
- You can create up to 500 roles for your organization.
- Every user must be assigned to a role, or their data will not display in opportunity reports, forecast roll-ups, and other displays based on roles.
- All users that require visibility to the entire organization should belong to the highest level in the hierarchy.
- It is not necessary to create individual roles for each title at your company. Instead, define a hierarchy of roles to control access of information entered by users in lower level roles.
- When you change a user's role, the sharing rules for the new role are applied.
- If you are a Salesforce Knowledge user, you can modify category visibility settings on the role detail page.
- To avoid performance issues, no single user should own more than 10,000 records of an object. Users who need to own more than that number of objects should either not be assigned a role or placed in a separate role at the top of the hierarchy. It's also important to keep that user out of public groups that might be used as the source for sharing rules.
- When an account owner is not assigned a role, the sharing access for related contacts is Read/Write, provided the organization-wide default for contacts is not Controlled by Parent. Sharing access on related opportunities and cases is No Access.
- If your organization uses Territory Management, forecasts are based on the territory hierarchy rather than the role hierarchy.

Assign Users to Roles

Quickly assign users to a particular role.

1. From Setup, enter *Roles* in the *Quick Find* box, then select **Roles**.
2. Click **Assign** next to the name of the desired role.
 -  **Note:** You can also access this page by clicking **Assign Users to Role** from the Users in Role related list. Large organizations should consider assigning roles via the [SOAP API](#) for efficiency.
3. Make a selection from the drop-down list to show the available users.
4. Select a user on the left, and click **Add** to assign the user to this role.
 -  **Note:** Removing a user from the Selected Users list deletes the role assignment for that user.

Role Fields

The fields that comprise a role entry have specific purposes. Refer to this table for descriptions of each field and how it functions in a role.

The visibility of fields depends on your organization's permissions and sharing settings.

Field	Description
Case Access	Specifies whether users can access other users' cases that are associated with accounts the users own. This field is not visible if your organization's sharing model for cases is Public Read/Write.
Contact Access	Specifies whether users can access other users' contacts that are associated with accounts the users own. This field is not visible if your organization's sharing model for contacts is Public Read/Write or Controlled by Parent.
Label	The name used to refer to the role or title of position in any user interface pages, for example, Western Sales VP.
Modified By	The name of the user who last modified this role's details, and the date and time that the role was modified.
Opportunity Access	Specifies whether users can access other users' opportunities that are associated with accounts the users own. This field is not visible if your organization's sharing model for opportunities is Public Read/Write.
Partner Role	Indicates whether this role is associated with a partner account. This field is available only when a Customer Portal or partner portal is enabled for the organization. If this checkbox is selected, you cannot edit the role. The default number of roles in portal accounts is three. You can reduce the number of roles or add roles to a maximum of three.
Role Name	The unique name used by the API and managed packages.
Role Name as displayed on reports	A role name that appears in reports. When editing a role, if the Role Name is long, you can enter an abbreviated name in this field.
Sharing Groups	These groups are automatically created and maintained. The Role group contains all users in this role plus all users in roles above this role.

Field	Description
	The Role and Subordinates group contains all users in this role plus all users in roles above and below this role in the hierarchy. The Role and Internal Subordinates group (available if Customer Portals or partner portals are enabled for your organization) contains all users in this role. It also contains all users in roles above and below this role, excluding Customer Portal and partner portal users.
This role reports to	The role above this role in the hierarchy.

SEE ALSO:

[Roles](#)

What Is a Group?

A group consists of a set of users. A group can contain individual users, other groups, or the users in a particular role or territory. It can also contain the users in a particular role or territory plus all the users below that role or territory in the hierarchy.

There are two types of groups:

- **Public groups**—Administrators and delegated administrators can create public groups. Everyone in the organization can use public groups. For example, an administrator can create a group for an employee carpool program. All employees can then use this group to share records about the program.
- **Personal groups**—Each user can create groups for their personal use. For example, users might need to ensure that certain records are always shared within a specified workgroup.

You can use groups in the following ways:

- To set up default sharing access via a sharing rule
- To share your records with other users
- To specify that you want to synchronize contacts owned by others users
- To add multiple users to a Salesforce CRM Content library
- To assign users to specific actions in Salesforce Knowledge

Public Group Considerations

For organizations with a large number of users, consider these tips when creating public groups to optimize performance.

- Create a group when at least a few users need the same access.
- Create a group for members who don't need to frequently move in or out of the groups.
- Avoid creating groups within groups that result in more than five levels of nesting.
- Enable automatic access to records using role hierarchies for public groups by selecting **Grant Access Using Hierarchies** when creating the group. However, don't use this option if you're creating a public group with All Internal Users as members.

SEE ALSO:

[What Is a Group?](#)

Group Member Types

When you create or edit a group, you can select the following types of members from the `Search` drop-down list. Depending on your organization settings, some types may not be available.

Member Type	Description
Customer Portal Users	All of your Customer Portal users. This is only available when a Customer Portal is enabled for your organization.
Partner Users	All of your partner users. This is only available when a partner portal is enabled for your organization.
Personal Groups	All of your own groups. This is only available when creating other personal groups.
Portal Roles	All roles defined for your organization's partner portal or Customer Portal. This includes all users in the specified portal role, except high-volume portal users.  Note: A portal role name includes the name of the account that it's associated with, except for person accounts, which include the user Alias .
Portal Roles and Subordinates	All roles defined for your organization's partner portal or Customer Portal. This includes all of the users in the specified portal role plus all of the users below that role in the portal role hierarchy, except for high-volume portal users.  Note: A portal role name includes the name of the account that it's associated

Create and Edit Groups

Only administrators and delegated administrators can create and edit public groups, but anyone can create and edit their own personal groups.

To create or edit a group:

1. Click the control that matches the type of group:
 - For personal groups, go to your personal settings and click **My Personal Information** or **Personal**—whichever one appears. Then click **My Groups**. The Personal Groups related list is also available on the user detail page.
 - For public groups, from Setup, enter *Public Groups* in the *Quick Find* box, then select **Public Groups**.
2. Click **New**, or click **Edit** next to the group you want to edit.
3. Enter the following:

Field	Description
Label	The name used to refer to the group in any user interface pages.
Group Name (public groups only)	The unique name used by the API and managed packages.
Grant Access Using Hierarchies (public groups only)	<p>Select Grant Access Using Hierarchies to allow automatic access to records using your role hierarchies. When selected, any records shared with users in this group are also shared with users higher in the hierarchy.</p> <p>Deselect Grant Access Using Hierarchies if you're creating a public group with All Internal Users as members, which optimizes performance for sharing records with groups.</p> <p> Note: If Grant Access Using Hierarchies is deselected, users that are higher in the role hierarchy don't receive automatic access. However, some users—such as those with the "View All" and "Modify All" object permissions and the "View All Data" and "Modify All Data" system permissions—can still access records they don't own.</p>
Search	<p>From the <i>Search</i> drop-down list, select the type of member to add. If you don't see the member you want to add, enter keywords in the search box and click Find.</p> <p> Note: For account owners to see child records owned by high-volume portal users, they must be members of any portal share groups with access to the portal users' data.</p>

Sharing Records with Manager Groups

Share records up or down the management chain using sharing rules or manual sharing.

The role hierarchy controls the level of visibility that users have into your organization's data. With Spring '15, you can use manager groups to share records with your management chain, instead of all managers in the same role based on the role hierarchy. Manager groups can be used wherever other groups are used, such as in a manual share or sharing rule. But they cannot be added to other groups and don't include portal users. Manager groups can contain Standard and Chatter Only users only.

Every user has two manager groups—Managers Group (1) and Manager Subordinates Group (2)—where (1) includes a user's direct and indirect managers, and (2) includes a user and the user's direct and indirect reports. On a sharing rule setup page, these groups are available on the Share with drop-down list.

To find out who a user's manager is, from Setup, enter *Users* in the **Quick Find** box, then select **Users**. Click a user's name. The **Manager** field on the user detail page displays the user's manager.

To enable users to share records with the manager groups, follow these steps.

1. From Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**.
2. On the Sharing Settings page, click **Edit**.
3. In **Other Settings**, select **Manager Groups** and then click **Save**.

With manager groups, you can share records to these groups via manual sharing, sharing rules, and Apex managed sharing. Apex sharing reasons is not supported. For Apex managed sharing, include the row cause ID, record ID, and the manager group ID. For more information, see the [Force.com Apex Code Developer's Guide](#).

Inactive users remain in the groups of which they are members, but all relevant sharing rules and manual sharing are retained in the groups.

EDITIONS

-  **Note:** If your organization has User Sharing enabled, you can't see the users whom you don't have access to. Additionally, a querying user who doesn't have access to another user can't query that user's groups.
-  **Example:** You might have a custom object for performance reviews whose organization-wide default is set to Private. After deselecting the `Grant Access Using Hierarchies` checkbox, only the employee who owns the review record can view and edit it. To share the reviews up the management chain, administrators can create a sharing rule that shares to a user's Managers Group. Alternatively, the employee can share the review record with the user's Managers Group by using manual sharing.

Sharing Rules Overview

Make automatic exceptions to your organization-wide sharing settings for defined sets of users.

-  **Note:**  [Who Sees What: Record Access via Sharing Rules](#)
Watch how you can grant access to records using sharing rules.

For example, use sharing rules to extend sharing access to users in public groups, roles, or territories. Sharing rules can never be stricter than your organization-wide default settings. They simply allow greater access for particular users.

You can create these types of sharing rules.

Type	Based on	Set Default Sharing Access for
Account sharing rules	Account owner or other criteria, including account record types or field values	Accounts and their associated contracts, opportunities, cases, and optionally, contacts and orders
Account territory sharing rules	Territory assignment	Accounts and their associated cases, contacts, contracts, and opportunities
Asset sharing rules	Asset owner or other criteria, including asset record types or field values	Individual asset records
Campaign sharing rules	Campaign owner or other criteria, including campaign record types or field values	Individual campaign records
Case sharing rules	Case owner or other criteria, including case record types or field values	Individual cases and associated accounts

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Account, asset, and contact sharing rules are available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Account territory, case, lead, opportunity, order, and custom object sharing rules are available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Campaign sharing rules are available in **Professional** Edition for an additional cost, and **Enterprise, Performance, Unlimited,** and **Developer** Editions

Type	Based on	Set Default Sharing Access for
Contact sharing rules	Contact owner or other criteria, including contact record types or field values	Individual contacts and associated accounts
Custom object sharing rules	Custom object owner or other criteria, including custom object record types or field values	Individual custom object records
Lead sharing rules	Lead owner or other criteria, including lead record types or field values	Individual leads
Opportunity sharing rules	Opportunity owner or other criteria, including opportunity record types or field values	Individual opportunities and their associated accounts
Order sharing rules	Order owner or other criteria, including order record types or field values	Individual orders
User sharing rules	Group membership or other criteria, including username and whether the user is active	Individual user records
User provisioning request sharing rules	User provisioning request owner, only; criteria-based sharing rules aren't available	Individual user provisioning request records

**Note:**

- You can't include high-volume portal users in sharing rules because they don't have roles and can't be in public groups.
- Developers can use Apex to programmatically share custom objects (based on record owners, but not other criteria). This does not apply to User Sharing.

SEE ALSO:

- [Criteria-Based Sharing Rules Overview](#)
- [Sharing Rule Considerations](#)

Criteria-Based Sharing Rules Overview

Criteria-based sharing rules determine whom to share records with based on field values in records. For example, let's say you use a custom object for job applications, with a custom picklist field named "Department." You can create a criteria-based sharing rule that shares all job applications in which the Department field is set to "IT" with all IT managers in your organization.

Note:

- Although criteria-based sharing rules are based on values in the records and not the record owners, a role or territory hierarchy still allows users higher in the hierarchy to access the records.
- You can't use Apex to create criteria-based sharing rules. Also, criteria-based sharing cannot be tested using Apex.
- You can use the Metadata API to create criteria-based sharing rules starting in API version 24.0.
- You can't include high-volume portal users in sharing rules because they don't have roles and can't be in public groups.

You can create criteria-based sharing rules for accounts, opportunities, cases, contacts, leads, campaigns, and custom objects. You can create up to 50 criteria-based sharing rules per object.

- Record types
- These field types:
 - Auto Number
 - Checkbox
 - Date
 - Date/Time
 - Email
 - Number
 - Percent
 - Phone
 - Picklist
 - Text
 - Text Area
 - URL
 - Lookup Relationship (to user ID or queue ID)

 **Note:** Text and Text Area are case-sensitive. For example, a criteria-based sharing rule that specifies "Manager" in a text field won't share records with "manager" in the field. To create a rule with several common cases of a word, enter each value separated by a comma.

Sharing Rule Categories

When you define a sharing rule, you can choose from the following categories in the `owned by members of` and `Share with` drop-down lists. Depending on the type of sharing rule and the features enabled for your organization, some categories may not appear.

 **Note:** You can't include high-volume portal users in sharing rules because they don't have roles and can't be in public groups.

Category	Description
Managers Groups	All direct and indirect managers of a user.
Manager Subordinates Groups	A manager and all direct and indirect reports who he or she manages.
Queues	All records owned by the queue, excluding records owned by individual members of the queue. Available only in the <code>owned by members of</code> list.
Public Groups	All public groups defined by your administrator. If a partner portal or Customer Portal is enabled for your organization, the All Partner Users or All Customer Portal Users group displays. These groups includes all users allowed to access your partner portal or Customer Portal, except for high-volume portal users.
Roles	All roles defined for your organization. This includes all of the users in the specified role.
Portal Roles	All roles defined for your organization's partner portal or Customer Portal. This includes all users in the specified portal role, except high-volume portal users. A portal role name includes the name of the account that it's associated with, except for person accounts, which include the user Alias .
Roles and Subordinates	All roles defined for your organization. This includes all of the users in the specified role plus all of the users in roles below that role, including partner portal and Customer Portal roles that contain users with a portal license type. Portal roles are only included in this category if a partner portal or Customer Portal is enabled for your organization. The Roles, Internal and Portal Subordinates data set category is only available in your organization after you create at least one role in the role hierarchy.
Portal Roles and Subordinates	All roles defined for your organization's partner portal or Customer Portal. This includes all of the users in the specified portal role plus all of the users below that role in the portal role hierarchy, except for high-volume portal users.

Creating Lead Sharing Rules

Lead sharing rules are based on the record owner or on other criteria, including record type and certain field values. You can define up to 300 lead sharing rules, including up to 50 criteria-based sharing rules.

1. If you plan to include public groups in your sharing rule, confirm that the appropriate groups have been created.
2. From Setup, enter *Sharing Settings* in the Quick Find box, then select **Sharing Settings**.
3. In the Lead Sharing Rules related list, click **New**.
4. Enter the **Label Name** and **Rule Name**. The Label is the sharing rule label as it appears on the user interface. The Rule Name is a unique name used by the API and managed packages.
5. Enter the **Description**. This field describes the sharing rule. It is optional and can contain up to 1000 characters.
6. Select a rule type.
7. Depending on the rule type you selected, do the following:

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in:

- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create sharing rules:

- "Manage Sharing"

- **Based on record owner**—In the `owned by members of` line, specify the users whose records will be shared: select a category from the first drop-down list and a set of users from the second drop-down list (or lookup field, if your organization has over 200 queues, groups, roles, or territories).
- **Based on criteria**—Specify the Field, Operator, and Value criteria that records must match to be included in the sharing rule. The fields available depend on the object selected, and the value is always a literal number or string. Click **Add Filter Logic...** to change the default AND relationship between each filter.

 **Note:** To use a field that's not supported by criteria-based sharing rules, you can create a workflow rule or Apex trigger to copy the value of the field into a text or numeric field, and use that field as the criterion.

8. In the `Share with` line, specify the users who get access to the data: select a category from the first drop-down list and a set of users from the second drop-down list or lookup field.
9. Select the sharing access setting for users.

Access Setting	Description
Read Only	Users can view, but not update, records.
Read/Write	Users can view and update records.

10. Click **Save**.

Creating Campaign Sharing Rules

Campaign sharing rules can be based on the record owner or on other criteria, including record type and certain field values. You can define up to 300 campaign sharing rules, including up to 50 criteria-based sharing rules.

1. If you plan to include public groups in your sharing rule, confirm that the appropriate groups have been created.
2. From Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**.
3. In the Campaign Sharing Rules related list, click **New**.
4. Enter the **Label Name** and **Rule Name**. The Label is the sharing rule label as it appears on the user interface. The Rule Name is a unique name used by the API and managed packages.
5. Enter the **Description**. This field describes the sharing rule. It is optional and can contain up to 1000 characters.
6. Select a rule type.
7. Depending on the rule type you selected, do the following:

EDITIONS

Available in: Salesforce Classic

Available in: **Professional** Edition for an additional cost, and **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To create sharing rules:

- "Manage Sharing"

- **Based on record owner**—In the `owned by members of` line, specify the users whose records will be shared: select a category from the first drop-down list and a set of users from the second drop-down list (or lookup field, if your organization has over 200 queues, groups, roles, or territories).
- **Based on criteria**—Specify the Field, Operator, and Value criteria that records must match to be included in the sharing rule. The fields available depend on the object selected, and the value is always a literal number or string. Click **Add Filter Logic...** to change the default AND relationship between each filter.

 **Note:** To use a field that's not supported by criteria-based sharing rules, you can create a workflow rule or Apex trigger to copy the value of the field into a text or numeric field, and use that field as the criterion.

8. In the `Share with` line, specify the users who get access to the data: select a category from the first drop-down list and a set of users from the second drop-down list or lookup field.
9. Select the sharing access setting for users.

Access Setting	Description
Read Only	Users can view, but not update, records.
Read/Write	Users can view and update records.
Full Access	Any user in the selected group, role, or territory can view, edit, transfer, delete, and share the record, just like the record's owner. With a Full Access sharing rule, users can also view, edit, delete, and close activities associated with the record if the organization-wide sharing setting for activities is Controlled by Parent.

10. Click **Save**.

Sharing Rule Considerations

Sharing rules allow you to selectively grant data access to defined sets of users. Review the following notes before using sharing rules:

Granting Access

- You can use sharing rules to grant wider access to data. You cannot restrict access below your organization-wide default levels.
- If multiple sharing rules give a user different levels of access to a record, the user gets the most permissive access level.
- Sharing rules automatically grant additional access to related records. For example, opportunity sharing rules give role or group members access to the account associated with the shared opportunity if they do not already have it. Likewise, contact and case sharing rules provide the role or group members with access to the associated account as well.
- Users in the role hierarchy are automatically granted the same access that users below them in the hierarchy have from a sharing rule, provided that the object is a standard object or the **Grant Access Using Hierarchies** option is selected.
- Regardless of sharing rules, users can, at a minimum, view the accounts in their territories. Also, users can be granted access to view and edit the contacts, opportunities, and cases associated with their territories' accounts.

Updating

- Creating an owner-based sharing rule with the same source and target groups as an existing rule overwrites the existing rule.
- Once a sharing rule has been saved, you can't change the `Share with` field settings when you edit the sharing rule.
- Sharing rules apply to all new and existing records that meet the definition of the source data set.
- Sharing rules apply to both active and inactive users.
- When you change the access levels for a sharing rule, all existing records are automatically updated to reflect the new access levels.
- When you delete a sharing rule, the sharing access created by that rule is automatically removed.
- When you modify which users are in a group, role, or territory, the sharing rules are reevaluated to add or remove access as necessary.
- When you transfer records from one user to another, the sharing rules are reevaluated to add or remove access to the transferred records as necessary.
- Making changes to sharing rules may require changing a large number of records at once. To process these changes efficiently, your request may be queued and you may receive an email notification when the process has completed.
- Lead sharing rules do not automatically grant access to lead information after leads are converted into account, contact, and opportunity records.

Portal Users

- You can create rules to share records between most types of Customer Portal users and Salesforce users. Similarly, you can create sharing rules between Customer Portal users from different accounts as long as they have the Customer Portal Manager user license. However, you can't include high-volume portal users in sharing rules because they don't have roles and can't be in public groups.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Account and contact sharing rules are available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Account territory, case, lead, opportunity, order, and custom object sharing rules are available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Campaign sharing rules are available in **Professional** Edition for an additional cost, and **Enterprise, Performance, Unlimited, and Developer** Editions

Only custom object sharing rules are available in **Database.com**

- You can easily convert sharing rules that include Roles, Internal and Portal Subordinates to include Roles and Internal Subordinates instead by using the Convert Portal User Access wizard. Furthermore, you can use this wizard to convert any publicly accessible report, dashboard, and document folders to folders that are accessible by all users except for portal users.

Managed Package Fields

If a criteria-based sharing rule references a field from a licensed managed package whose license has expired, (`expired`) is appended to the label of the field. The field label is displayed in the field drop-down list on the rule's definition page in Setup. Criteria-based sharing rules that reference expired fields aren't recalculated, and new records aren't shared based on those rules. However, the sharing of existing records prior to the package's expiration is preserved.

User Sharing Overview

Control who sees whom in your organization with standard sharing functionality.

Watch a demo:  [Who Sees Whom: User Sharing](#)

Watch how you can set up User Sharing in your organization.

User Sharing enables you to show or hide an internal or external user from another user in your organization. For example, you might be a manufacturer who needs to include all dealers in your organization while still keeping them from seeing or interacting with each other. You can set the organization-wide defaults for the user object to Private. Then, open up access among groups of dealers who need to see and interact with each other in the organization with sharing rules or manual sharing.

With User Sharing, you can:

- Assign the "View All Users" permission to users who need to see or interact with all users. This permission is automatically enabled for users who have the "Manage Users" permission.
- Set the [organization-wide default](#) for user records to Private or Public Read Only.
- Create [user sharing rules](#) based on group membership or other criteria.
- Create [manual shares](#) for user records to open up access to individual users or groups.
- Control the visibility of external users in customer or partner portals and communities.

Understanding User Sharing

Set organization-wide defaults for internal and external user records. Then, extend access using sharing rules based on membership to public groups, roles, or territories, or use manual sharing to share individual user records with other users or groups.

When you enable user sharing, users can see other users in search, list views, and so on only if they have Read access on those users.

Review these considerations before you implement user sharing.

“View All Users” permission

This permission can be assigned to users who need Read access to all users, regardless of the sharing settings. If you already have the “Manage Users” permission, you are automatically granted the “View All Users” permission.

Organization-wide defaults for user records

This setting defaults to Private for external users and Public Read Only for internal users. When the default access is set to Private, users can only read and edit their own user record. Users with subordinates in the role hierarchy maintain read access to the user records of those subordinates.

User sharing rules

General [sharing rule considerations](#) apply to user sharing rules. User sharing rules are based on membership to a public group, role, or territory. Each sharing rule shares members of a source group with those of the target group. You must create the appropriate public groups, roles, or territories before creating your sharing rules. Users inherit the same access as users below them in the role hierarchy.

Manual sharing for user records

Manual sharing can grant read or edit access on an individual user, but only if the access is greater than the default access for the target user. Users inherit the same access as users below them in the role hierarchy. Apex managed sharing is not supported.

User sharing for external users

Users with the “Manage External Users” permission have access to external user records for Partner Relationship Management, Customer Service, and Customer Self-Service portal users, regardless of sharing rules or organization-wide default settings for User records. The “Manage External Users” permission does not grant access to guest or Chatter External users.

User Sharing Compatibility

When the organization-wide default for the user object is set to Private, User Sharing does not fully support these features.

- Chatter Messenger is not available for external users. It is available for internal users only when the organization-wide default for the user object is set to Public Read Only.
- Customizable Forecasts—Users with the “View All Forecast” permission can see users to whom they don't have access.
- Salesforce CRM Content—A user who can create libraries can see users they don't have access to when adding library members.
- Standard Report Types—Some reports based on standard report types expose data of users to whom a user doesn't have access. For more information, see [Control Standard Report Visibility](#).

Set the Org-Wide Sharing Defaults for User Records

Set the org-wide sharing defaults for the user object before opening up access.

For user records, you can set the organization-wide sharing default to Private or Public Read Only. The default must be set to Private if there is at least one user who shouldn't see a record.

Let's say that your organization has internal users (employees and sales agents) and external users (customers/portal users) under different sales agents or portal accounts, with these requirements:

- Employees can see everyone.
- Sales agents can see employees, other agents, and their own customer user records only.
- Customers can see other customers only if they are under the same agent or portal account.

To meet these requirements, set the default external access to Private, and extend access using sharing rules, manual sharing, or user permissions.

When the feature is first turned on, the default access setting is Private for external users. The default for internal users is Public Read Only. To change the organization-wide defaults for external access to the user object:

1. From Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**.
2. Click **Edit** in the Organization-Wide Defaults area.
3. Select the default internal and external access you want to use for user records.
The default external access must be more restrictive or equal to the default internal access.
4. Click **Save**.

Users have Read access to those below them in the role hierarchy and full access on their own user record.

Creating User Sharing Rules

Share members of a group to members of another group, or share users based on criteria.

User sharing rules can be based on membership to public groups, roles, or territories, or on other criteria such as Department and Title. By default, you can define up to 300 user sharing rules, including up to 50 criteria-based sharing rules. Contact Salesforce for information about increasing these limits.

User sharing rules based on membership enable user records belonging to members of one group to be shared with members of another group. Before you can create a membership-based user sharing rule, confirm that the appropriate groups have been created.

Users inherit the same access as users below them in the role hierarchy.

1. From Setup, enter *Sharing Settings* in the Quick Find box, then select **Sharing Settings**.
2. In the User Sharing Rules related list, click **New**.
3. Enter the **Label Name** and click the **Rule Name** field to auto-populate it.
4. Enter the **Description**. This field describes the sharing rule. It is optional and can contain up to 1000 characters.
5. Select a rule type.
6. Depending on the rule type you selected, do the following:
 - a. **Based on group membership**—Users who are members of a group can be shared with members of another group. In the *Users who are members of* line, select a category from the first drop-down list and a set of users from the second drop-down list (or lookup field, if your organization has over 200 groups, roles, or territories).
 - b. **Based on criteria**—Specify the Field, Operator, and Value criteria that records must match to be included in the sharing rule. The fields available depend on the object selected, and the value is always a literal number or string. Click **Add Filter Logic...** to change the default AND relationship between each filter.
7. In the *Share with* line, specify the group that should have access to the user records. Select a category from the first drop-down list and a set of users from the second drop-down list or lookup field.
8. Select the sharing access setting for users.

Access Setting	Description
Read Only	Users can view, but not update, records. They can see target users in list views, lookups, search, and interact with them on Chatter.
Read/Write	Users can view and update records.

9. Click **Save**.

[User Sharing Overview](#)

Share User Records

Your administrator defines your organization's sharing model and default access levels for user records. If the organization-wide default access is set to Private or Public Read Only, you can extend sharing privileges for your own user record. However, you can't restrict access below your organization's default access levels.

You can share external user records, such as external community users and customer portal or partner portal users. You can also share an internal user record with an external user. To view and manage sharing details, click **Sharing** on the user detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the user record. On this page, you can perform these tasks.

- To show a filtered list of items, select a predefined list from the **view** drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the **view** drop-down list and click **Edit**.
- [Grant access](#) to the record for other users, groups, roles, or territories by clicking **Add**. This method of granting access is also known as *manual sharing* of your user records.
- Edit or delete the manual share by clicking **Edit** or **Del** next to the rule.

SEE ALSO:

[User Sharing Overview](#)

[Differences Between User Sharing with Manual Sharing and Sharing Sets](#)

Grant Access to User Records

You can manually grant access to your user records so that others can access them. Users inherit the same access permissions as users below them in the role hierarchy. Granting access to a user record makes the user's detail page visible to others. It also makes the user visible in lookups, list views, search, and so on.

You can share your user record manually if others cannot access it through the organization-wide defaults, sharing rules, or role hierarchy. If you gain access through more than one method, the higher level of access is maintained. High-volume portal users can be shared with other users using manual shares, but not in sharing rules.

1. From Setup, enter *Users* in the *Quick Find* box, then select **Users**. Click the name of the user you want to share.
2. On the User Detail page, click **Sharing**.
3. Click **Add**.
4. From the drop-down list, select the group, user, role, or territory to share with.
5. Choose which users have access by adding them to the Share With list.
6. Select the access level for the record you are sharing.
Possible values are Read/Write or Read Only, depending on your organization-wide defaults for users. You can only grant a higher access level than your organization-wide default.
7. Click **Save**.
8. To change record access, on the user's Sharing Detail page, click **Edit** or **Del**.

USER PERMISSIONS

To grant access to your own user record:

- "Read" on the user with whom you're sharing

Controlling Who Community or Portal Users Can See

If your organization has enabled a community and has portal licenses provisioned for it, User Sharing is enabled automatically. When User Sharing is on, you can choose which other users community users can see by default. If your organization has Customer or Partner Portals, you can choose a default for them as well. Users who can see one another can interact on all the communities or portals in your organization. For example, if you would like to have a more private community, you can deselect the **Community User Visibility** checkbox and use other sharing features like sharing rules, manual shares, or portal access.

For Communities and Portals, you can choose different defaults.

Communities

The initial default is to allow community users to be seen by all other internal and external users in communities they are a member of. You can change the default to allow external users in communities to be seen only by themselves and their superiors in the role hierarchy. The setting provides Read access only and applies to all communities in your organization.

Visibility to users as a result of the **Community User Visibility** preference is not inherited through the role hierarchy. If a manager in the role hierarchy is not a member of a community, but their subordinate is, the manager does not gain access to other members of the community.

Portals

The initial default is to allow portal users to be seen by other portal users within the same account. You can change the default to allow external users in portals to be seen by only themselves and their superiors in the role hierarchy. The setting provides Read access only and applies to all of the portals in your organization.

 **Note:** Partner portal users also have access to their channel manager.

1. From Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**.
2. Click **Edit** in the Organization-Wide Defaults area.
3. Deselect the **Portal User Visibility** checkbox to allow users to be seen by only themselves and their superiors. Or select the checkbox to let portal users be seen by all other portal users within the same account.
4. For **Community User Visibility**, deselect the checkbox to allow users to be seen only by themselves and their superiors. Select the checkbox to allow community users to be seen by all other users in their communities.

 **Note:** This option only appears if Salesforce Communities is enabled.

5. Click **Save**.

Selecting either of these options is a quick way of overriding an organization-wide default setting of Private for external access to the User object for Community or Portal users.

Once you have set these defaults, you can selectively expand access to users.

USER PERMISSIONS

To set Community and Portal User Visibility:

- "Manage Sharing"

Control Standard Report Visibility

Show or hide standard reports that might expose data of users to whom a user doesn't have access.

You can control whether users can see reports based on standard report types that can expose data of users to whom they don't have access. When User Sharing is first enabled, all reports that contain data of users to whom a viewing user doesn't have access are hidden.

1. From Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**.
2. Click **Edit** in the Organization-Wide Defaults area.
3. To allow users to view reports based on standard report types that can expose data of users to whom they don't have access, select the **Standard Report Visibility** checkbox. Or, to hide these reports, deselect this checkbox.
4. Click **Save**.

If the organization-wide default for the user object is Private and the Standard Report Visibility checkbox is selected, a viewing user can see only the names of the users that they don't have access to in the report. User details such as username and email are hidden. When you deselect the **Standard Report Visibility** checkbox, users with the "View All Users" permission can still see all reports based on standard report types. All users can also see these reports if the organization-wide default for the user object is Public Read Only.

Important: When Analytics sharing is in effect, all users in the organization get Viewer access to report and dashboard folders that are shared with them. Users who have been designated Manager or Editor on a folder, and users with additional administrative permissions, can have more access. Each user's access to folders is based on the combination of folder access and user permissions. To ensure that standard report folders are hidden as needed, remove sharing for all users from the folders. Then deselect the **View Dashboards in Public Folders** and **View Reports in Public Folders** checkboxes for the users' profiles.

USER PERMISSIONS

To set standard report visibility:

- "Manage Sharing"

Control Manual Sharing for User Records

Enable or prevent users from sharing their own user records with other users across the organization.

You can control whether the **Sharing** button is displayed on user detail pages. This button enables a user to grant others access to the user's own user record. You can hide or display this button for all users by following these steps.

1. From Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**.
2. Click **Edit** in the Organization-Wide Defaults area.
3. Select the **Manual User Record Sharing** checkbox to display the **Sharing** button on user detail pages, which enables users to share their records with others. Or deselect the checkbox to hide the button, which prevents users from sharing their user records with others.
4. Click **Save**.

When the organization-wide default for users is set to Public Read Only, users get read access to all other user records, can see those users in search and list views, and can interact with those users on Chatter and Communities.

 **Example:** For example, a partner user wants to collaborate with the sales representative in Communities. If you have disabled the **Community User Visibility** checkbox in the Sharing Settings page, community users can only be seen by themselves and their superiors in the role hierarchy. You can use manual sharing to grant the partner user read access to the sales representative by using the **Sharing** button on the sales representative's user detail page. This access enables both parties to interact and collaborate in Communities.

Restoring User Visibility Defaults

User Sharing enables you to control who sees who in the organization. You can restore your defaults if you have previously used User Sharing.

To restore user visibility defaults:

1. From Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**.
2. Set the organization-wide defaults to Public Read Only for internal access and Private for external access.
3. Enable portal account user access.
On the Sharings Settings page, select the **Portal User Visibility** checkbox. This option enables customer portal users to see other users under the same portal account. Additionally, partner portal users can see the portal account owner.
4. Enable network member access.
On the Sharing Settings page, select the **Community User Visibility** checkbox. This option enables community members to be seen by all other users in their communities.
5. Remove user sharing rules.
On the Sharing Settings page, click **Del** next to all available user sharing rules.
6. Remove HVPU access to user records.
On the Customer Portal Setup page, click **Del** next to all available sharing sets for HVPU.

After user visibility is restored to the defaults, all internal users are visible to each other, portal users under the same portal account are visible to each other, and community members in the same community are visible to each other.

[User Sharing Overview](#)

Differences Between User Sharing with Manual Sharing and Sharing Sets

Manual sharing and sharing sets provide access to different groups of users.

You can control who sees whom in the organization, including internal and external users, if your organization has User Sharing enabled. Manual sharing and sharing sets provide additional access beyond the organization-wide defaults and sharing rules. External users, such as high-volume portal or community users (HVPU), don't have roles and can't be used in sharing rules.

EDITIONS

Available in: **Salesforce Classic**

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

 **Example:** Grant internal and non-HVPU users access to a user by creating a manual share using the Sharing button on the user detail page of that user. Grant HVPU access to other users by creating a sharing set for your portals or communities.

The following table shows when to use manual sharing and sharing sets.

	Users Getting Access		
	Internal	Non-HVPU ¹	HVPU ²
Internal	Manual Sharing	Manual Sharing	Sharing Set
Non-HVPU	Manual Sharing	Manual Sharing	Sharing Set
HVPU	Manual Sharing	Manual Sharing	Sharing Set

¹ Non-HVPU refers to an external user who is not using an HVPU profile.

² HVPU refers to an external user that has one of these profiles:

- Authenticated Website
- Customer Community User
- Customer Community Login User
- High Volume Customer Portal
- High Volume Portal
- Overage Authenticated Website User
- Overage High Volume Customer Portal User

[Sharing Set Overview](#)

Sharing Considerations

Learn how sharing models give users access to records they don't own.

The sharing model is a complex relationship between role hierarchies, user permissions, sharing rules, and exceptions for certain situations. Review the following notes before setting your sharing model:

Exceptions to Role Hierarchy-based Sharing

Users can always view and edit all data owned by or shared with users below them in the role hierarchy. Exceptions to this include:

- An option on your organization-wide default allows you to ignore the hierarchies when determining access to data.
- Contacts that are not linked to an account are always private. Only the owner of the contact and administrators can view it. Contact sharing rules do not apply to private contacts.
- Notes and attachments marked as private via the `Private` checkbox are accessible only to the person who attached them and administrators.

- Events marked as private via the `Private` checkbox are accessible only by the event owner. Other users cannot see the event details when viewing the event owner's calendar. However, users with the "View All Data" or "Modify All Data" permission can see private event details in reports and searches, or when viewing other users' calendars.
- Users above a record owner in the role hierarchy can only view or edit the record owner's records if they have the "Read" or "Edit" object permission for the type of record
- Visibility to users as a result of the **Community User Visibility** preference is not inherited through the role hierarchy. If a manager in the role hierarchy is not a member of a community, but their subordinate is, the manager does not gain access to other members of the community. This only applies if Salesforce Communities is enabled in your organization.

Deleting Records

- The ability to delete individual records is controlled by administrators, the record owner, users in a role hierarchy above the record owner, and any user that has been granted "Full Access."
- If the sharing model is set to Public Read/Write/Transfer for cases or leads or Public Full Access for campaigns, any user can delete those types of records.

Adding Related Items to a Record

- You must have "Read/Write" access to a record to be able to add notes or attachments to the record.
- You must have at least "Read" access to a record to be able to add activities or other associated records to it.

Adding or Removing Sharing Access Manually

- The ability to manually extend the sharing access of individual records is controlled by administrators, the record owner, users in a role hierarchy above the record owner, and any user that has been granted "Full Access."
- Changing your sharing model deletes any manual shares your users have created.

User Permissions and Object-Level Permissions

While your sharing model controls visibility to records, user permissions and object-level permissions control what users can do to those records.

- Regardless of the sharing settings, users must have the appropriate object-level permissions. For example, if you share an account, those users can only see the account if they have the "Read" permission on accounts. Likewise, users who have the "Edit" permission on contacts may still not be able to edit contacts they do not own if they are working in a Private sharing model.
- Administrators, and users with the "View All Data" or "Modify All Data" permissions, have access to view or edit all data.

Account Sharing

- To restrict users' access to records they do not own that are associated with accounts they do own, set the appropriate access level on the role. For example, you can restrict a user's access to opportunities they do not own yet are associated with accounts they do own using the `Opportunity Access` option.
- Regardless of the organization-wide defaults, users can, at a minimum, view the accounts in their territories. Also, users can be granted access to view and edit the contacts, opportunities, and cases associated with their territories' accounts.

Apex Sharing

The organization-wide default settings can't be changed from private to public for a custom object if Apex code uses the sharing entries associated with that object. For example, if Apex code retrieves the users and groups who have sharing access on a custom object

Invoice__c (represented as `Invoice__share` in the code), you can't change the object's organization-wide sharing setting from private to public.

Campaign Sharing

- In Enterprise, Unlimited, Performance, and Developer Editions, designate all users as Marketing Users when enabling campaign sharing. This simplifies administration and troubleshooting because access can be controlled using sharing and profiles.
-  **Note:** Professional Edition customers cannot manage users this way because custom profiles are not enabled in Professional Edition organizations.
- To segment visibility between business units while maintaining existing behavior within a business unit:
 1. Set the campaign organization-wide default to Private.
 2. Create a sharing rule to grant marketing users Public Full Access to all campaigns owned by users within their business unit.
 3. Create a sharing rule to grant all non-marketing users in a business unit Read Only access to all campaigns owned by users in their business unit.
- When a single user, such as a regional marketing manager, owns multiple campaigns and needs to segment visibility between business units, share campaigns individually instead of using sharing rules. Sharing rules apply to all campaigns owned by a user and do not allow segmenting visibility.
- Create all campaign sharing rules prior to changing your organization-wide default to reduce the affect the change has on your users.
- To share all campaigns in your organization with a group of users or a specific role, create a sharing rule that applies to campaigns owned by members of the "Entire Organization" public group.
- Minimize the number of sharing rules you need to create by using the "Roles and Subordinates" option instead of choosing a specific role.
- If campaign hierarchy statistics are added to the page layout, a user can see aggregate data for a parent campaign and all the campaigns below it in the hierarchy regardless of whether that user has sharing rights to a particular campaign within the hierarchy. Therefore, consider your organization's campaign sharing settings when enabling campaign hierarchy statistics. If you do not want users to see aggregate hierarchy data, remove any or all of the campaign hierarchy statistics fields from the Campaign Hierarchy related list. These fields will still be available for reporting purposes.
- If the sharing model is set to Public Full Access for campaigns, any user can delete those types of records.

Campaign Member Sharing

Campaign member sharing is controlled by campaign sharing rules. Users that can see a campaign can also see associated campaign members.

Contact Sharing

- The organization-wide sharing default for contacts is not available to organizations that have person accounts enabled.
- If your organization-wide default for contacts is set to Controlled by Parent, the `Contact Access` options are not available when sharing related records like accounts; instead, all access to contacts is determined by the user's access to the contact's account.

Price Book Sharing

- Sharing on price books controls whether users can add the price book and its products to opportunities.

- User permissions control whether users can view, create, edit, and delete price books.

SEE ALSO:

[Overview of Sharing Settings](#)

Viewing Sharing Overrides

When you select an object in the Sharing Settings page, the page includes a Sharing Overrides related list, which shows any profiles that ignore sharing settings for that object.

To view the Sharing Overrides list, from Setup, enter *Sharing Settings* in the Quick Find box, then select **Sharing Settings**. Next, select an object from the Manage Sharing Settings For list.

For each profile, the list specifies the permissions that allow it to override sharing settings. The “View All Data” and “Modify All Data” permissions override sharing settings for all objects in the organization, while the object permissions “View All” and “Modify All” override sharing settings for the named object.

 **Note:** The Sharing Overrides list doesn't show permissions granted through permission sets, which may also override sharing settings for an object.

To override sharing settings for specific objects, you can create or edit permission sets or profiles and enable the “View All” and “Modify All” object permissions. These permissions provide access to all records associated with an object across the organization, regardless of the sharing settings. Before setting these permissions, compare the different ways to control data access.

Sharing Calculations

Recalculate Sharing Rules

When you make changes to groups, roles, and territories, sharing rules are usually automatically reevaluated to add or remove access as necessary. Changes could include adding or removing individual users from a group, role, or territory, changing which role a particular role reports to, changing which territory a particular territory is subordinate to, or adding or removing a group from within another group.

 **Note:** You don't need to recalculate each time you edit or create a sharing rule. Only use the Recalculate buttons on the Sharing Rules related lists if sharing rule updates have failed or are not working as expected. The administrator will receive a notification email if sharing rule updates have failed.

To manually recalculate an object's sharing rules:

1. From Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**.
2. In the Sharing Rules related list for the object you want, click **Recalculate**.
3. If you want to monitor the progress of a recalculation, from Setup, enter *Background Jobs* in the **Quick Find** box, then select **Background Jobs**.

 **Note:** The **Recalculate** button is disabled when group membership or sharing rule calculations are deferred. Sharing rules for related objects are automatically recalculated; for example, account sharing rules are recalculated when opportunity sharing rules are recalculated since the opportunity records are in a master-detail relationship on account records.

When sharing is recalculated, Salesforce also runs all Apex sharing recalculations. During sharing rule recalculation, related object sharing rule will be calculated as well. You'll receive an email that notifies you when the recalculation is completed. For example, when recalculating sharing rule for opportunities, account sharing rules are recalculated as well since opportunity is a detail of an account object.

Automatic sharing rule calculation is enabled by default. You can defer sharing rule calculation by suspending and resuming at your discretion.

[Asynchronous Parallel Recalculation of Sharing Rules](#)

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Account and contact sharing rules are available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Account territory, case, lead, opportunity, order sharing rules, and custom object sharing rules are available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Campaign sharing rules are available in **Professional** Edition for an additional cost, and **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To recalculate sharing rules:

- "Manage Sharing"

Asynchronous Parallel Recalculation of Sharing Rules

Speed up sharing rule recalculation by running it asynchronously and in parallel.

When you create, update, or delete sharing rules, the resulting recalculation is now processed asynchronously and in parallel. The recalculation is run in parallel and asynchronously in the background, which speeds up the process and provides better resilience to site operations such as patches and server restarts. You'll receive an email notification upon completion. Before the recalculation is completed, you can't run other sharing operations such as creating a sharing rule or updating the organization-wide defaults.

Parallel sharing rule recalculation is also run in these cases.

- Click the Recalculate button for the sharing rules on the Sharing Settings page
- Recalculate your sharing rules on the Defer sharing page

You can monitor the progress of your parallel recalculation on the Background Jobs page or view your recent sharing operations on the View Setup Audit Trail page.

Recalculation of sharing rules maintains implicit sharing between accounts and child records. In the Background Jobs page, these processes corresponds to these job sub types: **Account — Extra Parent Access Removal** and **Account — Parent Access Grant**. Additionally, deleting a sharing rule corresponds to the job sub type **Object — Access Cleanup**, denoting that irrelevant share rows are removed.

 **Note:** For an in-depth look at record access, see [Designing Record Access for Enterprise Scale](#).

[Monitoring Background Jobs](#)

[Recalculate Sharing Rules](#)

[Built-in Sharing Behavior](#)

Defer Sharing Calculations Overview

 **Note:** The defer sharing calculation feature isn't enabled by default. To enable it for your organization, contact Salesforce.

Performing a large number of configuration changes can lead to very long sharing rule evaluations or timeouts. To avoid these issues, an administrator can suspend these calculations and resume calculations during an organization's maintenance period.

Deferring sharing calculation is ideal if you make a large number of changes to roles, territories, groups, users, portal account ownership, or public groups participating in sharing rules, and want to suspend the automatic sharing calculation to a later time.

Group membership and sharing rule calculation are enabled by default.

If

You can

Group membership and sharing rule calculation are enabled

- Suspend, update, and resume group membership calculation. This suspends sharing rule calculation and requires a full recalculation of sharing rules.

SEE ALSO:

[Recalculate Sharing Rules](#)

Manage Group Membership Calculations

When you make changes to roles, territories, groups, or users, or change ownership of portal accounts, group membership is automatically recalculated to add or remove access as necessary. Changes can include adding or removing a user from a group or changing a role to allow access to different sets of reports.

If you are making changes to groups that affect a lot of records, you may want to suspend automatic group membership calculation and resume at a later time. Note that you might experience sharing inconsistencies in your records if you don't resume calculation.

To suspend or resume group membership calculation:

- From Setup, enter *Defer Sharing Calculations* in the **Quick Find** box, then select **Defer Sharing Calculations**.
- In the Group Membership Calculations related list, click **Suspend**.
 -  **Note:** If sharing rule calculations are enabled, suspending group membership calculations also suspends sharing rule calculations. Resuming group membership calculations also requires full sharing rule recalculation.
- Make your changes to roles, territories, groups, users, or portal account ownership.
- To enable group membership calculation, click **Resume**.

Object-Specific Share Locks (Pilot)

When you create, edit, or delete a sharing rule, recalculation runs to update record access in the organization. This operation can take some time if you have many users and a lot of data. The object-specific share locks feature enables you to make changes to a sharing rule for other objects, without waiting for recalculation across all objects to complete. Depending on the object, sharing rule type, and target group of the users, you can make changes to sharing rules on another object or the same object via the UI or API.

 **Note:** We provide this feature to selected customers through a pilot program that requires agreement to specific terms and conditions. To be nominated to participate in the program, contact Salesforce. Because pilot programs are subject to change, we can't guarantee acceptance. This pilot feature isn't generally available, as referenced in this document or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available features.

Without object-specific share locks, you can't submit simultaneous sharing changes until recalculation across all objects is complete. If you are enabling object-specific share locks, consider the following changes in your organization.

Criteria-based and ownership-based sharing rules

Recalculation is run if a sharing rule has changed or when you click the **Recalculate** button on the Sharing Settings page. Clicking this button locks sharing rules for that object (1), but you can still make changes to sharing rules for another object.

 **Note:** You don't need to recalculate each time you edit or create a sharing rule. Only use the Recalculate buttons on the Sharing Rules related lists if sharing rule updates have failed or are not working as expected. The administrator will receive a notification email if sharing rule updates have failed.

The screenshot shows the 'Sharing Rules' page with three sections: Lead Sharing Rules, Account Sharing Rules, and Opportunity Sharing Rules. The 'Lead Sharing Rules' section is active and shows a recalculation in progress. A yellow warning banner at the top states: 'A sharing rule recalculation on Leads has been initiated by Diana Widjaja on 8/10/2015 12:44 PM. You can't submit any changes for Leads prior to the completion of the operation. Diana Widjaja will receive an email when the operation finishes.' Below this, a table lists the sharing rules. The first rule is highlighted with a red box around the number '1' in the 'Criteria' column. The table has columns for 'Action', 'Criteria', 'Shared With', and 'Lead'.

Action	Criteria	Shared With	Lead
Edit Del	Lead: Company EQUALS AW Computing	All Internal Users	Read/Write

The 'Account Sharing Rules' section shows 'No sharing rules specified.' The 'Opportunity Sharing Rules' section shows one rule with criteria 'Opportunity: Opportunity Name CONTAINS Acme Computing', shared with 'All Internal Users', and 'Read Only' access.

When an ownership-based sharing recalculation is in progress, you can't create, edit, or delete ownership-based sharing rules for an object that targets the affected group of users. For example, let's say you're creating an ownership-based lead sharing rule targeting all internal users. You can create, update, or delete another ownership-based sharing rules for leads targeting all internal users only after the recalculation finishes. You'll receive an email notification when the recalculation is complete. However, you can still create another ownership-based sharing rules for leads targeting any other public group except the All Internal Users group, while the recalculation from the creation of the first sharing rule is still in progress.

When a criteria-based sharing recalculation is in progress, you can't edit or delete that rule (2). But you can simultaneously create, edit, or delete any other criteria-based or ownership-based sharing rule.

⚠ An organization-wide default update has been initiated by Diana Widjaja on 8/7/2015 10:40 AM. You can't submit any changes prior to the completion of the operation. Diana Widjaja will receive an email when the operation finishes.

Account, cases, contacts, and opportunities

Sharing rules can affect accounts and the associated account children—cases, contacts, and opportunities, so they are locked together to ensure that recalculation runs properly. For example, creating and editing account sharing rules prevents you from creating or editing a case, contact, or opportunity sharing rule. Similarly, creating or editing an opportunity sharing rule prevents you from creating or editing a case, contact, or account sharing rule before recalculation is complete. Note that locks are not shared across objects, except in the case of accounts and associated account children.

 **Note:** Clicking the **Recalculate** button for any of these four objects' sharing rules prevents anyone from making changes to any sharing rules for those objects until recalculation is completed.

In the following example, an ownership-based account sharing rule has been deleted and recalculation is in progress. Although you can't create, edit, or delete another ownership-based sharing rule belonging to any of these objects, you can make changes to a criteria-based sharing rule (3) belonging to those objects.

Built-in Sharing Behavior

Salesforce provides implicit sharing between accounts and child records (opportunities, cases, and contacts), and for various groups of portal users.

Sharing between accounts and child records

- **Access to a parent account**—If you have access to an account’s child record, you have implicit Read Only access to that account.
- **Access to child records**—If you have access to a parent account, you have access to the associated child records. The account owner’s role determines the level of access to child records.

Sharing behavior for portal users

- **Account and case access**—An account’s portal user has Read Only access to the parent account and to all of the account’s contacts.
- **Management access to data owned by Service Cloud portal users**—Since Service Cloud portal users don’t have roles, portal account owners can’t access their data via the role hierarchy. To grant them access to this data, you can add account owners to the portal’s share group where the Service Cloud portal users are working. This step provides access to all data owned by Service Cloud portal users in that portal.

EDITIONS

Available in: Salesforce Classic

Sharing for accounts and contacts is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Sharing for cases and opportunities is available in **Enterprise, Performance, Unlimited,** and **Developer** Editions

- **Case access**—If a portal user is a contact on a case, then the user has Read Only access on the case.

Group membership operations and sharing recalculation

Simple operations such as changing a user's role, moving a role to another branch in the hierarchy, or changing a portal account's owner can trigger a recalculation of sharing rules. Salesforce must check access to user's data for people who are above the user's new or old role in the hierarchy, and either add or remove shares to any affected records.

-  **Note:** These sharing behaviors simplify administration for data access but can make mass inserts and mass updates slow. For best practices on designing record access in a large organization, see [Designing Record Access for Enterprise Scale](#).

[Securing Data Access](#)

Resolving Insufficient Privileges Errors

Most Insufficient Privileges errors are caused by a missing permission or sharing setting that's preventing you from accessing a record or performing a task, like running a report.

A user might not have the right access on different levels, such as an object, a record, or a process. For example, a user's profile might be preventing the user from accessing the account object, or a user's role might be preventing the user from accessing a case record. You might also see this error when you click a link to a record or a Visualforce page tab to which you don't have access.

Most cases can be resolved by using the Sharing button on the record detail page, which enables you to share the record to another user if necessary. Administrators can also resolve this issue using the API, such as querying the UserRecordAccess object to check a user's access to a set of records. For more information, see the [SOAP API Developer's Guide](#).

If these tools can't help you resolve the issue, an administrator can try to diagnose it with this troubleshooting flow.

- [Resolve object-level access errors by reviewing the user profiles and permission sets.](#)
- [Resolve record-level access errors by reviewing the sharing settings, such as organization-wide defaults and sharing rules.](#)
- [Resolve process-level errors by reviewing validation rules and Apex triggers.](#)

It's a good idea for an administrator to log in to the application using your login to help you resolve an issue. You can [grant administrators access for a specified duration](#).

Note:  [Who Sees What](#) Watch this video series to understand how to grant users the access they need.

Available in: **All Editions**

Resolve Permission and Object-Level Access Errors

Insufficient Privileges errors might be caused by a lack of object and user permissions. You can troubleshoot this type of errors through a user's profile and permission sets.

Generally, the best method for investigating object and permission access issues is through the API. However, you can use the following steps to investigate via point-and-click tools.

1. Verify the object permissions in the user's profile.

Object permissions, configured on profiles and permission sets, determine which objects a user can read, create, edit, or delete.

a. On the user detail page, click the user's profile.

b. On the profile overview page, go to **Object Settings** or **Object Permissions**.

Note the permissions for the object. For example, if the user is trying to view an account, check that the "Read" permission for the account and contact objects on the user profile is enabled.

Or if the user is trying to run a report, he or she might not have "Read" permission on an object that the report references.

2. Verify the user permissions in one of the following ways, depending on your profile user interface.

- From the enhanced profile user interface, review the permissions in the App Permissions and System Permissions sections.
- From the original profile user interface, review the permissions under Administrative Permissions and General User Permissions.

Note the relevant user permissions. For example, if the user is trying to send an email to a lead, check that the "Send Email" permission is enabled.

3. Verify the permissions in the user's permission sets.

a. On the user detail page, scroll to the Permission Set Assignments related list and click each permission set.

b. On the permission set overview page, click Object Settings and review the assigned object permissions.

c. Review the user permissions in the App Permissions and System Permissions sections.

d. Repeat these steps for each permission set assigned to the user.

4. If needed, assign the necessary permission using a permission set or by updating the profile. Permission sets provide access on an individual basis. Assign permissions on the user profile *only* if all users of this profile require access. Be sure you're aware of your organization's security policy and take action accordingly.

- "Manage Profiles and Permission Sets"

AND

"Customize Application"

Resolve Record-Level Access Errors

Insufficient Privileges errors might be caused by your sharing settings, such as roles or sharing rules.

To verify if your error is at record-level, follow these steps. Alternatively, you can also use the API to query a user's access to a set of records or use the Sharing button on the record detail page.

1. If your organization uses roles, check the user's role in relation to the record owner.

For example, users can delete records only if they are the record owner, higher in the role hierarchy than the record owner, or the administrator. Similarly, users always have read access to records whose owners are below them in the role hierarchy, unless **Grant Access Using Hierarchies** is deselected (custom objects only).

- a. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.

Verify the role of the user and that of the user whose record is being accessed.

For example, a user can't delete or merge accounts owned by someone in an unrelated role hierarchy, even if the user has the appropriate permissions on the objects.

2. If the user should have gotten access via a sharing rule, review your sharing rules.

The user might have been unintentionally left out from a sharing rule.

- a. From Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**.

- b. Check the public group (or other categories such as roles or queues) that the user should belong to for that sharing rule.

3. Verify your sales teams.

If your organization uses teams for accounts, opportunities, or cases, you might have missed the user when setting up the teams. Review your teams to determine if the user should have gotten access through a team.

- a. From Setup, enter the team that you want to check, such as *Account Teams*, in the **Quick Find** box, then select the team.

Add the user to the team, if appropriate.

4. Review your manual shares.

The user might have gained access via a manual share but lost this access because the record owner changed, causing the manual share to be automatically dropped. The manual share might have been removed using the **Sharing** button on the record detail page. Only the record owner, an administrator, or a user above the owner in the role hierarchy can create or remove a manual share on the record.

- a. On the record detail page, click **Sharing**.

The Sharing Detail page shows the users, groups, roles, and territories that have access to the record.

- b. If the user must gain access via a manual share, create a manual share by clicking **Add**.

5. Review your territories.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions**

USER PERMISSIONS

To create or edit sharing rules:

- "Manage Sharing"

To set up teams:

- "Customize Application"

To manage territories:

- "Manage Territories"

If your organization is using territories, the user might be missing from the territories or the record might not be under the correct territory where the user is a member. Otherwise, you must be a forecast manager, `Forecast managers can manage territories` is selected, and you are working below your position in the territory hierarchy.

[Roles](#)

[Sharing Rules Overview](#)

Resolve Process-Level Access Errors

Insufficient Privileges errors might be caused by a validation rule.

To resolve Insufficient Privileges errors, you would typically determine if they are caused by misconfigured permission sets, profiles, or sharing settings. Otherwise, you might want to review your organization's validation rules.

1. Review your validation rules.
A validation rule might be preventing the user from completing a task, such as transferring a case record after it's closed.
2. From your object management settings, find the object that you want to check, and then scroll down to Validation Rules.
3. Verify that none of the validation rules are causing the error. Or fix the validation rule if the user must gain access through it.

Record Access FAQ

- [Why does a user have access to an account?](#)

Why does a user have access to an account?

A user may have access to an account from:

- Record Ownership
- Implicit access from an associated child record such as a case, contact, or opportunity
- Organization-wide sharing defaults
- Role hierarchy
- Sharing rules
- Manual sharing
- Account team or territory

To find out why a user has access to the record, click the **Sharing** button on the account detail page to see a list of users who have access and for which reasons. Click **Expand List** to see all users who have access.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions**

USER PERMISSIONS

To view and change validation rules:

- "View Setup and Configuration"

AND

"Customize Application"

To view and define Apex triggers:

- "Author Apex"

The following users don't show up in the list even if they may have access:

- All users, if the organization-wide defaults are set to Public Read Only or Public Read/Write
- High-volume portal users

 **Note:** If the **Sharing** button does not appear, the organization-wide sharing defaults may have been set to Controlled by Parent or Public Read. Otherwise, only the record owner, an administrator, or a user above the owner in the role hierarchy can see the Sharing Detail page.

Table 2: Troubleshooting guideline for user access to a record

Access Type	Description
Record owner	The record owner always gets access to his or her own record.
Implicit access	Corresponds to the "Associated record owner or sharing" entry in the Reason column of the Sharing Detail page. The user may have access to a child record of an account (opportunity, case, or contact), which grants them Read access on that account. You cannot overwrite this access. For example, if the user has access to a case record, he or she has implicit Read access to the parent account record.
Organization-wide sharing default	Check if the defaults for the account object are set to Private. If it is, the user may have gained access via other methods listed here. It must be set to Private if at least one of your users should not see a record.
Role hierarchy	The user may have inherited Read access from a subordinate in the role hierarchy. You can't override this behavior for non-custom objects. If the user who has access is on a different branch of the hierarchy from the account owner, check the sharing rules, account teams, and account territory.
Sharing rules	The user may have gotten access because he or she has been included in a relevant sharing rule. If the sharing rule uses public groups (or other categories such as roles) to grant access, check your public groups to see if the user has been included in the group.
Manual shares	The user may have gotten access through the Sharing button of the record. Only the record owner, an administrator, or a user above the owner in the role hierarchy can create or remove a manual share on the record.
Account Teams and Territory	The user may have been added to an Account Team by the account owner, an administrator, a user above the owner in the role hierarchy, or an account team member. If your organization uses territory management, check if the user who has access is higher in the territory hierarchy than the account owner. Managers gain the same access as their subordinates. Additionally, if the user is a member of Group A, which is a member of Group B, he or she gets access to all accounts shared to Group B, at the same level of access as members of Group B.

Managing Folders

A *folder* is a place where you can store reports, dashboards, documents, or email templates. Folders can be public, hidden, or shared, and can be set to read-only or read/write. You control who has access to its contents based on roles, permissions, public groups, and license types. You can make a folder available to your entire organization, or make it private so that only the owner has access.

- To access document folders, click the **Documents** tab.
- To access email template folders, from Setup, enter *Email Templates* in the Quick Find box, then select **Email Templates**.

To create a folder, click **Create New Folder**.

To edit a folder, click **Edit** next to the folder name. Alternatively, select a folder name from the Folder drop-down list and click **Edit**.

 **Note:** You can modify the contents of a folder only if the folder access level is set to read/write. Only users with the “Manage Public Documents” or “Manage Public Templates” permission can delete or change a read-only folder. Regardless of permissions or folder settings, users can’t edit unfiled or personal folders. Users with the “Manage Reports in Public Folders” permission can edit all reports in public folders but not reports in other users’ personal folders.

[Creating and Editing Folders](#)

[Deleting Folders](#)

[Filing Items in Folders](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Report folders not available in: **Contact Manager, Group, and Personal Editions**

USER PERMISSIONS

To create, edit, or delete public document folders:

- “Manage Public Documents”

To create, edit, and delete public email template folders:

- “Manage Public Templates”

To create, edit, and delete public report folders:

- “Manage Reports in Public Folders”

To create, edit, and delete public dashboard folders:

- “Manage Dashboards” AND “View All Data”

Creating and Editing Folders

Click **Create New Folder** or **Edit** from most pages that list folders.

1. Enter a `Folder Label`. The label is used to refer to the folder on user interface pages.
2. If you have the “Customize Application” permission, enter a unique name to be used by the API and managed packages.
3. Choose a `Public Folder Access` option. Select read/write if you want users to be able to change the folder contents. A read-only folder can be visible to users but they can't change its contents.
4. Select an unfiled report, dashboard, or template and click **Add** to store it in the new folder. Skip this step for document folders.
5. Choose a folder visibility option:
 - `This folder is accessible by all users, including portal users` gives folder access to all users in your organization, including portal users.
 - `This folder is accessible by all users, except for portal users` gives folder access to all users in your organization, but denies access to portal users. This option is only available for report and dashboard folders in organizations with a partner portal or Customer Portal enabled. If you don't have a portal, you won't see it.
 - `This folder is hidden from all users` makes the folder private.
 - `This folder is accessible only by the following users` allows you to grant access to a desired set of users:
 - a. Choose “Public Groups”, “Roles”, “Roles and Subordinates”, “Roles, Internal and Portal Subordinates” (if you have portals enabled), “Territories,” or “Territories and Subordinates” from the `Search` drop-down list. The choices vary by Edition and whether your organization has territory management.

 **Note:** When you share a folder with a group, managers of the group members have no access to the folder unless those managers are also members of the group.
 - b. If the `Available for Sharing` list does not immediately display the desired value, enter search criteria and click **Find**.
 - c. Select the desired value from the `Available for Sharing` list and click **Add** to move the value to the `Shared To` list.

 **Note:** You can use enhanced folder sharing to give your users more detailed levels of access to reports folders and dashboard folders. For more information, see [Turn On Enhanced Sharing for Reports and Dashboards](#) and [Share a Report or Dashboard Folder](#).

6. Click **Save**.

[Managing Folders](#)

EDITIONS

Available in: **All Editions** except **Database.com**

Report folders not available in: **Contact Manager, Group, and Personal Editions**

Document folder restriction not available in: **Developer Edition**

USER PERMISSIONS

To create, edit, or delete public document folders:

- “Manage Public Documents”

To create, edit, and delete public email template folders:

- “Manage Public Templates”

To create, edit, and delete public report folders:

- “Manage Reports in Public Folders”

To create, edit, and delete public dashboard folders:

- “Manage Dashboards” AND “View All Data”

Deleting Folders

You can only delete folders that are empty. Before you begin, remove all the documents, dashboards, templates, or reports from the folder you would like to delete.

1. Click **Edit** next to the folder name from any page that lists folders. On the Reports tab, click  then **Edit** in the Folders pane.
2. Click **Delete** or  then **Delete**.
3. Click **OK** to confirm.

SEE ALSO:

[Managing Folders](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Report folders not available in: **Contact Manager, Group, and Personal Editions**

USER PERMISSIONS

To create, edit, or delete public document folders:

- "Manage Public Documents"

To create, edit, and delete public email template folders:

- "Manage Public Templates"

To create, edit, and delete public report folders:

- "Manage Reports in Public Folders"

To create, edit, and delete public dashboard folders:

- "Manage Dashboards" AND "View All Data"

Filing Items in Folders

To move a document, dashboard, report, or email template to a different folder:

1. Select the item to be stored in a folder.
2. Click **Edit Properties**.
3. Choose another folder.
4. Click **Save**.

Just like report folders contain reports and email template folders contain email templates, document folders can only contain documents. To store an attachment in a document folder, save the attachment to your computer and upload it to the document library.

 **Note:** Email templates that are used by Web-to-Case, Web-to-Lead, assignment rules, or escalation rules must be marked as “Available for Use.”

Import Your Data

Importing Overview

You can import up to 50,000 records into Salesforce from an existing data source.

 **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with `dataimporter.app` at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the **Quick Find** box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Report folders not available in: **Contact Manager, Group, and Personal Editions**

USER PERMISSIONS

To create, edit, or delete public document folders:

- “Manage Public Documents”

To create, edit, and delete public email template folders:

- “Manage Public Templates”

To create, edit, and delete public report folders:

- “Manage Reports in Public Folders”

To create, edit, and delete public dashboard folders:

- “Manage Dashboards” AND “View All Data”

EDITIONS

Available in: Salesforce Classic

Your edition determines the types of objects you can import.

You can import data from ACT!, Outlook, and any program that can save data in the comma delimited text format (.csv), such as Excel or GoldMine.

 **Note:** If commas are not appropriate for your locale, use a tab or other delimiter.

The number of records you can import depends on your permissions and the type of data you're importing. You can import as many records as allowed, as long as you don't exceed the overall data storage limits for your organization

Which records can be imported?

Type of record	Import record limit	Users with access	Overview topic
Business accounts and contacts owned by you	500 at a time	All users	What Is Imported for Business Accounts and Contacts?
Business accounts and contacts owned by different users	50,000 at a time	Administrators; Users with the "Modify All Data" permission	What Is Imported for Business Accounts and Contacts?
Person accounts owned by you	50,000 at a time	All users	What Is Imported for Person Accounts?
Person accounts owned by different users	50,000 at a time	Administrators; Users with the "Import Person Accounts" permission	What Is Imported for Person Accounts?
Leads	50,000 at a time	Administrators; Users with "Read", "Create", and "Edit" on leads and the "Import Leads" permission	What is Imported for Leads?
Campaign members	50,000 for importing leads as new campaign members and updating the status of existing campaign members.	Administrators; Marketing users (or users with the "Import Leads" permission and the "Edit" permission on campaigns) can import new leads as campaign members. Users also need the "Read" permission on contacts to use the campaign update wizard to make existing leads and contacts campaign members.	What is Imported for Campaign Members?
Custom objects	50,000 at a time	Administrators; Users with the "Modify All Data" permission	What Is Imported for Custom Objects?
Solutions	50,000 at a time	Administrators; Users with the "Import Solutions" permission	What Is Imported for Solutions?

Which records can be imported?

Type of record	Import record limit	Users with access	Overview topic
Assets	These records cannot be imported via the import wizards.

[Importing Overview](#)

What Is Imported for Business Accounts and Contacts?

The import wizards for contacts and business accounts allow you to match records in a variety of ways in order to prevent duplicates. Contacts can be matched by Salesforce ID, name, or email. Business accounts can be matched by Salesforce ID or by name and site. Matching by Salesforce ID is inclusive of both contacts and business accounts; if you match one by Salesforce ID, the other will also be matched by Salesforce ID.

Matching by Name and Site

If you choose to match contacts by name and business accounts by name and site (which are the recommended options), the import wizards automatically create a business account for each unique business account name and site in the import file. They also create a separate contact for each contact name listed in the file. The contacts are then associated with the appropriate business accounts.

If the business account or contact already exists in the system, and you have read/write access to the record, the wizards add your import data to the existing data in Salesforce. In addition, if a business account or contact name in your import file is similar to an existing business account or contact name, the import data is added to the existing data in Salesforce.

Matching by Salesforce ID

You can also choose to match contacts and business accounts by Salesforce ID. With this selected, the Salesforce ID will be the criteria for de-duplication. That is, if you are matching by ID and a record in your source file has the same ID as a record in Salesforce, then that record will be updated in Salesforce. Note that record IDs are case-sensitive and must match exactly.

Overwriting Existing Account Values

The wizards never overwrite your existing business account fields unless you check the `Overwrite existing account values` checkbox in the wizard. With this box checked, you can insert or update existing business account fields with new data.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Organization import not available in: **Personal Edition, Database.com**

However, you cannot use this checkbox to update existing field data with blank values. With this box unchecked, the wizard updates any empty business account fields, but does not touch any fields with existing data.

If you do not have read/write access to an existing business account or contact, the wizards create a new business account or contact owned by you. In addition, the wizards create new business accounts and contacts based on specific fields in your import file.

In Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, the import wizards can also import new business account and contact notes. The wizards do not import notes that are exact duplicates of existing contact or business account notes.

[Data Import Wizard](#)

[Importing My Contacts from Outlook or ACT!](#)

[Import My Contacts from Other Sources](#)

[Deciding on A Method for Importing Data](#)

[Importing Overview](#)

What Is Imported for Person Accounts?

 **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with `dataimporter.app` at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the `Quick Find` box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

The import wizards for person accounts allow you to prevent the creation of duplicate records by matching records according to one of the following fields: `Account Name`, `Salesforce ID`, or `Email`. In your import file, include a column for the field that you are using for record matching.

 **Note:** Your administrator may have renamed “person account” to another term. If so, the import wizard will refer to the new name.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Person account import available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Matching by Name

When you select this option, the import wizard will detect existing records in Salesforce that have the same name. Note that this type of matching is not case-sensitive - for example, names that begin with a capital letter will be matched with the same name that begins with a lowercase letter. If necessary, scan and standardize your custom object names before performing the import to prevent unintended matches.

Matching by Salesforce ID

A Salesforce ID is a system-generated, case-sensitive string of 15 or 18 letters and numbers that uniquely identifies each Salesforce record. When you select this option, the import wizard will detect existing records in Salesforce that have the same Salesforce ID. Note that Salesforce IDs are case-sensitive and must match exactly. Salesforce IDs can be obtained by running reports that include the ID field of the record.

Matching by Email

With this option, person accounts in your import file will be matched with existing person accounts in Salesforce according to the exact value in the `Email` field.

Matching by External ID

An external ID is a custom field that has the "External ID" attribute, meaning that it contains unique record identifiers from a system outside of Salesforce. When you select this option, the import wizard will detect existing records in Salesforce that have the same external ID. Note that this operation is not case-sensitive - for example, "ABC" will be matched with "abc". However, there is an exception: if the custom field has the separate "Unique" attribute and the case-sensitive option for that attribute is selected, uppercase and lowercase letters will not be considered identical.

If necessary, scan and standardize your external ID values before performing the import to prevent unintended matches.

When matching by external ID, if the import wizard finds duplicate records, only the first three duplicate records are reported to you in the confirmation email.

 **Note:** Only account custom fields with the "External ID" attribute are available for this step. While all custom contact fields are available on person account page layouts, custom contact fields with the "External ID" attribute are not available as matching fields during person account import.

Ignoring or Updating Matching Records

When the import wizard detects existing records in Salesforce that match according to the field you have chosen, you can choose one of the following actions:

- **Do not update existing records and only insert new records** - If there are records in your file that are new and do not match any existing records, then insert them into Salesforce. Also, ignore any records in your file that match an existing record, and do nothing to the existing record.
- **Update existing records and do not insert any new records** - If there are records in your file that match an existing record, then update the existing record. Also, ignore any records in your file that do not match an existing record, and do not insert them as new records.
- **Update existing records and insert new records** - If there are records in your file that are new and do not match any existing records, then insert them into Salesforce. Also, if there are records in your file that match an existing record, then update the existing record.

[Importing Overview](#)

What is Imported for Leads?

You can import data into the standard lead fields and into any custom lead fields you may have, even if a particular field is hidden or read only in your page layout or field-level security settings for leads.

Importing Leads With Matching Types

You can choose whether to match leads in your import file with existing leads in Salesforce. Leads can be matched according to the following types: Salesforce ID, name, or email. Choosing a matching type sets the criteria for avoiding duplicate leads. For example, if you are matching by email and a lead in your source file has the same email as a lead in Salesforce, then that lead will be updated in Salesforce. If you are not matching by email and a lead in your source file has the same email as a lead in Salesforce, then a new lead will be created.

The wizards never overwrite your existing lead fields unless you check the `Overwrite existing lead values` checkbox in the wizard. With this box checked, you can insert or update existing lead fields with new data. However, you cannot use this checkbox to update existing field data with blank values. With this box unchecked, the wizard updates any empty lead fields, but does not touch any fields with existing data.

Importing Leads Without Matching Types

If you choose a matching type of "None" in the Data Import Wizard, for each lead in your import file, the Data Import Wizard creates a new lead in Salesforce. You can merge leads after they are imported.

What is Imported for Campaign Members?

- **Data Import Wizard** - For each lead in your import file, this wizard imports the lead, associates the lead with a campaign, and inserts a `Member Status` value for the lead in that campaign. You can import data into the standard lead fields and into any custom lead fields, even if a particular field is hidden or read only in your page layout or field-level security settings. If you have duplicate leads in your import file, the wizard does not merge them. In addition, if any of the imported leads match an existing lead, the wizard does not merge the duplicate data into one lead.
- **Campaign Update Wizard** - For each contact or lead in your import file, this wizard updates only the `Member Status` value of the matching contact or lead in Salesforce. You cannot add new leads or contacts, nor can you update any other fields in the existing lead or contact records.

What Is Imported for Custom Objects?

The Data Import Wizard for custom objects allows you to prevent the creation of duplicate records by matching records according to one of the following fields: custom object name, Salesforce ID, or external ID. In your import file, include a column for the field that you are using for record matching.

Matching by Name

When you select this option, the import wizard will detect existing records in Salesforce that have the same name. Note that this type of matching is not case-sensitive - for example, names that begin with a capital letter will be matched with the same name that begins with a lowercase letter. If necessary, scan and standardize your custom object names before performing the import to prevent unintended matches.

Matching by Salesforce ID

A Salesforce ID is a system-generated, case-sensitive string of 15 or 18 letters and numbers that uniquely identifies each Salesforce record. When you select this option, the import wizard will detect existing records in Salesforce that have the same Salesforce ID. Note that Salesforce IDs are case-sensitive and must match exactly. Salesforce IDs can be obtained by running reports that include the ID field of the record.

Matching by External ID

An external ID is a custom field that has the "External ID" attribute, meaning that it contains unique record identifiers from a system outside of Salesforce. When you select this option, the import wizard will detect existing records in Salesforce that have the same external ID. Note that this operation is not case-sensitive - for example, "ABC" will be matched with "abc". However, there is an exception: if the custom field has the separate "Unique" attribute and the case-sensitive option for that attribute is selected, uppercase and lowercase letters will not be considered identical.

If necessary, scan and standardize your external ID values before performing the import to prevent unintended matches.

When matching by external ID, if the import wizard finds duplicate records, only the first three duplicate records are reported to you in the confirmation email.

Ignoring or Updating Matching Records

When the import wizard detects existing records in Salesforce that match according to the field you have chosen, you can choose one of the following actions:

- **Do not update existing records and only insert new records** - If there are records in your file that are new and do not match any existing records, then insert them into Salesforce. Also, ignore any records in your file that match an existing record, and do nothing to the existing record.
- **Update existing records and do not insert any new records** - If there are records in your file that match an existing record, then update the existing record. Also, ignore any records in your file that do not match an existing record, and do not insert them as new records.
- **Update existing records and insert new records** - If there are records in your file that are new and do not match any existing records, then insert them into Salesforce. Also, if there are records in your file that match an existing record, then update the existing record.

EDITIONS

Available in: Salesforce Classic

Custom object import available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To import custom objects:

- "Modify All Data"

 **Note:** Custom objects with two master-detail relationships cannot be imported using the import wizard.

What Is Imported for Solutions?

The Data Import Wizard allows you to prevent the creation of duplicate records by matching records according to one of the following fields: solution title, Salesforce ID, or external ID. In your import file, include a column for the field that you are using for record matching.

Matching by Solution Title

When you select this option, the import wizard will detect existing solutions in Salesforce that have the same title. Note that this type of matching is not case-sensitive - for example, titles that begin with a capital letter will be matched with the same title that begins with a lowercase letter. If necessary, scan and standardize your solution titles before performing the import to prevent unintended matches.

Matching by Salesforce ID

A Salesforce ID is a system-generated, case-sensitive string of 15 or 18 letters and numbers that uniquely identifies each Salesforce record. When you select this option, the import wizard will detect existing records in Salesforce that have the same Salesforce ID. Note that Salesforce IDs are case-sensitive and must match exactly. Salesforce IDs can be obtained by running reports that include the ID field of the record.

Matching by External ID

An external ID is a custom field that has the "External ID" attribute, meaning that it contains unique record identifiers from a system outside of Salesforce. When you select this option, the import wizard will detect existing records in Salesforce that have the same external ID. Note that this operation is not case-sensitive - for example, "ABC" will be matched with "abc". However, there is an exception: if the custom field has the separate "Unique" attribute and the case-sensitive option for that attribute is selected, uppercase and lowercase letters will not be considered identical.

If necessary, scan and standardize your external ID values before performing the import to prevent unintended matches.

When matching by external ID, if the import wizard finds duplicate records, only the first three duplicate records are reported to you in the confirmation email.

Ignoring or Updating Matching Records

When the import wizard detects existing records in Salesforce that match according to the field you have chosen, you can choose one of the following actions:

- **Do not update existing records and only insert new records** - If there are records in your file that are new and do not match any existing records, then insert them into Salesforce. Also, ignore any records in your file that match an existing record, and do nothing to the existing record.

Notes on Importing Data

- **Field Accessibility**—In the organization-wide import wizards for accounts and leads, you can import data into any standard or custom field even if it is hidden or read only in your page layout or field-level security settings. For the Import My Contacts wizard, you can import data only into the fields that are editable for you in your page layout or field-level security settings. Field-level security is available in Enterprise, Unlimited, Performance, and Developer Editions only.
- **New Values for Picklists and Multi-Select Picklists**—If your import file contains data to be displayed in picklists or multi-select picklists, the wizards warn you when you attempt to import a new picklist value that does not match any valid picklist values. If you ignore the warning, the new value is automatically added to the imported record. Your administrator can later edit the field to add the necessary values. Note that the import wizards do not allow you to import more than 100 new picklist or multi-select picklist values for any field during a single import.
If your organization uses the Translation Workbench, the import wizards look for matching translated values before creating new inactive picklist values.
- **Multi-Select Picklists**—To import multiple values into a multi-select picklist, separate the values by a semicolon in your import file.
You can import up to 100 values at a time in a multi-select picklist field. If you have more than 100 values in your import file for any one record, the import wizard leaves the field blank in that record.
- **Checkboxes**—To import data into a checkbox field, use 1 for checked values and 0 for unchecked values.
- **Default Values**—For picklist, multi-select picklist, and checkbox fields, if you do not map the field in the import wizard, the default value for the field, if any, is automatically inserted into the new or updated record.
- **Date/Time Fields**—Ensure that the format of any date/time fields you are importing matches how they display in Salesforce per your locale setting.
- **Formula Fields**—Formula fields cannot accept imported data because they are read only.
- **Field Validation Rules**—Salesforce runs validation rules on records before they are imported. Records that fail validation aren't imported. Consider deactivating the appropriate validation rules before running an import if they affect the records you are importing.

EDITIONS

Available in: **Salesforce Classic**

Your edition determines the types of objects you can import.

- **Universally Required Fields**—You must include universally required fields in your import files or the import will fail.

[Importing Overview](#)

Importing Multiple Currencies

If your organization has set up the ability to use multiple currencies, you can import amounts in different currencies.

Import My Accounts and Contacts

For personal imports, all amounts in new accounts and contacts are imported in your personal currency. When import updates amounts in existing records, the amounts in your file are converted from your personal currency to the currency of the account or contact.

For example, suppose your personal currency is U.S. dollars, and your import file has 100 as the annual revenue of an existing account with `Account Currency` of euros. The new `Annual Revenue` value of the account is EUR 92, assuming a conversion rate of 0.92 and "EUR" as the currency code for euros.

EDITIONS

Available in: Salesforce Classic

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Organization Import

When importing accounts, contacts, custom objects, leads, or solutions for your organization, you can specify the currency type for amount fields using the `Currency ISO Code` column in your import file. The following rules apply.

- **Entering currency codes** - Enter a currency code in the `Currency ISO Code` column in your import file. Currency codes are three letter codes that follow an international standard. For example, USD is the currency code for U.S. dollars. From Setup, enter *Manage Currencies* in the `Quick Find` box, then select **Manage Currencies** to see a list of valid codes for your organization.
- **Using one currency for accounts and contacts** - If you are importing accounts and contacts, the `Currency ISO Code` column applies to both an account and its associated contact. You cannot specify different currencies for associated accounts and contacts.
- **Updating the currency code** - When updating the currency code but not the currency amount for accounts and contacts, the amount isn't converted to the corresponding number in the new currency.
- **Entering inactive currencies** - If you enter an inactive currency in your import file, your personal currency is used instead. However, amounts aren't modified. For example, if your file has AUD 100 for 100 Australian dollars but AUD is an inactive currency for your organization, it's imported as USD 100, assuming your personal currency is U.S. dollars.
- **Omitting the Currency ISO Code column** - When creating records via importing, if you don't use the `Currency ISO Code` column or fail to map it, your personal currency is used. For example, if your file has 100 and your personal currency is U.S. dollars (currency code = USD), it's imported as USD 100.

When updating existing records via importing, if you don't use the `Currency ISO Code` column or fail to map it, any amounts are interpreted as having the currency of the record. For example, if your file has 100 for a record that has a currency of EUR (the currency code for euros), this amount is interpreted as EUR 100.

[Data Import Wizard](#)

Create Export Files for Import Wizards

Before you can import data into Salesforce, use your existing software to create a data export file.

An export file contains all the information you want to import.

Your export file can contain a mixture of new records and updates to existing records. You'll choose how records are matched to avoid duplication. For example, you can choose to match accounts and contacts by name or by email address. If you choose to match by email address, then the contact already in Salesforce will be updated if a record in your imported data has the same email address. However, if records have the same name but different email addresses, the records will remain separate.

1. Use your existing software to create a data export file.
 - [Exporting from ACT!](#)
 - [Exporting from LinkedIn®](#)
 - [Exporting from Outlook](#)
 - [Exporting from GoldMine 4.0](#)
 - [Exporting from GoldMine 5.0](#)
 - [Exporting from Palm Desktop](#)
 - [Exporting from Other Data Sources](#)
 - [Exporting from Salesforce](#)
2. Review data you will import to ensure that it is more up-to-date than what is already in Salesforce. Your Salesforce data will be replaced with data from your import file, even if it is out of date.
3. Compare your data fields with the Salesforce fields you can import into, and verify that your data will be mapped into the appropriate Salesforce fields. See [Preparing Your Data for Import](#) on page 607.
4. If you are the administrator and are importing for multiple users, combine export data from multiple sources into a single comma delimited text file (.csv) using Excel.

Note: When importing records from multiple users, your export file must include a `Record Owner` field for all new records which must contain the full usernames or first and last names of existing, active users. Existing record owners will not be changed; new records will be assigned to the user listed in the `Record Owner` field. For example, records that should be owned by Joe Smith in your organization must have that user's username ("jsmith@acme.com") or first and last names (for example, "Joe Smith", or "Smith Joe" for Asian locales). For lead imports, you can also specify the name of a lead queue.

When importing leads, you can alternatively use a lead assignment rule to specify the owners of the imported data, instead of using a `Record Owner` field.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Exporting from ACT!

ACT! allows you to export contact data in a text-delimited format which can then be imported. To export contact data from ACT! (versions 4.0 or 2000):

1. Launch ACT! and open your database.
2. Select **File > Data Exchange > Export...**
3. Select the file type **Text-Delimited**.
4. Choose a file name and location for the exported data and click **Next**.
5. Select **Contact records only**.
6. Click the **Options...** button.
7. Select **Comma** for the field separator character.

 **Note:** If commas are not appropriate for your locale, use a tab or other delimiter.

8. Select **Yes, export field names** and click **OK**.
9. Click **Next**.
10. Select **All Records** and then click **Next**.
11. Leave the export field order list alone, and click **Finish**.

SEE ALSO:

[Default Field Mapping for ACT!](#)

[Create Export Files for Import Wizards](#)

Exporting from LinkedIn®

You can export contact data from LinkedIn in a text-delimited format, which you can then import.

- Open www.linkedin.com/addressBookExport and follow the steps on the page using the **Microsoft Outlook (.CSV file)** option.

Exporting from Outlook

Microsoft® Outlook® allows you to export data in a CSV (comma-separated values) format which can then be imported.

1. Launch Outlook.
2. Select **File > Import and Export...**
3. Choose **Export to a file** and click **Next**.
4. Choose **Comma Separated Values (Windows)** and click **Next**.

 **Note:** If commas are not appropriate for your locale, use a tab or other delimiter.

5. Select the **Contacts** folder and click **Next**. You can select a different contacts folder if you have contacts stored in multiple folders.
6. Choose a file name for the exported data and click **Next**.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

7. Click **Finish**.

Exporting from GoldMine 4.0

GoldMine 4.0 allows you to export contact data in a text format that can be imported. Additionally, you can export GoldMine 4.0 notes for import into Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations.

- [Exporting Contacts from GoldMine 4.0](#)
- [Exporting Notes from GoldMine 4.0](#)

Exporting Contacts from GoldMine 4.0

To export contact data from GoldMine 4.0, follow these steps:

1. Launch GoldMine 4.0.
2. Choose **Export Records** from the **Tools** menu.
3. Select **Export to a new file** and **DBF file**, and click **Next**.
4. In the list of GoldMine Fields on the left side of the dialog, select all of the fields, and click **Add Field**. Then click **Next**.
5. Choose the location for the export file, and click **Next**.
6. Select **No** when asked if you want to save these settings, and click **Next**.
7. Click **Finish**.
8. After the export finishes, locate the exported file and change its file extension from .dbf to .csv. The file is now ready for import into Salesforce.

Exporting Notes from GoldMine 4.0

Before importing your GoldMine 4.0 notes into Salesforce, you must import your GoldMine 4.0 contacts.

To export notes from GoldMine 4.0, follow these steps:

1. Launch GoldMine 4.0.
2. Choose **Export Records** from the **Tools** menu.
3. Select **Export to a new file** and **ASCII file**, and click **Next**.
4. In the list of GoldMine Fields on the left side of the dialog, select the `company`, `lastname`, and `notes` fields, and click **Add Field**. Then click **Next**.
5. Choose the location for the export file, and click **Next**.
6. Select **No** when asked if you want to save these settings, and click **Next**.
7. Click **Finish**.
8. After the export finishes, locate the exported file and change its file extension to .csv.
9. Open the file.
10. Add a header column by right-clicking on the first row and choosing **Insert**.

11. In column A, enter `Company`.
12. In column B, enter `Last Name`.
13. In column C, enter `Note`.
14. If necessary, clean up the file prior to importing it. Common problems include notes that have been broken between columns (this occurs when notes contain quotation marks).

Exporting from GoldMine 5.0

GoldMine 5.0 allows you to export contact data in a text format that can be imported. Additionally, you can export GoldMine 5.0 notes for import into Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations.

- [Exporting Contacts from GoldMine 5.0](#)
- [Exporting Notes from GoldMine 5.0](#)

Exporting Contacts from GoldMine 5.0

To export contact data from GoldMine 5.0, follow these steps:

1. Launch GoldMine 5.0.
2. Choose **Tools > Import/Export Wizard > Export Contact Records**.
3. Select **Export to a new file** and **ASCII file**, and click **Next**.
4. Select **ALL Contact Records!** in the drop-down list, and click **Next**.
5. In the list of GoldMine Fields on the left side of the dialog, select the fields you want to export, and click **Add Field**. We recommend you select all fields, except the `notes` field. See [Exporting Notes from GoldMine 5.0](#) on page 605 for information on how to export notes.
6. Click **Next**.
7. Choose the location for the export file, select the **Export GoldMine field names...** checkbox, and then click **Next**.
8. Select **No** when asked if you want to save these settings, and click **Next**.
9. Click **Finish**.
10. After the export finishes, locate the exported file and change its file extension from `.txt` to `.csv`. The file is now ready for import into Salesforce.

Exporting Notes from GoldMine 5.0

Before importing your GoldMine 5.0 notes into Salesforce, you must import your GoldMine 5.0 contacts.

To export notes from GoldMine 5.0, follow these steps:

1. Launch GoldMine 5.0.
2. Choose **Tools > Import/Export Wizard > Export Contact Records**.
3. Select **Export to a new file** and **ASCII file**, and click **Next**.
4. Select **ALL Contact Records!** in the drop-down list, and click **Next**.

5. In the list of GoldMine Fields on the left side of the dialog, select the `company`, `lastname`, and `notes` fields, and click **Add Field**. Then click **Next**.
6. Choose the location for the export file, select the **Export GoldMine field names...** checkbox, and then click **Next**.
7. Select **No** when asked if you want to save these settings, and click **Next**.
8. Click **Finish**.
9. After the export finishes, locate the exported file and change its file extension from `.txt` to `.csv`.
10. Open the file.
11. If necessary, clean up the file prior to importing it. Common problems include notes that have been broken between columns (this occurs when notes contain quotation marks).

- [Field Mapping for Other Data Sources and Organization Import](#)
- [Create Export Files for Import Wizards](#)

Exporting from Palm Desktop

The Palm Desktop allows you to export your Address Book contacts in a CSV (comma-separated values) format which can then be imported.

1. Open the Address Book in the Palm Desktop. If you only want to export specific contacts, select those records.
2. Choose **Export** from the **File** menu.
3. In the "Export To File" dialog, enter a name for the file and choose a folder for it. In the **Export as** drop-down list, choose "Comma Separated (*.csv;*.txt)". Select the range of records to export - either **All** or **Currently selected records**.

 **Note:** If commas are not appropriate for your locale, use a tab or other delimiter.

4. Click **Export**.
5. In the "Specify Export Fields" dialog box, select the Address Book fields you want to export, and click **OK**.

SEE ALSO:

- [Field Mapping for Other Data Sources and Organization Import](#)
- [Create Export Files for Import Wizards](#)

Exporting from Other Data Sources

You can import data into the system from any other application that can create a CSV (comma-separated values) file.

1. Save your data source as a CSV file.

 **Note:** If commas are not appropriate for your locale, use a tab or other delimiter.

2. Ensure your file includes only one name per field. The system cannot accept more than one name per field.
3. Ensure your file separates names and titles into two fields. The system cannot accept fields containing both names and titles.

4. Ensure your file includes only one phone number per field.

SEE ALSO:

[Field Mapping for Other Data Sources and Organization Import](#)
[Create Export Files for Import Wizards](#)

Exporting from Salesforce

You can export account, contact, custom object, lead, or solution reports from Salesforce to create an import file for the import wizards. You must include the `Account ID`, `Contact ID`, `Custom Object ID`, `Lead ID`, or `Solution ID` value for each respective record in your report. These ID fields are unique Salesforce identifiers and are used to accurately match your data with existing Salesforce records.

To create an import file with these ID fields, you first need to export the data from Salesforce.

1. Run an account, contact, custom object, lead, or solution report in Salesforce, include the respective ID field, and export it to Excel.
2. If you are exporting both leads and contacts to be targeted in a campaign:
 - a. In Excel, combine the exported reports into one CSV (comma-separated values) file. Make sure all of the ID field values are in the same column.
 - b. Rename the `Lead ID/Contact ID` column to `Record Id`.
 - c. Add a column entitled `Status`, and enter the campaign member status for each contact or lead.

 **Note:** If commas are not appropriate for your locale, use a tab or other delimiter.

 **Note:** Remember that Salesforce record IDs are case-sensitive and should never be changed manually in your import file.

SEE ALSO:

[Create Export Files for Import Wizards](#)

Preparing Your Data for Import

After exporting your data from Salesforce or your existing application, prepare your data before importing it.

 **Note:** If your data has information in fields that do not match any of the standard fields, your administrator can create custom fields for that data prior to import.

You must include universally required fields in your import files or the import will fail.

Preparing Contacts

When importing from ACT! or Outlook, the Import My Contacts wizard automatically maps fields from ACT! and Outlook to Salesforce.

When importing from other data sources, you must use Excel® to label the columns in your import file as specified in [Field Mapping for Other Data Sources and Organization Import](#) on page 614.

EDITIONS

Available in: Salesforce Classic

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Preparing Person Accounts

When importing person accounts, use the field labels in Salesforce as the column labels in your import file.

Preparing Organization's Business Accounts and Contacts

When importing business accounts and contacts for your organization, you must use Excel® to label the columns in your import file as specified in [Field Mapping for Other Data Sources and Organization Import](#) on page 614.

Preparing Organization's Leads

When importing general leads or leads for campaigns, use the import file labels specified in [Field Mapping for Importing Leads](#) on page 619.

Preparing Custom Objects

When importing a custom object, use the field labels shown on the custom object detail page in Salesforce as the column labels in your import file.

Preparing Solutions

When importing solutions, use the field labels in Salesforce as the column labels in your import file.

You can enter HTML into the solutions you plan to import into Salesforce. However, unless your organization has enabled HTML solutions, HTML tags will display in the solutions after they are imported.

For security purposes, Salesforce automatically filters all HTML solutions for potentially malicious HTML. If potentially malicious HTML is detected in an HTML solution, then the potentially malicious HTML is either automatically removed or transformed into text for users who view the HTML solution. Note that users will not be able to notice when potentially malicious HTML is removed from an HTML solution.

You can import solutions written in HTML format into Salesforce. However, for security purposes, only the HTML tags listed below are allowed. The content of any HTML tags not listed below is automatically removed when saved in HTML solutions. Furthermore, the content of all `<script>` and `<iframe>` tags, as well as all JavaScript, is automatically removed when saved in HTML solutions. Additionally, Cascading Style Sheets (CSS) are not supported in HTML solutions.

The following HTML tags are allowed in HTML solutions imported into Salesforce:

<code><a></code>	<code><dt></code>	<code><q></code>
<code><abbr></code>	<code></code>	<code><samp></code>
<code><acronym></code>	<code></code>	<code><small></code>
<code><address></code>	<code><h1></code>	<code></code>
<code></code>	<code><h2></code>	<code><strike></code>
<code><bdo></code>	<code><h3></code>	<code></code>
<code><big></code>	<code><h4></code>	<code><sub></code>
<code><blockquote></code>	<code><h5></code>	<code><sup></code>
<code>
</code>	<code><h6></code>	<code><table></code>
<code><caption></code>	<code><hr></code>	<code><tbody></code>
<code><cite></code>	<code><i></code>	<code><td></code>
<code><code></code>	<code></code>	<code><tfoot></code>
<code><col></code>	<code><ins></code>	<code><th></code>

<code><colgroup></code>	<code><kbd></code>	<code><thead></code>
<code><dd></code>	<code></code>	<code><tr></code>
<code></code>	<code></code>	<code><tt></code>
<code><dfn></code>	<code><p></code>	<code></code>
<code><div></code>	<code><pre></code>	<code><var></code>
<code><dl></code>		

Within the above tags, you can include the following attributes:

<code>alt</code>	<code>face</code>	<code>size</code>
<code>background</code>	<code>height</code>	<code>src</code>
<code>border</code>	<code>href</code>	<code>style</code>
<code>class</code>	<code>name</code>	<code>target</code>
<code>colspan</code>	<code>rowspan</code>	<code>width</code>

The above attributes which can include a URL are limited to URLs that begin with the following:

- `http:`
- `https:`
- `file:`
- `ftp:`
- `mailto:`
- `#`
- `/` for relative links

Field Mapping for Other Data Sources and Organization Import

If you are importing accounts and contacts for an organization, or importing individual data from sources other than Outlook or ACT!, the Import Wizards map the fields as correctly as possible. You must fine-tune the mapping before completing the import. Before importing your data, Salesforce recommends that you use Excel to label the columns in your import file with the labels listed below. Field length limits for each object are listed in the [Salesforce Field Reference Guide](#).

 **Note:** The default mappings listed below are offered as a guide for importing; they do not ensure 100% accuracy in mapping your data. **You must fine-tune the mapping in the Import Wizards.** Remember that you can map the same field multiple times if necessary—for example, for the account and contact address fields.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Organization import not available in: **Personal Edition**, **Database.com**

Common Fields for Contacts and Accounts

Field Mapping for Importing Leads

When you import leads, the Data Import Wizard and the campaign Import Leads wizard map the fields in your import file as correctly as possible, but you must fine-tune the mapping before completing the import. Prior to importing your leads, it is recommended that you use Excel to label the columns in your lead import file with the labels listed in the following table.

 **Note:** The following default mappings are offered as a guide. They don't ensure 100% accuracy in mapping your data, so you must fine-tune the mapping in the Import Wizard.

Label for Your Import File	Salesforce Lead Field
Annual Revenue	Annual Revenue
City	City
Company	Company
Country	Country
Currency ISO Code	Lead Currency
(Note: You can use this field only for organizations that use multiple currencies; see Importing Multiple Currencies on page 601.)	
Description	Description
Email	Email
(The import wizard verifies this is a valid email address in the form: jsmith@acme.com.)	
Email Opt Out	Email Opt Out
(Use "1" to indicate that the user opts out; use "0" to indicate that the user wants emails.)	
No. of Employees	No. of Employees
Fax	Fax
Full Name or First Name & Last Name	First Name and Last Name
(Note: When importing lead names, use either Full Name or First Name and Last Name, but not both.)	
Industry	Industry
Lead Division	Lead Division

Importing My Contacts from Outlook or ACT!

Individual users can import up to 500 contacts and business accounts from Outlook or ACT! with the Import My Contacts wizard.

Important: Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with `dataimporter.app` at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the **Quick Find** box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

Before starting the Import My Contacts wizard, create an export file and correctly prepare your data. If you are not importing from ACT! or Outlook, use the instructions in [Import My Contacts from Other Sources](#).

Tip: You can only import data into fields that you can edit.

1. From your personal settings, enter *Import* in the **Quick Find** box, select **Import My Accounts & Contacts**, and click **Start the Import Wizard!**. Alternatively, click the **Import My Accounts & Contacts** link in the Tools area of the account home page.
Labels for contacts and business accounts may have been renamed by your administrator, in which case the "Import My..." links may have customized text.

2. Specify whether your data came from Act! or Outlook. Click **Next**.

3. Click **Choose File** to upload your file.

Note: Import a small test file to make sure that you've prepared your import file correctly.

4. Optionally, click **Customize Mappings** to verify field mappings.

5. Click **Import Now!** to complete your import.

You can also view the following video playlist to get more information:  [Importing Your Accounts and Contacts](#).

IN THIS SECTION:

[Import My Contacts from Other Sources](#)

With the Import My Contacts wizard, you can import up to 500 contacts and associated business accounts from almost any source.

[Importing Overview](#)

Import My Contacts from Other Sources

With the Import My Contacts wizard, you can import up to 500 contacts and associated business accounts from almost any source.

Before starting the Import My Contacts wizard, create an export file and correctly prepare your data. If you're importing from ACT! or Outlook, see [Importing My Contacts from Outlook or ACT!](#).

Your export file format must be a comma delimited text file (.csv).

 **Tip:** You can import data only into fields that you can edit.

1. From Setup, enter *Import* in the **Quick Find** box, select **Import My Accounts & Contacts**, and then click **Start the Import Process**. Alternatively, click the **Import My Accounts & Contacts** link in the Tools area of the account home page.

Your administrator can rename labels for contacts and business accounts, in which case, the "Import My..." links can have customized text.

2. Click **Next**.
3. To upload your file, click **Choose File**.

 **Note:** To make sure that you've prepared your import file correctly, import a small test file.

4. If necessary, change the default character encoding setting.
5. Choose whether duplicates will be identified by email address or name, and then click **Next**.
6. To ensure that contact data is entered into the correct fields, review the default mappings and correct any incorrect mappings, and then click **Next**.
 - You're automatically assigned as the owner for any contacts or business accounts that you import, so mapping to a **RECORD OWNER** field isn't necessary.
 - To overwrite your existing business account information with imported data, select **Overwrite existing account values**. If imported data fields are blank, existing data isn't deleted.
7. If some fields don't map, and your organization is a Professional, Enterprise, Unlimited, Performance, or Developer Edition organization, you can choose not to import unmapped fields or choose to have data from unmapped fields imported as a Note for the contact or business account. All unmapped imported data for a record is included in a single note.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To import your contacts:

- "Read", "Create", "Edit" and "Delete" on contacts
- AND
- "Modify All Data" on contacts

8. To complete your import, click **Import Now!**.

Import My Person Accounts

 **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with `dataimporter.app` at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the **Quick Find** box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

With the Import My Person Accounts wizard, you can import person accounts that you own. To understand how person account records are matched to prevent duplicates, see [What Is Imported for Person Accounts?](#) on page 595.

 **Note:** Your administrator may have renamed “person account” to another term. If so, the import wizard will refer to the new name.

Follow these steps to import your person accounts. Click each link for more details.

1. [Launch the wizard](#)
2. [xPrevent duplicate records](#) on page 624
3. [Select record types](#) on page 624
4. [Upload your import file](#) on page 624
5. [Map fields](#) on page 624
6. [Confirm and submit your import](#) on page 624
7. [Complete your import](#) on page 625

Launch the wizard

1. To import your person accounts, from your personal settings, enter *Import*, then select **Import My Person Accounts**.
Alternatively, click **Import My Person Accounts** in the Tools area of the accounts home page.
2. For best results, perform all of the steps provided on the introductory page.
3. Click **Start the Import Wizard!** to begin your import.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Person account import available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To import your own person accounts:

- “Create” on accounts

AND

“Read” on contacts

AND

“Import Personal Contacts”

AND

At least one person account record type available from your profile or permission sets

Prevent duplicate records

1. Choose the field that you are using to match existing records in Salesforce with records in your import file. The `External ID` option is disabled if no external ID fields have been created for your records.
2. Choose what you want to happen if matches are found - only import new records, only update existing records, or update existing records and import new ones.

Note: If you have chosen to match by `Salesforce ID`, you can only update existing records; you cannot import new ones.

3. Click **Next**.

Select record type

1. Choose the record type that you want to assign to the records in your import file.
2. If you are inserting new records and updating existing records at the same time, then choose whether to override the record types of existing records.
3. Click **Next**.

Upload your import file

1. Click **Browse...** to provide the location of your import file.
2. Choose the character encoding of your import file. In most cases, you can accept the default value.
3. Make additional settings depending on the setup of your organization, such as whether workflow rules will be triggered and the language of the records in the import file.
4. Click **Next**.

Map fields

1. Map the fields in your import file to the appropriate Salesforce fields by matching the fields on the left, which includes all the columns in your import file, with the appropriate Salesforce field on the right. If the column labels in your import file exactly match field labels in Salesforce, the wizard automatically maps those fields for you. However, if two or more of your file's column labels are identical matches with a field in Salesforce, you must map the fields manually.

Note: Some Salesforce fields cannot be updated using import, for example, the `Created Date` and `Last Modified Date`. So even though you may be using an exported report as your import file, some of the Salesforce fields in your file cannot be mapped.

2. Click **Next**. The import wizard warns you if you have not mapped all of the fields in your import file. Unmapped field values are not imported.

Confirm and submit your import

1. Read any warning messages that the import wizard displays. Optionally, click **Previous** to return to earlier steps and resolve potential problems.
2. Click **Import Now!** to submit your import request to Salesforce.

Complete your import

1. A message indicates approximately how long the import will take. When the import operation is finished, a message from Customer Support will be sent to the email address shown.
2. Click **Finish** to exit the wizard.
3. To monitor the status of your pending import, from Setup, click **Monitoring > Imports**.

SEE ALSO:

Import My Organization's Person Accounts

 **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with `dataimporter.app` at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the **Quick Find** box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

With the Import My Organization's Person Accounts wizard, you can import person accounts that are owned by different users. To understand how person account records are matched to prevent duplicates, see [What Is Imported for Person Accounts?](#) on page 595.

 **Note:** If the label for person accounts has been renamed for your organization, the renamed label will appear in the import wizard itself and in the Tools area of the accounts home page, but not in the Setup tree. (Renamed labels do not appear in any pages in Setup.)

Follow these steps to import person accounts for your organization.

1. [Launch the wizard](#) on page 625
2. [Prevent duplicate records](#) on page 626
3. [Specify owner and lookup relationships](#)
4. [Select record type](#) on page 626
5. [Upload your import file](#) on page 627
6. [Map fields](#) on page 627
7. [Confirm and submit your import](#) on page 627
8. [Complete your import](#) on page 627

 **Note:** The import wizard is dynamic; it displays different screens depending on what you are importing and the setup of your organization.

Launch the wizard

To import person accounts for your organization:

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Person account import available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To import your organization's person accounts:

- "Modify All Data"

1. From Setup, enter “Import Person Accounts” in the **Quick Find** box, then select **Import Person Accounts**.
Alternatively, click **Import My Organization's Person Accounts** in the Tools area of the accounts home page.
2. For best results, perform all of the steps provided on the introductory page.
3. Click **Start the Import Wizard!** to begin your import.

Prevent duplicate records

1. The import wizard can compare the records in your import file with existing records in Salesforce in order to prevent duplicate records from being created as a result of your import. Indicate whether you would like to prevent duplicate records from being created. You must select **Yes** in order to update existing records.
2. If you choose **Yes**, then additional choices will appear:
 - Choose the field that you are using to match existing records in Salesforce with records in your import file. The **External ID** option is disabled if no external ID fields have been created for your records.
 - Choose what you want to happen if matches are found—only import new records, only update existing records, or update existing records and import new ones.

 **Note:** If you have chosen to match by **Salesforce ID**, you can only update existing records; you cannot import new ones.
3. Click **Next**.

Specify owner and lookup relationships

1. Specify the field in your import file that contains person account owners.
When you choose “Name,” the following formats are valid:
 - First name followed by last name
 - Last name followed by first name
 - Alias
 - Username
2. Records can have custom fields that create lookup relationships with other records. If you have included lookup fields in your import file, then check the corresponding boxes.

 **Note:** Any related records must already exist in Salesforce before proceeding. Related records will not be updated during your import even if your import file contains different values for fields on those related records.
3. Click **Next**.

Select record type

1. Choose the record type that you want to assign to the records in your import file.
2. If you are inserting new records and updating existing records at the same time, then choose whether to override the record types of existing records.
3. Click **Next**.

Upload your import file

1. Click **Browse...** to provide the location of your import file.
2. Choose the character encoding of your import file. In most cases, you can accept the default value.
3. Make additional settings depending on the setup of your organization, such as whether workflow rules will be triggered and the language of the records in the import file.
4. Click **Next**.

Map fields

1. Map the fields in your import file to the appropriate Salesforce fields by matching the fields on the left, which includes all the columns in your import file, with the appropriate Salesforce field on the right. If the column labels in your import file exactly match field labels in Salesforce, the wizard automatically maps those fields for you. However, if two or more of your file's column labels are identical matches with a field in Salesforce, you must map the fields manually.

Note: Some Salesforce fields cannot be updated using import, for example, the `Created Date` and `Last Modified Date`. So even though you may be using an exported report as your import file, some of the Salesforce fields in your file cannot be mapped.

2. Click **Next**. The import wizard warns you if you have not mapped all of the fields in your import file. Unmapped field values are not imported.

Confirm and submit your import

1. Read any warning messages that the import wizard displays. Optionally, click **Previous** to return to earlier steps and resolve potential problems.
2. Click **Import Now!** to submit your import request to Salesforce.

Complete your import

1. A message indicates approximately how long the import will take. When the import operation is finished, a message from Customer Support will be sent to the email address shown.
2. Click **Finish** to exit the wizard.
3. To monitor the status of your pending import, from Setup, click **Monitoring > Imports**.

[Create Export Files for Import Wizards](#)

[Preparing Your Data for Import](#)

[Importing Overview](#)

Data Import Wizard

The Data Import Wizard provides a unified interface that lets you import data for a number of standard Salesforce objects, including accounts, contacts, leads, and solutions. The wizard also lets you import data for custom objects.

You can use the Data Import Wizard to import up to 50,000 records at a time.

Salesforce recommends you import using a small test file first to make sure that you have prepared your source data correctly.

The Data Import Wizard is supported in these browsers:

- Google Chrome™ versions 29 and later
- Mozilla® Firefox® versions 23 and later
- Microsoft® Internet Explorer® versions 9 and later
- Apple® Safari® versions 5 and later

Drag and drop of CSV files is not supported in Internet Explorer 9.

1. Prepare your data for import and create an import file.

Avoid errors, duplication of data, and frustration by preparing your data for import before you launch the wizard. See the FAQ item “How do I prepare my data for import?” on the Data Import Wizard welcome page for more information on preparing your data.

You can also view the following video playlist to get more information:  [Data Import How To Series](#)

2. Start the wizard.

- From Setup, enter *Data Import Wizard* in the Quick Find box, then select **Data Import Wizard**.
- Review the information provided on the welcome page, then click **Launch Wizard!**

 **Note:** Users who aren't administrators can also access the Data Import Wizard from their personal settings.

3. Choose the data that you want to import.

- Click **Standard Objects** to import accounts, contacts, leads, or solutions. Click **Custom Objects** to import custom objects.
- Specify whether you want to add new records to Salesforce, update existing records, or add and update records simultaneously.
- Specify matching and other criteria as necessary. Hover your mouse over the question marks for more information about each option.
- Specify the file that contains your data.

You can specify your data file by dragging the CSV to the upload area of the page or by clicking the CSV category you're using and then navigating to and selecting the file.
- Choose a character encoding method for your file. Most users will not need to change their character encoding.
- Click **Next**.

4. Map your data fields to Salesforce data fields.

The Data Import Wizard tries to map as many of your data fields as possible to standard Salesforce data fields. If Salesforce can't automatically map fields, however, you'll need to do it manually. Unmapped fields are not imported into Salesforce.

To see a list of standard Salesforce data fields, from the management settings for the object, go to the fields area.

EDITIONS

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To import accounts and contacts:

- “Import Personal Contacts”

To import leads:

- “Import Leads”

To import solutions:

- “Import Solutions”

To import custom objects:

- “Modify All Data”

- a. Scan the list of mapped data fields and locate any unmapped fields.
 - b. Click **Map** to the left of each unmapped field.
 - c. In the Map Your Field dialog box, choose the Salesforce field(s) you want to map to and click **Map**.
 -  **Note:** The Map Your Field dialog box also gives you the option of saving data from unmapped fields in a general notes field for accounts and contacts. To do so, choose Account Note or Contact Note from the Map To drop-down list and click **Map**.
 - d. To change mappings that Salesforce performed automatically, click **Change** to the left of the appropriate field, then choose the Salesforce field(s) you want to map to and click **Map**.
 - e. Click **Next**.
5. Review and start your import.
 - a. Review your import information on the Review page. If you still have unmapped fields that you want to import, click **Previous** to return to the previous page and specify your mappings.
 - b. Click **Start Import**.

6. Check import status.

From Setup, enter *Bulk Data Load Jobs* in the *Quick Find* box, then select **Bulk Data Load Jobs**.

-  **Note:** The Bulk Data Load Jobs page is not available in Professional Edition. Additionally, only administrators have access to the Bulk Data Load Jobs page in Salesforce Setup. If you're not an administrator, you can check the status of your upload by monitoring the relevant tabs in Salesforce.

Need help getting started? Check out www.salesforce.com/gettingstarted to access live webinars, videos, setup series and more. For hands-on help with data importing, complete the [Importing Data](#) module in Trailhead.

[How many records can I import?](#)

[What kind of objects can I import?](#)

[Can I do simultaneous imports?](#)

[How long does it take to complete an import?](#)

SEE ALSO:

[Data Import Wizard](#)

How many records can I import?

The Data Import Wizard lets you import up to 50,000 records at a time.

SEE ALSO:

[Data Import Wizard FAQ](#)

What kind of objects can I import?

You can use the Data Import Wizard to import accounts, contacts, leads, solutions, and custom objects.

SEE ALSO:

[Data Import Wizard FAQ](#)

Can I do simultaneous imports?

The Data Import Wizard does not support simultaneous—or concurrent—data import jobs. You must finish one data import before beginning the next.

SEE ALSO:

[Data Import Wizard FAQ](#)

How long does it take to complete an import?

The time it takes to complete an import using the Data Import Wizard varies, depending on the amount of data you're importing. Imports are generally not immediate, and can take up to several minutes.

If you're a Salesforce administrator, you can check the status of an import on the Bulk Downloads page. (From Setup, enter *Bulk Data Load Jobs* in the *Quick Find* box, then select **Bulk Data Load Jobs**.)

If you're not a Salesforce administrator, and you want to know the status of an import, you'll need to wait until you receive the status email. You can also monitor the import manually by checking the relevant tabs in Salesforce.

SEE ALSO:

[Data Import Wizard FAQ](#)

Using the Import Queue

Important: Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with `dataimporter.app` at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the `Quick Find` box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

Administrators can check the Import Queue to view details about an import or to cancel an organization import. Import details are removed from the queue three days after completion.

1. From Setup, enter *Imports* in the `Quick Find` box, then select **Imports**.
2. Select the file name of the import file to see the Import Queue Detail page for that file.

If you want to cancel an import, and the import has not started processing, click **Del**. You cannot cancel an import after it has started processing.

The possible values of the `Status` column are listed below:

Status	Description
Aborted	The import did not complete successfully. The error details are emailed to the user who performed the import. Aborted imports can be retried within three days, but, if multiple retry attempts are made, the import cannot remain in the queue for more than 30 days from the original import attempt.
Completed	The import completed successfully without errors.
Error	The import was processed and errors were encountered. The error details are emailed to the user who performed the import. The user can fix the errors, and then attempt the import again.
Pending	The import is in the queue but has not started processing yet.
Processing	The import is in the queue and is currently being processed.

Undoing an Import

If you import accounts, contacts, leads, or solutions by mistake, your administrator can from Setup, enter *Mass Delete Records* in the *Quick Find* box, then select **Mass Delete Records** to delete the items you mistakenly imported. View the [Using Mass Delete to Undo Imports](#) document for instructions.

The Mass Delete Records tools do not support custom objects. If you import custom objects by mistake in Enterprise, Unlimited, Performance, or Developer Edition, your administrator can use the Data Loader to mass delete the mistakenly imported records. See [Performing Mass Deletes](#) on page 644.

Data Loader

Data Loader

Data Loader is a client application for the bulk import or export of data. Use it to insert, update, delete, or export Salesforce records.

When importing data, Data Loader reads, extracts, and loads data from comma separated values (CSV) files or from a database connection. When exporting data, it outputs CSV files.

 **Note:** If commas are not appropriate for your locale, use a tab or other delimiter.

You can use Data Loader in two different ways:

- User interface—When you use the user interface, you work interactively to specify the configuration parameters, CSV files used for import and export, and the field mappings that map the field names in your import file with the field names in Salesforce.
- Command line (Windows only)—When you use the command line, you specify the configuration, data sources, mappings, and actions in files. This enables you to set up Data Loader for automated processing.

Data Loader offers the following key features:

- An easy-to-use wizard interface for interactive use
- An alternate command-line interface for automated batch operations (Windows only)
- Support for large files with up to 5 million records
- Drag-and-drop field mapping
- Support for all objects, including custom objects
- Can be used to process data in both Salesforce and Database.com
- Detailed success and error log files in CSV format
- A built-in CSV file viewer
- Support for Windows XP, Windows 7, and Mac OS X

SEE ALSO:

[Encrypt Fields](#)

[Encrypt Fields](#)

When to Use Data Loader

Data Loader complements the web-based import wizards that are accessible from the Setup menu in the online application. Refer to the following guidelines to determine which method best suits your business needs:

Use Data Loader when:

- You need to load 50,000 to 5,000,000 records. Data Loader is supported for loads of up to 5 million records. If you need to load more than 5 million records, we recommend you work with a Salesforce partner or visit the [App Exchange](#) for a suitable partner product.
- You need to load into an object that is not yet supported by the import wizards.
- You want to schedule regular data loads, such as nightly imports.
- You want to export your data for backup purposes.

Use the import wizards when:

- You are loading less than 50,000 records.
- The object you need to import is supported by import wizards. To see what import wizards are available and thus what objects they support, from Setup, enter *Data Management* in the **Quick Find** box, then select **Data Management**.
- You want to prevent duplicates by uploading records according to account name and site, contact email address, or lead email address.

For more information about the import wizards, see [Importing Overview](#) on page 591.

Install and Configure Data Loader

Considerations for Installing Data Loader

System Requirements for Windows

To use Data Loader for Windows, you need:

- Microsoft® Windows® 7 or Windows XP
- 120 MB of free disk space
- 256 MB of available memory
- Java JRE 1.6
- Sun JVM 1.6
- Administrator privileges on the machine

System Requirements for Mac OS

To use Data Loader for Mac, you need:

- Mac® OS X
- 120 MB of free disk space
- 256 MB of available memory
- Java JRE 1.6
- Sun JVM 1.6
- Administrator privileges on the machine

Installation Considerations

Over time, several versions of the Data Loader client application have been available for download.

Some earlier versions were called “AppExchange Data Loader” or “Sforce Data Loader.” You can run different versions at the same time on one computer. However, do not install more than one copy of the same version.

The latest version is always available in Salesforce. If you have installed the latest version and want to install it again, first remove the version on your computer.

 **Tip:** If you experience login issues in the command line interface after upgrading to a new version of Data Loader, please try re-encrypting your password to solve the problem. For information on the password encryption utility, see [Encrypt from the Command Line](#) on page 648.

 **Note:** The Data Loader command-line interface is supported for Windows only.

To make changes to the source code, download the open-source version of Data Loader from <https://github.com/forcedotcom/dataloader>.

Login Considerations

If your organization restricts IP addresses, logins from untrusted IPs are blocked until they’re activated. Salesforce automatically sends you an activation email that you can use to log in. The email contains a security token that you must add to the end of your password. For example, if your password is *mypassword*, and your security token is *XXXXXXXXXX*, you must enter *mypasswordXXXXXXXXXX* to log in.

EDITIONS

USER PERMISSIONS

To access the page to download Data Loader:

- “Modify All Data”

To use Data Loader:

- The appropriate user permission for the operation you are doing, for example, “Create” on accounts to insert new accounts

Configure Data Loader

Use the Settings menu to change the default operation settings of Data Loader.

1. Open the Data Loader.
2. Choose **Settings > Settings**.
3. Edit the fields as desired:

Field	Description
Batch size	In a single insert, update, upsert, or delete operation, records moving to or from Salesforce are processed in increments of this size. The maximum value is 200. We recommend a value between 50 and 100. The maximum value is 10,000 if the <code>Use Bulk API</code> option is selected.
Insert null values	Select this option to insert blank mapped values as <code>null</code> values during data operations. Note that when you are updating records, this option instructs Data Loader to overwrite any existing data in mapped fields. This option is not available if the <code>Use Bulk API</code> option is selected. Empty field values are ignored when you update records using the Bulk API. To set a field value to <code>null</code> when the <code>Use Bulk API</code> option is selected, use a field value of <code>#N/A</code> .
Assignment rule	Specify the ID of the assignment rule to use for inserts, updates, and upserts. This option applies to inserts, updates, and upserts on cases and leads. It also applies to updates on accounts if your organization has territory assignment rules on accounts. The assignment rule overrides <code>Owner</code> values in your CSV file.
Server host	Enter the URL of the Salesforce server with which you want to communicate. For example, if you are loading data into a sandbox, change the URL to <code>https://test.salesforce.com</code> .
Reset URL on Login	By default, Salesforce resets the URL after login to the one specified in <code>Server host</code> . To turn off this automatic reset, disable this option.
Compression	Compression enhances the performance of Data Loader and is turned on by default. You

EDITIONS

- Database.com

Field	Description
Timeout	<p>may want to disable compression if you need to debug the underlying SOAP messages. To turn off compression, enable this option.</p>
Query request size	<p>Specify how many seconds Data Loader waits to receive a response back from the server before returning an error for the request.</p> <p>In a single export or query operation, records are returned from Salesforce in increments of this size. The maximum value is 2,000 records. Larger values may improve performance but use more memory on the client.</p>
Generate status files for exports	<p>Select this option to generate success and error files when exporting data.</p>
Read all CSVs with UTF-8 encoding	<p>Select this option to force files to open in UTF-8 encoding, even if they were saved in a different format.</p>
Write all CSVs with UTF-8 encoding	<p>Select this option to force files to be written in UTF-8 encoding.</p>
Use European date format	<p>Select this option to support the date formats <code>dd/MM/yyyy</code> and <code>dd/MM/yyyy HH:mm:ss</code>.</p>
Allow field truncation	<p>Select this option to truncate data in the following types of fields when loading that data into Salesforce: Email, Multi-select Picklist, Phone, Picklist, Text, and Text (Encrypted).</p> <p>In Data Loader versions 14.0 and earlier, values for fields of those types are truncated by Data Loader if they are too large. In Data Loader version 15.0 and later, the load operation fails if a value is specified that is too large.</p> <p>Selecting this option allows you to specify that the previous behavior, truncation, be used instead of the new behavior in Data Loader versions 15.0 and later. This option is selected by default and has no effect in versions 14.0 and earlier.</p> <p>This option is not available if the <code>Use Bulk API</code> option is selected. In that case, the load operation fails for the row if a value is specified that is too large for the field.</p>
Use Bulk API	<p>Select this option to use the Bulk API to insert, update, upsert, delete, and hard delete records. The Bulk API is optimized to load or delete a large number of records asynchronously. It's faster than the default SOAP-based API due to parallel processing and fewer network round-trips.</p> <p> Warning: You can hard delete records when you configure Data Loader to <code>Use Bulk API</code>. Keep in mind that hard deleted records are immediately deleted and can't be recovered from the Recycle Bin.</p>

Field	Description
Enable serial mode for Bulk API	<p>Select this option to use serial instead of parallel processing for Bulk API. Processing in parallel can cause database contention. When this is severe, the load may fail. Using serial mode guarantees that batches are processed one at a time. Note that using this option may significantly increase the processing time for a load.</p> <p>This option is only available if the <code>Use Bulk API</code> option is selected.</p>
Upload Bulk API Batch as Zip File	<p>Select this option to use Bulk API to upload zip files containing binary attachments, such as Attachment records or Salesforce CRM Content.</p> <p>This option is only available if the <code>Use Bulk API</code> option is selected.</p>
Time Zone	<p>Select this option to specify a default time zone.</p> <p>If a date value does not include a time zone, this value is used.</p> <ul style="list-style-type: none"> • If no value is specified, the time zone of the computer where Data Loader is installed is used. • If an incorrect value is entered, GMT is used as the time zone and this fact is noted in the Data Loader log. <p>Valid values are any time zone identifier which can be passed to the Java <code>getTimeZone(java.lang.String)</code> method. The value can be a full name such as <code>America/Los_Angeles</code>, or a custom ID such as <code>GMT-8:00</code>.</p>
Proxy host	The host name of the proxy server, if applicable.
Proxy port	The proxy server port.
Proxy username	The username for proxy server authentication.
Proxy password	The password for proxy server authentication.
Proxy NTLM domain	The name of the Windows domain used for NTLM authentication.
Start at row	If your last operation failed, you can use this setting to begin where the last successful operation finished.

4. Click **OK** to save your settings.

SEE ALSO:

[Data Loader Behavior with Bulk API Enabled](#)

[Configure the Data Loader to Use the Bulk API](#)

Data Loader Behavior with Bulk API Enabled

Enabling the Bulk API in Data Loader allows you to load or delete a large number of records faster than using the default SOAP-based API. However, there are some differences in behavior in Data Loader when you enable the Bulk API. One important difference is that it allows you to execute a hard delete if you have the permission and license. See [Configure Data Loader](#) on page 635.

The following settings are not available on the **Settings > Settings** page in Data Loader when the `Use Bulk API` option is selected:

Insert null values

This option enables Data Loader to insert blank mapped values as `null` values during data operations when the Bulk API is disabled. Empty field values are ignored when you update records using the Bulk API. To set a field value to `null` when the `Use Bulk API` option is selected, use a field value of `#N/A`.

Allow field truncation

This option directs Data Loader to truncate data for certain field types when the Bulk API is disabled. A load operation fails for the row if a value is specified that is too large for the field when the `Use Bulk API` option is selected.

SEE ALSO:

[Configure Data Loader](#)

Configure the Data Loader to Use the Bulk API

The Bulk API is optimized to load or delete a large number of records asynchronously. It is faster than the SOAP-based API due to parallel processing and fewer network round-trips. By default, Data Loader uses the SOAP-based API to process records.

To configure Data Loader to use the Bulk API for inserting, updating, upserting, deleting, and hard deleting records:

1. Open the Data Loader.
2. Choose **Settings > Settings**.
3. Select the `Use Bulk API` option.
4. Click **OK**.

Note:

- You can also select the `Enable serial mode for Bulk API` option. Processing in parallel can cause database contention. When this is severe, the load may fail. Using serial mode guarantees that batches are processed one at a time. Note that using this option may significantly increase the processing time for a load.
- **Caution:** You can hard delete records when you configure Data Loader to `Use Bulk API`. Keep in mind that hard deleted records are immediately deleted and can't be recovered from the Recycle Bin.

Use Data Loader

Data Types Supported by Data Loader

Data Loader supports the following data types:

Base64

String path to file (converts the file to a base64–encoded array). Base64 fields are only used to insert or update attachments and Salesforce CRM Content. For more information, see [Uploading Attachments](#) on page 644 and [Upload Content with the Data Loader](#) on page 645.

Boolean

- True values (case insensitive) = `yes, y, true, on, 1`
- False values (case insensitive) = `no, n, false, off, 0`

Date Formats

We recommend you specify dates in the format `yyyy-MM-ddTHH:mm:ss.SSS+/-HHmm`:

- `yyyy` is the four-digit year
- `MM` is the two-digit month (01-12)
- `dd` is the two-digit day (01-31)
- `HH` is the two-digit hour (00-23)
- `mm` is the two-digit minute (00-59)
- `ss` is the two-digit seconds (00-59)
- `SSS` is the three-digit milliseconds (000-999)
- `+/-HHmm` is the Zulu (UTC) time zone offset

The following date formats are also supported:

- `yyyy-MM-dd'T'HH:mm:ss.SSS'Z'`
- `yyyy-MM-dd'T'HH:mm:ss.SSS Pacific Standard Time`
- `yyyy-MM-dd'T'HH:mm:ss.SSPacific Standard Time`
- `yyyy-MM-dd'T'HH:mm:ss.SSS PST`
- `yyyy-MM-dd'T'HH:mm:ss.SSSPST`
- `yyyy-MM-dd'T'HH:mm:ss.SSS GMT-08:00`
- `yyyy-MM-dd'T'HH:mm:ss.SSSGMT-08:00`
- `yyyy-MM-dd'T'HH:mm:ss.SSS -800`
- `yyyy-MM-dd'T'HH:mm:ss.SSS-800`
- `yyyy-MM-dd'T'HH:mm:ss`
- `yyyy-MM-dd HH:mm:ss`
- `yyyyMMdd'T'HH:mm:ss`
- `yyyy-MM-dd`
- `MM/dd/yyyy HH:mm:ss`
- `MM/dd/yyyy`
- `yyyyMMdd`

Note the following tips for date formats:

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

- To enable date formats that begin with the day rather than the month, select the `Use European date format` box in the Settings dialog. European date formats are `dd/MM/yyyy` and `dd/MM/yyyy HH:mm:ss`.
- If your computer's locale is east of Greenwich Mean Time (GMT), we recommend that you change your computer setting to GMT in order to avoid date adjustments when inserting or updating records.
- Only dates within a certain range are valid. The earliest valid date is 1700-01-01T00:00:00Z GMT, or just after midnight on January 1, 1700. The latest valid date is 4000-12-31T00:00:00Z GMT, or just after midnight on December 31, 4000. These values are offset by your time zone. For example, in the Pacific time zone, the earliest valid date is 1699-12-31T16:00:00, or 4:00 PM on December 31, 1699.

Double

Standard double string

ID

A Salesforce ID is a case-sensitive 15-character or case-insensitive 18-character alphanumeric string that uniquely identifies a particular record.

Tip: To ensure data quality, make sure that all Salesforce IDs you enter in Data Loader are in the correct case.

Integer

Standard integer string

String

All valid XML strings; invalid XML characters are removed.

Export Data

You can use the Data Loader export wizard to extract data from any Salesforce object. When you export, you can choose to include (**Export All**) or exclude (**Export**) soft-deleted records.

1. Open the Data Loader.
2. Click **Export** or **Export All**. These commands can also be found in the File menu.
3. Enter your Salesforce username and password. Click **Log in** to log in. After your login completes successfully, click **Next**. (Until you log out or close the program, you will not be asked to log in again.)

If your organization restricts IP addresses, logins from untrusted IPs are blocked until they're activated. Salesforce automatically sends you an activation email that you can use to log in. The email contains a security token that you must add to the end of your password. For example, if your password is `mypassword`, and your security token is `XXXXXXXXXX`, you must enter `mypasswordXXXXXXXXXX` to log in.

4. Choose an object. For example, select the Account object. If your object name does not display in the default list, check `Show all objects` to see a complete list of objects that you can access. The objects will be listed by localized label name, with developer name noted in parentheses. For object descriptions, see the [SOAP API Developer's Guide](#).
5. Click **Browse...** to select the CSV file to which the data will be exported. You can enter a new file name to create a new file or choose an existing file.

If you select an existing file, the contents of that file are replaced. Click **Yes** to confirm this action, or click **No** to choose another file.

6. Click **Next**.
7. Create a SOQL query for the data export. For example, check `Id` and `Name` in the query fields and click **Finish**. As you follow the next steps, you will see that the CSV viewer displays all the Account names and their IDs. SOQL is the Salesforce Object Query

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

USER PERMISSIONS

To export records:

- "Read" on the records

To export all records:

- "Read" on the records

Language that allows you to construct simple but powerful query strings. Similar to the SELECT command in SQL, SOQL allows you to specify the source object, a list of fields to retrieve, and conditions for selecting rows in the source object.

- a. Choose the fields you want to export.
- b. Optionally, select conditions to filter your data set. If you do not select any conditions, all the data to which you have read access will be returned.
- c. Review the generated query and edit if necessary.

 **Tip:** You can use a SOQL relationship query to include fields from a related object. For example:

```
Select Name, Pricebook2Id, Pricebook2.Name, Product2Id, Product2.ProductCode FROM PricebookEntry WHERE IsActive = true
```

Or:

```
Select Id, LastName, Account.Name FROM Contact
```

When using relationship queries in Data Loader, the fully specified field names are case-sensitive. For example, using ACCOUNT.NAME instead of Account.Name does not work.

Data Loader doesn't support nested queries or querying child objects. For example, queries similar to the following return an error:

```
SELECT Amount, Id, Name, (SELECT Quantity, ListPrice, PriceBookEntry.UnitPrice, PricebookEntry.Name, PricebookEntry.product2.Family FROM OpportunityLineItems) FROM Opportunity
```

Also, Data Loader doesn't support queries that make use of polymorphic relationships. For example, the following query results in an error:

```
SELECT Id, Owner.Name, Owner.Type, Owner.Id, Subject FROM Case
```

For more information on SOQL, see the [Force.com SOQL and SOSL Reference](#).

8. Click **Finish**, then click **Yes** to confirm.
9. A progress information window reports the status of the operation.
10. After the operation completes, a confirmation window summarizes your results. Click **View Extraction** to view the CSV file, or click **OK** to close. For more details, see [Reviewing Data Loader Output Files](#) on page 646.

 **Note:**

- Data Loader currently does not support the extraction of attachments. As a workaround, we recommend that you use the weekly export feature in the online application to export attachments.
- If you select compound fields for export in the Data Loader, they cause error messages. To export values, use individual field components.

Define Data Loader Field Mappings

When you insert, delete, or update files, use the Mapping Dialog window to associate Salesforce fields with the columns of your CSV file. For more information, see [Insert, Update, or Delete Data Using Data Loader](#) on page 642.

1. To automatically match fields with columns, click **Auto-Match Fields to Columns**. The Data Loader populates the list at the bottom of the window based on the similarity of field and column names. For a delete operation, automatic matching works only on the ID field.
2. To manually match fields with columns, click and drag fields from the list of Salesforce fields at the top to the list of CSV column header names at the bottom. For example, if you are inserting new Account records where your CSV file contains the names of new accounts, click and drag the `Name` field to the right of the `NAME` column header field.
3. Optionally, click **Save Mapping** to save this mapping for future use. Specify a name for the SDL mapping file.

If you select an existing file, the contents of that file are replaced. Click **Yes** to confirm this action, or click **No** to choose another file.

4. Click **OK** to use your mapping for the current operation.

The insert, update, upsert, delete, and hard delete wizards in Data Loader allow you to add new records, modify existing records, or delete existing records. Note that "upsert" is a combination of inserting and updating. If a record in your file matches an existing record, the existing record is updated with the values in your file. If no match is found, then the record is created as new. When you hard delete records, the deleted records are not stored in the Recycle Bin and become immediately eligible for deletion. For more information, see [Configure Data Loader](#) on page 635.

1. Open the Data Loader.
2. Click **Insert**, **Update**, **Upsert**, **Delete** or **Hard Delete**. These commands can also be found in the File menu.
3. Enter your Salesforce username and password. Click **Log in** to log in. After your login completes successfully, click **Next**. (Until you log out or close the program, you are not asked to log in again.)

If your organization restricts IP addresses, logins from untrusted IPs are blocked until they're activated. Salesforce automatically sends you an activation email that you can use to log in. The email contains a security token that you must add to the end of your password. For example, if your password is `mypassword`, and your security token is `XXXXXXXXXX`, you must enter `mypasswordXXXXXXXXXX` to log in.

4. Choose an object. For example, if you are inserting Account records, select **Account**. If your object name does not display in the default list, check `Show all objects` to see a complete list of the objects that you can access. The objects are listed by localized

label name, with developer name noted in parentheses. For object descriptions, see the [Object Reference for Salesforce and Force.com](#).

5. Click **Browse...** to select your CSV file. For example, if you are inserting Account records, you could specify a CSV file named `insertaccounts.csv` containing a `Name` column for the names of the new accounts.
6. Click **Next**. After the object and CSV file are initialized, click **OK**.
7. If you are performing an upsert:
 - a. Your CSV file must contain a column of ID values for matching against existing records. The column may be either an external ID (a custom field with the "External ID" attribute), or `Id` (the Salesforce record ID). From the drop-down list, select which field to use for matching. If the object has no external ID fields, `Id` is automatically used. Click **Next** to continue.
 - b. If your file includes the external IDs of an object that has a relationship to your chosen object, enable that external ID for record matching by selecting its name from the drop-down list. If you make no selection here, you can use the related object's `Id` field for matching by mapping it in the next step. Click **Next** to continue.
8. Define how the columns in your CSV file map to Salesforce fields. Click **Choose an Existing Map** to select an existing field mapping, or click **Create or Edit a Map** to create a new map or modify an existing map. For more details and an example of usage, see [Define Data Loader Field Mappings](#) on page 642.
9. Click **Next**.
10. For every operation, the Data Loader generates two unique CSV log files; one file name starts with "success," while the other starts with "error." Click **Browse...** to specify a directory for these files.
11. Click **Finish** to perform the operation, and then click **Yes** to confirm.
12. As the operation proceeds, a progress information window reports the status of the data movement.
13. After the operation completes, a confirmation window summarizes your results. Click **View Successes** to view your success file, click **View Errors** to open your errors file, or click **OK** to close. For more information, see [Reviewing Data Loader Output Files](#) on page 646.

 **Tip:**

- If you are updating or deleting large amounts of data, review [Perform Mass Updates](#) and [Performing Mass Deletes](#) for tips and best practices.
- There is a five-minute limit to process 100 records when the Bulk API is enabled. Also, if it takes longer than 10 minutes to process a file, the Bulk API places the remainder of the file back in the queue for later processing. If the Bulk API continues to exceed the 10-minute limit on subsequent attempts, the file is placed back in the queue and reprocessed up to 10 times before the operation is permanently marked as failed. Even if the processing failed, some records could have completed successfully, so you must check the results. If you get a timeout error when loading a file, split your file into smaller files, and try again.

Perform Mass Updates

To update a large number of records at one time, we recommend the following steps:

1. Obtain your data by performing an export of the objects you wish to update, or by running a report. Make sure your report includes the record ID.
2. As a backup measure, save an extra copy of the generated CSV file.
3. Open your working file in a CSV editor such as Excel, and update your data.
4. Launch Data Loader and follow the update wizard. Note that matching is done according to record ID. See [Insert, Update, or Delete Data Using Data Loader](#) on page 642.
5. After the operation, review your success and error log files. See [Reviewing Data Loader Output Files](#) on page 646.
6. If you made a mistake, use the backup file to update the records to their previous values.

Performing Mass Deletes

To delete a large number of records at one time using Data Loader, we recommend the following steps:

1. As a backup measure, export the records you wish to delete, being sure to select all fields. (See [Export Data](#) on page 640.) Save an extra copy of the generated CSV file.
2. Next, export the records you wish to delete, this time using only the record ID as the desired criterion.
3. Launch the Data Loader and follow the delete or hard delete wizard. Map only the ID column. See [Insert, Update, or Delete Data Using Data Loader](#) on page 642.
4. After the operation, review your success and error log files. See [Reviewing Data Loader Output Files](#) on page 646.

Uploading Attachments

You can use Data Loader to upload attachments to Salesforce. Before uploading attachments, note the following:

- If you intend to upload via the Bulk API, verify that `Upload Bulk API Batch as Zip File` on the **Settings > Settings** page is enabled.
- If you are migrating attachments from a source Salesforce organization to a target Salesforce organization, begin by requesting a data export for the source organization. On the Schedule Export page, make sure to select the `Include Attachments...` checkbox, which causes the file `Attachment.csv` to be included in your export. You can use this CSV file to upload the attachments. For more information on the export service, see [Exporting Backup Data](#) on page 684.

To upload attachments:

1. Confirm that the CSV file you intend to use for attachment importing contains the following required columns (each column represents a Salesforce field):
 - `ParentId` - the Salesforce ID of the parent record.
 - `Name` - the name of the attachment file, such as `myattachment.jpg`.
 - `Body` - the absolute path to the attachment on your local drive.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

Ensure that the values in the `Body` column contain the full file name of the attachments as they exist on your computer. For example, if an attachment named `myattachment.jpg` is located on your computer at `C:\Export`, `Body` must specify `C:\Export\myattachment.jpg`. Your CSV file might look like this:

```
ParentId,Name,Body
50030000000VDowAAG,attachment1.jpg,C:\Export\attachment1.gif
701300000000iNHAAY,attachment2.doc,C:\Export\files\attachment2.doc
```

The CSV file can also include other optional Attachment fields, such as `Description`.

2. Proceed with an insert or upsert operation; see [Insert, Update, or Delete Data Using Data Loader](#) on page 642. At the `Select data objects` step, make sure to select the `Show all Salesforce objects` checkbox and the Attachment object name in the list.

Upload Content with the Data Loader

You can use Data Loader to bulk upload documents and links into libraries in Salesforce CRM Content. Before uploading documents or links, note the following.

- If you intend to upload via the Bulk API, verify that `Upload Bulk API Batch as Zip File` on the **Settings > Settings** page is enabled.
 - When you upload a document from your local drive using Data Loader, specify the path in the `VersionData` and `PathOnClient` fields in the CSV file. `VersionData` identifies the location and extracts the format, and `PathOnClient` identifies the type of document being uploaded.
 - When you upload a link using the Data Loader, specify the URL in `ContentUrl`. Don't use `PathOnClient` or `VersionData` to upload links.
 - You can't export content using the Data Loader.
 - If you're updating content that you've already uploaded:
 - Perform the Insert function.
 - Include a `ContentDocumentId` column with an 18-character ID. Salesforce uses this information to determine that you're updating content. When you map the `ContentDocumentId`, the updates are added to the content file. If you don't include the `ContentDocumentId`, the content is treated as new, and the content file isn't updated.
1. Create a CSV file with the following fields.
 - `Title` - file name.
 - `Description` - (optional) file or link description.
 -  **Note:** If there are commas in the description, use double quotes around the text.
 - `VersionData` - complete file path on your local drive (for uploading documents only).
 -  **Note:** Files are converted to base64 encoding on upload. This action adds approximately 30% to the file size.
 - `PathOnClient` - complete file path on your local drive (for uploading documents only).
 - `ContentUrl` - URL (for uploading links only).
 - `OwnerId` - (optional) file owner, defaults to the user uploading the file.
 - `FirstPublishLocationId` - library ID.
 - `RecordTypeId` - record type ID.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

 **Note:** If you publish to a library that has restricted record types, specify `RecordTypeId`.

To determine the `RecordTypeId` values for your organization using Data Loader, follow the steps in [Exporting Data](#). The following is a sample SOQL query:

```
Select Id, Name FROM RecordType WHERE SubjectType = 'ContentVersion'
```

To determine the `RecordTypeId` values for your organization using the AJAX Toolkit:

- a. Log in to Salesforce.
- b. Enter this URL in your browser:
`http://instanceName.salesforce.com/soap/ajax/35.0/debugshell.html`. Enter the *instanceName*, such as *na1*, for your organization. You can see the *instanceName* in the URL field of your browser after logging in to Salesforce.

- c. In the AJAX Toolkit Shell page, type:

```
sforce.connection.describeSObject("ContentVersion")
```

- d. Press **Enter**.
- e. Click the arrows for `recordTypeInfo`s.

The `RecordTypeId` values for your organization are listed.

- `TagsCsv` - (optional) tag.

A sample CSV file is:

```
Title,Description,VersionData,PathOnClient,OwnerId,FirstPublishLocationId,RecordTypeId,TagsCsv
testfile,"This is a test file, use for bulk
upload",c:\files\testfile.pdf,c:\files\testfile.pdf,0050000000000000,058700000004Cd0,012300000008o2sAQG,one
```

2. Upload the CSV file for the `ContentVersion` object (see [Insert, Update, or Delete Data Using Data Loader](#) on page 642). All documents and links are available in the specified library.

Reviewing Data Loader Output Files

After every import or export, Data Loader generates two CSV output files that contain the results of the operation. One file name starts with “success,” while the other starts with “error.” During every export, Data Loader saves the extracted data to a CSV file that you specify in the wizard. Data Loader has a built-in CSV file viewer with which you can open and view these files.

To view output files from a Data Loader operation:

1. Choose **View > View CSV**.
2. Specify the number of rows to view. Each row in the CSV file corresponds to one Salesforce record. The default is 1000.
3. To view a CSV file of your choice, click **Open CSV**. To view the last success file, click **Open Success**. To view the last error file, click **Open Error**. The CSV file opens in a new window.
4. Optionally, click **Open in External Program** to open the file in the associated external program, such as Microsoft® Office Excel.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

The “success” file contains all of the records that were successfully loaded. In this file, there's a column for the newly generated record IDs. The “error” file contains all of the records that were rejected from the load operation. In this file, there's a column that describes why the load failed.

5. Click **Close** to return to the CSV Chooser window, and then click **OK** to exit the window.

 **Note:** To generate success files when exporting data, select the `Generate status files for exports` setting. For more information, see [Configure Data Loader](#) on page 635.

View the Data Loader Log File

If you need to investigate a problem with Data Loader, or if requested by Salesforce Customer Support, you can access log files that track the operations and network connections made by Data Loader.

The log file, `sd1.log`, contains a detailed chronological list of Data Loader log entries. Log entries marked “INFO” are procedural items, such as logging in to and out of Salesforce. Log entries marked “ERROR” are problems such as a submitted record missing a required field. The log file can be opened with commonly available text editor programs, such as Microsoft Notepad.

If you are using Data Loader for Windows, view the log file by entering `%TEMP%\sd1.log` in either the Run dialog or the Windows Explorer address bar.

If you are using Data Loader for Mac OSX, view the log file by opening terminal and entering `open $TMPDIR/sd1.log`.

If you are having login issues from the command line, ensure that the password provided in the configuration parameters is encrypted. If you are having login issues from the UI, you may need to obtain a new security token.

Run Batch Processes (Windows Only)

Batch Mode

 **Note:** The Data Loader command-line interface is supported for Windows only.

You can run Data Loader in batch mode from the command line. See the following topics:

- [Installed Directories and Files](#)
- [Encrypt from the Command Line](#)
- [Upgrade Your Batch Mode Interface](#)
- [Data Loader Command-Line Interface](#)
- [Configure Batch Processes](#)
- [Data Loader Process Configuration Parameters](#)
- [Data Loader Command-Line Operations](#)
- [Configure Database Access](#)
- [Map Columns](#)
- [Run Individual Batch Processes](#)
- [Data Access Objects](#)

 **Note:** If you have used the batch mode from the command line with a version earlier than 8.0, see [Upgrade Your Batch Mode Interface](#) on page 649.

EDITIONS

Installed Directories and Files

 **Note:** The Data Loader command-line interface is supported for Windows only.

In versions 8.0 and later, [installing the Data Loader](#) creates several directories under the installation directory. The following directories are involved in running the program from the command line for automated batch processing:

bin

Contains the batch files `encrypt.bat` for [encrypting passwords](#) and `process.bat` for [running batch processes](#).

For information on running the Data Loader from the command line, see [Data Loader Command-Line Interface](#) on page 649.

conf

The default configuration directory. Contains the configuration files `config.properties`, `Loader.class`, and `log-conf.xml`.

The `config.properties` file that is generated when you modify the Settings dialog in the graphical user interface is located at `C:\Documents and Settings\your Windows username\Application Data\Salesforce\Data Loader version_number`. You can copy this file to the `conf` installation directory to use it for batch processes.

samples

Contains subdirectories of sample files for reference.

File Path Convention

The file paths provided in these topics start one level below the installation directory. For example, `\bin` means `C:\Program Files\Salesforce\Data Loader version_number\bin`, provided you accepted the default installation directory. If you installed the program to a different location, please substitute that directory path as appropriate.

Encrypt from the Command Line

 **Note:** The Data Loader command-line interface is supported for Windows only.

When running Data Loader in batch mode from the command line, you must encrypt the following configuration parameters:

- `sfdc.password`
- `sfdc.proxyPassword`

Data Loader offers an encryption utility to secure passwords specified in configuration files. This utility is used to encrypt passwords, but data that you transmit using Data Loader is not encrypted.

1. Run `\bin\encrypt.bat`.
2. At the command line, follow the prompts provided to execute the following actions:

Generate a key

Key text is generated on screen from the text you provide. Carefully copy the key text to a key file, omitting any leading or trailing spaces. The key file can then be used for encryption and decryption.

Encrypt text

Generates an encrypted version of a password or other text. Optionally, you can provide a key file for the encryption. In the configuration file, make sure that the encrypted text is copied precisely and the key file is mentioned.

Verify encrypted text

Given encrypted and decrypted versions of a password, verifies whether the encrypted password provided matches its decrypted version. A success or failure message is printed to the command line.

Upgrade Your Batch Mode Interface

 **Note:** The Data Loader command-line interface is supported for Windows only.

The batch mode interface in Data Loader versions 8.0 and later aren't backward-compatible with earlier versions. If you're using a version earlier than 8.0 to run batch processes, your options are as follows:

Maintain the old version for batch use

Do not uninstall your old version of Data Loader. Continue to use that version for batch processes. You can't take advantage of newer features such as database connectivity, but your integrations will continue to work. Optionally, install the new version alongside the old version and dedicate the old version solely to batch processes.

Generate a new config.properties file from the new GUI

If you originally generated your `config.properties` file from the graphical user interface, use the new version to set the same properties and generate a new file. Use this new file with the new batch mode interface. For more information, see [Data Loader Command-Line Interface](#) on page 649.

Manually update your config.properties file

If your old `config.properties` file was created manually, you must manually update it for the new version. For more information, see [Installed Directories and Files](#) on page 648.

EDITIONS

- Database.com

Data Loader Command-Line Interface

 **Note:** The Data Loader command-line interface is supported for Windows only.

For automated batch operations such as nightly scheduled loads and extractions, run Data Loader from the command line. Before running any batch operation, be sure to include your encrypted password in the configuration file. For more information, see [Data Loader Introduction](#) on page 666 and [Encrypt from the Command Line](#) on page 648. From the command line, navigate to the `bin` directory and type `process.bat`, which takes the following parameters:

- The directory containing `config.properties`.
- The name of the batch process bean contained in `process-conf.xml`.

For more information about using `process.bat`, see [Run Individual Batch Processes](#) on page 665.

To view tips and instructions, add `-help` to the command contained in `process.bat`.

Data Loader runs whatever operation, file, or map is specified in the configuration file that you specify. If you do not specify a configuration directory, the current directory is used. By default, Data Loader configuration files are installed at the following location:

```
C:\Program Files\Salesforce\Data Loader version number\conf
```

You use the `process-conf.xml` file to configure batch processing. Set the name of the process in the bean element's `id` attribute: (for example `<bean id="myProcessName">`).

If you want to implement enhanced logging, use a copy of `log-conf.xml`.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

You can change parameters at runtime by giving `param=value` as program arguments. For example, adding `process.operation=insert` to the command changes the configuration at runtime.

You can set the minimum and maximum heap size. For example, `-Xms256m -Xmx256m` sets the heap size to 256 MB.

 **Note:** These topics only apply to Data Loader version 8.0 and later.

 **Tip:** If you experience login issues in the command line interface after upgrading to a new version of Data Loader, please try re-encrypting your password to solve the problem. For information on the password encryption utility, see [Encrypt from the Command Line](#) on page 648.

Configure Batch Processes

 **Note:** The Data Loader command-line interface is supported for Windows only.

Use `\samples\conf\process-conf.xml` to configure your Data Loader processes, which are represented by `ProcessRunner` beans. A process should have `ProcessRunner` as the `class` attribute and the following properties set in the configuration file:

name

Sets the name of the `ProcessRunner` bean. This value is also used as the non-generic thread name and for configuration backing files (see below).

configOverrideMap

A property of type `map` where each entry represents a configuration setting: the key is the setting name; the value is the setting value.

enableLastRunOutput

If set to `true` (the default), output files containing information about the last run, such as `sendAccountsFile_lastrun.properties`, are generated and saved to the location specified by `lastRunOutputDirectory`. If set to `false`, the files are not generated or saved.

lastRunOutputDirectory

The directory location where output files containing information about the last run, such as `sendAccountsFile_lastrun.properties`, are written. The default value is `\conf`. If `enableLastRunOutput` is set to `false`, this value is not used because the files are not generated.

The configuration backing file stores configuration parameter values from the last run for debugging purposes, and is used to load default configuration parameters in `config.properties`. The settings in `configOverrideMap` take precedence over those in the configuration backing file. The configuration backing file is managed programmatically and does not require any manual edits.

For the names and descriptions of available process configuration parameters, see [Data Loader Process Configuration Parameters](#) on page 651.

Data Loader Process Configuration Parameters

 **Note:** The Data Loader command-line interface is supported for Windows only.

When running Data Loader from the command line, you can specify the following configuration parameters in the `process-conf.xml` file. In some cases, the parameter is also represented in the graphical user interface at **Settings > Settings**.

 **Tip:** A sample `process-conf.xml` file can be found in the `\samples` directory that's installed with Data Loader.

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
<code>dataAccess.readUTF8</code>	boolean	Read all CSVs with UTF-8 encoding	Select this option to force files to open in UTF-8 encoding, even if they were saved in a different format. Sample value: <code>true</code>
<code>dataAccess.writeUTF8</code>	boolean	Write all CSVs with UTF-8 encoding	Select this option to force files to be written in UTF-8 encoding. Sample value: <code>true</code>
<code>dataAccess.name</code>	string	Not applicable (N/A)	Name of the data source to use, such as a CSV file name. For databases, use the name of the database configuration in <code>database-conf.xml</code> . Sample value: <code>c:\dataloader\data\extractLead.csv</code>
<code>dataAccess.readBatchSize</code>	integer	N/A	Number of records read from the database at a time. The maximum value is 200. Sample value: 50
<code>dataAccess.type</code>	string	N/A	Standard or custom data source type. Standard types are <code>csvWriter</code> , <code>csvRead</code> , <code>databaseWrite</code> , and <code>databaseRead</code> . Sample value: <code>csvWrite</code>

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
<code>dataAccess.writeBatchSize</code>	integer	N/A	Number of records written to the database at a time. The maximum value is 2,000. Note the implication for a large parameter value: if an error occurs, all records in the batch are rolled back. In contrast, if the value is set to 1, each record is processed individually (not in batch) and errors are specific to a given record. We recommend setting the value to 1 when you need to diagnose problems with writing to a database. Sample value: 500
<code>process.enableExtractStatusOutput</code>	boolean	Generate status files for exports	Select this option to generate success and error files when exporting data. Sample value: <code>true</code>
<code>process.enableLastRunOutput</code>	boolean	N/A	When running Data Loader in batch mode, you can disable the generation of output files such as <code>sendAccountsFile_lastRun.properties</code> . Files of this type are saved by default to the <code>conf</code> directory. To stop the writing of these files, set this option to <code>false</code> . Alternatively, you can change the location of the directory where these files are saved, using process.lastRunOutputDirectory . Sample value: <code>true</code>
<code>process.encryptionKeyFile</code>	string (file name)	N/A	Name of the file that contains the encryption key. See Encrypt from the Command Line on page 648. Sample value: <code>c:\dataloader\conf\my.key</code>
<code>process.initialLastRunDate</code>	date	N/A	The initial setting for the <code>process.lastRunDate</code> parameter, which can be used in a SQL string and is automatically updated when a process has run successfully. For an explanation of the date format syntax, see Date Formats on page 639. Format must be <code>yyyy-MM-ddTHH:mm:ss.SSS+/-HHmm</code> . For example: <code>2006-04-13T13:50:32.423-0700</code>

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
<code>process.lastRunOutputDirectory</code>	string (directory)	N/A	<p>When running Data Loader in batch mode, you can change the location where output files such as <code>sendAccountsFile_lastRun.properties</code> are written. Files of this type are saved by default to the <code>\conf</code> directory. To change the location, change the value of this option to the full path where the output files should be written.</p> <p>Alternatively, you can stop the files from being written, using <code>process.enableLastRunOutput</code>.</p>
<code>process.loadRowToStartAt</code>	number	Start at row	<p>If your last operation failed, you can use this setting to begin where the last successful operation finished.</p> <p>Sample value: 1008</p>
<code>process.mappingFile</code>	string (file name)	N/A	<p>Name of the field mapping file to use. See Map Columns on page 664.</p> <p>Sample value: <code>c:\dataloader\conf\accountExtractMap.sdl</code></p>
<code>process.operation</code>	string	N/A	<p>The operation to perform. See Data Loader Command-Line Operations on page 659.</p> <p>Sample value: <code>extract</code></p>
<code>process.statusOutputDirectory</code>	string (directory)	N/A	<p>The directory where “success” and “error” output files are saved. The file names are automatically generated for each operation unless you specify otherwise in <code>process-conf.xml</code>.</p> <p>Sample value: <code>c:\dataloader\status</code></p>
<code>process.outputError</code>	string (file name)	N/A	<p>The name of the CSV file that stores error data from the last operation.</p> <p>Sample value: <code>c:\dataloader\status\myProcessErrors.csv</code></p>
<code>process.outputSuccess</code>	string (file name)	N/A	<p>The name of the CSV file that stores success data from the last operation. See also <code>process.enableExtractStatusOutput</code> on page 652.</p> <p>Sample value: <code>c:\dataloader\status\myProcessSuccesses.csv</code></p>

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
<code>process.useEuropeanDates</code>	boolean	Use European date format	Select this option to support the date formats <code>dd/MM/yyyy</code> and <code>dd/MM/yyyy HH:mm:ss</code> . Sample value: <code>true</code>
<code>sfdc.assignmentRule</code>	string	Assignment rule	Specify the ID of the assignment rule to use for inserts, updates, and upserts. This option applies to inserts, updates, and upserts on cases and leads. It also applies to updates on accounts if your organization has territory assignment rules on accounts. The assignment rule overrides <code>Owner</code> values in your CSV file. Sample value: <code>03Mc00000026J7w</code>
<code>sfdc.bulkApiCheckStatusInterval</code>	integer	N/A	The number of milliseconds to wait between successive checks to determine if the asynchronous Bulk API operation is complete or how many records have been processed. See also sfdc.useBulkApi . We recommend a value of 5000. Sample value: 5000
<code>sfdc.bulkApiSerialMode</code>	boolean	Enable serial mode for Bulk API	Select this option to use serial instead of parallel processing for Bulk API. Processing in parallel can cause database contention. When this is severe, the load may fail. Using serial mode guarantees that batches are processed one at a time. Note that using this option may significantly increase the processing time for a load. See also sfdc.useBulkApi . Sample value: <code>false</code>
<code>sfdc.bulkApiZipContent</code>	boolean	Upload Bulk API Batch as Zip File	Select this option to use Bulk API to upload zip files containing binary attachments, such as Attachment records or Salesforce CRM Content. See also sfdc.useBulkApi . Sample value: <code>true</code>
<code>sfdc.connectionTimeoutSecs</code>	integer	N/A	The number of seconds to wait for a connection during API calls. Sample value: 60
<code>sfdc.debugMessages</code>	boolean	N/A	If true, enables SOAP message debugging. By default, messages are sent to STDOUT unless you specify an

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
			alternate location in <code>sfdc.debugMessagesFile</code> . Sample value: <code>false</code>
<code>sfdc.debugMessagesFile</code>	string (file name)	N/A	See process.enableExtractStatusOutput on page 652. Stores SOAP messages sent to or from Salesforce. As messages are sent or received, they are appended to the end of the file. As the file does not have a size limit, please monitor your available disk storage appropriately. Sample value: <code>\lexiloader\status\sfdcSoapTrace.log</code>
<code>sfdc.enableRetries</code>	boolean	N/A	If true, enables repeated attempts to connect to Salesforce servers. See sfdc.maxRetries on page 656 and sfdc.minRetrySleepSecs on page 656. Sample value: <code>true</code>
<code>sfdc.endpoint</code>	URL	Server host	Enter the URL of the Salesforce server with which you want to communicate. For example, if you are loading data into a sandbox, change the URL to <code>https://test.salesforce.com</code> . Sample production value: <code>https://login.salesforce.com/services/Soap/u/35.0</code>
<code>sfdc.entity</code>	string	N/A	The Salesforce object used in the operation. Sample value: <code>Lead</code>
<code>sfdc.externalIdField</code>	string	N/A	Used in upsert operations; specifies the custom field with the "External ID" attribute that is used as a unique identifier for data matching. Sample value: <code>LegacySKU__c</code>
<code>sfdc.extractionRequestSize</code>	integer	Query request size	In a single export or query operation, records are returned from Salesforce in increments of this size. The maximum value is 2,000 records. Larger values may improve performance but use more memory on the client. Sample value: <code>500</code>

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
<code>sfdc.extractionSOQL</code>	string	N/A	The SOQL query for the data export. Sample value: <code>SELECT Id, LastName, FirstName, Rating, AnnualRevenue, OwnerId FROM Lead</code>
<code>sfdc.insertNulls</code>	boolean	Insert null values	Select this option to insert blank mapped values as null values during data operations. Note that when you are updating records, this option instructs Data Loader to overwrite any existing data in mapped fields. Sample value: <code>false</code>
<code>sfdc.loadBatchSize</code>	integer	Batch size	In a single insert, update, upsert, or delete operation, records moving to or from Salesforce are processed in increments of this size. The maximum value is 200. We recommend a value between 50 and 100. Sample value: 100
<code>sfdc.maxRetries</code>	integer	N/A	The maximum number of repeated attempts to connect to Salesforce. See sfdc.enableRetries on page 655. Sample value: 3
<code>sfdc.minRetrySleepSecs</code>	integer	N/A	The minimum number of seconds to wait between connection retries. The wait time increases with each try. See sfdc.enableRetries on page 655. Sample value: 2
<code>sfdc.noCompression</code>	boolean	Compression	Compression enhances the performance of Data Loader and is turned on by default. You may want to disable compression if you need to debug the underlying SOAP messages. To turn off compression, enable this option. Sample value: <code>false</code>
<code>sfdc.password</code>	encrypted string	N/A	An encrypted Salesforce password that corresponds to the username provided in sfdc.username . See also Encrypt from the Command Line on page 648. Sample value: 4285b36161c65a22

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
<code>sfdc.proxyHost</code>	URL	Proxy host	The host name of the proxy server, if applicable. Sample value: <code>http://myproxy.internal.company.com</code>
<code>sfdc.proxyPassword</code>	encrypted string	Proxy password	An encrypted password that corresponds to the proxy username provided in <code>sfdc.proxyUsername</code> . See also Encrypt from the Command Line on page 648. Sample value: <code>4285b36161c65a22</code>
<code>sfdc.proxyPort</code>	integer	Proxy port	The proxy server port. Sample value: <code>8000</code>
<code>sfdc.proxyUsername</code>	string	Proxy username	The username for proxy server authentication. Sample value: <code>jane.doe</code>
<code>sfdc.resetUrlOnLogin</code>	boolean	Reset URL on Login	By default, Salesforce resets the URL after login to the one specified in <code>sfdc.endpoint</code> . To turn off this automatic reset, disable this option by setting it to <code>false</code> . Valid values: <code>true</code> (default), <code>false</code>
<code>sfdc.timeoutSecs</code>	integer	Timeout	Specify how many seconds Data Loader waits to receive a response back from the server before returning an error for the request. Sample value: <code>540</code>
<code>sfdc.timezone</code>	string	Time Zone	If a date value does not include a time zone, this value is used. <ul style="list-style-type: none"> If no value is specified, the time zone of the computer where Data Loader is installed is used. If an incorrect value is entered, GMT is used as the time zone and this fact is noted in the Data Loader log. Valid values are any time zone identifier which can be passed to the Java <code>getTimeZone(java.lang.String)</code> method. The value can be a full name such as <code>America/Los_Angeles</code> , or a custom ID such as <code>GMT-8:00</code> .

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
			You can retrieve the default value by running the <code>TimeZone.getDefault()</code> method in Java. This value is the time zone on the computer where Data Loader is installed.
			<p>Select this option to truncate data in the following types of fields when loading that data into Salesforce: Email, Multi-select Picklist, Phone, Picklist, Text, and Text (Encrypted).</p> <p>In Data Loader versions 14.0 and earlier, values for fields of those types are truncated by Data Loader if they are too large. In Data Loader version 15.0 and later, the load operation fails if a value is specified that is too large.</p> <p>Selecting this option allows you to specify that the previous behavior, truncation, be used instead of the new behavior in Data Loader versions 15.0 and later. This option is selected by default and has no effect in versions 14.0 and earlier.</p> <p>This option is not available if the <code>Use Bulk API</code> option is selected. In that case, the load operation fails for the row if a value is specified that is too large for the field.</p>
<code>sfdc.truncateFields</code>	boolean	Allow field truncation	Sample value: <code>true</code>
			<p>Select this option to use the Bulk API to insert, update, upsert, delete, and hard delete records. The Bulk API is optimized to load or delete a large number of records asynchronously. It's faster than the default SOAP-based API due to parallel processing and fewer network round-trips. See also sfdc.bulkApiSerialMode.</p>
<code>sfdc.useBulkApi</code>	boolean	Use Bulk API	Sample value: <code>true</code>
			<p>Salesforce username. See sfdc.password.</p>
<code>sfdc.username</code>	string	N/A	Sample value: <code>jdoe@mycompany.com</code>

Data Loader Command-Line Operations

 **Note:** The Data Loader command-line interface is supported for Windows only.

When running Data Loader in batch mode from the command line, several operations are supported. An operation represents the flow of data between Salesforce and an external data source such as a CSV file or a database. See the following list of operation names and descriptions.

Extract

Uses a [Salesforce Object Query Language](#) to export a set of records from Salesforce, then writes the exported data to a data source. Soft-deleted records are not included.

Extract All

Uses a Salesforce Object Query Language to export a set of records from Salesforce, including both existing and soft-deleted records, then writes the exported data to a data source.

Insert

Loads data from a data source into Salesforce as new records.

Update

Loads data from a data source into Salesforce, where existing records with matching ID fields are updated.

Upsert

Loads data from a data source into Salesforce, where existing records with a matching custom external ID field are updated; records without matches are inserted as new records.

Delete

Loads data from a data source into Salesforce, where existing records with matching ID fields are deleted.

Hard Delete

Loads data from a data source into Salesforce, where existing records with matching ID fields are deleted without being stored first in the Recycle Bin.

Configure Database Access

 **Note:** The Data Loader command-line interface is supported for Windows only.

When you run Data Loader in batch mode from the command line, use `\samples\conf\database-conf.xml` to configure database access objects, which you use to extract data directly from a database.

DatabaseConfig Bean

The top-level database configuration object is the `DatabaseConfig` bean, which has the following properties:

sqlConfig

The [SQL configuration bean](#) for the data access object that interacts with a database.

dataSource

The bean that acts as database driver and authenticator. It must refer to an implementation of `javax.sql.DataSource` such as `org.apache.commons.dbcp.BasicDataSource`.

The following code is an example of a `DatabaseConfig` bean:

```
<bean id="AccountInsert"
      class="com.salesforce.dataloader.dao.database.DatabaseConfig"
```

Available in:

- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

```

    singleton="true">
    <property name="sqlConfig" ref="accountInsertSql"/>
</bean>

```

DataSource

The `DataSource` bean sets the physical information needed for database connections. It contains the following properties:

driverClassName

The fully qualified name of the implementation of a JDBC driver.

url

The string for physically connecting to the database.

username

The username for logging in to the database.

password

The password for logging in to the database.

Depending on your implementation, additional information may be required. For example, use `org.apache.commons.dbcp.BasicDataSource` when database connections are pooled.

The following code is an example of a `DataSource` bean:

```

<bean id="oracleRepDataSource"
    class="org.apache.commons.dbcp.BasicDataSource"
    destroy-method="close">
    <property name="driverClassName" value="oracle.jdbc.driver.OracleDriver"/>
    <property name="url" value="jdbc:oracle:thin:@myserver.salesforce.com:1521:TEST"/>
    <property name="username" value="test"/>
    <property name="password" value="test"/>
</bean>

```

Versions of Data Loader from API version 25.0 onwards do not come with an Oracle JDBC driver. Using Data Loader to connect to an Oracle data source without a JDBC driver installed will result in a “Cannot load JDBC driver class” error. To add the Oracle JDBC driver to Data Loader:

- Download the latest JDBC driver from <http://www.oracle.com/technetwork/database/features/jdbc/index-091264.html>.
- Copy the JDBC.jar file to `data loader install folder/java/bin`.

[Spring Framework](#)
[Data Access Objects](#)
[SQL Configuration](#)

Spring Framework

 **Note:** The Data Loader command-line interface is supported for Windows only.

The Data Loader configuration files are based on the [Spring Framework](#), which is an open-source, full-stack Java/J2EE application framework.

The Spring Framework allows you to use XML files to configure beans. Each bean represents an instance of an object; the parameters correspond to each object's setter methods. A typical bean has the following attributes:

id

Uniquely identifies the bean to `XmlBeanFactory`, which is the class that gets objects from an XML configuration file.

class

Specifies the implementation class for the bean instance.

For more information on the Spring Framework, see [the official documentation](#) and the [support forums](#). Note that Salesforce cannot guarantee the availability or accuracy of external websites.

SEE ALSO:

[Configure Database Access](#)

Data Access Objects

 **Note:** The Data Loader command-line interface is supported for Windows only.

When running Data Loader in batch mode from the command line, several data access objects are supported. A data access object allows access to an external data source outside of Salesforce. They can implement a read interface (`DataReader`), a write interface (`DataWriter`), or both. See the following list of object names and descriptions.

csvRead

Allows the reading of a comma or tab-delimited file. There should be a header row at the top of the file that describes each column.

csvWrite

Allows writing to a comma-delimited file. A header row is added to the top of the file based on the column list provided by the caller.

databaseRead

Allows the reading of a database. Use `database-conf.xml` to configure database access.

databaseWrite

Allows writing to a database. Use `database-conf.xml` to configure database access.

SQL Configuration

 **Note:** The Data Loader command-line interface is supported for Windows only.

When running Data Loader in batch mode from the command line, the `SqlConfig` class contains configuration parameters for accessing specific data in the database. As shown in the code samples below, queries and inserts are different but very similar. The bean must be of type `com.salesforce.dataloader.dao.database.SqlConfig` and have the following properties:

sqlString

The SQL code to be used by the data access object.

The SQL can contain replacement parameters that make the string dependent on configuration or operation variables. Replacement parameters must be delimited on both sides by "@" characters. For example, `@process.lastRunDate@`.

sqlParams

A property of type `map` that contains descriptions of the replacement parameters specified in `sqlString`. Each entry represents one replacement parameter: the key is the replacement parameter's name, the value is the fully qualified Java type to be used when the parameter is set on the SQL statement. Note that "java.sql" types are sometimes required, such as `java.sql.Date` instead of `java.util.Date`. For more information, see [the official JDBC API documentation](#).

columnNames

Used when queries (SELECT statements) return a `JDBC ResultSet`. Contains column names for the data outputted by executing the SQL. The column names are used to access and return the output to the caller of the `DataReader` interface.

SQL Query Bean Example

```
<bean id="accountMasterSql"
  class="com.salesforce.dataloader.dao.database.SqlConfig"
  singleton="true">
  <property name="sqlString"/>
  <value>
    SELECT distinct
      '012x00000000Ij7' recordTypeId,
      accounts.account_number,
      org.organization_name,
      concat (concat(parties.address1, ' '), parties.address2) billing_address,

      locs.city,
      locs.postal_code,
      locs.state,
      locs.country,
      parties.sic_code
    from
      ar.hz_cust_accounts accounts,
      ar.hz_organization_profiles org,
      ar.hz_parties parties,
      ar.hz_party_sites party_sites,
      ar.hz_locations locs
    where
      accounts.PARTY_ID = org.PARTY_ID
      and parties.PARTY_ID = accounts.PARTY_ID
      and party_sites.PARTY_ID = accounts.PARTY_ID
```

```

        and locs.LOCATION_ID = party_sites.LOCATION_ID
        and (locs.last_update_date > @process.lastRunDate@ OR
accounts.last_update_date > @process.lastRunDate@
    </value>
</property>
<property name="columnNames">
    <list>
        <value>recordTypeId</value>
        <value>account_number</value>
        <value>organization_name</value>
        <value>billing_address</value>
        <value>city</value>
        <value>postal_code</value>
        <value>state</value>
        <value>country</value>
        <value>sic_code</value>
    </list>
</property>
<property name="sqlParams">
    <map>
        <entry key="process.lastRunDate" value="java.sql.Date"/>
    </map>
</property>
</bean>

```

SQL Insert Bean Example

```

<bean id="partiesInsertSql"
    class="com.salesforce.dataloader.dao.database.SqlConfig"
    singleton="true">
    <property name="sqlString"/>
        <value>
            INSERT INTO REP.INT_PARTIES (
                BILLING_ADDRESS, SIC_CODE)
            VALUES (@billing_address@, @sic_code@)
        </value>
    </property>
    <property name="sqlParams"/>
        <map>
            <entry key="billing_address" value="java.lang.String"/>
            <entry key="sic_code" value="java.lang.String"/>
        </map>
    </property>
</bean>

```

SEE ALSO:

[Configure Database Access](#)

Map Columns

 **Note:** The Data Loader command-line interface is supported for Windows only.

When running Data Loader in batch mode from the command line, you must create a properties file that maps values between Salesforce and data access objects.

1. Create a new mapping file and give it an extension of `.sdl`.
2. Observe the following syntax:
 - On each line, pair a data source with its destination.
 - In an import file, put the data source on the left, an equals sign (=) as a separator, and the destination on the right. In an export file, put the destination on the left, an equals sign (=) as a separator, and the data source on the right.
 - Data sources can be either column names or constants. Surround constants with double quotation marks, as in "sampleconstant". Values without quotation marks are treated as column names.
 - Destinations must be column names.
 - You may map constants by surrounding them with double quotation marks, as in:

```
"Canada"=BillingCountry
```

3. In your configuration file, use the parameter `process.mappingFile` to specify the name of your mapping file.

 **Note:** If your field name contains a space, you must escape the space by prepending it with a backslash (\). For example:

```
Account\ Name=Name
```

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

Column Mapping Example for Data Insert

The Salesforce fields are on the right.

```
SLA__C=SLA__c
BILLINGCITY=BillingCity
SYSTEMMODSTAMP=
OWNERID=OwnerId
CUSTOMERPRIORITY__C=CustomerPriority__c
ANNUALREVENUE=AnnualRevenue
DESCRIPTION=Description
BILLINGSTREET=BillingStreet
SHIPPINGSTATE=ShippingState
```

Column Mapping Example for Data Export

The Salesforce fields are on the left.

```
Id=account_number
Name=name
Phone=phone
```

Column Mapping for Constant Values

Data Loader supports the ability to assign constants to fields when you insert, update, and export data. If you have a field that should contain the same value for each record, you specify that constant in the `.sdl` mapping file instead of specifying the field and value in the CSV file or the export query.

The constant must be enclosed in double quotation marks. For example, if you're importing data, the syntax is

```
"constantvalue"=field1.
```

If you have multiple fields that should contain the same value, you must specify the constant and the field names separated by commas. For example, if you're importing data, the syntax would be `"constantvalue"=field1, field2`.

Here's an example of an `.sdl` file for inserting data. The Salesforce fields are on the right. The first two lines map a data source to a destination field, and the last three lines map a constant to a destination field.

```
Name=Name
NumEmployees=NumberOfEmployees
"Aerospace"=Industry
"California"=BillingState, ShippingState
"New"=Customer_Type__c
```

A constant must contain at least one alphanumeric character.

 **Note:** If you specify a constant value that contains spaces, you must escape the spaces by prepending each with a backslash (\). For example:

```
"Food\ &\ Beverage"=Industry
```

Run Individual Batch Processes

 **Note:** The Data Loader command-line interface is supported for Windows only.

To start an individual batch process, use `\bin\process.bat`, which requires the following parameters:

A configuration directory

The default is `\conf`.

To use an alternate directory, create a new directory and add the following files to it:

- If your process is not interactive, copy `process-conf.xml` from `\samples\conf`.
- If your process requires database connectivity, copy `database-conf.xml` from `\samples\conf`.
- Copy `config.properties` from `\conf`.

A process name

The name of the ProcessRunner bean from `\samples\conf\process-conf.xml`.

Process Example

```
process ../conf accountMasterProcess
```

 **Note:** You can configure external process launchers such as the Microsoft Windows XP Scheduled Task Wizard to run processes on a schedule.

Command-Line Quick Start (Windows Only)

Data Loader Introduction

 **Note:** The Data Loader command-line interface is supported for Windows only.

In addition to using Data Loader interactively to import and export data, you can run it from the command line. You can use commands to automate the import and export of data.

This quick start shows you how to use the Data Loader command-line functionality to import data. Follow these steps.

- [Step 1: Create the encryption key](#)
- [Step 2: Create the encrypted password for your login username](#)
- [Step 3: Create the Field Mapping File](#)
- [Step 4: Create a `process-conf.xml` file that contains the import configuration settings](#)
- [Step 5: Run the process and import the data](#)

Prerequisites

 **Note:** The Data Loader command-line interface is supported for Windows only.

To step through this quick start requires the following:

- Data Loader installed on the computer that runs the command-line process.
- The Java Runtime Environment (JRE) installed on the computer that runs the command-line process.
- Familiarity with importing and exporting data by using the Data Loader interactively through the user interface. This makes it easier to understand how the command-line functionality works.

 **Tip:** When you install Data Loader, sample files are installed in the samples directory. This directory is found below the program directory, for example, `C:\Program Files (x86)\salesforce.com\Apex Data Loader 22.0\samples\`. Examples of files that are used in this quick start can be found in the `\samples\conf` directory.

Step One: Create the Encryption Key

 **Note:** The Data Loader command-line interface is supported for Windows only.

When you use Data Loader from the command line, there's no user interface. Therefore, you need to provide the information that you would normally enter in the user interface by using a text file named `process-conf.xml`. For example, you add the username and password that Data Loader uses to log in to Salesforce. The password must be encrypted before you add it to the `process-conf.xml` file, and creating the key is the first step in that process.

1. Open a command prompt window by clicking **Start > All Programs > Accessories > Command Prompt**. Alternatively, you can click **Start > Run**, enter `cmd` in the **Open** field, and click **OK**.

- In the command window, enter `cd \` to navigate to the root directory of the drive where Data Loader is installed.
- Navigate to the Data Loader `\bin` directory by entering this command. Be sure to replace the file path with the path from your system.

```
cd C:\Program Files (x86)\salesforce.com\Apex Data Loader 22.0\bin
```

- Create an encryption key by entering the following command. Replace `<seedtext>` with any string.

```
encrypt.bat -g <seedtext>
```

Note: To see a list of command-line options for `encrypt.bat`, type `encrypt.bat` from the command line.

- Copy the generated key from the command window to a text file named `key.txt` and make a note of the file path. In this example, the generated key is `e8a68b73992a7a54`.

Note: Enabling quick edit mode on a command window can make it easier to copy data to and from the window. To enable quick edit mode, right-click the top of the window and select **Properties**. On the **Options** tab, select **QuickEdit Mode**.

The encryption utility is used to encrypt passwords, but data that you transmit using Data Loader is not encrypted.

SEE ALSO:

[Step Two: Create the Encrypted Password](#)

Step Two: Create the Encrypted Password

Note: The Data Loader command-line interface is supported for Windows only.

In this step, you create the encrypted password using the key that you generated in the previous step.

- In the same command prompt window, enter the following command. Replace `<password>` with the password that Data Loader uses to log in to Salesforce. Replace `<filepath>` with the file path to the `key.txt` file that you created in the previous step.

```
encrypt.bat -e <password> "<filepath>\key.txt"
```

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

2. Copy the encrypted password that is generated by the command. You use this value in a later step.

SEE ALSO:

[Step Three: Create the Field Mapping File](#)

Step Three: Create the Field Mapping File

 **Note:** The Data Loader command-line interface is supported for Windows only.

The field mapping file associates data sources with destinations. This is a text file, typically with an `.sdl` file extension.

1. Copy the following to a text file and save it with a name of `accountInsertMap.sdl`. This is a data insert, so the data source is on the left of the equals sign and the destination field is on the right.

```
#Mapping values
#Thu May 26 16:19:33 GMT 2011
Name=Name
NumberOfEmployees=NumberOfEmployees
Industry=Industry
```

 **Tip:** For complex mappings, you can use the Data Loader user interface to map source and destination fields and then save those mappings to an `.sdl` file. This is done on the Mapping dialog box by clicking **Save Mapping**.

SEE ALSO:

[Step Four: Create the Configuration File](#)

Step Four: Create the Configuration File

 **Note:** The Data Loader command-line interface is supported for Windows only.

The `process-conf.xml` file contains the information that Data Loader needs to process the data. Each `<bean>` in the `process-conf.xml` file refers to a single process such as an insert, upsert, export, and so on. Therefore, this file can contain multiple processes. In this step, you edit the file to insert accounts into Salesforce.

1. Make a copy of the `process-conf.xml` file from the `\samples\conf` directory. Be sure to maintain a copy of the original because it contains examples of other types of Data Loader processing such as upserts and exports.
2. Open the file in a text editor, and replace the contents with the following XML:

```
<!DOCTYPE beans PUBLIC "-//SPRING//DTD BEAN//EN"
"http://www.springframework.org/dtd/spring-beans.dtd">
<beans>
```

      <entry key="sfdc.entity" value="Account"/>
      <entry key="process.operation" value="insert"/>
      <entry key="process.mappingFile"
        value="C:\DLTest\Command Line\Config\accountInsertMap.sdl"/>
      <entry key="dataAccess.name"
        value="C:\DLTest\In\insertAccounts.csv"/>
      <entry key="process.outputSuccess"
        value="c:\DLTest\Log\accountInsert_success.csv"/>
      <entry key="process.outputError"
        value="c:\DLTest\Log\accountInsert_error.csv"/>
      <entry key="dataAccess.type" value="csvRead"/>
      <entry key="process.initialLastRunDate"
        value="2005-12-01T00:00:00.000-0800"/>
    </map>
  </property>
</bean>
</beans>

```

3. Modify the following parameters in the `process-conf.xml` file. For more information about the process configuration parameters, see [Data Loader Process Configuration Parameters](#) on page 651.

- `sfdc.endpoint`—Enter the URL of the Salesforce instance for your organization; for example, `https://na1.salesforce.com`.
- `sfdc.username`—Enter the username Data Loader uses to log in.
- `sfdc.password`—Enter the encrypted password value that you created in step 2.
- `process.mappingFile`—Enter the path and file name of the mapping file.
- `dataAccess.Name`—Enter the path and file name of the data file that contains the accounts that you want to import.
- `sfdc.debugMessages`—Currently set to `true` for troubleshooting. Set this to `false` after your import is up and running.
- `sfdc.debugMessagesFile`—Enter the path and file name of the command line log file.

- `process.outputSuccess`—Enter the path and file name of the success log file.
- `process.outputError`—Enter the path and file name of the error log file.

 **Warning:** Use caution when using different XML editors to edit the `process-conf.xml` file. Some editors add XML tags to the beginning and end of the file, which causes the import to fail.

 **Note:** The Data Loader command-line interface is supported for Windows only.

Now that all the pieces are in place, you can run Data Loader from the command line and insert some new accounts.

1. Copy the following data to a file name `accountInsert.csv`. This is the account data that you import into your organization.

```
Name, Industry, NumberOfEmployees
Dickenson plc, Consulting, 120
GenePoint, Biotechnology, 265
Express Logistics and Transport, Transportation, 12300
Grand Hotels & Resorts Ltd, Hospitality, 5600
```

2. In the command prompt window, enter the following command:

```
process.bat "<file path to process-conf.xml>" <process name>
```

- Replace `<file path to process-conf.xml>` with the path to the directory containing `process-conf.xml`.
- Replace `<process name>` with the process specified in `process-conf.xml`.

Your command should look something like this:

```
process.bat "C:\DLTest\Command Line\Config" accountInsert
```

After the process runs, the command prompt window displays success and error messages. You can also check the log files:

`insertAccounts_success.csv` and `insertAccounts_error.csv`. After the process runs successfully, the

`insertAccounts_success.csv` file contains the records that you imported, along with the ID and status of each record.

For more information about the status files, see [Reviewing Data Loader Output Files](#) on page 646.

Data Loader Third-Party Licenses

Can I mass upload data into Salesforce?

Group, Professional, Performance, Unlimited, Enterprise, and Developer editions have the Data Import Wizard for accounts, contacts, leads, and custom objects that allow you to mass import data. To access them, from Setup, click **Data Management**. In addition, Performance, Unlimited, Enterprise, and Developer editions have API access to use database mass upload tools like Data Loader.

Should I sync Outlook or use import wizards to upload my data into Salesforce?

Use the following information to determine how to upload data into your Salesforce organization.

- To upload accounts and contacts for multiple users at the same time, use the Data Import Wizard, and select **Accounts and Contacts**.
 - To upload your contacts from any application other than Microsoft Outlook, use the Data Import Wizard, and select **Accounts and Contacts**.
 - To keep your Outlook contacts, accounts, and calendar events up-to-date with Salesforce, we recommend that you use Exchange Sync or Salesforce for Outlook to initially sync your data and for all subsequent updates.
 - To upload custom objects, leads, and solutions, use the Data Import Wizard and select the appropriate object to import those kinds of records into Salesforce. You can't sync those records using Exchange Sync or Salesforce for Outlook.
 - To upload business accounts and contacts for multiple users at the same time, use the Data Import Wizard, and select **Accounts and Contacts**.
 - To upload person accounts, use the Import My Person Accounts wizard.
-  **Note:** When you import person accounts, the following limitations apply.
- The unified Data Import Wizard doesn't support person accounts.
 - You can't upload person accounts by using Salesforce for Outlook.

- You can sync contacts in Outlook to person accounts in Salesforce only if the person accounts already exist. (Syncing doesn't convert Outlook contacts to person accounts in Salesforce.)

For more information about importing person accounts, see [Import My Person Accounts](#) on page 623.

Who in my organization can use the import wizards?

All users in your organization can use the Import My Contacts wizard. In Enterprise, Unlimited, Performance, or Developer Edition organizations with person accounts enabled, all users can use the Import My Person Accounts wizard.

Only an administrator can use the organization-wide Data Import Wizard to import accounts, contacts, leads, solutions, or custom objects for multiple users at one time. In Personal Edition, the Data Import Wizard isn't available. In Contact Manager Edition, leads and solutions in the Data Import Wizard aren't available. In Group Edition, solutions in the Data Import Wizard isn't available.

! **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with `dataimporter.app` at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the **Quick Find** box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

What permissions do I need to import records?

Data Loader

To import records with the Data Loader, you need "Create" permission on the record you want to import.

Import Wizard for Records You Own

Records being imported	Access needed
My Contacts	"Import Personal Contacts"
My Person Accounts	"Create" on accounts AND "Read" on contacts AND "Import Personal Contacts" AND At least one person account record type available from your profile or permission sets

Import Wizard for Records Owned By Other Users

Records being imported	Access needed
My Organization's Accounts and Contacts	Administrators Users with "Modify All Data" permission

Records being imported	Access needed
My Organization's Person Accounts	Any user with "Modify All Data" permission
My Organization's Leads	"Read", "Create", and "Edit" on leads AND "Import Leads"
My Organization's Solutions	Any user with "Import Solutions" permission
My Organization's Custom Objects	Any user with "Import Custom Objects" permission

Import Wizard for Campaign Members

Records being imported	Access needed
New Campaign Members (Data Import Wizard)	"Edit" on campaigns AND Marketing User checked in your user information AND "Import Leads"
Updated Campaign Members (Campaign Update Wizard)	"Edit" on campaigns AND "Import Leads" AND "Read" on contacts Marketing User checked in your user information

 **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with `dataimporter.app` at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the Quick Find box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

What file formats can the import wizards handle?

You can import contacts and business accounts directly from an ACT! or Outlook file, or from any CSV (comma-separated values) file, such as a GoldMine or Excel file. You can import leads, solutions, custom objects, or person accounts from any CSV file.

 **Note:** If commas are not appropriate for your locale, use a tab or other delimiter.

What data can be imported?

You can use import wizards to import the following records:

Contacts and business accounts

Use the Import My Contacts wizard and the Data Import Wizard to import contacts and business accounts.

In Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, you can also import contact and business account notes.

Person accounts

In Enterprise, Unlimited, Performance, and Developer Edition organizations, use the Import My Person Accounts wizard to import person accounts that you own. Administrators can use the Import My Organization's Person Accounts wizard to import person accounts for multiple users.

Leads

In Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, use the Data Import Wizard to import leads.

Solutions

In Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, use the Data Import Wizard to import solutions.

Custom objects

In Contact Manager, Group, Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, use the Data Import Wizard to import custom objects.

In the Data Import Wizard for accounts, contacts, leads, solutions, and custom objects, administrators can import into any of the listed fields, even if a field is hidden or read-only in their page layout or field-level security settings. Individual users can import only into the fields that are accessible to them via their page layout or field-level security settings.

Import wizards for other records are not available.

 **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with `dataimporter.app` at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the Quick Find box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

Are there size restrictions on my import data?

Yes. Your import file cannot exceed 100MB in size, and each record in the file cannot be bigger than 400KB. In addition, each imported note and each imported description cannot exceed 32KB. Descriptions longer than 32KB are truncated.

In addition to the import file limits, your import is also subject to the overall storage limits for your organization. Note that the size of your import file does not directly correlate to the storage space needed for those records. For example, an import file of 50MB in size may not create 50MB of data in Salesforce.

 **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with `dataimporter.app` at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the Quick Find box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

Why can't I log in to Data Loader?

If you're having trouble logging in to Data Loader, try the following solutions.

- Add a security key to the end of your password to log in to Data Loader.
- Change the `server host` to point to the appropriate server in Data Loader by following these steps:
 1. Start the Data Loader.
 2. Navigate to **Settings > Settings**.

3. Set `Server host` to `https://instance_name.salesforce.com`, where `instance_name` is the Salesforce instance you're on.
 4. Click **OK** to save your settings.
- Ask your administrator whether you're working behind a proxy server. If so, adjust your Data Loader settings. If you're using APIs that are behind a proxy server, the proxy server prevents the APIs from connecting with Salesforce servers; you won't see information about the APIs under Login History.
 - Try to log in on another computer to verify that your local device settings aren't causing the problem.

Why isn't Data Loader importing special characters?

If Data Loader fails to import special characters such as ö, ñ, or é, your source data file might not be properly encoded. To ensure the file is properly encoded:

1. Make any modifications to your source data file in .xls format.
2. In Microsoft® Excel®, save a copy of your file as a Unicode Text file.
3. Open the Unicode Text file you just saved with a text editor.
4. Click **File** > **Save As** to change the following file settings:
 - File name extension—`.csv`
 - Save as type—**All Files**
 - Encoding—**UTF-8**
5. Click **Save**, and close the file.

Note: Don't open the file after you have saved the settings or you may revert the encoding changes.

6. Import the data using Data Loader as you normally would, and select the newly created .csv file.

Can I import into custom fields?

Yes. Your administrator must create the custom fields prior to import.

For checkbox fields, records with a value of 1 in the field are imported as checked while a value of 0 is not checked.

SEE ALSO:

[Importing Overview](#)

Can I import into fields that are not on my page layout?

No. You can import only into the fields that are accessible to you via your page layout or field-level security settings. However, in the organization-wide import wizards for accounts, contacts, leads, solutions, and custom objects, administrators have access to import into any of the listed fields, even if a field is hidden or read-only in their page layout or field-level security settings.

Important: Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with `dataimporter.app` at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the Quick Find box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

Can I import data into a picklist field if the values don't match?

We recommend that you import your data into an existing picklist when that picklist accurately represents your data, even if the exact values don't match. The import wizards warn you before importing any new picklist values. However, the wizards accept any value for a picklist field, even if the value isn't predefined. Your administrator can later edit the picklist to include the needed values. Note that the import wizards don't allow you to import more than 100 new picklist or multi-select picklist values for any field during a single import.

 **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with `dataimporter.app` at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the Quick Find box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

Can I delete my imported data if I make a mistake?

Your administrator can from Setup, enter *Mass Delete Records* in the Quick Find box, then select **Mass Delete Records** to perform a mass delete of accounts, contacts, leads, or solutions that you mistakenly imported. You cannot mass delete mistakenly imported custom objects.

View the [Using Mass Delete to Undo Imports](#) document for instructions.

For organization imports that have not begun processing, you can cancel an import in the Import Queue. From Setup, enter *Imports* in the Quick Find box, then select **Imports**. The import queue is not accessible to Personal Edition organizations.

How do I update records using the Data Import Wizard?

You can use the Data Import Wizard to update leads, contacts, or accounts using the record's ID as the unique identifier. These steps do not apply to custom objects.

 **Note:** These steps assume you have administrator-level of knowledge with Salesforce.

Before you begin, prepare the data you're updating.

1. Create a tabular report for the records you're updating, including the record ID and the fields you're updating.
2. Save the report locally as a .csv file for backup purposes.
3. Click **Save As** to create a new version of the .csv file and make your changes to the data.
4. Click **Save**.

After you have updated the report, import the .csv file into Salesforce. The steps vary based on the records you're updating.

To Update Leads

1. From Setup, enter *Data Import Wizard* in the Quick Find box, select **Data Import Wizard**, then click **Launch Wizard!**
2. Click **Leads**.
3. Click **Update existing records**.
4. Under Matching Type, choose **Salesforce.com ID**. Click **Next**.
5. Select **Overwrite existing lead values**.
6. Map the `Lead ID` field to the Lead ID column in your local file, as well as all other fields.
7. Review, and click **Import Now!**

To Update Accounts or Contacts

1. From Setup, enter *Data Import Wizard* in the *Quick Find* box, select **Data Import Wizard**, then click **Launch Wizard!**.
2. Click **Accounts and Contacts**.
3. Click **Update existing records**.
4. Under Contact Matching Type, choose **Salesforce.com ID**. The Account Matching Type automatically matches the Contact Matching Type. Click **Next**.
5. Map the `Contact Id` field to the Contact ID column in your local file, and map the other contact fields. Click **Next**.
6. Map the contact phone and address fields. Click **Next**.
7. Select **Overwrite existing account values**, map the `Account Id` field to the Account ID column in your local file, and map the other account fields.
8. Upload your CSV file you're importing.
9. Map the extra import fields, and click **Next**.
10. Click **Import Now!**.

The Data Import Wizard matches the record IDs in your file with the record IDs in Salesforce and updates the fields that were mapped.

SEE ALSO:

[Data Import Wizard](#)

Why do date fields import incorrectly when I use the Data Loader?

When importing date fields using the Data Loader, sometimes dates import incorrectly because the Data Loader converts the date specified in the imported .csv file to GMT. If your machine's time zone isn't GMT or if your machine's clock adjusts for daylight savings time (DST), your dates may be off by a day.

To prevent the Data Loader from adjusting the date when it converts to GMT, directly change the format of cells containing dates to reflect the native time zone.

1. Open your .csv file in Microsoft® Excel®.
2. In each cell in which you entered dates, add hour data to represent the native time zone. For example, if the date is June 9, 2011 and the time zone is GMT+8, enter *June 9, 2011 8:00*. Excel will reformat this to *6/9/2011 8:00*.
3. Right-click the cell in which you entered dates, and click **Format Cells**.
4. Click **Number > Custom**.
5. In *Type*, enter *yyyy-mm-ddThh:mm:ss.sssZ*. For example, if the cell was *6/9/2011 8:00*, it's now *2011-06-09T08:00:00.00Z*.

What does the Import Queue show me?

From Setup, enter *Imports* in the *Quick Find* box, then select **Imports**. The Import Queue shows all of the unprocessed files that you've submitted by using the Data Import Wizard in Setup. You can see when each file was submitted, its status, and a processing time estimate. Click **Del** to cancel an import file that has not begun processing. The import queue is not accessible to Personal Edition organizations.

 **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with

dataimporter.app at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the **Quick Find** box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

How long does it take to import a file?

For the individual user import wizard, the length of time required depends on the amount of data, but on average it only takes a few minutes.

The administrator import wizards work asynchronously, and you will receive a notification email after your file has been successfully imported. The asynchronous import can take a few minutes to no more than 24 hours.

Administrators, except in Personal Edition, can also check the Import Queue to view the progress of import files. From Setup, enter *Imports* in the **Quick Find** box, then select **Imports**. To expedite the import process, we recommend you review the directions in [Importing Overview](#) on page 591.

 **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with dataimporter.app at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the **Quick Find** box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

Why might there be a delay in importing my file?

In order to manage the volume of imports and ensure that all users receive the highest level of performance, organization import files are accepted in “asynchronous” mode. This means that your file passes through a controlled queue and will be imported when the system can best manage the data, however your organization import will not take longer than 24 hours to complete. You will receive a notification email when the import is complete.

Can I import amounts in different currencies?

If your Group, Professional, Enterprise, Unlimited, Performance, or Developer Edition organization has set up the ability to use multiple currencies, you can import amounts in different currencies using the **Currency ISO Code** column in your import file.

Can Customer Support help me import my data?

Customer Support is available to assist Group, Contact Manager, Professional, Enterprise, Unlimited, and Performance Edition organizations throughout the import process.

Can I import data in more than one language?

The import wizard imports one language at a time, the language of the user doing the import. If you have the same data in different languages, run an import for each additional language.

 **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with dataimporter.app at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the **Quick Find** box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

How do I perform mass updates to records?

To update more than 50,000 but less than 5 million records, use Data Loader.

To update more than 5 million records, we recommend you work with a Salesforce partner or visit the [AppExchange](#) for a suitable partner product.

How do I update fields with blank values?

To replace fields with null values, you must use Data Loader.

1. Choose **Start > All Programs > Salesforce > Data Loader > Data Loader** to open Data Loader.
2. Click **Export** and complete the wizard. When the operation finishes, click **View Extraction**.
3. Click **Open in external program** to open your data in Excel. Blank out the fields you want to update.
4. In Data Loader, choose **Settings > Settings**, and select **Insert null values**. Click **OK** to save your settings.
5. Click **Update** and follow the wizard to reimport your data.

What is an external ID?

When importing custom objects, solutions, or person accounts, you can use external IDs to prevent duplicate records from being created as a result of the import operation.

An external ID is a custom field that has the “External ID” attribute, meaning that it contains unique record identifiers from a system outside of Salesforce. When you select this option, the import wizard will detect existing records in Salesforce that have the same external ID. Note that this operation is not case-sensitive - for example, “ABC” will be matched with “abc”. However, there is an exception: if the custom field has the separate “Unique” attribute and the case-sensitive option for that attribute is selected, uppercase and lowercase letters will not be considered identical.

Importing Person Accounts

- [How do I prevent duplicate person accounts?](#)
- [Should I sync Outlook or use import wizards to upload my data into Salesforce?](#)
- [How do I use the import wizard to mass update existing person accounts?](#)
- [Which person account fields are required for importing?](#)
- [Can I update lookup fields for my person accounts?](#)

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

How do I prevent duplicate person accounts?

To prevent duplicate person account records from being created as a result of your import, populate a column in your import file with the names, email addresses, Salesforce IDs, or external IDs of the person accounts. These are the fields that can be used to match rows in your import file with existing records in Salesforce. In the wizard, you can specify the field you are using for record matching and what action to take when a matching existing record is found.

Important: Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with `dataimporter.app` at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the Quick Find box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

How do I use the import wizard to mass update existing person accounts?

To mass update existing person account records via the import wizards:

1. Run a person account report and export the results to Excel. To enable record matching, make sure to include the name, email address, Salesforce ID, or external ID field in the report.
 2. Use Excel or a similar application to update field values in the import file as desired.
 3. Launch the appropriate import wizard.
 - If you own the records in your import file, launch the Import My Person Accounts wizard from your personal settings by selecting **Import > Import Person Accounts**.
 - If the records in your import file are owned by multiple different users, launch the Import My Organization's Person Accounts wizard from Setup by entering "Import Person Accounts" in the `Quick Find` box, then selecting **Import Person Accounts**.
 4. At the Prevent Duplicates step:
 - If you are using the Import My Organization's Person Accounts wizard, choose the `Yes` radio button. This option is not included in the other wizard.
 - In the "Which field..." section, choose the field in your file to use for record matching: name, Salesforce ID, email address, or external ID.
 - In the "If existing records..." section, choose the second option, `Update existing records and do not insert any new records`.
 5. Proceed with the remaining steps in the wizard.
 6. After finishing the wizard and receiving the email notification that the process has completed, verify in Salesforce that the records have been updated as you intended.
-  **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with `dataimporter.app` at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the `Quick Find` box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

Which person account fields are required for importing?

Each person account has a name field that should be included in your import file. In addition, if your administrator has defined universally required custom fields for person accounts, those fields should be included in your import file.

Can I update lookup fields for my person accounts?

Yes, if person accounts have a lookup relationship with another object, you can use the import wizard to update the value of that lookup field. We recommend the following procedure:

1. Run a person account report and export the results to Excel. In the report, include the Salesforce IDs of both the person account and the object referenced in the lookup field.
2. Use Excel or a similar application to update field values in the import file as desired.
3. Start the Import My Organization's Person Accounts wizard from Setup by entering "Import Person Accounts" in the `Quick Find` box, then selecting **Import Person Accounts**.
4. At the Prevent Duplicates step:
 - Choose the `Yes` radio button.
 - Choose `Salesforce ID`.
 - `Update existing records and do not insert any new records` is automatically selected because you are matching by Salesforce ID.

5. At the Specify Relationships step:
 - Specify the record owner field in your import file.
 - Check the box that corresponds to the lookup field you are including in your import file.
 6. At the Define Lookup Matching step, choose `Salesforce ID`.
7. After finishing the wizard and receiving the email notification that the process has completed, verify in Salesforce that the person account records have been updated as you intended.

Note: Any related records must already exist in Salesforce before proceeding. Related records will not be updated during your import even if your import file contains different values for fields on those related records.

Important: Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with `dataimporter.app` at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the Quick Find box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

Importing Campaign Members

- [Why are there two campaign import wizards?](#)
- [How many campaign members can I import?](#)
- [Who can import campaign members?](#)
- [What status is assigned to campaign members?](#)
- [How do I prepare my campaign import file?](#)

EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Why are there two campaign import wizards?

You can access the campaign import wizards via the **Add Members - Import File** and **Update & Add Members - Import File** links on the **Manage Members** page, which is available from any campaign detail page. The wizards are:

- **Data Import Wizard:** To access this wizard from a campaign detail page, click **Manage Members > Add Members - Import File > Leads**. Use this wizard to import leads. It imports a list of names, creates or updates leads in the system, and associates those leads with your campaign.
- **Campaign Update Wizard:** To access this wizard from a campaign detail page, click **Manage Members > Update & Add Members - Import File > Update & Add Campaign Members**. Use this wizard to update the campaign member statuses of existing leads and contacts. It imports a list of existing Salesforce contacts and leads, associates them with your campaign, and updates their response history.

How many campaign members can I import?

The number of campaign members that can be imported is determined by the following wizards:

- **Lead Import Wizard:** Import up to 50,000 leads at one time.
- **Campaign Update Wizard:** Update up to 50,000 existing contacts and leads at one time.

In addition to the record limits, your import is also subject to the overall storage limits for your organization.

Important: Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with

dataimporter.app at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the **Quick Find** box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

Who can import campaign members?

In order to use the Data Import Wizard to import new leads for a campaign or campaign import wizards to update the campaign history for multiple leads and contacts, users must have the **Marketing User** checkbox selected on their personal information. They must also have the Marketing User profile (or the "Edit" permission on campaigns and "Import Leads" permission).

What status is assigned to campaign members?

With the campaign import wizards, you can assign a campaign member status to a lead or contact in one of two ways:

- Add a **Status** column to your import file. Enter the status for each lead or contact on the campaign.
- Select a default status in the campaign import wizard. Any lead or contact with a blank or invalid status in your import file will automatically be assigned to the default status.

 **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with dataimporter.app at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the **Quick Find** box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

How do I prepare my campaign import file?

A campaign import file can be prepared by using one of the following wizards:

- **Lead Import Wizard:** Prepare your import file of new leads using Excel.
- **Campaign Update Wizard:** Update only the member status of an existing lead or contact. Your import file must include a **Status** column plus a **Record Id** column that contains the unique **Salesforce Contact ID** or **Lead ID** values for the leads and contacts.

 **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the unified Data Import Wizard. (Individual import wizards open in small pop-up windows, while the unified wizard opens in a full browser with dataimporter.app at the end of the URL.) To start using the unified wizard, from Setup, enter *Data Import Wizard* in the **Quick Find** box, then select **Data Import Wizard**. (The options you see depend on your permissions.)

Manage Data

Exporting Backup Data

Your organization can generate backup files of your data on a weekly or monthly basis depending on your edition. You can export all your organization's data into a set of comma-separated values (CSV) files.

 **Note:** Users with the “Weekly Export” permission can view all exported data and all custom objects and fields in the Export Service page. This permission is granted by default only to the System Administrator profile because it enables wide visibility.

You can generate backup files manually once every six days (for weekly export) or 28 days (for monthly export). You can also schedule backup files to generate automatically at weekly or monthly intervals.

Heavy traffic can delay an export delivery. For example, assume that you schedule a weekly export to run until the end of the month, beginning April 1. The first export request enters the queue, but due to heavy traffic, the export isn't delivered until April 8. On April 7, when your second export request is scheduled to be processed, the first request is still in the queue, so the second request isn't processed until April 14.

- From Setup, enter *Data Export* in the *Quick Find* box, then select **Data Export** and **Export Now** or **Schedule Export**.
 - The **Export Now** option prepares your files for export immediately. This option is only available if enough time has passed since your last export.
 - The **Schedule Export** option allows you to schedule the export process for weekly or monthly intervals.
- Select the desired encoding for your export file.
- Select *Include images, documents, and attachments* and *Include Chatter files and Salesforce CRM Content document versions* to include these items in your export data.

 **Note:** Selecting *Include images, documents, and attachments* and *Include Chatter files and Salesforce CRM Content document versions* increases data export processing time.
- Select *Replace carriage returns with spaces* to have spaces instead of carriage returns or line breaks in your export files. This selection is useful if you plan to use your export files for importing or other integrations.
- If you're scheduling your export, select the frequency (only available for organizations with monthly exports), start and end dates, and time of day for your export.
- Under *Exported Data*, select the types of data to include in your export. We recommend that you select **Include all data** if you are not familiar with the terminology used for some of the types of data. Note the following:
 - Formula and roll-up summary fields are always excluded from exports.
 - If your organization uses divisions, data from all divisions is included in the export.
 - If your organization uses person accounts and you are exporting accounts, all account fields are included in the account data.
 - If your organization uses person accounts and you are exporting contacts, person account records are included in the contact data. However, the contact data only includes the fields shared by contacts and person accounts.
 - For information on field limitations, see the [Salesforce Field Reference Guide](#).
- Click **Start Export** or **Save**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Weekly export available in: **Enterprise, Performance,** and **Unlimited** Editions

Monthly export available in: **All** editions, except for Database.com

USER PERMISSIONS

To export data:

- “Weekly Export”

Salesforce creates a zip archive of CSV files and emails you when it's ready. Exports complete as soon as possible, however we can't guarantee the date and time of completion. Large exports are broken up into multiple files. Follow the link in the email or click **Data Export** to download the zip file. Zip files are deleted 48 hours after the email is sent. The 48-hour time limit doesn't include weekends, so if your download file is ready on Thursday at 4 p.m., that file isn't deleted until Monday at 4 p.m.

 **Note:** For security purposes, Salesforce may require users to pass a CAPTCHA user verification test to export data from their organization. This simple text-entry test prevents malicious programs from accessing your organization's data. To pass the test, users must correctly type the two words displayed on the overlay into the overlay's text box field. Note that the words entered into the text box field must be separated by a space.

 **Tip:** Any automated processes that process the export files should rely on the column headings in the CSV files, rather than the position of the columns.

Depending on the encoding selected, you might have to make adjustments to the export file before viewing it. Use the following instructions that apply to the character encoding you selected.

Viewing Unicode (UTF-8) Encoded Export Files

If you have Microsoft Excel 2003:

1. Open Microsoft Excel.
2. Click **File > New**.
3. Click **Data > Import External Data > Import Data**.
4. Select the CSV file to open and Microsoft Excel launches the text import wizard.
5. Select "Delimited" and choose the "Unicode (UTF-8)" option for File origin.
6. Click **Next**.
7. Select "Comma" in the Delimiters section and click **Finish**. You might be prompted to select a range of cells.

 **Note:** If commas are not appropriate for your locale, use a tab or other delimiter.

8. Repeat these steps for each file.

If you have an earlier version of Microsoft Excel (pre-2003):

1. Open the file in Microsoft Excel.
2. Select **File > Save As**.
3. Save the file as type Web Page.
4. Select **Tools > Options > General** tab and click the **Web Options** button.
5. Select the Encoding tab, and then choose the "Unicode (UTF-8)" option.
6. Click **OK** to close the dialog boxes.
7. Select **File > Save** to save the file with selected encoding.
8. Repeat these steps for each file.

Viewing Unicode (UTF-16, Big Endian) Encoded Export Files

Open the export files in a text editor that supports this character set. Microsoft Excel does not support this character set.

Viewing Unicode (Little Endian) Encoded Export Files

1. Open the file in Microsoft Excel.
2. Click column A to highlight the entire first column.
3. Open the **Data** menu and choose **Text to Columns**.
4. Select the "Delimited" radio button and click **Next**.
5. Select "Comma" in the Delimiters section and click **Finish**.
 **Note:** If commas are not appropriate for your locale, use a tab or other delimiter.
6. Repeat these steps for each file.

Transferring Records Overview

A record owner, or any user above the owner in the role or territory hierarchy, can transfer a single record to another user. With some objects, like cases, leads, and campaigns, a user may be granted access to transfer records through sharing. Depending on the type of object, there may be multiple ways to transfer records to another user:

Method	Available for
Transfer a single record	Accounts, campaigns, cases, contacts, contracts, leads, and custom objects
Transfer multiple records by selecting the records from a list view and clicking Change Owner	Cases, leads, and custom objects, which can belong to either a user or a queue
Transfer multiple records using the Mass Transfer tool	Accounts, leads, and custom objects

Ability to Change Ownership

- Users with the “Modify All Data” permission, or users with the “Modify All” permission for the given object, can transfer any record, regardless of who owns the record.
- To transfer a single record or multiple records from a list view, the new owner must have at least the “Read” permission on the object type. This rule does not apply if you use the mass transfer tool.
- To transfer ownership of any single record in an organization that does not use territory management, a user must have the appropriate “Edit” permission and either own the record or be above the owner in the role hierarchy.

For example, to transfer ownership of an account, a user must have “Read” and “Edit” access to the account. Additionally, the new owner of the record must have at least “Read” permission on accounts.

The Public Full Access and Public Read/Write/Transfer sharing settings give all users the ability to transfer ownership of that type of record as long as they have the appropriate “Edit” permission.

- In organizations that use territory management, users that have been assigned to territories can be enabled to transfer the accounts in their territories, even if they are not the record owner.
- To transfer campaigns, users must also have the `Marketing User` checkbox selected on their user record.

Changing Ownership for Portal Accounts

- To transfer a Partner account, you must have the “Manage Users” or “Manage External Users” permission.
- If you are the owner of a Customer Portal account and want to transfer the account, you can transfer the account to any user in your same role without the need for special permission. You cannot transfer a Customer Portal account to a user with a higher or lower role.
- Partner accounts can only be transferred to users with the “Manage External Users” permission.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Accounts, Campaigns, Contacts, Contracts, Leads, and Cases are not available in **Database.com**.

USER PERMISSIONS

To transfer multiple accounts, campaigns, contacts, contracts, and custom objects:

- “Transfer Record”
- AND
- “Edit” on the object type

To transfer multiple leads:

- “Transfer Leads” OR “Transfer Record”
- AND
- “Edit” on leads

To transfer multiple cases:

- “Transfer Cases” OR “Transfer Record”
- AND
- “Edit” on cases

- To transfer a Portal account with both Customer and Partner Portal users, you must have the “Manage Users” permission.
- You cannot assign an account with Customer Portal users to an owner who is a partner user.

SEE ALSO:

[Mass Transferring Records](#)

Mass Transferring Records

Use the Mass Transfer tool to transfer multiple accounts, leads, service contracts, and custom objects from one user to another.

 **Note:** To transfer any records that you do not own, you must have the required user permissions as well as read sharing access on the records.

1. From Setup, enter *Mass Transfer Records* in the `Quick Find` box, then select **Mass Transfer Records**.
2. Click the link for the type of record to transfer.
3. Optionally, fill in the name of the existing record owner in the `Transfer from` field. For leads, you can transfer from users or queues.
4. In the `Transfer to` field, fill in the name of new record owner. For leads, you can transfer to users or queues.
5. If your organization uses divisions, select the `Change division...` checkbox to set the division of all transferred records to the new owner’s default division.
6. When transferring accounts, you can:
 - Select `Transfer open opportunities not owned by the existing account owner` to transfer open opportunities owned by other users that are associated with the account.
 - Select `Transfer closed opportunities` to transfer closed opportunities associated with the account. This option applies only to closed opportunities owned by the account owner; closed opportunities owned by other users are not changed.
 - Select `Transfer open cases owned by the existing account owner` to transfer open cases that are owned by the existing account owner and associated with the account.
 - Select `Transfer closed cases` to transfer closed cases that are owned by the existing account owner and associated with the account.
 - Select `Keep Account Team` to maintain the existing account team associated with the account. Deselect this checkbox if you want to remove the existing account team associated with the account.
 - Select `Keep Opportunity Team on all opportunities` to maintain the existing team on opportunities associated with this account. Any opportunity splits are preserved, and split percentages assigned to the previous owner transfer to the new one. If this box is unchecked, all opportunity team members and splits are deleted when the opportunity is transferred.

 **Note:** If you transfer closed opportunities, the opportunity team is maintained, regardless of this setting.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer** and **Database.com** Editions

Accounts, Service Contracts, and Leads are not available in **Database.com**.

USER PERMISSIONS

To mass transfer accounts and service contracts:

- “Transfer Record”
- AND
- “Edit” on the object type
- AND
- “Transfer Leads”

To mass transfer custom objects:

- “Transfer Record”
- AND
- “Edit” on the object type

To mass transfer leads:

- “Transfer Leads” OR “Transfer Record”
- AND
- “Edit” on leads

7. Enter search criteria that the records you are transferring must match. For example, you could search accounts in California by specifying *Billing State/Province equals CA*.
8. Click **Find**.
9. Select the checkbox next to the records you want to transfer. Optionally, check the box in the column header to select all currently displayed items.

Note: If duplicate records are found, you must select only one of the records to transfer. Transferring duplicate records results in an error.

Duplicate records may display if you filter leads based on Campaign Member Status and a matching lead has the same campaign member status on multiple campaigns. For example, if you specify *Campaign Member Status equals Sent*, and a matching lead named John Smith has the status Sent on two campaigns, his record will display twice.

10. Click **Transfer**.

Transfer of Associated Items

When you change record ownership, some associated items that are owned by the current record owner are also transferred to the new owner.

Record	Associated items that are also transferred
Accounts	Contacts (on business accounts only), attachments, notes, open activities, open opportunities owned by the current account owner, and optionally, closed opportunities and open opportunities owned by other users.
Leads	Open activities. When transferring leads to a queue, open activities are not transferred.

Access to Transferred Items

When transferring accounts and their related data in Professional, Enterprise, Unlimited, Performance, and Developer Editions, all previous access granted by manual sharing, Apex managed sharing, or sharing rules is removed. New sharing rules are then applied to the data based on the new owner. The new owner may need to manually share the transferred accounts and opportunities as necessary to grant access to certain users.

[Transferring Records Overview](#)

Deleting Multiple Records and Reports

You can delete multiple reports or records at one time.

The record types you can mass-delete include cases, solutions, accounts, contacts, leads, products, and activities.

Here are some ways mass delete might be handy.

- You've identified multiple reports that are no longer used and you want to unclutter the list of reports on the Reports tab.
- You imported your organization's leads incorrectly and you want to start over.
- A user who recently left your organization had contacts that were duplicates of other users' data and you want to delete these duplicate contacts.
- Your organization used to enter leads as accounts with the `Type` field set to "Prospect." You now want to convert these accounts into leads.

Tip: Run a report of these accounts, export it to Excel, and then use the Import My Organization's Leads wizard to import the data as leads. Then using mass delete, select accounts as the record type to delete and enter "Type equals Prospect" to locate all accounts you want to delete.

- You want to delete all the leads that have been converted for your organization. Select the lead record type, enter "Converted equals 1" for the search criteria, then choose Search.
 - You want to clean up web-generated leads that were created incorrectly, or delete accounts and contacts with whom you no longer do business.
1. We strongly suggest you run a report to archive your information. You should also run a weekly export of your data; see [Exporting Backup Data](#) on page 684.
 2. From Setup, enter *Mass Delete Records* in the `Quick Find` box, then select **Mass Delete Records** and click the link for the type of record to delete.
 3. Review the information that will be deleted along with the records.
 4. Specify conditions that the selected items must match, for example, "State equals California."
 5. If you're deleting accounts, specify whether you want to delete accounts with attached closed/won opportunities or attached opportunities owned by other users.
 6. If you're deleting products, check **Archive Products** if you also want to delete products that are on opportunities. Check this option to:
 - Delete products that are not on opportunities and move them to the Recycle Bin.
 - Archive products that are on opportunities. These products are not moved to the Recycle Bin and cannot be recovered.

Leave this box unchecked to delete only those products that are not on opportunities. Selected products that are on opportunities will remain checked after the deletion to indicate they were not included in the deletion.
 7. Choose **Search** to find records that match, and select the items you want to delete. Optionally, check the box in the column header to select all currently displayed items.
 8. To permanently delete records, select `Permanently delete the selected records`.

Important: Selecting this option prevents you from recovering the selected records from the Recycle Bin.
 9. Click **Delete**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions**

This feature is only available in **Database.com** via the API. You can only mass delete records of custom objects in **Database.com**.

USER PERMISSIONS

To mass delete data:

- "Modify All Data"

If you did not select `Permanently delete the selected records`, deleted items are moved to the Recycle Bin.

SEE ALSO:

[Notes on Using Mass Delete](#)

[Undoing an Import](#)

[Using Mass Delete to Undo Imports](#)

Notes on Using Mass Delete

Consider the following when using mass delete:

General Notes About Mass-Deleting

- You can delete up to 250 items at one time.
- When you delete a record, any associated records that display on that record's related lists are also deleted.
- Only reports in public report folders can be mass-deleted.
- You can't mass-delete reports that are attached to dashboards, scheduled, or used in reporting snapshots.

Notes About Mass Delete for Sales Teams

- You can't delete partner accounts that have partner users.
- Products on opportunities cannot be deleted, but they can be archived.
- When you mass-delete products, all related price book entries are deleted with the deleted products.
- When you delete activities, any archived activities that meet the conditions are also deleted.
- When you delete activities, requested meetings aren't included in the mass-delete until they are confirmed and automatically converted to events.
- When you delete recurring events, their child events are not displayed in the list of possible items to delete, but they are deleted.

Notes About Mass Delete for Service Teams

- Accounts and contacts associated with cases cannot be deleted.
- Contacts enabled for Self-Service, and their associated accounts, cannot be deleted.
- Deleting a master solution does not delete the translated solutions associated with it. Instead, each translated solution becomes a master solution.
- Deleting a translated solution removes the association with its master solution.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions**

This feature is only available in **Database.com** via the API. You can only mass delete records of custom objects in **Database.com**.

USER PERMISSIONS

To mass delete data:

- "Modify All Data"

Mass Update Addresses

When your data is consistent, your reports and related metrics are more accurate and easier to understand. For example, having different abbreviations for a country or state can skew your data. To make your addresses consistent, you can update country and state/province information in existing fields at one time.

You can mass update addresses in contacts, contracts, and leads.

 **Tip:** To ensure data consistency in new records, consider using state and country picklists.

1. From Setup, enter *Mass Update Addresses* in the Quick Find box, then select **Mass Update Addresses**.
2. Select **Countries** or **State/Province**. If you chose State/Province, enter the country in which to update the state or province.
3. Click **Next**.
4. Select the values to update and click **Add**. The Selected Values box displays the values to update. The Available Values box displays the address values found in existing records. To find more addresses to update, enter all or part of a value and click **Find**.
If your organization has large amounts of data, instead of using the Available Values box, enter existing values to update in the text area. Separate each value with a new line.
5. In the **Replace selected values with** field, enter the value with which to replace the specified address data, and click **Next**. If your organization has large amounts of data, this field is called **Replace entered values with**.
The number and type of address records to update are displayed. If you have large amounts of data, only the values to update are displayed.
6. Click **Replace** to update the values.

Scalability FAQ

- [How scalable is Salesforce?](#)
- [Will I see a degradation in performance as Salesforce's subscriber base grows?](#)

SEE ALSO:

[Can I automatically back up my data in Salesforce?](#)

How scalable is Salesforce?

The service has the capacity to scale to the largest of teams. The architecture behind the service was designed to handle millions of users. We scale as rapidly as our customers require.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except for **Database.com**.

USER PERMISSIONS

To mass update addresses:

- "Modify All Data"

To mass update addresses of contracts:

- "Modify All Data"

AND

"Activate Contracts"

Will I see a degradation in performance as Salesforce's subscriber base grows?

No. We are very conscious of performance and have designed the service to be scalable in such a way that we can constantly stay ahead of customer demand. Our architecture allows us to easily add web and application servers to accommodate more users. The system architecture also allows us to add more database servers as needed to accommodate more users. In addition, the facility that houses our servers provides us with guaranteed bandwidth, which we can increase as needed.

Force.com Platform Cache

Define Partitions for Data Cached with Force.com Platform Cache

Partitions improve application performance by distributing cache space in the best way for your org. Cache data to designated partitions to ensure that it's not overwritten by other applications or less-critical data. Create and manage org partitions declaratively by using the Platform Cache Partition tool in Setup.

Partitions are integral to the API, and cache capability depends on them. To use the Force.com platform cache, you need at least one partition. Each partition has one session cache and one org cache segment. Each cache segment has its own capacity and time-to-live attributes and uses an LRU algorithm.

Use the Platform Cache Partition tool to:

- Create or remove org partitions.
- Allocate the session cache and org cache capacities of each partition to balance performance across apps.
- View a snapshot of all cache partitions with their current and total capacities.
- View details about each partition.
- Make any partition the default partition, for example to use via static methods.

First create at least one partition and allocate cache capacity to that partition's session cache and org cache segments. You can distribute your org's cache space across any number of partitions. Session and org cache allocations can be zero or greater than five and must be whole numbers. The sum of all partition allocations, including the default partition, equals the platform cache total allocation. The total allocated capacity of all cache segments must equal or be less than the org's overall capacity.

You can have only one default partition, but you can define any partition as the default partition. When the capacity of the default partition is used up and is zero, you can't create any more partitions. When a partition has no capacity left, cache operations aren't performed, and no error is returned.

When performing cache operations within the default partition, you can omit the partition name from the key.

 **Note:** If platform cache code is intended for a package, we recommend not using the default partition in the package. Instead, explicitly reference and package a non-default partition.

View the org's capacity allocation on the Platform Cache Partition page. To access the Partition tool in Setup, enter *Platform Cache* in the **Quick Find** box, then select **Platform Cache**.

Capacity calculations occur every five minutes by default. To make sure you're seeing the latest capacity and allocation, click **Recalculate**.

Manage Duplicate Records

Duplicate Management

Maintaining clean and accurate data is one of the most important things you can do to help your organization get the most out of Salesforce. Use Data.com Duplicate Management to control whether and when users can create duplicate records in Salesforce; customize the logic that's used to identify duplicates; and create reports on the duplicates that users save.

 **Note:** Duplicate Management uses Data.com technology, but does *not* require a Data.com license.

After Duplicate Management is set up, here's how it works.

- *When a user attempts to save a new record*, the record is first compared with existing Salesforce records to identify possible duplicates (1). The criteria used to compare records and identify the possible duplicates are defined by a *matching rule*. Next, a list of possible duplicates is returned (2). What happens when the record being saved is identified as a possible duplicate depends on what's defined in the *duplicate rule* (3). For example, the duplicate rule could block users from saving the possible duplicate record or allow them to save it anyway. Both the Block and Allow options include an alert, which tells users why they can't save the record and what they need to do. The Allow option includes the ability to report on the duplicate records.
- *When a user attempts to save an edited record*, the record is first checked to see if the user has changed the value of a matching rule field. If so, the duplicate management process works as described for new records. If not, no further action is taken and duplicates are not detected.

[Duplicate Record Sets](#)

Quickly see a list of duplicate records, grouped into duplicate sets, by clicking the Duplicate Record Sets tab. To do so, your organization needs to use the report action with its duplicate rules.

[Duplicate Error Logs](#)

If your organization uses Data.com Duplicate Management, you can view any system errors that prevent the duplicate rules or matching rules from running successfully.

[How Duplicate Management Affects Your Users](#)

When you've created and activated duplicate rules and your users try to save a record that's identified as a possible duplicate, users will be given guidance on how to proceed. This is what they'll see.

Duplicate Rules

Duplicate rules are used to control whether and when users can save duplicate records within Salesforce.

Duplicate rules tell Salesforce what action to take when a user attempts to create a duplicate record. Each duplicate rule needs to include at least one matching rule to identify which existing records are possible duplicates.

You can configure your duplicate rule to perform an action when a new record is created and when an existing record is edited. However, the rule will only run for edited records if the fields being edited are included in the associated matching rule.

Example: The duplicate rule can block users from saving records that have been identified as possible duplicates or allow them to save them anyway. Both the Block and Allow options include an alert, which tells users why they can't save the record and what they need to do. The Allow option includes the ability to report on the duplicate records.

SEE ALSO:

[Create or Edit Duplicate Rules](#)

[Duplicate Management](#)

Matching Rules

Matching rules are used to identify duplicate records within Salesforce.

Watch a video:  [Understanding Matching Rules](#) (4:32)

A matching rule is made up of individual fields that are assembled into an equation. Each field contains matching criteria that tell the rule how to compare the fields and what conditions need to be met for the specific field to be considered a match.

After a matching rule is activated, one or more match keys are automatically created and applied to existing records. (Also known as indexing, this process improves performance and returns a better set of match candidates because the matching rule is only looking for duplicates among records with the same match key.)

When the matching rule is run, it compares each field against the corresponding field in existing records that share the same match keys, and uses the matching criteria to determine how closely the fields, and ultimately the records, match.

EDITIONS

- Performance
- Unlimited
- Developer

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

 **Example:** A simple matching rule might specify that if two records' `Email` and `Phone` values match exactly, they are possible duplicates. Or you can use a variety of “fuzzy” matching methods to compare the fields.

Use matching rules with duplicate rules to manage whether and when users are allowed to create duplicate records within Salesforce. You can use the standard matching rules or create your own custom matching rule. We recommend you use the standard matching rules because they've been carefully designed to return the best possible set of match candidates.

SEE ALSO:

[Create or Edit Custom Matching Rules](#)

[Matching Rule Reference](#)

Duplicate Record Sets

Quickly see a list of duplicate records, grouped into duplicate sets, by clicking the Duplicate Record Sets tab. To do so, your organization needs to use the report action with its duplicate rules.

When a user saves a record that's identified as a duplicate by a duplicate rule with the report action:

- The saved record and all its duplicates, up to 100, will be assigned to a new or existing duplicate record set.
- The saved record and each of its duplicates will be listed as a duplicate record item within the duplicate record set.
- If the duplicate rule is configured to find duplicates across objects, all cross-object duplicates will be listed as duplicate record items within the duplicate record set.

Duplicate record sets and duplicate record items can be used to do the following.

- [Create custom report types](#)
- Create custom fields
- Write validation rules, triggers, and workflow rules
- Modify the fields that can appear on the respective page layouts

When using duplicate record sets, keep a few things in mind.

- By default, duplicate record sets are visible to only administrators, but the administrator can grant visibility to other users.
- If a lead is identified as a duplicate but converted before the duplicate record set is created, the converted lead won't be included in a duplicate set.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Duplicate Error Logs

If your organization uses Data.com Duplicate Management, you can view any system errors that prevent the duplicate rules or matching rules from running successfully.

From Setup, enter *Duplicate Error Logs* in the Quick Find box, then select **Duplicate Error Logs**. There, you can see which, if any, errors occurred. Error logs are deleted after 90 days.

Example: Here are some scenarios that could produce an error on the log.

- The match engine used for fuzzy matching is temporarily unavailable. Therefore, any matching rules that include fuzzy matching methods will not run.
- The Report action on duplicate rules fails because the system is unable to create a duplicate record set.

How Duplicate Management Affects Your Users

When you've created and activated duplicate rules and your users try to save a record that's identified as a possible duplicate, users will be given guidance on how to proceed. This is what they'll see.

Title:

- All duplicate rules include a system-generated message (1) that tells the user how many possible duplicates were found. The number of possible duplicates includes only the records the user has access to, even if the duplicate rule's record-level security was set to *Bypass sharing rules*. (The *Bypass sharing rule* option tells the associated matching rule to compare all records, regardless of the user's access.) If the user doesn't have access to any of the records that are identified as possible duplicates, then this message just says there are duplicates detected and the number of duplicates isn't included. The possible duplicates displayed in the list only includes records the user has access to.
- If your duplicate rule includes an alert, it will appear beneath the system-generated message (2).
- If your duplicate rule allows users to save a record even though it might be a possible duplicate, the **Save (Ignore Alert)** button is present (3). If your duplicate rule blocks users from saving a record that is a possible duplicate, the **Save** button is present but the record cannot be saved successfully until the user makes the necessary changes to the record so it's no longer flagged as a possible duplicate.
- The list of possible duplicates (4) includes only records the user has access to. The fields shown in the list include only fields the user has access to (up to the first 7 fields that were compared by the associated matching rule). A maximum of 5 records are displayed in this list, but if more than 5 duplicates are found, users can click **Show All >>** to see full list of records, up to 100. Records are listed in the order they were last modified. Users can go directly to one of the records in the list by clicking on its link.
- The highlighted fields (5) are the fields that were compared by the associated matching rule and determined to match.

[Duplicate Management](#)

Set Up Duplicate Management in Salesforce

To use Data.com Duplicate Management in your organization, you need two separate rules: a duplicate rule and a matching rule. The duplicate rule tells Salesforce what action to take when duplicates are identified. The matching rule defines how records are compared to one another to identify possible duplicates.

IN THIS SECTION:

[Create or Edit Duplicate Rules](#)

Use duplicate rules to define what happens when a user tries to save a duplicate record.

[Create or Edit Custom Matching Rules](#)

Use matching rules to determine how two records are compared and identified as duplicates.

[Create Custom Report Types for Duplicate Record Reports](#)

If your organization uses the Report action with its duplicate rules, you can run reports to analyze the quality of your data and to see how well your duplicate rules are working. That way, you can fine tune your duplicate rules if needed. First, you'll need to set up the appropriate custom report types.

Create or Edit Duplicate Rules

Use duplicate rules to define what happens when a user tries to save a duplicate record.

Watch a demo:  [Managing Duplicate Records in Salesforce with Duplicate Rules](#) (3:12)

In order for users to see the list of possible duplicates detected by the duplicate rule, they must have read access to the object defined in the rule.

1. From Setup, enter *Duplicate Rules* in the **Quick Find** box, then select **Duplicate Rules**.
2. To edit an existing rule, click the rule name, then click **Edit**. To create a new rule, click **New Rule**, then select the object you want the rule to apply to.
3. Enter the rule details, including the rule's name, description, and record-level security settings.
4. Select which action will occur when a user tries to save a duplicate record.

If the action includes an alert to users, we'll provide default alert text that you can customize. Only the Allow action includes the report option.

5. In the Matching Rules section, first select the object that records will be compared with. Then select which matching rule will determine how records are identified as duplicates.

The list includes all available matching rules for the selected object. If none of the matching rules in the list are what you want, select *Create New Matching Rule*.

 **Tip:** We recommend you use the standard matching rules because they've been carefully designed to return the best possible set of match candidates. Just be sure you've activated them.

If, however, you decide to create a new matching rule, we recommend you first finish creating your duplicate rule. Then create and activate the new matching rule. When you come back to the duplicate rule, it will automatically have the newly created matching rule associated it, as long as it didn't already have an associated matching rule.

USER PERMISSIONS

To create, edit, or delete duplicate rules:

- "Customize Application"

To activate and deactivate duplicate rules:

- "Customize Application"

To view duplicate rules:

- "View Setup and Configuration"

6. Make sure you've selected the field mapping for each matching rule, if needed.

If the matching rule is comparing records from two different objects or uses custom fields:

- You'll need to decide how you want the fields from the first object to be compared to the fields from the second object. For example, you might map a custom field called `work_email` to the standard `Email` field.
- Some data may be truncated prior to matching two text fields with different maximum lengths.

7. If you want your duplicate rule to run only if specific conditions are met, specify the conditions.

For example, you could add a condition that tells the rule to run only if the record was entered by a user with a certain profile or role, or if the record includes a specific country or state.

8. Save the rule.

9. Activate the rule.

For the activation to succeed, all associated matching rules must be active.

10. If you have more than one active duplicate rule for a particular object, you may want to adjust the order in which the rules are processed. You can reorder rules by clicking **Reorder** from any rule's detail page.

Tip: If the first duplicate rule finds a match for a particular record, that record will not be evaluated by subsequent duplicate rules. Therefore, you should order your duplicate rule so that rules with the Block action are run before rules with the Allow action.

SEE ALSO:

[Duplicate Rules](#)

[Matching Rules](#)

Create or Edit Custom Matching Rules

Use matching rules to determine how two records are compared and identified as duplicates.

[Watch a Demo](#) (3:39)

1. From Setup, enter *Matching Rules* in the Quick Find box, then select **Matching Rules**.
2. If editing an existing matching rule, make sure the rule is inactive.
3. Click **New Rule** or **Edit** next to the existing rule you want to edit.
4. Select which object this matching rule will apply to.
5. Enter a name and description for the rule.
6. Enter the [matching criteria](#).
 7. If you need to adjust the matching equation, click **Add Filter Logic...** Here you can, for example, manually change an AND expression to an OR expression.
 8. Save the rule.
 9. Activate the rule.

The activation process may take some time, so we'll send you an email when the process is complete and your matching rule is ready to use.

After the matching rule is active, it's available to use with other Data.com Duplicate Management tools. For example, using a matching rule with a [duplicate rule](#) tells Salesforce to take certain actions when users try to save a record the matching rule has identified as a duplicate.

Create Custom Report Types for Duplicate Record Reports

If your organization uses the Report action with its duplicate rules, you can run reports to analyze the quality of your data and to see how well your duplicate rules are working. That way, you can fine tune your duplicate rules if needed. First, you'll need to set up the appropriate custom report types.

The only records that will appear in these reports are:

- Records identified as duplicates by duplicate rules that include the report action.
 - Records that were manually added to the Duplicate Record Set object.
1. Make sure you're familiar with custom report types and the general steps for creating and maintaining them.
 2. Create custom report types with the appropriate object relationships and configure them as necessary.

Here are some examples of custom report types to get you started.

Report Type	Possible Use	A (Primary Object)	B	Additional Steps
Account Duplicates	Create reports on the duplicate accounts that were found by your duplicate rules.	Accounts	Duplicate Record Items	
Contact Duplicates	Create reports on the duplicate contacts that were found by your duplicate rules.	Contacts	Duplicate Record Items	
Lead Duplicates	Create reports on the duplicate leads that were found by your duplicate rules.	Leads	Duplicate Record Items	
All Duplicates	Create reports to see how well your duplicate rules are performing.	Duplicate Record Set	Duplicate Record Items	Add the Duplicate Rule Name lookup field to the Duplicate Record Set page layout.

3. Deploy the report types you want to make available to users.

[Duplicate Record Sets](#)

Matching Rule Reference

Here's some additional information that will help you understand how matching rules work and how to use them.

IN THIS SECTION:

[Standard Matching Rules](#)

We've provided several standard matching rules that you can use with Data.com Duplicate Management tools, such as duplicate rules. Each standard matching rule has been carefully designed to return the best possible set of match candidates for accounts, contacts, or leads.

[Matching Criteria for Matching Rules](#)

Matching rules use criteria to determine how closely a field on a new or edited record matches the same field on an existing record, and, ultimately, whether the two records match. When you create a custom matching rule, you need to define certain criteria. Standard matching rules include additional criteria, all of which are defined for you.

[Matching Methods Used with Matching Rules](#)

The matching method is the part of the matching rule's matching criteria that determines how a specific field in one record is compared to the same field in another record. We've provided an exact matching method and a variety of fuzzy matching methods.

[Matching Algorithms Used with Matching Methods](#)

The matching method and matching algorithm are part of the matching rule's matching criteria. Together, they determine how a specific field in one record is compared to the same field in another record and whether the fields are considered matches.

[Match Keys and Matching Rules](#)

Match keys are used to increase the effectiveness of matching rules. By understanding how match keys are created, you'll get a better sense of how matching rules work.

[Match Keys Used by Standard Matching Rules](#)

Match keys are used to increase the effectiveness of matching rules. Review the match key information for a better understanding of how standard matching rules work.

Standard Matching Rules

We've provided several standard matching rules that you can use with Data.com Duplicate Management tools, such as duplicate rules. Each standard matching rule has been carefully designed to return the best possible set of match candidates for accounts, contacts, or leads.

IN THIS SECTION:

[Standard Account Matching Rule](#)

Like all matching rules, the standard matching rule used for account records is made up of fields that are arranged into an equation. Each field contains matching criteria that the rule uses to determine how closely the field matches the same field in an existing record, and ultimately whether the record is a match.

[Standard Contact and Lead Matching Rule](#)

Like all matching rules, the standard matching rule used for contact and lead records is made up of fields that are arranged into an equation. Each field also contains matching criteria that the rule uses to determine how closely the field matches the same field in an existing record, and ultimately whether the record is a match.

Standard Account Matching Rule

Like all matching rules, the standard matching rule used for account records is made up of fields that are arranged into an equation. Each field contains matching criteria that the rule uses to determine how closely the field matches the same field in an existing record, and ultimately whether the record is a match.

Matching Equation

! **Important:** In order for the Standard Account Matching Rule to return matches accurately, the new or edited record must include a value in the `Account Name` and either the `City` or `ZIP` fields.

Rule Name	Matching Equation
Standard Account Matching Rule	$(\text{Account Name AND Billing Street})$ OR $(\text{Account Name AND City})$ OR $(\text{Account Name AND ZIP})$ OR $(\text{Account Name AND Phone})$ OR $(\text{Website AND Phone})$ OR $(\text{Website AND Billing Street})$

Matching Criteria

For a definition of each matching criterion, see [Matching Criteria for Matching Rules](#) on page 710.

Field	Matching Algorithms	Scoring Method	Threshold	Blank Fields	Special Handling
Account Name	Acronym Edit Distance	Maximum	70	Don't match	Removes words such as <code>Inc</code> and <code>Corp</code> before comparing fields. Also, company names are normalized. For example, <code>1st</code>

Field	Matching Algorithms	Scoring Method	Threshold	Blank Fields	Special Handling
	Exact				National Bank is normalized to First National Bank.
Phone	Exact	Weighted Average	80	Don't match on all sections expect Area Code, which ignores blank fields	<p>Phone numbers are broken into sections and compared by those sections. Each section has its own matching method and match score. The section scores are weighted to come up with one score for the field. This process works best with North American data.</p> <ul style="list-style-type: none"> • International code (Exact, 10% of field's match score) • Area code (Exact, 50% of field's match score) • Next 3 digits (Exact, 30% of field's match score) • Last 4 digits (Exact, 10% of field's match score) <p>For example, suppose these two phone numbers are being compared: <i>1-415-555-1234</i> and <i>1-415-555-5678</i>.</p> <p>All sections match exactly <i>except</i> the last 4 digits, so the field has a match score of 90, which is considered a match because it exceeds the threshold of 80.</p>
Billing Street	Edit Distance Exact	Weighted Average	80	Don't match	<p>Addresses are broken into sections and compared by those sections. Each section has its own matching method and match score. The section scores are weighted to come up with one score for the field. This process works best with North American data.</p> <ul style="list-style-type: none"> • Street Number (Exact, 20% of field's match score) • Street Name (Edit Distance, 50% of field's match score) • Street Suffix (Exact, 15% of field's match score) • Suite Number (Exact, 15% of field's match score) <p>For example, suppose these two billing streets are being compared: <i>123 Market Street, Suite 100</i> and <i>123 Market Drive, Suite 300</i>.</p> <p>Because only the street number and street name match, the field has a match score of 70, which is not considered a match because it's less than the threshold of 80.</p>
ZIP	Exact	Weighted Average	80	Don't match	<p>ZIP codes are broken into sections and compared by those sections. Each section has its own matching method and match score. The section scores are weighted to come up with one score for the field.</p> <ul style="list-style-type: none"> • First 5 digits (Exact, 90% of field's match score) • Next 4 digits(Exact, 10% of field's match score) <p>For example, suppose these two ZIP codes are being compared: <i>94104-1001</i> and <i>94104</i>.</p>

Field	Matching Algorithms	Scoring Method	Threshold	Blank Fields	Special Handling
					Because only the first 5 digits match, the field has a match score of 90, which is considered a match because it exceeds the threshold of 80.
City	Edit Distance Exact	Maximum	85	Don't match	
Website	Exact	Maximum	100	Don't match	Only the website domain is compared. For example, a field value <code>http://www.salesforce.com</code> becomes <code>salesforce.com</code> .

[Matching Rule Reference](#)

Standard Contact and Lead Matching Rule

Like all matching rules, the standard matching rule used for contact and lead records is made up of fields that are arranged into an equation. Each field also contains matching criteria that the rule uses to determine how closely the field matches the same field in an existing record, and ultimately whether the record is a match.

Matching Equation

Rule Name	Matching Equation
Standard Contact Matching Rule	<i>(First Name AND Last Name AND Title AND Company Name)</i>
Standard Lead Matching Rule	<i>OR (First Name AND Last Name AND Email)</i> <i>OR (First Name AND Last Name AND Phone AND Company Name)</i> <i>OR (First Name AND Last Name AND Mailing Street AND (City OR ZIP OR Phone))</i> <i>OR (First Name AND Last Name AND Mailing Street AND Title)</i> <i>OR (First Name AND Last Name AND Title AND Email)</i> <i>OR (First Name AND Last Name AND Phone)</i>

Matching Criteria

For a definition of each matching criteria, see [Matching Criteria for Matching Rules](#) on page 710.

Fields on Contacts	Fields on Leads	Matching Algorithms	Scoring Method	Threshold	Blank Fields	Special Handling
First Name	First Name	Exact Initials Jaro-Winkler Distance Metaphone 3 Name Variant	Maximum	85	Don't match (Ignores blank fields when Email is included in field grouping)	<p>If record contains a value for the both <code>First Name</code> and <code>Last Name</code> fields, those values will be transposed to account for possible data entry mistakes.</p> <p>For example, if the first name is <i>George</i> and the last name is <i>Michael</i>, the matching rule will also evaluate first name as <i>Michael</i> and the last name as <i>George</i>.</p>
Last Name	Last Name	Exact Keyboard Distance Metaphone 3	Maximum	90	Don't match (Ignores blank fields when Email is included in field grouping)	<p>If record contains a value for the both <code>First Name</code> and <code>Last Name</code> fields, those values will be transposed to account for possible data entry mistakes.</p> <p>For example, if the first name is <i>George</i> and the last name is <i>Michael</i>, the matching rule will also evaluate first name as <i>Michael</i> and the last name as <i>George</i>.</p>
Title	Title	Acronym Exact Kullback-Liebler Distance	Maximum	50	Don't match	
Account Name	Company	Acronym Edit Distance Exact	Maximum	70	Don't match	
Email	Email	Exact	Maximum	100	Don't match	
Phone	Phone	Exact	Weighted Average	80	Don't match on all sections except Area Code, which ignores blank fields	<p>Phone numbers are broken into sections and compared by those sections. Each section has its own matching method and match score. The section scores are weighted to come up with one score for the field. This process works best with North American data.</p> <ul style="list-style-type: none"> • International code (Exact, 10% of field's match score) • Area code (Exact, 50% of field's match score) • Next 3 digits (Exact, 30% of field's match score) • Last 4 digits (Exact, 10% of field's match score) <p>For example, suppose these two phone numbers are being compared: <i>1-415-555-1234</i> and <i>1-415-555-5678</i>.</p>

Fields on Contacts	Fields on Leads	Matching Algorithms	Scoring Method	Threshold	Blank Fields	Special Handling
						All sections match exactly <i>except</i> the last 4 digits, so the field has a match score of 90, which is considered a match because it exceeds the threshold of 80.
Mailing Street	Street	Exact	Weighted Average`	80	Don't match	<p>Addresses are broken into sections and compared by those sections. Each section has its own matching method and match score. The section scores are weighted to come up with one score for the field. This process works best with North American data.</p> <ul style="list-style-type: none"> • Street Name (Edit Distance, 50% of field's match score) • Street Number (Exact, 20% of field's match score) • Street Suffix (Exact, 15% of field's match score) • Suite Number (Exact, 15% of field's match score) <p>For example, suppose these two addresses are being compared: <i>123 Market Street, Suite 100</i> and <i>123 Market Drive, Suite 300</i>.</p> <p>Because only the street number and street name match, the field has a match score of 70, which is not considered a match because it's less than the threshold of 80.</p>

[Matching Rule Reference](#)

Matching Criteria for Matching Rules

Matching rules use criteria to determine how closely a field on a new or edited record matches the same field on an existing record, and, ultimately, whether the two records match. When you create a custom matching rule, you need to define certain criteria. Standard matching rules include additional criteria, all of which are defined for you.

 **Note:** This release contains a beta version of Data.com Duplicate Management that is production quality but has known limitations. You can provide feedback and suggestions on the [Salesforce Success Community](#). For information on enabling this feature for your organization, contact Salesforce.

Criterion Definition

**Automatically
Defined
for
Custom
Matching
Rules**

Field Indicates which field to compare. When selecting fields, keep in mind that:

- The available fields depend on which object the matching rule applies to and include both standard and custom fields.
- The supported input field types are email, lookup relationship, number, phone, standard picklists, custom picklists (single-select only), text, and URL.
- An auto-numbered lookup relationship field cannot be used in a matching rule.
- If you enable `State` and `Country` picklists for your organization, we recommend using **State/Province Code** and **Country Code** in your matching rules. These fields yield better duplicate detection results than the state and country text fields.

Matching Method Defines how the fields are compared. We've provided an exact matching method and various fuzzy matching methods. Each matching method is further defined by matching algorithms and other criteria.

For more information about matching methods, see [Matching Methods Used with Matching Rules](#) on page 713.

Matching Algorithm Defines the logic that determines whether 2 fields match. For the Exact matching method, the Exact matching algorithm is automatically used. For the Fuzzy matching method, various fuzzy matching algorithms can be used. Each matching algorithm used is automatically given a match score based on how closely it's able to match the two fields. For example, if you select Exact matching and the two fields match, the match score is 100. If the 2 fields don't match, the match score is 0.

For more information about matching algorithms, see [Matching Algorithms Used with Matching Methods](#) on page 715.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Criterion	Definition	Automatically Defined for Custom Matching Rules
Match Blank Fields	<p>Specifies how blank fields affect whether the 2 fields being compared are considered matches. If you select the <code>Match Blank Fields</code> checkbox for any field, and that field is blank in <i>both</i> records being compared, the fields are considered matches. If, however, you select the <code>Match Blank Fields</code> checkbox for any field, and that field is blank in <i>only one</i> of the records being compared, the fields are not considered matches.</p> <p>If you don't select the <code>Match Blank Fields</code> checkbox for any field, and that field is blank in <i>both</i> records being compared, the fields are <i>not</i> considered matches.</p>	
Scoring Method	<p>Determines how the matching algorithms' match scores are calculated to come up with one match score for the field. Each matching algorithm used is automatically given a match score based on how closely it's able to match the two fields. Scoring method is used only by the standard matching rules.</p> <p><i>Average:</i> Uses the average match score.</p> <p><i>Maximum:</i> Uses the highest match score.</p> <p><i>Minimum:</i> Uses the lowest match score.</p> <p><i>Weighted Average</i> Uses the weight of each matching method to determine the average match score.</p>	
Threshold	<p>Determines the minimum match score needed for the field to be considered a match. The field is automatically given a match score based on how closely it matches the same field in an existing record.</p>	
Match Key	<p>A code that allows the matching rule to quickly return a list of possible duplicates. Once the matching rule is activated, the match key is automatically applied to all existing records so that when the matching rule runs, it's only looking for duplicates among records with the same match key. This process improves performance and returns a better set of match candidates.</p> <p>For more information about match keys, including examples, see Match Keys and Matching Rules on page 716.</p>	

Example

 **Example:** Assuming your custom contact matching rule includes the following criteria, here's how records are compared and matched.

- Matching equation is `Email AND (Phone OR City)`.
- All fields use the Exact matching method.
- The `Match Blanks Fields` checkbox is selected for `Phone` and `City`.

New Record A

Email	Phone	City
jdoe@salesforce.com	415-555-1234	San Francisco

Existing Records Compared with New Record A

Record	Email	Email Match Score	Phone	Phone Match Score	City	City Match Score	Record Matches?
1	jdoe@salesforce.com	100	415-555-1234	100	none	0	Yes
2	jdoe@salesforce.com	100	none	0	San Francisco	100	Yes
3	jsmith@salesforce.com	0	415-555-1234	100	San Francisco	100	No
4	none	0	415-555-1234	100	Oakland	0	No
5	jdoe@salesforce.com	100	415-555-7777	0	San Jose	0	No

New Record B

Email	Phone	City
jdoe@salesforce.com	none	none

Existing Records Compared with New Record B

Record	Email	Email Match Score	Phone	Phone Match Score	City	City Match Score	Record Matches?
1	jdoe@salesforce.com	100	415-555-1234	0	none	100	Yes
2	jdoe@salesforce.com	100	none	100	San Francisco	0	Yes
3	jdoe@salesforce.com	100	none	100	none	100	Yes
4	jsmith@salesforce.com	0	415-555-1234	0	San Francisco	0	No

Matching Methods Used with Matching Rules

The matching method is the part of the matching rule's matching criteria that determines how a specific field in one record is compared to the same field in another record. We've provided an exact matching method and a variety of fuzzy matching methods.

Matching Method	Description
Exact	This method looks for strings that match a pattern exactly. If you're using international data, we recommend you use the Exact matching method with your matching rules.
Fuzzy	This method looks for strings that match a pattern approximately. We've provided the logic for a variety of fuzzy matching methods.

For a definition of each matching criterion, see [Matching Criteria for Matching Rules](#) on page 710.

Fuzzy Matching Method	Matching Algorithms	Scoring Method	Threshold	Special Handling
Fuzzy: First Name	Exact Initials Jaro-Winkler Name Variant	Maximum	85	The <code>Middle Name</code> field, if used in your matching rule, is compared by the Fuzzy: First Name matching method.
Fuzzy: Last Name	Exact Keyboard Distance Metaphone 3	Maximum	90	
Fuzzy: Company Name	Acronym Exact Syllable Alignment	Maximum	70	Removes words such as <code>Inc</code> and <code>Corp</code> before comparing fields. Also, company names are normalized. For example, <code>IBM</code> is normalized to <code>International Business Machines</code> .
Fuzzy: Phone	Exact	Weighted Average	80	Phone numbers are broken into sections and compared by those sections. Each section has its own matching method and match score. The section scores are weighted to come up with one score for the field. This process works best with North American data. <ul style="list-style-type: none"> • International code (Exact, 10% of field's match score) • Area code (Exact, 50% of field's match score) • Next 3 digits (Exact, 30% of field's match score)

Fuzzy Matching Method	Matching Algorithms	Scoring Method	Threshold	Special Handling
				<ul style="list-style-type: none"> Last 4 digits (Exact, 10% of field's match score) <p>For example, suppose these two phone numbers are being compared: <i>1-415-555-1234</i> and <i>1-415-555-5678</i>.</p> <p>All sections match exactly <i>except</i> the last 4 digits, so the field has a match score of 90, which is considered a match because it exceeds the threshold of 80.</p>
Fuzzy: City	Edit Distance Exact	Maximum	85	
Fuzzy: Street	Exact	Weighted Average	80	<p>Addresses are broken into sections and compared by those sections. Each section has its own matching method and match score. The section scores are weighted to come up with one score for the field. This process works best with North American data.</p> <ul style="list-style-type: none"> Street Name (Edit Distance, 50% of field's match score) Street Number (Exact, 20% of field's match score) Street Suffix (Exact, 15% of field's match score) Suite Number (Exact, 15% of field's match score) <p>For example, suppose these two billing streets are being compared: <i>123 Market Street, Suite 100</i> and <i>123 Market Drive, Suite 300</i>.</p> <p>Because only the street number and street name match, the field has a match score of 70, which is not considered a match because it's less than the threshold of 80.</p>
Fuzzy: ZIP	Exact	Weighted Average	80	<p>ZIP codes are broken into sections and compared by those sections. Each section has its own matching method and match score. The section scores are weighted to come up with one score for the field.</p> <ul style="list-style-type: none"> First 5 digits (Exact, 90% of field's match score)

Fuzzy Matching Method	Matching Algorithms	Scoring Method	Threshold	Special Handling
				<ul style="list-style-type: none"> Next 4 digits(Exact, 10% of field's match score) <p>For example, suppose these two ZIP codes are being compared: <i>94104-1001</i> and <i>94104</i>. Because only the first 5 digits match, the field has a match score of 90, which is considered a match because it exceeds the threshold of 80.</p>
Fuzzy: Title	Acronym Exact Kullback-Liebler Distance	Maximum	50	

Matching Algorithms Used with Matching Methods

The matching method and matching algorithm are part of the matching rule's matching criteria. Together, they determine how a specific field in one record is compared to the same field in another record and whether the fields are considered matches.

We've provided an exact matching method and a variety of fuzzy matching methods. If the exact matching method is selected, then the exact matching algorithm is automatically used to compare the fields. If one of the fuzzy matching method is selected, then a variety of fuzzy matching algorithms is used to compare the fields. A field can be compared using more than one matching algorithm, and a matching score is given to each matching algorithm based on how closely it's able to match the fields. The fields being compared by the matching algorithms are *not* case sensitive.

For more information about the matching methods, see [Matching Methods Used with Matching Rules](#) on page 713.

Matching Algorithms Available with Exact Matching Method

Matching Algorithm	Description
Exact	Determines whether two strings are the same. For example, <i>salesforce.com</i> and <i>Salesforce</i> are not considered a match because they're not exactly the same, and return a match score of 0.

Matching Algorithms Available with Fuzzy Matching Methods

Matching Algorithm	Description
Acronym	Determines whether a business name matches its acronym. For example, <i>Advanced Micro Devices</i> and its acronym <i>AMD</i> are considered a match and return a match score of 100.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Matching Algorithm	Description
Edit Distance	Determines the similarity between two strings based on the number of deletions, insertions, and character replacements needed to transform one string into the other. For example, VP Sales matches VP of Sales with match score of 73.
Initials	Determines the similarity of two sets of initials in personal names. For example, the first name Jonathan and its initial J match and return a match score of 100.
Jaro-Winkler Distance	Determines the similarity between two strings based on the number of character replacements needed to transform one string into the other. This method is best for short strings, such as personal names. For example, Johnny matches Johny with a match score of 97.
Keyboard Distance	Determines the similarity between two strings based on the number of deletions, insertions, and character replacements needed to transform one string into the other, weighted by the position of the keys on the keyboard.
Kullback Liebler Distance	Determines the similarity between two strings based on the percentage of words in common. For example Director of Engineering matches Engineering Director with a match score of 65.
Metaphone 3	Determines the similarity between two strings based on their sounds. This algorithm attempts to account for the irregularities among languages and works well for first and last names. For example, Joseph matches Josef with a match score of 100.
Name Variant	Determines whether two names are variation of each other. For example, Bob is a variation of Robert and returns a match score of 100. Bob is not a variation of Bill and returns a match score of 0.

[Matching Rule Reference](#)

Match Keys and Matching Rules

Match keys are used to increase the effectiveness of matching rules. By understanding how match keys are created, you'll get a better sense of how matching rules work.

A *match key* is a code that allows a matching rule to quickly return a list of possible duplicates. After the matching rule is activated, the match key is automatically applied to all existing records so that when the matching rule runs, it's only looking for duplicates among records with the same match key. Also known as indexing, this process improves performance and returns a better set of match candidates.

The match keys for both standard and custom matching rules are automatically created based on the fields in the matching rule. Because each custom matching rule can have only 10 match keys, you're prevented from saving a matching rule that would require more than 10 match keys.

The process of creating match keys includes several steps.

1. The matching rule equation (that is, the arrangement of fields) is rewritten into a standardized format that translates OR statements into AND statements.
2. The fields are normalized using the same methods as standard matching rules. For details, see [Match Keys Used by Standard Matching Rules](#) on page 717.
3. The standardized field format and the normalized field values are combined to create the match keys.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

 **Note:** We currently don't create match keys for the `Title` and `Address` fields. Therefore, if those fields are included in your matching rule, they won't generate match keys.

 **Example:** Example

Field Name	Field Value	Normalized Field Value
First Name	John	j
Email	john_oreilly@us.intel.com	joreilly@intelcom
Last Name	O'Reilly	arl
Company	Intel Corp.	intel

Matching Rule Equation	Standardized Format	Match Keys (Field Combinations)	Match Keys (with Normalized Field Values)
(First Name OR Email) AND (Last Name OR Company)	(First Name AND Last Name) OR	First Name Last Name	jarl
	(First Name AND Company) OR	First Name Company	jintel
	(Email AND Last Name) OR	Email Last Name	joreilly@intelcomarl
	(Email AND Company) OR	Email Company	joreilly@intelcomintel

Match Keys Used by Standard Matching Rules

Match keys are used to increase the effectiveness of matching rules. Review the match key information for a better understanding of how standard matching rules work.

What is a Match Key?

A *match key* is a code that allows a matching rule to quickly return a list of possible duplicates. After the matching rule is activated, the match key is automatically applied to all existing records so that when the matching rule runs, it's only looking for duplicates among records with the same match key. Also known as indexing, this process improves performance and returns a better set of match candidates.

How to Read a Match Key

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

- The field used in the match key (1)
- Number of tokens (or character string sets) in the field value to include in match key (2). If no number is present, then all tokens are included.
- Number of characters per token to include in the match key (3). If no number is present, then all characters are included.
- Additional field used in the match key (4)

Normalization of Fields

Before the match keys are applied to any records, the field values of those records are normalized.

Field	Normalization Details	Examples
Company	Expands acronyms. Lowercases first letter of each word. Removes suffixes, such as <i>Corporation, Incorporated, Inc, Limited, Ltd.</i> Removes stopwords <i>and, the, of.</i>	IBM = international business machines Intel Corp. = intel
First Name	Removes salutations and all but first letter of first word. Lowercases first letter. Replaces first name with alias, if applicable.	Dr. Jane = j Mr. Bob = robert = r
Last Name	Removes special characters and suffixes. Replaces consecutive identical consonants with single consonant. Lowercases first letter. After normalization, the double metaphone algorithm is applied so that misspellings and spelling variants are accounted for.	O'Reilly, Jr. = oreily (without double metaphone) O'Reilly, Jr. = oreily = arl (with double metaphone)
Email	Removes special characters, such as underscores and periods, from both parts of the email address.	john_doe@salesforce.com = jdoe@salesforcecom john.doe@us.salesforce.com = jdoe@salesforcecom
Phone	Removes all non-digit and non-alpha characters. For all U.S. phone numbers, converts alpha characters to numeric characters and removes leading international code. Removes last four digits.	1-800-555-1234 = 800555 44 20 0540 0202 = 44200540
Website	Removes protocol (http), subdomain (www), and any file path. Then takes only the last two or three tokens, depending on if there are international designations.	http://www.us.salesforce.com/product = salesforce.com http://www.ox.ac.uk/ = ox.ac.uk

Pre-defined Match Keys

After fields are normalized, the following match keys are applied to all existing records. Also known as indexing, this process occurs when a matching rule is activated.

Match Key	Objects Applied To	Example
Company (2,6) City (, 6)	Account	Account: salesforce.com = salesf City: San Francisco = sanfra Key: salesfsanfra
Company (2,6) ZIP (1,3)	Account	Account Name: salesforce.com = salesf ZIP: 94105-5188 = 941 Key: salesf941
Email	Contact Lead	Email: john_doe@us.ibm.com = johndoe@ibm.com Key: johndoe@ibm.com
First_Name (1,1) Last_Name Email	Contact Lead	First Name: John = j Last: Doe = doe = t (with double metaphone applied) Email: john_doe@us.salesforce.com = johndoe@salesforce.com Key: jt@salesforce.com
First_Name (1,1) Last_Name Company (2,5)	Contact Lead	First Name: Marc = m Last Name: Benioff = pnf (with double metaphone applied) Company: salesforce.com = sales Key: mpnfsales
First_Name (1,1) Last_Name Phone	Contact Lead	First Name: Marc = m Last Name: Benioff = pnf (with double metaphone applied) Phone: 1-415-555-1234 = 415555 Key: mpnf415555
First_name (1,1) Last_Name Email (domain)	Contact Lead	First Name: Marc = m Last Name: Benioff = pnf (with double metaphone applied) Email: marc.benioff@salesforce.com = salesforce.com Key: mpnfsalesforce.com
Website City (,6)	Account	Website: https://www.salesforce.com = salesforce.com City: San Francisco = sanfra Key: salesforce.comsanfra

Match Key	Objects Applied To	Example
Website ZIP (1,3)	Account	Website: https://www.salesforce.com = salesforce.com ZIP: 94105-5188 = 941 Key: salesforce.com941

Duplicate Management FAQs

Answers to common questions about Data.com Duplicate Management.

IN THIS SECTION:

[How does duplicate prevention work with Data.com Prospector and Data.com Clean?](#)

[Why am I getting an error saying my matching rule uses too many OR operators within groupings?](#)

EDITIONS

How does duplicate prevention work with Data.com Prospector and Data.com Clean?

Adding Records with Data.com Prospector

It depends on what your organization's Data.com duplicate preferences are.

If your organization does not allow duplicate records to be added to Salesforce from Data.com, then Data.com will block duplicate records from being added to Salesforce and the duplicate rule won't need to run. The user trying to add records from Data.com will receive an error log detailing which records couldn't be added because they are duplicates.

If your organization allows duplicate records to be added to Salesforce from Data.com, then the duplicate rules will run. The duplicate rule will determine if the duplicate record is allowed or blocked. Records that are blocked by the duplicate rule will appear in the error log.

Updating Records with Data.com Clean

It depends on what your organization's duplicate rules are. If your duplicate rule is set to block duplicates on edit, then a record can't be cleaned if cleaning creates a duplicate.

For Clean jobs, if your duplicate rule is set to block or alert, then a record can't be cleaned if the cleaning creates a duplicate. An entity error appears in the Clean Jobs History table for any record that can't be cleaned during a job.

If your duplicate rule is set to allow duplicates on edit, then a record can be cleaned even if it creates a duplicate. In addition, no alert displays when manually cleaning records even if your duplicate rule is set to alert.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

- Developer

Why am I getting an error saying my matching rule uses too many OR operators within groupings?

A matching rule has a limit of 10 fields that are arranged into an equation. When a matching rule is saved, we rewrite the equation into a standardized format that translates the OR statements to AND statements. The standardized format has a limit of 10 rows.

 **Example:** If your matching rule includes the following equation...

(Field 1 OR Field 2) AND

(Field 3 OR Field 4) AND

(Field 5 OR Field 6) AND

(Field 7 OR Field 8)

...it would be rewritten as

(Field 1 AND Field 3 AND Field 5 AND Field 7) OR

(Field 1 AND Field 3 AND Field 5 AND Field 8) OR

(Field 1 AND Field 3 AND Field 6 AND Field 7) OR

(Field 1 AND Field 3 AND Field 6 AND Field 8) OR

(Field 1 AND Field 4 AND Field 5 AND Field 7) OR

(Field 1 AND Field 4 AND Field 5 AND Field 8) OR

(Field 1 AND Field 4 AND Field 6 AND Field 7) OR

(Field 1 AND Field 4 AND Field 6 AND Field 8) OR

(Field 2 AND Field 3 AND Field 5 AND Field 7) OR

(Field 2 AND Field 3 AND Field 5 AND Field 8) OR

(Field 2 AND Field 3 AND Field 6 AND Field 7) OR

(Field 2 AND Field 3 AND Field 6 AND Field 8) OR

(Field 2 AND Field 4 AND Field 5 AND Field 7) OR

(Field 2 AND Field 4 AND Field 5 AND Field 8) OR

(Field 2 AND Field 4 AND Field 6 AND Field 7) OR

(Field 2 AND Field 4 AND Field 6 AND Field 8)

Although this matching rule is within the field limit, it exceeds the row limit of 10 when written in the standardized format, and therefore can't be saved. You need to refine the matching rule so it uses fewer OR operators within groupings.

Security

Security Overview

Salesforce is built with security to protect your data and applications. You can also implement your own security scheme to reflect the structure and needs of your organization. Protecting your data is a joint responsibility between you and Salesforce. The Salesforce security features enable you to empower your users to do their jobs safely and efficiently.

Salesforce limits exposure of data to the users that act on it. Implement security controls that you think are appropriate for the sensitivity of your data. Your data is protected from unauthorized access from outside your company. Also safeguard it from inappropriate usage by your users.

For information about the various security components in Salesforce, see the following topics:

- [Trust and Salesforce](#)
- [Security Infrastructure](#)
- [Auditing](#)
- [Platform Encryption](#)
- [Session Security](#)
- [User Authentication Overview](#)
- [Single Sign-on Overview](#)
- [Network-Based Security](#)
- [CAPTCHA Security for Data Exports](#)
- [My Domain](#)
- [About Identity Providers and Service Providers](#)
- [Passwords](#)
- [Securing Data Access](#)

[Security Implementation Guide](#)

Trust and Salesforce

Trust starts with transparency. That's why Salesforce displays real-time information on system performance and security on the trust site at <http://trust.salesforce.com>. This site provides live data on system performance, alerts for current and recent phishing and malware attempts, and tips on best security practices for your organization.

The Security tab on the trust site includes valuable information that can help you to safeguard your company's data. In particular, phishing and malware are Internet scams on the rise.

Phishing is a social engineering technique that attempts to acquire sensitive information such as usernames, passwords and credit card details by masquerading as a trustworthy entity in an electronic communication. Phishers often direct users to enter details at a fake website whose URL and look-and-feel are almost identical to the legitimate one. As the Salesforce community grows, it has become an increasingly appealing target for phishers. You will never get an email or a phone call from a Salesforce employee asking you to reveal a password, so you should refuse to reveal it to anyone. You can report any suspicious activities by clicking the **Report a Suspicious Email** link under the **Trust** tab at <http://trust.salesforce.com>.

Malware is software designed to infiltrate or damage a computer system without the owner's informed consent. It is a general term used to cover a variety of forms of hostile, intrusive, or annoying software, and it includes computer viruses and spyware.

What Salesforce is Doing

Customer security is the foundation of customer success, so Salesforce will continue to implement the best possible practices and technologies in this area. Recent and ongoing actions include:

- Actively monitoring and analyzing logs to enable proactive alerts to customers who have been affected.
- Collaborating with leading security vendors and experts on specific threats.
- Executing swift strategies to remove or disable fraudulent sites (often within an hour of detection).
- Reinforcing security education and tightening access policies within Salesforce.
- Evaluating and developing new technologies both for our customers and for deployment within our infrastructure.

What Salesforce Recommends You Do

Salesforce is committed to setting the standards in software-as-a-service as an effective partner in customer security. So, in addition to internal efforts, Salesforce strongly recommends that customers implement the following changes to enhance security:

- Modify your Salesforce implementation to activate IP range restrictions. This will allow users to access Salesforce only from your corporate network or VPN. For more information, see [Setting Login Restrictions](#) on page 758.
- Set session security restrictions to make spoofing more difficult. For more information, see [Modify Session Security Settings](#) on page 748
- Educate your employees not to open suspect emails and to be vigilant in guarding against phishing attempts.
- Use security solutions from leading vendors such as Symantec to deploy spam filtering and malware protection.
- Designate a security contact within your organization so that Salesforce can more effectively communicate with you. Contact your Salesforce representative with this information.
- Consider using two-factor authentication techniques, such as RSA tokens, to restrict access to your network. For more information, see [Salesforce Two-Factor Authentication](#) on page 760

Salesforce has a Security Incident Response Team to respond to any security issues. To report a security incident or vulnerability to Salesforce, please contact security@salesforce.com. Describe the issue in detail, and the team will respond promptly.

Security Infrastructure

One of the core features of a multi-tenant platform is the use of a single pool of computing resources to service the needs of many different customers. Salesforce protects your organization's data from all other customer organizations by using a unique organization identifier, which is associated with each user's session. Once you log in to your organization, your subsequent requests are associated with your organization, using this identifier.

Salesforce utilizes some of the most advanced technology for Internet security available today. When you access the application using a Salesforce-supported browser, Transport Layer Security (TLS) technology protects your information using both server authentication and Classic Encryption, ensuring that your data is safe, secure, and available only to registered users in your organization.

In addition, Salesforce is hosted in a secure server environment that uses a firewall and other advanced technology to prevent interference or access from outside intruders.

Auditing

Auditing features do not secure your organization by themselves, but these features provide information about usage of the system, which can be critical in diagnosing potential or real security issues. It is important that someone in your organization perform regular audits to detect potential abuse. The other security features provided by Salesforce are preventative. To verify that your system is actually secure, you should perform audits to monitor for unexpected changes or usage trends.

Auditing features include:

Record Modification Fields

All objects include fields to store the name of the user who created the record and who last modified the record. This provides some basic auditing information.

Login History

You can review a list of successful and failed login attempts to your organization for the past six months. See [Monitor Login History](#) on page 906.

Field History Tracking

You can also enable auditing for individual fields, which will automatically track any changes in the values of selected fields. Although auditing is available for all custom objects, only some standard objects allow field-level auditing. See [Track Field History](#) on page 911.

Setup Audit Trail

Administrators can also view a Setup Audit Trail, which logs when modifications are made to your organization's configuration. See [Monitor Setup Changes](#) on page 908.

Platform Encryption

Platform Encryption gives your data a whole new layer of security while preserving critical platform functionality. The data you select is encrypted at rest using an advanced key derivation system. You can protect data at a more granular level than ever before, so that your company can confidently comply with privacy policies, regulatory requirements, and contractual obligations for handling private data.

IN THIS SECTION:

[Encrypt Fields and Files](#)

To implement Platform Encryption in your organization, create a tenant secret and then specify the fields and files you want to encrypt, and designate users who can generate, rotate and archive your organization's keys.

[Manage Tenant Secrets and Keys](#)

With Platform Encryption, you manage your own tenant secret, which is used to derive the keys that protect your data. After you create a unique tenant secret for your organization, you can rotate it, archive it, and share responsibility for it with other users.

[How Platform Encryption Works](#)

Platform Encryption builds on the data encryption options that Salesforce offers out of the box. It enables you to encrypt the data stored in many standard and custom fields and in files and attachments. Data is encrypted at rest, not just when transmitted over a network, so it is protected even when other lines of defense have been compromised.

EDITIONS

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in Salesforce Classic only.

Encrypt Fields and Files

To implement Platform Encryption in your organization, create a tenant secret and then specify the fields and files you want to encrypt, and designate users who can generate, rotate and archive your organization's keys.

IN THIS SECTION:

[Encrypt Fields](#)

Select the fields you want to encrypt. When a field is encrypted, its value appears as asterisks to users who don't have permission to view it.

[Encrypt Files and Attachments](#)

Encrypt files and attachments using Platform Encryption for another layer of data protection. When Platform Encryption is on, the body of each file or attachment is encrypted when it is uploaded.

[Turn Platform Encryption Off](#)

At some point you may need to disable Platform Encryption for fields, files, or both. When you turn off Platform Encryption, encrypted data is not mass-decrypted and any functionality that is affected by encryption is not restored. Contact Salesforce if you need help with this.

Encrypt Fields

Select the fields you want to encrypt. When a field is encrypted, its value appears as asterisks to users who don't have permission to view it.

Depending on the size of your organization, enabling a standard field for encryption can take a few minutes.

1. Make sure that your organization has an active encryption key. If you're not sure, check with your administrator.
2. From Setup, enter *Platform Encryption* in the **Quick Find** box, then select **Platform Encryption**.
3. Select **Enable Encrypted Standard Fields**.
4. Select **Edit**.
5. Select the fields to encrypt, and save your settings.

The automatic Platform Encryption validation service kicks off. If any of your organization's settings are blocking encryption, you will receive an email with instructions for fixing them.

Field values are automatically encrypted only in records created or updated after you've enabled encryption. Salesforce recommends updating existing records to ensure that their field values are encrypted. For example, if you encrypt the `Description` field on the Case object, use the Data Loader to update all case records. Contact Salesforce if you need help with this.

EDITIONS

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in Salesforce Classic only.

EDITIONS

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in Salesforce Classic only.

USER PERMISSIONS

To view setup:

- "View Setup and Configuration"

To enable encrypted fields:

- "Customize Application"

 **Note:** This information applies to Platform Encryption and not to Classic Encryption.

SEE ALSO:

- [Which Fields Can I Encrypt?](#)
- [What to Expect When You Encrypt Certain Fields](#)
- [Data Loader](#)
- [Automatic Validation for Platform Encryption](#)
- [Back to Parent Topic](#)
- [Which Fields Can I Encrypt?](#)
- [What to Expect When You Encrypt Certain Fields](#)
- [Data Loader](#)
- [Automatic Validation for Platform Encryption](#)
- [Back to Parent Topic](#)

Encrypt Files and Attachments

Encrypt files and attachments using Platform Encryption for another layer of data protection. When Platform Encryption is on, the body of each file or attachment is encrypted when it is uploaded.

 **Note:** Before you begin, make sure that your organization has an active encryption key; if you're not sure, check with your administrator.

You can encrypt these kinds of files:

- Files attached to feeds.
- Files attached to records.
- Files in the Content, Libraries, and Files tabs (Chatter files, including file previews, and Salesforce CRM Content files).
- Files managed with Salesforce Files Sync
- Notes (Beta)

Some types of files and attachments can't be encrypted:

- Chatter group and profile photos
 - Documents
 - Email attachments
1. From Setup, enter *Platform Encryption* in the Quick Find box, then select **Platform Encryption**.
 2. Select **Enable Encrypted Files and Attachments**.
 3. Click **Set Preferences**.

 **Important:** Users with access to the file can work normally with it regardless of their encryption-specific permissions. Users who are logged into your organization and have read access can search and view the body content.

Users can continue to upload files and attachments per the usual file size limits. Any expansion of file sizes caused by encryption doesn't count against these limits.

EDITIONS

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in Salesforce Classic only.

USER PERMISSIONS

To view setup:

- "View Setup and Configuration"

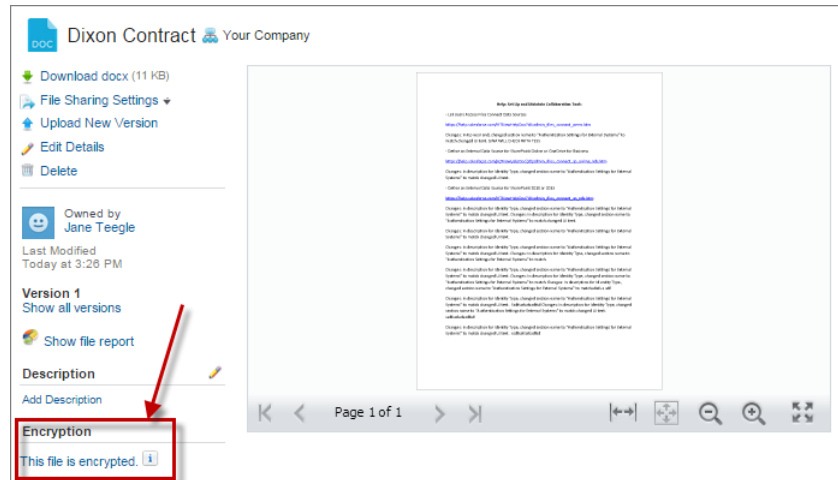

To enable encrypted files:

- "Customize Application"

Turning on file and attachment encryption affects new files and attachments. It does not automatically encrypt files and attachments that were already in Salesforce. To encrypt existing files, contact Salesforce.

To check whether a file or attachment is encrypted, look for the encryption indicator on the detail page of the file or attachment, or query the `isEncrypted` field on the ContentVersion object (for files) or on the Attachment object (for attachments).

Here's what it looks like when a file is encrypted.

Note: This information applies to Platform Encryption and not to Classic Encryption.

SEE ALSO:

[Automatic Validation for Platform Encryption](#)

[Back to Parent Topic](#)

[Automatic Validation for Platform Encryption](#)

[Back to Parent Topic](#)

Turn Platform Encryption Off

At some point you may need to disable Platform Encryption for fields, files, or both. When you turn off Platform Encryption, encrypted data is not mass-decrypted and any functionality that is affected by encryption is not restored. Contact Salesforce if you need help with this.

1. From Setup, enter *Platform Encryption* in the **Quick Find** box, then select **Platform Encryption**.
2. Clear the fields you want to make visible to users without the "View Encrypted Data" permission.
3. To disable field encryption entirely, clear **Enable Encrypted Standard Fields**.
4. To disable encryption for files, select **Disable Encrypted Files and Attachments**.

The limitations and special behaviors that apply to encrypted fields persist after encryption is disabled. The values can remain encrypted at rest and masked in some places. All previously encrypted files and attachments remain encrypted at rest.

Encrypted fields remain accessible after you disable encryption, as long as the key used to encrypt them has not been destroyed.

SEE ALSO:

[Back to Parent Topic](#)

[Back to Parent Topic](#)

Manage Tenant Secrets and Keys

With Platform Encryption, you manage your own tenant secret, which is used to derive the keys that protect your data. After you create a unique tenant secret for your organization, you can rotate it, archive it, and share responsibility for it with other users.

Authorized users generate tenant secrets on demand from the Platform Encryption page. Authorized developers can generate them by coding a call to the TenantSecret object in the Salesforce API.

Data encryption keys are never shared across organizations or saved to any disk. Instead, they are derived on demand from a master secret and an organization-specific tenant secret and then cached on an application server.

IN THIS SECTION:

[Create a Tenant Secret](#)

Create a unique tenant secret for your organization, then authorize specific people to use it to produce new data encryption keys.

[Rotate Your Platform Encryption Keys](#)

Key rotation is the process of generating a new tenant secret and archiving the previously active one. By controlling the lifecycle of your organization's tenant secrets, you control the lifecycle of the derived data encryption keys.

[Export and Import a Tenant Secret](#)

Your tenant secret is unique to your organization and to the specific data to which it applies. Salesforce recommends that you export your secret to ensure continued data access in cases where you need to gain access to the related data again.

EDITIONS

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in Salesforce Classic only.

USER PERMISSIONS

To view setup:

- "View Setup and Configuration"

To disable encryption:

- "Customize Application"

EDITIONS

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in Salesforce Classic only.

USER PERMISSIONS

To manage tenant secrets:

- "Manage Encryption Keys"

[Destroy A Tenant Secret](#)

Only destroy tenant secrets in extreme cases where access to related data is no longer needed. Your tenant secret is unique to your organization and to the specific data to which it applies. Once you destroy a tenant secret, related data is not accessible unless you previously exported the key and then import the key back into Salesforce

[The TenantSecret Object](#)

[Back to Parent Topic](#)

[Which User Permissions Does Platform Encryption Require?](#)

[The TenantSecret Object](#)

[Back to Parent Topic](#)

Create a Tenant Secret

Create a unique tenant secret for your organization, then authorize specific people to use it to produce new data encryption keys.

1. Create your tenant secret.
 - a. From Setup, enter *Platform Encryption* in the *Quick Find* box, then select **Platform Encryption**.
 - b. Click **Create Tenant Secret**.
2. Assign the “Manage Encryption Keys” permission to people you trust to manage tenant secrets for your organization.

You can add this permission to a profile or a permission set: from Setup, enter *Profiles* or *Permission Sets* in the *Quick Find* box.

 **Note:** Administrators have the “Manage Encryption Keys” permission enabled by default.

 **Note:** This information applies to Platform Encryption and not to Classic Encryption.

SEE ALSO:

[Permission Sets](#)

[Profiles](#)

[Permission Sets](#)

[Profiles](#)

EDITIONS

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in Salesforce Classic only.

USER PERMISSIONS

To manage tenant secrets:

- “Manage Encryption Keys”

Rotate Your Platform Encryption Keys

Key rotation is the process of generating a new tenant secret and archiving the previously active one. By controlling the lifecycle of your organization's tenant secrets, you control the lifecycle of the derived data encryption keys.

Your key rotation is determined by your organization's security policies. You can rotate the tenant secret once every 24 hours in a production organization, and every four hours in a sandbox environment. Master secrets used in the key derivation function are rotated with each major Salesforce release. This has no impact on the customer keys or on encrypted data, until the tenant secret is rotated.

1. Check the statuses of keys in your organization from Setup by entering *Platform Encryption* in the **Quick Find** box, then selecting **Platform Encryption**. Keys can be active, archived, or destroyed.

ACTIVE

Can be used to encrypt and decrypt new or existing data.

ARCHIVED

Cannot encrypt new data. Can be used to decrypt data previously encrypted with this key when it was active.

DESTROYED

Cannot encrypt or decrypt data. Data encrypted with this key when it was active can no longer be decrypted.

2. From Setup, enter *Platform Encryption* in the **Quick Find** box, then select **Platform Encryption**.
3. Click **Generate New Tenant Secret**.
4. If you want to re-encrypt existing field values with a newly generated tenant secret, edit and save the encrypted fields using the Data Loader or another tool.

Get the data to update by exporting the objects via the API or by running a report that includes the record ID. This triggers the encryption service to encrypt the existing data again using the newest key.

 **Note:** This information applies to Platform Encryption and not to Classic Encryption.

EDITIONS

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in Salesforce Classic only.

USER PERMISSIONS

To manage tenant secrets:

- "Manage Encryption Keys"

Export and Import a Tenant Secret

Your tenant secret is unique to your organization and to the specific data to which it applies. Salesforce recommends that you export your secret to ensure continued data access in cases where you need to gain access to the related data again.

1. From Setup, enter *Platform Encryption* in the **Quick Find** box, then select **Platform Encryption**.
2. In the table that lists your keys, find the tenant secret you want and click **Export**.
3. Confirm your choice in the warning box, then save your exported file.

The file name is `tenant-secret-org-<organization ID>-ver-<tenant secret version number>.txt`. For example,
`tenant-secret-org-00DD0000007eTR-ver-1.txt`.

4. Note the specific version you're exporting, and give the exported file a meaningful name. Store the file in a safe location in case you need to import it back into your organization.

 **Note:** Your exported tenant secret is itself encrypted.

5. To import your tenant secret again, click **Import > Choose File** and select your file. Make sure you're importing the correct version of the tenant secret.

 **Note:** This information applies to Platform Encryption and not to Classic Encryption.

Destroy A Tenant Secret

Only destroy tenant secrets in extreme cases where access to related data is no longer needed. Your tenant secret is unique to your organization and to the specific data to which it applies. Once you destroy a tenant secret, related data is not accessible unless you previously exported the key and then import the key back into Salesforce

 **Note:** If you create a sandbox organization from your production organization and then later destroy the tenant secret on your sandbox organization, the tenant secret continues to exist without change on the production organization.

1. From Setup, enter *Platform Encryption* in the **Quick Find** box, then select **Platform Encryption**.
2. From the table that lists your tenant secrets, go to the row that contains the one you want to destroy and click **Destroy**.
3. A warning box appears. If this is the tenant secret you want to destroy:
 - a. Type in the text as shown.
 - b. Select the checkbox acknowledging that you're destroying a tenant secret.
 - c. Click **Destroy**.

 **Note:** This information applies to Platform Encryption and not to Classic Encryption.

EDITIONS

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in Salesforce Classic only.

USER PERMISSIONS

- "Manage Encryption Keys"

EDITIONS

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in Salesforce Classic only.

USER PERMISSIONS

To manage tenant secrets:

- "Manage Encryption Keys"

How Platform Encryption Works

Platform Encryption builds on the data encryption options that Salesforce offers out of the box. It enables you to encrypt the data stored in many standard and custom fields and in files and attachments. Data is encrypted at rest, not just when transmitted over a network, so it is protected even when other lines of defense have been compromised.

Encrypting files, fields, and attachments has no effect on your organization's storage limits.

 **Note:** This information applies to Platform Encryption and not to Classic Encryption.

IN THIS SECTION:

[Platform Encryption Best Practices](#)

Take the time to identify the most likely threats to your organization. This will help you distinguish data that needs encryption from data that doesn't, so that you can encrypt only what you need to. Make sure your tenant secret and keys are backed up, and be careful who you allow to manage your secrets and keys.

[Which Fields Can I Encrypt?](#)

You can encrypt certain fields on the Account, Contact, Case, and Case Comment objects. When Platform Encryption is on, users with the the "View Encrypted Data" permission can see the contents of encrypted fields, but users without that permission see only masked values (that is, the values are replaced with asterisks).

[Platform Encryption Terminology](#)

Encryption has its own specialized vocabulary. To get the most out of your Platform Encryption features, it's a good idea to familiarize yourself with the key terms, such as hardware security module, key rotation, and master secret.

[Behind the Scenes: The Platform Encryption Process](#)

When users submit data, the application server looks for the organization-specific data encryption key in its cache. If it isn't there, the application server gets the encrypted tenant secret from the database and asks the key derivation server to derive the key. The encryption service then encrypts the data on the application server.

[Automatic Validation for Platform Encryption](#)

When you turn on encryption, Salesforce automatically checks for potential side effects and warns you if any existing settings may pose a risk to data access or the normal operation of your Salesforce organization. For example, encryption is blocked if you try to encrypt fields used in criteria-based sharing rules.

[Which User Permissions Does Platform Encryption Require?](#)

Assign permissions to your users according to their roles with regard to encryption. Some users will need the "View Encrypted Data" permission. Some will need other combinations of permissions in order to select data for encryption or work with encryption keys.

[How Do I Deploy Platform Encryption?](#)

When you deploy Platform Encryption to your organization with a tool such as Force.com IDE, Migration Tool, or Workbench, the Encrypted field attribute persists. However, if you deploy to organizations with different encryption settings, the effect depends on whether Platform Encryption is enabled in the target organization.

[How Does Platform Encryption Work In a Sandbox?](#)

Refreshing a sandbox from a production organization creates an exact copy of the production organization. If Platform Encryption is enabled on the production organization, all encryption settings are copied, including tenant secrets created in production.

[What's the Difference Between Classic Encryption and Platform Encryption?](#)

Classic encryption lets you protect a special type of custom text fields, which you create for that purpose. With Platform Encryption you can encrypt a variety of widely-used standard fields, along with some custom fields and many kinds of files. Platform Encryption also supports person accounts, cases, search, workflow, approval processes, and other key Salesforce features.

EDITIONS

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in Salesforce Classic only.

Platform Encryption Considerations

You can expect excellent data protection when using Platform Encryption, but keep these considerations in mind before enabling it.

Platform Encryption Best Practices

Take the time to identify the most likely threats to your organization. This will help you distinguish data that needs encryption from data that doesn't, so that you can encrypt only what you need to. Make sure your tenant secret and keys are backed up, and be careful who you allow to manage your secrets and keys.

1. Define a threat model for your organization.

Walk through a formal threat modeling exercise to identify the threats that are most likely to affect your organization. Use your findings to create a data classification scheme, which can help you decide what data to encrypt.

2. Encrypt only where necessary.

- Not all data is sensitive. Focus on information that requires encryption to meet your regulatory, security, compliance, and privacy requirements. Unnecessarily encrypting data impacts functionality and performance.
- Evaluate your data classification scheme early and work with stakeholders in security, compliance, and business IT departments to define requirements. Balance business-critical functionality against security and risk measures and challenge your assumptions periodically.

3. Create a strategy early for backing up and archiving keys and data.

If your tenant secrets are destroyed, reimport them to access your data. You are solely responsible for making sure your data and tenant secrets are backed up and stored in a safe place. Salesforce cannot help you with deleted, destroyed or misplaced tenant secrets.

4. Understand that encryption applies to all users, regardless of their permissions.

- You control who reads encrypted field values in plaintext using the "View Encrypted Data" permission. However, the data stored in these fields is encrypted at rest, regardless of user permissions.
- Functional limitations are imposed on users who interact with encrypted data. Consider whether encryption can be applied to a portion of your business users and how this application affects other users interacting with the data.

5. Read the Platform Encryption considerations and understand their implications on your organization.

- Evaluate the impact of the considerations on your business solution and implementation.
- Test Platform Encryption in a sandbox environment before deploying to a production environment.
- Before enabling encryption, fix any violations that you uncover. For example, referencing encrypted fields in a SOQL WHERE clause triggers a violation. Similarly, if you reference encrypted fields in a SOQL ORDER BY clause, a violation occurs. In both cases, fix the violation by removing references to the encrypted fields.

6. Analyze and test AppExchange apps before deploying them.

- If you use an app from the AppExchange, test how it interacts with encrypted data in your organization and evaluate whether its functionality is affected.
- If an app interacts with encrypted data that's stored outside of Salesforce, investigate how and where data processing occurs and how information is protected.

EDITIONS

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in Salesforce Classic only.

- If you suspect Platform Encryption could affect the functionality of an app, ask the provider for help with evaluation. Also discuss any custom solutions that must be compatible with Platform Encryption.
 - Apps on the AppExchange that are built exclusively using Force.com inherit Platform Encryption capabilities and limitations.
7. Platform Encryption is not a user authentication or authorization tool. Use field-level security settings, page layout settings, and validation rules, not Platform Encryption, to control which users can see which data. Make sure that a user inadvertently granted the View Encrypted Data permission would still see only appropriate data.
By default, any user can edit encrypted fields, even users without the “View Encrypted Data” permission.
 8. Grant the “Manage Encryption Keys” user permission to authorized users only.
Users with the “Manage Encryption Keys” permission can generate, export, import, and destroy organization-specific keys. Monitor the key management activities of these users regularly with the setup audit trail.
 9. Grant the “View Encrypted Data” user permission to authorized users only.
Grant the “View Encrypted Data” permission to users who must view encrypted fields in plaintext, including integration users who must read sensitive data in plaintext. Encrypted files are visible to all users who have access to the files, regardless of the “View Encrypted Data” permission.
 10. Mass-encrypt your existing data.
Existing field and file data is not automatically encrypted when you turn on Platform Encryption. To encrypt existing field data, update the records associated with the field data. This action triggers encryption for these records so that your existing data is encrypted at rest. To encrypt existing files, contact Salesforce.
 11. Avoid encrypting Currency, Number, Date, and Date/Time data.
You can often keep private, sensitive, or regulated data safe without encrypting associated `Currency`, `Number`, `Date`, and `Date/Time` fields. Encrypting these fields can have broad functional consequences across the platform, such as disruptions to roll-up summary reports, report timeframes, and calculations.
 12. Communicate to your users about the impact of encryption.
Before you enable Platform Encryption in a production environment, inform users about how it affects your business solution. For example, share the information described in Platform Encryption considerations, where it's relevant to your business processes.
 13. Use discretion when granting login access.
If a user with the “View Encrypted Data” permission grants login access to another user, the other user is able to view encrypted fields in plaintext.
 14. Encrypt your data using the most current key.
When you generate a new tenant secret, any new data is encrypted using this key. However, existing sensitive data remains encrypted using previous keys. In this situation, Salesforce strongly recommends re-encrypting these fields using the latest key. Contact Salesforce for help with this.

SEE ALSO:[Back to Parent Topic](#)[Back to Parent Topic](#)

Which Fields Can I Encrypt?

You can encrypt certain fields on the Account, Contact, Case, and Case Comment objects. When Platform Encryption is on, users with the the “View Encrypted Data” permission can see the contents of encrypted fields, but users without that permission see only masked values (that is, the values are replaced with asterisks).

In either case, encrypted fields work normally throughout the Salesforce user interface, business processes, and APIs. (There are some exceptions; for example, encrypted fields can't be sorted.)

When you turn encryption on, existing field values aren't encrypted immediately. Values are encrypted only after they are touched. Contact Salesforce for help encrypting existing data.

Encrypted Standard Fields

You can encrypt the contents of these standard field types.

- On the Account object:
 - Account Name
- On the Contact object:
 - Email
 - Fax
 - Home Phone
 - Mailing Address (Encrypts only Mailing Street and Mailing City)
 - Mobile
 - Name (Encrypts First Name, Middle Name, and Last Name)
 - Other Phone
 - Phone
- On the Case object:
 - Subject
 - Description
- On Case Comments:
 - Body

Encrypted Custom Fields

You can encrypt the contents of these custom field types:

- Email
- Phone
- Text
- Text Area
- Text Area (Long)
- URL

EDITIONS

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in Salesforce Classic only.

Important: Once a custom field is encrypted, you can't change the field type. For custom phone and email fields, you also can't change the field format.

You can't use currently or previously encrypted custom fields in custom formula fields or criteria-based sharing rules.

You can't use Schema Builder to create an encrypted custom field.

Some custom fields can't be encrypted:

- Fields that have the `Unique` or `External ID` attributes or include these attributes on previously encrypted custom fields
- Fields that are used in custom formula fields
- Fields on external data objects

Note: This information applies to Platform Encryption and not to Classic Encryption.

[Encrypt Fields](#)

[Back to Parent Topic](#)

Platform Encryption Terminology

Encryption has its own specialized vocabulary. To get the most out of your Platform Encryption features, it's a good idea to familiarize yourself with the key terms, such as hardware security module, key rotation, and master secret.

Data Encryption

The process of applying a cryptographic function to data that results in ciphertext. The platform encryption process uses symmetric key encryption and a 256-bit Advanced Encryption Standard (AES) algorithm using CBC mode, PKCS5 padding, and a randomized, 128-bit initialization vector (IV) to encrypt field-level data and files stored on the Salesforce platform. Both data encryption and decryption occur on the application servers.

Data Encryption Keys

Platform Encryption uses data encryption keys to encrypt and decrypt data. Data encryption keys are derived on a key derivation server using keying material split between a per-release master secret and an organization-specific tenant secret stored encrypted in the database as a part of your organization. The 256-bit derived keys exist in memory until evicted from the cache.

Encrypted Data at Rest

Data that is encrypted when stored on disk. Salesforce supports encryption for fields stored in the database, documents stored in Files, Content Libraries, and Attachments, and archived data.

Encryption Key Management

Refers to all aspects of key management, such as key creation, processes, and storage. Tenant secret management is performed by administrators or users who have the "Manage Encryption Keys" permission, enabled from Setup by entering *Platform Encryption* in the *Quick Find* box and then selecting **Platform Encryption**.

Hardware Security Module (HSM)

Used to provide cryptography processing as well as key management for authentication. Platform Encryption uses HSMs to generate and store secret material and run the function that derives data encryption keys used by the encryption service to encrypt and decrypt data.

EDITIONS

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in Salesforce Classic only.

Initialization Vector (IV)

A random sequence used with a key to encrypt data.

Key Derivation Function (KDF)

Uses a pseudorandom number generator and input such as a password to derive keys. Platform Encryption uses PBKDF2 (Password-based Key Derivation Function 2) with HMAC-SHA-256.

Key (Tenant Secret) Rotation

The process of generating a new tenant secret and archiving the previously active one. Active tenant secrets are used for both encryption and decryption. Archived ones are used only for decryption until all data has been re-encrypted using the new, active tenant secret.

Master HSM

The master HSM consists of a USB device used to generate secure, random secrets each Salesforce release. The master HSM is "air-gapped" from Salesforce's production network and stored securely in a bank safety deposit box.

Master Secret

Used in conjunction with the tenant secret and key derivation function to generate a derived data encryption key. The master secret is updated each release by Salesforce and encrypted using the per-release master wrapping key, which is in turn encrypted with the Key Derivation Servers' public key so it can be stored encrypted on the file system. Only HSMs can decrypt it. *No Salesforce employees have access to these keys in cleartext.*

Master Wrapping Key

A symmetric key is derived and used as a master wrapping key, also known as a key wrapping key, encrypting all the per-release keys and secrets bundle.

Tenant Secret

An organization-specific secret used in conjunction with the master secret and key derivation function to generate a derived data encryption key. When an organization administrator rotates a key, a new tenant secret is generated. To access the tenant secret via the API, refer to the TenantSecret object. *No Salesforce employees have access to these keys in cleartext.*

SEE ALSO:

[Back to Parent Topic](#)

[Back to Parent Topic](#)

Behind the Scenes: The Platform Encryption Process

When users submit data, the application server looks for the organization-specific data encryption key in its cache. If it isn't there, the application server gets the encrypted tenant secret from the database and asks the key derivation server to derive the key. The encryption service then encrypts the data on the application server.

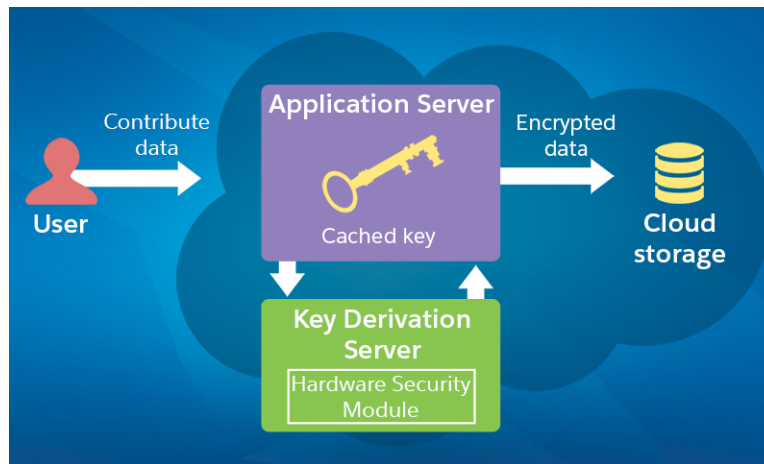

Salesforce securely generates the master and tenant secrets by using Hardware Security Modules (HSMs). The unique key is derived by using PBKDF2, a Key Derivation Function (KDF), with the master and tenant secrets as inputs.

EDITIONS

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in Salesforce Classic only.

Platform Encryption Process Flow

1. Data is sent to the application server.
2. The application server looks for the organization-specific data encryption key in its cache.
3. If the data encryption key is not in the cache:
 - a. The application server gets the encrypted tenant secret from the database, authenticates to the key derivation server over a secured channel, and asks the key derivation server for the key.
 - b. The key derivation server derives the key in the hardware security module, using the master secret and the tenant secret, and sends it back securely to the application server.
4. The encryption service encrypts the data on the application server.
5. The encrypted data is stored.

Salesforce generates a new master secret at the start of each release.

[Back to Parent Topic](#)

Automatic Validation for Platform Encryption

When you turn on encryption, Salesforce automatically checks for potential side effects and warns you if any existing settings may pose a risk to data access or the normal operation of your Salesforce organization. For example, encryption is blocked if you try to encrypt fields used in criteria-based sharing rules.

Validation results are returned via email when you use the UI and are synchronous when you use the API.

If the validation process gives you an error message when you enable Platform Encryption, you may be able to use this information to solve the issue. These are the factors that the validation service checks:

EDITIONS

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in Salesforce Classic only.

Errors

If You Use...	Suggested Solutions
Criteria-Based Sharing Rules	Fields can't be used in criteria-based sharing rules.
SOQL queries	Encrypted fields cannot be used in certain portions of a SOQL query.
Formula fields	Formula fields cannot reference encrypted fields.
Skinny tables	Fields used in skinny tables cannot be encrypted, and encrypted fields cannot be used in skinny tables.
Communities and Portals	If you encrypt standard fields, you can't enable Communities or Portals in your organization. If Communities or Portals are already enabled in your organization, you can't encrypt standard fields.

 **Note:** This information applies to Platform Encryption and not to Classic Encryption.

[Back to Parent Topic](#)

Which User Permissions Does Platform Encryption Require?

Assign permissions to your users according to their roles with regard to encryption. Some users will need the "View Encrypted Data" permission. Some will need other combinations of permissions in order to select data for encryption or work with encryption keys.

	View Encrypted Data	Manage Encryption Keys	Customize Application	View Setup and Configuration
View data in encrypted fields	✓			
View Platform Encryption setup page			✓	✓
Edit Platform Encryption setup Page, excluding key management			✓	
Generate, destroy, export, and import tenant secrets		✓		
Query TenantSecret object via the API		✓		

The "View Encrypted Data" Permission

As administrator, you decide which users can see field values unmasked. You do this by granting the "View Encrypted Data" permission in profiles or permission sets. Administrators do not automatically have the permission, and standard profiles do not include it by default.

 **Tip:**

When you have the “View Encrypted Data” permission and grant login access to other users, they can see encrypted field values in plain text. To avoid exposing sensitive data, clone your profile, remove the “View Encrypted Data” permission from the cloned profile, and assign yourself to the cloned profile; then grant login access to the other user.

When you turn encryption on, existing field values aren't encrypted immediately. Values are encrypted only after they are touched.

An encrypted file is visible to all users who have access to that file, regardless of the “View Encrypted Data” permission.

Users without the “View Encrypted Data” permission can't:

- Edit required encrypted lookup fields.
- Use Chatter publisher related lists,
- Use the Copy Mailing Address to Other Address functionality in contacts.
- Choose which value to keep from two merged account records if the same value is encrypted in both. In this scenario, Salesforce retains the value from the master account record.
- Create records that require a value for an encrypted standard field.

When the running user on a report or dashboard has the View Encrypted Data permission, readers of the report chart or dashboard who don't have the View Encrypted Data permission may still see encrypted data.

When users without the “View Encrypted Data” permission clone a record with encrypted, non-lookup fields, the encrypted field values are blank in the new record.

When a user who doesn't have the “View Encrypted Data” permission clones a record, encrypted fields show masked data.

Users without the “View Encrypted Data” permission can still do some things with encrypted fields:

- Change the value of an encrypted field, unless the field-level security is set to read-only.
- See encrypted fields in search results, although their values are masked.
- Create contact and opportunity records from Chatter actions, related lists on account detail pages, and Quick Create.

 **Note:** This information applies to Platform Encryption and not to Classic Encryption.

How Do I Deploy Platform Encryption?

When you deploy Platform Encryption to your organization with a tool such as Force.com IDE, Migration Tool, or Workbench, the Encrypted field attribute persists. However, if you deploy to organizations with different encryption settings, the effect depends on whether Platform Encryption is enabled in the target organization.

You can use change sets to deploy Platform Encryption to custom fields. Regardless of how you deploy, Salesforce automatically checks to see if the implementation violates Platform Encryption guidelines.

 **Important:** Custom fields in packages cannot be encrypted. If you use managed or unmanaged packages in deployment, the Encrypted field attribute is ignored.

Source Organization	Target Organization	Result
Platform Encryption enabled	Platform Encryption enabled	The source Encrypted field attribute indicates enablement
Platform Encryption enabled	Platform Encryption not enabled	The Encrypted field attribute is ignored
Platform Encryption not enabled	Platform Encryption enabled	The target Encrypted field attribute indicates enablement

 **Note:** This information applies to Platform Encryption and not to Classic Encryption.

SEE ALSO:

[Back to Parent Topic](#)

[Back to Parent Topic](#)

How Does Platform Encryption Work In a Sandbox?

Refreshing a sandbox from a production organization creates an exact copy of the production organization. If Platform Encryption is enabled on the production organization, all encryption settings are copied, including tenant secrets created in production.

Once a sandbox is refreshed, tenant secret changes are confined to your current organization. This means that when you rotate or destroy a tenant secret on sandbox, it doesn't affect the production organization.

As a best practice, rotate tenant secrets on sandboxes after a refresh. Rotation ensures that production and sandbox use different tenant secrets. Destroying tenant secrets on a sandbox renders encrypted data unusable in cases of partial or full copies.

 **Note:** This information applies to Platform Encryption and not to Classic Encryption.

Available in Salesforce Classic only.

Field	Object	Effect
		non-ASCII values, Salesforce recommends creating validation rules to enforce these limits.

SEE ALSO:

[Encrypt Fields](#)[Back to Parent Topic](#)[Encrypt Fields](#)[Back to Parent Topic](#)

General Platform Encryption Considerations

These considerations apply to all data that you encrypt using Platform Encryption.

Search

- Search index files aren't encrypted.
- If you encrypt fields with a key and then destroy the key, the corresponding search terms remain in the search index. However, you can't decrypt the data associated with the destroyed key.

SOQL/SOSL

- If you query encrypted data, invalid strings return an `INVALID_FIELD` error instead of the expected `MALFORMED_QUERY`.
- Encrypted fields can't be used with the following SOQL and SOSL clauses and functions:
 - Aggregate functions such as `MAX()`, `MIN()`, and `COUNT_DISTINCT()`
 - WHERE clause
 - GROUP BY clause
 - ORDER BY clause
 - Dynamic queries within an Apex class

 **Tip:** Consider whether you can replace SOQL/WHERE clauses with SOSL/FIND queries. For example, SOQL/WHERE won't work with encrypted fields in Computer-telephony integration (CTI).

Accounts, Person Accounts, and Contacts

- When you encrypt any of the following Account fields, the equivalent Contact fields are also encrypted, and vice versa:
 - Name
 - Phone
 - Fax
- When you encrypt any of the following Account or Contact fields, the equivalent fields in Person Accounts are also encrypted:
 - Name
 - Mailing Address

EDITIONS

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in Salesforce Classic only.

- Phone
- Fax
- Mobile
- Home Phone
- Other Phone
- Email

Field Audit Trail

If your organization has Field Audit Trail enabled, previously archived data isn't encrypted when you turn on Platform Encryption. For example, your organization uses Field Audit Trail to define a data history retention policy for an account field, such as the phone number field. After enabling Platform Encryption, you turn on encryption for that field, and phone number data in the account is encrypted. New phone number records are encrypted as they are created, and previous updates to the phone number field that are stored in the Account History related list are also encrypted. However, phone number history data that is already archived in the `FieldHistoryArchive` object continues to be stored without encryption. If your organization needs to encrypt previously archived data, contact Salesforce.

Page Layouts

If you preview a page layout as a profile without the "View Encrypted Data" permission, the preview's sample data isn't masked. Instead, the sample data may be blank or appear in plaintext.

Email

- When included in email templates, encrypted field values appear in plaintext to users with the "View Encrypted Data" permission. Otherwise, whether the recipient sees plaintext or masked data is determined by the running users permissions.
- Users without the "View Encrypted Data" permission can't send Stay-in-Touch requests.

Activity History

When an Activity History related list contains references to encrypted fields, those fields are encrypted in their original context. The list itself is not encrypted, and any unencrypted values in the list are visible in plaintext.

REST API

You can't get autosuggestions via the REST API when a field is encrypted.

Data Import

You can't use the Data Import Wizard to perform matching using master-detail relationships or update records that contain encrypted fields. You can use it to add new records, however.

Reports

- Report charts and dashboard components that display encrypted field values may be cached on disk unencrypted.
- You can't aggregate, sort, or filter on encrypted data.

General

- Encrypted fields can't be used in:

- Criteria-based sharing rules.
 - Filter criteria for list views, reports, and dashboards.
 - Portals: communities, customer, self-service, and partner.
 - Similar opportunities searches.
 - External lookup relationships.
 - Skinny tables.
 - Filter criteria for data management tools.
- In the Salesforce1 mobile app, records cloned by users without the “View Encrypted Data” permission show masked data for encrypted fields.
 - Live Agent chat transcripts are not encrypted at rest.
 - Duplicate rules are not supported.
 - Web-to-Case is supported, but the Web Company, Web Email, Web Name and Web Phone fields are not encrypted at rest.
-  **Note:** This information applies to Platform Encryption and not to Classic Encryption.

[Back to Parent Topic](#)

Session Security

After logging in, a user establishes a session with the platform. Use session security to limit exposure to your network when a user leaves their computer unattended while still logged on. It also limits the risk of internal attacks, such as when one employee tries to use another employee’s session.

You can control the session expiration time window for user logins. Session expiration allows you to select a timeout for user sessions. The default session timeout is two hours of inactivity. When the session timeout is reached, users are prompted with a dialog that allows them to log out or continue working. If they do not respond to this prompt, they are automatically logged out.

-  **Note:** When a user closes a browser window or tab they are not automatically logged off from their Salesforce session. Please ensure that your users are aware of this, and that they end all sessions properly by clicking *Your Name* > **Logout**.

By default, Salesforce uses TLS (Transport Layer Security) and requires secure connections (HTTPS) for all communication. The `Require secure connections (HTTPS)` setting determines whether TLS (HTTPS) is required for access to Salesforce, apart from Force.com sites, which can still be accessed using HTTP. If you ask Salesforce to disable this setting and change the URL from `https://` to `http://`, you can still access the application. However, you should require all sessions to use TLS for added security. See [Modify Session Security Settings](#) on page 748.

You can restrict access to certain types of resources based on the level of security associated with the authentication (login) method for the user’s current session. By default, each login method has one of two security levels: Standard or High Assurance. You can change the session security level and define policies so specified resources are only available to users with a High Assurance level. For details, see [Session-level Security](#) on page 751.

SEE ALSO:

[Set Trusted IP Ranges for Your Organization](#)

Modify Session Security Settings

You can modify session security settings to specify connection type, timeout settings, and more.

1. From Setup, enter *Session Settings* in the Quick Find box, then select **Session Settings**.
2. Customize the session security settings.

Field	Description
Timeout value	<p>Length of time after which the system logs out inactive users. For Portal users, the timeout is between 10 minutes and 12 hours even though you can only set it as low as 15 minutes. Select a value between 15 minutes and 12 hours. Choose a shorter timeout period if your organization has sensitive information and you want to enforce stricter security.</p> <p> Note: The last active session time value isn't updated until halfway through the timeout period. So if you have a 30-minute timeout, the system doesn't check for activity until 15 minutes have passed. For example, if you update a record after 10 minutes, the last active session time value isn't updated because there was no activity after 15 minutes. You're logged out in 20 more minutes (30 minutes total), because the last active session time wasn't updated. Suppose that you update a record after 20 minutes. That's 5 minutes after the last active session time is checked. Your timeout resets, and you have another 30 minutes before being logged out, for a total of 50 minutes.</p>
Disable session timeout warning popup	<p>Determines whether the system prompts inactive users with a timeout warning message. Users are prompted 30 seconds before timeout as specified by the <code>Timeout value</code>.</p>
Force logout on session timeout	<p>Requires that when sessions time out for inactive users, current sessions become invalid. The browser refreshes and returns to the login page. To access the organization, the user must log in again.</p> <p> Note: Do <i>not</i> select <code>Disable session timeout warning popup</code> when enabling this option.</p>
Lock sessions to the IP address from which they originated	<p>Determines whether user sessions are locked to the IP address from which the user logged in, helping to prevent unauthorized persons from hijacking a valid session.</p>

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

The `Lock sessions to the IP address from which they originated` setting is available in: **Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

All other settings available in: **Personal, Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

USER PERMISSIONS

To modify session security settings:

- “Customize Application”

Field	Description
	<p> Note: This option can inhibit various applications and mobile devices.</p>
Lock sessions to the domain in which they were first used	<p>Associates a current UI session for a user, such as a community user, with a specific domain to help prevent unauthorized use of the session ID in another domain. This preference is enabled by default for organizations created with the Spring '15 release or later.</p>
Require secure connections (HTTPS)	<p>Determines whether HTTPS is required to log in to or access Salesforce, apart from Force.com sites, which can still be accessed using HTTP.</p> <p>This option is enabled by default for security reasons.</p> <p> Note: The Reset Passwords for Your Users page can only be accessed using HTTPS.</p>
Force relogin after Login-As-User	<p>Determines whether an administrator who is logged in as another user is returned to their previous session after logging out as the secondary user.</p> <p>If the option is enabled, an administrator must log in again to continue using Salesforce after logging out as the user; otherwise, the administrator is returned to the original session after logging out as the user. This option is enabled by default for new organizations beginning with the Summer '14 release.</p>
Require HttpOnly attribute	<p>Restricts session ID cookie access. A cookie with the HttpOnly attribute is not accessible via non-HTTP methods, such as calls from JavaScript.</p> <p> Note: If you have a custom or packaged application that uses JavaScript to access session ID cookies, selecting <code>Require HttpOnly attribute</code> breaks your application because it denies the application access to the cookie. If <code>Require HttpOnly attribute</code> is selected, the AJAX Toolkit debugging window is not available.</p>
Use POST requests for cross-domain sessions	<p>Sets the organization to send session information using a POST request, instead of a GET request, for cross-domain exchanges, such as when a user is using a Visualforce page. In this context, POST requests are more secure than GET requests, because POST requests keep the session information in the body of the request. However, if you enable this setting, embedded content from another domain, such as:</p> <pre data-bbox="716 1535 1446 1581" style="border: 1px solid #ccc; padding: 5px;"><code></code></pre> <p>might not display.</p>
Enforce login IP ranges on every request	<p>Restricts the IP addresses from which users can access Salesforce to only the IP addresses defined in Login IP Ranges. If this option is enabled, login IP ranges are enforced on each page request, including requests from client applications. If this option is not enabled, login IP ranges are enforced only when a user logs in. This option affects all user profiles that have login IP restrictions.</p>

Field	Description
Enable caching and password autocomplete on login page	Allows the user's browser to store usernames. If enabled, after an initial login, usernames are auto-filled into the <code>User Name</code> field on the login page. This preference is selected by default and caching and autocomplete are enabled.
Enable the SMS method of identity confirmation	Allows users to receive a one-time PIN delivered via SMS. If this option is selected, administrators or users must verify their mobile phone number before taking advantage of this feature. This setting is selected by default for all organizations.
Require security tokens for API logins from callouts (API version 31.0 and earlier)	Requires the use of security tokens for API logins from callouts, such as Apex callouts or callouts using the AJAX proxy, in API version 31.0 and earlier. In API version 32.0 and later, security tokens are required by default.
Login IP Ranges (for Contact Manager, Group, and Professional Editions)	<p>Specifies a range of IP addresses users must log in from (inclusive), or the login fails.</p> <p>To specify a range, click New and enter a Start IP Address and End IP Address to define the range, which includes the start and end values.</p> <p>This field is not available in Enterprise, Unlimited, Performance, and Developer Editions. In those editions, you can specify a valid Login IP Range in the user profile settings.</p>
Enable clickjack protection for Setup pages	Protects against clickjack attacks on setup Salesforce pages. Clickjacking is also known as a user interface redress attack. (Setup pages are available from the Setup menu.)
Enable clickjack protection for non-Setup Salesforce pages	Protects against clickjack attacks on non-setup Salesforce pages. Clickjacking is also known as a user interface redress attack. Setup pages already include protection against clickjack attacks. (Setup pages are available from the Setup menu.) This setting is selected by default for all organizations.
Enable clickjack protection for customer Visualforce pages with standard headers	<p>Protects against clickjack attacks on your Visualforce pages with headers enabled. Clickjacking is also known as a user interface redress attack.</p> <p> Warning: If you use custom Visualforce pages within a frame or iframe, you might see a blank page or the page may display without the frame. For example, Visualforce pages in a page layout do not function when clickjack protection is on.</p>
Enable clickjack protection for customer Visualforce pages with headers disabled	<p>Protects against clickjack attacks on your Visualforce pages with headers disabled when setting <code>showHeader="false"</code> on the page. Clickjacking is also known as a user interface redress attack.</p> <p> Warning: If you use custom Visualforce pages within a frame or iframe, you might see a blank page or the page may display without the frame. For example, Visualforce pages in a page layout do not function when clickjack protection is on.</p>
Enable CSRF protection on GET requests on non-setup pages	Protects against Cross Site Request Forgery (CSRF) attacks by modifying non-setup pages to include a random string of characters in the URL parameters or as a hidden form field. With every GET and POST request, the

Field	Description
Enable CSRF protection on POST requests on non-setup pages	application checks the validity of this string of characters and doesn't execute the command unless the value found matches the expected value. This setting is selected by default for all organizations.
Logout URL	Redirects users to a specific page after they log out of Salesforce, such as an authentication provider's page or a custom-branded page. This URL is used only if no logout URL is specified in the identity provider, SAML single sign-on, or external authentication provider settings. If no value is specified for Logout URL, the default is <code>https://login.salesforce.com</code> , unless MyDomain is enabled. If My Domain is enabled, the default is <code>https://customdomain.my.salesforce.com</code> .

3. Click **Save**.

Session Security Levels

You can restrict access to certain types of resources based on the level of security associated with the authentication (login) method for the user's current session. By default, each login method has one of two security levels: Standard or High Assurance. You can change the session security level and define policies so specified resources are only available to users with a High Assurance level.

The different authentication methods are assigned these security levels, by default.

- Username and Password — Standard
- Delegated Authentication — Standard
- Two-Factor Authentication — High Assurance
- Authentication Provider — Standard
- SAML — Standard

 **Note:** The security level for a SAML session can also be specified using the `SessionLevel` attribute of the SAML assertion sent by the identity provider. The attribute can take one of two values, `STANDARD` or `HIGH_ASSURANCE`.

To change the security level associated with a login method:

1. From Setup, enter *Session Settings* in the Quick Find box, then select **Session Settings**.
2. Under Session Security Levels, select the login method.
3. Click the **Add** or **Remove** arrow to move it to the proper category.

Currently, the only features that use session-level security are reports and dashboards in Salesforce Reports and Dashboards, and connected apps. You can set policies requiring High Assurance on these types of resources and specify an action to take if the session used to access the resource is not High Assurance. The supported actions are:

- Block — Blocks access to the resource by showing an insufficient privileges error.
- Raise session level — Prompts users to complete two-factor authentication. When users authenticate successfully, they can access the resource. For reports and dashboards, you can apply this action when users access reports or dashboards, or just when they export and print them.

 **Warning:** Raising the session level to high assurance by redirecting the user to complete two-factor authentication is not a supported action in Lightning Experience. If your org has Lightning Experience enabled, and you set a policy that requires a high assurance session to access reports and dashboards, Lightning Experience users with a standard assurance session are blocked

from reports and dashboards. Also, they don't see the icons for these resources in the navigation menu. As a workaround, users with a standard assurance session can log out and log in again using an authentication method that is defined as high assurance by their org. They then have access to reports and dashboards. Alternatively, they can switch to Salesforce Classic, where they are prompted to raise the session level when they attempt to access reports and dashboards.

To set a High Assurance required policy for accessing a connected app:

1. From Setup, enter *Connected Apps* in the **Quick Find** box, then select the option for managing connected apps.
2. Click **Edit** next to the connected app.
3. Select **High Assurance session required**.
4. Select one of the actions presented.
5. Click **Save**.

To set a High Assurance required policy for accessing reports and dashboards:

1. From Setup, enter *Access Policies* in the **Quick Find** box, then select **Access Policies**.
2. Select **High Assurance session required**.
3. Select one of the actions presented.
4. Click **Save**.

The session levels have no impact on any resources in the app other than connected apps, reports, and dashboards for which explicit security policies have been defined.

SEE ALSO:

[Session Security](#)
[Find Setup](#)

Set Trusted IP Ranges for Your Organization

Trusted IP Ranges define a list of IP addresses from which users can log in without receiving a login challenge for verification of their identity, such as a code sent to their mobile phone.

Note:  [Who Sees What: Organization Access](#)

Watch how you can restrict login through IP ranges and login hours.

To help protect your organization's data from unauthorized access, you can specify a list of IP addresses from which users can log in without receiving a login challenge. However, this does not restrict access, entirely, for users outside of the Trusted IP Range. After these users complete the login challenge (usually by entering a code sent to their mobile device or email address), they can log in.

1. From Setup, enter *Network Access* in the **Quick Find** box, then select **Network Access**.
2. Click **New**.
3. Enter a valid IP address in the **Start IP Address** field and a higher IP address in the **End IP Address** field.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To view network access:

- "Login Challenge Enabled"

To change network access:

- "Manage IP Addresses"

The start and end addresses define the range of allowable IP addresses from which users can log in, including the start and end values. If you want to allow logins from a single IP address, enter the same address in both fields. For example, to allow logins from only 125.12.3.0, enter 125.12.3.0 as both the start and end addresses.

The start and end IP addresses must be in an IPv4 range and include no more than 33,554,432 addresses (2^{25} , a /7 CIDR block).

4. Optionally, enter a description for the range. For example, if you maintain multiple ranges, enter details about the part of your network that corresponds to this range.
5. Click **Save**.

 **Note:** For organizations that were activated before December 2007, Salesforce automatically populated your organization's trusted IP address list in December 2007, when this feature was introduced. The IP addresses from which trusted users had already accessed Salesforce during the past six months were added.

User Session Information

The User Session Information page helps you monitor and protect your organization by showing active sessions and session details for your organization. You can create custom list views, view details about a user associated with a specific session, and easily end suspicious sessions.

Non-administrators can see their own session information, while administrators can view all user sessions for an organization.

When you manually end a user's session by clicking the **Remove** button, the user must log in again to the organization.

The following table contains information about the fields you can view on this page. Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) may vary.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Field	Description
City	The city where the user's IP address is physically located. This value is not localized.
Country	The country where the user's IP address is physically located. This value is not localized.
Country Code	The ISO 3166 code for the country where the user's IP address is physically located. This value is not localized. For more information, see Country Codes - ISO 3166 .
Created	The date and time stamp of when the session began.
Latitude	The latitude where the user's IP address is physically located.
Location	The approximate location of the IP address from where the user logged in. To show more geographic information, such as approximate city and postal code, create a custom view to include those fields. This value is not localized.
Longitude	The longitude where the user's IP address is physically located.
Login Type	The type of login associated with the session. Some login types include Application, SAML, and Portal.

Field	Description
Parent Session ID	If a session has a parent, this ID is the parent's unique ID.
Postal Code	The postal code where the user's IP address is physically located. This value is not localized.
Session ID	The unique ID for the session.
Session Type	The type of session the user is logged in to. For example, common ones are UI, Content, API, and Visualforce.
Source IP	The IP address associated with the session.
Subdivision	The name of the subdivision where the user's IP address is physically located. This value is not localized.
User Type	The profile type associated with the session.
Username	The username used when logged in to the session. To view the user's profile page, click the username.
Updated	The date and time stamp of the last session update due to activity. For example, during a UI session, users make frequent changes to records and other data as they work. With each change, both the <code>Updated</code> and <code>Valid Until</code> date and time stamps are refreshed.
Valid Until	If you don't end the session manually, the date and time stamp of when the session automatically expires.

SEE ALSO:

[User Authentication Overview](#)

[Understanding Session Types](#)

Understanding Session Types

Learn about the session types in the User Session Information page to help you monitor and protect your organization.

You can view the session type for a specific user on the User Session Information page. To access the page from Setup, enter *Session Management* in the *Quick Find* box, then select **Session Management**.

Session types indicate the type of session a user is utilizing to access an organization. Session types can be persistent or temporary and accessed via the user interface, API, or other methods, such as an OAuth authentication process.

The following table describes the session types.

Session Type	Description
API	Created when accessing an organization through the API.
APIOnlyUser	Created to enable a password reset in the user interface for API-only users.
Chatter Networks	Created when using Chatter Networks or Chatter Communities.
ChatterNetworksAPIOnly	Created when using the Chatter Networks or Chatter Communities API.
Content	Created when serving user-uploaded content.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Session Type	Description
OauthApprovalUI	A session that only allows access to the OAuth approval page.
Oauth2	Created via OAuth flows. For example, if you use OAuth authentication for a connected app, this type of session is created.
SiteStudio	Created when using the Sites Studio user interface.
SitePreview	A session that is initiated when an internal canvas app is invoked. This will always be a child session with a UI parent session.
SubstituteUser	A session created when one user logs in via another user. For example, if an administrator logs in as another user, a SubstituteUser session is created.
TempContentExchange	A temporary user interface session to switch to the content domain, such as the user interface into which users type in their credentials.
TempOauthAccessTokenFrontdoor	A temporary session via the OAuth access token assertion flow that cannot be refreshed and must be mapped to a regular session type.
TempVisualforceExchange	A temporary session to switch to the Visualforce domain.
TempUIFrontdoor	A temporary session that cannot be refreshed and must be mapped to a regular session type.
UI	Created when using a user interface page.
UserSite	Initiated when a canvas application is invoked. Always a child session with a UI parent session.
Visualforce	Created via a Visualforce page.
WDC_API	A session using the Work.com API. This is always a child session and cannot be used in the user interface.

[User Session Information](#)

Security Activation

Identity Confirmation Activations

Identity confirmation activations track activated device IP address and client browser information.

Identity confirmation is used to verify the identities of users coming from unknown devices. It adds an extra layer of security on top of authentication. When a user comes from an unknown device with a new IP address, the user is challenged to verify their identity using the highest-priority verification method available. In order of priority, the methods are:

1. Verification code generated by a mobile authenticator app connected to the user's account
2. Verification code sent via SMS to the user's verified mobile phone
3. Verification code sent via email to the user's email address

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Available in all editions

Once the user enters the code and completes the identity verification challenge, the device (and client browser) is considered activated.

On the Activations page in Setup, Salesforce admins and end users can see device IP addresses and client browsers that have been activated for an org. Admins can revoke the activation status for a given user's device/browser combination.

For Salesforce admins, the Activations page in Setup provides information about all the activated device IP addresses and client browser information for all users in their org. Admins can revoke the activation status for one, many, or all users and can filter on specific criteria, such as username or login IP to determine which activated devices to revoke.

For example, a user can tell their Salesforce admin that their device has been lost, but they've been issued a new device and still need access to the org. The Salesforce admin can revoke the lost device and client browser activation status, effectively removing the IP address and browser information from the database. Anyone attempting to access the org from that revoked device is challenged for identity verification, adding a needed layer of security, while making sure users stay productive.

For users, the Activations page gives information about their activated device IP addresses and client browser information. End users can only revoke the activation status for their own activated device IP addresses and client browsers.

For example, a user logs in to their org and looks at their activated devices on the Activations page, and notices that there are several devices activated. The user has only logged in from a work laptop and doesn't recognize the IP addresses, so they immediately revoke the activation status of those devices. Since this user is challenged for identity verification using SMS to their mobile device, anyone trying to log in to the org from one of the unknown devices will fail the identity verification challenge. The user can then report the potential security breach.

SEE ALSO:

[Use Identity Confirmation Activations](#)

Use Identity Confirmation Activations

Use identity confirmation activations to verify and revoke activation status for users.

To see all the currently activated login IPs and browsers, from Setup, enter *Activations* in the **Quick Find** box, then select **Activations**. Look at the Activated Login IP section for login IPs or scroll to the Activated Client Browsers section for browsers. The oldest entries appear at the top of the lists.

Admins can revoke the activation status of one or more users and device addresses, or of one or more browsers, by checking their entries, clicking **Remove**, and confirming the action. A user can only view and revoke their own activated device IP addresses and browsers. A user that's been deactivated is challenged for identity verification at their next login attempt. You have to revoke both the login IP and the client browser information in order to trigger an identity verification.

You can create custom views of activated login IPs or activated client browsers by clicking **Create New View** and then naming the view, selecting filter criteria and fields to display, and specifying visibility.

User Security

User Authentication Overview

Salesforce provides each user in your organization with a unique username and password that must be entered each time a user logs in. Salesforce issues a session cookie only to record encrypted authentication information for the duration of a specific session. The session cookie does not include either the username or password of the user. Salesforce does not use cookies to store other confidential user and session information, but instead implements more advanced security methods based on dynamic data and encoded session IDs.

SEE ALSO:

[Single Sign-on Overview](#)

[Network-Based Security](#)

[CAPTCHA Security for Data Exports](#)

[User Session Information](#)

Single Sign-on Overview

Salesforce has its own system of user authentication, but some companies prefer to use an existing single sign-on capability to simplify and standardize their user authentication. You have two options to implement single sign-on—federated authentication using Security Assertion Markup Language (SAML) or delegated authentication.

- Federated authentication using Security Assertion Markup Language (SAML) allows you to send authentication and authorization data between affiliated but unrelated Web services. This enables you to sign on to Salesforce from a client application. Federated authentication using SAML is enabled by default for your organization.
- Delegated authentication single sign-on enables you to integrate Salesforce with an authentication method that you choose. This enables you to integrate authentication with your LDAP (Lightweight Directory Access Protocol) server, or perform single sign-on by authenticating using a token instead of a password. You manage delegated authentication at the permission level, allowing some users to use delegated authentication, while other users continue to use their Salesforce-managed password. Delegated authentication is set by permissions, not by organization.

The primary reasons for using delegated authentication include:

- Using a stronger type of user authentication, such as integration with a secure identity provider
- Making your login page private and accessible only behind a corporate firewall
- Differentiating your organization from all other companies that use Salesforce in order to reduce phishing attacks

You must request that this feature be enabled by Salesforce. Contact Salesforce to enable delegated authentication single sign-on for your organization.

- Authentication providers let your users log in to your Salesforce organization using their login credentials from an external service provider. Salesforce supports the OpenID Connect protocol that allows users to log in from any OpenID provider such as Google, Paypal, LinkedIn and other services supporting OpenID Connect. When authentication providers are enabled, Salesforce does not validate a user's password. Instead, Salesforce uses the user's login credentials from the external service provider to establish authentication credentials.

SEE ALSO:

[User Authentication Overview](#)

Network-Based Security

User authentication determines who can log in, while *network-based security* limits from where users can log in and access, and when. Use network-based security to limit the window of opportunity for an attacker by restricting the origin of user access requests. Network-based security can also make it more difficult for an attacker to use stolen credentials.

To enhance network-based security, you can restrict the hours during which users can log in. You can also restrict the range of IP addresses from which users can log in and access Salesforce. If IP address restrictions are defined for a user's profile and a login originates from an unknown IP address, Salesforce does not allow the login. These restrictions help protect your data from unauthorized access and phishing attacks.

To set the organization-wide list of trusted IP addresses from which users can always log in without a login challenge, see [Set Trusted IP Ranges for Your Organization](#) on page 752. To restrict login hours by profile, or to restrict login and access requests by IP addresses for specific profiles, see [Setting Login Restrictions](#) on page 758.

SEE ALSO:

[User Authentication Overview](#)

CAPTCHA Security for Data Exports

By request, Salesforce can also require users to pass a user verification test to export data from Salesforce. This simple, text-entry test helps prevent malicious programs from accessing your organization's data, as well as reducing the risk of automated attacks. CAPTCHA is a type of network-based security. To pass the test, users must type two words displayed on an overlay into the overlay's text box field, and click a **Submit** button. Salesforce uses CAPTCHA technology provided by [reCaptcha](#) to verify that a person, as opposed to an automated program, has correctly entered the text into the overlay. CAPTCHA stands for "Completely Automated Public Turing test to tell Computers and Humans Apart."

[User Authentication Overview](#)

Setting Login Restrictions

To help protect your organization's data against unauthorized access, you have several options for setting login and access restrictions.

Login Hours

For each profile, you can set the hours when users can log in. See:

- [View and Edit Login Hours in the Enhanced Profile User Interface](#)
- [View and Edit Login Hours in the Original Profile User Interface](#)

Two-Factor Authentication for User Interface Logins

For each profile, you can require users to enter a time-based token as a second form of authentication when they log in via the user interface. See [Set Two-Factor Authentication Login Requirements](#) on page 762.

Two-Factor Authentication for API Logins

For each profile, you can allow the use of a time-based token to access the service instead of the standard security token. If users add a time-based token to their account and this permission is enabled, they must use this token instead of the standard security token whenever it's requested, such as when resetting the account's password. See [Set Two-Factor Authentication Requirements for API Access](#) on page 763.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Login IP Address Ranges

For Enterprise, Performance, Unlimited, Developer, and Database.com editions, you can set the Login IP Range addresses from which users can log in on an individual profile. Users outside of the Login IP Range set on a profile can't access your Salesforce organization. See:

- [Restricting Login IP Ranges in the Enhanced Profile User Interface](#)
- [Restrict Login IP Addresses in the Original Profile User Interface](#)

For Contact Manager, Group, and Professional Editions, set the Login IP Range. From Setup, enter *Session Settings* in the **Quick Find** box, then select **Session Settings**.

Login IP Address Range Enforcement for All Access Requests

You can restrict all access to Salesforce to the IP addresses included in Login IP Ranges in users' profiles. For example, suppose a user logs in successfully from an IP address defined in Login IP Ranges. The user then moves to a different location and has a new IP address that is outside of Login IP Ranges. When the user refreshes the browser or tries to access Salesforce, including access from a client application, the user is denied. To enable this option, from Setup, enter *Session Settings* in the **Quick Find** box, select **Session Settings**, and then select **Enforce login IP ranges on every request**. This option affects all user profiles that have login IP restrictions.

Organization-Wide Trusted IP Ranges

For all users, you can set a list of IP address ranges from which they can always log in without receiving a login challenge. These users can log in to your organization once they provide the additional verification. See [Set Trusted IP Ranges for Your Organization](#).

When users log in to Salesforce, either via the user interface, the API, or a desktop client such as Salesforce for Outlook, Connect Offline, Connect for Office, or the Data Loader, Salesforce confirms that the login is authorized as follows:

1. Salesforce checks whether the user's profile has login hour restrictions. If login hour restrictions are specified for the user's profile, any login outside the specified hours is denied.
2. If the user has the "Two-Factor Authentication for User Interface Logins" permission, Salesforce prompts the user for a time-based token (which the user may also be prompted to create if it hasn't already been added to the account) upon logging in.
3. If the user has the "Two-Factor Authentication for API Logins" permission and a time-based token has been added to the account, Salesforce returns an error if a time-based token is not used to access the service in place of the standard security token.
4. Salesforce then checks whether the user's profile has IP address restrictions. If IP address restrictions are defined for the user's profile, any login from an undesignated IP address is denied, and any login from a specified IP address is allowed. If the **Enforce login IP ranges on every request** session setting is enabled, the IP address restrictions are enforced for each page request, including requests from client applications.
5. If profile-based IP address restrictions are not set, Salesforce checks whether the user is logging in from an IP address they have not used to access Salesforce before:
 - If the user's login is from a browser that includes a Salesforce cookie, the login is allowed. If the user previously used the browser to log in to Salesforce and has not cleared the browser cookies, the browser has the Salesforce cookie.
 - If the user's login is from an IP address in your organization's trusted IP address list, the login is allowed.
 - If the user's login is not from a trusted IP address or a browser with a Salesforce cookie, the login is blocked.

Whenever a login is blocked or returns an API login fault, Salesforce must verify the user's identity:

- For access via the user interface, the user is prompted to enter a token (also called a verification code) to confirm the user's identity.
 -  **Note:** Users aren't asked for a verification code the first time they log in to Salesforce.
- For access via the API or a client, users must add their security token (or time-based token if Two-Factor Authentication on API Logins is set on the user profile and the users have added a time-based token to their account) to the end of their password to log in.

A security token is an automatically generated key from Salesforce. For example, if a user's password is *mypassword*, and the security token is *XXXXXXXXXX*, the user must enter *mypasswordXXXXXXXXXX* to log in. Or, some client applications have a separate field for the security token.

Users can obtain their security token by changing their password or resetting their security token via the Salesforce user interface. When a user changes their password or resets their security token, Salesforce sends a new security token to the email address on the user's Salesforce record. The security token is valid until a user resets their security token, changes their password, or has their password reset.

 **Tip:** Before you access Salesforce from a new IP address, we recommend that you get your security token from a trusted network using **Reset My Security Token**.

Tips on Setting Login Restrictions

Consider the following when setting login restrictions:

- When a user's password is changed, the security token is reset. A blocked login can occur until the user adds the automatically generated security token to the end of the password when logging in to Salesforce via the API or a client.
- Partner Portal and Customer Portal users aren't required to activate computers to log in.
- For more information on API login faults, see the Core Data Types Used in API Calls topic in the [SOAP API Developer's Guide](#).
- If single sign-on is enabled for your organization, API and desktop client users can log in to Salesforce unless their profile has IP address restrictions set, and they try to log in from outside of the range defined for that profile. Furthermore, the single sign-on authority usually handles login lockout policies for users with the "Is Single Sign-On Enabled" permission. However, if the security token is enabled for your organization, then your organization's login lockout settings determine the number of times a user can attempt to log in with an invalid security token before being locked out of Salesforce.
- These events count toward the number of times a user can attempt to log in with an invalid password before being locked out of Salesforce, as defined in your organization's login lockout settings:
 - Each time users are prompted to confirm their identity (when a user clicks **Email me a verification code**, for example)
 - Each time users incorrectly add the security token or time-based token to the end of their password to log in to the API or a client

Salesforce Two-Factor Authentication

Salesforce admins can enhance security by requiring a second level of authentication on every login, called "two-factor authentication" (2FA). You can also require two-factor authentication when a user meets certain criteria, such as attempting to view reports or logging in from an unrecognized IP address.

Basic Identity Confirmation

When a user logs in, Salesforce considers the user's geographic location and browser. If they're not recognized, Salesforce prompts the user to verify their identity using the highest-priority verification method available for that user. The following is the order of priority for verification methods.

1. Verification code generated by a mobile authenticator app connected to the user's account
2. Verification code sent via SMS to the user's verified mobile device
3. Verification code sent via email to the user's email address

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

The user enters the code as a secondary verification of their identity. After verification, the user doesn't need to provide this information again, unless they log in from a browser or location that isn't verified by Salesforce.

How Two-Factor Authentication Works

For stronger identity verification, you can require a second level of authentication on every login, or every login through the API (for developers and client applications), or for access to specific features. Two-factor authentication leverages an authentication service, such as the Salesforce Authenticator app, the Google Authenticator app, or another supported authentication service. The service provides a code, called the "time-based one-time password" (TOTP) or "time-based token," which users specify (in addition to their password) when they log in.

Admins enable two-factor authentication through permissions. Users add the authenticator service's one-time password generator app or device through their own personal settings.

Configuring Two-Factor Authentication

Salesforce admins customize the circumstances that prompt users for a second factor of authentication in the following ways.

- Require it for every login. Set the two-factor login requirement for every time the user logs in to Salesforce. You can also enable this feature for API logins, which includes the use of client applications like the Data Loader. For more information, see [Set Two-Factor Authentication Login Requirements](#) or [Set Two-Factor Authentication Requirements for API Access](#).

[Walk Through It: Secure Logins with a Unique Code \(Two-Factor Authentication\)](#)

- Use "stepped up" authentication (also known as "high assurance" authentication). Sometimes you don't need two-factor authentication for every user's login, but you want to secure certain resources. If the user tries to use a connected app or access reports, then Salesforce prompts the user to enter a verification code. For more information, see [Session Security Levels](#).
- Use login flows. Login flows leverage the Flow Designer and profiles so you can build post-authentication requirements as the user logs in, including custom two-factor authentication processes. For more information, see the following examples.
 - [Login Flows](#)
 - [Implementing SMS-based Two-factor Authentication](#)
 - [Enhancing Security with Two Factor Authentication](#)

Users have to connect an authenticator app, which generates the verification code, to their Salesforce accounts. For more information, see [Connect a One-Time Password Generator App or Device](#).

SEE ALSO:

[Activate Your Computer](#)

[Setting Login Restrictions](#)

[Custom Login Flows](#)

[Connect a One-Time Password Generator App or Device](#)

[Remove or Reset a User's One-Time Password Generator App](#)

Set Two-Factor Authentication Login Requirements

Salesforce admins can require users to enter a time-based one-time password (TOTP) generated from an authenticator app when they log in to Salesforce.

To require this authentication every time a user logs in to Salesforce, select the “Two-Factor Authentication for User Interface Logins” permission in the user profile (for cloned profiles, only) or permission set.

[Enhancing Security with Two-Factor Authentication](#) (6:56 minutes)

See a demonstration of Two-Factor Authentication for Salesforce, and when to use it.

[Walk Through It: Secure Logins with a Unique Code \(Two-Factor Authentication\)](#)

Users must enter the code generated by the authenticator app every time they log in to Salesforce.

After two-factor authentication is enabled, it applies to users logging in to Salesforce, including organizations with custom domains created using My Domain.

The basic implementation of two-factor authentication doesn't apply to users of the following authentication methods. You can enforce two-factor authentication for these users with custom login flows.

- SAML for single sign-on
- Social sign-on in to organizations or Communities
- Username and password authentication in to Communities

USER PERMISSIONS

To edit profiles and permission sets:

- “Manage Profiles and Permission Sets”

Set Two-Factor Authentication Requirements for API Access

Salesforce admins can set the “Two-Factor Authentication for API Logins” permission to allow using a second authentication challenge for API access to Salesforce. API access includes the use of applications like the Data Loader and developer tools for customizing an organization or building client applications.

The “Two-Factor Authentication for User Interface Logins” permission is a prerequisite for “Two-Factor Authentication for API Logins”. So, once these permissions are enabled, users must enter a second authentication value when logging in to Salesforce through the user interface. This second factor of authentication is also called a “time-based one-time password” (TOTP) or “time-based token.”

Users can connect an authenticator app to their account to generate the time-based one-time password.

SEE ALSO:

- [Salesforce Two-Factor Authentication](#)
- [Connect a One-Time Password Generator App or Device](#)
- [Set Two-Factor Authentication Login Requirements](#)
- [Reset Your Security Token](#)

Remove or Reset a User’s One-Time Password Generator App

Only one mobile app that generates one-time passwords can be connected to a user’s account. If the user loses access to the app, such as when the user replaces or loses a mobile device, the app must be disconnected from the user’s account. Then a new app can be connected, if desired.

Users and Salesforce admins can remove the user’s existing configuration.

On the user’s Advanced User Details page, find **App Registration: One-Time Password Generator** and click **Disconnect**.

Custom Login Flows

Login flows allow administrators to build post-authentication processes to match their business practices, associate the flow with a user profile, and send the user through that flow when logging in. Use login flows to collect registration information from users, provide a terms of service acceptance form, prompt the user for a second factor of authentication, and other customization.

Use the Flow Designer to create login flows, and then associate those flows with specific profiles in your organization. You can connect the same flow to multiple profiles. Users with the profile are directed to the login flow after they authenticate, but before the user is directed to the organization's content. The login flow screens are embedded within the standard Salesforce login page for an integrated user login experience.

Login flows support all the Salesforce user interface authentication methods, including username and password, delegated authentication, SAML single sign-on, and social sign-on through a third-party authentication provider. You can apply login flows to Salesforce organizations, communities, and portals.

 **Note:** You can't apply login flows to API logins or when sessions are passed to the UI through `frontdoor.jsp` from a non-UI login process. Only flows of type Flow are supported.

IN THIS SECTION:

[Create a Login Flow](#)

Use the Cloud Flow Designer to build a login flow process, then associate the finished flow with a profile.

[Connect a Login Flow to a Profile](#)

After you create a login flow in Flow Designer and activate the flow, you associate it with a profile in your organization. Users with that profile are then directed to the login flow.

SEE ALSO:

[Cloud Flow Designer](#)

EDITIONS

- Unlimited
- Developer

Create a Login Flow

Use the Cloud Flow Designer to build a login flow process, then associate the finished flow with a profile.

When a user's profile is associated with a login flow, the user is directed to the flow as part of the authentication process. The login flow screens are embedded in the standard Salesforce login page. During the authentication process, these users have restricted access to the login flow screens. At the end of a successful authentication and completion of the login flow, the user is redirected to the organization. Otherwise, an explicit action can be defined within the flow to deny access.

For example, an administrator can create a login flow that implements a custom two-factor authentication process to add a desired security layer. A flow like this uses Apex methods to get the session context, extract the user's IP address, and verify if the request is coming from a Trusted IP Range. (To find or set the Trusted IP Range, from Setup, enter *Network Access* in the *Quick Find* box, then select **Network Access**.) If the request is coming from within a Trusted IP Range address, Salesforce skips the flow and logs the user into the organization. Otherwise, Salesforce invokes the flow providing one of three options.

1. Direct the user to log in with additional credentials, such as a time-based one-time password (TOTP).
2. Force the user to log out.
3. Direct the user to a page with more options.

You can also build login flows that direct users to customized pages, such as forms to gather more information, or pages providing users with additional information.

Build Your Own Login Flow

Use the following process to build your own login flow.

1. Create a new flow using the Flow Designer and Apex.

For example, you can design a custom IP-based two-factor authentication flow that requires a second factor of authentication only if the user is logging in from outside of the corporate Trusted IP Range. (To find or set the Trusted IP Range, from Setup, enter *Network Access* in the *Quick Find* box, then select **Network Access**.)

 **Note:** Do not set the Login IP Ranges directly in the user profile. The Login IP Ranges set directly in a profile restrict access to the organization for users of that profile who are outside that range, entirely, and those users cannot enter the login flow process.

The flow should contain the following.

- a. A new Apex class defining an Apex plugin that implements from the (`Process.Plugin`) and uses the `Auth.SessionManagement` class to access the time-based one-time password (TOTP) methods and services. The new Apex class for the plugin generates a time-based key with a quick response (QR) code to validate the TOTP provided by the user against the TOTP generated by Salesforce.
- b. A screen element to scan a QR code.
- c. A decision element to handle when the token is valid and when the token is invalid.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To open, edit, or create a flow in the Cloud Flow Designer:

- "Manage Force.com Flow"

Within the flow, you can set input variables. If you use the following specified names, these values will be populated for the flow when it starts.

Name	Value Description
LoginFlow_LoginType	The user type, such as Chatter Community external user
LoginFlow_IpAddress	The user's current IP address
LoginFlow_LoginIpAddress	The user's IP address used during login, which can change after authentication
LoginFlow_UserAgent	The user agent string provided by the user's browser
LoginFlow_Platform	The operating system for the user
LoginFlow_Application	Application used to request authentication
LoginFlow_Community	Current Community, if this login flow applies to a Community
LoginFlow_SessionLevel	The current session security level, Standard or High Assurance
LoginFlow_UserId	The user's 18-character ID.

During the flow, you can assign the following, pre-defined variables values for specific behavior.

 **Note:** The flow loads these values only *after* a UI screen is refreshed (a user clicking a button does not load the values, a new screen must be added to the flow for the values to be loaded).

Name	Value Description
LoginFlow_FinishLocation	A Text value. Provide a string that defines where the user goes after completing the login flow. The string should be a valid Salesforce URL (the user cannot leave the organization and stay in the flow) or relative path.
LoginFlow_ForceLogout	A Boolean value. Set this variable to <code>true</code> to log the user out, immediately, and force the user to exit the flow.

2. Save the flow.
3. Activate the flow.

4. Connect the login flow to a profile.

SEE ALSO:

[Custom Login Flows](#)[Login Flow Samples](#)[Connect a Login Flow to a Profile](#)[Cloud Flow Designer](#)

Connect a Login Flow to a Profile

After you create a login flow in Flow Designer and activate the flow, you associate it with a profile in your organization. Users with that profile are then directed to the login flow.

1. From Setup, enter *Login Flows* in the **Quick Find** box, then select **Login Flows**.
2. Click **New**.
3. Enter a name to reference the login flow association when you edit or delete it. The name doesn't need to be unique.
4. Select the login flow for the profile. The drop-down list includes all the available flows saved in the Flow Designer. Only active flows of type Flow are supported.
5. Select a user license for the profile to which you want to connect the flow. The profile list then shows profiles with that license.
6. Select the profile to connect to the login flow.
7. Click **Save**.

Users of the profile are now directed to the login flow.

After you associate the login flow, you can edit or delete the flows listed on this login flows page.

You can associate a login flow with one or more profiles. However, a profile can't be connected to more than one login flow.

Transaction Security Policies

Transaction Security Policies

Transaction Security policies give you a way to look through events in your organization and specify actions to take when certain combinations occur. Transaction Security monitors events according to the policies that you set up. When a policy is triggered, you can receive a notification and have an optional action taken.

Policies evaluate activity using events you specify. For each policy, you define real-time actions, such as notify, block, force two-factor authentication, or choose a session to end. When you enable Transaction Security for your org, a Concurrent Sessions Limiting policy is created and a corresponding Apex class is created in the org. An administrator can enable the policy immediately or edit the Apex class to customize it.

For example, suppose that you activate the Concurrent Sessions Limiting policy to limit the number of concurrent sessions per user. In addition, you change the policy to notify you via email when the policy is triggered. You also update the policy's Apex implementation to limit users to three sessions instead of the default five sessions. (That's easier than it sounds.) Later, someone with three login sessions tries to create a fourth. The policy prevents that and requires the user to end one of the existing sessions before proceeding with the new session. At the same time, you are notified that the policy was triggered.

A transaction security policy consists of events, notifications, and actions.

- Policies to apply to the organization, made up of events. Available event types are:
 - Data Export for Account, Contact, Lead, and Opportunity objects
 - Entity for authentication providers and sessions, client browsers, and login IP
 - Logins
 - Resource Access for connected apps and reports and dashboards
- Available policy notifications—You can be notified via email, by an in-app notification, or both.
- Actions to take if the policy is triggered:
 - Block the operation
 - Require a higher level of assurance using two-factor authentication
 - End a current session

You can also take no action and only receive a notification. The actions available depend on the event type selected.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

- Unlimited
- Developer

Set Up Transaction Security

Activate and configure transaction security on your org before creating your own custom policies. Only an active user assigned the System Administrator profile can use this feature.

1. You must enable transaction security policies before use. This task is done once when you first go to Transaction Security.
 - a. From Setup, enter *Transaction Security* in the Quick Find box, then select **Transaction Security**.
 - b. To enable the policy list view and install the ConcurrentSessionsLimitingPolicy, select **Enable custom transaction security policies** at the top of the page.

The ConcurrentSessionsLimitingPolicy limits concurrent sessions and is triggered in two ways:

- When a user with five current sessions tries to log in for a sixth session
- When an administrator that's already logged in tries to log in a second time

You can adjust the number of sessions allowed by changing the Apex policy implementation `ConcurrentSessionsPolicyCondition`.

2. After Transaction Security is enabled, set the preferences for your org.
 - a. Click **Default Preferences** on the Transaction Security Policies page.
 - b. Select the preference **When users exceed the maximum number of Salesforce sessions allowed, close the oldest session**.

Login policies affect programmatic access and access from Salesforce Classic and Lightning Experience. When you create a policy that limits the number of concurrent user sessions, all sessions count toward that limit. Regular logins with a username and password, logins by web applications, logins using Authentication Providers, and all other login types are considered.

The session limit isn't a problem in Salesforce Classic or Lightning Experience because you're prompted to select which session or sessions to end. That choice isn't available from within a program, so the program receives a Transaction Security exception that the session limit has been reached.

Selecting **When users exceed the maximum number of Salesforce sessions allowed, close the oldest session** prevents this problem. When a programmatic request is made that requires a login but no more sessions are allowed, older sessions are ended until the number of sessions is below the limit. The setting also works for logins from the UI. Instead of being asked to select a session to end, the oldest session is automatically ended, and the new login proceeds for the new session. Here's how the OAuth flows handle login policies with and without the preference being set.

Flow Type	Action If Preference Is Selected	Action If Preference Is Not Selected
OAuth 2.0 web server	Authorization Code and Access Token granted Older sessions are ended until you're within policy compliance.	Authorization Code granted, but Access Token not granted Older sessions are ended until you're within policy compliance.
OAuth 2.0 user-agent	Access Token granted Older sessions are ended until you're within policy compliance.	Access Token granted Older sessions are ended until you're within policy compliance.

EDITIONS

USER PERMISSIONS

To create, edit, and manage transaction security policies:

- "Author Apex"
- AND
- "Customize Application"

Flow Type	Action If Preference Is Selected	Action If Preference Is Not Selected
OAuth 2.0 refresh token flow	Access Token granted Older sessions are ended until you're within policy compliance.	TXN_SECURITY_END_SESSION exception
OAuth 2.0 JWT bearer token	Access Token granted Older sessions are ended until you're within policy compliance.	TXN_SECURITY_END_SESSION exception
OAuth 2.0 SAML bearer assertion	Access granted Older sessions are ended until you're within policy compliance.	TXN_SECURITY_END_SESSION exception
OAuth 2.0 username and password	Access granted Older sessions are ended until you're within policy compliance.	Access denied due to more than the number of sessions allowed by the policy
SAML assertion	Not applicable	Not applicable

For more information on authentication flows, see [Authenticating Apps with OAuth](#) in the Salesforce help.

Create Custom Transaction Security Policies

Create your own custom policies that are triggered by specific events. Only an active user assigned the System Administrator profile can use this feature.

- From Setup, enter *Transaction Security* in the Quick Find box, select **Transaction Security**, and then click **New** in Custom Transaction Security Policies.
- Enter the basic information fields for your new policy.
 - For clarity and easier maintenance, use similar names for the API and the policy. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
 - Event Type**—Determines the available actions. It can be one of the following:
 - Login**—A user login. Login lets you set any combination of notifications, plus these actions:
 - Block access completely
 - Require two-factor authentication to continue
 - Require the end of a current login session to continue
 - Entity**—An object type. Select a specific resource and the type of notifications desired.
 - Data Export**—Notifies you if the selected object type has been exported using the Data Loader API client.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create, edit, and manage transaction security policies:

- "Author Apex"
- AND
- "Customize Application"

- **AccessResource**—Notifies you when the selected resource has been accessed. You can block access or require two-factor authentication before access is allowed.
 - **Notifications**—You can select all, some, or no notification methods for each policy.
 - **Recipient**—Must be an active user assigned the System Administrator profile.
 - **Real-time Actions**—Specifies what to do when the policy is triggered. The actions available vary depending on the event type. Email and In-App notifications are always available. For login and resource events, you can also block the action or require a higher level of access control with two-factor authentication. For login events, you can require ending an existing session before continuing with current session. You can set the default action for ending a session to always close the oldest session.
-  **Note:** Two-factor authentication is not available in Salesforce1 for the AccessResource event type. The Block action is used instead.
-  **Important:** Don't create a policy requiring the two-factor authentication action without first providing your users a way to get a time-based, one-time password. This password is their second authentication factor. Otherwise, if users encounter a situation that requires a second authentication factor, they can't finish their task, such as logging in or running a report.
- You can use an existing class for `Apex Policy` or select **Generate Apex** to have a default policy class created that implements the `TxnSecurity.PolicyCondition` interface.
 - The user selected for `Execute Policy As` must have the System Administrator profile.
3. You can optionally create a condition for a specific property as part of the policy. For example, you can create a policy that's triggered when a report or dashboard is accessed from a specific source IP. The source IP is the property you're checking.
 - The available properties depend on the event type selected.
 - If the event type is Login, you can look for property changes that occurred within a given number of days or an exact match to a property value.
 4. To enable a policy, select the policy's checkbox. You can enable and disable policies according to your requirements.
 5. Click **Save**.

After saving your selection, you're shown the editing page for your new policy. You can modify your policy here and review its Apex class.

If you didn't specify a condition value before you generated the Apex interface for a policy, you can add the condition later. Edit the Apex code to include a condition before you activate your policy. If you never include a condition, your policy is never triggered. See [Apex Policies for Transaction Security Notifications](#) for examples.

You can create multiple policies for the same type of event, but we recommend that your policies and their actions don't overlap. All the policies for a given event execute when the event occurs, but their order of execution is indeterminate. For example, if you have two policies enabled for an exported contact, you can't be sure which policy is triggered first. If one policy copies the contact and the other policy deletes the contact, the copy operation fails if the deletion is done first.

Apex Policies for Transaction Security Notifications

Every Transaction Security policy must implement the Apex `TxnSecurity.PolicyCondition` interface. Here are several examples.

If you didn't specify a condition value before you generated the Apex interface for a policy, you can add the condition later. Edit the Apex code to include a condition before you activate your policy. If you never include a condition, your policy is never triggered. See the following examples for how to write up the condition.

Your `TxnSecurity.PolicyCondition` implementation isn't deleted when you delete a transaction security policy. You can reuse your Apex code in other policies.

This Apex policy example implements a policy that is triggered when someone logs in from multiple IP addresses in the past 24 hours.

Example:

```
global class LoginPolicyCondition implements
TxnSecurity.PolicyCondition {

    public boolean evaluate(TxnSecurity.Event e) {
        AggregateResult[] results = [SELECT SourceIp FROM LoginHistory
        WHERE UserId = :e.userId AND LoginTime = LAST_N_DAYS:1 GROUP
        BY SourceIp];

        if(!results.isEmpty() && results.size() > 1) {
            return true;
        }

        return false;
    }
}
```

This Apex policy example implements a policy that is triggered when a session is created from a specific IP address.

Example:

```
global class SessionPolicyCondition implements TxnSecurity.PolicyCondition {

    public boolean evaluate(TxnSecurity.Event e) {
        AuthSession eObj = [SELECT SourceIp FROM AuthSession WHERE Id = :e.entityId];
        if(eObj.SourceIp == '1.1.1.1'){
            return true;
        }

        return false;
    }
}
```

This DataExport policy implements a policy that is triggered when someone exports data via the Data Loader.

Example:

```
global class DataExportPolicyCondition implements TxnSecurity.PolicyCondition {

    public boolean evaluate(TxnSecurity.Event e) {
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

```
if(e.data.get('SourceIp') == '1.1.1.1' ){
    return true;
}

return false;
}
```

This Apex policy is triggered when someone accesses Reports.

 **Example:**

```
global class ReportsPolicyCondition implements TxnSecurity.PolicyCondition {

    public boolean evaluate(TxnSecurity.Event e) {
        if(e.data.get('SessionLevel') == 'STANDARD' ){
            return true;
        }

        return false;
    }
}
```

This Apex policy is triggered when someone accesses a Connected App.

 **Example:**

```
global class ConnectedAppsPolicyCondition implements TxnSecurity.PolicyCondition {

    public boolean evaluate(TxnSecurity.Event e) {
        if(e.data.get('SessionLevel') == 'STANDARD' && (e.entityId == '0CiD00000004Cce')){
            return true;
        }

        return false;
    }
}
```

Manage Transaction Security Policies

Use Transaction Security policies to define, enable, and generate Apex code to implement your policies. Specify how to be notified when a policy is triggered, and then select the policies to enable. Only an active user assigned the System Administrator profile can use this feature.

1. From Setup, enter *Transaction Security* in the **Quick Find** box, then select **Transaction Security**.
2. From the Transaction Security Policies page, you can
 - Edit a view
 - Create a view
 - Edit a policy
 - Create a policy
 - Edit the `TxnSecurity.PolicyCondition` Apex class for a policy
 - Delete a policy
 - Set the transaction security default preferences

You can change the transaction security default preferences at any time.

Receiving Transaction Security Notifications

You receive the notifications you've selected when an enabled policy is triggered. The notifications are formatted for easy recognition.

Email Notifications

Email notifications are sent from Transaction Security with subject "Transaction Security Alert!" The body of the message contains the policy that was triggered and the event or events that occurred to trigger the policy. The times listed are when the policy was triggered in the recipient's locale and time zone. For example, a policy is triggered at 6:46 PM in the Eastern Standard Time zone. The administrator receiving the notification is in the Pacific Standard Time zone, so the times are shown as PST. Here's an example.

Example:

```
From: Transaction Security <noreply@salesforce.com>
To: Admin@company.com
Sent: Friday, November 12, 2014, 5:35 PM
Subject: Transaction Security Alert!
```

```
This is a transaction security policy alert.
```

```
Policy: An administrator created a new user.
```

```
Event(s) responsible for triggering this policy:
```

```
1. Created new user Lisa Johnson at 11/12/2014 5:35:09 PM PST
```

EDITIONS

In-App Notifications

In-app notifications are available only if you're a Salesforce1 user. The notification lists the policy that was triggered. Here's an example.

Example:

```
Transaction Security Alert:
Policy New Encrypted Custom Field was triggered.
```

My Domain

My Domain

Enhance access security and brand your organization's pages by enabling your custom domain.

Using My Domain, you can define a custom Salesforce domain name. A custom domain name helps you better manage login and authentication for your organization in several key ways.

- Highlight your business identity with your unique domain URL.
- Brand your login screen and customize right-frame content.
- Block or redirect page requests that don't use the new domain name.
- Access increased support for single sign-on. My Domain is required to use some Salesforce Identity features, such as authentication providers and identity providers.
- Set custom login policy and determine how users are authenticated.
- Let users select an alternate identity provider from the login page.

You can define a custom domain name only one time. My Domain is also available for sandbox environments.

 **Note:** My Domain is subject to additional [Terms of Use](#).

Your domain name uses standard URL format, including:

- The protocol: `https://`
- The subdomain prefix: your brand or term
- The domain: `my.salesforce.com`

For example, a company called Universal Containers wants to use the subdomain `universalcontainers`. The company's login URL would be `https://universalcontainers.my.salesforce.com/`. You can use up to 40 characters.

Salesforce is automatically enabled as an identity provider when a domain is created. After your domain is deployed, you can add or change identity providers and increase security for your organization by customizing your domain's login policy.

You must enable My Domain if you want to use Lightning components in Lightning component tabs, Lightning Pages, the Lightning App Builder, or standalone apps.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

USER PERMISSIONS

To set up a domain name:

- "Customize Application"

Define Your Domain Name

Sign up for your organization's custom domain name.

Start setting up your custom domain name by finding a domain name unique to your organization and signing up for it.

1. From Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**.
2. Enter the subdomain name you want to use within the sample URL. For example, a company called Universal Containers wants to use the subdomain `universalcontainers`. The company's login URL would be `https://universalcontainers.my.salesforce.com/`. You can use up to 40 characters.

You can't use these reserved words for subdomains:

- `www`
- `salesforce`
- `heroku`

And, you can't start the domain name with:

- `root`
- `status`

3. Click **Check Availability**. If your name is already taken, choose a different one.
4. Click **Terms and Conditions** to review your agreement, then select the checkbox.
5. Click **Register Domain**.
6. You receive an email when your domain name is ready for testing. (It can take from 30 seconds to 24 hours.)

Your domain isn't rolled out until you've tested and deployed it.

To define a domain name:

- "Customize Application"

Guidelines and Best Practices for Implementing My Domain

These tips help smooth the transition to a new domain name.

- Test in a sandbox first, because you can't set login policies before deploying your domain. To test these customizations, custom UI features, Visualforce pages, and application URL changes, define and deploy a domain name in a sandbox environment.
- Deploy your new domain when your organization receives minimal traffic, like during a weekend, so you can troubleshoot while traffic is low.
- If you've customized your Salesforce UI with features such as custom buttons or Visualforce pages, make sure that you test custom elements thoroughly before deploying your domain name. Your customizations should not use instance-based URLs.
- Make sure that you update any application URLs that were created before you enabled a domain name. For example, the `Email Notification URL` field in Chatter Answers continues to send notifications with the old URLs to internal users unless you update it.
- If your domain is registered but has not yet been deployed, URLs will show My Domain URLs when you log in from the My Domain login page. However, links that originate from merge fields that are embedded in emails sent asynchronously, such as workflow emails, will still contain the old URLs. After your domain is deployed, those links will show the new My Domain URLs.
- Help your users get started using your new domain name by providing links to pages they use frequently, such as your login page. Let your users know if the login policy will be changed and encourage them to update their bookmarks the first time they're redirected.
- Only use `Prevent login from https://login.salesforce.com` if you're concerned that users who are not aware of your custom domain might try to use it. Otherwise, leave the option available to your users as they get used to the new domain name.
- Choose the `Redirect Policy` option `Redirected with a warning to the same page within the domain` to give users time to update their bookmarks with the new domain name.

You can use your domain's login policy settings to gradually phase in your domain name for your users. Redirecting users with a warning for a few days or weeks before requiring users to use the new domain name to access your pages gives them time to change their bookmarks.

- Bookmarks do not work when the `Redirect to the same page within the domain` option is selected for partner portals. Manually change the existing bookmarks to point to the new domain URL by replacing the Salesforce instance name with your custom domain name. For example, replace `na1.salesforce.com` with `<mydomain>.my.salesforce.com` in the bookmark's URL.
- If you block application page requests that don't use the new Salesforce domain name URLs, let your users know they need to either update old bookmarks or create new ones for the login page as well as any tabs or links within the application. Users will be required to use the new URLs immediately if you change your login redirect policy to `Not Redirected`.
- If you are using My Domain, you can identify which users are logging in with the new login URL and when. From Setup, enter `Login History` in the `Quick Find` box, then select **Login History** and view the Username and Login URL columns.
- Communicate the upcoming change to your users before deploying it.
- On the `login.salesforce.com` page, users can click the **Log in to a custom domain** link to provide your custom domain name and log in. In this case, they need to know the domain name. However, you should give them a direct link to your custom domain's login page.

If you have the following.

API integrations into your organization

You should do the following.

Check to see if the API client is directly referencing the server endpoint. The API client should use the [LoginResult.serverURL](#)

If you have the following.**You should do the following.**

	<p>value returned by the login request, instead of using a hard coded server URL.</p> <p>After your custom domain is deployed, Salesforce returns the server URL containing your domain. Even though the redirect policy settings have no effect on API calls (the old calls to instance URLs should continue to work) the best practice is to use the value returned by Salesforce.</p>
Email templates	Replace references to the organization's instance URL with your custom domain.
Custom Visualforce pages or custom Force.com apps	Replace references to the organization's instance URL with your custom domain. See How to find hard-coded references with the Force.com IDE .
Chatter	Tell your users to update any bookmarks in the left navigation of their Chatter groups.
Zones for Communities (Ideas/Answers/Chatter Answers)	<p>Manually update the <code>Email Notification URL</code>.</p> <p>To update the URL, clear the existing URL so that the field is blank. Save the page, and the system populates the field with your new My Domain URL.</p>

[My Domain URL Changes](#)[Test and Deploy Your New Domain Name](#)[My Domain](#)

Test and Deploy Your New Domain Name

After you set up your domain name, test it and then roll it out to your users.

Before deploying your domain to your users, you can log in to test your domain. Testing gives you the chance to explore your domain name and helps you verify addresses for important pages that your users will need to use after your domain rolls out.

Important: After you deploy your new domain name, you can't reverse it.

1. Test your domain login. From Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**, then click **Click here to login**. Or, click the URL in the email to log in to Salesforce using your new domain name.
You can customize your domain login page and add authentication services (like social sign-on) before you deploy the domain to your users. You can also test domains in sandbox environments. However, before deploying your domain, you can't set a login policy, such as preventing users from logging in at login.salesforce.com.
2. Test the new domain name by clicking tabs and links. All pages show your new domain name. If you've customized your Salesforce UI with features such as custom buttons or Visualforce pages, make sure that you test custom elements thoroughly before deploying your domain name. Your customizations should not use instance-based URLs.
3. To roll out the new domain name to your organization, from Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain** and then click **Deploy to Users**.

When you deploy your domain, it's activated immediately, and all users are redirected to pages with new domain addresses. You can now set login policies in the Domain Settings section that appears after you deploy your domain.

My Domain URL Changes

When you set up a domain name for your organization, all of your application URLs, including those of Visualforce pages, will change. Make sure that you update any application URLs that were created before you enabled a domain name. For example, the **Email Notification URL** field in Chatter Answers continues to send notifications with the old URLs to internal users unless you update it. This table shows you the differences.

URL Type	Old URL	New URL
Login	https://login.salesforce.com	https://<subdomain>.my.salesforce.com
Application page or tab	https://na1.salesforce.com /<pageID>	https://<subdomain>.my.salesforce.com/<pageID>

Set the My Domain Login Policy

Secure your login by customizing the login policy for your domain.

Customize your login policy to add a layer of security for your organization. By default, users may log in from a generic Salesforce login page, bypassing the login page specific to your domain. Users are also allowed to make page requests without your domain name, such as when using old bookmarks.

1. From Setup, enter *My Domain* in the Quick Find box, then select **My Domain**.
2. Under My Domain Settings, click **Edit**.
3. To turn off authentication for users who do not use your domain-specific login page, select the login policy. For example, this will prevent users from logging in at the generic `https://<instance>.salesforce.com/` login page, and being redirected to your pages after login. This option enhances security by preventing login attempts by anyone who does not know your domain name.
4. Choose a redirect policy.
 - a. Choose **Redirect to the same page within the domain** to allow users to continue using URLs that do not include your domain name. Choosing this option does not enhance security for your organization.

 **Note:** Bookmarks do not work when the **Redirect to the same page within the domain** option is selected for partner portals. Manually change the existing bookmarks to point to the new domain URL by replacing the Salesforce instance name with your custom domain name. For example, replace `na1.salesforce.com` with `<mydomain>.my.salesforce.com` in the bookmark's URL.

Customize Your Login Page Branding

Customize the look and feel of your login page by adding a background color, logo, and right-side iframe content. Customizing your login page helps users recognize your page by tying it to your company's branding.

[Watch a Demo](#) (1:58 minutes)

1. From Setup, enter *My Domain* in the `Quick Find` box, then select **My Domain**.
2. Under Authentication Configuration, click **Edit**.
3. To customize your logo, upload an image.
Images can be .jpg, .gif, or .png files up to 100 KB. Maximum image size is 250px by 125px.
4. To customize your login page background, click the  or enter a valid hexadecimal color code.
5. Enter the URL of the file to be included in the right-side iframe on the login page.
The file must be at a URL that uses SSL encryption and the `https://` prefix. Maximum content size is 478px by 397px.
6. Optionally, select authentication services as identity providers on the login page, such as social sign-on providers like Google and Facebook. Users can then log in with accounts from those services. Configure authentication services as Auth. Providers in Setup.
7. Click **Save**.

Add Identity Providers on a Login Page

Allow users to authenticate using alternate identity provider options right from your login page.

If you've enabled single sign-on and configured SAML, or set up external authentication providers as Auth. Providers in Setup, you can provide links to these alternate identity providers on your domain's login page. Users are sent to the alternate identity provider's login screen to authenticate and then are redirected back to Salesforce.

 **Note:** Available authentication services include all providers configured as SAML single sign-on identify providers or external authentication providers, except Janrain. Janrain can't be used for authentication from the login page.

1. From Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**.
2. Under Authentication Configuration, click **Edit**.
3. Select one or more already configured authentication services as an identity provider.
4. Click **Save**.

- [Can I rename or remove my custom domain name?](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Performance, Unlimited, Enterprise, Developer,** and **Database.com** Editions. Some topics don't apply to **Database.com**.

What is My Domain?

Using My Domain, administrators can define a custom Salesforce domain name for their organization. The custom domain name appears in all organization URLs and replaces the instance name (such as `na1`). URLs for organizations using My Domain use the format `https://<mydomain>.my.salesforce.com` (such as `https://mydomain.my.salesforce.com`).

My Domain is not used as a custom domain for sites, communities, or portals. The domains are defined separately.

Which Salesforce Editions is My Domain available in?

Performance, Unlimited, Enterprise, Developer, Professional, and Group editions.

What are My Domain's advantages?

My Domain allows customers to:

- Customize the login page with their own branding.
- Use Identity features for single sign-on. My Domain is required for:
 - Single sign-on into a Salesforce organization
 - Using a Salesforce organization as an identity provider for single sign-on into third-party applications or other Salesforce organizations
- Preserve deep links (such as `https://<mydomain>.my.salesforce.com/001/o`) through any future organization splits and migrations.

Does My Domain work differently in different Salesforce Editions?

The only difference is that Developer Edition URLs are appended with "-developer-edition".

Does My Domain work in sandboxes?

Sandboxes and production organizations are different environments, and maintain separate domain name registries. So, you can use the same My Domain name in sandbox. In fact, during a sandbox refresh, the My Domain name of the production organization is copied into sandbox.

For example, if the production organization name is `acme.my.salesforce.com`, the sandbox name is `acme--<sandboxName>.csN.my.salesforce.com`.

You should test your custom domain in a sandbox before deploying it to find any hard-coded references to URLs in Visualforce pages, email templates, or other content.

What are the differences between the Redirect Policy options?

After you deploy your domain, you can select a redirect option for users trying to access a page in your organization without using the custom domain name.

To see the assigned policy, from Setup, enter *My Domain* in the *Quick Find* box, then select **My Domain**.

If *Redirected to the same page within the domain* is selected, users are immediately sent to the new URL, without any notification.

If *Redirected with a warning to the same page within the domain* is selected, users briefly see a standard warning message before being redirected to the new URL. The warning gives users a chance to change their bookmarks and start getting used to using the new domain name. The message can't be customized.

If *Not redirected* is selected, the user sees the page is missing. This is recommended as the most secure option, but it is a best practice to use *Redirected with a warning to the same page within the domain* for a short period of time after your custom domain is deployed so users get used to the new URLs.

How does My Domain work with single sign-on?

My Domain is required for single sign-on implementation. For inbound single sign-on requests, the custom domain enables deep linking directly to pages in the organization. No changes are required for the identity provider. The Salesforce SAML endpoint (`login.salesforce.com`) continues to work for SAML and OAUTH requests, even if your organization deploys My Domain and has *Prevent login from `https://login.salesforce.com`* for users selected in the My Domain Settings.

 **Note:** If you're using external Chatter groups along with single sign-on for employees, then users outside of your company are redirected to a SAML identity provider they can't access. For your implementation to work, migrate external Chatter groups to communities, or in the My Domain settings do *not* select *Prevent login from `https://login.salesforce.com`*. This allows users to continue to login through `login.salesforce.com`.

Is My Domain available for the API?

Yes, you can use the Salesforce APIs with your My Domain.

Is the subdomain for My Domain related to the subdomain for Sites?

No. The subdomains you use for Sites and My Domain can be the same or different.

Is there a limit on how long our subdomain can be?

Yes. You can use up to 40 characters. The protocol (`https://`) and the domain (`my.salesforce.com`) are not included in the limit.

After we set up My Domain, will we still be able to log in from `https://login.salesforce.com`?

Yes, unless your system administrator prevents it. If so, you'll need to log in using your new My Domain URL.

Will we still be able to log in from a URL that includes a Salesforce instance, like `https://na1.salesforce.com`?

Yes, unless your system administrator prevents it. If so, you'll need to log in using your new My Domain URL.

Can we still use our old Salesforce bookmarks?

Yes, if your system administrator allows it. If so, you'll be redirected to the Salesforce page using its new My Domain URL. If your system administrator prevents using old bookmarks, or you see a warning, you should update your bookmarks using the new domain name.

Will our Visualforce and content (files) page URLs change?

URLs for your Visualforce pages contain your new domain name, such as `https://<mydomain>--c.<instance>.visual.force.com`.

URLs for your content (files) also contain your new domain name, such as `https://<mydomain>--c.<instance>.content.force.com`.

Can I rename or remove my custom domain name?

You can't change your custom domain name, or reverse its deployment, once deployed. If you have a special need to change it, contact Salesforce Customer Support.

App Launcher

Enable the App Launcher

The App Launcher presents users with logos that link to their on-premise applications, connected apps, and Salesforce apps, all from a unified user interface. Administrators can set the default app order for their organizations.

All Lightning Experience users get the App Launcher.

Salesforce Classic, users need the "Use Identity Features" permission, and the App Launcher option in their profile set to **Visible**. Users see only the apps they are authorized to see.

In Salesforce Classic, administrators using the System Administrator profile automatically have access to the App Launcher. Administrators using profiles cloned from the System Administrator profile do not.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Enable the App Launcher with a Profile in Salesforce Classic

Create a profile and assign it to users, so they can access the App Launcher.

 **Note:** These steps work in Salesforce Classic. If you see a row of tabs across the top of your screen, you're in Salesforce Classic. If you see a navigation bar on the left, you're in Lightning Experience.

In Salesforce Classic, administrators using the System Administrator profile automatically have access to the App Launcher. Administrators using profiles cloned from the System Administrator profile do not.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Click **New Profile**.
3. Select an Existing Profile as a basis for the new profile.
For example, select **Standard User**.
4. Enter the name of the new profile.
For example, *Standard User Identity*.
5. Click **Save**.
6. In the detail page for the new profile, click **Edit**.
7. In Custom App Settings, set the App Launcher to **Visible**, if it isn't already.
Under Tab Settings, verify that the App Launcher tab is set to **Default On**.
8. Under Administrative Permissions, select **Use Identity Features**.
9. Click **Save**.
10. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
11. Click **Edit** next to each user you want to access the App Launcher.
12. In the user's Profile field, select the new profile that has "Use Identity Features" enabled.
For example, you might use the *Standard User Identity* profile.
13. Click **Save**.
When you log in as the selected user, the App Launcher appears in the drop-down app menu.

Enable the App Launcher with a Permission Set in Salesforce Classic

Create a permission set and assign it to users, so they can access the App Launcher.

 **Note:** These steps work in Salesforce Classic. If you see a row of tabs across the top of your screen, you're in Salesforce Classic. If you see a navigation bar on the left, you're in Lightning Experience.

1. From Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**.
2. Click **New**.
3. Enter a Label for the new permission set.
For example, *Identity Features*.
4. Optionally, restrict the use of this permission set to a specific User License.
5. Click **Save**.
6. Click **System Permissions**.
7. Click **Edit**.
8. Select **Use Identity Features**.
9. Click **Save**.
10. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
11. Click the name of an existing user to whom you want to give access to the App Launcher.
12. In the **Permission Set Assignments** related list, click **Edit Assignments**.
13. Add the new permission set you created for identity features to Enabled Permission Sets.
14. Click **Save**.

Configure File Upload and Download Security Settings

For security reasons, your organization may want to configure the way some file types are handled during upload and download.

To manage file upload and download settings:

1. From Setup, enter *File Upload and Download Security* in the Quick Find box, then select **File Upload and Download Security**.
2. Click **Edit**.
3. To prevent users from uploading files that may pose a security risk, select **Don't allow HTML uploads as attachments or document records**.

This setting blocks upload of these MIME file types: `.html`, `.htt`, `.mht`, `.svg`, `.swf`, `.thtml`, and `.xhtml`.

 **Warning:** Keep the following in mind when selecting this option:

- If your organization uses the partner portal to give your partner users access to Salesforce, we don't recommend enabling this setting. Enabling this setting prevents your organization from customizing the appearance of your partner portal.
- HTML attachments are not permitted on solutions, regardless of whether this security setting is enabled. In addition, this setting does not affect attachments on email templates; HTML attachments on email templates are always permitted.
- After this setting is enabled, previously-uploaded HTML documents and attachments are unaffected. However, when users attempt to view an HTML attachment or

document, their browser first prompts them to open the file in the browser, save it to their computer, or cancel the action.

4. Set download behavior for each file type:
 - a. **Download** (recommended): The file, regardless of file type, is always downloaded.
 - b. **Execute in Browser**: The file, regardless of file type, is displayed and executed automatically when accessed in a browser or through an HTTP request.
 - c. **Hybrid**: The file uses the default browser execution behavior, but downloads Chatter and Salesforce CRM Content files.
5. Click **Save**.

Connection Security

About Single Sign-On

Single sign-on is a process that allows network users to access all authorized network resources without having to log in separately to each resource. Single sign-on allows you to validate usernames and passwords against your corporate user database or other client application rather than having separate user passwords managed by Salesforce.

Salesforce offers the following ways to use single sign-on:

- Federated authentication using Security Assertion Markup Language (SAML) allows you to send authentication and authorization data between affiliated but unrelated Web services. This enables you to sign on to Salesforce from a client application. Federated authentication using SAML is enabled by default for your organization.
- Delegated authentication single sign-on enables you to integrate Salesforce with an authentication method that you choose. This enables you to integrate authentication with your LDAP (Lightweight Directory Access Protocol) server, or perform single sign-on by authenticating using a token instead of a password. You manage delegated authentication at the permission level, allowing some users to use delegated authentication, while other users continue to use their Salesforce-managed password. Delegated authentication is set by permissions, not by organization.

The primary reasons for using delegated authentication include:

- Using a stronger type of user authentication, such as integration with a secure identity provider
- Making your login page private and accessible only behind a corporate firewall
- Differentiating your organization from all other companies that use Salesforce in order to reduce phishing attacks

You must request that this feature be enabled by Salesforce. Contact Salesforce to enable delegated authentication single sign-on for your organization.

- Authentication providers let your users log in to your Salesforce organization using their login credentials from an external service provider. Salesforce supports the OpenID Connect protocol that allows users to log in from any OpenID provider such as Google, Paypal, LinkedIn and other services supporting OpenID Connect. When authentication providers are enabled, Salesforce does not validate a user's password. Instead, Salesforce uses the user's login credentials from the external service provider to establish authentication credentials.

When you have an external identity provider, and configure single sign-on for your Salesforce organization, Salesforce is then acting as a *service provider*. You can also enable Salesforce as an [identity provider](#), and use single sign-on to connect to a different service provider. Only the service provider needs to configure single sign-on.

The Single Sign-On Settings page displays which version of single sign-on is available for your organization. To learn more about the single sign-on settings, see [Configuring SAML Settings for Single Sign-On](#). For more information about SAML and Salesforce security, see the [Security Implementation Guide](#).

Benefits of Single Sign-On

Implementing single sign-on can offer the following advantages to your organization:

- **Reduced Administrative Costs:** With single sign-on, users only need to memorize a single password to access both network resources or external applications and Salesforce. When accessing Salesforce from inside the corporate network, users are logged in seamlessly, without being prompted to enter a username or password. When accessing Salesforce from outside the corporate network, the users' corporate network login works to log them in. With fewer passwords to manage, system administrators receive fewer requests to reset forgotten passwords.
- **Leverage Existing Investment:** Many companies use a central LDAP database to manage user identities. By delegating Salesforce authentication to this system, when a user is removed from the LDAP system, they can no longer access Salesforce. Consequently, users who leave the company automatically lose access to company data after their departure.
- **Time Savings:** On average, a user takes five to 20 seconds to log in to an online application; longer if they mistype their username or password and are prompted to reenter them. With single sign-on in place, the need to manually log in to Salesforce is avoided. These saved seconds add up to increased productivity.
- **Increased User Adoption:** Due to the convenience of not having to log in, users are more likely to use Salesforce on a regular basis. For example, users can send email messages that contain links to information in Salesforce such as records and reports. When the recipients of the email message click the links, the corresponding Salesforce page opens automatically.
- **Increased Security:** Any password policies that you have established for your corporate network will also be in effect for Salesforce. In addition, sending an authentication credential that is only valid for a single use can increase security for users who have access to sensitive data.

[Viewing Single Sign-On Login Errors](#)

Best Practices for Implementing Single Sign-On

Salesforce offers the following ways to use single sign-on:

- Federated authentication using Security Assertion Markup Language (SAML) allows you to send authentication and authorization data between affiliated but unrelated Web services. This enables you to sign on to Salesforce from a client application. Federated authentication using SAML is enabled by default for your organization.
- Delegated authentication single sign-on enables you to integrate Salesforce with an authentication method that you choose. This enables you to integrate authentication with your LDAP (Lightweight Directory Access Protocol) server, or perform single sign-on by authenticating using a token instead of a password. You manage delegated authentication at the permission level, allowing some users to use delegated authentication, while other users continue to use their Salesforce-managed password. Delegated authentication is set by permissions, not by organization.

The primary reasons for using delegated authentication include:

- Using a stronger type of user authentication, such as integration with a secure identity provider
- Making your login page private and accessible only behind a corporate firewall
- Differentiating your organization from all other companies that use Salesforce in order to reduce phishing attacks

You must request that this feature be enabled by Salesforce. Contact Salesforce to enable delegated authentication single sign-on for your organization.

- Authentication providers let your users log in to your Salesforce organization using their login credentials from an external service provider. Salesforce supports the OpenID Connect protocol that allows users to log in from any OpenID provider such as Google, Paypal, LinkedIn and other services supporting OpenID Connect. When authentication providers are enabled, Salesforce does not validate a user's password. Instead, Salesforce uses the user's login credentials from the external service provider to establish authentication credentials.

In addition, you can also configure SAML for use with portals as well as for Sites.

Delegated Authentication Best Practices

Consider the following best practices when implementing delegated authentication single sign-on for your organization.

- Your organization's implementation of the Web service must be accessible by Salesforce servers. This means you must deploy the Web service on a server in your DMZ. Remember to use your server's external DNS name when entering the `Delegated Gateway URL` in the Delegated authentication section in Salesforce (from Setup, enter *Single Sign-On Settings* in the *Quick Find* box, then select **Single Sign-On Settings**).
- If Salesforce and your system cannot connect, or the request takes longer than 10 seconds to process, the login attempt fails. An error is reported to the user indicating that his or her corporate authentication service is down.
- Namespaces, element names, and capitalization must be exact in SOAP requests. Wherever possible, generate your server stub from the WSDL to ensure accuracy.
- For security reasons, you should make your Web service available by TLS. You must use a certificate from a trusted provider, such as Verisign or Thawte. For a full list of trusted providers, contact Salesforce.
- The IP address that originated the login request is `sourceIp`. Use this information to restrict access based on the user's location. Note that the Salesforce feature that validates login IP ranges continues to be in effect for single sign-on users. For more information, see [Setting Login Restrictions](#) on page 758.

Federated Authentication is available in: **All Editions**

Delegated Authentication is available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Customer Portals and partner portals are not available in **Database.com**

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"
- AND
- "Modify All Data"

- You may need to map your organization's internal usernames and Salesforce usernames. If your organization does not follow a standard mapping, you may be able to extend your user database schema (for example, Active Directory) to include the Salesforce username as an attribute of a user account. Your authentication service can then use this attribute to map back to a user account.
- We recommend that you do not enable single sign-on for system administrators. If your system administrators are single sign-on users and your single sign-on server has an outage, they have no way to log in to Salesforce. System administrators should always be able to log in to Salesforce so they can disable single sign-on in the event of a problem.
- We recommend that you use a Developer Edition account or a sandbox when developing a single sign-on solution before implementing it in your organization. To sign up for a free Developer Edition account, go to developer.salesforce.com.
- Make sure to test your implementation with Salesforce clients such as Salesforce for Outlook, Connect for Office, and Connect Offline. For more information, see [Single Sign-On for Salesforce clients](#).

Federated Authentication using SAML Best Practices

Consider the following best practices when implementing federated single sign-on with SAML for your organization.

- Obtain the `Salesforce Login URL` value from the Single Sign On Settings configuration page and put it in the corresponding configuration parameter of your Identity Provider (sometimes called the "Recipient URL").
- Salesforce allows a maximum of three minutes for clock skew with your IDP server; make sure your server's clock is up-to-date.
- If you are unable to log in with SAML assertion, always check the login history and note the error message. Use the SAML Assertion Validator on the Single Sign On Settings configuration page to troubleshoot.
- You need to map your organization's internal usernames and Salesforce usernames. You have two choices to do this: add a unique identifier to the `FederationIdentifier` field of each Salesforce user, or extend your user database schema (for example, Active Directory) to include the Salesforce username as an attribute of a user account. Choose the corresponding option for the `SAML User ID Type` field and configure your authentication service to send the identifier in SAML assertions.
- Before allowing users to log in with SAML assertions, enable the SAML organization preference and provide all the necessary configurations.
- Use the My Domain feature to prevent users from logging in to Salesforce directly, and gives administrators more control over login policies. You can use the URL parameters provided in the `Salesforce Login URL` value from the Single Sign-On Settings configuration page with your custom domain.

For example, if the `Salesforce Login URL` is `https://login.salesforce.com/?saml=02HKiP...`

you can use `https://<my_domain_name>.my.salesforce.com/?saml=02HKiP...`

- We recommend that you use Developer Edition account or a sandbox when testing a SAML single sign-on solution. To sign up for a free Developer Edition account, go to developer.salesforce.com.
- Sandbox copies are made with federated authentication with SAML disabled. Any configuration information is preserved, except the value for `Salesforce Login URL`. The `Salesforce Login URL` is updated to match your sandbox URL, for example `http://cs1.salesforce.com`, after you re-enable SAML. To enable SAML in the sandbox, from Setup, enter *Single Sign-On Settings* in the `Quick Find` box, then select **Single Sign-On Settings**; then click **Edit**, and select `SAML Enabled`.
- Your identity provider must allow you to set the service provider's audience URL. The value must match the `Entity ID` value in the single sign-on configuration. The default value is `https://saml.salesforce.com`.

Single Sign-On for Portals Best Practices

Customer Portals and partner portals are not available for new organizations in the Summer '13 release or later. Use Communities instead. For more information about single sign-on and SAML for Communities, see "Configuring SAML for Communities" in [Getting Started With Communities](#). If you continue to use portals, note the following information.

- Only SAML version 2.0 can be used with portals.
- Only Customer Portals and partner portals are supported.
- Service provider initiated login is not supported.
- Both the `portal_id` and `organization_id` attributes are required for single sign-on for portals. If only one is specified, the user receives an error.
- If both the `portal_id` and `organization_id` attributes are populated in the SAML assertion, the user is directed to that portal login. If neither is populated, the user is directed to the regular SAML Salesforce login.
- More than one portal can be used with a single organization.

Single Sign-On for Sites Best Practices

- Only SAML version 2.0 can be used with Sites.
- Only Customer Portals and partner portals are supported.
- Service provider initiated login is not supported.
- The `portal_id`, `organization_id` and `siteUrl` attributes are required for single sign-on for Sites. If only one is specified, the user receives an error.
- If all three of the `portal_id`, `organization_id` and `siteUrl` attributes are populated in the SAML assertion, the user is directed to that Sites login. If the `siteUrl` isn't populated and the other two are, the user is directed to that portal login.
- More than one portal can be used with a single organization.

[Single Sign-On Implementation Guide](#)

Understanding Delegated Authentication Single Sign-On

Salesforce uses the following process for authenticating users using delegated authentication single sign-on:

1. When a user tries to log in—either online or using the API—Salesforce validates the username and checks the user’s permissions and access settings.
2. If the user has the “Is Single Sign-On Enabled” user permission, then Salesforce does not validate the username and password. Instead, a Web services call is made to the user’s organization, asking it to validate the username and password.

 **Note:** Salesforce doesn’t store, log, or view the password in any way. It is disposed of immediately once the process is complete.

3. The Web services call passes the `username`, `password`, and `sourceIp` to your Web service. (`sourceIp` is the IP address that originated the login request. You must create and deploy an implementation of the Web service that can be accessed by Salesforce servers.)
4. Your implementation of the Web service validates the passed information and returns either `true` or `false`.
5. If the response is `true`, then the login process continues, a new session is generated, and the user proceeds to the application. If `false` is returned, then the user is informed that his or her username and password combination is invalid.

 **Note:** There may be a momentary delay before a user can log in after being given delegated authentication due to the time required for the user account to become available in the organization.

Configuring Salesforce for Delegated Authentication

To enable delegated authentication single sign-on (SSO) for your organization:

1. Contact Salesforce to enable delegated authentication single sign-on for your organization.
2. Build your single sign-on Web service:
 - a. In Salesforce, download the Web Services Description Language (WSDL) file `AuthenticationService.wsdl` from Setup by entering *Download Delegated Authentication WSDL* in the **Quick Find** box, then selecting **Download Delegated Authentication WSDL**. The WSDL describes the delegated authentication single sign-on service and can be used to automatically generate a server-side stub to which you can add your specific implementation. For example, in the WSDL2Java tool from Apache Axis, you can use the `--server-side` switch. In the `wsdl.exe` tool from .NET, you can use the `/server` switch.

For a sample request and response, see [Sample SOAP Message for Delegated Authentication](#) on page 818.

- b. Add a link to your corporate intranet or other internally-accessible site that takes the authenticated user's credentials and passes them through an HTTP POST to the Salesforce login page.

Because Salesforce does not use the `password` field other than to pass it back to you, you do not need to send a password in this field. Instead, you could pass another authentication token, such as a Kerberos Ticket so that your actual corporate passwords are not passed to or from Salesforce.

You can configure the Salesforce delegated authentication authority to allow only tokens or to accept either tokens or passwords. If the authority only accepts tokens, a Salesforce user cannot log in to Salesforce directly, because they cannot create a valid token. However, many companies choose to allow both tokens and passwords. In this environment, a user could still log in to Salesforce through the login page.

When the Salesforce server passes these credentials back to you in the `Authenticate` message, verify them, and the user will gain access to the application.

3. In Salesforce, specify your organization's single sign-on gateway URL from Setup by entering *Single Sign-On* in the **Quick Find** box, selecting **Single Sign-On Settings**, then clicking **Edit**. Enter the URL in the **Delegated Gateway URL** text box.

For security reasons, Salesforce restricts the outbound ports you may specify to one of the following:

- 80: This port only accepts HTTP connections.
- 443: This port only accepts HTTPS connections.
- 1024–66535 (inclusive): These ports accept HTTP or HTTPS connections.

4. Optionally, check the **Force Delegated Authentication Callout** box.

 **Note:** When this box is unchecked, a call is not made to the SSO endpoint if the login attempt first fails because of login restrictions within the Salesforce organization. If you must record every login attempt, then check this box to force a callout to the SSO endpoint regardless of login restriction failures.

5. Enable the "Is Single Sign-On Enabled" permission.

-  **Important:** If single sign-on is enabled for your organization, API and desktop client users can log in to Salesforce unless their profile has IP address restrictions set, and they try to log in from outside of the range defined for that profile. Furthermore, the single sign-on authority usually handles login lockout policies for users with the "Is Single Sign-On Enabled" permission. However,

if the security token is enabled for your organization, then your organization's login lockout settings determine the number of times a user can attempt to log in with an invalid security token before being locked out of Salesforce. For more information, see [Setting Login Restrictions](#) on page 758. For information on how to view login errors, see [Viewing Single Sign-On Login Errors](#) on page 798.

[Understanding Delegated Authentication Single Sign-On](#)

Control Individual API Client Access to Your Salesforce Organization

With API Client Whitelisting, restrict all API client applications, such as the Data Loader, to require administrator approval, unless the user's profile or permission set has the "Use Any API Client" permission.

Administrators may grant some users API access through the "API Enabled" permission. After it's given, this permission allows the user API access through any client (such as the Data Loader, Salesforce1, Salesforce for Outlook, or the Force.com Migration Tool). For finer control over which applications the user can use for API access, you can implement API Client Whitelisting. This feature leverages the existing authorization capabilities of connected apps. With API Client Whitelisting, an administrator can approve or block individual client application access for each associated connected app. All client applications that are not configured as connected apps are denied access. If you are not using connected apps, you can relax this restriction for individual users by assigning them a profile or permission set with "Use Any API Client" enabled.

 **Note:** Contact Salesforce to enable API Client Whitelisting. After it's enabled, all client access is restricted until explicitly allowed by the administrator. This restriction might block access to applications that your users are already using. Before you enable this feature, you should configure and approve connected apps for any client applications you want users to continue using, or give the users a profile or permission set with "Use Any API Client" enabled.

To configure API Client Whitelisting, do the following.

1. Contact Salesforce to get the feature enabled for your organization.
2. From Setup, enter *Connected Apps* in the *Quick Find* box, then select the option for managing connected apps.
3. In the App Access Settings, click **Edit**.
4. Select **Limit API access to installed connected apps with the "Admin approved users are pre-authorized" policy**.

Optionally, select **Allow Visualforce pages to bypass this restriction** so that any Visualforce pages that use the API continue to be authorized to access objects in the organization. If you enable API Client Whitelisting without selecting this option, only approved connected apps are authorized, and Visualforce pages might not behave as expected. Also, if unchecked, client applications that call `getSessionId()` are denied access. Apps that make API calls to Salesforce using a session obtained in a Visualforce context are denied access unless you select this checkbox.

5. Click **Save**.

After you select this feature, all client applications need explicit approval by an administrator to be authorized for the organization, unless the user has a profile or permission set with "Use Any API Client" enabled.

Some components for commonly used apps are automatically installed as connected apps in organizations. These components support apps such as the Data Loader, Salesforce1, Workbench and more. After you select this feature, these components will also require

About SAML

Security Assertion Markup Language (SAML) is an XML-based standard that allows you to communicate authentication decisions between one service and another. It underlies many Web single sign-on solutions. Salesforce supports SAML for single sign-on into Salesforce from a corporate portal or identity provider.

Much of the work to set up single sign-on using SAML occurs with your identity provider:

1. Establish a SAML identity provider and [gather information](#) about how they will connect to Salesforce. This is the provider that will send single sign-on requests to Salesforce.
2. Provide information to your identity provider, such as the [URLs for the start and logout pages](#).
3. Configure Salesforce using the instructions in [Configuring SAML Settings for Single Sign-On](#). This is the only step that takes place in Salesforce.

Your identity provider should send SAML assertions to Salesforce using the SAML Web Single Sign-on Browser POST profile. Salesforce sends SAML responses to the `Identity Provider Login URL` specified under Setup, by entering *Single Sign-On* in the `Quick Find` box, then selecting **Single Sign-On Settings**. Salesforce receives the assertion, verifies it against your Salesforce configuration, and allows single sign-on if the assertion is true.

If you have problems with the SAML assertion after you configure Salesforce for SAML, use the SAML Assertion Validator to [validate the SAML assertion](#). You may need to obtain a SAML assertion from your identity provider.

If your users are having problems using SAML to login, you can [review the SAML login history](#) to determine why they were not able to log in and share that information with your identity provider.

If your identity provider supports metadata, and if you've configured SAML using version 2.0, you can click **Download Metadata** to download an XML configuration file to send them, which they can then upload to automatically configure their settings for connecting to your Salesforce organization or community.

Working With Your Identity Provider

- You must gather the following information from your identity provider before configuring Salesforce for SAML.
 - The version of SAML the identity provider uses (1.1 or 2.0)
 - The entity ID of the identity provider (also known as the issuer)
 - An authentication certificate.
 -  **Tip:** Be sure to store the certificate where you can access it from your browser. This will be uploaded to Salesforce in a later step.
 - The following SAML assertion parameters, as appropriate:
 - The SAML user ID type
 - The SAML user ID location
 - Attribute Name
 - Attribute URI
 - Name ID format
 -  **Note:** Attribute Name, Attribute URI, and Name ID format are only necessary if the [SAML User ID Location](#) is in an Attribute element, and not the name identifier element of a Subject statement.
 -  **Tip:** To set up single sign-on quickly, you can import SAML 2.0 settings from an XML file (or a URL pointing to the file) on the Single Sign-On Settings page. Obtain the XML from your identity provider.

You may also want to share [more information](#) about these values with your identity provider.

-  **Tip:** Enable Salesforce for SAML and take a screenshot of the page for your identity provider. From Setup, enter *Single Sign-On Settings* in the Quick Find box, then select **Single Sign-On Settings**, click **Edit**, then select **SAML Enabled**.

- Work with your identity provider to setup the [start, login, and logout pages](#).
- Share the [example SAML assertions](#) with your identity provider so they can determine the format Salesforce requires for successful single sign-on.

Configuring SAML Settings for Single Sign-On

From this page, you can configure your organization to use single sign-on. You can also set up just-in-time provisioning. Work with your identity provider to properly configure these settings. For more information about single sign-on, see [About Single Sign-On](#). For more information about just-in-time provisioning, see [About Just-In-Time Provisioning](#).

To configure SAML settings for single sign-on from your corporate identity provider to Salesforce:

1. [Gather information from your identity provider.](#)
2. [Provide information to your identity provider.](#)
3. [Set up single sign-on.](#)
4. [Set up an identity provider to encrypt SAML assertions \(optional\).](#)
5. [Enable Just-in-Time user provisioning \(optional\).](#)
6. [Edit the SAML JIT handler](#) if you selected `Custom SAML JIT with Apex Handler` for Just-in-Time provisioning.
7. [Test the single sign-on connection.](#)

Set up single sign-on

1. In Salesforce, from Setup, enter *Single Sign-On Settings* in the `Quick Find` box, then select **Single Sign-On Settings**, and click **Edit**.
2. Select `SAML Enabled`. You must enable SAML to view the SAML single sign-on settings.
3. Specify the SAML version used by your identity provider.
4. Click **Save**.
5. In SAML Single Sign-On Settings, click the appropriate button to create a new configuration, as follows.
 - **New** - Specify all settings manually.
 - **New from Metadata File** - Import SAML 2.0 settings from a XML file from your identity provider. This option reads the XML file and uses it to complete as many of the settings as possible.

 **Note:** If your XML file contains information for more than one configuration, the first configuration that occurs in the XML file is used.
 - **New from Metadata URL** - Import SAML 2.0 settings from a public URL. This option reads the XML file located at a public URL and uses it to complete as many of the settings as possible. The URL must be added to Remote Site Settings to access it from your Salesforce org.
6. Give this setting a **Name** for reference within your organization.

Salesforce inserts the corresponding **API Name** value, which you can customize if necessary.
7. Enter the `Issuer`. This is often referred to as the entity ID for the identity provider.
8. If your Salesforce organization has [domains](#) deployed, specify whether you want to use the base domain (`https://saml.salesforce.com`) or the custom domain for the **Entity ID**. You must share this information with your identity provider.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Federated Authentication is available in: **All** Editions

Delegated Authentication is available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Authentication Providers are available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"
- AND
- "Modify All Data"

 **Tip:** Generally, use the custom domain as the entity ID. If you already have single sign-on configured before deploying a domain, the base domain is the entity ID. If you are providing Salesforce to Salesforce services, you must specify the custom domain.

9. For the `Identity Provider Certificate`, use the **Browse** button to locate and upload the authentication certificate issued by your identity provider.
10. For the `Request Signing Certificate`, select the certificate you want from the ones saved in your **Certificate and Key Management** settings.
11. For the `Request Signature Method`, select the hashing algorithm for encrypted requests, either `RSA-SHA1` or `RSA-SHA256`.
12. Optionally, if the identity provider encrypts SAML assertions, select the `Assertion Decryption Certificate` they're using from the ones saved in your **Certificate and Key Management** settings. This field is available only if your organization supports multiple single sign-on configurations. For more information, see [Set up an identity provider to encrypt SAML assertions](#).
13. For the `SAML Identity Type`, `SAML Identity Location`, and other fields described in [Identity Provider Values](#), specify the values provided by your identity provider as appropriate.
14. For the `Service Provider Initiated Request Binding`, select the appropriate value based on the information provided by your identity provider.
15. For SAML 2.0, if your identity provider has specific login or logout pages, specify them in **Identity Provider Login URL** and **Identity Provider Logout URL**, respectively.

 **Note:** These fields appear in Developer Edition and sandbox organizations by default and in production organizations only if My Domain is enabled. The fields do not appear in trial organizations or sandboxes linked to trial organizations.

16. For the `Custom Error URL`, specify the URL of the page users should be directed to if there's an error during SAML login. It must be a publicly accessible page, such as a public site Visualforce page. The URL can be absolute or relative.
17. Optionally, set up Just-in-Time user provisioning. For more information, see [Enable Just-in-Time user provisioning](#) and [About Just-in-Time Provisioning for SAML](#).
18. Click **Save**.

If your identity provider supports metadata, and if you've configured SAML using version 2.0, you can click **Download Metadata** to download an XML configuration file to send them, which they can then upload to automatically configure their settings for connecting to your Salesforce organization or community.

Set up an identity provider to encrypt SAML assertions

When Salesforce is the service provider for inbound SAML assertions, you can pick a saved certificate to decrypt inbound assertions from third party identity providers. You need to provide a copy of this certificate to the identity provider.

1. In the Single Sign-On Settings page in Setup, add a new SAML configuration.
2. In the `Assertion Decryption Certificate` field, specify the certificate for encryption from the ones saved in your **Certificate and Key Management** settings.

 **Note:** If you don't see the `Assertion Decryption Certificate` field you need to enable multiple single sign-on for your organization (this applies to organizations created before the Summer '13 release that are not using SAML 1.1). To enable multiple single sign-on configurations, select **Enable Multiple Confgs** on the **Single Sign-On Settings** page. If this setting has already been enabled, the field appears, and you won't see the **Enable Multiple Confgs** button.

3. Set the `SAML Identity Location` to `Identity is in the NameIdentifier` element of the `Subject` statement.

For a successful authentication, the user must be identified in the <Subject> statement of the assertion. For more information, see [Identity Provider Values](#).

4. When you save the new SAML configuration, your organization's SAML settings value for the `Salesforce Login URL` (also known as the "Salesforce ACS URL") changes. Get the new value (from the Single Sign-On Settings page in Setup), and click the name of the new SAML configuration. The value is in the `Salesforce Login URL` field.
5. The identity provider must use the `Salesforce Login URL` value.
6. You also need to provide the identity provider with a copy of the certificate selected in the `Assertion Decryption Certificate` field to use for encrypting assertions.

Enable Just-in-Time user provisioning

1. In SAML Single Sign-On Settings, select `User Provisioning Enabled`.
 - `Standard` - This option allows you to provision users automatically using attributes in the assertion.
 - `Custom SAML JIT with Apex handler` - This option provisions users based on logic in an Apex class.
2. If you selected `Standard`, click **Save** and [test the single sign-on connection](#). If you selected `Custom SAML JIT with Apex handler`, proceed to the next step.
3. In the `SAML JIT Handler` field, select an existing Apex class as the SAML JIT handler class. This class must implement the [SamJitHandler interface](#). If you do not have an Apex class, you can generate one by clicking `Automatically create a SAML JIT handler template`. You must edit this class and modify the default content before using it. For more information, see [Edit the SAML JIT handler](#).
4. In the `Execute Handler As` field, select the user that runs the Apex class. The user must have "Manage Users" permission.
5. Just-in-time provisioning requires a Federation ID in the user type. In `SAML Identity Type`, select `Assertion contains the Federation ID from the User object`. If your identity provider previously used the Salesforce username, communicate to them that they must use the Federation ID.
6. Click **Save**.

Edit the SAML JIT handler

1. From Setup, enter `Apex Classes` in the `Quick Find` box, then select **Apex Classes**.
2. Edit the generated Apex SAML JIT handler to map fields between SAML and Salesforce. In addition, you can modify the generated code to support the following:
 - Custom fields
 - Fuzzy profile matching
 - Fuzzy role matching
 - Contact lookup by email
 - Account lookup by account number
 - Standard user provisioning into a community
 - Standard user login into a community
 - Default profile ID usage for portal Just-in-Time provisioning
 - Default portal role usage for portal Just-in-Time provisioning
 - Username generation for portal Just-in-Time provisioning

For example, to support custom fields in the generated handler code, find the “Handle custom fields here” comment in the generated code. After that code comment, insert your custom field code. For more information and examples, see the [SamlJitHandler Interface documentation](#).

 **Note:** If your identity provider sends JIT attributes for the Contact or Account object with the User object in the same assertion, the generated handler may be unable to make updates. For a list of User fields that cannot be updated at the same time as the Contact or Account fields, see [sObjects That Cannot Be Used Together in DML Operations](#).

Test the single sign-on connection

After you have configured and saved your SAML settings, test them by trying to access the identity provider's application. Your identity provider directs the user's browser to POST a form containing SAML assertions to the Salesforce login page. Each assertion is verified, and if successful, single sign-on is allowed.

If you have difficulty signing on using single sign-on after you have configured and saved your SAML settings, use the [SAML Assertion Validator](#). You may have to obtain a SAML assertion from your identity provider first.

If your users are having problems using SAML to login, you can [review the SAML login history](#) to determine why they were not able to log in and share that information with your identity provider.

If you are using SAML version 2.0, after you've finished configuring SAML, the OAuth 2.0 Token Endpoint field is populated. Use this with the Web single sign-on authentication flow for OAuth 2.0.

Viewing Single Sign-On Settings

After you have configured your Salesforce organization to use SAML, you can view the single sign-on settings. From Setup, enter *Single Sign-On Settings* in the Quick Find box, then select **Single Sign-On Settings**.

This page lists the details of your SAML configuration. Most of these fields are the same as the fields on the page where you [configured SAML](#). The following fields contain information automatically generated by completing the configuration. The available fields depend on your configuration.

Field	Description
Salesforce Login URL	For SAML 2.0 only. If you select "Assertion contains User's Salesforce username" for SAML User ID Type and "User ID is in the NameIdentifier element of the Subject statement" for SAML User ID Location, this URL is the URL associated with login for the Web single sign-on OAuth assertion flow.
Salesforce Logout URL	For SAML 2.0. Displays the Salesforce logout URL that the user is directed to after he or she logs off. This URL is only used if no value is specified for Identity Provider Logout URL.
OAuth 2.0 Token Endpoint	For SAML 2.0 only: The ACS URL used with enabling Salesforce as an identity provider in the Web single sign-on OAuth assertion flow.

From this page you can do any of the following:

- Click **Edit** to change the existing SAML configuration.
- Click **SAML Assertion Validator** to validate the SAML settings for your organization using a SAML assertion provided by your identity provider.
- If your identity provider supports metadata, and if you've configured SAML using version 2.0, you can click **Download Metadata** to download an XML configuration file to send them, which they can then upload to automatically configure their settings for connecting to your Salesforce organization or community.

Identity Provider Values

Before you can configure Salesforce for SAML, you must receive information from your identity provider. This information must be used on the [single sign-on page](#).

The following information might be useful for your identity provider.

Field	Description
SAML Version	The version of SAML your identity provider uses. Salesforce currently supports version 1.1 and 2.0. The SAML specifications for the various versions are linked below: <ul style="list-style-type: none"> • SAML 1.1 • SAML 2.0
Issuer	The Entity ID—a URL that uniquely identifies your SAML identity provider. SAML assertions sent to Salesforce must match this value exactly in the <code><saml:Issuer></code> attribute of SAML assertions.
Entity ID	The issuer in SAML requests generated by Salesforce, and is also the expected audience of any inbound SAML Responses. If you don't have domains deployed, this value is always <code>https://saml.salesforce.com</code> . If you have domains deployed, Salesforce recommends that you use your custom domain name. You can find the value on the Single Sign-On Settings page. From Setup, enter <i>Single Sign-On Settings</i> in the Quick Find box, then select Single Sign-On Settings .
Identity Provider Certificate	The authentication certificate issued by your identity provider.
Request Signing Certificate	The certificate (saved in the Certificate and Key Management page in Setup) used to generate the signature on a SAML request to the identity provider when Salesforce is the service provider for a service provider-initiated SAML login. If a certificate has not been saved in the Certificate and Key Management page in Setup, Salesforce uses the global proxy certificate by default. Using a saved signing certificate provides more control over events, such as certificate expiration, than using the global proxy certificate.
Request Signature Method	The hashing algorithm for encrypted requests, either RSA-SHA1 or RSA-SHA256.
SAML Identity Type	The element in a SAML assertion that contains the string that identifies a Salesforce user. Values are: <p>Assertion contains User's Salesforce username Use this option if your identity provider passes the Salesforce username in SAML assertions.</p>

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"
- AND
- "Modify All Data"

Field	Description
	<p>Assertion contains the Federation ID from the User object Use this option if your identity provider passes an external user identifier, for example an employee ID, in the SAML assertion to identify the user.</p> <p>Assertion contains the User ID from the User object Use this option if your identity provider passes an internal user identifier, for example a user ID from your Salesforce organization, in the SAML assertion to identify the user.</p>
SAML Identity Location	<p>The location in the assertion where a user should be identified. Values are:</p> <p>Identity is in the NameIdentifier element of the Subject statement The Salesforce Username or FederationIdentifier is located in the <Subject> statement of the assertion.</p> <p>Identity is in an Attribute element The Salesforce Username or FederationIdentifier is specified in an <AttributeValue>, located in the <Attribute> of the assertion.</p>
Attribute Name	If “Identity is in an Attribute element” is selected, this contains the value of the AttributeName that is specified in <Attribute> that contains the User ID.
Attribute URI	If SAML 1.1 is the specified SAML version and “Identity is in an Attribute element” is selected, this contains the value of the AttributeNamespace that is specified in <Attribute>.
Name ID Format	If SAML 2.0 is the specified SAML version and “Identity is in an Attribute element” is selected, this contains the value for the nameid-format. Possible values include unspecified, emailAddress or persistent. All legal values can be found in the “Name Identifier Format Identifiers” section of the Assertions and Protocols SAML 2.0 specification .
Service Provider Initiated Request Binding	<p>If you’re using My Domain, chose the binding mechanism your identity provider requests for your SAML messages. Values are:</p> <p>HTTP POST HTTP POST binding sends SAML messages using base64-encoded HTML forms.</p> <p>HTTP Redirect HTTP Redirect binding sends base64-encoded and URL-encoded SAML messages within URL parameters.</p> <p>No matter what request binding is selected, the SAML Response will always use HTTP POST binding.</p>
Identity Provider Login URL	<p>For SAML 2.0 only: The URL where Salesforce sends a SAML request to start the login sequence.</p> <p>If you have domains deployed and a value specified for this field, login requests are usually sent to the address specified by this field. However, if you need to bypass this value (for example, your identity provider is down) add the login parameter to the query string for the login page. For example: <code>http://mydomain.my.salesforce.com?login</code>.</p> <p> Note: This field appears in Developer Edition production and sandbox organizations by default and in production organizations only if My Domain is enabled. This field does not appear in trial organizations or sandboxes linked to trial organizations.</p>

Field	Description
Identity Provider Logout URL	For SAML 2.0 only: The URL to direct the user to when they click the Logout link in Salesforce. The default is <code>http://www.salesforce.com</code> .  Note: This field appears in Developer Edition production and sandbox organizations by default and in production organizations only if My Domain is enabled. This field does not appear in trial organizations or sandboxes linked to trial organizations.
Salesforce Login URL	The URL associated with logging in for the Web browser single sign-on flow.
OAuth 2.0 Token Endpoint	For SAML 2.0 only: The ACS URL used with the API when enabling Salesforce as an identity provider in the Web single sign-on OAuth assertion flow.
Custom Error URL	The URL of the page users should be directed to if there's an error during SAML login. It must be a publicly accessible page, such as a public site Visualforce page. The URL can be absolute or relative.

Start, Login, and Logout URL Values

In addition to the information used during the single sign-on, your identity provider can also set the start, login, and logout pages. You can also specify these pages yourself when you [configure single sign-on](#).

The following information might be useful to your identity provider if they are setting these pages.

- The SAML specification supports an HTML form that is used to pass the SAML assertion via HTTPS POST.
- For SAML 1.1, the SAML identity provider can embed name-value pairs in the `TARGET` field to pass this additional information to Salesforce prepended with a specially formatted URL that contains URL-encoded parameters.
- The URL for SAML 1.1 to include in the `TARGET` field is as follows: `https://saml.salesforce.com/?`
- For SAML 2.0, instead of using the `TARGET` field, the identity providers uses the `<AttributeStatement>` in the SAML assertion to specify the additional information.
- Salesforce supports the following parameters:

-  **Note:** For SAML 1.1 these parameters must be URL-encoded. This allows the URLs, passed as values that include their own parameters, to be handled correctly. For SAML 2.0, these parameters are part of the `<AttributeStatement>`.
 - `ssoStartPage` is the page to which the user should be redirected when trying to log in with SAML. The user is directed to this page when requesting a protected resource in Salesforce, without an active session. The `ssoStartPage` should be the SAML identity provider's login page.
 - `startURL` is the URL where you want the user to be directed when sign-on completes successfully. This URL can be absolute, such as `https://na1.salesforce.com/001/o` or it can be relative, such as `/001/o`. This parameter is only used in SAML 1.1. In SAML 2.0, the start URL is the page the user attempted to access before they were authenticated.
 - `logoutURL` is the URL where you want the user to be directed when they click the **Logout** link in Salesforce. The default is `http://www.salesforce.com`.

The following sample `TARGET` field is for SAML 1.1, and includes properly-encoded parameters. It passes a customized start page, as well as start and logout URLs embedded as parameter values in the query string.

```
https://saml.salesforce.com/?ssoStartPage=https%3A%2F%2Fwww.customer.org%2Flogin%2F&startURL=%2F001%2Fo&logoutURL=http%3A%2F%2Fwww.salesforce.com
```

The following is an example of an <AttributeStatement> for SAML 2.0 that contains both ssoStartPage and logoutURL:

```
<saml:AttributeStatement>
  <saml:Attribute Name="ssoStartPage"
NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
  <saml:AttributeValue xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="xs:anyType">
    http://www.customer.org
  </saml:AttributeValue>
</saml:Attribute>

  <saml:Attribute Name="logoutURL"
NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:uri">
  <saml:AttributeValue xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="xs:string">
    https://www.salesforce.com
  </saml:AttributeValue>
</saml:Attribute>
</saml:AttributeStatement>
```

SEE ALSO:

[About SAML](#)

Customize SAML Start, Error, Login, and Logout Pages

You can customize the start, error, login, and logout pages for single sign-on users using SAML 1.1 or 2.0. As part of your configuration, decide the following:

- If your identity provider uses SAML 1.1, the URL to direct the user to when single sign-on successfully completes (known as the start page). This URL can be absolute, such as `https://na1.salesforce.com/001/o` or it can be relative, such as `/001/o`. This URL must be an endpoint that accepts SAML authentication requests.

In SAML 2.0, the start page is the page the user attempted to access before they were authenticated. The SAML 2.0 start page must support Sp-init single sign-on.

If you are using SAML 2.0, you can also use the `RelayState` parameter to control where users get redirected after a successful login.

- The single sign-on start page where Salesforce sends a SAML request to start the login sequence. We recommend that if you specify a single sign-on start page that you also specify a logout page. When you specify a logout page, when a user clicks logout or if a user's session expires, the user is redirected to that page. If you don't specify a logout page, the user is redirected to the general Salesforce login page.
- The URL to direct the user to when they click the Logout link in Salesforce (known as the logout page). The default is `https://login.salesforce.com`, unless MyDomain is enabled. If My Domain is enabled, the default is `https://customdomain.my.salesforce.com`.

For SAML 2.0, these values can be set either during the single sign-on configuration, or by your identity provider in the login URL or SAML assertion. The order of precedence is:

1. Session cookie—if you've already logged in to Salesforce and a cookie still exists, the login and logout pages specified by the session cookie are used.
2. Values passed in from the identity provider.
3. Values from the single sign-on configuration page.

If you decide not to add these values to the single sign-on configuration, share them with your identity provider. The identity provider must [use these values](#) either in the login URL or the assertion.

You can also decide if you want users to be directed to a custom error page if there's an error during SAML login: It must be a publicly accessible page, such as a public site Visualforce page. The URL can be absolute or relative. Use this value when you [configure SAML](#).

Example SAML Assertions

Share the example SAML assertions with your identity provider so they can determine the format of the information Salesforce requires for successful single-sign on. The assertion must be signed according to the [XML Signature specification](#), using RSA and either SHA-1 or SHA-256.

In addition to the general single sign-on examples for both SAML 1.1 and SAML 2.0, use the following samples for the specific feature:

- [assertions for portals](#)
- [assertions for Sites](#)
- [SOAP message for delegated authentication](#)
- [assertion for just-in-time provisioning](#)

SAML User ID type is the Salesforce username, and SAML User ID location is the <NameIdentifier> element in the <Subject> element

SAML 1.1:

```
<Subject>
  <NameIdentifier>user101@salesforce.com</NameIdentifier>
</Subject>
```

SAML 2.0:

```
<saml:Subject>
  <saml:NameID
Format="urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified">user101@salesforce.com</saml:NameID>

  <saml:SubjectConfirmation Method="urn:oasis:names:tc:SAML:2.0:cm:bearer">

Sample SAML Assertions for Portals

The following shows the `portal_id` and `organization_id` attributes in a SAML assertion statement:

```

<saml:AttributeStatement>
    <saml:Attribute Name="portal_id">
        <saml:AttributeValue xsi:type="xs:anyType">060D00000000SHZ</saml:AttributeValue>
    </saml:Attribute>

    <saml:Attribute Name="organization_id">
        <saml:AttributeValue xsi:type="xs:anyType">00DD00000000F7P5</saml:AttributeValue>

    </saml:Attribute>
</saml:AttributeStatement>

```

The following is a complete SAML assertion statement that can be used for single sign-on for portals. The organization is using federated sign-on, which is included in an attribute (see the `<saml:AttributeStatement>` in bold text in the assertion), not in the subject.

```

  </saml:Attribute>
</saml:AttributeStatement>

```

Sample SOAP Message for Delegated Authentication

As part of the delegated authentication single sign-on process, a Salesforce server makes a SOAP 1.1 request to authenticate the user who is passing in the credentials. Here is an example of this type of request. Your single sign-on Web service needs to accept this request, process it, and return a `true` or `false` response.

Sample Request

```

<?xml version="1.0" encoding="UTF-8" ?>
<soapenv:Envelope
  xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/">
  <soapenv:Body>
    <Authenticate xmlns="urn:authentication.soap.sforce.com">
      <username>sampleuser@sample.org</username>
      <password>myPassword99</password>
      <sourceIp>1.2.3.4</sourceIp>
    </Authenticate>
  </soapenv:Body>
</soapenv:Envelope>

```

```

    </Authenticate>
  </soapenv:Body>
</soapenv:Envelope>

```

Sample Response Message

```

<?xml version="1.0" encoding="UTF-8"?>
<soapenv:Envelope
  xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/">
  <soapenv:Body>
    <AuthenticateResult xmlns="urn:authentication.soap.sforce.com">
      <Authenticated>false</Authenticated>
    </AuthenticateResult>
  </soapenv:Body>
</soapenv:Envelope>

```

Sample SAML Assertion for Just-In-Time Provisioning

The following is a sample SAML assertion for just in time provisioning.

```

<saml:AttributeStatement>

  <saml:Attribute Name="User.Username"
    NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
    <saml:AttributeValue xsi:type="xs:anyType">testuser@123.org

[About SAML](#)

Reviewing the SAML Login History

When a user logs in to Salesforce from another application using single sign-on, SAML assertions are sent to the Salesforce login page. The assertions are checked against assertions in the authentication certificate that are specified on the Single Sign-On Settings page in Setup. If a user fails to log in, a message is written to the login history log that indicates why the login failed. In addition, the [SAML Assertion Validator](#) may be automatically populated with the invalid assertion.

To view the login history, from Setup, enter *Login History* in the *Quick Find* box, then select **Login History**. After viewing the login history, you may want to share the information with your identity provider.

The following are the possible failures:

Assertion Expired

An assertion's [timestamp](#) is more than five minutes old.

Note: Salesforce does make an allowance of three minutes for clock skew. This means, in practice, that an assertion can be as much as eight minutes after the timestamp time, or three minutes before it. This amount of time may be less if the assertion's validity period is less than five minutes.

Assertion Invalid

An assertion is not valid. For example, the `<Subject>` element of an assertion might be missing.

Audience Invalid

The value specified in `<Audience>` must be `https://saml.salesforce.com`.

Configuration Error/Perm Disabled

Something is wrong with the SAML configuration in Salesforce. For example, the uploaded certificate might be corrupted, or the organization preference might have been turned off. To check your configuration, from Setup, enter *Single Sign-On Settings* in the *Quick Find* box, then select **Single Sign-On Settings**. Next, get a sample SAML assertion from your identity provider, and then click [SAML Assertion Validator](#).

Issuer Mismatched

The issuer or entity ID specified in an assertion does not match the issuer specified in your Salesforce configuration.

Recipient Mismatched

The recipient specified in an assertion does not match the recipient specified in your Salesforce configuration.

Replay Detected

The same assertion ID was used more than once. [Assertion IDs](#) must be unique within an organization.

Signature Invalid

The signature in an assertion cannot be validated by the certificate in your Salesforce configuration.

Subject Confirmation Error

The `<Subject>` specified in the assertion does not match the SAML configuration in Salesforce.

Validating SAML Settings for Single Sign-On

If your users have difficulty logging into Salesforce after you [configure Salesforce for single sign-on](#), use the SAML Assertion Validator and the [login history](#) to validate the SAML assertions sent by your identity provider.

1. Obtain a SAML assertion from your identity provider. The assertion can be either in plain XML format or base64 encoded.

If a user tries to log in to Salesforce and fails, the invalid SAML assertion is used to automatically populate the SAML Assertion Validator if possible.
2. From Setup, enter *Single Sign-On Settings* in the Quick Find box, then select **Single Sign-On Settings**, then click **SAML Assertion Validator**.
3. Enter the SAML assertion into the text box, and click **Validate**.
4. Share the results of the [validation errors](#) with your identity provider.

SAML Assertion Validation Errors

Salesforce imposes the following validity requirements on assertions:

Authentication Statement

The identity provider must include an `<AuthenticationStatement>` in the assertion.

Conditions Statement

If the assertion contains a `<Conditions>` statement, it must contain a valid timestamp.

Timestamps

The validity period specified in an assertion is honored. In addition, an assertion's timestamp must be less than five minutes old, plus or minus three minutes, regardless of the assertion's validity period setting. This allows for differences between machines. The `NotBefore` and `NotOnOrAfter` constraints must also be defined and valid.

Attribute

If your Salesforce configuration is set to `Identity is in an Attribute` element, the assertion from the identity provider must contain an `<AttributeStatement>`.

If you are using SAML 1.1, both `<AttributeName>` and `<AttributeNamespace>` are required as part of the `<AttributeStatement>`.

If you are using SAML 2.0, only `<AttributeName>` is required.

Format

The `Format` attribute of an `<Issuer>` statement must be set to `"urn:oasis:names:tc:SAML:2.0:nameid-format:entity"` or not set at all.

For example:

```
<saml:Issuer
  Format="urn:oasis:names:tc:SAML:2.0:nameid-format:entity">https://www.salesforce.com</saml:Issuer>
```

The following example is also valid:

```
<saml:Issuer >https://www.salesforce.com</saml:Issuer>
```

Issuer

The issuer specified in an assertion must match the issuer specified in Salesforce.

Subject

The subject of the assertion must be resolved to be either the Salesforce username or the Federation ID of the user.

Audience

The `<Audience>` value is required and must match the `Entity` ID from the single sign-on configuration. The default value is `https://saml.salesforce.com`.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Federated Authentication is available in: **All** Editions

Delegated Authentication is available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Authentication Providers are available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"
- AND
- "Modify All Data"

Recipient

The recipient specified in an assertion must match either the Salesforce login URL specified in the Salesforce configuration or the OAuth 2.0 token endpoint. This is a required portion of the assertion and is always verified.

Signature

A valid signature must be included in the assertion. The signature must be created using the private key associated with the certificate that was provided in the SAML configuration.

Recipient

Verifies that the recipient and organization ID received in the assertion matches the expected recipient and organization ID, as specified in the single sign-on configuration. This is an optional portion of the assertion and is only verified if it's present. For example:

```
Recipient that we found in the assertion: http://aalbert-salesforce.com:8081/
?sam1=02HKiPoin4zeKLPYxfj3twkPsNSJF3fxsh0Jnq4vVeQr3xNkIWmZC_IVk3
Recipient that we expected based on the Single Sign-On Settings page:
http://asmith.salesforce.com:8081/
?sam1=EK03Almz90Cik_ig0L97.0BRme6mT4o6nzi0t_JROL6HLbdR1WVP5aQO5w
Organization Id that we expected: 00Dx0000000BQ1I
Organization Id that we found based on your assertion: 00D000000000062
```

Site URL Attribute

Verifies if a valid Sites URL is provided. Values are:

- Not Provided
- Checked
- Site URL is invalid
- HTTPS is required for Site URL
- The specified Site is inactive or has exceeded its page limit

[About SAML](#)

About Just-in-Time Provisioning for SAML

With Just-in-Time provisioning, you can use a SAML assertion to create regular and portal users on the fly the first time they try to log in. This eliminates the need to create user accounts in advance. For example, if you recently added an employee to your organization, you don't need to manually create the user in Salesforce. When they log in with single sign-on, their account is automatically created for them, eliminating the time and effort with on-boarding the account. Just-in-Time provisioning works with your SAML identity provider to pass the correct user information to Salesforce in a SAML 2.0 assertion. You can both create and modify accounts this way. Because Just-in-Time provisioning uses SAML to communicate, your organization must have SAML-based single sign-on enabled.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Benefits of Just-in-Time Provisioning

Implementing Just-in-Time provisioning can offer the following advantages to your organization.

- **Reduced Administrative Costs:** Provisioning over SAML allows customers to create accounts on-demand, as part of the single sign-on process. This greatly simplifies the integration work required in scenarios where users need to be dynamically provisioned, by combining the provisioning and single sign-on processes into a single message.

- **Increased User Adoption:** Users only need to memorize a single password to access both their main site and Salesforce. Users are more likely to use your Salesforce application on a regular basis.
- **Increased Security:** Any password policies that you have established for your corporate network are also in effect for Salesforce. In addition, sending an authentication credential that is only valid for a single use can increase security for users who have access to sensitive data.

- [Just-in-Time Provisioning for Communities](#)
- [Just-in-Time Provisioning Errors](#)
- [Example SAML Assertions](#)
- [About Single Sign-On](#)

Just-in-Time Provisioning Requirements

Just-in-Time provisioning requires the creation of a SAML assertion. Consider the following when creating your SAML assertion.

- `ProvisionVersion` is supported as an optional attribute. If it isn't specified, the default is 1.0. For example:

```
<saml:Attribute Name="ProvisionVersion" NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
  <saml:AttributeValue xsi:type="xs:anyType">1.0</saml:AttributeValue>
</saml:Attribute>
```

- ProfileIDs change per organization, even for standard profiles. To make it easier to find the profile name, Salesforce allows you to do a profile name lookup by passing the `ProfileName` into the `ProfileId` field.

Field Requirements for the SAML Assertion

To correctly identify which object to create in Salesforce, you must use the `User.` prefix for all fields passed in the SAML assertion. In this example, the `User.` prefix has been added to the `Username` field name.

```
<saml:Attribute
  Name="User.Username"
  NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
  <saml:AttributeValue xsi:type="xs:anyType">testuser@123.org</saml:AttributeValue>
</saml:Attribute>
```

The following standard fields are supported.

Fields	Required	Comments
AboutMe		
Alias		If not present, a default is derived from FirstName and LastName.
CallCenter		
City		
CommunityNickname		If not present, a default is derived from the UserName.

Fields	Required	Comments
CompanyName		
Country		
DefaultCurrencyIsoCode		Derived from organization settings.
DelegatedApproverId		
Department		
Division		
Email	Y	For example, <code>User.Email=test2@salesforce.com</code>
EmailEncodingKey		If not present, a default is derived from the organization settings.
EmployeeNumber		
Extension		
Fax		
FederationIdentifier (insert only)		If present, it must match the SAML subject, or the SAML subject is taken instead. Can't be updated with SAML.
FirstName		
ForecastEnabled		
IsActive		
LastName	Y	
LanguageLocaleKey		
LocaleSidKey		If not present, a default is derived from the organization settings.
Manager		
MobilePhone		
Phone		
ProfileId	Y	For example, <code>User.ProfileId=Standard User</code>
ReceivesAdminInfoEmails		
ReceivesInfoEmails		
State		
Street		
TimeZoneSidKey		If not present, a default is derived from the organization settings.
Title		
Username (insert only)	Y	For example, <code>User.Username=test2@test.com</code> . Can't update using SAML.

Fields	Required	Comments
UserRoleId		Defaults to "no role" if blank.
Zip		

Other field requirements:

- Only text type custom fields are supported.
- Only the `insert` and `update` functions are supported for custom fields.
- When using the API for user creation, you can pass the new username into the `User.Username` field. You can also specify the `User.FederationIdentifier` if it is present. However, the `Username` and `FederationIdentifier` fields can't be updated with API.

[About Just-in-Time Provisioning for SAML](#)

[Just-in-Time Provisioning for Portals](#)

[Just-in-Time Provisioning for Communities](#)

["Configuring SAML for Communities" in Getting Started With Communities](#)

Just-in-Time Provisioning for Portals

With Just-in-Time (JIT) provisioning for portals, you can use a SAML assertion to create customer and partner portal users on the fly the first time they try to log in. This eliminates the need to create user accounts in advance. Because JIT uses SAML to communicate, your organization must have SAML-based single sign-on enabled.

-  **Note:** Starting with Summer '13, Customer Portals and partner portals are no longer available for new organizations. Existing organizations continue to have access to these portals. If you don't have a portal, but want to easily share information with your customers or partners, try Communities.

Existing organizations using Customer Portals and partner portals may continue to use their portals or transition to Communities. Contact your Salesforce Account Executive for more information.

Creating Portal Users

The `Portal ID` and `Organization ID` must be specified as part of the SAML assertion. You can find both of these on the company information page for the organization or portal. Because you can also provision regular users, the `Portal ID` is used to distinguish between a regular and portal JIT provisioning request. If no `Portal ID` is specified, then the request is treated as a JIT request for regular platform user. Here are the requirements for a creating a portal user.

- You must specify a `Federation ID`. If the ID belongs to an existing user account, the user account is updated. In case of an inactive user account, the user account is updated, but left inactive unless `User.IsActive` in the JIT assertion is set to true. If there is no user account with that `Federation ID`, the system creates a new user.
- If the portal isn't self-registration enabled and a default new user profile and role aren't specified, the `User.ProfileId` field must contain a valid profile name or ID associated with the portal. In addition, the `User.PortalRole` field must contain a valid portal role name or ID.

-  **Note:** The `User.Role` must be null.

Creating and Modifying Accounts

Create or modify an account by specifying a valid `Account` ID or both the `Account.AccountNumber` and `Account.Name`.

- Matching is based on `Account.AccountNumber`. If multiple accounts are found, an error is displayed. Otherwise, the account is updated.
- If no matching account is found, one is created.
- You must specify the `Account.Owner` in the SAML assertion and ensure that the field level security for the `Account.AccountNumber` field is set to visible for this owner's profile.

Creating and Modifying Contacts

Create or modify a contact by specifying the a valid Contact ID in `User.Contact` or both the `Contact.Email` and `Contact.LastName`.

- Matching is based on `Contact.Email`. If multiple contacts are found, an error is displayed. Otherwise, the contact is updated.
- If no matching contact is found, one is created.

Supported Fields for the Portal SAML Assertion

To correctly identify which object to create in Salesforce, you must use a prefix. In the SAML assertion, use the `Account` prefix for all fields in the Account schema (for example `Account.AccountId`) and `Contact` prefix for all fields in the Contact schema. In this example, the `Contact` prefix has been added to the `Email` field name.

```
<saml:Attribute
  Name="Contact.Email"
  NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
  <saml:AttributeValue xsi:type="xs:anyType">testuser@123.org</saml:AttributeValue>
</saml:Attribute>
```

In addition to the standard fields supported for regular SAML JIT users, these fields are supported for accounts.

Fields	Required	Comments
Billing		Street City State PostalCode Country
AnnualRevenue		
Description		
Fax		
FederationIdentifier (insert only)	Y	If present, it must match the SAML subject or the SAML subject is taken instead. Can't be updated using SAML.

- [About Just-in-Time Provisioning for SAML](#)
- [Just-in-Time Provisioning Requirements](#)
- [Just-in-Time Provisioning for Communities](#)
- ["Configuring SAML for Communities" in Getting Started With Communities](#)

Just-in-Time Provisioning for Communities

With Just-in-Time (JIT) provisioning for Communities, you can use a SAML assertion to create customer and partner community users on the fly the first time they try to log in from an identity provider. This eliminates the need to create user accounts in advance. Because JIT uses SAML to communicate, your organization must have SAML-based single sign-on enabled. Then, you can work with the identity provider to generate the necessary SAML assertions for JIT.

SAML Single Sign-on Settings

Follow the instructions for [Configuring SAML Settings for Single Sign-On](#) with `SAML Enabled`. Set the values for your configuration, as needed, and also include the following values specific to your community for JIT provisioning.

1. Check `User Provisioning Enabled`.

Note:

- Just-in-time provisioning requires a Federation ID in the user type. In `SAML User ID Type`, select `Assertion contains the Federation ID from the User object`.
- If your identity provider previously used the Salesforce username, communicate to them that they must use the Federation ID.

2. The **Entity ID** should be unique across your organization and begin with `https`. You can't have two SAML configurations with the same **Entity ID** in one organization. Specify whether you want to use the base domain (`https://saml.salesforce.com`) or the community URL (such as `https://acme.force.com/customers`) for the **Entity ID**. You must share this information with your identity provider.

Tip: Generally, use the community URL as the entity ID. If you are providing Salesforce to Salesforce services, you must specify the community URL.

3. In `SAML User ID Type`, select `Assertion contains the Federation ID from the User object`. If your identity provider previously used the Salesforce username, communicate to them that they must use the Federation ID.

Creating and Modifying Community Users

The SAML assertion needs the following.

- A `Recipient URL`. This is the Community Login URL from the SAML Single Sign-On Settings detail page in your organization. The URL is in the following form.

```
https://<community_URL>/login?so=<orgID>
```

For example, `Recipient="https://acme.force.com/customers/login?so=00DD000000JsCM"` where `acme.force.com/customers` is the community home page and `00DD000000JsCM` is the `Organization ID`.

If an Assertion Decryption Certificate has been uploaded to the organization's SAML Single Sign-On Settings, include the certificate ID in the URL using the `sc` parameter, such as

`Recipient="https://acme.force.com/customers/login?so=00DD000000JsCM&sc=0LE000000Dp"` where `0LE000000Dp` is the certificate ID.

- Salesforce attempts to match the `Federation ID` in the subject of the SAML assertion (or in an attribute element, depending upon how the SAML Identity Location is defined in the SAML Single Sign-On Settings) to the `FederationIdentifier` field of an existing user record.
 1. If a matching user record is found, Salesforce uses the attributes in the SAML assertion to update the specified fields.
 2. If a user with a matching user record isn't found, then Salesforce searches the contacts under the specified `Account ID` (`Contact.Account` or `Account.AccountNumber`) for a match based on the Contact ID (`User.ContactId`) or email (`Contact.Email`).
 - i. If a matching contact record is found, Salesforce uses the attributes in the SAML assertion to update the specified contact fields, and then inserts a new user record.
 - ii. If a matching contact record isn't found, then Salesforce searches the accounts for a match based on the `Contact.Account` or both the `Account.AccountNumber` and `Account.Name` specified in the SAML assertion, or updates the existing contact and user records for the account if a match is found.
 - i. If a matching account record is found, Salesforce inserts a new user record and updates the account records based the attributes provided in the SAML assertion.
 - ii. If a matching account record isn't found, Salesforce inserts a new account record, inserts a new contact record, and inserts a new user record based on the attributes provided in the SAML assertion.

In the case of an inactive user account, the user account is updated, but left inactive unless `User.IsActive` in the JIT assertion is set to true. If there is no user account with that `Federation ID`, the system creates a new user.

- If the community doesn't have self-registration enabled, and a default new user profile and role aren't specified, the `User.ProfileId` field must contain a valid profile name or ID associated with the community.

Salesforce attempts to match the `Federation ID` in the subject of the SAML assertion to the `FederationIdentifier` field of an existing user record.

- 📌 **Note:** Salesforce also supports custom fields on the User object in the SAML assertion. Any attribute in the assertion that starts with `User` is parsed as a custom field. For example, the attribute `User.NumberOfProductsBought__c` in the assertion is placed into the field `NumberOfProductsBought` for the provisioned user. Custom fields are not supported for Accounts or Contacts.

Supported Fields for the Community SAML Assertion

To correctly identify which object to create in Salesforce, you must use a prefix. In the SAML assertion, use the `Account` prefix for all fields in the Account schema (for example `Account.AccountId`) and `Contact` prefix for all fields in the Contact schema. In this example, the `Contact` prefix has been added to the `Email` field name.

```
<saml:Attribute
  Name="Contact.Email"
  NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
  <saml:AttributeValue xsi:type="xs:anyType">testuser@123.org</saml:AttributeValue>
</saml:Attribute>
```

In addition to the standard fields supported for regular SAML JIT users, these fields are supported for accounts.

Fields	Required	Comments
Billing		Street City State PostalCode Country

Just-in-Time Provisioning Errors

Following are the error codes and descriptions for Just-in-Time provisioning for SAML.

SAML errors are returned in the URL parameter, for example:

```
http://login.salesforce.com/identity/jit/saml-error.jsp?
ErrorCode=5&ErrorDescription=Unable+to+create+user&ErrorDetails=
INVALID_OR_NULL_FOR_RESTRICTED_PICKLIST+TimeZoneSidKey
```

 **Note:** Salesforce redirects the user to a custom error URL if one is specified in your SAML configuration.

Error Messages

Code	Description	Error Details
1	Missing Federation Identifier	MISSING_FEDERATION_ID
2	Mis-matched Federation Identifier	MISMATCH_FEDERATION_ID
3	Invalid organization ID	INVALID_ORG_ID
4	Unable to acquire lock	USER_CREATION_FAILED_ON_UROG
5	Unable to create user	USER_CREATION_API_ERROR
6	Unable to establish admin context	ADMIN_CONTEXT_NOT_ESTABLISHED

Code	Description	Error Details
8	Unrecognized custom field	UNRECOGNIZED_CUSTOM_FIELD
9	Unrecognized standard field	UNRECOGNIZED_STANDARD_FIELD
11	License limit exceeded	LICENSE_LIMIT_EXCEEDED
12	Federation ID and username do not match	MISMATCH_FEDERATION_ID_AND_USERNAME_ATTRS
13	Unsupported provision API version	UNSUPPORTED_VERSION
14	Username change isn't allowed	USER_NAME_CHANGE_NOT_ALLOWED
15	Custom field type isn't supported	UNSUPPORTED_CUSTOM_FIELD_TYPE
16	Unable to map a unique profile ID for the given profile name	PROFILE_NAME_LOOKUP_ERROR
17	Unable to map a unique role ID for the given role name	ROLE_NAME_LOOKUP_ERROR
18	Invalid account	INVALID_ACCOUNT_ID
19	Missing account name	MISSING_ACCOUNT_NAME
20	Missing account number	MISSING_ACCOUNT_NUMBER
22	Unable to create account	ACCOUNT_CREATION_API_ERROR
23	Invalid contact	INVALID_CONTACT
24	Missing contact email	MISSING_CONTACT_EMAIL
25	Missing contact last name	MISSING_CONTACT_LAST_NAME
26	Unable to create contact	CONTACT_CREATION_API_ERROR

[About Just-in-Time Provisioning for SAML](#)

[Just-in-Time Provisioning for Portals](#)

About External Authentication Providers

You can enable users to log into your Salesforce organization using their login credentials from an external service provider such as Facebook[®] or Janrain[®].

Note:  [Social Sign-On](#) (11:33 minutes)

Learn how to configure single sign-on and OAuth-based API access to Salesforce from other sources of user identity.

Do the following to successfully set up an authentication provider for single sign-on.

- Correctly configure the service provider website.
- Create a registration handler using Apex.
- Define the authentication provider in your organization.

When set up is complete, the authentication provider flow is as follows.

1. The user tries to login to Salesforce using a third party identity.
2. The login request is redirected to the third party authentication provider.
3. The user follows the third party login process and approves access.
4. The third party authentication provider redirects the user to Salesforce with credentials.
5. The user is signed into Salesforce.

Note: If a user has an existing Salesforce session, after authentication with the third party they are automatically redirected to the page where they can approve the link to their Salesforce account.

Defining Your Authentication Provider

We support the following providers:

- [Facebook](#)
- [Google](#)
- [Janrain](#)
- [LinkedIn](#)

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"

AND

"Manage Auth. Providers"

- [Microsoft Access Control Service](#)
- [Salesforce](#)
- [Twitter](#)
- [Any service provider who implements the OpenID Connect protocol](#)

Adding Functionality to Your Authentication Provider

You can add functionality to your authentication provider by using additional request parameters.

- [Scope](#) – Customizes the permissions requested from the third party
- [Site](#) – Enables the provider to be used with a site
- [StartURL](#) – Sends the user to a specified location after authentication
- [Community](#) – Sends the user to a specific community after authentication
- [Authorization Endpoint](#) on page 868 – Sends the user to a specific endpoint for authentication (Salesforce authentication providers, only)

Creating an Apex Registration Handler

A registration handler class is required to use Authentication Providers for the single sign-on flow. The Apex registration handler class must implement the `Auth.RegistrationHandler` interface, which defines two methods. Salesforce invokes the appropriate method on callback, depending on whether the user has used this provider before or not. When you create the authentication provider, you can automatically create an Apex template class for testing purposes. For more information, see [RegistrationHandler](#) in the *Force.com Apex Code Developer's Guide*.

Configuring a Facebook Authentication Provider

To use Facebook as an authentication provider:

1. **Set up** a Facebook application, making Salesforce the application domain.
2. **Define** a Facebook authentication provider in your Salesforce organization.
3. **Update** your Facebook application to use the `Callback URL` generated by Salesforce as the Facebook `Website Site URL`.
4. **Test** the connection.

Setting up a Facebook Application

Before you can configure Facebook for your Salesforce organization, you must set up an application in Facebook:

-  **Note:** You can skip this step by allowing Salesforce to use its own default application. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).
1. Go to the [Facebook website](#) and create a new application.
 2. Modify the application settings and set the Application Domain to Salesforce.
 3. Note the Application ID and the Application Secret.

Defining a Facebook Provider in your Salesforce Organization

You need the Facebook Application ID and Application Secret to set up a Facebook provider in your Salesforce organization.

-  **Note:** You can skip specifying these key values in the provider setup by allowing Salesforce to manage the values for you. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).
1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
 2. Click **New**.
 3. Select Facebook for the `Provider Type`.
 4. Enter a `Name` for the provider.
 5. Enter the `URL Suffix`. This is used in the client configuration URLs. For example, if the URL suffix of your provider is "MyFacebookProvider", your single sign-on URL is similar to:
`https://login.salesforce.com/auth/sso/00Dx000000000001/MyFacebookProvider`.
 6. Use the Application ID from Facebook for the `Consumer Key` field.
 7. Use the Application Secret from Facebook for the `Consumer Secret` field.
 8. Optionally, set the following fields.
 - a. Enter the base URL from Facebook for the `Authorize Endpoint URL`. For example, `https://www.facebook.com/v2.2/dialog/oauth`. If you leave this field blank, Salesforce uses the version of the Facebook API that your application uses.
-  **Tip:** You can add query string parameters to the base URL, if necessary. For example, to get a refresh token from Google for offline access, use
`https://accounts.google.com/o/oauth2/auth?access_type=offline&approval_prompt=force`.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"

AND

"Manage Auth. Providers"

In this example, the additional `approval_prompt` parameter is necessary to ask the user to accept the refresh action, so that Google continues to provide refresh tokens after the first one.

- b. Enter the `Token Endpoint URL` from Facebook. For example, `https://www.facebook.com/v2.2/dialog/oauth`. If you leave this field blank, Salesforce uses the version of the Facebook API that your application uses.
- c. Enter the `User Info Endpoint URL` to change the values requested from Facebook's profile API. See https://developers.facebook.com/docs/facebook-login/permissions/v2.0#reference-public_profile for more information on fields. The requested fields must correspond to requested scopes. If you leave this field blank, Salesforce uses the version of the Facebook API that your application uses.
- d. `Default Scopes` to send along with the request to the authorization endpoint. Otherwise, the hardcoded defaults for the provider type are used (see [Facebook's developer documentation](#) for these defaults).
For more information, see [Using the Scope Parameter](#)

- e. `Custom Error URL` for the provider to use to report any errors.
- f. `Custom Logout URL` to provide a specific destination for users after they log out, if they authenticated using the single sign-on flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
- g. Select an already existing Apex class as the `Registration Handler class` or click `Automatically create a registration handler template` to create an Apex class template for the registration handler. You must edit this class and modify the default content before using it.

Note: You must specify a registration handler class for Salesforce to generate the `Single Sign-On Initialization URL`.

- h. Select the user that runs the Apex handler class for **Execute Registration As**. The user must have "Manage Users" permission. A user is required if you selected a registration handler class or are automatically creating one.
- i. To use a portal with your provider, select the portal from the Portal drop-down list.
- j. Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only, and does not appear on the login page for your Salesforce organization or custom domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

You can specify a path to your own image, or copy the URL for one of our sample icons into the field.

9. Click **Save**.

Be sure to note the generated `Auth. Provider Id` value. You must use it with the `Auth.AuthToken` Apex class.

Several client configuration URLs are generated after defining the authentication provider:

- `Test-Only Initialization URL`: Administrators use this URL to ensure the third-party provider is set up correctly. The administrator opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `Single Sign-On Initialization URL`: Use this URL to perform single sign-on into Salesforce from a third party (using third-party credentials). The end user opens this URL in a browser, and signs in to the third party. This then either creates a new user for them, or updates an existing user, and then signs them into Salesforce as that user.
- `Existing User Linking URL`: Use this URL to link existing Salesforce users to a third-party account. The end user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- `Oauth-Only Initialization URL`: Use this URL to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token; this flow does not provide for future single sign-on functionality.

- `Callback URL`: Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider has to redirect to the `Callback URL` with information for each of the above client configuration URLs.

The client configuration URLs support additional request parameters that enable you to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Updating Your Facebook Application

After defining the Facebook authentication provider in your Salesforce organization, go back to Facebook and update your application to use the `Callback URL` as the Facebook `Website Site URL`.

Testing the Single Sign-On Connection

In a browser, open the `Test-Only Initialization URL` on the Auth. Provider detail page. It should redirect you to Facebook and ask you to sign in. Upon doing so, you are asked to authorize your application. After you authorize, you are redirected back to Salesforce.

- [About External Authentication Providers](#)

Configure a Google Authentication Provider

Let users log in to a Salesforce organization using their Google accounts.

To use Google as an authentication provider:

1. [Set up](#) a Google application, making Salesforce the application domain.
2. [Define](#) a Google authentication provider in your Salesforce organization.
3. [Update](#) your Google application to use the `Callback URL` generated by Salesforce as the `Google Website Site URL`.
4. [Test](#) the connection.

Set Up a Google Application

Before you can configure Google for your Salesforce organization, you must set up an application in Google:

 **Note:** You can skip this step by allowing Salesforce to use its own default application. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).

1. Go to the [Google website](#) and create a new application.
2. Modify the application settings and set the Application Domain to Salesforce.
3. Note the Application ID and the Application Secret.

Define a Google Provider in Your Salesforce Organization

You need the Google Application ID and Application Secret to set up a Google provider in your Salesforce organization.

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"

AND

"Manage Auth. Providers"

 **Note:** You can skip specifying these key values in the provider setup by allowing Salesforce to manage the values for you. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).

1. From Setup, enter *Auth. Providers* in the *Quick Find* box, then select **Auth. Providers**.
2. Click **New**.
3. Select Google for the *Provider Type*.
4. Enter a *Name* for the provider.
5. Enter the *URL Suffix*, which is used in the client configuration URLs. For example, if the URL suffix of your provider is "MyGoogleProvider", your single sign-on URL is similar to:
`https://login.salesforce.com/auth/sso/00Dx0000000001/MyGoogleProvider.`
6. Use the Application ID from Google for the *Consumer Key* field.
7. Use the Application Secret from Google for the *Consumer Secret* field.
8. Optionally, set the following fields.
 - a. *Authorize Endpoint URL* to specify the base authorization URL from Google. For example, `https://accounts.google.com/o/oauth2/authorize`. The URL must start with `https://accounts.google.com/o/oauth2`.
 -  **Tip:** You can add query string parameters to the base URL, if necessary. For example, to get a refresh token from Google for offline access, use `https://accounts.google.com/o/oauth2/auth?access_type=offline&approval_prompt=force`. The `approval_prompt` parameter is necessary to ask the user to accept the refresh action so that Google continues to provide refresh tokens after the first one.
 - b. *Token Endpoint URL* to specify the OAuth token URL from Google. For example, `https://accounts.google.com/o/oauth2/accessToken`. The URL must start with `https://accounts.google.com/o/oauth2`.
 - c. *User Info Endpoint URL* to change the values requested from Google's profile API. The URL must start with `https://www.googleapis.com/oauth2/`.
 - d. *Default Scopes* to send with the request to the authorization endpoint. Otherwise, the hardcoded defaults for the provider type are used. For the defaults, see [Google's developer documentation](#).
For more information, see [Using the Scope Parameter](#).
 - e. *Custom Error URL* to specify a URL for the provider to report errors.
 - f. *Custom Logout URL* to provide a specific destination for users after they log out, if they authenticated using the single sign-on flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
 - g. To create an Apex class template for the registration handler, select an existing Apex class as the *Registration Handler* class or click *Automatically create a registration handler template*. Edit this class and modify the default content before using it.

 **Note:** Specify a registration handler class for Salesforce to generate the *Single Sign-On Initialization URL*.
 - h. Select the user that runs the Apex handler class for **Execute Registration As**. The user must have "Manage Users" permission. You must specify a user if you selected a registration handler class or are automatically creating one.
 - i. To use a portal with your provider, select the portal from the *Portal* list.

- j. Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only, and does not appear on the login page for your Salesforce organization or custom domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

You can specify a path to your own image, or copy the URL for one of our sample icons into the field.

9. Click **Save**.

Note the generated `Auth. Provider Id` value. You use it with the `Auth.AuthToken` Apex class.

Several client configuration URLs are generated after defining the authentication provider:

- `Test-Only Initialization URL`: Administrators use this URL to ensure that the third-party provider is set up correctly. The administrator opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `Single Sign-On Initialization URL`: Use this URL to perform single sign-on into Salesforce from a third party (using third-party credentials). The end user opens this URL in a browser and signs in to the third party. The third party then either creates a user or updates an existing user, and then signs them into Salesforce as that user.
- `Existing User Linking URL`: Use this URL to link existing Salesforce users to a third-party account. The end user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- `OAuth-Only Initialization URL`: Use this URL to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token; this flow does not provide for future single sign-on functionality.
- `Callback URL`: Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider redirects to the `Callback URL` with information for each client configuration URL.

The client configuration URLs support other request parameters that enable you to direct users to log in to specific sites, obtain customized permissions from a third party, or go to a location after authenticating.

Update Your Google Application

After defining the Google authentication provider in your Salesforce organization, go back to Google and update your application to use the `Callback URL` as the `Google Website Site URL`.

Test the Single Sign-On Connection

In a browser, open the `Test-Only Initialization URL` on the Auth. Provider detail page. It redirects you to Google and asks you to sign in. You're then asked to authorize your application. After you authorize, you're redirected to Salesforce.

Configure a Janrain Authentication Provider

Setting up a Janrain authentication provider is slightly different from setting up other providers. You don't use the Single Sign-On Initialization URL that you obtain after registering your provider with Salesforce to start the flow. Instead you use Janrain's login widget that's deployed on your site.

To set up your Janrain provider:

1. [Register](#) your application with Janrain and get an `apiKey`.
2. [Define](#) the Janrain authentication provider in your Salesforce organization.
3. [Get](#) the login widget code from Janrain.
4. [Set up](#) a site that calls the login widget code in your Salesforce organization.

Register Your Application

You must sign up for a Janrain account from the [Janrain website](#). Once you have your Janrain account, you need the `apiKey`.

1. Click **Deployment > Sign-in for Web > Handle Tokens**.
2. Copy the `apiKey`. You need this when creating the Janrain provider in your Salesforce organization.
3. Add `Salesforce` to the Janrain domain whitelist in your Janrain account at **Deployment > Application Settings > Domain Whitelist**.

Define the Janrain Provider in your Salesforce Organization

You need the Janrain `apiKey` to create a Janrain provider in your Salesforce organization.

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **New**.
3. Select Janrain for the `Provider Type`.
4. Enter a `Name` for the provider.
5. Enter the `URL Suffix`. This is used in the `Callback URL`. For example, if the URL suffix of your provider is "MyJanrainProvider", your `Callback URL` is similar to `https://login.salesforce.com/services/authcallback/00D300000007CvvEAE/MyJanrainProvider`.
6. Use the Janrain `apiKey` value for the `Consumer Secret`.
7. Optionally enter a `Custom Error URL` for the provider to use to report any errors.
8. Optionally, enter a `Custom Logout URL` to provide a specific destination for users after they log out, if they authenticated using the single sign-on flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
9. Select an already existing Apex class as the `Registration Handler` class or click **Automatically create a registration handler template** to create the Apex class template for the registration handler. You must edit this class to modify the default content before using it.

 **Note:** You must specify a registration handler class for Salesforce to use single sign-on.

- Unlimited
- Developer

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"

AND

"Manage Auth. Providers"

10. Select the user that runs the Apex handler class for **Execute Registration As**. The user must have “Manage Users” permission. A user is required if you selected a registration handler class or are automatically creating one.
11. To use a portal with your provider, select the portal from the Portal drop-down list.
12. Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only, and does not appear on the login page for your Salesforce organization or custom domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.
You can specify a path to your own image, or copy the URL for one of our sample icons into the field.

13. Click **Save**.

Note the value of the generated `Callback URL`. You need it to complete the Janrain setup.

Several client configuration parameters are available after configuring Janrain as the authentication provider. Use these for the `flowtype` value in the `Callback URL` with your Janrain login widget:

- `test`: Use this parameter to make sure the third-party provider is set up correctly. The administrator configures a Janrain widget to use `flowtype=test`, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `link`: Use this parameter to link existing Salesforce users to a third-party account. The end user goes to a page with a Janrain widget configured to use `flowtype=link`, signs in to the third party, signs in to Salesforce, and approves the link.
- `sso`: Use this parameter to perform single sign-on into Salesforce from a third party (using third-party credentials). The end user goes to a page with a Janrain widget configured to use `flowtype=sso`, and signs in to the third party. This then either creates a new user for them, or updates an existing user, and then signs them into Salesforce as that user.

The client configuration URLs support additional request parameters that enable you to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Get the Login Widget Code from Janrain

You need to get the login widget code from Janrain for your Salesforce organization.

1. From your Janrain account, click **Application > Sign-in for Web > Get the Code**.
2. Enter the `Callback URL` value from your Janrain provider information in your Salesforce organization along with the query parameter `flowtype=sso` as the token URL. For example,

```
https://login.salesforce.com/services/authcallback/00DD#####/JanrainApp?flowtype=sso
```

For a custom domain created with My Domain, replace `login.salesforce.com` with your My Domain name.

For a community, add the `community` parameter and pass it to the login widget as the token URL. For example,

```
janrain.settings.tokenUrl='https://login.salesforce.com/services/authcallback/00DD#####/JanrainApp'+ '?flowtype=sso&community='+encodeURIComponent('https://acme.force.com/customers');
```

Create a Site to Call the Login Widget

1. Enable Sites.
2. Create a page and copy the login widget code to the page.

3. Create a new site and specify the page you just created as the home page for the site.

Configure a Salesforce Authentication Provider

You can use a connected app as an authentication provider. You must complete these steps:

1. [Define a Connected App.](#)
2. [Define the Salesforce authentication provider in your organization.](#)
3. [Test the connection.](#)

Define a Connected App

Before you can configure a Salesforce provider for your Salesforce organization, you must define a connected app that uses single sign-on. From Setup, enter `Apps` in the `Quick Find` box, then select **Apps**.

After you finish defining a connected app, save the values from the `Consumer Key` and `Consumer Secret` fields.

 **Note:** You can skip this step by allowing Salesforce to use its own default application. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).

Define the Salesforce Authentication Provider in your Organization

You need the values from the `Consumer Key` and `Consumer Secret` fields of the connected app definition to set up the authentication provider in your organization.

 **Note:** You can skip specifying these key values in the provider setup by allowing Salesforce to manage the values for you. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **New**.
3. Select Salesforce for the `Provider Type`.
4. Enter a `Name` for the provider.
5. Enter the `URL Suffix`. This is used in the client configuration URLs. For example, if the URL suffix of your provider is "MySFDCProvider", your single sign-on URL is similar to `https://login.salesforce.com/auth/sso/00Dx000000000001/MySFDCProvider`.
6. Paste the value of `Consumer Key` from the connected app definition into the `Consumer Key` field.
7. Paste the value of `Consumer Secret` from the connected app definition into the `Consumer Secret` field.
8. Optionally, set the following fields.
 - a. `Authorize Endpoint URL` to specify an OAuth authorization URL.

EDITIONS

- Developer

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"

AND

"Manage Auth. Providers"

For the `Authorize Endpoint URL`, the host name can include a sandbox or custom domain name (created using My Domain), but the URL must end in `.salesforce.com`, and the path must end in `/services/oauth2/authorize`. For example, `https://test.salesforce.com/services/oauth2/authorize`.

- b.** `Token Endpoint URL` to specify an OAuth token URL.

For the `Token Endpoint URL`, the host name can include a sandbox or custom domain name (created using My Domain), but the URL must end in `.salesforce.com`, and the path must end in `/services/oauth2/token`. For example, `https://test.salesforce.com/services/oauth2/token`.

- c.** `Default Scopes` to send along with the request to the authorization endpoint. Otherwise, the hardcoded default is used. For more information, see [Using the Scope Parameter](#).

 **Note:** When editing the settings for an existing Salesforce authentication provider, you might have the option to select a checkbox to include the organization ID for third-party account links. For Salesforce authentication providers set up in the Summer '14 release and earlier, the user identity provided by an organization does not include the organization ID. So, the destination organization can't differentiate between users with the same user ID from two sources (such as two sandboxes). Select this checkbox if you have an existing organization with two users (one from each sandbox) mapped to the same user in the destination organization, and you want to keep the identities separate. Otherwise, leave this checkbox unselected. After enabling this feature, your users need to re-approve the linkage to all of their third party links. These links are listed in the Third-Party Account Links section of a user's detail page. Salesforce authentication providers created in the Winter '15 release and later have this setting enabled by default and do not display the checkbox.

- d.** `Custom Error URL` for the provider to use to report any errors.

- e.** `Custom Logout URL` to provide a specific destination for users after they log out, if they authenticated using the single sign-on flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.

- 9.** Select an already existing Apex class as the `Registration Handler` class or click `Automatically create a registration handler template` to create the Apex class template for the registration handler. You must edit this template class to modify the default content before using it.

 **Note:** You must specify a registration handler class for Salesforce to generate the `Single Sign-On Initialization URL`.

- 10.** Select the user that runs the Apex handler class for `Execute Registration As`. The user must have "Manage Users" permission. A user is required if you selected a registration handler class or are automatically creating one.

- 11.** To use a portal with your provider, select the portal from the Portal drop-down list.

- 12.** Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only, and does not appear on the login page for your Salesforce organization or custom domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

You can specify a path to your own image, or copy the URL for one of our sample icons into the field.

- 13.** Click `Save`.

Note the value of the Client Configuration URLs. You need the `Callback URL` to complete the last step, and you use the `Test-Only Initialization URL` to check your configuration. Also be sure to note the `Auth. Provider Id` value because you must use it with the `Auth.AuthToken` Apex class.

- 14.** Return to the connected app definition that you created earlier (on the Apps page in Setup, click the connected app name) and paste the value of `Callback URL` from the authentication provider into the `Callback URL` field.

Several client configuration URLs are generated after defining the authentication provider:

- `Test-Only Initialization URL`: Administrators use this URL to ensure the third-party provider is set up correctly. The administrator opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `Single Sign-On Initialization URL`: Use this URL to perform single sign-on into Salesforce from a third party (using third-party credentials). The end user opens this URL in a browser, and signs in to the third party. This then either creates a new user for them, or updates an existing user, and then signs them into Salesforce as that user.
- `Existing User Linking URL`: Use this URL to link existing Salesforce users to a third-party account. The end user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- `OAuth-Only Initialization URL`: Use this URL to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token; this flow does not provide for future single sign-on functionality.
- `Callback URL`: Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider has to redirect to the `Callback URL` with information for each of the above client configuration URLs.

The client configuration URLs support additional request parameters that enable you to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Test the Single Sign-On Connection

In a browser, open the `Test-Only Initialization URL` on the Auth. Provider detail page. Both the authorizing organization and target organization must be in the same environment, such as production or sandbox.

SEE ALSO:

[Using Request Parameters with Client Configuration URLs](#)

[About External Authentication Providers](#)

Configure an OpenID Connect Authentication Provider

You can use any third-party Web application that implements the server side of the OpenID Connect protocol, such as Amazon, Google, and PayPal, as an authentication provider.

You must complete these steps to configure an OpenID authentication provider:

1. [Register](#) your application, making Salesforce the application domain.
2. [Define](#) an OpenID Connect authentication provider in your Salesforce organization.
3. [Update](#) your application to use the `Callback URL` generated by Salesforce as the callback URL.
4. [Test](#) the connection.

Register an OpenID Connect Application

Before you can configure a Web application for your Salesforce organization, you must register it with your service provider. The process varies depending on the service provider. For example, to register a Google app, [Create an OAuth 2.0 Client ID](#).

1. Register your application on your service provider's website.
2. Modify the application settings and set the application domain (or `Home Page URL`) to Salesforce.
3. Note the Client ID and Client Secret, as well as the Authorize Endpoint URL, Token Endpoint URL, and User Info Endpoint URL, which should be available in the provider's documentation. Here are some common OpenID Connect service providers:
 - [Amazon](#)
 - [Google](#)
 - [PayPal](#)

Define an OpenID Connect Provider in Your Salesforce Organization

You need some information from your provider (the Client ID and Client Secret, as well as the Authorize Endpoint URL, Token Endpoint URL, and User Info Endpoint URL) to configure your application in your Salesforce organization.

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **New**.
3. Select OpenID Connect for the `Provider Type`.
4. Enter a `Name` for the provider.
5. Enter the `URL Suffix`. This is used in the client configuration URLs. For example, if the URL suffix of your provider is "MyOpenIDConnectProvider," your single sign-on URL is similar to:
`https://login.salesforce.com/auth/sso/00Dx0000000001/MyOpenIDConnectProvider`.
6. Use the Client ID from your provider for the `Consumer Key` field.
7. Use the Client Secret from your provider for the `Consumer Secret` field.
8. Enter the base URL from your provider for the `Authorize Endpoint URL`.

Tip: You can add query string parameters to the base URL, if necessary. For example, to get a refresh token from Google for offline access, use

`https://accounts.google.com/o/oauth2/auth?access_type=offline&approval_prompt=force`.

To edit the settings:

- "Customize Application"

AND

"Manage Auth. Providers"

In this specific case, the additional `approval_prompt` parameter is necessary to ask the user to accept the refresh action, so Google will continue to provide refresh tokens after the first one.

9. Enter the `Token Endpoint URL` from your provider.
10. Optionally, set the following fields.
 - a. `User Info Endpoint URL` from your provider.
 - b. `Token Issuer`. This value identifies the source of the authentication token in the form `https: URL`. If this value is specified, the provider must include an `id_token` value in the response to a token request. The `id_token` value is not required for a refresh token flow (but will be validated by Salesforce if provided).
 - c. `Default Scopes` to send along with the request to the authorization endpoint. Otherwise, the hardcoded defaults for the provider type are used (see the [OpenID Connect developer documentation](#) for these defaults).
For more information, see [Using the Scope Parameter](#).

11. You can select `Send access token in header` to have the token sent in a header instead of a query string.

12. Optionally, set the following fields.
 - a. `Custom Error URL` for the provider to use to report any errors.
 - b. `Custom Logout URL` to provide a specific destination for users after they log out, if they authenticated using the single sign-on flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
 - c. Select an existing Apex class as the `Registration Handler class` or click `Automatically create a registration handler template` to create an Apex class template for the registration handler. You must edit this class and modify the default content before using it.

 **Note:** You must specify a registration handler class for Salesforce to generate the `Single Sign-On Initialization URL`.

- d. Select the user that runs the Apex handler class for **Execute Registration As**. The user must have the “Manage Users” permission. A user is required if you selected a registration handler class or are automatically creating one.
- e. To use a portal with your provider, select the portal from the Portal drop-down list.
- f. Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only, and does not appear on the login page for your Salesforce organization or custom domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

You can specify a path to your own image, or copy the URL for one of our sample icons into the field.

13. Click **Save**.

Be sure to note the generated `Auth. Provider Id` value. You must use it with the `Auth.AuthToken` Apex class.

Several client configuration URLs are generated after defining the authentication provider:

- `Test-Only Initialization URL`: Administrators use this URL to ensure the third-party provider is set up correctly. The administrator opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `Single Sign-On Initialization URL`: Use this URL to perform single sign-on into Salesforce from a third party (using third-party credentials). The end user opens this URL in a browser, and signs in to the third party. This then either creates a new user for them, or updates an existing user, and then signs them into Salesforce as that user.
- `Existing User Linking URL`: Use this URL to link existing Salesforce users to a third-party account. The end user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.

- `OAuth-Only Initialization URL`: Use this URL to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token; this flow does not provide for future single sign-on functionality.
- `Callback URL`: Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider has to redirect to the `Callback URL` with information for each of the above client configuration URLs.

The client configuration URLs support additional request parameters that enable you to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Update Your OpenID Connect Application

After defining the authentication provider in your Salesforce organization, go back to your provider and update your application's `Callback URL` (also called the `Authorized Redirect URI` for Google applications and `Return URL` for PayPal).

Test the Single Sign-On Connection

In a browser, open the `Test-Only Initialization URL` on the Auth. Provider detail page. It should redirect you to your provider's service and ask you to sign in. Upon doing so, you're asked to authorize your application. After you authorize, you're redirected back to Salesforce.

Configure a Microsoft® Access Control Service Authentication Provider

You can use Microsoft Access Control Service as an authentication provider, using the OAuth protocol. Authorization is typically done by a Microsoft Office 365 service like SharePoint® Online.

Salesforce supports authentication from a Microsoft Access Control Service using only OAuth. Single sign-on authentication from a Microsoft authentication provider is not supported.

You must complete these steps to configure a Microsoft Access Control Service authentication provider:

1. [Define](#) a Microsoft Access Control Service authentication provider in your Salesforce organization.
2. [Register](#) your application with Microsoft, making Salesforce the application domain.
3. [Edit](#) your Microsoft Access Control Service authentication provider details in Salesforce to use the `Consumer Key` and `Consumer Secret` generated when you registered your application with Microsoft.
4. [Test](#) the connection.

Define a Microsoft Access Control Service Authentication Provider in Your Salesforce Organization

Before you can register an application in SharePoint Online or the Microsoft Seller Dashboard, you need the callback URL that will be used to redirect the authorized user to Salesforce.

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **New**.
3. Select Microsoft Access Control Service for the `Provider Type`.
4. Enter a `Name` for the provider.
5. Enter the `URL Suffix`. This is used in the client configuration URLs. For example, if the URL suffix of your provider is "MyMicrosoftACSPProvider," your callback URL is similar to:

To edit the settings:

- "Customize Application"

AND

"Manage Auth. Providers"

`https://login.salesforce.com/services/authcallback/00Dx0000000001/MyMicrosoftACSPProvider`

6. Enter a placeholder value for the `Consumer Key` field (you'll edit this value after your application is registered with Microsoft).
7. Enter a placeholder value for the `Consumer Secret` field (you'll edit this value after your application is registered with Microsoft).
8. Enter the base URL from your provider for the `Authorize Endpoint URL`. For example, SharePoint Online uses the following form:

`https://<sharepoint online host name>/_layouts/15/OAuthAuthorize.aspx`

9. Enter the `Token Endpoint URL` in the following form.

`https://accounts.accesscontrol.windows.net/<tenant>/tokens/OAuth/2?resource=<sender ID>/<sharepoint online host name>&<tenant>`

- `<tenant>` is the Office 365 tenant name ending with `.onmicrosoft.com` or the corresponding tenant globally unique identifier (GUID).
- `<sender ID>` is the identifier for the sender of the token. For example, SharePoint uses `00000003-0000-0ff1-ce00-000000000000`

10. Optionally, set the following fields.

- `Default Scopes` to send along with the request to the authorization endpoint. See <http://msdn.microsoft.com/en-us/library/jj687470.aspx#Scope> for more information about scopes for SharePoint Online. Or [Using the Scope Parameter](#) for more information about using scopes with Salesforce.
- `Custom Error URL` for the provider to use to report any errors.
- `Custom Logout URL` to provide a specific destination for users after they log out, if they authenticated using the single sign-on flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
- To use a portal with your provider, select the portal from the `Portal` drop-down list. If you have a portal set up for your organization, this option can redirect the login request to the portal login page. Otherwise, leave as `None`.
- Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only, and does not appear on the login page for your Salesforce organization or custom domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

You can specify a path to your own image, or copy the URL for one of our sample icons into the field.

11. Click **Save**.

Be sure to note the generated `Auth. Provider Id` value. You can use it with the [Auth.AuthToken Apex class](#).

Several client configuration URLs are generated after defining the authentication provider:

- `Test-Only Initialization URL`: Administrators use this URL to ensure the third-party provider is set up correctly. The administrator opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `Oauth-Only Initialization URL`: Use this URL to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token; this flow does not provide for future single sign-on functionality.
- `Callback URL`: Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider has to redirect to the `Callback URL` with information for each of the above client configuration URLs.

The client configuration URLs support additional request parameters that enable you to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Register Your Application with Microsoft

Before you can configure an application for your Salesforce organization, you must get an application identity using one of the options provided by Microsoft. For example see [Guidelines for registering apps for SharePoint 2013](#) for details about registering a remote application for SharePoint.

1. Register your application using one of the options provided by Microsoft.
2. Modify the application settings and set the redirect URI to the authentication provider's `Callback URL`.
3. Note the `Client ID` and `Client Secret`.
4. Click **Save**.

Edit Your Microsoft Access Control Service Authentication Provider Details

After registering your application with Microsoft, go back to your Microsoft Access Control Service authentication provider details, and update the `Consumer Key` and `Consumer Secret` with the values provided by Microsoft.

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **Edit** next to the name of your Microsoft Access Control Service authentication provider.
3. Enter the `Client ID` value provided by Microsoft in the `Consumer Key` field.
4. Enter the `Client Secret` value provided by Microsoft in the `Consumer Secret` field.

Test the Connection

In a browser, open the `Test-Only Initialization URL` on the Auth. Provider detail page. It should redirect you to your provider's service and ask you to sign in. Upon doing so, you're asked to authorize your application. After you authorize, you're redirected back to Salesforce.

Configure a LinkedIn Authentication Provider

Let users log in to a Salesforce organization using their LinkedIn account.

Complete these steps to configure LinkedIn as an authentication provider.

1. [Decide which scopes \(user details\) to get from LinkedIn.](#)
2. [Set up a LinkedIn application.](#)
3. [Define a LinkedIn Provider in your Salesforce organization](#) and establish a registration handler.
4. [Edit the registration handler.](#)
5. [Update your LinkedIn application](#) to use the Callback URL generated by Salesforce as an entry in the LinkedIn OAuth 2.0 Redirect URLs.
6. [Test the single sign-on connection.](#)

Decide which scopes (user details) to get from LinkedIn

Scopes determine the information you get from LinkedIn about a user during the authorization process. You can request some basic information, such as username and a photo URL, or you can get more specific information, such as an address, phone number, contact list, and more. The user approves the exchange of information before it is given.

When you set up LinkedIn as an Auth. Provider, you can set the scopes in three different places: in the LinkedIn application settings, in the Salesforce Auth. Provider settings, or in a query to LinkedIn's user info endpoint using field selectors. Consider the following as you decide where to specify the scopes, and the values to use.

- You can leave this value blank in the LinkedIn and Salesforce settings. The default value is `r_basicprofile`, which provides only the most basic user information as defined by LinkedIn.
- Salesforce requires the email address for users.
- Refer to the [LinkedIn Authentication documentation](#) for a list of supported values and their meaning, or the [LinkedIn Field Selectors page](#) for information about requesting scopes using a URL.
- If you set the Default Scopes in the Salesforce Auth. Provider settings, that value overrides the value in the LinkedIn Application settings.
- Separate multiple scope values in the LinkedIn Application settings or the Salesforce Auth. Provider settings with a space, only, such as `r_basicprofile r_emailaddress`.
- If you use LinkedIn Field Selectors with a URL, separate multiple values with a comma, only, such as `https://api.linkedin.com/v1/people/~:(id,formatted-name,first-name,last-name,public-profile-url,email-address)`.

Set up a LinkedIn application

Before you can configure LinkedIn for your Salesforce organization, set up an application in LinkedIn.

 **Note:** You can skip this step by allowing Salesforce to use its own default application. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).

1. Sign in to your developer account for the [LinkedIn website](#).
2. Click the username at the top and select **API Keys**.
3. Click **Add New Application**.
4. Enter the application settings.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"

AND

"Manage Auth. Providers"

5. Note the API Key and Secret Key of the new application. You need these later in Salesforce.
6. Optionally, enter a LinkedIn supported scope value or several space-separated values.
For more information about using scopes with LinkedIn, see [Decide which scopes \(user details\) to get from LinkedIn](#).

Define a LinkedIn Provider in your Salesforce organization

You need the LinkedIn `API Key` and `Secret Key` to set up a LinkedIn provider in your Salesforce organization.

 **Note:** You can skip specifying these key values in the provider setup by allowing Salesforce to manage the values for you. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **New**.
3. Select LinkedIn for the `Provider Type`.
4. Enter a `Name` for the provider.
5. Enter the `URL Suffix`. This is used in the client configuration URLs. For example, if the URL suffix of your provider is "MyLinkedInProvider," your single sign-on URL is similar to:
`https://login.salesforce.com/services/sso/00Dx0000000001/MyLinkedInProvider`
6. Use the `API Key` from LinkedIn for the `Consumer Key` field.
7. Use the `Secret Key` from LinkedIn for the `Consumer Secret` field.
8. Optionally, set the following fields.
 - a. `Authorize Endpoint URL` to enter the base authorization URL from LinkedIn. For example, `https://www.linkedin.com/uas/oauth2/authorization/auth`. The URL must start with `https://www.linkedin.com/uas/oauth2/authorization`.

 **Tip:** You can add query string parameters to the base URL, if necessary. For example, to get a refresh token from Google for offline access, use `https://accounts.google.com/o/oauth2/auth?access_type=offline&approval_prompt=force`. The `approval_prompt` parameter is necessary to ask the user to accept the refresh action so that Google continues to provide refresh tokens after the first one.
 - b. `Token Endpoint URL` to enter the OAuth token URL from LinkedIn. For example, `https://www.linkedin.com/uas/oauth2/accessToken/token`. The URL must start with `https://www.linkedin.com/uas/oauth2/accessToken`.
 - c. `User Info Endpoint URL` to change the values requested from LinkedIn's profile API. For more information, see <https://developer.linkedin.com/documents/profile-fields>. The URL must start with `https://api.linkedin.com/v1/people/~`, and the requested fields must correspond to requested scopes.
 - d. `Default Scopes` to enter a supported value or several space-separated values that represent the information you get from LinkedIn. For more information, see [Decide which scopes \(user details\) to get from LinkedIn](#).
 - e. `Custom Error URL` for the provider to use to report any errors.
 - f. `Custom Logout URL` to provide a specific destination for users after they log out, if they authenticated using the single sign-on flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
 - g. Click **Automatically create a registration handler template** to create an Apex class template for the [registration handler](#), unless you already have one. Edit this class later, and modify the default content before using it.

 **Note:** Specify a registration handler class for Salesforce to generate the Single Sign-On Initialization URL.

- h. Select the user that runs the Apex handler class for `Execute Registration As`. The user must have the “Manage Users” permission. A user is required if you selected a registration handler class or are automatically creating one.
 - i. To use a portal for LinkedIn users, select the portal from the Portal drop-down list.
9. Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only, and does not appear on the login page for your Salesforce organization or custom domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

You can specify a path to your own image, or copy the URL for one of our sample icons into the field.

10. Click **Save**.

Several client configuration URLs are generated after defining the authentication provider:

- `Test-Only Initialization URL`: Administrators use this URL to ensure the third-party provider is set up correctly. The administrator opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `Single Sign-On Initialization URL`: Use this URL to perform single sign-on into Salesforce from a third party (using third-party credentials). The end user opens this URL in a browser, and signs in to the third party. This then either creates a new user for them, or updates an existing user, and then signs them into Salesforce as that user.
- `Existing User Linking URL`: Use this URL to link existing Salesforce users to a third-party account. The end user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- `OAuth-Only Initialization URL`: Use this URL to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token; this flow does not provide for future single sign-on functionality.
- `Callback URL`: Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider has to redirect to the `Callback URL` with information for each of the above client configuration URLs.

The client configuration URLs support additional request parameters that enable you to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Edit the Registration Handler

1. From Setup, enter `Apex Classes` in the `Quick Find` box, then select **Apex Classes**.
2. Edit the auto-created Apex registration handler (or the existing registration handler if you had one) to map fields between LinkedIn and Salesforce

 **Note:** The default profile query for LinkedIn only retrieves the following fields: first-name, last-name, headline, profile URL. The default registration handler requires email. Either remove the email requirement from the registration handler or change the desired scopes in [Decide which scopes \(user details\) to get from LinkedIn](#) to include the email address, and any other fields you want in the registration handler.

The following is an example Apex registration handler specifically for a LinkedIn application as the Auth. Provider. This registration handler assumes the requested scopes include `r_basicprofile` and `r_emailaddress`. It also assumes the users are logging in to a customer portal.

```
//TODO:This auto-generated class includes the basics for a Registration
//Handler class. You will need to customize it to ensure it meets your needs and
//the data provided by the third party.
global class LinkedInRegHandler implements Auth.RegistrationHandler {
    //Creates a Standard salesforce or a community user
    global User createUser(Id portalId, Auth.UserData data) {
        if (data.attributeMap.containsKey('sfdc_networkid')) {
```

```

//We have a community id, so create a user with community access
//TODO: Get an actual account
Account a =[SELECT Id FROM account WHERE name = 'LinkedIn Account'];
Contact c = new Contact();
c.accountId = a.Id;
c.email = data.email;
c.firstName = data.firstName;
c.lastName = data.lastName;
insert(c);
//TODO: Customize the username and profile. Also check that the username
//doesn't already exist and possibly ensure there are enough org licenses
//to create a user. Must be 80 characters or less.
User u = new User();
Profile p =[SELECT Id FROM profile WHERE name = 'Customer Portal Manager'];

u.username = data.firstName + '@sfdc.linkedin.com';
u.email = data.email;
u.lastName = data.lastName;
u.firstName = data.firstName;
String alias = data.firstName;
//Alias must be 8 characters or less
if (alias.length() > 8) {
    alias = alias.substring(0, 8);
}
u.alias = alias;
u.languageLocaleKey = UserInfo.getLocale();
u.localesidkey = UserInfo.getLocale();
u.emailEncodingKey = 'UTF-8';
u.timeZoneSidKey = 'America/Los_Angeles';
u.profileId = p.Id;
u.contactId = c.Id;
return u;
} else {
//This is not a community, so create a regular standard user
User u = new User();
Profile p =[SELECT Id FROM profile WHERE name = 'Standard User'];
//TODO: Customize the username. Also check that the username doesn't
//already exist and possibly ensure there are enough org licenses
//to create a user. Must be 80 characters or less
u.username = data.firstName + '@salesforce.com';
u.email = data.email;
u.lastName = data.lastName;
u.firstName = data.firstName;
String alias = data.firstName;
//Alias must be 8 characters or less
if (alias.length() > 8) {
    alias = alias.substring(0, 8);
}
u.alias = alias;
u.languageLocaleKey = UserInfo.getLocale();
u.localesidkey = UserInfo.getLocale();
u.emailEncodingKey = 'UTF-8';
u.timeZoneSidKey = 'America/Los_Angeles';
u.profileId = p.Id;

```

```

        return u;
    }
}
//Updates the user's first and last name
global void updateUser(Id userId, Id portalId, Auth.UserData data) {
    User u = new User(id = userId);
    u.lastName = data.lastName;
    u.firstName = data.firstName;
    update(u);
}
}

```

See the [RegistrationHandler Interface documentation](#) for more information and examples.

Update Your LinkedIn Application

After you define the LinkedIn authentication provider in your Salesforce organization, go back to LinkedIn and update your application to use the Salesforce-generated `Callback URL` as the LinkedIn OAuth 2.0 `Redirect URLs` value.

Test the Single Sign-on Connection

In a browser, open the `Test-Only Initialization URL` on the Auth. Provider detail page. It should redirect you to LinkedIn and ask you to sign in. Upon doing so, you are asked to authorize your application. After you authorize, you are redirected back to Salesforce.

Configure a Twitter Authentication Provider

Let users log in to a Salesforce organization with their Twitter accounts.

Complete these steps to configure Twitter as an authentication provider.

1. [Set up a Twitter application.](#)
2. [Define a Twitter Provider in your Salesforce organization](#) and establish a registration handler.
3. [Edit the registration handler.](#)
4. [Update your Twitter application](#) to use the Callback URL generated by Salesforce as an entry in the Twitter application settings.
5. [Test the single sign-on connection.](#)

Set up a Twitter Application

Before you can configure Twitter for your Salesforce organization, you must set up an application in Twitter.

-  **Note:** You can skip this step by allowing Salesforce to use its own default application. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).
1. Sign in to your developer account for the [Twitter website](#).
 2. Click on the user icon at the top and select **My Applications** (or go to apps.twitter.com).
 3. Click **Create New App**.
 4. Enter the application settings.

- AND
- "Manage Auth. Providers"

5. In the API Keys, note the `API key` and `API secret` of the new application, you'll need these later in Salesforce.

Define a Twitter Provider in your Salesforce organization

You need the Twitter `API key` and `API Secret` from your Twitter application to set up a Twitter provider in your Salesforce organization.

 **Note:** You can skip specifying these key values in the provider setup by allowing Salesforce to manage the values for you. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **New**.
3. Select Twitter for the `Provider Type`.
4. Enter a `Name` for the provider.
5. Enter the `URL Suffix`. This is used in the client configuration URLs. For example, if the URL suffix of your provider is "MyTwitterProvider," your single sign-on URL is similar to:

```
https://login.salesforce.com/services/sso/00Dx0000000001/MyTwitterProvider
```

6. Use the `API key` from Twitter for the `Consumer Key` field.
7. Use the `API secret` from Twitter for the `Consumer Secret` field.
8. Optionally, set the following fields
 - a. `Custom Error URL` for the provider to use to report any errors.
 - b. `Custom Logout URL` to provide a specific destination for users after they log out, if they authenticated using the single sign-on flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
 - c. Click **Automatically create a registration handler template** to create an Apex class template for the [registration handler](#), unless you already have one. You must edit this class, later, and modify the default content before using it.

 **Note:** You must specify a registration handler class for Salesforce to generate the Single Sign-On Initialization URL.

- d. Select the user that runs the Apex handler class for `Execute Registration As`. The user must have the "Manage Users" permission. A user is required if you selected a registration handler class or are automatically creating one.
- e. To use a portal for Twitter users, select the portal from the Portal drop-down list.
- f. Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only, and does not appear on the login page for your Salesforce organization or custom domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

You can specify a path to your own image, or copy the URL for one of our sample icons into the field.

9. Click **Save**.

Several client configuration URLs are generated after defining the authentication provider:

- `Test-Only Initialization URL`: Administrators use this URL to ensure the third-party provider is set up correctly. The administrator opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `Single Sign-On Initialization URL`: Use this URL to perform single sign-on into Salesforce from a third party (using third-party credentials). The end user opens this URL in a browser, and signs in to the third party. This then either creates a new user for them, or updates an existing user, and then signs them into Salesforce as that user.

- **Existing User Linking URL:** Use this URL to link existing Salesforce users to a third-party account. The end user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- **Callback URL:** Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider has to redirect to the `Callback URL` with information for each of the above client configuration URLs.

The client configuration URLs support additional request parameters that enable you to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Edit the Registration Handler

1. From Setup, enter `Apex Classes` in the `Quick Find` box, then select **Apex Classes**.
2. Edit the auto-created Apex registration handler (or the existing registration handler if you had one) to map fields between Twitter and Salesforce.

The following is an example Apex registration handler specifically for a Twitter application as the Auth. Provider.

```
global class MyTwitterRegHandler implements Auth.RegistrationHandler{

global User createUser(Id portalId, Auth.UserData data)
{
    if(data.attributeMap.containsKey('sfdc_networkid'))
    {
        // Create communities user
        Account a = [SELECT Id FROM account WHERE name='Twitter Account']; // Make sure
this account exists

        Contact c = new Contact();
        c.accountId = a.Id;
        c.email = 'temp@CHANGE-ME.com';
        c.firstName = data.fullname.split(' ')[0];
        c.lastName = data.fullname.split(' ')[1];
        insert(c);

        User u = new User();
        Profile p = [SELECT Id FROM profile WHERE name='Customer Portal Manager'];
        u.username = data.username + '@sfdc-portal-twitter.com';
        u.email = 'temp@CHANGE-ME.com';
        u.firstName = data.fullname.split(' ')[0];
        u.lastName = data.fullname.split(' ')[1];
        String alias = data.fullname;

        //Alias must be 8 characters or less
        if(alias.length() > 8) {
            alias = alias.substring(0, 8);
        }

        u.alias = alias;
        u.languageLocaleKey = 'en_US';
        u.localesidkey = 'en_US';
        u.emailEncodingKey = 'UTF-8';
        u.timeZoneSidKey = 'America/Los_Angeles';
        u.profileId = p.Id;
        u.contactId = c.Id;
        return u;
    }
}
```

```

} else {
    // Create Standard SFDC user
    User u = new User();
    Profile p = [SELECT Id FROM profile WHERE name='Standard User'];
    u.username = data.username + '@sfdc-twitter.com';
    u.email = 'temp@CHANGE-ME.com';
    u.firstName = data.fullname.split(' ')[0];
    u.lastName = data.fullname.split(' ')[1];
    String alias = data.fullname;
    if(alias.length() > 8)
        alias = alias.substring(0, 8);

    u.alias = alias;
    u.languageLocaleKey = 'en_US';
    u.localesidkey = 'en_US';
    u.emailEncodingKey = 'UTF-8';
    u.timeZoneSidKey = 'America/Los_Angeles';
    u.profileId = p.Id;
    return u;
}
}

global void updateUser(Id userId, Id portalId, Auth.UserData data)
{
    User u = new User(id=userId);
    u.firstName = data.fullname.split(' ')[0];
    u.lastName = data.fullname.split(' ')[1];
    String alias = data.fullname;
    if(alias.length() > 8)
        alias = alias.substring(0, 8);

    u.alias = alias;
    update(u);
}
}

```

See the [RegistrationHandler Interface documentation](#) for more information and examples.

Update Your Twitter Application

After you define the Twitter authentication provider in your Salesforce organization, go back to Twitter and update your application to use the Salesforce-generated `Callback URL` as the `Callback URL` value in your Twitter application settings.

Note: In your Twitter application, make sure that you select **Allow this application to be used to Sign In with Twitter**.

Test the Single Sign-on Connection

In a browser, open the `Test-Only Initialization URL` on the Auth. Provider detail page. It should redirect you to Twitter and ask you to sign in. Upon doing so, you are asked to authorize your application. After you authorize, you are redirected back to Salesforce.

Using Salesforce-Managed Values in Auth. Provider Setup

You can choose to let Salesforce automatically create key values when setting up a Facebook, Salesforce, LinkedIn, Twitter, or Google Auth. Provider. This allows you to skip the step of creating your own third-party application.

When you choose to use Salesforce-managed values in your Auth. Provider setup, Salesforce uses its own default application in the background from which it generates the values, eliminating the need for you to create your own application.

To use Salesforce-managed values, leave all of the following fields blank if they display in your Auth. Provider setup.

- Consumer Key
- Consumer Secret
- Authorize Endpoint URL
- Token Endpoint URL
- User Info Endpoint URL
- Default Scopes

If you specify a value for one of the preceding fields, then that indicates that you are using your own third-party application or connected app and you must specify values for the `Consumer Key` and `Consumer Secret`.

 **Example:** Suppose you want to set up single sign-on using a LinkedIn authentication provider to enable login to Salesforce with LinkedIn credentials. You can skip creating a LinkedIn application, since you choose to use Salesforce-created values in Auth. Provider setup. Next, you define the LinkedIn authentication provider in your organization and test the connection using the procedure in [Configure a LinkedIn Authentication Provider](#).

Using Frontdoor.jsp to Log Into Salesforce

You can use `frontdoor.jsp` to give users access to Salesforce from a custom Web interface, such as a remote access Force.com site or other API integration, using their existing session ID and the server URL.

To authenticate users with `frontdoor.jsp`, you must pass the server URL and full session ID (not just the 15 or 18 character ID) to `frontdoor.jsp`.

The best way to pass the values is through a form that uses a `POST` request. For example, the following form posts the current session ID to `frontdoor.jsp`.

```
<form method="POST" action="https://instance.salesforce.com/secur/frontdoor.jsp">
<input type="hidden" name="sid"
      value="full_sessionID_value"
      />
<input type="submit" name="login" value="Log In" /></form>
```

You can also send the values as URL parameters, but this approach is not as secure as a `POST` request because it exposes the session ID in the URL.

```
https://instance.salesforce.com/secur/frontdoor.jsp?sid=full_sessionID_value
&retURL=optional_relative_url_to_open
```

For organizations that use a custom domain created using My Domain, you must pass the domain name in the server URL.

- Performance
- Unlimited
- Developer

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"

AND

"Manage Auth. Providers"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

The following form posts the current session ID to `frontdoor.jsp` for a custom domain.

```
<form method="POST" action="https://domain_name.my.salesforce.com/secur/frontdoor.jsp">
<input type="hidden" name="sid"
  value="full_sessionID_value"
  />
<input type="submit" name="login" value="Log In" /></form>
```

The following example sends the values as URL parameters.

```
https://domain_name.my.salesforce.com/secur/frontdoor.jsp?sid=full_sessionID_value
&retURL=optional_relative_url_to_open
```

Instance

You must know the instance of the user's organization. For example, if the `serverUrl` returned when you log in via the API is `https://na1.salesforce.com`, `na1` is the instance. The rest of the server address (the `salesforce.com` domain name) remains the same.

If you're building an integration for a single Salesforce organization, you can hard code this value. If you're building an integration for multiple organizations, parse the instance from the `serverUrl` of the returned `LoginResult` from the SOAP API `login()` call.

Full Session ID

You can obtain the full session ID from:

- The `access_token` from an OAuth authentication
 - 💡 **Tip:** One of the scopes specified when you create a connected app must be `web` or `full`.
- The `LoginResult` returned from a SOAP API `login()` call
- The `Apex UserInfo.getSessionId()`

The session ID returned using the Visualforce `{!GETSESSIONID() }` can't be used on `frontdoor.jsp`.

- 📌 **Note:** Not all session types are supported with `frontdoor.jsp`, such as community API sessions. For these sessions, consider using SAML for single sign-on, instead.

Relative URL to Open

You can optionally include a URL-encoded relative path to redirect users to the Salesforce user interface or a particular record, object, report, or Visualforce page (for example, `/apex/MyVisualforcePage`).

Using Request Parameters with Client Configuration URLs

You can add functionality to your authentication provider by using additional request parameters.

Authentication providers support additional request parameters you can use to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Add the request parameters to the following client configuration URLs. These were generated after you defined your authentication provider:

- Test-Only Initialization URL
- Single Sign-On Initialization URL
- Existing User Linking URL
- Callback URL

Append any of these parameters to your URL as needed. For Janrain providers, append them to the appropriate callback URL.

- [Scope](#) – Customizes the permissions requested from the third party
- [Site](#) – Enables the provider to be used with a site
- [StartURL](#) – Sends the user to a specified location after authentication
- [Community](#) – Sends the user to a specific community after authentication
- [Authorization Endpoint](#) on page 868 – Sends the user to a specific endpoint for authentication (Salesforce authentication providers, only)

“Manage Auth. Providers”

Using the Scope Parameter

Customizes the permissions requested from the third party like Facebook or Janrain so that the returned access token has additional permissions.

You can customize requests to a third party to receive access tokens with additional permissions. Then you use `Auth.AuthToken` methods to retrieve the access token that was granted so you can use those permissions with the third party.

The default scopes vary depending on the third party, but usually do not allow access to much more than basic user information. Every provider type (Open ID Connect, Facebook, Salesforce, and others), has a set of default scopes it sends along with the request to the authorization endpoint. For example, Salesforce's default scope is `id`.

You can send scopes in a space-delimited string. The space-delimited string of requested scopes is sent as-is to the third party, and overrides the default permissions requested by authentication providers.

Janrain does not use this parameter; additional permissions must be configured within Janrain.

Example: The following is an example of a `scope` parameter requesting the Salesforce scopes `api` and `web`, added to the `Single Sign-On Initialization URL`, where:

- `orgID` is your Auth. Provider ID
 - `URLsuffix` is the value you specified when you defined the authentication provider
- `https://login.salesforce.com/services/auth/sso/orgID/URLsuffix?scope=id%20api%20web`

Valid scopes vary depending on the third party; refer to your individual third-party documentation. For example, Salesforce scopes are:

Value	Description
<code>api</code>	Allows access to the current, logged-in user's account using APIs, such as REST API and Bulk API. This value also includes <code>chatter_api</code> , which allows access to Chatter REST API resources.
<code>chatter_api</code>	Allows access to Chatter REST API resources only.
<code>custom_permissions</code>	Allows access to the custom permissions in an organization associated with the connected app, and shows whether the current user has each permission enabled.
<code>full</code>	Allows access to all data accessible by the logged-in user, and encompasses all other scopes. <code>full</code> does not return a refresh token. You must explicitly request the <code>refresh_token</code> scope to get a refresh token.
<code>id</code>	Allows access to the identity URL service. You can request <code>profile</code> , <code>email</code> , <code>address</code> , or <code>phone</code> , individually to get the same result as using <code>id</code> ; they are all synonymous.
<code>openid</code>	Allows access to the current, logged in user's unique identifier for OpenID Connect apps. The <code>openid</code> scope can be used in the OAuth 2.0 user-agent flow and the OAuth 2.0 Web server authentication flow to get back a signed ID token conforming to the OpenID Connect specifications in addition to the access token.
<code>refresh_token</code>	Allows a refresh token to be returned if you are eligible to receive one. This lets the app interact with the user's data while the user is offline, and is synonymous with requesting <code>offline_access</code> .

Value	Description
visualforce	Allows access to Visualforce pages.
web	Allows the ability to use the <code>access_token</code> on the Web. This also includes <code>visualforce</code> , allowing access to Visualforce pages.

SEE ALSO:

[Using Request Parameters with Client Configuration URLs](#)

Using the Site Parameter

Use your authentication provider to log into a site or link to a sites user.

To use your provider with a site, you need to do the following:

- Enable the provider to be used with a site
- Ensure the site is configured to use the same portal
- Add the site-specific login URL information to the appropriate client configuration URL, such as the `Single Sign-On Initialization URL`, using the `site` parameter

Example: You create the site login Visualforce page, or specify the default page, when you create the site. An example site login URL is:

```
https%3A%2F%2Fmysite.force.com%2FsiteLogin.
```

The following is an example of a site-login URL added to the `Single Sign-On Initialization URL`, using the `site` parameter, where:

- `orgID` is your Auth. Provider ID
 - `URLsuffix` is the value you specified when you defined the authentication provider
- ```
https://login.salesforce.com/services/auth/ss/orgID/URLsuffix?site=https%3A%2F%2Fmysite.force.com%2FsiteLogin
```

If you don't specify a `site` parameter, the user proceeds either to a standard portal (if set up for a portal) or the standard application (if not).

## Using the StartURL Parameter

Send your user to a specific location after authenticating or linking.

To direct your users to a specific location after authenticating, you need to specify a URL with the `startURL` request parameter. This URL must be a relative URL; passing an absolute URL results in an error. If you don't add `startURL`, the user is sent to either `/home/home.jsp` (for a portal or standard application) or to the default sites page (for a site) after authentication completes.

 **Example:** For example, with a `Single Sign-On Initialization URL`, the user is sent to this location after being logged in. For an `Existing User Linking URL`, the “Continue to Salesforce” link on the confirmation page leads to this page.

The following is an example of a `startURL` parameter added to the `Single Sign-On Initialization URL`, where:

- `orgID` is your Auth. Provider ID
  - `URLsuffix` is the value you specified when you defined the authentication provider
- `https://login.salesforce.com/services/auth/ss/oid/URLsuffix?startURL=%2F050000000001%3Fredirect%3D`

## Using the Community URL Parameter

Send your user to a specific Community after authenticating.

To direct your users to a specific community after authenticating, you need to specify a URL with the `community` request parameter. If you don't add the parameter, the user is sent to either `/home/home.jsp` (for a portal or standard application) or to the default sites page (for a site) after authentication completes.

 **Example:** For example, with a `Single Sign-On Initialization URL`, the user is sent to this location after being logged in. For an `Existing User Linking URL`, the "Continue to Salesforce" link on the confirmation page leads to this page.

The following is an example of a `community` parameter added to the `Single Sign-On Initialization URL`, where:

- `orgID` is your Auth. Provider ID
  - `URLsuffix` is the value you specified when you defined the authentication provider
- `https://login.salesforce.com/services/auth/ss/oid/URLsuffix?community=https://aone.force.com/support`

## Using the Authorization Endpoint Parameter

Send your user to a specific authorization endpoint.

You can add a `provAuthorizeEndpointHost` parameter to a Salesforce authentication provider URL to direct users to an authorization endpoint for a provided domain, such as a custom domain created using My Domain. Providing an authorization endpoint lets you take advantage of features like session discovery during authorization. This parameter is only available for Salesforce authentication providers, and cannot be used to send users to an authorization page outside of a Salesforce domain.

To direct your users to a specific Salesforce authorization endpoint, you need to specify a URL with the `provAuthorizeEndpointHost` request parameter and a valid `https` host. Query strings appended to the host URL are ignored. However, you can specify a community path.

 **Example:** The following is an example of a `provAuthorizeEndpointHost` parameter added to the authentication provider URL:

- `orgID` is your Auth. Provider ID
- `URLsuffix` is the value you specified when you defined the authentication provider

```
https://login.salesforce.com/services/auth/sso/orgID/
URLsuffix?provAuthorizeEndpointHost=https%3A%2F%2Fmydomain.my.salesforce.com
```

The following is an example of a `provAuthorizeEndpointHost` directed to a community URL

```
https://login.salesforce.com/services/auth/sso/orgID/
URLsuffix?provAuthorizeEndpointHost=https%3A%2F%2Fmycommunity.force.com%2Fbilling
```

If an authorization endpoint is not provided, Salesforce uses the default authorization endpoint for the authorization provider. If no default is set for the authorization provider, Salesforce uses the endpoint for `login.salesforce.com`.

The authorization endpoint does not change the token endpoint, which continues to be the configured or default host. For example, if the authorization endpoint is a sandbox instance, and your provider is set to use a production token endpoint, the flow fails, because authorization was granted by the sandbox instance, only.

## About Salesforce Certificates and Keys

 **Note:** This information applies to Classic Encryption and not to Platform Encryption.

To work with Salesforce certificates and keys, from Setup, enter *Certificate and Key Management* in the **Quick Find** box, then select **Certificate and Key Management**. From this page you can manage:

- Your certificates
- Authentication Certificates
- Your master encryption keys

### Certificates

Salesforce certificates and key pairs are used for signatures that verify a request is coming from your organization. They are used for authenticated SSL communications with an external web site, or when using your organization as an Identity Provider. You only need to generate a Salesforce

To create, edit, and manage certificates:

- “Customize Application”

certificate and key pair if you're working with an external website that wants verification that a request is coming from a Salesforce organization.

Salesforce offers two types of certificates:

**Self-signed**

A self-signed certificate is signed by Salesforce with the SHA-256 signature algorithm. Not all external websites accept self-signed certificates.

**CA-signed**

A CA-signed certificate is signed by an external certificate authority (CA). Most external websites accept CA-signed certificates. You must first generate the certificate signing request to send to a CA, and then import the signed version of the certificate before you can use it.

You can export all your certificates and private keys into a keystore for storage or import certificates and keys from a keystore. This allows you to move keys from one organization to another. The exported file is in the Java Keystore (JKS) format, and the imported file must also be in the JKS format. For more information about the JKS format, see [Oracle's Java KeyStore documentation](#).

## Mutual Authentication Certificates

 **Note:** If you don't see this option on the Certificate and Key Management page, contact Salesforce to enable the feature.

Salesforce can verify if a request comes from your organization using Salesforce certificates *and* certificates via Transport Layer Security (TLS) connections from HTTPS clients for mutual authentication.

## Master Encryption Keys

Fields that are encrypted using encrypted custom fields, such as social security number or credit card number, use a master encryption key to encrypt the data. This key is automatically assigned when you enable encrypted fields for your organization. You can manage the master key based on your organization's security needs and regulatory requirements.

## Creating Certificates and Key Pairs

Salesforce offers two types of certificates:

### Self-signed

A self-signed certificate is signed by Salesforce with the SHA-256 signature algorithm. Not all external websites accept self-signed certificates.

### CA-signed

A CA-signed certificate is signed by an external certificate authority (CA). Most external websites accept CA-signed certificates. You must first generate the certificate signing request to send to a CA, and then import the signed version of the certificate before you can use it.

To create a Salesforce certificate:

1. From Setup, enter *Certificate and Key Management* in the **Quick Find** box, then select **Certificate and Key Management**.
  2. Select either **Create Self-Signed Certificate** or **Create CA-Signed Certificate**, based on what kind of certificate your external website accepts. You can't change the type of a certificate after you've created it.
  3. Enter a descriptive label for the Salesforce certificate. This name is used primarily by administrators when viewing certificates.
  4. Enter the **Unique Name**. This name is automatically populated based on the certificate label you enter. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Use the **Unique Name** when referring to the certificate using the Force.com Web services API or Apex.
  5. Select a **Key Size** for your generated certificate and keys. We recommend that you use the default key size of 2048 for security reasons. Selecting 2048 generates a certificate using 2048-bit keys and is valid for two years. Selecting 1024 generates a certificate using 1024-bit keys and is valid for one year.
-  **Note:** Once you save a Salesforce certificate, you can't change the key size.
6. If you're creating a CA-signed certificate, you must also enter the following information. These fields are joined together to generate a unique certificate.

| Field         | Description                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Common Name   | The fully qualified domain name of the company requesting the signed certificate. This is generally of the form:<br><code>http://www.mycompany.com.</code> |
| Email Address | The email address associated with this certificate.                                                                                                        |
| Company       | Either the legal name of your company, or your legal name.                                                                                                 |
| Department    | The branch of your company using the certificate, such as marketing or accounting.                                                                         |
| City          | The city where the company resides.                                                                                                                        |
| State         | The state where the company resides.                                                                                                                       |
| Country Code  | A two-letter code indicating the country where the company resides. For the United States, the value is <i>US</i> .                                        |

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

### USER PERMISSIONS

To create, edit, and manage certificates:

- "Customize Application"

### 7. Click **Save**.

Downloaded self-signed certificates have `.crt` extensions. Downloaded certificate signing requests have `.csr` extensions.

After you successfully save a Salesforce certificate, the certificate and corresponding keys are automatically generated.

You can have a maximum of 50 certificates.

After you create a CA-signed certificate, you must [upload the signed certificate](#) before you can use it.

 **Note:** After you create a CA-signed certificate and certificate request, the certificate is not active and you can't use it until it's been signed by a certificate authority and uploaded into your organization.

#### SEE ALSO:

[About Salesforce Certificates and Keys](#)

[Uploading Certificate Authority \(CA\)-Signed Certificates](#)

[Repeating an Upload of a CA-Signed Certificate](#)

## Uploading Certificate Authority (CA)-Signed Certificates

After you [create a CA-signed certificate](#), you must do the following before the certificate is active and you can use the certificate.

1. From Setup, enter *Certificate and Key Management* in the **Quick Find** box, then select **Certificate and Key Management**, click the name of the certificate, then click **Download Certificate Signing Request**.
2. Send the certificate request to the certificate authority of your choice.
3. After the certificate authority sends back the signed certificate, from Setup, enter *Certificate and Key Management* in the **Quick Find** box, then select **Certificate and Key Management**, click the name of the certificate, then click **Upload Signed Certificate**.
4. Click **Browse** to locate the CA-signed certificate. The CA-signed certificate must match the certificate created in Salesforce. If you try to upload a different CA-signed certificate, the upload fails.
5. Click **Save** to finish the upload process. Click **Cancel** at any time to not upload the certificate.

After you successfully upload the signed certificate, the status of the certificate is changed to `Active` and you can use CA-signed certificate.

A certificate chain is a hierarchical order of certificates where one certificate issues and signs another certificate lower in the hierarchy. Upload a certificate chain as a single PEM-encoded CA-signed certificate representing the concatenated chain of certificates. The uploaded certificate chain must include the intermediate certificates in the following order.

- Start with the server or client certificate and then add its signing certificate.
- If more than one intermediate certificate exists between the server or client certificate and the root, add each certificate as the one that signed the previous certificate.
- The root certificate is optional, and generally should not be included.

#### SEE ALSO:

[About Salesforce Certificates and Keys](#)

#### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

#### USER PERMISSIONS

To create, edit, and manage certificates:

- "Customize Application"

## Repeating an Upload of a CA-Signed Certificate

If you upload a CA-signed certificate and either forget to upload complete certificate information or need to upload a renewed certificate, you can upload it again to finish the process. This saves you time because you don't need to start over with a new key and certificate. When you upload again, published site domains are automatically republished if they have at least one Force.com site or community. Additionally, the expiration date of the certificate record is updated to the expiration date of the newly uploaded certificate.

To upload a CA-signed certificate again:

1. From Setup, enter *Certificate and Key Management* in the **Quick Find** box, then select **Certificate and Key Management**.

2. Click on the name of the CA-Signed certificate that you want to upload again.

 **Note:** Your certificate should have a `.crt` extension.

3. Click **Update Signed Certificate** and **Choose File**.

4. Click **Browse** to locate the CA-signed certificate. The CA-signed certificate's public key must match the public key of the certificate record created in Salesforce. If you try to upload a different CA-signed certificate, the upload fails.

 **Note:** You can click **Cancel** at any time to cancel the upload.

5. Click **Save** to finish the upload process.

A certificate chain is a hierarchical order of certificates where one certificate issues and signs another certificate lower in the hierarchy. Upload a certificate chain as a single PEM-encoded CA-signed certificate representing the concatenated chain of certificates. The uploaded certificate chain must include the intermediate certificates in the following order.

- Start with the server or client certificate and then add its signing certificate.
- If more than one intermediate certificate exists between the server or client certificate and the root, add each certificate as the one that signed the previous certificate.
- The root certificate is optional, and generally should not be included.

## Setting Up Mutual Authentication Certificates

Use mutual authentication for your organization by creating a mutual authentication certificate.

 **Note:** If you don't see this option on the Certificate and Key Management page, contact Salesforce to enable the feature.

Follow these steps to upload a certificate.

1. Click **Upload Mutual Authentication Certificate**.
2. Give your certificate a label and name and click **Choose File** to locate the certificate.
3. Click **Save** to finish the upload process.
4. Enable the "Enforce SSL/TLS Mutual Authentication" user permission for an "API Only" user. This "API Only" user configures the API client to connect on port 8443 to present the signed client certificate.

Note that the client certificate must include any intermediate certificates in the certificate chain when contacting port 8443.

A certificate chain is a hierarchical order of certificates where one certificate issues and signs another certificate lower in the hierarchy. Upload a certificate chain as a single PEM-encoded CA-signed certificate representing the concatenated chain of certificates. The uploaded certificate chain must include the intermediate certificates in the following order.

- Start with the server or client certificate and then add its signing certificate.
- If more than one intermediate certificate exists between the server or client certificate and the root, add each certificate as the one that signed the previous certificate.
- The root certificate is optional, and generally should not be included.

## Configuring Your API Client to Use Mutual Authentication

Enforce SSL/TLS mutual authentication.

[Setting Up Mutual Authentication Certificates](#) steps should be completed before configuring your API client.

1. Log in to the Salesforce service using port 8443. Include:
  - a. Your credentials
  - b. Your signed certificate information

For example, your configuration using `cURL` may look something like this, where `@login.txt` contains the login Soap message with your credentials and `fullcert.pem:xxxxxx` is your certificate information:

```
curl -k https://na1.salesforce.com:8443/services/Soap/u/31.0 -H "Content-Type: text/xml; charset=UTF-8" -H "SOAPAction: login" -d @login.txt -v -E fullcert.pem:xxxxxx
```

2. Once a session ID is returned from your call, you can perform other actions, such as queries. For example:

```
curl -k https://na1.salesforce.com:8443/services/Soap/u/31.0 -H "Content-Type: text/xml; charset=UTF-8" -H "SOAPAction: example" -d @accountQuery.xml -v -E fullcert.pem:xxxxxx
```

where `@accountQuery.xml` is the file name containing the query Soap message with session ID from the login response.

### USER PERMISSIONS

To create, edit, and manage certificates:

- "Customize Application"

To enforce mutual authentication on port 8443 for standard SSL/TLS connections:

(Assign to users with the "Api Only" User permission.)

- "Enforce SSL/TLS Mutual Authentication"

To access Salesforce only through a Salesforce API:

- "Api Only User"

## Managing Master Encryption Keys

 **Note:** This information applies to Classic Encryption and not to Platform Encryption.

Fields that are encrypted using encrypted custom fields, such as social security number or credit card number, use a master encryption key to encrypt the data. This key is automatically assigned when you enable encrypted fields for your organization. You can manage the master key based on your organization's security needs and regulatory requirements. With master encryption keys, you can do the following:

- Archive the existing key and create a new key
- Export an existing key after it's been archived
- Delete an existing key
- Import an existing key after it's been deleted

### Archiving and Creating New Keys

To archive your current key and create a new key:

1. From Setup, enter *Certificate and Key Management* in the **Quick Find** box, then select **Certificate and Key Management**.
2. Click **Archive Current Key and Create New Key**.
3. A warning message displays letting you know you are changing keys. Click **OK**.
4. A new key is generated, assigned the next sequential number, and activated.

All new data is encrypted using the new key. Existing data continues to use the archived key until the data is modified and saved. Then data is encrypted using the new key.

After you archive a key, you can export or delete it.

### Exporting Keys

You can export your keys to a back-up location for safe keeping. It's a good idea to export a copy of any key before deleting it.

Exporting creates a text file with the encrypted key. You can import the key back into your organization at a later time.

Click **Export** next to the key you want to export.

### Deleting Keys

Don't delete a key unless you're absolutely certain no data is currently encrypted using the key. After you delete a key, any data encrypted with that key can no longer be accessed. If you export the key before you delete it, you can import the key back into your organization.

To delete a key, click **Delete** next to the key you want to delete.

The date the key is deleted displays.

### Importing Keys

If you have data associated with a deleted key, you can import an exported key back into your organization. Any data that was not accessible becomes accessible again.

#### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

#### USER PERMISSIONS

To create, edit, and manage certificates:

- "Customize Application"

Click **Import** next to the key you want to import.

SEE ALSO:

[About Salesforce Certificates and Keys](#)

## Editing Salesforce Certificates and Key Pairs

After you create a Salesforce certificate (including, if enabled, mutual authentication certificates) you can only change the `Label` and the `Unique Name`. You can't change the type, key size, or other properties. The certificate and the keys aren't regenerated when you edit a Salesforce certificate.

 **Warning:** Apex and the Force.com Web services API use the `Unique Name` to access the certificate. Changing the `Unique Name` could cause your code to break.

To edit a Salesforce certificate:

1. From Setup, enter *Certificate and Key Management* in the `Quick Find` box, then select **Certificate and Key Management**.
2. Click **Edit** next to the name of a Salesforce certificate.
3. Make your changes, then click **Save**.

To delete a certificate, click **Del**. If a certificate is being used as part of the configuration of your identity provider, you cannot delete it.

[About Salesforce Certificates and Keys](#)

## Viewing Salesforce Certificates and Key Pairs

To view the details of a Salesforce certificate, from Setup, enter *Certificate and Key Management* in the `Quick Find` box, then select **Certificate and Key Management**, then click the name of a certificate.

From the certificate detail page, you can do any of the following:

- Click **Edit** to [edit the label or unique name](#) of the certificate.
- Click **Delete** to delete the certificate.
- Click **Download Certificate** to download the full Base-64 encoded certificate. This is only available for active certificates. For CA-signed certificates, you must first [upload the signed certificate](#) before you can download or use it.
- Click **Download Certificate Signing Request** for CA-signed certificates that have not yet had the signed certificate uploaded.
- Click **Upload Signed Certificate** to upload the CA-signed certificate or to upload it again.

## About Identity Providers and Service Providers

An *identity provider* is a trusted provider that enables you to use single sign-on to access other websites. A *service provider* is a website that hosts applications. You can enable Salesforce as an identity provider, then define one or more service providers, so your users can access other applications directly from Salesforce using single sign-on. This can be a great help to your users: instead of having to remember many passwords, they will only have to remember one. Plus, the applications can be added as tabs to your Salesforce organization, which means users won't have to switch between programs.

Before you can enable Salesforce as an identity provider, you must [set up a domain](#).

Enabling Salesforce as an identity provider requires a [Salesforce certificate and key pair that is signed by an external certificate authority \(CA-signed\) or self-signed](#). If you haven't generated a Salesforce certificate and key pair, one is automatically created for you when you enable Salesforce as an identity provider. You also have the option of picking an already generated certificate, or creating one yourself.

Salesforce uses the SAML 2.0 standard for single sign-on and generates SAML assertions when configured as an identity provider.

Use the [identity provider event log](#) if your users have errors when trying to log into your service provider's apps.

## Using Identity Providers and Service Providers

Salesforce supports the following:

- Identity-provider-initiated login—when Salesforce logs into a service provider at the initiation of the end-user
- Service-provider-initiated login—when the service provider requests Salesforce to authenticate a user, at the initiation of the end-user

The following is the general flow when Salesforce as an identity provider logs into a service provider.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

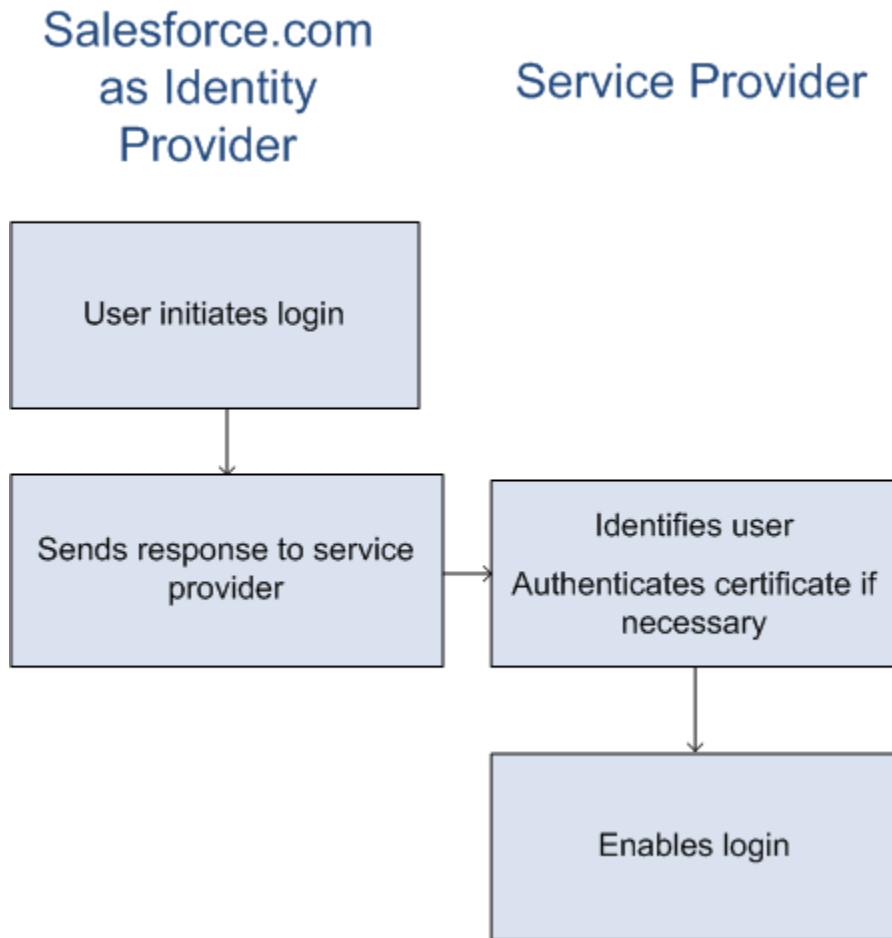

Available in:

- Developer
- Enterprise
- Performance
- Unlimited
- Database.com

### USER PERMISSIONS

Define and modify identity providers and service providers:

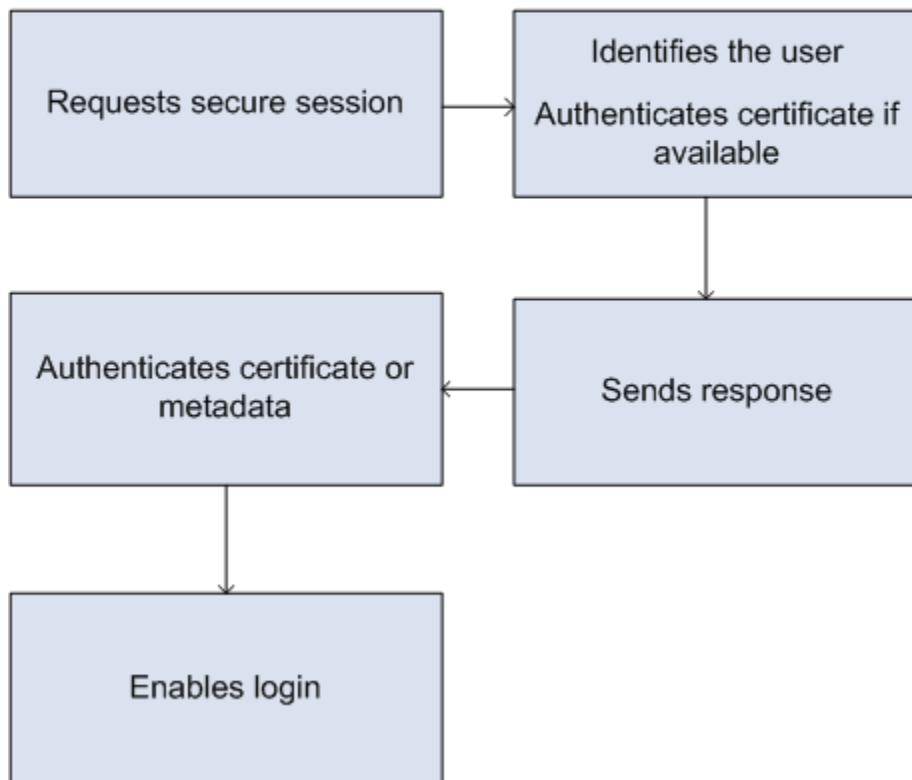

- "Customize Application"

1. User tries to access a service provider already defined in Salesforce.
2. Salesforce sends a [SAML response](#) to the service provider.
3. Service provider identifies the user and authenticates the certificate.
4. If the user is identified, they are logged into the service provider.

The following is the general flow when a service provider initiates login and uses Salesforce to identify the user.

## Service Provider      Salesforce.com as Identity Provider

1. The service provider sends a valid SAML request. The endpoint is automatically generated when the service provider is defined—the SP-Initiated POST Endpoint.
2. Salesforce identifies the user included in the SAML request.

```

<samlp:AuthnRequest ID="bndkmeemcaamihajeloilkagfdliilbhjnjmlmfo" Version="2.0"
 IssueInstant="2010-05-24T22:57:19Z"
 ProtocolBinding="urn:oasis:names:tc:SAML:2.0:bindings:HTTP-POST"
 ProviderName="google.com" IsPassive="false"
 AssertionConsumerServiceURL="https://www.google.com/a/resp.info/acs">
 <saml:Issuer>google.com</saml:Issuer>
 <samlp:NameIDPolicy AllowCreate="true"
 Format="urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified"/>
</samlp:AuthnRequest>

```

If a certificate was included as part of the definition, Salesforce authenticates the certificate.

 **Note:** If a certificate is included in the service provider definition, and the SAML request does not contain a certificate, the request fails, and the user is not logged in using Salesforce. If the definition does not include a certificate, and the request includes a signature, the request succeeds if the user is identified correctly.

3. If the user isn't already logged into Salesforce, they are prompted to do so.

4. Salesforce sends a [SAML response](#) to the service provider.
5. The service provider authenticates the SAML response sent by Salesforce. If the user has been authenticated, they are logged into the service provider. The user is also logged into Salesforce.

**Important:** Salesforce doesn't provide any mechanism for automatically logging the user out of Salesforce when they log out of the service provider.

The following is an example of the SAML response from Salesforce. You might want to share this information with your service provider.

```

## Enable Salesforce as an Identity Provider

To enable Salesforce as an identity provider:

1. [Set up a domain using My Domain](#), and deploy it to all users.
2. From Setup, enter *Identity Provider* in the **Quick Find** box, then select **Identity Provider**, and then click **Enable Identity Provider**.
3. By default, a Salesforce identity provider uses a self-signed certificate generated automatically with the SHA-256 signature algorithm. If you've already created self-signed certificates, select the certificate to use when securely communicating with other services.

If you want to use a CA-signed certificate instead of self-signed certificate, following these steps.

- a. Create and import a new CA-signed certificate. For instructions, see [About Salesforce Certificates and Keys](#).
- b. From Setup, enter *Identity Provider* in the **Quick Find** box, then select **Identity Provider**.
- c. Click **Edit**, and then select the CA-signed certificate.
- d. Click **Save**.

After you enable Salesforce as an identity provider, you can define service providers by creating connected apps (From Setup, enter *Apps* in the **Quick Find** box, then select **Apps**).

SEE ALSO:

- [About Identity Providers and Service Providers](#)
- [Creating Certificates and Key Pairs](#)
- [Creating a Connected App](#)

## View Your Identity Provider Details

After you enable an identity provider for your organization, you can view the details from Setup by entering *Identity Provider* in the **Quick Find** box, then selecting **Identity Provider**. You might need to share this information, such as *Issuer*, with your service provider.

From this page you can click:

- **Edit** to change the certificate associated with your identity provider.
  -  **Warning:** Changing the certificate can disable access to external applications. You might need to update all external applications to validate the new certificate information.
- **Disable** to disable your identity provider.
  -  **Warning:** If you disable your identity provider, users can no longer access any external applications.
- **Download Certificate** to download the certificate associated with your identity provider. Your service provider can use this information for connecting to Salesforce.
- **Download Metadata** to download the metadata associated with your identity provider. Your service provider can use this information for connecting to Salesforce.

### USER PERMISSIONS

Define and modify identity providers and service providers:

- "Customize Application"

- In the SAML Metadata Discovery Endpoints section, you can access URLs for the SAML identity provider information for your custom domain and each community. Your service provider can use these URLs to configure single sign-on to connect to Salesforce.
    - Salesforce Identity—URL of identity provider metadata for your custom domain in My Domain.
    - *Community Name* Community Identity—URL of identity provider metadata for the named community.
  - In the service providers section, next to the name of an existing service provider, click **Edit** to change its definition, click **Profiles** to add or remove user profiles that have access to this service provider, or click **Del** to delete it.
-  **Note:** To define a new service provider, from Setup, enter *Apps* in the *Quick Find* box, then select **Apps** and then create a new SAML-enabled connected app.

SEE ALSO:

[About Identity Providers and Service Providers](#)

## Prerequisites for Defining Service Providers

Before defining a service provider:

1. [Enable Salesforce as an identity provider.](#)
2. Give your service provider information about your configuration of Salesforce as an identity provider. This information is available as metadata that you can download and give to your service provider for easy configuration. However, not all service providers support metadata. If your service provider supports certificates instead, you might be required to download the certificate. From Setup, enter *Identity Provider* in the *Quick Find* box, then select **Identity Provider**, then click **Download Certificate** or **Download Metadata**.
3. Get the following information from your service provider:
  - Assertion consumer service (ACS) URL
  - Entity ID
  - Subject type—specifies if the subject for the SAML response from Salesforce (as an identity provider) is a Salesforce user name or a federation ID
  - Security certificate—only required when the service provider is initiating login to Salesforce and signing their SAML requests

## Defining Service Providers as SAML-Enabled Connected Apps

1. Complete the [prerequisites](#).
2. From Setup, enter `Apps` in the `Quick Find` box, then select **Apps**.
3. Under Connected Apps, click **New**.
4. Specify the required fields under Basic Information.
5. Under Web App Settings, select **Enable SAML** and then provide the following:

### Entity Id

This value comes from the service provider. Each entity ID in an organization must be unique. If you're accessing multiple apps from your service provider, you only need to define the service provider once, and then use the `RelayState` parameter to append the URL values to direct the user to the correct app after signing in.

### ACS URL

The ACS, or assertion consumer service, URL comes from the SAML service provider.

### Subject Type

Specifies which field defines the user's identity for the app. Options include the user's username, federation ID, user ID, a custom attribute, or an algorithmically calculated persistent ID. A custom attribute can be any custom field added to the User object in the organization, as long as it is one of the following data types: Email, Text, URL, or Formula (with Text Return Type). After you select `Custom Attribute` for the **Subject Type**, Salesforce displays a **Custom Attribute** field with a list of the available User object custom fields in the organization.

### Name ID Format

Specifies the format attribute sent in SAML messages. "Unspecified" is selected by default. Depending on your SAML service provider, you may want to set this to email address, persistent, or transient.

### Issuer

By default, the standard issuer for your identity provider is used (your organization's My Domain). If your SAML service provider requires a different value, specify it here.

6. Optionally specify the following:

### Start URL

Directs users to a specific location when they run the application. The Start URL can be an absolute URL, such as `https://na1.salesforce.com/001/o`, or it can be the link for the application name, such as `https://customer.goodApp.com` for GoodApp. Specifying a Start URL makes the application available in the Force.com app menu and in App Launcher.

### Verify Request Signatures

Select `Verify Request Signatures` if the service provider gave you a security certificate. Browse your system for the certificate. This is only necessary if you plan to initiate logging into Salesforce from the service provider and the service provider signs their SAML requests.

 **Important:** If you upload a certificate, all SAML requests must be signed. If no certificate is uploaded, all SAML requests are accepted.

### Encrypt SAML Response

Select `Encrypt SAML Response` to upload a certificate and select an encryption method for encrypting the assertion. Valid encryption algorithm values are `AES-128` (128-bit key), `AES-256` (256-bit key), and `Triple-DES` (Triple Data Encryption Algorithm).

7. Click **Save**.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

### USER PERMISSIONS

Define and modify identity providers and service providers:

- "Customize Application"

To authorize users for this SAML application:

1. From Setup, enter *Connected Apps* in the *Quick Find* box, then select the option for managing connected apps.
2. Click the name of the application.
3. Select the profiles and/or permission sets that can access the application.

SEE ALSO:

[About Identity Providers and Service Providers](#)  
[Custom Fields](#)

## Map Salesforce Users to App Users

If the *Subject Type* for the service provider definition is *Federation ID*, you must map the Salesforce user to the username used to sign into the service provider.

To map a Salesforce user to the app user:

1. From Setup, enter *Users* in the *Quick Find* box, then select **Users**, then click **Edit** for every user who needs to be mapped.
2. In *Federation ID*, under *Single Sign On Information*, enter the username to be used to log into the service provider.
3. Click **Save**.

 **Tip:** Use SOAP API if you have a large number of user profiles or permission sets to update. See the [SOAP API Developer's Guide](#).

## View Your Service Provider Details

After you define a service provider for your organization by creating a SAML-enabled connected app, you can view the details from Setup by entering *Connected Apps* in the *Quick Find* box, then selecting **Connected Apps**, and then selecting the name of the app. You might need to share this information, such as *SP-Initiated POST Endpoint* or *SP-Initiated Redirect Endpoint*, with your service providers.

From this page you can click:

- **Edit** to change the values of the service provider definition.
- **Delete** to delete a service provider definition.
-  **Warning:** If you delete a service provider definition, your users will no longer have access to that service provider.
- **Profile Access** to change which profiles have access to this service provider.

SEE ALSO:

[About Identity Providers and Service Providers](#)

## Enabling Identity Providers and Defining Service Providers for Portals and Sites

When enabling identity providers and defining service providers for Force.com Sites, Customer Portals and partner portals, note the following:

- When [defining a service provider](#), if the *Subject Type* is *Username*, the Salesforce organization ID is prepended to the user name in the SAML assertion. For example, if the user is *jDeoint@WFC.com*, the subject for the SAML assertion contains *00DE000000FFLT@jDeoint@WFC.com*. If the *Subject Type* is *Federation ID*, the exact federation ID is used.
- The attribute *is\_portal\_user* included in the SAML assertion generated by Salesforce contains values. You might want to share the following example with your service provider.

```
<saml:Attribute Name="is_portal_user"
 NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
 <saml:AttributeValue
 xmlns:xs="http://www.w3.org/2001/XMLSchema"
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xsi:type="xs:anyType">true
```

## SEE ALSO:

[About Identity Providers and Service Providers](#)

## Using the Identity Provider Event Log

The identity provider event log records both problems and successes with inbound SAML authentication requests from another app provider, and outbound SAML responses when Salesforce is acting as an identity provider. To view the identity provider event log, from Setup, enter *Identity Provider Event Log* in the Quick Find box, then select **Identity Provider Event Log**. You can show successes, failures, or both in the log. You can view the 50 most recent events in the UI; you can view more by creating a report.

## Examples Using Identity Providers and Service Providers

This section contains two examples of setting up Salesforce as an identity provider, then setting up two different service providers:

- [Google Apps](#)—shows service-provider initiated login.
- [Salesforce](#)—shows identity-provider initiated login.

### Setting up Single Sign-on to Google Apps Example

This example shows how to set up single sign-on from Salesforce to Google Apps. In this example, Google is the service provider, and Google Apps is the app provided by the service provider.

For this example to work:

- You must already have a Premier Edition Google Apps account
- Your Salesforce organization must be set up for single sign-on using SAML 2.0

The general steps are as follows, with more specifics on each step below.

1. [Generate a domain name and enable an identity provider](#) in your Salesforce organization.
2. [Define the service provider in Salesforce](#).
3. [Enable the Salesforce user and profile](#).

### Generating a Domain Name and Enabling an Identity Provider

To prepare your Salesforce organization for this example, generate a domain name and enable Salesforce as an identity provider:

1. Log in to Salesforce.
2. Generate a domain name for your organization:
  - a. From Setup, enter *My Domain* in the *Quick Find* box, then select **My Domain**, enter a new subdomain name, and click **Check Availability**.
  - b. If the name is available, click the **Terms and Conditions** check box, then click **Register Domain**.

 **Important:** You must deploy your domain name before you can enable Salesforce as an identity provider.

3. Enable Salesforce as an identity provider:
  - a. From Setup, enter *Identity Provider* in the *Quick Find* box, then select **Identity Provider**.
  - b. Click **Enable**.
  - c. Click **Download Certificate**. Remember where you save the certificate, as you will upload it later.

### Defining a Service Provider

To define the service provider:

1. Log in to Salesforce.
2. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
3. Click **New** in the *Connected Apps* section and for *Connected App Name*, enter *Google Apps*.
4. In the *Web App Settings* area, select **Enable SAML** and then enter the following information:

| Field        | Value                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------|
| ACS URL      | The URL for your Google App account, such as<br><code>https://www.google.com/a/respond.info</code> |
| Entity ID    | google.com                                                                                         |
| Subject Type | Federation ID                                                                                      |

5. Click **Save**.
6. To authorize access to this app, enter *Connected Apps* in the *Quick Find* box, select the option for managing connected apps, and then click the name of the application. Then select the current user's profile.
7. Copy the value in the *SP-Initiated Redirect Endpoint* field. You will use this value later.

## Mapping the Salesforce user to the Google Apps user

1. From your personal settings, enter *Advanced User Details* in the Quick Find box, then select **Advanced User Details**. No results? Enter *Personal Information* in the Quick Find box, then select **Personal Information**.
2. Click **Edit**.
3. For *Federation ID*, enter the username you use to sign into Google Apps, for example, JSmith@TGroup.com.
4. Click **Save**.

## Setting up Google Apps

1. Log in to your Google Apps account.
2. Click the **Advanced tools** tab, then the **Set up single sign-on (SSO)** link.
3. Check the *Enable Single Sign-on* checkbox.
4. For *Sign-in page URL*, enter the URL copied from the *SP-Initiated Redirect Endpoint* field, from [defining a service provider](#).
5. For *Sign-out page URL*, specify the URL where you want your users to go after they log out of Google Apps, such as, `http://www.mydomain.salesforce.com`.
6. For *Change password URL*, use the following URL:  
`https://mydomain.salesforce.com/_ui/system/security/ChangePassword`, where *mydomain* is the name you specified for your custom domain when you generated your domain.
7. For *Verification certificate*, upload the certificate you downloaded from [enabling an identity provider](#).
8. Click **Save Changes**.

## Testing Your Implementation

To verify that your Salesforce organization can use single sign-on to Google Apps:

1. Log out of Google Apps and Salesforce.
2. Try to access a Google app page, such as `http://docs.google.com/a/respond.info/` or `http://mail.google.com/a/respond.info/`.
3. You are redirected to a Salesforce sign-on page. After you login, you are at the specified Google app page.

An alternate test is to add the Google App to a web tab in your Salesforce organization.

1. Log in to Salesforce.
2. From Setup, enter *Tabs* in the Quick Find box, then select **Tabs**, then click **New** in the *Web Tabs* section.
3. Choose a tab layout and click **Next**.
4. Enter a label to display on the tab.
5. Use the default name. This is the same as the label.
6. Click the *Tab style* lookup icon to display the Tab Style Selector. Select an icon. Keep all other defaults.
7. Click **Next**.
8. In the *Button or Link URL* text box, enter a Google App page, such as `docs.google.com/a/respond.info/` or `mail.google.com/a/respond.info/`, then click **Next**.

 **Note:** This has to be an absolute URL, that is, it must contain either `http://` or `https://`.

9. Click **Next** and **Save**.
10. Click the new tab at the top of your page. You are automatically logged into the specified Google app page.

## Setting up Single Sign-on from Salesforce to Salesforce

This example shows how to set up a Salesforce app to initiate single sign-on from one Salesforce organization to another.

The initiating Salesforce organization, that is, the organization that you want to initially log into, acts as the *identity provider*. The Salesforce organization that you want to access using an app acts as the *service provider*. For example, suppose you have two Salesforce organizations: a sales organization and an ideas organization. You can set up single sign-on between the two organizations so your users only have to log into and remember the password for one.

For this example to work, your initiating Salesforce organization must be set up for single sign-on using SAML 2.0. The general steps are as follows, with more specifics on each of these steps.

1. [Generate a domain name and enable an identity provider](#) in the Salesforce organization that is acting as an identity provider.
2. [Set up the Salesforce organization](#) that is acting as a service provider.
3. [Define the service provider app](#) in the Salesforce organization that is acting as an identity provider.
4. [Test your implementation](#).

## Generating a Domain Name and Enabling an Identity Provider

All the work in the following steps is done on the Salesforce organization that is acting as the identity provider.

To prepare your Salesforce organization for this example, generate a domain name and enable Salesforce as an identity provider:

1. Log in to Salesforce.
2. Generate a domain name for your organization:
  - a. From Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**, enter a new subdomain name, and click **Check Availability**.
  - b. If the name is available, click the **Terms and Conditions** check box, then click **Register Domain**.
 

 **Important:** You must deploy your domain name before you can enable Salesforce as an identity provider.
3. Enable Salesforce as an identity provider:
  - a. From Setup, enter *Identity Provider* in the **Quick Find** box, then select **Identity Provider**.
  - b. Click **Enable**.
  - c. Click **Download Certificate**. Remember where you save the certificate, as you will upload it later.

## Setting up a Salesforce Organization as Service Provider

To configure a second Salesforce organization as the service provider:

1. Log in to the Salesforce organization that acts as the service provider.
2. Enable and configure SAML:
  - a. From Setup, enter *Single Sign-On Settings* in the **Quick Find** box, then select **Single Sign-On Settings**, then click **Edit**.
  - b. Select the **SAML Enabled** check box.
  - c. Use the following settings:

| Field                         | Value                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| SAML Version                  | 2.0                                                                                                                                               |
| Issuer                        | The identity provider issuer URL, created when the identity provider is set up. For example, <code>https://mycustomdomain.salesforce.com</code> . |
| Identity Provider Certificate | Browse for the certificate you downloaded in <a href="#">enabling an identity provider</a> .                                                      |
| SAML User ID Type             | Select Assertion contains the Federation ID from the User object                                                                                  |
| SAML User ID Location         | Select User ID is in the NameIdentifier element of the Subject statement                                                                          |

- d. Click **Save**.
  - e. Copy and save the values from the fields `Salesforce Login URL` and `Entity ID`. You need these values later, when defining the Salesforce service provider.
3. Link your user in the service provider organization to the user in the identity provider organization:
    - a. From your personal settings, enter *Advanced User Detail* in the `Quick Find` box, then select **Advanced User Detail**. No results? Enter *Personal Information* in the `Quick Find` box, then select **Personal Information**.
    - b. Click **Edit**.
    - c. For `Federation ID`, enter the username used to sign into the Salesforce identity provider organization, for example, `IDP_org@TGroup.com`.
    - d. Click **Save**.

### Defining the Service Provider in the Identity Provider Organization

To define the service provider, you create a SAML enabled Web App as a connected app:

1. Log in to the Salesforce organization that acts as the identity provider.
2. From Setup, enter `Apps` in the `Quick Find` box, then select **Apps**, then in the `Connected Apps` section, click **New**.
3. Specify the following information:

| Field              | Value                                                                             |
|--------------------|-----------------------------------------------------------------------------------|
| Connected App Name | Salesforce Service Provider                                                       |
| Contact Email      | Contact Salesforce should use for contacting you or your support team.            |
| Enable SAML        | Select this option to enter service provider details.                             |
| Entity Id          | Use the Entity ID from <a href="#">setting up the service provider</a>            |
| ACS URL            | Use the Salesforce Login URL from <a href="#">setting up the service provider</a> |

| Field        | Value           |
|--------------|-----------------|
| Subject Type | Select Username |

4. Click **Save**.
5. Select the profiles allowed to access this service provider. You must select the current user's profile for this example to work.
6. Click **Save**.
7. Copy down the value of the `IdP-Initiated Login URL` field. You will use this value later, in testing.

## Testing Your Implementation

To verify that your Salesforce organizations can use single sign-on to connect, create a web tab:

1. Log in to the Salesforce organization that is acting like a service provider.
2. From Setup, enter `Tabs` in the `Quick Find` box, then select **Tabs**, then click **New** in the `Web Tabs` section.
3. Choose a tab layout and click **Next**.
4. Enter a label to display on the tab.
5. Use the default name. This is the same as the label.
6. Click the `Tab Style` lookup icon to display the Tab Style Selector. Select an icon.
7. Click **Next**.
8. In the Button or Link URL text box, enter the value of the `IdP-Initiated Login URL` field from [defining the service provider](#), then click **Next**.
 

 **Note:** This has to be an absolute URL, that is, it must contain either `http://` or `https://`.
9. Click **Next**, then **Save**.
10. Click the new tab at the top of your page. If you have logged out of the Salesforce organization that acts as the identity provider, you are prompted to log in. Once you are logged in, you should see the Salesforce organization that acts as the identity provider in the tab.

## Configuring Remote Settings

Before any Visualforce page, Apex callout, or JavaScript code using XMLHttpRequest in an s-control or custom button can call an external site, that site must be registered in the Remote Site Settings page, or the call will fail.

To access the page, from Setup, enter *Remote Site Settings* in the Quick Find box, then select **Remote Site Settings**. This page displays a list of any remote sites already registered and provides additional information about each site, including remote site name and URL.

For security reasons, Salesforce restricts the outbound ports you may specify to one of the following:

- 80: This port only accepts HTTP connections.
- 443: This port only accepts HTTPS connections.
- 1024–66535 (inclusive): These ports accept HTTP or HTTPS connections.

To register a new site:

1. Click **New Remote Site**.
2. Enter a descriptive term for the *Remote Site Name*.
3. Enter the URL for the remote site.
4. To allow access to the remote site regardless of whether the user's connection is over HTTP or HTTPS, select the *Disable Protocol Security* checkbox. When selected, Salesforce can pass data from an HTTPS session to an HTTP session, and vice versa. Only select this checkbox if you understand the security implications.
5. Optionally, enter a description of the site.
6. Click **Save** to finish, or click **Save & New** to save your work and begin registering an additional site.

## Named Credentials

### Named Credentials

A named credential specifies the URL of a callout endpoint and its required authentication parameters in one definition. You can simplify the setup of authenticated Apex callouts by specifying a named credential as the callout endpoint. You can instead specify a URL as the callout endpoint and register that URL in your organization's remote site settings. In that case, however, you handle the authentication in your code. Doing so can be less secure and especially complicated for OAuth authentication.

Salesforce manages all the authentication for Apex callouts that specify a named credential as the callout endpoint, so that your code doesn't have to. You can also skip remote site settings, which are otherwise required for Apex callouts to external sites.

By separating the endpoint URL and authentication from the Apex code, named credentials make callouts easier to maintain. For example, if an endpoint URL changes, you simply update the named credential. All callouts that reference the named credential then continue to work without any changes to the code.

If you have multiple organizations, you can create a named credential with the same name in each organization. Each of these named credentials can have a different endpoint URL, for example, to accommodate differences in development and production environments. Because the code references only the named credential's name, you can package and deploy the same Apex class in all your organizations without programmatically checking the environment.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Visualforce and S-controls are not available in **Database.com**

### USER PERMISSIONS

To configure remote settings:

- "Modify All Data"

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

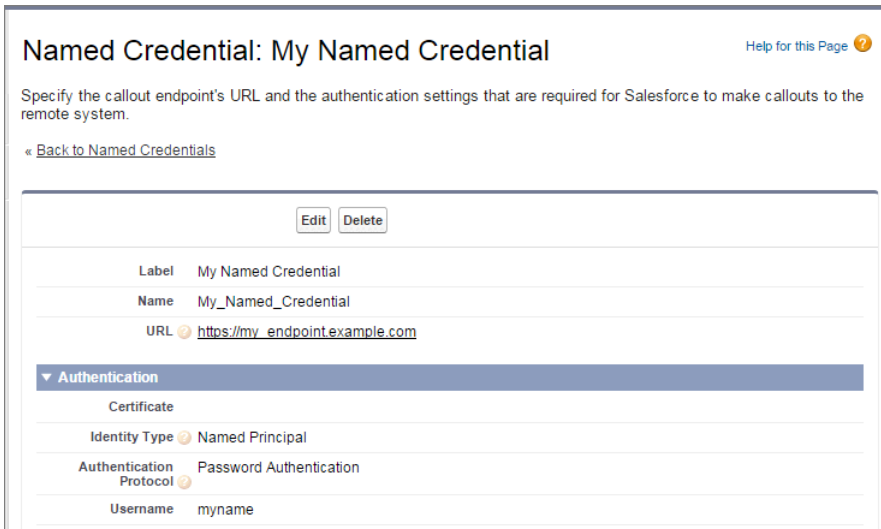

Available in all editions

Named credentials support basic password authentication and OAuth 2.0. You can set up each named credential to use an organization-wide named principal or to use per-user authentication so that users can manage their own credentials.

 **Example:** In the following sample code, a named credential and an appended path specify the callout's endpoint.

```
HttpRequest req = new HttpRequest();
req.setEndpoint('callout:My_Named_Credential/some_path');
req.setMethod('GET');
Http http = new Http();
HTTPResponse res = http.send(req);
System.debug(res.getBody());
```

The referenced named credential specifies the endpoint URL and the authentication settings.

The screenshot shows the configuration page for a named credential. The title is "Named Credential: My Named Credential" with a "Help for this Page" link. Below the title is a description: "Specify the callout endpoint's URL and the authentication settings that are required for Salesforce to make callouts to the remote system." There is a "Back to Named Credentials" link. The main configuration area includes "Edit" and "Delete" buttons. The fields are: Label (My Named Credential), Name (My\_Named\_Credential), URL (https://my\_endpointexample.com), Authentication (expanded to show Certificate, Identity Type (Named Principal), Authentication Protocol (Password Authentication), and Username (myname)).

You can code the callout endpoint as the URL instead of the named credential, but your code then handles the authentication. Our example uses basic password authentication, but keep in mind that OAuth authentication is much more complex and is an ideal use case for named credentials.

```
HttpRequest req = new HttpRequest();
req.setEndpoint('https://my_endpoint.example.com/some_path');
req.setMethod('GET');

// Because we didn't set the endpoint as a named credential,
// our code has to specify:
// - The required username and password to access the endpoint
// - The header and header information

String username = 'myname';
String password = 'mypwd';

Blob headerValue = Blob.valueOf(username + ':' + password);
String authorizationHeader = 'BASIC ' +
EncodingUtil.base64Encode(headerValue);
req.setHeader('Authorization', authorizationHeader);

// Create a new http object to send the request object
```

```
// A response object is generated as a result of the request

Http http = new Http();
HTTPResponse res = http.send(req);
System.debug(res.getBody());
```

## Define a Named Credential

Create a named credential to specify the URL of a callout endpoint and its required authentication parameters in one definition. You can then specify the named credential as an Apex callout endpoint to let Salesforce handle all the authentication. You can also skip remote site settings, which are otherwise required for Apex callouts to external sites.

1. From Setup, enter *Named Credentials* in the **Quick Find** box, then select **Named Credentials**.
2. Click **New Named Credential**, or click **Edit** to modify an existing named credential.
3. Complete the fields.

| Field | Description                                                                                                                                                                                                                                                                                                                                                  |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Label | <p>A user-friendly name for the named credential that's displayed in the Salesforce user interface, such as in list views.</p> <p>If you set <b>Identity Type</b> to <b>Per User</b>, this label appears when your users view or edit their authentication settings for external systems.</p>                                                                |
| Name  | <p>A unique identifier that's used to refer to this named credential from Apex callouts and through the API.</p> <p>The name can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>                              |
| URL   | <p>The URL or root URL of the callout endpoint. Must begin with <i>http://</i> or <i>https://</i>.</p> <p>You can append a specific path in each Apex callout. For example, if you create a named credential that's named "My_Example" and set the URL to <i>https://my.example.com</i>, you can set the Apex callout to use a specific path as follows.</p> |

```
HttpRequest req = new HttpRequest();
req.setEndpoint('callout:My_Example/my/appended/path');
```

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

### USER PERMISSIONS

To view, create, edit, or delete named credentials:

- "Modify All Data"

| Field         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Certificate   | If you specify a certificate, your Salesforce organization supplies it when establishing each two-way SSL connection with the external system. The certificate is used for digital signatures, which verify that requests are coming from your organization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Identity Type | <p>Determines whether you're using one set or multiple sets of credentials to access the external system.</p> <ul style="list-style-type: none"> <li>Anonymous: No identity and therefore no authentication.</li> <li>Per User: Use separate credentials for each user who accesses the external system via callouts. Select this option if the external system restricts access on a per-user basis.           <p>After you grant user access through permission sets or profiles in Salesforce, users can manage their own authentication settings for external systems in their personal settings.</p> </li> <li>Named Principal: Use the same set of credentials for all users who access the external system from your organization. Select this option if you have one designated user account on the external system that can be used by all your organization's users to connect to the external system.</li> </ul> |

4. Select the authentication protocol.

- If you select **OAuth 2.0**, complete the following fields.

| Field                             | Description                                                         |
|-----------------------------------|---------------------------------------------------------------------|
| Authentication Provider           | Choose the provider that was created for this named credential.     |
| Scope                             | Specifies the scope of permissions to request for the access token. |
| Start Authentication Flow on Save | Select to test the credentials when you click <b>Save</b> .         |

- If you select **Password Authentication**, enter the username and password for accessing the external system.
 

If you selected Per User for `Identity Type`, administration credentials are still required for your organization to access the external system.

5. If you want to use custom headers or bodies in the callouts, enable the relevant options.

| Field                         | Description                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Generate Authorization Header | <p>By default, Salesforce automatically generates an authorization header and applies it to each callout that references the named credential.</p> <p>Deselect this option only if one of the following statements applies.</p> <ul style="list-style-type: none"> <li>The remote endpoint doesn't support authorization headers.</li> </ul> |

| Field                             | Description                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                   | <ul style="list-style-type: none"> <li>The authorization headers are provided by other means. For example, in Apex callouts, the developer can have the code construct a custom authorization header for each callout.</li> </ul>                                                                                                             |
| Allow Merge Fields in HTTP Header | <p>In each Apex callout, the code specifies how the HTTP header and request body are constructed. For example, the Apex code can set the value of a cookie in an authorization header.</p> <p>These options enable the Apex code to use merge fields to populate the HTTP header and request body with org data when the callout is made.</p> |
| Allow Merge Fields in HTTP Body   |                                                                                                                                                                                                                                                                                                                                               |

To create Apex callouts to a named credential, use this format for the `endpoint` parameter in the `setEndpoint` method.

```
HttpRequest req = new HttpRequest();
req.setEndpoint('callout:My_Named_Credential/some_path');
```

## Grant Access to Authentication Settings for Named Credentials

For named credentials that use per-user authentication, grant access to users through permission sets and profiles. Doing so lets users set up and manage their own authentication settings for accessing the external system.

- From Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets** or **Profiles**.
- Click the name of the permission set or profile that you want to modify.
- Do one of the following.
  - For a permission set, or for a profile in the enhanced profile user interface, click **Named Credential Access** in the Apps section. Then click **Edit**.
  - For a profile in the original profile user interface, click **Edit** in the Enabled Named Credential Access section.
- Add the named credentials that you want to enable.
- Click **Save**.

# Identity Connect

## About Identity Connect

Identity Connect provides Active Directory integration.

Identity Connect provides Active Directory integration with Salesforce via a service which runs on either Windows or Linux platforms. This integration includes syncing Active Directory users with either Salesforce or Identity Connect acting as the Identity Service Provider (IDP) for Single Sign On (SSO) Active Directory integration when logging into Salesforce.

SEE ALSO:

- [Salesforce Identity Connect Implementation Guide](#)
- [Installing Identity Connect](#)
- [Enabling Identity Connect](#)

## Installing Identity Connect

Your organization must have at least one Identity Connect license. To obtain Identity Connect, contact Salesforce.

The Identity Connect software will typically be installed on a server by your IT department. Each user does not need to install Identity Connect individually.

1. From Setup, enter *Identity Connect* in the **Quick Find** box, then select **Identity Connect**.

 **Note:** **Identity Connect** doesn't appear in Setup until Salesforce adds the feature to your organization.

2. Click the download link that corresponds to your operating system.
3. Install the software according to the [Salesforce Identity Connect Implementation Guide](#).

SEE ALSO:

- [About Identity Connect](#)
- [Enabling Identity Connect](#)

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available for an additional cost in: **Enterprise**, **Performance**, and **Unlimited** Editions. **Developer** Edition includes 10 Identity Connect permission set licenses.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available for an additional cost in: **Enterprise**, **Performance**, and **Unlimited** Editions. **Developer** Edition includes 10 Identity Connect permission set licenses.

### USER PERMISSIONS

To install Identity Connect:

- "Manage Users"

## Enabling Identity Connect

To obtain Identity Connect, contact Salesforce.

To enable Identity Connect for a user:

1. [Assign the Identity Connect license to the user.](#)
2. Create a permission set and add the “Use Identity Connect” permission to it.
3. Assign the permission set to the user.

Walk Through It: create, edit, and assign a permission set

## Monitor Your Organization

### About the System Overview Page

 **Note:** The system overview page shows only the items enabled for your organization. For example, your system overview page shows workflow rules only if workflow is enabled for your organization.

The system overview page shows usage data and limits for your organization, and displays messages when you reach 95% of your limit (75% of portal roles). Click the numbers under each metric to get more details about your usage. If it’s available, use Checkout to increase usage limits for your organization. For example, if your organization reaches the limit for custom objects, the system overview page notifies you with a message link. Click the link to clean up any unused objects, or visit Checkout to increase your limit for objects.

To access the system overview page, from Setup, enter *System Overview* in the Quick Find box, then select **System Overview**.

The system overview page displays usage for:

#### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available for an additional cost in: **Enterprise**, **Performance**, and **Unlimited** Editions. **Developer** Edition includes 10 Identity Connect permission set licenses.

#### USER PERMISSIONS

To assign a permission set license:

- “Manage Internal Users”

To create and assign permission sets:

- “Manage Profiles and Permission Sets”

To view users that are assigned to a permission set:

- “View Setup and Configuration”

#### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: All Editions except **Personal** Edition

#### USER PERMISSIONS

To access the system overview page:

- “Customize Application”

- [Schema](#)
- [API usage](#)
- [Business logic](#)
- [User interface](#)
- [Most used licenses](#)
- [Portal roles](#)

 **Note:** The object limit percentages are truncated, not rounded. For example, if your organization uses 95.55% of the limit for a particular customization, the object limit displays 95%.

## System Overview: Schema

The Schema box in the system overview page shows usage information for:

- Custom objects

 **Note:** Soft-deleted custom objects and their data count against your limits. We recommend that you hard delete or erase custom objects you no longer need.

- Data storage

## System Overview: API Usage

The API Usage box in the system overview page shows usage information for API requests in the last 24 hours.

Limits are enforced against the aggregate of all API calls made by the organization in a 24 hour period; limits are not on a per-user basis. When an organization exceeds a limit, all users in the organization may be temporarily blocked from making additional calls. Calls will be blocked until usage for the preceding 24 hours drops below the limit.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: All Editions except **Personal** Edition

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

## System Overview: Business Logic

The Business Logic box in the system overview page shows usage information for:

- Rules
- Apex triggers
- Apex classes
- Code used: Total number of characters in your Apex triggers and Apex classes (excluding comments, test methods, and @isTest annotated classes).

## System Overview: User Interface

The User Interface box in the system overview page shows usage information for:

- Custom apps
- Site.com sites: We only count published Site.com sites.
- Active Force.com sites
- Flows: We only count active flows.
- Custom tabs
- Visualforce pages

## System Overview: Most Used Licenses

The Most Used Licenses box in the system overview page counts only active licenses, and by default shows the top three used licenses for your organization. Any license that reaches 95% usage also appears. Click **Show All** to view all the licenses for your organization.

## System Overview: Portal Roles

The Portal Roles box in the system overview page shows the usage data and limit for total partner portal, Customer Portal, and Communities roles. The system overview page displays a message when your organization reaches 75% of its allotted portal roles.

-  **Note:** The maximum number of portal roles for an organization is 5000. This limit includes portal roles associated with all of the organization's customer portals, partner portals, or communities. To prevent unnecessary growth of this number, we recommend reviewing and reducing the number of roles for each of your portals and communities. Additionally, delete any unused portal roles. If you still require more portal roles, please contact Salesforce Customer Support.

## Monitoring Resources

### Items that Require Storage

Storage is divided into two categories: file storage and data storage. File storage includes files in attachments, the Documents tab, the Files tab, the File field, Salesforce CRM Content, Chatter files (including user photos), and Site.com assets. Data storage includes the following:

- Accounts
- Article types (format: "[Article Type Name]")
- Article type translations (format: "[Article Type Name] Version")
- Campaigns
- Campaign Members
- Cases
- Case Teams
- Contacts
- Contracts
- Custom objects
- Email messages
- Events
- Forecast items
- Google docs
- Ideas
- Leads
- Notes
- Opportunities
- Opportunity Splits
- Orders
- Quotes
- Quote Template Rich Text Data

#### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

- Performance
- Unlimited
- Developer

#### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

#### USER PERMISSIONS

To view storage usage:

- "Manage Internal Users"

- Solutions
- Tags: Unique tags
- Tasks

## Storage Capacity

For file storage, Contact Manager, Group, Professional, Enterprise, Performance, and Unlimited Editions are allocated a per-user limit multiplied by the number of users in the organization plus an additional per-organization allocation. For example, a Professional Edition organization with 10 users receives 11 GB of file storage, or 100 MB per user multiplied by 10 users plus an additional 10 GB. A Professional Edition organization with 100 users receives 20 GB of file storage, or 100 MB per user multiplied by 100 users plus an additional 10 GB.

For data storage, Contact Manager, Group, Professional, Enterprise, Performance, and Unlimited Editions are allocated either 1 GB or a per-user limit, whichever is greater. For example, a Professional Edition organization with 10 users receives 1 GB because 10 users multiplied by 20 MB per user is 200 MB, which is less than the 1 GB minimum. A Professional Edition organization with 100 users receives more than the 1 GB minimum because 100 users multiplied by 20 MB per user is 2,000 MB.

The values in the Storage Allocation Per User License column below apply to Salesforce and Salesforce Platform user licenses.

| Salesforce Edition | Data Storage Minimum Per Organization | Data Storage Allocation Per User License | File Storage Allocation Per Organization                            | File Storage Allocation Per User License |
|--------------------|---------------------------------------|------------------------------------------|---------------------------------------------------------------------|------------------------------------------|
| Contact Manager    | 1 GB                                  | 20 MB                                    | 10 GB + the greater of 1 GB or combined per-user storage allocation | 100 MB                                   |
| Group              | 1 GB                                  | 20 MB                                    | 10 GB + the greater of 1 GB or combined per-user storage allocation | 100 MB                                   |
| Professional       | 1 GB                                  | 20 MB                                    | 10 GB + the greater of 1 GB or combined per-user storage allocation | 100 MB                                   |
| Enterprise         | 1 GB                                  | 20 MB                                    | 10 GB + the greater of 1 GB or combined per-user storage allocation | 100 MB                                   |
| Performance        | 1 GB                                  | 120 MB                                   | 10 GB + the greater of 1 GB or combined per-user storage allocation | 100 MB                                   |
| Unlimited          | 1 GB                                  | 120 MB                                   | 10 GB + the greater of 1 GB or combined per-user storage allocation | 100 MB                                   |
| Developer          | 5 MB                                  | N/A                                      | 20 MB                                                               | N/A                                      |
| Personal           | 20 MB (approximately 10,000 records)  | N/A                                      | 20 MB                                                               | N/A                                      |

If your organization uses custom user licenses, contact Salesforce to determine if these licenses provide additional storage. For a description of user licenses, see [User Licenses Overview](#).

## Viewing Storage Usage

To view your organization's current storage usage from Setup, enter *Storage Usage* in the *Quick Find* box, then select **Storage Usage**. You can view the available space for data storage and file storage, the amount of storage in use per record type, the top users according to storage utilization, and the largest files in order of size. To view what types of data a particular user is storing, click that user's name.

In all Editions except Personal Edition, administrators can view storage usage on a user-by-user basis:

1. From Setup, enter *Users* in the *Quick Find* box, then select **Users**.
2. Click the name of any user.
3. Click **View** next to the *Used Data Space* or *Used File Space* fields to view that user's storage usage by record type.

Data storage and file storage are calculated asynchronously and your organization's storage usage isn't updated immediately, if you import or add a large number of records or files.

Individual users can view their own storage usage in their personal information.

## Increasing Storage

When you need more storage, increase your storage limit or reduce your storage usage.

- Purchase additional storage space, or add user licences in Professional, Enterprise, Unlimited, and Performance Editions.
- Delete outdated leads or contacts.
- Remove any unnecessary attachments.
- Delete files in Salesforce CRM Content.

## Storage Considerations

When planning your storage needs, keep in mind:

- Person accounts count against both account and contact storage because the API considers each person account to consist of one account as well as one contact.
- Archived activities count against storage.
- Active or archived products, price books, price book entries, and assets don't count against storage.

## Monitor Login History

Administrators can monitor all login attempts for their organization and enabled portals or communities. The login history page displays the most recent 20,000 attempts. To see more records, download the information to a CSV or GZIP file.

### Download Login History

You can download the past six months of user logins to your Salesforce organization to a CSV or GZIP file.

1. From Setup, enter *Login History* in the **Quick Find** box, then select **Login History**.
2. Select the file format to download.
  - **Excel csv file:** Download a CSV file of all user logins to your Salesforce organization for the past six months. This report includes logins through the API.
  - **gzipped Excel csv file:** Download a CSV file of all user logins to your Salesforce organization for the past six months. This report includes logins through the API. The file is compressed, which is the preferred option for quickest download time.
3. Select the file contents. All Logins includes API access logins.
4. Click **Download Now**.

 **Note:** Older versions of Microsoft Excel can't open files with more than 65,536 rows. If you can't open a large file in Excel, see the [Microsoft Help and Support article about handling large files](#).

### Create List Views

You can create new list views sorted by login time and login URL. For example, you can create a view of all logins between a particular time range. Like the default view, a custom view displays the most recent 20,000 logins.

1. On the Login History page, click **Create New View**.
2. Enter the name to appear in the View drop-down list.
3. Specify the filter criteria.
4. Select the fields to display.

You can choose up to 15 fields. You can display only the fields that are available in your page layout. Text area fields display up to 255 characters.

 **Note:** Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) may vary.

### View Your Login History

You can view your personal login history.

1. From your personal settings, enter *Login History* in the **Quick Find** box, then select **Login History**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
2. To download a CSV file of your login history for the past six months, click **Download...**

#### EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Developer
- Enterprise
- Group
- Performance
- Professional
- Unlimited

#### USER PERMISSIONS

To monitor logins:

- "Manage Users"

 **Note:** For security purposes, Salesforce may require users to pass a CAPTCHA user verification test to export data from their organization. This simple text-entry test prevents malicious programs from accessing your organization's data. To pass the test, users must correctly type the two words displayed on the overlay into the overlay's text box field. Note that the words entered into the text box field must be separated by a space.

## Single Sign-On with SAML

If your organization uses SAML single sign-on identity provider certificates, single sign-on logins appear in the history.

## My Domain

If you are using My Domain, you can identify which users are logging in with the new login URL and when. From Setup, enter *Login History* in the **Quick Find** box, then select **Login History** and view the Username and Login URL columns.

SEE ALSO:

[Find Your Personal Settings](#)

## Monitoring Training History

As an administrator, it is important to know that your team is learning how to use Salesforce effectively. The Training Class History shows you all of the Salesforce training classes your users have taken.

Administrators can view the Training Class History from Setup by entering *Training History* in the **Quick Find** box, then selecting **Training History**. After taking a live training class, users must submit the online training feedback form to have their training attendance recorded in the training history.

 **Note:** If you don't see this link under **Manage Users**, your organization has been migrated to a new system. You need to be a Help & Training Admin to access the training reports via My Cases in Help & Training. Contact Salesforce if you do not have this access.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Database.com

### USER PERMISSIONS

To view training history:

- "Manage Users"

## Monitor Setup Changes

The setup audit trail history helps you track the recent setup changes that you and other administrators have made to your organization. Audit history can be especially useful in organizations with multiple administrators.

To view the setup audit trail history, from Setup, enter *View Setup Audit Trail* in the **Quick Find** box, then select **View Setup Audit Trail**. To download your organization's full setup history for the past 180 days, click the **Download** link.

The setup audit trail history shows you the 20 most recent setup changes made to your organization. It lists the date of the change, who made it, and what the change was. Additionally, if a delegate (such as an administrator or customer support representative) makes a setup change on behalf of an end-user, the Delegate User column shows the delegate's username. For example, if a user grants login access to an administrator and the administrator makes a setup change, the administrator's username is listed.

The setup audit trail history tracks the following types of changes:

| Setup          | Changes Tracked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Track Field History

You can select certain fields to track and display the field history in the History related list of an object. The field history data is retained for up to 18 months. You can track the field history of custom objects and the history of the following standard objects.

- Accounts
- Assets
- Cases
- Contacts
- Entitlements
- Service contracts
- Contract line items
- Contracts
- Leads
- Opportunities
- Articles
- Solutions
- Products

Modifying any of these fields adds an entry to the History related list. All entries include the date, time, nature of the change, and who made the change. Not all field types are available for historical trend reporting. Certain changes, such as case escalations, are always tracked.

 **Note:** Field history increases beyond your current limits require purchasing the Field Audit Trail add-on following the Spring '15 release. When the add-on subscription is enabled, your field history storage is changed to reflect the retention policy associated with the offering. If your org was created prior to June 2011 and your field history limits remain static, Salesforce commits to retain your field history without a limit. If your org was created after June 2011 and you decide not to purchase the add-on, field history is retained for a maximum of 18 months.

## Considerations

- Changes to fields with more than 255 characters are tracked as edited, and their old and new values are not recorded.
- Tracked field values are not automatically translated; they display in the language in which they were made. For example, if a field is changed from *Green* to *Verde*, *Verde* is displayed no matter what a user's language is, unless the field value has been translated into other languages via the Translation Workbench. This also applies to record types and picklist values.
- Changes to custom field labels that have been translated via the Translation Workbench are shown in the locale of the user viewing the History related list. For example, if a custom field label is *Red* and translated into Spanish as *Rojo*, then a user with a Spanish locale sees the custom field label as *Rojo*. Otherwise, the user sees the custom field label as *Red*.
- Changes to date fields, number fields, and standard fields are shown in the locale of the user viewing the History related list. For example, a date change to *August 5, 2012* shows as *8/5/2012* for a user with the English (United States) locale, and as *5/8/2012* for a user with the English (United Kingdom) locale.

### EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

Standard Objects are not available in **Database.com**

- If a trigger causes a change on an object the current user doesn't have permission to edit, that change is not tracked because field history honors the permissions of the current user.

## Track Field History for Standard Objects

If you use both business accounts and person accounts, review the following before enabling account field history tracking:

- Field history tracking for accounts affects both business accounts and person accounts.
- Enabling field history tracking on person accounts does not enable field history tracking on personal contacts.

To set up field history tracking:

1. From the management settings for the object whose field history you want to track, go to the fields area.
2. Click **Set History Tracking**.

**Tip:** When you enable tracking for an object, customize your page layouts to include the object's history related list.

3. For accounts, contacts, leads, and opportunities, select the `Enable Account History`, `Enable Contact History`, `Enable Lead History`, or `Enable Opportunity History` checkbox.
4. Choose the fields you want tracked.

You can select a combination of up to 20 standard and custom fields per object. This limit includes fields on business accounts and person accounts.

Certain changes, such as case escalations, are always tracked.

You can't track the following fields:

- `Formula`, `roll-up summary`, or `auto-number` fields
- `Created By` and `Last Modified By`
- `Expected Revenue` field on opportunities
- `Master Solution Title` or the `Master Solution Details` fields on solutions; these fields display only for translated solutions in organizations with multilingual solutions enabled.

5. Click **Save**.

Salesforce tracks history from this date and time forward. Changes made prior to this date and time are not included.
