For example, if you are a sales manager, you might wish to see “Pipeline amount” as a line and “Number of open deals” as vertical bars, on the same chart.

1. Edit the chart for any summary or matrix report, or edit a dashboard component that displays a summary or matrix report.
2. Choose a chart type that allows combination charts:
 - Bar chart
 - Column chart

EDITIONS

Available in: Salesforce Classic

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To create, edit, and delete reports:

- “Create and Customize Reports”
- AND
- “Report Builder”

- Grouped column chart
- Stacked column chart
- Line chart
- Cumulative line chart

3. Select the **Plot additional values** checkbox. The chart preview updates as you configure your combination chart.
4. Select a `Value` to plot on the chart.
5. Choose a `Display` option. Available options differ based on your chart type and whether you're editing a chart or a dashboard component.
 - For columns or bars, click **Add Bar** or **Add Column** links to add up to three sets.
 - When adding a line to a vertical column chart, select **Use second axis** to show a separate axis for the added line on the right side of the column chart. A separate axis can be useful when the two values have different ranges or units.

 **Note:** Selecting **Use second axis** makes more values available in the `Value` drop-down list. Without this option, you can only pick from values of the same type as the primary Y-axis—for example, number, currency, or percentage. This option is only available for certain combination charts.

6. Once you've set up your report, click **Run Report** or **Save**.

Note:

- If you lose access to a field used in a chart, another field may be used in its place. If no other fields are available, record count is used.
- To show combination charts in a dashboard, use the `Use chart as defined in source report` option.
- Filtered drill-down doesn't work for combination charts in dashboards.

[Add a Chart to a Report](#)

[Combination Chart Examples](#)

Combination Chart Examples

Use a combination chart to show multiple values against a single axis range, show two chart types together, or compare two continuous summary values.

A *combination chart* plots multiple sets of data on a single chart.

Column-on-Column

Add columns to a column chart to show multiple values against a single axis range.

To create the chart in this example, choose the Vertical Column chart type, set the opportunity sum of amount as the `Y-Axis`, stage as the `X-Axis`, and use the **Plot additional values** option to add the sum of expected revenue as a column.

You can quickly compare the actual values against the expected values for each stage.

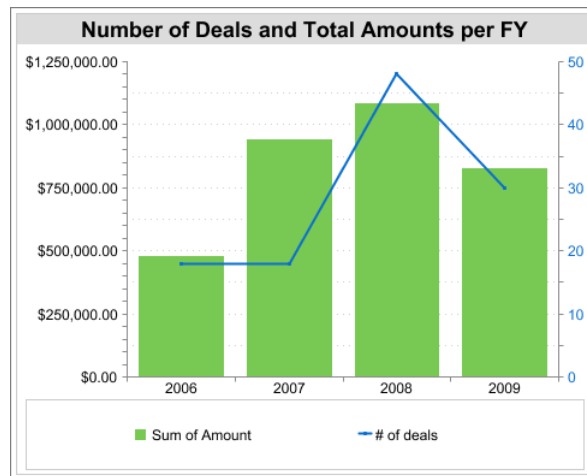

Line-on-Column

Add a line to a column chart to show two chart types together. Using a second axis allows you to add different types of values to the chart.

To create the chart in this example, choose the Vertical Column chart type, set the opportunity sum of amount as the *Y-Axis*, fiscal year as the *X-Axis*, and use the **Plot additional values** option to add the number of deals as a line. Summary values of different types won't be available in the *Values* drop-down list unless you select **Use second axis**.

You can see both the total amount and number of deals for each year on a single chart.

Line-on-Line

Add a line to a line chart to compare two continuous summary values.

To create the chart in this example, set up a custom summary formula to calculate a three-week moving average of opportunity amounts, then choose the Line chart type, set the opportunity sum of amount as the *Y-Axis*, date as the *X-Axis*, and use the **Plot additional values** option to add the calculated three-week moving average as a line.

You can compare sales against the moving average over time.

The custom summary formula used in this example is shown here:

```
(OppProductTrends__c.Amount__c:SUM+ PREVGROUPVAL (OppProductTrends__c.Amount__c:SUM, OppProductTrends__c.as_of_date__c) + PREVGROUPVAL (OppProductTrends__c.Amount__c:SUM, OppProductTrends__c.as_of_date__c, 2)) / 3
```

Chart Formatting Options

Control the appearance and behavior of your chart using these options.

Field	Description
Chart Title	Enter a name for the chart.
Title Color	Select the color for the text of your chart title.
Title Size	Select the font size for the text of your chart title. The maximum size is 18. Larger values are shown at 18 points.
Text Color	Select a color for all the text and labels in your chart.
Text Size	Select a font size for all the text and labels in your chart. The maximum size is 18. Larger values are shown at 18 points.
Background Fade	Choose a direction for a gradient color background. Also select a Start Color and End Color for the gradient. Use white for both if you do not want a background design.
Legend Position	Choose a place to display the legend in relation to your chart.
Combine Small Groups into "Others"	Combine all groups less than or equal to 3% of the total into a single "Others" wedge or segment. Deselect to show all values individually on the chart. This only applies to pie, donut, and funnel charts. This option is on by default for pie and donut charts, and off for funnel.
X- or Y-Axis Range	Choose a manual or automatic axis range for bar, line, or column charts. If you choose manual, enter numbers for the minimum and maximum axis values to be displayed. If there are data points outside

Field	Description
	the range that you set, the axis automatically extends to include those values when you generate the chart.
Show Axis Labels	Display labels for each axis of your chart. This only applies to bar and line charts.
Show Labels	Display labels for your pie, donut, or funnel chart.
Show Group %	Display the percentage value for each group in the chart.
Show X- or Y-Axis Values	Display the values of individual records or groups on the chart axis. This only applies to certain horizontal bar and vertical column charts.
Show Values	Display the values of individual records or groups on the chart. This only applies to certain chart types.
Show Wedge %	Display the percentage value for each wedge of pie and donut charts.
Show Total	Display the total value for the donut chart.
Show Segment %	Display the percentage value for each segment of funnel charts.
Show Details on Hover	Display values, labels, and percentages when hovering over charts. Hover details depend on chart type. Percentages apply to pie, donut, and funnel charts only. Hover is disabled when viewing charts that have more than 200 data points.
Chart Size	Select a size for the chart, from Tiny to Extra Large.
Chart Position	Place the chart above or below your report.

Show Report Data in Tables

To help readers scan for data easily, try hiding details and ranges, limiting the number of results shown, and highlighting with color. You can also show your table in a dashboard component.

IN THIS SECTION:

1. [Show and Hide Report Details](#)

You can show or hide report details from either the run reports page or the report builder. When you hide details, individual records don't display in the report. Groupings, summary formulas, and record counts remain visible.

2. [Highlight Data Ranges](#)

Highlight field values on summary or matrix reports based on ranges and colors you specify. To enable conditional highlighting, your report must contain at least one summary field or custom summary formula.

3. [Use a Tabular Report in a Dashboard](#)

You can use a tabular report as the source report for a dashboard table or chart component, if you limit the number of rows it returns.

4. [Limit Report Results](#)

Set limits to the scope of your report to avoid processing too many records. The built-in choices for limiting your results vary according to the object you are reporting on.

SEE ALSO:

[Highlight Data Ranges](#)

[Limit Report Results](#)

[Show and Hide Report Details](#)

[Use a Tabular Report in a Dashboard](#)

Show and Hide Report Details

You can show or hide report details from either the run reports page or the report builder. When you hide details, individual records don't display in the report. Groupings, summary formulas, and record counts remain visible.

- From the run reports page, click **Hide Details** to hide individual records. Click **Show Details** to show all records.
- From the report builder, click **Show > Details**. A check mark beside the **Details** menu item means that details are displayed. Click **Details** to toggle between showing or hiding records.

SEE ALSO:

- "Run Reports"

To create, edit, and delete reports:

- "Create and Customize Reports"

AND

"Report Builder"

Highlight Data Ranges

Highlight field values on summary or matrix reports based on ranges and colors you specify. To enable conditional highlighting, your report must contain at least one summary field or custom summary formula.

To set conditional highlighting, click **Show > Conditional Highlighting** in report builder, then set the breakpoint values and their range colors as follows:

Field	Description
Summary	Choose a summary field whose number ranges you want represented by colors.
Low Color	Select a color to represent data that falls below the Low Breakpoint value.
Low Breakpoint	The number that acts as the threshold between the Low Color and the Mid Color. Values that are exactly the same as the Low Breakpoint value are shown as the Mid Color.
Mid Color	Select a color to represent data that falls between the Low Breakpoint and High Breakpoint values.
High Breakpoint	The number that acts as the threshold between the Mid Color and the High Color. Values that are exactly the same as the High Breakpoint value are shown as the High Color.
High Color	Select a color to represent data that falls above the High Breakpoint value.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To create, edit, and delete reports:

- “Create and Customize Reports”

AND

“Report Builder”

Use a Tabular Report in a Dashboard

You can use a tabular report as the source report for a dashboard table or chart component, if you limit the number of rows it returns.

1. Click **Add > Row Limit**.
2. Set the `Row Limit` to `10`, `25`, or `Custom`. If you choose custom enter a number between one and 99.
3. Set the `Sort By` and sort order options. If you chose **Limit Rows by this Field** for a column, these options are already set.
4. Click **OK**.
5. Click **Dashboard Settings** in the toolbar.
6. Choose a `Name` and `Value` to use in dashboard tables and charts. Tables show both name and value. Charts are grouped by name.
7. Click **OK**. You can now use this tabular report as the source report for a dashboard component.

 **Tip:** When you create a dashboard component to display your tabular report, you can use the dashboard component editor to override the settings you chose in **Dashboard Settings**.

SEE ALSO:

[Dashboards Help You Visualize Complex Information](#)
[Filter Your Report Data](#)

Limit Report Results

Set limits to the scope of your report to avoid processing too many records. The built-in choices for limiting your results vary according to the object you are reporting on.

- To see a collapsed view of a report showing only the headings, subtotals, and total in report builder, deselect **Show > Details**.
On the report run page, click **Hide Details** or **Show Details** at the top of the report.
- To filter by a field, click **Add > Field Filter**. With tabular, summary, and matrix reports, you can drag a field from the Fields pane to the Filters pane to add a report filter.
- Cross filters work like ordinary filters, but they have some special characteristics of their own. To add one, click **Add > Cross Filter**.
- In Professional, Enterprise, Unlimited, Performance, and Developer edition organizations, the **Hierarchy** links let you browse report results based on the role or territory hierarchies.
- If your organization uses divisions to segment data and you have the “Affected by Divisions” permission, use the Division drop-down list to include records in just one division or all divisions. Select `Current` to show records in your current working division. Reports that are already scoped (such as My Cases or My team’s accounts) include records in all divisions, and you can’t further limit them to a specific division. If you do not have the “Affected by Divisions” permission, your reports include records in all divisions.
- You can set the maximum number of records to display in a tabular report by clicking **Add > Row Limit** in report builder. Set the number of rows, then choose a field to sort by, and the sort order. [Limiting rows on a tabular report](#) allows you to use it as a source report for dashboard table and chart components.

EDITIONS

USER PERMISSIONS

To create, edit, and delete reports:

- “Create and Customize Reports”

AND

“Report Builder”

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To create, edit, and delete reports:

- “Create and Customize Reports”

AND

“Report Builder”

The `Row Limit` option on tabular reports shows only fields from the primary object on reports created from custom report types where object A may or may not have object B. For example, in an accounts with or without contacts report, only fields from accounts are shown. Fields from objects after a may-or-may-not association on custom report types aren't shown. For example, in an accounts with contacts with or without cases report, only fields from accounts and contacts are available to use. If you change the report format, **Row Limit** settings are lost.

 **Note:** Only the first 255 characters in a custom text field count for filtering purposes. For example, if you add a field filter to find opportunities where the custom text field `Customer notes` includes the word “phone,” but “phone” appears after the 255th character in the field, the filter will not find that record. In standard text fields, all characters count, regardless of the length of the field.

Report on Salesforce Data with Excel

Connect for Office includes an Excel add-in that enables you to securely access your Salesforce reports with Microsoft® Excel®. You create the reports you need in Salesforce, then pull them into an Excel worksheet, and use Excel's formulas, charts, and pivot tables to customize and analyze your data.

The Excel add-in provides the same access to reports and fields that you normally experience in Salesforce. You can distribute your customized Excel worksheets via the Documents tab, allowing all users to track customized analytics in real time. You can reference data from multiple reports in one worksheet to create a single-page overview of key metrics.

Communication between Excel and Salesforce uses the same secure HTTPS protocol as when you log in via your Web browser.

IN THIS SECTION:

1. [Install Connect for Office](#)

2. [Log Into Connect for Office](#)

You need to log in to Salesforce before you can request data from your Salesforce reports.

3. [Import Reports Into Excel with Connect for Office](#)

Import your custom or standard Salesforce reports into Excel so you can further analyze the data using Excel's formulas, charts, and pivot tables.

4. [Refresh and Update Data with Connect for Office](#)

Keep your Salesforce reports up to date in Excel by periodically refreshing the report data and any pivot tables you have created.

Install Connect for Office

The system requirements for Connect for Office are:

- Microsoft® Office 2007
 - Microsoft® Windows Vista® (32-bit only)
1. Close all Microsoft® Office programs, including Word, Excel®, and Outlook®.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To access Salesforce reports from Excel:

- “Run Reports”

AND

“Export Reports”

EDITIONS

Available in: Salesforce Classic

Available in all editions

- From your personal settings, enter *Office* in the **Quick Find** box, then select **Connect for Office**.

 **Tip:** If you can't see the download page, ask your administrator for access.

- Click **Install Now**.
- Click **Yes** when prompted to install Connect for Office. We recommend that you install Connect for Office to the default folder suggested by the installer.
- After the installation completes, open Excel or Word, and select the **Salesforce** menu to begin using Connect for Office.
- The first time you open Word, you are prompted to enable macros from Salesforce. You must enable the macros and accept Salesforce as a macro publisher to use the Word add-in.

 **Note:** The Connect for Office installer edits the registry on your computer. If your organization imposes security that prevents you from editing the registry, log in as the administrator of your machine before installing Connect for Office or contact your IT department for assistance.

SEE ALSO:

[Find Your Personal Settings](#)

Log Into Connect for Office

You need to log in to Salesforce before you can request data from your Salesforce reports.

- Open Excel.
- In Microsoft Office 2003 and earlier, select **Log In** from the **Salesforce** drop-down menu on the Excel toolbar. In Microsoft Office 2007, select the Salesforce tab on the Ribbon, click the **Reporting** drop-down menu, and then select **Log In**.
- Enter your Salesforce username and password.
- Click **Login**.

 **Note:** If your organization restricts IP addresses, logins from untrusted IPs are blocked until they're activated. Salesforce automatically sends you an activation email that you can use to log in. The email contains a security token that you must add to the end of your password. For example, if your password is *mypassword*, and your security token is *XXXXXXXXXX*, you must enter *mypasswordXXXXXXXXXX* to log in.

Import Reports Into Excel with Connect for Office

Import your custom or standard Salesforce reports into Excel so you can further analyze the data using Excel's formulas, charts, and pivot tables.

- Create a custom report in Salesforce. You can also use any of the standard reports.
- Open a blank worksheet in Excel.
- Select the Salesforce tab on the Ribbon, click the **Reporting** drop-down menu, and then select **Import a Report...**

 **Note:** In Microsoft Office 2003 and earlier, select **Import a Report...** from the **Salesforce** drop-down menu on the Excel toolbar.

- Select a report from the list of standard and custom Salesforce reports available to you.
- Specify where you want to put the report data in your Excel file.

EDITIONS

Available in: Salesforce Classic

Available in all editions

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To access reports in Excel:

- "Run Reports"

AND

"Export Reports"

- a. Enter the name of your Excel worksheet in the `Destination worksheet` field.
- b. In the `Ce11` field, enter the uppermost cell where you want to begin putting the data.

If the specified worksheet and cells already contain report data, Connect for Office moves the existing data over to make room for the new report data.

 **Tip:** Avoid renaming worksheets that contain imported reports. When you do that the connection between the worksheet and your report is lost. You must import the report again to refresh the data.

6. Choose **Raw Data** to import the data without formatting, subtotals, or grand totals. Choose **Formatted** to keep the colors, fonts, subtotals, and grand totals from the Salesforce report.

This is useful for importing large matrix reports with the data already summarized into a small table.

 **Tip:**

- The **Raw Data** option is best if you're importing summary or matrix reports for use with Excel formulas and pivot tables.
- Use the **Formatted** option if you're importing large matrix reports with the data already summarized into a small table.

7. Click **OK**.

 **Tip:** You can copy and paste data from Excel into other Office applications. Use the **Paste Special** option, rather than **Paste**, to reference the Excel data as a worksheet object. If the data then changes in Excel, you can right-click the object and update it automatically. See the Microsoft Word help for more information.

Refresh and Update Data with Connect for Office

Keep your Salesforce reports up to date in Excel by periodically refreshing the report data and any pivot tables you have created.

After logging into Salesforce, select any of the following options from the **Salesforce** Ribbon tab (or toolbar in Office 2003 and earlier):

- **Refresh Existing Reports...** - Allows you to choose which reports you want to update in Excel.
 1. From the list of reports you have imported, select the reports to update.
 2. Optionally, select **Update Pivot Tables** to update any pivot tables you have created in Excel for the selected reports. The **Refresh All Reports** menu choice does this automatically.
 3. Click **Refresh Selected** to update the report data.

To remove reports from this list, select the report names and click **Delete Selected**. The reports are not removed from your Excel worksheet or from Salesforce, only from the list of reports available for refreshing.

- **Refresh All Reports** - Refreshes all of the reports that you have imported into your Excel file, including the pivot tables referenced by those reports.

 **Tip:**

- If you write a formula, select an entire column rather than a range of cells, because the number of rows in your report may change when you refresh the report data. For example, use `=Sum(Sheet2!E:E)` to sum column E rather than `=Sum(Sheet2!E1:E200)`.
- If you use the `VLOOKUP` and `HLOOKUP` functions in Excel to join data across different cell ranges, these functions may make report record IDs, which are 15-character alphanumeric IDs, case-sensitive. Make sure to use the correct case when identifying report records. See the Microsoft Excel help for more information.

Upgrade the Report Wizard

Report builder, a powerful drag-and-drop editor, is the standard tool for creating and editing reports. If your organization is still using the old report wizard, you should upgrade to report builder.

- All profiles get access to the report builder by default. (You may continue to see the “Report Builder” permission in permission sets and profiles and the PermissionSet and Profile objects in the API, though the upgrade overrides those settings.)
- The old report wizard is available only to users in Accessibility Mode.
- Group and Professional Edition organizations can use report builder.
- You get scatter charts, a new chart type for reports.

New organizations automatically get the latest version of report builder. If you don't see the Report Builder Upgrade section on the User Interface Settings page, the upgrade has already been enabled for your organization.

Assigning the “Report Builder” permission to all users through profiles or permission sets isn't the same thing as enabling report builder for your entire organization. To enable report builder for your organization, follow these steps.

 **Important:** Upgrading **does not affect** any of your existing reports. However, once you upgrade, you can't return to the old report wizard.

1. From Setup, enter *Reports* in the *Quick Find* box, then select **Reports and Dashboards Settings**.
2. Review the Report Builder Upgrade section of the page and click **Enable**. If you don't see the button, report builder has already been enabled for your entire organization.
3. Confirm your choice by clicking **Yes, Enable Report Builder for All Users**.

Run and Then Read a Report

Click on a report's name to run it. After running a report, there are a series of tools you can use to help you read the information.

IN THIS SECTION:

1. [Run a Report](#)
To run a report, find it on the Reports tab and click the report name. Most reports run automatically when you click the name. If you're already viewing a report, click **Run Report** to run it immediately or schedule a future run. In Lightning Experience, the **Run Report** button only appears after you save a report.
2. [Find a Report](#)
Search for a report by name, description, or who created it or modified it last. Filter, sort, or search within a selected folder to refine your results.
3. [Get the Information You Need From the Reports Tab List View](#)
To see the information you want to see about your reports, you can resize, hide, reorder, sort columns, and select the number of records to display in your list view on the Reports tab.
4. [Print a Report](#)
Print a report from the run page of a report using your browser's print function.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To modify report and dashboard settings:

- “Customize Application”

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All editions** except **Database.com**

Run a Report

To run a report, find it on the Reports tab and click the report name. Most reports run automatically when you click the name. If you're already viewing a report, click **Run Report** to run it immediately or schedule a future run. In Lightning Experience, the **Run Report** button only appears after you save a report.

If you don't see any results, check the report for one of these conditions:

- The report didn't return any data. Check your filter criteria to make sure some data is returned.
- Due to field-level security, you don't have access to one of the groupings you selected.
- Your custom summary formula's context didn't match the chart settings. For example, if the formula is calculated for Industry, but the chart doesn't include Industry, no results are returned.
- Your values are out of the range of acceptable values. The maximum value allowed is 9999999999999999. The minimum value allowed is -9999999999999999.

If your report returns more than 2,000 records, only the first 2,000 records are displayed. To see a complete view of your report results, click **Export Details**.

If your report takes longer than 10 minutes to complete, Salesforce cancels the report. Try the following techniques to reduce the amount of data in your report:

- Filter for your own records, rather than all records.
- Limit the scope of the data to a specific date range.
- Exclude unnecessary columns from your report.
- Hide the report details.

Get the Information You Need From the Reports Tab List View

To see the information you want to see about your reports, you can resize, hide, reorder, sort columns, and select the number of records to display in your list view on the Reports tab.

- Customize your list view as follows:

Option	Description
To resize a column	Click and drag its right margin to the preferred size.
To hide a column	Click  > Columns on any column and deselect the column you want to hide.
To reorder a column	Drag it to where you'd like it to appear.
To sort a column	Click  for the column and select Sort Ascending or Sort Descending . Sorting applies to all items in the list view, including the ones on subsequent pages.

To change the number of records displayed per page

Click  in the lower left corner of the list and select the desired setting. You can view 10, 25, 50, 100, or 200 records at a time. When you change this setting, you return to the first page of list results.

Once set, however, you view the same number of records throughout the list. The record display setting on the Reports tab doesn't affect list views elsewhere in Salesforce.

USER PERMISSIONS

To print reports:

- “Run Reports” and “Export Reports”

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

IN THIS SECTION:

1. [Share Reports and Dashboards](#)

Reports and dashboards are shared through folders. You share the folder, not the report or dashboard itself. To let others work with your report or dashboard, give them Viewer, Editor or Manager access to the folder where the report or dashboard is stored.

2. [Deliver Your Report](#)

To get the information in your report to the people who need it, you can share the report's URL, make the report available for Chatter feeds, or export the data to another tool, such as Excel. You can also set the report to run on a schedule so that viewers always have the latest information.

3. [Overview of Embedded Report Charts](#)

Typically, users have had to navigate to the Reports tab to find data. But you can give them valuable information directly on the pages they visit often. To do that, just embed report charts in detail pages for standard or custom objects. When users see charts on pages, they are empowered to make decisions based on data they see in the context of the page without going elsewhere to look for it. For example, an opportunity record shows important data directly on its detail page.

Share Reports and Dashboards

Reports and dashboards are shared through folders. You share the folder, not the report or dashboard itself. To let others work with your report or dashboard, give them Viewer, Editor or Manager access to the folder where the report or dashboard is stored.

Note: Users can't share report and dashboard folders in Lightning Experience. All sharing permissions set on folders in Salesforce Classic are obeyed in Lightning Experience.

IN THIS SECTION:

1. [Share a Report or Dashboard Folder](#)

To enable others to use a report or a dashboard, share the folder it is in. Give each user, public group, or role the degree of access to the folder that makes sense for them.

2. [Access Levels for Report and Dashboard Folders](#)

Each user, group, or role can have its own level of access to a report and dashboard folder. Viewers can see the data; Editors can determine what data is shown; and Managers can control access.

3. [Comparing Access Levels for Report and Dashboard Folders](#)

Use this chart for a quick view of what Viewer, Editor, and Manager access enables users to do with report and dashboard folders.

4. [User Permissions for Sharing Reports and Dashboards](#)

Each level of access to a report or dashboard folder consists of a combination of specific user permissions. As an administrator, you can further fine-tune users' access to dashboards and reports by assigning or removing one or more permissions.

Share a Report or Dashboard Folder

To enable others to use a report or a dashboard, share the folder it is in. Give each user, public group, or role the degree of access to the folder that makes sense for them.

Note: To give someone access to a folder, you must have either Manager access to that folder, the “Manage Reports in Public Folders” permission (for report folders), or the “Manage Dashboards in Public Folders” permission (for dashboard folders).

When you create a folder, you’re its manager. Only you, and others with administrative permissions, can see it.

If a folder does not have Manager access, it is public, and users with the “View Reports in Public Folders” permission can view it. Depending on their object access, these users can also run the report.

EDITIONS

Available in: Salesforce Classic

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To share a report folder:

- “Manager” folder access or “Manage Reports in Public Folders”

To share a dashboard folder:

- “Manager” folder access or “Manage Dashboards in Public Folders”

(1) Share your folder by user, by user group, or by role. (2) Choose the access level you want each user, group, or role to have. (3) Stop sharing the folder with the user, group, or role.

IN THIS SECTION:

1. Share a Report or Dashboard with an Individual User

If you only have one or two people to share a report or dashboard folder with, give them access individually.

2. Share a Report or Dashboard with a Group

If more than one or two people need access to an analytics folder, share the folder with a public group. That way you don’t have to keep track of which individuals you’ve shared it with.

3. [Share a Report or Dashboard by Role](#)

When you give people access to a report or dashboard folder based on their role, you can control who has access without having to keep track of users or groups.

SEE ALSO:

[Access Levels for Report and Dashboard Folders](#)

[User Permissions for Sharing Reports and Dashboards](#)

Share a Report or Dashboard with an Individual User

If you only have one or two people to share a report or dashboard folder with, give them access individually.

1. On the Reports tab, hover over a report folder in the left pane, click , and then select **Share**.

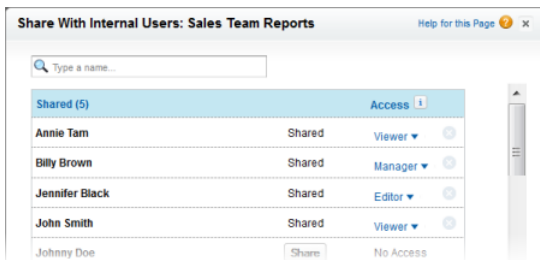

2. Select **Internal Users**.

Note: Internal users don't include customer portal or partner portal users.

3. Find the user you want, click **Share**, and choose an access level.

To search, just start entering a name.

4. Click **Done**, review your changes, and click **Close**.

EDITIONS

Available in: Salesforce Classic

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To share a report folder with internal users:

- "Manager" folder access or "Manage Reports in Public Folders"

To share a dashboard folder with internal users:

- "Manager" folder access or "Manage Dashboards in Public Folders"

Share a Report or Dashboard with a Group

If more than one or two people need access to an analytics folder, share the folder with a public group. That way you don't have to keep track of which individuals you've shared it with.

1. On the Reports tab, hover over a report folder in the left pane, click , and then select **Share**.
2. Select **Public Groups**.
3. Find the group you want, and click **Share**.
To search, start typing a name.

4. Choose the sharing level you want to give this group.
 **Note:** Portal users can only have Viewer access to reports, and they can't use dashboards.
5. Click **Done**, review your changes, and click **Close**.

Share a Report or Dashboard by Role

When you give people access to a report or dashboard folder based on their role, you can control who has access without having to keep track of users or groups.

You can give report or dashboard folder access to users in a role, or to those users plus users in roles subordinate to that role.

For example, suppose the *VP of Sales* role and its subordinates have Viewer access to a dashboard folder, while the role itself (VP of Sales) has Manager access to the folder. This means a user in the VP of Sales role has greater control than someone with a role that's lower in the role hierarchy. If the VP of Sales leaves the company, whoever next assumes that role will be able to manage dashboards in the folder.

1. On the Reports tab, hover over a report folder in the left pane, click , and then select **Share**.
2. Select **Roles** or **Roles and Subordinates**.
 - Select **Roles** if you want to give access to all users who have that role.
 - Select **Roles and Subordinates** if you want to give access to those users plus everyone with a role below them in the role hierarchy.
3. Find the role you want, click **Share**, and choose a level of access.
To search, enter a name.

EDITIONS

USER PERMISSIONS

To share a report folder with a role or role and subordinates:

- "Manager" folder access or "Manage Reports in Public Folders"

To share a dashboard folder with a role or role and subordinates:

- "Manager" folder access or "Manage Dashboards in Public Folders"

4. Click **Done**, review your changes, and click **Close**.

Access Levels for Report and Dashboard Folders

Each user, group, or role can have its own level of access to a report and dashboard folder. Viewers can see the data; Editors can determine what data is shown; and Managers can control access.

-  **Tip:** If you're not ready to share a report or dashboard, keep it in a personal folder that only you can access. The "My Personal Custom Reports" folder and the "My Personal Dashboards" folder are already set up for you. Create more if you need them. When you create a folder, it is accessible only to you and users with administrative permissions until you share it.

IN THIS SECTION:

1. [Viewer Access Levels to Report and Dashboard Folders](#)
With Viewer access you can see the data in a report or dashboard, but you can't make any changes, except by cloning it into a new report or dashboard. All users have at least Viewer access to report and dashboard folders that have been shared with them. (Some users may have administrative user permissions that give them greater access.)
2. [Editor Access to Report and Dashboard Folders](#)
When you are an Editor on a folder, you can view and modify the reports and dashboards it contains, and move them to and from any other folders you have Editor or Manager access to.
3. [Manager Access to Report and Dashboard Folders](#)
With Manager access, you can do everything Viewers and Editors can do, plus control other users' access to it, change its properties, or delete it.

SEE ALSO:

- [Share a Report or Dashboard Folder](#)
- [Comparing Access Levels for Report and Dashboard Folders](#)

Viewer Access Levels to Report and Dashboard Folders

With Viewer access you can see the data in a report or dashboard, but you can't make any changes, except by cloning it into a new report or dashboard. All users have at least Viewer access to report and dashboard folders that have been shared with them. (Some users may have administrative user permissions that give them greater access.)

For example, Samir is a sales rep who likes to start his day by checking his position on the sales leader board, which appears on the Master Sales dashboard. He has to refresh the dashboard to

Available in: **All** editions except **Database.com**

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

get the latest standings, so he needs to be able to view the data in the underlying reports. But he doesn't want to edit the reports or the dashboard. All he needs is Viewer access to the folder that contains the Master Sales dashboard.

Editor Access to Report and Dashboard Folders

When you are an Editor on a folder, you can view and modify the reports and dashboards it contains, and move them to and from any other folders you have Editor or Manager access to.

For example, Allison, a sales manager, wants to provide a different sales dashboard for each of three regional teams. She'll need Editor access to the folder that contains the Master Sales dashboard so she can move the underlying reports into the right folders and then modify them to show the appropriate data. She'll also need the Create and Customize Dashboards user permission.

 **Note:** You can't give Editor access to standard report folders. All users get Viewer access to these folders by default.

Manager Access to Report and Dashboard Folders

With Manager access, you can do everything Viewers and Editors can do, plus control other users' access to it, change its properties, or delete it.

For example, Alan is a sales administrator who manages too many reports to pay attention to them all individually. He creates a report folder called Regional Reports. As its creator, he automatically has Manage rights to the folder. He gives Sales Reps, a public group, Viewer access. And he makes Allison, the sales manager, another Manager on the folder.

 **Note:** You can't give Manager access to standard report folders. All users get Viewer access to these folders by default.

Comparing Access Levels for Report and Dashboard Folders

Use this chart for a quick view of what Viewer, Editor, and Manager access enables users to do with report and dashboard folders.

	Viewer	Editor	Manager
View reports or dashboards in the folder	✓	✓	✓
Run reports in the folder	✓	✓	✓
Refresh dashboards in the folder	✓	✓	✓
Change, move, or delete your reports or dashboards in the folder	✓	✓	✓
See who has what level of access to the folder	✓	✓	✓
Change, move, or delete reports or dashboards that were created by someone else in the folder		✓	✓
Change the folder's name			✓

 **Note:** To change these dashboards, you need the "View All Data" permission.

User Permissions for Sharing Reports and Dashboards

Each level of access to a report or dashboard folder consists of a combination of specific user permissions. As an administrator, you can further fine-tune users' access to dashboards and reports by assigning or removing one or more permissions.

When analytics folder sharing is enabled, all users get Viewer access to report and dashboard folders except users with higher administrative permissions. To give users broader privileges, assign Editor or Manager folder access and give report and dashboard user permissions as needed.

User Permission	Description
Create and Customize Dashboards	Create, edit, and delete dashboards in My Personal Dashboards folder. Create dashboards and save into any shared folder if sharing rights allow.
Create and Customize Reports	Create, edit, and delete reports in My Personal Custom Reports folder. Create reports and save into any shared folder if sharing rights allow.
Create Dashboard Folders	Create dashboard folders and manage them if sharing rights allow.
Create Report Folders	Create report folders and manage them if sharing rights allow.
Edit My Dashboards	Edit, move, save, and delete dashboards you created in shared folders.
Edit My Reports	Edit, move, save, and delete reports you created in shared folders.
Manage Dashboards in Public Folders	Create, edit, delete dashboards ¹ , and manage their sharing in all public dashboard folders, which does not include others' personal folders. This permission allows users to edit and share dashboards in all folders, including hidden folders. They also get these permissions: <ul style="list-style-type: none"> • Create and Customize Dashboards • Create Dashboard Folders • Edit My Dashboards • View Dashboards in Public Folders ⁽¹ To edit a dynamic dashboard, users also need Manage Dynamic Dashboards and View My Team's Dashboards.)
Manage Reports in Public Folders	Create, edit, delete reports, and manage their sharing in all public report folders, which does not include others'

Deliver Your Report

To get the information in your report to the people who need it, you can share the report's URL, make the report available for Chatter feeds, or export the data to another tool, such as Excel. You can also set the report to run on a schedule so that viewers always have the latest information.

Administrators, or users with the "Manage Public Reports" and "Create and Customize Reports" permissions, can create custom reports that all users can view. They can also organize reports by creating custom report folders and configuring which groups of users have access to them.

To make a report public, run the report and click **Save As**. Give the report a name and choose a public report folder.

IN THIS SECTION:

1. [Export Report Data](#)
You can export your report data to a reusable format when you need to work with it in a dedicated tool, such as Microsoft Excel.
2. [Run Reports in the Background](#)
Run large reports in the background so you can keep working in Salesforce without waiting for results to display. This is a good way to run data-intensive reports that might otherwise time out due to the large number of report results.
3. [Schedule Reports](#)
You can set up a report to run itself daily, weekly, or monthly and send the results automatically to the people who need to see them, so that you don't have to remember to log in and do it yourself.
4. [Subscribe to Get Report Notifications](#)
Subscribe to a report to receive report notifications periodically when the metrics you care about most meet certain conditions. Set the conditions that trigger notification, and specify if you want to be notified via Salesforce1 notifications, Chatter, or email.

Export Report Data

You can export your report data to a reusable format when you need to work with it in a dedicated tool, such as Microsoft Excel.

-  **Note:** For security purposes, Salesforce may require users to pass a CAPTCHA user verification test to export data from their organization. This simple text-entry test prevents malicious programs from accessing your organization's data. To pass the test, users must correctly type the two words displayed on the overlay into the overlay's text box field. Note that the words entered into the text box field must be separated by a space.

IN THIS SECTION:

1. [Export a Report](#)
From the Reports tab, you can export data for a selected report to Excel or in comma-delimited format.
2. [Locale Settings for Exporting Report Data](#)
Some tips on using the comma-delimited format and working with Excel when you export report data.

Export a Report

From the Reports tab, you can export data for a selected report to Excel or in comma-delimited format.

1. On the Reports tab for a selected report, click  > **Export**.
 - If you set the “Do not save encrypted pages to disk” option in Internet Explorer, you will not be able to open your report online in Excel. You must save the exported report to your computer, and then open it in Excel. To change this setting in Internet Explorer, deselect “Do not save encrypted pages to disk” under Internet options.
 - Reports in the joined format can't be exported, but you can choose a printable view.
2. Set the **Export File Encoding** for your language.
3. Set the **Export File Format** to Excel or comma delimited.
4. Click **Export**.
5. In your browser's dialog, choose to save the file.
You can export up to 256 columns and 65,536 rows of data in one report.

Locale Settings for Exporting Report Data

Some tips on using the comma-delimited format and working with Excel when you export report data.

Exporting in Comma Separated Value Format

When exporting reports in the comma-separated values (.csv) format, the locale settings on your user detail page determine the field separator (delimiter) included in the exported file. For example, if your locale setting is English (United States), the decimal separator is a period (“.”). If your locale setting is French (France), the decimal separator is a comma (“,”). You can override the default separator for your locale by choosing Comma Delimited (non-locale) .csv from the `Export File Format` drop-down list.

Note that Excel does not display the field separator in .csv format. If you want to export reports to Excel in .csv format, we recommend that your locale setting in Salesforce match your Regional Options setting in Windows.

Run Reports in the Background

Run large reports in the background so you can keep working in Salesforce without waiting for results to display. This is a good way to run data-intensive reports that might otherwise time out due to the large number of report results.

Contact Salesforce to activate this feature for your organization.

Reports exported to the background run sequentially, one at a time. Therefore, the latest report exported to the background runs after all reports previously exported to the background finish running.

You can export an unlimited number of reports to the background.

IN THIS SECTION:

1. [Export a Report to Run in the Background](#)

To set up a report to run in the background, you have to export it in a special way.

2. [View and Manage Reports in the Background](#)

Once you've set up a report to run in the background, you can view and manage it from the background report exports list.

Export a Report to Run in the Background

To set up a report to run in the background, you have to export it in a special way.

1. Create or run a report.
2. Click **Export Details** and choose **Run Background Export** from the drop-down button.

 **Tip:** When running an existing report, click this button to avoid waiting for report results to display.

3. Select a file encoding setting and a file format in which to export the report.
4. Choose how to save the report parameters.
 - Click `Save revisions` to save any parameter changes you made to the report before exporting. Selecting this option overwrites the parameters of the original report.
 - Click `Save revisions to a copy` to create a new report before exporting. If you select this option, enter a name and description for the report, and choose a report folder in which to save the report parameters.

 **Note:** Only parameters are saved, not results. To view report results, you must view report details from the background report exports list.

5. Click **Start Background Export**.

When your report has finished running and its results are ready for viewing, a link to the report details is emailed to you. You can download report results from the report exports list. You can only download data that you have permission to view.

 **Note:** If commas are not appropriate for your locale, use a tab or other delimiter.

In the unlikely event that a background export of a report fails, an email notification is sent to you. Reports exported to the background can fail for a number of reasons. For example, between the time you exported the report and the export process began, fields may have been deleted from the report, the report may have been deleted, or the status of the custom report type from which the report was created may have been changed to "In Development."

View and Manage Reports in the Background

Once you've set up a report to run in the background, you can view and manage it from the background report exports list.

1. From Setup, enter *Background Report Exports* in the `Quick Find` box, then select **Background Report Exports**. The background report exports list appears.
2. View the details of a report exported to the background, such as its name, status, and location, by clicking the name of a report in the `Job Name` column.

 **Note:** For security purposes, Salesforce may require users to pass a CAPTCHA user verification test to export data from their organization. This simple text-entry test prevents malicious programs from accessing your organization's data. To pass the test, users must correctly type the two words displayed on the overlay into the overlay's text box field. Note that the words entered into the text box field must be separated by a space.

3. Click **Cancel** or **Del** next to the name of a report to cancel a pending export or to delete a report from the background report exports list.

When a report exported to the background finishes running, it is available for viewing in the background report exports list for 48 hours. After 48 hours, the report is automatically deleted.

USER PERMISSIONS

To schedule reports:

- "Schedule Reports"

Schedule a Report for Refresh

Schedule a report to run daily, weekly, or monthly. The report can be emailed in HTML format to users in your organization.

Watch a Demo:  [Tips for Scheduling Reports](#)

1. On the Reports tab, click a report name.
2. Click **Schedule Future Runs** from the **Run Report** drop-down menu.
If you're creating a new report, you are asked to save the report in a folder before scheduling. If the report folder is shared with a group, you can schedule the report only for the entire group. To schedule the report for an individual group member, share the report folder with that member.
3. On the Schedule Report page, specify a running user who has access to the folder where the report is stored.
The access level of the running user determines what other users, including portal users, see when they receive the scheduled report run results. You need the "View All Data" permission to specify a running user other than yourself.

 **Note:** If the running user becomes inactive, the report doesn't run. Salesforce sends an email notification to either activate the user, delete the report schedule, or change the running user to an active one. Salesforce sends the notification to users with the "Manage Users," "Modify All Data," and "Manage Billing" permissions. If no user has all these user permissions, Salesforce sends the notification to users with the "Manage Users" and "Modify All Data" user permissions.

4. Select an email setting.

Select	To
To me	Send the report to your email address specified on your user profile.
To me and/or others	Email the report to additional users.

You can send reports only to email addresses included on Salesforce user records. When portal users receive emailed reports, they see the same data as the running user set in the report schedule. If you have information you'd rather not share, schedule the report to run with a portal user as the running user.

 **Note:** Portal users receive report and dashboard refresh email notifications when the `Allow Reports and Dashboards to Be Sent to Portal Users` option is enabled.

5. Set the frequency, duration, and time for running the report:
 - In the `Frequency` field, select `Daily`, `Weekly`, or `Monthly` and then refine the frequency criteria.
 - Using the `Start` and `End` fields, specify the dates during which you want to schedule the report. To enter the current date, click the link showing the date.
 - Next to `Preferred Start Time`, click **Find available options** to choose a start time.
Your preferred start time might not be available if other users have already selected that time to schedule a report.

6. Click **Save Report Schedule**. You can choose:

Choose	To
Save report modifications with this schedule	Save both the report schedule and changes you made to the report.

- "Schedule Reports"

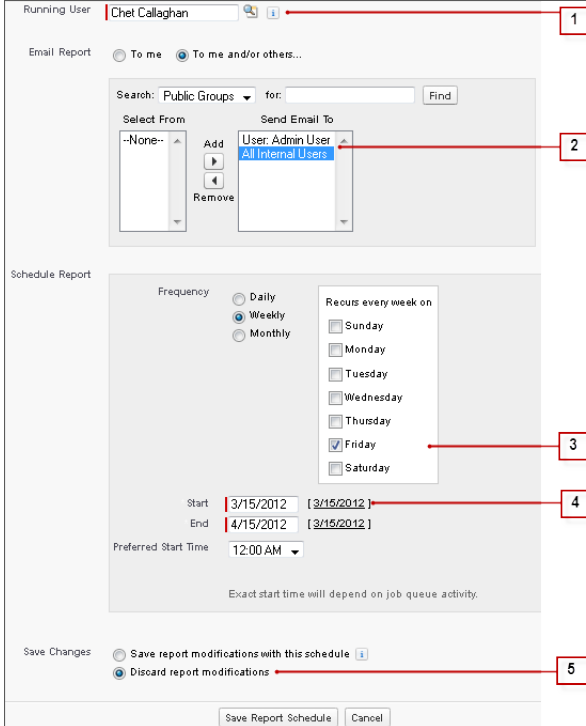

Choose**To****Discard report modifications**

Save the schedule only. Changes you made to the report are discarded.

Report recipients can click the report name in emailed reports to log in to Salesforce and view the report directly.

 **Example: Example**

A report is scheduled to run every Friday at midnight, and its results are emailed to a selected group and user.

The screenshot shows the 'Schedule Report' configuration page. At the top, the 'Running User' is set to 'Chet Callaghan' (callout 1). Below this, the 'Email Report' section has 'To me and/or others...' selected. The 'Send Email To' list includes 'User: Admin User' and 'All Internal Users' (callout 2). The 'Schedule Report' section shows 'Weekly' frequency and 'Friday' selected under 'Recurs every week on' (callout 3). The 'Start' date is '3/15/2012' and the 'End' date is '4/15/2012' (callout 4). At the bottom, 'Discard report modifications' is selected under 'Save Changes' (callout 5).

1. All users, including portal users, viewing the scheduled report see the report data that Sales Director Chet's access level allows.
2. Report run results are set to be emailed to a public user group called All Internal Users and the admin user. You can only send emails to users and groups with access to the report folders. The `Search` drop-down displays all available categories based on your search criteria in the `Running User` field.
3. The report is scheduled to run every Friday.
4. The report run is scheduled to start on the current date.
5. The schedule is saved without saving prior changes made to the report.

Tips on Scheduling Reports

Some tips to keep in mind about timings, limits, and email notifications when scheduling a report.

Scheduling Report Runs

- On the Reports tab, hover over  in the schedule column () to [view](#) a report's schedule. Note that users without the "Schedule Reports" permission can't see this icon and information.
- You can't create schedules for [joined reports](#).
- Your organization is limited to no more than 200 scheduled reports. Daily limits differ by edition. Additional scheduled reports may be available for purchase.
- Scheduled reports run in the time zone of the user who set up the schedule. For example, if the `Time Zone` field on your user record is set to Pacific Standard Time, and you schedule a report to run every day at 2:00 PM, then the report runs every day between 2:00 PM and 2:29 PM Pacific Standard Time.
- If you view and save a schedule in a time zone different from the one in which it was previously scheduled, the time slot could potentially change.
- If you schedule a report to run on a specific day of every month, the report runs only on months that have that specific day. For example, if you schedule a report to run on the 31st day of every month, then the report runs only on months that have 31 days. To schedule a report on the last day of every month, choose last from the `On day of every month` drop-down list.
- The report runs within 30 minutes of the time you select for `Preferred Start Time`. For example, if you select 2:00 PM as your preferred start time, the report runs any time between 2:00 PM and 2:29 PM, depending on how many other reports are scheduled at that time.
- Scheduling reports is not tracked in the audit trail history.

EDITIONS

Emailing Scheduled Reports

- Emailed reports don't include report charts. To email a chart of the report, create a dashboard and schedule a dashboard refresh.
- Reports display only the first 2,000 records (same as in a browser).
- Outlook 2007 limitation: Report emails containing tables more than 22 inches wide or with more than 63 columns might not display properly.
- The maximum size for emailed reports is 10 MB. Try the following techniques to reduce the amount of data in your report:
 - Filter for your own records, rather than all records.
 - Limit the scope of the data to a specific date range.
 - Exclude unnecessary columns from your report.
 - Hide the report details.

[Manage a Report's Schedule](#)

Subscribe to Get Report Notifications

Subscribe to a report to receive report notifications periodically when the metrics you care about most meet certain conditions. Set the conditions that trigger notification, and specify if you want to be notified via Salesforce1 notifications, Chatter, or email.

For example, you could subscribe to an open-issue report and get notified every morning if there are over 20 open issues. You can subscribe to notifications for up to five reports.

Watch a demo:  [Report Notifications](#)

 **Note:** Report Notifications doesn't appear as an available option for unsaved reports. Save the report before subscribing to it.

Personal Report Notifications aren't related to the Schedule Future Runs feature, which enables you to email reports at specified times without specifying conditions. To schedule emailed reports, select **Schedule Future Runs** from the Run Report drop-down menu.

1. On the Report Run page, click **Subscribe**.
2. On the Report Subscription page, choose whether to be notified each time conditions are met or only the first time.
3. Specify each condition in three parts: aggregate, operator, value.

For example, trigger notifications whenever the sum of amount is less than \$1 million.

- Aggregate is the metric that's the basis of your condition. It can be Record Count, Average Amount, Smallest Amount, Largest Amount, or Sum of Amount.
- Operator is the basis of comparison, such as Equal, Not Equal, Greater Than, and so on.
- Value is the number that you want the aggregate compared to.

Your conditions are evaluated when the report is run, and notifications are sent if all conditions are met (up to five conditions per report).

4. Schedule how often (every weekday, daily, or weekly) and when to evaluate for your conditions.
For example, run the report every weekday at 7 a.m.
5. Select one or more notification types.

- Send a Salesforce1 in-app notification
- Post to Chatter
- Send an email notification
- Execute a custom Apex action, such as creating tasks or escalating cases

For more information about developing a custom Apex class, see the [Force.com Apex Code Developer's Guide](#).

6. Make sure that the subscription is active if you're ready to start receiving notifications.
7. Click **Save** to schedule the notifications.

EDITIONS

Available in: Salesforce Classic

Available in: **All** editions except **Database.com**

USER PERMISSIONS

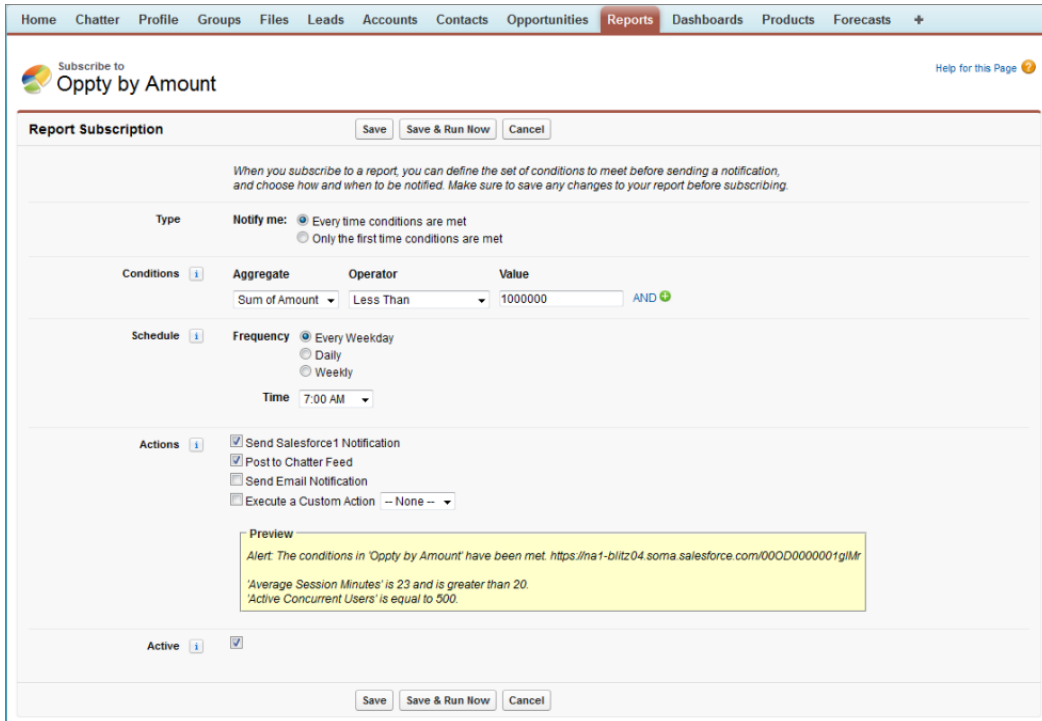

To subscribe to reports:

- "Run Reports"

To enable or disable report notification subscriptions:

- "Customize Application"

 **Example:** A report is scheduled to be run every weekday at 7 a.m. If the sum of the amount is less than 1,000,000, a Salesforce1 notification is sent and a Chatter post is made.

The screenshot shows the 'Report Subscription' configuration interface in Salesforce. The page title is 'Subscribe to Oppty by Amount'. The configuration is as follows:

- Report Subscription:** Save, Save & Run Now, Cancel
- When you subscribe to a report, you can define the set of conditions to meet before sending a notification, and choose how and when to be notified. Make sure to save any changes to your report before subscribing.**
- Type:** Notify me: Every time conditions are met, Only the first time conditions are met
- Conditions:**

Conditions	Aggregate	Operator	Value
	Sum of Amount	Less Than	1000000

AND 
- Schedule:** Frequency: Every Weekday, Daily, Weekly; Time: 7:00 AM
- Actions:**
 - Send Salesforce1 Notification
 - Post to Chatter Feed
 - Send Email Notification
 - Execute a Custom Action -- None --
- Preview:** Alert: The conditions in 'Oppty by Amount' have been met. <https://na1-blitz04.soma.salesforce.com/000D0000001gllMr>
'Average Session Minutes' is 23 and is greater than 20.
'Active Concurrent Users' is equal to 500.
- Active:**
- Buttons:** Save, Save & Run Now, Cancel

Overview of Embedded Report Charts

Typically, users have had to navigate to the Reports tab to find data. But you can give them valuable information directly on the pages they visit often. To do that, just embed report charts in detail pages for standard or custom objects. When users see charts on pages, they are empowered to make decisions based on data they see in the context of the page without going elsewhere to look for it. For example, an opportunity record shows important data directly on its detail page.

IN THIS SECTION:

1. [Example of Report Charts on an Account Page](#)

In this example, we've embedded two report charts on an important account page that show deals in the pipeline and open support cases for the account. From looking at the charts, the account executive can quickly gauge the account's activity and health.

2. [Add a Report Chart to a Page Layout](#)

To embed a report chart on standard or custom object pages, edit the object's page layout with the enhanced page layout editor, then add the chart.

3. [Customizing a Report Chart in a Page Layout](#)

After you add a report chart to a page, you can customize it in the Chart Properties dialog box on the page layout editor.

4. [Limits on Report Charts in Pages](#)

Consider these limits when embedding charts in detail pages.

Example of Report Charts on an Account Page

In this example, we've embedded two report charts on an important account page that show deals in the pipeline and open support cases for the account. From looking at the charts, the account executive can quickly gauge the account's activity and health.

- Medium

As of Aug 5, 2013 2:17:16 PM

1. The pipeline chart shows opportunities for the account in various stages including two that were won. The account executive can hover on the chart to get the value of each opportunity (Values are highlighted if the source report chart has hover enabled). She is able to click the chart, go to the report, and get more details for these opportunities.
2. From the charts on open cases, she can see there are a couple of unresolved support issues for the account. She can click the chart, drill into the report for case details and follow up with the support engineers to get them resolved before a crucial meeting with the client.

Add a Report Chart to a Page Layout

To embed a report chart on standard or custom object pages, edit the object’s page layout with the enhanced page layout editor, then add the chart.

Before you add a chart, check that:

- Its source report is in a folder that’s shared with users who need access. Reports in personal report folders are unavailable to add to a page.
- The source report format is summary or matrix.
- The source report has a chart.

1. Go to the page layout editor for the object that you’re adding a chart to.
2. Click **Edit** next to the page layout.
3. Click **Report Charts**.

EDITIONS

Customizing a Report Chart in a Page Layout

After you add a report chart to a page, you can customize it in the Chart Properties dialog box on the page layout editor.

IN THIS SECTION:

1. [Hiding a Report Chart that Shows an Error](#)
A chart can sometimes, for whatever reason, show an error on the detail page instead of data. Since a chart with an error is not that useful, you have the option to hide it from viewers.
2. [Filtering Report Charts to Show Data Relevant to the Page](#)
Charts usually filter to show relevant data when the chart's report type has a matching ID field for the record, such as Account ID for an account record. Occasionally, charts show data unfiltered. But you can set up a chart to be filterable if its report type has a lookup to the matching ID field.
3. [Refreshing Report Chart Data](#)
Normally, charts refresh data once every 24 hours. But you can change a chart to refresh each time someone opens the page it's on. The refresh option is under the Chart Properties dialog box of the page layout editor. However, we recommend daily refresh over selecting the option, because users will soon reach the refresh limit or will wait for chart data to show until refresh is complete.

To edit page layouts:

- "Customize Application"

Hiding a Report Chart that Shows an Error

A chart can sometimes, for whatever reason, show an error on the detail page instead of data. Since a chart with an error is not that useful, you have the option to hide it from viewers.

To hide such a chart, select **Hide chart with error** from the Chart Properties dialog box in the page layout editor.

A chart can show an error on a page for one or more of these reasons.

- The viewer doesn't have access to the field that's used for filtering.
- The viewer doesn't have access to the report folder.
- The report chart has been deleted from the report.
- The report definition has changed.
- The report itself is no longer available.

Filtering Report Charts to Show Data Relevant to the Page

Charts usually filter to show relevant data when the chart's report type has a matching ID field for the record, such as Account ID for an account record. Occasionally, charts show data unfiltered. But you can set up a chart to be filterable if its report type has a lookup to the matching ID field.

Make a Chart Filterable

When the chart's report type doesn't have a matching ID field for the record, the chart is not filtered. Instead, it shows all data.

A report chart on open cases shows information for all accounts on an account record. To make the chart filterable, edit the layout of the chart's cases custom report type, and add the `Account ID` field via lookup. Now when you view an account record, the chart is filtered.

Pick a Relevant Filter

Sometimes when there are multiple ID fields available to filter, the chart may not show any data. In such situations, select the most relevant ID field from the **Filtered by** drop-down in the Chart Properties dialog box. A chart on open opportunities on account records is filtered by `Partner Account ID`, which isn't that useful. But we can edit the chart properties and choose `Account ID` from the drop-down to filter by the account record.

 **Note:** Charts can't filter for relevant data if the source report has reached the limit of 20 field filters.

Refreshing Report Chart Data

Normally, charts refresh data once every 24 hours. But you can change a chart to refresh each time someone opens the page it's on. The refresh option is under the Chart Properties dialog box of the page layout editor. However, we recommend daily refresh over selecting the option, because users will soon reach the refresh limit or will wait for chart data to show until refresh is complete.

Daily Refresh

Charts refresh data once every 24 hours. If within that time users want the latest, they can click **Refresh** on the chart.

Refresh When User Opens the Page

To change a chart's normal refresh, select **Refresh each time a user opens the page** in the Chart Properties dialog box of the page layout editor. This option triggers a chart refresh each time someone opens the page the chart is on. Selecting the option is not recommended for two reasons.

- There's a risk of reaching the chart refresh limit faster. Refreshes count towards the hourly limit for each user and organization.
- For reports that take longer to run, selecting this option can make users wait to see chart data.

Limits on Report Charts in Pages

Consider these limits when embedding charts in detail pages.

- You can have two report charts per page.
- You can only add report charts from the enhanced page layout editor. The mini console and the original page layout editor are not supported.
- On detail pages, users can refresh up to 100 report charts every 60 minutes.

EDITIONS

Available in: Salesforce Classic

Available in: **All** editions except **Database.com**

- Your organization can refresh up to 3,000 report charts every 60 minutes.

SEE ALSO:

Organize Reports

Keep your reports at your fingertips by sorting them into folders and deleting unused reports. If you have a lot of reports, you can use the search field to find the one you need.

IN THIS SECTION:

- [Keep Favorite Report Folders In View](#)

Pin your most-used report and dashboard folders to the top of the folder list so you don't have to scroll down every time you need them.

- [Hide Unused Report Types](#)

If your users use only a subset of the available standard report types, you can hide the ones they don't need.

- [Move a Report or Dashboard Between Folders](#)

It's a good practice to keep reports and dashboards organized in folders that reflect their function and audience. You can drag and drop reports and dashboards from one folder to another.

- [Delete a Report](#)

You can delete a selected report from the Reports tab or from its run page.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

Keep Favorite Report Folders In View

Pin your most-used report and dashboard folders to the top of the folder list so you don't have to scroll down every time you need them.

- In the list of report and dashboard folders, hover over any folder, then click .

Reports & Dashboards

- Select **Pin to top**.

Your folder moves to the top of the folders list.

EDITIONS

Available in: Salesforce Classic

Available in all editions

Each new folder that you pin goes to the top of the list, above any folders you have already pinned. To move a pinned folder back to the top, just pin it again.

Hide Unused Report Types

If your users use only a subset of the available standard report types, you can hide the ones they don't need.

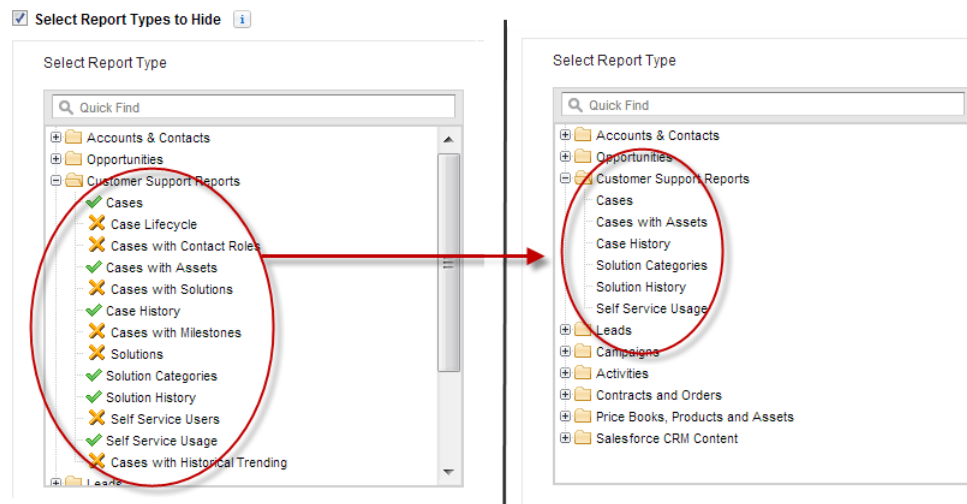

1. On the Reports tab, click **New Report**.
2. Select **Select Report Types to Hide**.
The green check mark next to a report means it's visible to everyone.
3. To hide the report type, click the check mark to change it to an X.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

Create New Report

Hidden report types don't show up when you use the search box on the Create New Report page.

If you hide all the report types in a folder, the folder is also hidden. However, if you later unhide the report type in the "Select Report Types to Hide" dialog box, users can see the folder.

Move a Report or Dashboard Between Folders

It's a good practice to keep reports and dashboards organized in folders that reflect their function and audience. You can drag and drop reports and dashboards from one folder to another.

Note: You need edit access to folders before moving items between them. Moving items using drag-and-drop isn't supported in accessibility mode.

Move a report or dashboard between folders by dragging from the list view to a report or dashboard folder on the Folders pane.

1. On the Reports tab list view, click and hold an item.

EDITIONS

Available in: Salesforce Classic

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To view the Reports tab:

- "Run Reports"

2. Drag the item into its destination folder in the Folders pane.

As you drag an item across a folder, a green check mark (1) indicates that the item can be moved into the selected folder. Conversely, a red icon (no) means that the item can't be moved into a selected folder.

Keep the following in mind when moving items:

- Drag one item at a time.
- You can't move items from installed AppExchange packages or standard report folders into other folders.

- Move reports into report folders and dashboards into dashboard folders.

Delete a Report

You can delete a selected report from the Reports tab or from its run page.

1. Delete a report in one of two ways:

Option	Description
To delete from the Reports tab	Next to the report, click  > Delete .
To delete from the report's run page	Click Delete .

2. Click **OK**.

Deleted reports are moved to the Recycle Bin. You can't delete reports in others' personal folders. You also can't delete reports used by dashboard components or reporting snapshots unless you first delete the dashboard component or reporting snapshot.

SEE ALSO:

[The Report Run Page](#)

Report Limits

As you report on your Salesforce data, be aware of these limits, restrictions, and differences between reporting in Lightning Experience and Salesforce Classic.

Salesforce Reports and Dashboards Limits

Reporting Snapshots	N/A	N/A	N/A	One per hour ² (off-peak hours only ³) (Limited to one preferred start time per day, which can't be changed)	One per hour ²	Two per hour ²	One per hour ² (off-peak hours only ³) (Limited to one preferred start time per day, which can't be changed)

¹ These limits apply to the report builder. If you're using the report wizard, the limit is 10.

² Up to a possible maximum of 200, total.

³ Off-peak hours are between 6 PM and 3 AM local time.

Salesforce retains historical data for the previous three months, plus the current month.

The following Salesforce Reports and Dashboards limits apply to all supported editions.

Report Limits

- The report builder preview shows a maximum of 20 rows for summary and matrix reports, and 50 rows for tabular.
- You can't have more than 250 groups or 4,000 values in a chart. If you see an error message saying that your chart has too many groups or values to plot, adjust the report filters to reduce the number. In combination charts, all groups and values count against the total.

- Reports display a maximum of 2,000 rows. To view all the rows, export the report to Excel or use the printable view for tabular and summary reports. For joined reports, export is not available, and the printable view displays a maximum of 20,000 rows.
 - Summary and matrix reports display the first 2,000 groupings when Show Details is disabled.
 - Matrix reports display a maximum of 400,000 summarized values.
 - Matrix reports display a maximum of 2,000 groupings in the vertical axis when Show Details is disabled. If there are more than 400,000 summarized values, rows are removed until the 2,000 groupings limit is met, then columns are removed until the number of summarized values moves below 400,000.
- When reports that have groupings are viewed in Salesforce1, they're converted to tabular reports.
- By default, reports time out after 10 minutes.
- In a joined report, each block can have up to 100 columns. A joined report can have up to 5 blocks.
- You can add up to 10 custom summary formulas to each block in a joined report. A joined report can have a total of 50 custom summary formulas.
- Each joined report can have up to 10 cross-block custom summary formulas.
- When you filter on standard long text area fields, such as Description or Solution Details, only the first 1000 characters of the field are searched for matches in reports.
- Only the first 254 characters in a rich text area or a long text area are displayed in a report.
- Summary fields on tabular, summary, and matrix reports can display up to 21-digits.
- Reports can't be filtered on custom long text area fields.
- Joined reports require that the new user interface theme is enabled. Users without the new theme are unable to create, edit, or run joined reports.
- Forecast reports include only opportunities that are set to close within the forecast period, except those assigned to the Omitted forecast category.
- Internet Explorer 6 is not supported for joined reports.

Dashboard Limits

- A dashboard filter can have up to 50 options. By default, 10 options are enabled. Contact Salesforce to extend your limit.
- Each dashboard can have up to 20 components.
- It's not possible to filter on bucket fields. However, it is possible to use a report filtered on a bucket field on the dashboard page.
- A dashboard table or chart can display up to 20 photos.
- You must wait at least one minute between dashboard refreshes.

Report Type Limits

- A custom report type can contain up to 60 object references. For example, if you select the maximum limit of four object relationships for a report type, then you could select fields via lookup from an additional 56 objects. However, users will receive an error message if they run a report from a custom report type and the report contains columns from more than 20 different objects.
- You can add up to 1000 fields to each custom report type.

Reporting Snapshot Limits

- The maximum number of rows you can insert into a custom object is 2,000.
- The maximum number of runs you can store is 200.
- The maximum number of source report columns you can map to target fields is 100.

Filtering Limits

Only the first 255 characters in a custom text field count for filtering purposes.

Embedded Report Charts Limits

- You can have two report charts per page.
- You can only add report charts from the enhanced page layout editor. The mini console and the original page layout editor are not supported.
- On detail pages, users can refresh up to 100 report charts every 60 minutes.
- Your organization can refresh up to 3,000 report charts every 60 minutes.

Acceptable range for values: The maximum value allowed is 9999999999999999. The minimum value allowed is -9999999999999999.

Reports and Dashboards API Limits

The following limits apply to both the Reports and Dashboards REST API and Reports and Dashboards API via Apex.

- Cross filters, standard report filters, and filtering by row limit are unavailable when filtering data.
- Historical trend reports are only supported for matrix reports.
- The API can process only reports that contain up to 100 fields selected as columns.
- A list of up to 200 recently viewed reports can be returned.
- Your organization can request up to 500 synchronous report runs per hour.
- The API supports up to 20 synchronous report run requests at a time.
- A list of up to 2,000 instances of a report that was run asynchronously can be returned.
- The API supports up to 200 requests at a time to get results of asynchronous report runs.
- Your organization can request up to 1,200 asynchronous requests per hour.
- Asynchronous report run results are available within a 24-hour rolling period.
- The API returns up to the first 2,000 report rows. You can narrow results using filters.
- You can add up to 20 custom field filters when you run a report.
- Your organization can request up to 200 dashboard refreshes per hour.
- Your organization can request results for up to 5,000 dashboards per hour.

[Reports and Dashboards: Lightning Experience Limitations](#)

Troubleshoot Reports

Use these tips to help solve problems that arise when you're working with reports.

IN THIS SECTION:

1. [Why do my chart labels overlap?](#)
Sometimes the labels for your charts can overlap and be difficult to read. There may be too much data in the same space, or the segments or wedges of the chart may be too small.
2. [Why doesn't my report return any data?](#)
Check with your administrator to make sure you have access to the records you're trying to report on. If you're still not seeing any results in your report, try casting a wider net.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

3. [Why can't I see formula options in report builder?](#)

If you can't see the  **Add Formula** option in the Fields pane of report builder, change your report format to summary, matrix, or joined. Formulas don't show up for tabular reports.

4. [Why doesn't my report return the data I expect?](#)

Check your filters, groupings, fields, report type, and role or user hierarchy to make sure you are asking the right questions of your data.

5. [What are some common report limits?](#)

Here are some common report limits. To see a full list of analytics limits, see the Salesforce Limits guide.

6. [Why am I getting an "obsolete report" error message?](#)

You may be trying to report on data that isn't available.

7. [Improve Report Performance](#)

Many factors can cause a report to perform poorly or to time out. You can address most of them with simple changes, such as using the correct filter operators, applying more filters, and reducing the amount of data.

8. [Why is an old role name appearing in the "role hierarchy" trail of my report?](#)

Changes to role names aren't automatically updated in reports. To see the latest role name, change the `Role name as displayed on reports` field for the role record.

Why do my chart labels overlap?

Sometimes the labels for your charts can overlap and be difficult to read. There may be too much data in the same space, or the segments or wedges of the chart may be too small.

To fix overlapping labels, try the following:

- **Enlarge the chart.** Change the chart size in the report to large or extra large or make the dashboard column wider.
- **Remove extra grouping levels.** Reduce the number of grouping levels by using a different chart type. For example, horizontal bar charts have fewer values than grouped horizontal bar charts.
- **Use horizontal charts.** Horizontal charts use different spacing than vertical charts. The advantage of the horizontal bar charts is that the chart can be extended vertically to show numerous groupings, though the width is fixed. Depending on chart settings, you can also display Chatter photos.
- **Change the scale.** Set the chart to use larger units. For example, show values as multiples of 1000 or 1000000.
- **Group small values.** Select the `Combine Small Groups into 'Others'` option for pie, donut, and funnel charts.

Why doesn't my report return any data?

Check with your administrator to make sure you have access to the records you're trying to report on. If you're still not seeing any results in your report, try casting a wider net.

- Show more than your own records. For example, select **Show > All accounts**.
- Expand your time frame filters. For example, select All Time for `Range`, or select a broader custom range.
- Choose field filter operators carefully. If you select `Account Owner equals John James`, you limit potential results to exactly "John James." If you don't see the results you expect, consider expanding the selection by using `Account Owner contains James` instead.
- Check your filter logic. Make sure your combination of conditions isn't excluding all data.

[Limiting your report](#) can improve performance, but make sure you're not filtering out the data you want to see.

Why can't I see formula options in report builder?

If you can't see the  **Add Formula** option in the Fields pane of report builder, change your report format to summary, matrix, or joined. Formulas don't show up for tabular reports.

Why doesn't my report return the data I expect?

Check your filters, groupings, fields, report type, and role or user hierarchy to make sure you are asking the right questions of your data.

Filters

Make sure to include all the data you want. To change a report filter, hover over it and click **Edit** or **Remove**. Your filters display when you run your report; click **Edit** on that page to make additional changes.

Groupings

When you group by a field, you remove it from the details of the report. If you export the report, you see the field, though it does not appear in the detail area.

Fields

After checking your groupings, check your fields. If your report contains multiple related records—for example, an account, its opportunities, and their products—look at the detail pages for the account record, opportunity record, and product line item to ensure that the fields contain data. If the data isn't available in the format you want, work with your Salesforce administrator to add formula fields to get the data. When formula fields are added to an object, they appear in record detail pages and in reports.

Report Type

The report type selected may not be appropriate or the records anticipated may not share the relationship between objects required for the report type. When choosing a report, be sure you understand which fields are available in the report type.

If your report type includes both parent and child objects, but no child fields are used in a report, the report shows parent records whether they have a child record or not.

Hierarchy

Hierarchy options let you drill down to different data sets based on the role or user hierarchy. The selected hierarchy level, or its default role, may affect the data shown.

Note: Hierarchy applies to activity and opportunity reports.

What are some common report limits?

Here are some common report limits. To see a full list of analytics limits, see the Salesforce Limits guide.

Feature	Limit	Editions Info
Bucket fields per report	Up to 5 (each bucket field can have 20 buckets)	Available in Enterprise, Unlimited, Performance, and Developer Editions.
Matrix reports	Up to 400,000 summarized values. Data exceeding this limit is not displayed.	Available in all editions.
Scheduled reports per organization	One or two per hour, based on edition	Available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.
Field filters per report	Up to 20	Available in all editions.
Formulas per report	Up to 5	Available in all editions.

Feature	Limit	Editions Info
Rows displayed in a report	Up to 2,000. To view all the rows, export the report to Excel or use the printable view for tabular and summary reports. For joined reports, export is not available, and the printable view displays a maximum of 20,000 rows.	Available in all editions.
Rows displayed in the report builder preview	Up to 20 rows for summary and matrix reports, and up to 50 rows for tabular	Available for all editions.

1 2 3

Why am I getting an “obsolete report” error message?

You may be trying to report on data that isn't available.

Data may be unavailable because:

- An object in the report isn't enabled for reporting anymore.
- A lookup relationship used by objects in the report has been deleted or modified.
- An object in the report has been deleted.
- You don't have “View” permissions for an object in the report.

Improve Report Performance

Many factors can cause a report to perform poorly or to time out. You can address most of them with simple changes, such as using the correct filter operators, applying more filters, and reducing the amount of data.

Watch this video for quick tips on  [Making Your Reports Run Faster](#).

A report can take anywhere from a few seconds to several minutes to run. Occasionally, a report is so complex that it exceeds the timeout limit and fails. If the report is slow to load, it's usually because it is:

- Querying too many objects
- Dealing with intricate lookups
- Has too many fields

For example, say that you run a sales team and want to see how many Leads each of your salespeople has. You build a report that returns all the leads in your company. Now you have all the data you need, but also some that you don't, and your report takes a long time to run. To make your report run faster, filter it so that it only returns Leads assigned to your team. If you need your report to run even faster, consider filtering by time. Do you need to see Leads from last year, or the year before? If not, add a second filter which scopes your report to this year only. Now your report runs as fast as lightning!

If you can't view a report and want to edit it to avoid the time-out, append `?edit=1` to the report URL. Doing so gets you into edit mode, where you can adjust the criteria. Try these tips to get your reports to run more efficiently.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

- When filtering, use the `equals` or `not equal` to operators instead of `contains` or `does not contain`. For example, use `Account Owner equals John James`, not `Account Owner contains John`. Choose **AND** rather than **OR** for filter logic
- To narrow your report's date range, use time frame filters. For example, use `Last 30 Days` instead of `Current FY`.
- Set time frame filters by choosing a `Date Field` and `Range` to view. Only records for that time frame are shown.
- Reduce the number of fields in the report by removing unnecessary columns or fields.
- If you receive an error message saying that your activity report has too many results, filter on a picklist, text, or date field. Alternatively, rerun the report using a different activity data type such as "Activities with Accounts" or "Activities with Opportunities".
- Add time filters, scope filters, and filter criteria to the report to further narrow the results.

[Enter Filter Criteria](#)

[Getting the Most Out of Filter Logic](#)

Why is an old role name appearing in the "role hierarchy" trail of my report?

Changes to role names aren't automatically updated in reports. To see the latest role name, change the `Role name as displayed on reports` field for the role record.

Get the Right Data into Your Report

A well-designed report helps you turn raw data into information people can act on. Summarize values and group them into meaningful categories, filter out irrelevant facts, and gather data about multiple objects at once.

SEE ALSO:

[Group Your Report Data](#)

[Summarize Your Report Data](#)

[Filter Your Report Data](#)

Communicate Your Report Data Effectively

A report produces information in the form of a table. You can set up that table to help people scan quickly for the information they need. You can also add a graph to help users understand the data visually, and you can display the report's data on a dashboard.

SEE ALSO:

[Show Report Data Graphically](#)

[Show Report Data in Tables](#)

The Report Run Page

The Report Run page lets you control what happens to your report when you run it.

From the report run page, you can:

- Display a Chatter feed of updates and posts about the report.
- View **Report Generation Status**.
- Choose hierarchy options.
- Change top-level groupings using the **Summarize information** by drop-down.
- Change **Time Frame** and **View** options.
- Click **Run Report** to immediately run or schedule the report.
- Click **Show Details** to view all data or **Hide Details** to show only summary information.
- Click **Customize** to open the report in report builder.
- Print or export the report.
- Click **Subscribe** to set up report notifications, which notify you whenever certain metrics in the report meet your conditions.
- Click **Edit** next to the chart to change its properties, or click **Large, Medium, or Small** to change its size.
- Sort report results.
- Edit or clear applied filter criteria.
- For summary and matrix reports, filter selected rows by a particular field. Select the rows you want to view, choose a field to group by, then click **Drill Down**. For example, if you created an opportunity report that displays deals by industry, you can select the industries that are doing well and group by **Product Name** to see which products are selling in that industry. Click **Clear** to remove the drill-down filter.

Report Run Page Options

Customize the report run page to support the specific information you need for the way you work.

The following fields and buttons are available from the report run page, depending on your setup.

Option	Description
Customize	Opens the report builder to help you customize the report.
Date Field	Choose date-specific information about the records: created date, last updated date, and date of last activity.
Delete	Deletes the report. Deleted reports are moved to the Recycle Bin.
Display Currencies Using	Determines the currency type for report subtotals and amounts in the "converted" column of any field. Available only for organizations using multiple currencies. Amounts in reports are shown in their original currencies, and report totals are displayed in your personal currency. To change the currency go to the report builder and click Show > Currencies

Option	Description
Division	<p>Using, then select an active currency. For any amount, you can also choose to display the “converted” column (for example, “Annual Revenue (converted)”), which will show amounts in the selected currency.</p>
Drill Down	<p>For summary and matrix reports, filter selected rows by a particular field. Select the rows you want to view, choose a field to group by, then click Drill Down. For example, if you created an opportunity report that displays deals by industry, you can select the industries that are doing well and group by <code>Product Name</code> to see which products are selling in that industry. Click Clear to remove the drill-down filter.</p>
Export Details	<p>Exports data from the report to a Microsoft® Excel spreadsheet or CSV (comma-separated values) file.</p>
Hierarchy	<p>Provides options to view the report data based on role or territory hierarchy. View data for an individual user, a role, or an entire organization. Available only for Professional, Enterprise, Unlimited, Performance, and Developer Editions.</p>
Printable View	<p>Lets you display the report in Microsoft Excel format, for easy printing.</p>
Relationship to Opportunity	<p>Specifies a scope based on opportunity ownership or opportunity team; limits the data in an opportunity report.</p>
Range	<p>Specifies a time period for a report. You can limit the data by specific dates using any standard or custom date field defined for the type of record in the report. Works with <code>From</code> and <code>To</code> fields.</p>
Run Report	<p>Regenerates the report data based on current report settings.</p>
Save	<p>Saves changes to one of your existing custom reports.</p>
Save As	<p>Saves parameter changes to any custom, standard, or public report under a new name, without altering the original report.</p>
Show	<p>Specifies which items to include in the report: just the records you own, or all records to which you have access. Use this option to see team data in your report.</p>
Show/Hide Details	<p>Toggles the display to show all information or just summary information.</p>
Subscribe	<p>Lets you subscribe to receive report notifications, whenever certain metrics meet conditions you specify.</p>
Summarize information by	<p>Provides subtotals for the fields you specify.</p>

Option	Description
Units	Choose to view the age of a case in days, hours, or minutes. The age of an open case is the elapsed time from creation to the present. The age of a closed case is the elapsed time from creation to the closing time of the case.

Get Started with Reports

Set up your reporting environment, use the report builder to create a basic report, and organize your reports to make it easy to find information when you need it. In most cases, you can start with a standard report and customize it to your needs.

You can report on any data you have read or read/write access to. The available data varies depending on your sharing model, but you can almost always report on data owned by or shared with users below you in the role hierarchy, regardless of your sharing model. (Certain sharing models do not allow this.) Salesforce offers two ways to report on information owned by you or users who report to you:

- Some reports have a `view` filter. Choose the “My team’s” option, such as “My Team’s Opportunities,” to view data owned by you and users below you in the role hierarchy.
- Some reports, such as opportunity and activity reports, have **Hierarchy** links that allow you to drill down to different data sets based on the role or user hierarchy. If your organization uses territory management, in some reports these links are based on the territory hierarchy.

You can choose to sort the report by record owner or role when customizing the report.

Reports Give You Access to Your Data

Use reports to leverage the data your organization has accumulated over time. You can examine your organization’s data in almost infinite combinations, display it in easy-to-understand formats, and share the resulting insights with others via dashboards.

A *report* returns a set of records that meets certain criteria, and displays it in organized rows and columns. Report data can be filtered, grouped, and displayed graphically as a chart. Reports are stored in folders, which control who has access.

Dashboards

Learn about Dashboards

Dashboards give over-arching views of your Salesforce data. Before building, reading, and sharing dashboards, review these dashboard basics.

As you prepare to curate your Salesforce data with dashboards, keep these tips in mind:

- Reports provide all the data shown in a dashboard. Dashboards can show data from more than one report.
- When refreshing a dashboard, all the data-providing reports must run. If the reports take a long time to run, then the dashboard does too.
- Dashboards are shared via folders. Whomever has permission to the folder your dashboard is saved in also has access to your dashboard. Ensure that you save your dashboard in an appropriate folder.

Before creating or reading a dashboard, familiarize yourself with these features and concepts.

Dashboard Editor

The Dashboard Editor is a visual, drag-and-drop tool which you use to create dashboards and edit existing ones. The Dashboard Editor is where you add, edit, and arrange dashboard components.

To launch the Dashboard Editor, click **New Dashboard**.

Components

Dashboards are made up of components. Each component contains a chart or metric which shows data from one report. Different components can show data from different reports.

Running User (Viewing As)

In Salesforce, different users have different permissions to access data. A dashboard only displays data that the dashboard's running user can access.

For example, say you're viewing a dashboard describing Leads. Emily is a sales operations manager who sees all Leads, and Marcus is a direct sales specialist who sees only the leads he owns. If the Emily is the dashboard's running user, then the dashboard shows data about all the Leads in Salesforce. If Marcus is the running user, then the dashboard only shows data about Leads that Marcus owns.

Build a Dashboard

When you're ready to share Salesforce data with colleagues, build a dashboard. Dashboards let you curate data from reports using charts, tables, and metrics. If your colleagues need more information, then they're able to view your dashboard's data-supplying reports.

IN THIS SECTION:

1. [Create a Dashboard](#)

Create a dashboard to provide a graphical view of the data in your reports.

3. [Provide Individualized Views of a Dashboard](#)

Dynamic dashboards enable each user to see the data they have access to. With a dynamic dashboard, you can control data visibility without having to create a separate dashboard, with its own running user and folder, for each level of data access.

- "Run Reports" AND "Manage Dashboards"

To edit and delete dashboards you created:

- "Run Reports" AND "Manage Dashboards"

To edit and delete dashboards you didn't create:

- "Run Reports," "Manage Dashboards," AND "View All Data"

To create, edit, and delete dynamic dashboards:

- "Run Reports" AND "Manage Dynamic Dashboards"

Provide Individualized Views of a Dashboard

Dynamic dashboards enable each user to see the data they have access to. With a dynamic dashboard, you can control data visibility without having to create a separate dashboard, with its own running user and folder, for each level of data access.

Administrators control access to dashboards by storing them in folders with certain visibility settings. Dashboard folders can be public, hidden, or restricted to groups, roles, or territories. If you have access to a folder, you can view its dashboards.

Folders control access to the dashboard, but the *running user* determines access to data. The running user options are:

- **Run as specified user.** The dashboard runs using the security settings of that single, specific user. All users with access to the dashboard see the same data, regardless of their own personal security settings. This approach is perfect for sharing the big picture across a hierarchy or motivating team members by showing peer performance within a team. If you don't have "View All Data," you can only choose yourself. If you have "View My Team's Dashboards," you can choose any user below you in the role hierarchy.
- **Run as logged-in user.** A *dynamic dashboard* runs using the security settings of the user viewing the dashboard. Each user sees the dashboard according to his or her own access level. This approach helps administrators share one common set of dashboard components to users with different levels of access.

With a dynamic dashboard, you can control data visibility without having to create a separate dashboard, with its own running user and folder, for each level of data access. A single dynamic dashboard can display a standard set of metrics across all levels of your organization.

You can create up to three filters for each dynamic dashboard. Filtering dynamic dashboards gives administrators additional flexibility in creating dashboards. For example, you can create an organization-wide sales scorecard that contains sales rep and product filters. This allows individual sales managers to view their reps' performance collectively as well as individually. It also lets them view sales by product to understand which products specific reps are or aren't selling.

Managers with the "View My Team's Dashboards" or "View All Data" permission can set an option to preview the dashboard from the point of view of users under them in the role hierarchy.

Your organization can have up to five dynamic dashboards for Enterprise Edition, 10 for Unlimited and Performance Edition, and three for Developer Edition. Additional dynamic dashboards may be available for purchase.

Note:

- Following components isn't supported for dynamic dashboards.
- You can't save dynamic dashboards to personal folders.
- You can't schedule refreshes for dynamic dashboards. They must be refreshed manually.

Example Business Scenario

Let's say that your opportunity team consists of one vice president, four sales managers, and 40 sales reps—10 reps per manager. You've been asked to create dashboards that display the following metrics, restricted by role and hierarchy:

Role	Total Bookings	Close Rates by Competitor	Number of Activities by Meeting Type
Sales Rep	✓		✓
Sales Manager	✓	✓	
VP of Sales	✓	✓	

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Sales reps should only see their own data; managers should only see data for the reps they manage; and the VP should see data across the entire team. In this scenario, you'd typically have to create 45 different dashboards—one for every single person. You'd also have to create multiple folders to manage access rights.

With dynamic dashboards, you can create just *two* dashboards and store them in a single folder:

- Create a dynamic dashboard for sales reps with the following components:
 - A gauge of total bookings
 - A table of activities by meeting type
- Create a dynamic dashboard for managers and the VP with the following components:
 - A gauge of total bookings
 - A column chart of close rates by competitor
- Optionally, create filters that let viewers further refine their dashboard views. For example, create a filter on key accounts to let viewers focus on bookings, activities, and competitive threats for each account.

All users only see data that they can access. Sales reps see their own bookings and activities. Managers see bookings and close rates for the reps they manage. The VP sees bookings and close rates for the whole team. Because the metrics are the same for managers and the VP, you can use the same dynamic dashboard for both roles. The dynamic dashboards feature reduces the number of required dashboards from 45 to two!

IN THIS SECTION:

1. [Set Up Dynamic Dashboards](#)

To set up a dynamic dashboard, create a folder to hold the dashboard and its underlying reports, then create the dashboard.

SEE ALSO:

[Filter Dashboard Data](#)

[Create a Dashboard](#)

[Set Up Dynamic Dashboards](#)

Set Up Dynamic Dashboards

To set up a dynamic dashboard, create a folder to hold the dashboard and its underlying reports, then create the dashboard.

Your organization can have up to five dynamic dashboards for Enterprise Edition, 10 for Unlimited and Performance Edition, and three for Developer Edition.

Note:

- You can't save dynamic dashboards to personal folders.
- You can't schedule refreshes for dynamic dashboards. They must be refreshed manually.

1. Create folders accessible to all dashboard viewers to store dynamic dashboards and corresponding component source reports.
2. From the Dashboards tab, create a new dashboard or edit an existing one.
3. Click the  button next to the `View dashboard as` field.

 **Note:** If you don't have "Manage Dynamic Dashboards" permission, just enter a running user and skip to the final step. Enter "*" to see all available users.

4. Select `Run as logged-in user`.
5. Optionally, select `Let authorized users change running user` to enable those with permission to change the running user on the dashboard view page.
 - Users with "View My Team's Dashboards" can view the dashboard as any user below them in the role hierarchy.
 - Users with "View All Data" can edit the dashboard and view it as any user in their organization.
 - Users with "Enable Other User's Dashboard" can edit the dashboard if they have access to it, even if they aren't the running user and don't have "View All Data."
6. Click **OK**.
7. In the `View dashboard as` field, enter a running user.
8. Save your dashboard.
9. Set the appropriate `Show` option on the report run page.
For example, if you choose "My Team's Opportunities," each dynamic dashboard viewer can see all opportunities for the team.

 **Tip:** To avoid restricting the dashboard's view of the data:

- Make sure advanced filters don't include specific record owners (for example, *Opportunity Owner equals Frank Smith*).
- Don't click `Save Hierarchy Level` when saving opportunity reports.

To enable choosing a different running user for the dashboard:

- "View My Team's Dashboards" OR "View All Data"

Install the CRM Sample Dashboards from AppExchange

Use these dashboards from the AppExchange as a starting point for building dashboards that meet your business needs.

The CRM sample dashboards package from AppExchange offers best-practice dashboards with underlying reports that are based on your organization's standard objects and fields. You can use these sales, marketing, service, and support dashboards to track business processes and key performance metrics for yourself, your team, and your company. Dashboards in this package include:

- **Sales & Marketing Dashboards**
 - Marketing Executive Dashboard
 - Sales Executive Dashboard
 - Sales Manager Dashboard
 - Salesperson Dashboard
- **Customer Service Dashboards**
 - Agent Supervisor Overview Dashboard
 - Service Executive Overview Dashboard
 - Service KPIs Dashboard

1. In AppExchange, search for “Salesforce CRM Dashboards” and click **Get It Now**.
2. To install the sample dashboards, install the package.

Run and Then Read a Dashboard

Click on a dashboard's name to run it. Dashboard charts are interactive, so be sure to hover and click on them to get more info!

IN THIS SECTION:

1. [Refresh Dashboard Data](#)
Click **Refresh** to load the latest data into the dashboard. The data is as current as the date and time displayed after  at the top right corner of the dashboard.
2. [Schedule a Dashboard Refresh](#)
In Enterprise Edition, Unlimited Edition, and Performance Edition, you can schedule dashboards to refresh daily, weekly, or monthly.
3. [Choose a Dashboard Running User](#)
Select a *running user* to specify which data to display in a dashboard.
4. [Filter Dashboard Data](#)
Dashboard filters make it easy to provide different combinations of data from a single dashboard. You don't need separate dashboards for different sets of users — just give each group a filter that makes sense for them. When you use a filter on a dashboard, the filtered view is shown again the next time you visit the dashboard.

EDITIONS

Available in: Salesforce Classic

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

Refresh Dashboard Data

Click **Refresh** to load the latest data into the dashboard. The data is as current as the date and time displayed after **As of . . .** at the top right corner of the dashboard.

1. Click **Refresh** to replenish your dashboard with the most recent data.
When dashboard data is being refreshed, the **Refresh** button changes to **Refreshing...** You can leave the dashboard and do other things in Salesforce while the data refreshes. When the dashboard has finished refreshing, Salesforce 1 tells you that the dashboard is ready through the right-hand notification panel. Since push notifications aren't enabled for dashboard refreshes, you're notified only in the app and not in through email.

 **Tip:** If your dashboard data doesn't refresh after ten minutes, the refresh automatically stops. If necessary, click **Refresh** again.

When you refresh a dashboard, the dashboard data refreshes for anyone else in your organization that has access to that dashboard. Additional refreshes submitted during a refresh and up to one minute after the completion of a refresh are ignored; users view the most current data.

When you change filters on a dashboard, the dashboard shows previously cached data, if it exists. If no data exists, the dashboard fetches the latest. Either way, the dashboard's "Last Refreshed" date shows you the timestamp for the data you're viewing.

Schedule a Dashboard Refresh

In Enterprise Edition, Unlimited Edition, and Performance Edition, you can schedule dashboards to refresh daily, weekly, or monthly.

-  **Note:** Users with the "View Setup and Configuration" permission can view all the dashboards scheduled to refresh for your organization on the All Scheduled Jobs page. To view the All Scheduled Jobs page, from Setup, enter *Scheduled Jobs* in the *Quick Find* box, then select **Scheduled Jobs**. Users with "Modify all Data" permission can click **Del** next to a specific scheduled dashboard refresh to permanently delete all instances of the scheduled refresh.

You can also set up Salesforce to send an email with an HTML version of the dashboard when the refresh completes. For email applications that don't support HTML, the email includes text and a link to the dashboard.

1. On the Dashboards tab, select a dashboard using the *View Dashboard* field.
2. Click **Refresh** and choose **Schedule Refresh**

Filters aren't applied when you schedule or email a dashboard.

Each dashboard has a *running user*, whose security settings determine which data to display in a dashboard.

 **Note:** If the running user becomes inactive, the dashboard doesn't run.

3. Select notification settings.
 - Click **To me** to send an email to your user's address.
 - Click **To others . . .** to send an email to additional Salesforce users.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To refresh dashboard data:

- "Run Reports" AND access to dashboard folder

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited

USER PERMISSIONS

To schedule and email a dashboard refresh:

- "Schedule Dashboards"

To delete the schedule to refresh a dashboard:

- "Modify All Data"

 **Note:** Portal users receive report and dashboard refresh email notifications when the `Allow Reports and Dashboards to Be Sent to Portal Users` option is enabled.

- Dashboard refresh notifications may not display properly in Outlook 2007.
- In HTML-formatted dashboard refresh notifications, users can click the name of the dashboard to log in to Salesforce and view the dashboard.
- To send a dashboard refresh notification to other users, store the dashboard in a public folder with access granted to others. Other users can't access dashboards in your personal folders. To add a dashboard to a public folder, edit the dashboard properties.
- Users can click components in a dashboard refresh notification to view the source report in Salesforce.
- Dashboard components that include Visualforce pages and s-controls may not display in dashboard refresh notifications. Users must view them in Salesforce.
- Dashboard refresh notifications can be viewed offline in email clients.
- If a dashboard has filters, only the unfiltered version is emailed.
- By default, Salesforce sends images in dashboard emails as `.png` (Portable Network Graphic) files, which are not supported in Lotus Notes. When you enable the `Use Images Compatible with Lotus Notes in Dashboard Emails` > option, Salesforce uses `.jpg` images, which Lotus Notes supports, when sending dashboard emails. The “Schedule Dashboard” permission is required to view this option.

 **Note:** Dashboard emails that contain images compatible with Lotus Notes are substantially larger and the image quality may be lower.

4. Schedule the refresh.

a. Set the `Frequency` field.

Click the `Daily`, `Weekly`, or `Monthly` fields to show more options.

The total number and frequency of your scheduled dashboard refreshes depends on your Salesforce edition. Enterprise, Unlimited, and Performance Editions can have up to 200 scheduled dashboard refreshes. Unlimited and Performance Edition users can schedule up to two dashboard refreshes an hour per day. Enterprise Edition users can schedule up to one dashboard refresh an hour per day. Additional scheduled dashboards may be available for purchase. Contact your Salesforce representative for information.

b. Specify dates in the `Start` and `End` fields.

Dashboards refresh in the time zone of the user who scheduled the refresh. For example, if the `Time Zone` field on your user record is set to Pacific Standard Time (PST), and you schedule a dashboard to refresh every day at 2:00 PM, then the dashboard will refresh every day between 2:00 PM and 2:29 PM PST. If you view and save a schedule in a time zone different from the one in which it was previously scheduled, the time slot could potentially change.

c. Under `Preferred Start Time`, click **Find available options...** to choose a time.

The dashboard refresh runs within 30 minutes of your preferred start time. For example, if you select 2:00 PM, the refresh may happen any time between 2:00 PM and 2:29 PM, depending on availability.

 **Note:** Your preferred start time may not be available if other users have already selected it.

- If you schedule a dashboard to refresh on a specific day of every month, it only refreshes on months that have that specific day. For example, if you schedule a refresh for the 31st of every month, the dashboard won't refresh on 30-day months. To refresh on the last day of every month, choose “Last” from the `On day of every month` drop-down list.
- Dashboards won't refresh as scheduled if the running user doesn't have access to the dashboard folder.
- If a dashboard has filters, only the unfiltered version is refreshed.

- You can't schedule refreshes for dynamic dashboards. They must be refreshed manually.

5. Click **Save**.

To delete a scheduled dashboard refresh, click **Refresh** > **Schedule Refresh** > **Unschedule Dashboard**.

The scheduled refresh is permanently deleted, and not sent to the Recycle Bin. Deleting the scheduled refresh does not affect the dashboard itself.

[Apply a Dashboard Filter](#)

[Refresh Dashboard Data](#)

Choose a Dashboard Running User

Select a *running user* to specify which data to display in a dashboard.

Each dashboard has a *running user*, whose security settings determine which data to display in a dashboard.

 **Note:** The “Manage Dynamic Dashboards” permission, required for selecting a running user, isn't available in **Professional** Edition.

If you have “View All Data,” you can choose any user in your organization to be a running user of the dashboard. If you have “View My Team's Dashboards,” you can choose any user below you in the role hierarchy.

 **Note:** Dashboard components that use Visualforce ignore the running user; content displays only if the viewing user has access to the Visualforce page. Other components in the dashboard are not affected.

Users with a Salesforce Platform or Salesforce Platform One user license can only view a dashboard if the dashboard running user also has the same license type. Consider creating separate dashboards for users with different license types.

- Edit a dashboard.
- Click the  button next to the `View dashboard as` field.

 **Note:** If you don't have “Manage Dynamic Dashboards” permission, just enter a running user and skip to the final step. Enter “*” to see all available users.

3. Choose a running user setting.

- Run as specified user.** The dashboard runs using the security settings of that single, specific user. All users with access to the dashboard see the same data, regardless of their own personal security settings. This approach is perfect for sharing the big picture across a hierarchy or motivating team members by showing peer performance within a team. If you don't have “View All Data,” you can only choose yourself. If you have “View My Team's Dashboards,” you can choose any user below you in the role hierarchy.
- Run as logged-in user.** A *dynamic dashboard* runs using the security settings of the user viewing the dashboard. Each user sees the dashboard according to his or her own access level. This approach helps administrators share one common set of dashboard components to users with different levels of access.

- Unlimited
- Developer

USER PERMISSIONS

To create, edit, and delete dashboards:

- “Run Reports” AND “Manage Dashboards”

To create, edit, and delete dynamic dashboards:

- “Run Reports” AND “Manage Dynamic Dashboards”

To enable choosing a different running user for the dashboard:

- “View My Team's Dashboards” OR “View All Data”

4. Optionally, select `Let authorized users change running user` to enable those with permission to change the running user on the dashboard view page.
 - Users with “View My Team’s Dashboards” can view the dashboard as any user below them in the role hierarchy.
 - Users with “View All Data” can edit the dashboard and view it as any user in their organization.
 - Users with “Enable Other User’s Dashboard” can edit the dashboard if they have access to it, even if they aren’t the running user and don’t have “View All Data.”
-  **Note:** If you have “View All Data” or “View My Team’s Dashboards,” you can preview the dashboard *edit* page as a different user, but you must select `Let authorized users change running user` to change the running user from the dashboard *view* page.
5. Click **OK**.
6. In the `View dashboard as` field, enter a running user.
7. Save your dashboard.

Filter Dashboard Data

Dashboard filters make it easy to provide different combinations of data from a single dashboard. You don’t need separate dashboards for different sets of users — just give each group a filter that makes sense for them. When you use a filter on a dashboard, the filtered view is shown again the next time you visit the dashboard.

A filter has a name, a filter operator and one or more values. Each filter can have up to 10 options. Each dashboard can have up to 3 filters. Contact Salesforce to increase the filter options limit. A maximum of 50 filter options is possible.

You can filter on picklists, lookups, and checkboxes, and on text, numeric, date, and date/time fields.

When you change filters on a dashboard, the dashboard shows previously cached data, if it exists. If no data exists, the dashboard fetches the latest. Either way, the dashboard’s “Last Refreshed” date shows you the timestamp for the data you’re viewing. Click **Refresh** to get the most recent data.

-  **Note:** There are some things you can’t do with dashboard filters.
- Filters can’t be added to dashboards that contain Visualforce or s-control components.
 - It’s not possible to filter on bucket fields. However, it is possible to use a report filtered on a bucket field on the dashboard page.
 - Filters aren’t applied when you schedule or email a dashboard.
 - You can’t filter data on a joined report in dashboard view or add a filter to a dashboard that only has joined reports.
 - You can’t use custom formula fields in a dashboard filter.

IN THIS SECTION:

1. [Add a Dashboard Filter](#)
To create a dashboard filter, select a field that contains the type of information you want to filter on, then define how the filter returns the data.
2. [Apply a Dashboard Filter](#)
Filter a dashboard to analyze the information interactively. When you filter a dashboard, the filtered view is preserved so that the next time you see the dashboard, data is filtered by the same view.

[Add a Dashboard Filter](#)

[Apply a Dashboard Filter](#)

[Create a Dashboard](#)

[Set Up Dynamic Dashboards](#)

Add a Dashboard Filter

To create a dashboard filter, select a field that contains the type of information you want to filter on, then define how the filter returns the data.

The field you select for the filter may have *equivalent fields*. Equivalent fields share the same underlying object as the field you select for the filter. You can use equivalent fields to filter components that don't have the exact field you selected for the filter, or to filter some components differently. For example, if you filter on the `Account Owner` field, equivalent fields may include `Opportunity Owner` or `Opportunity Created by`, as all three are part of the User object.

When you edit a dashboard, you can see how each component is being filtered under `Filtered By`. If equivalent fields are available for a component, you can select a different field to filter the component.

1. Click **Edit** on your dashboard, then click **Add Filter**.
2. Select the field to filter on from the `Field` drop-down. The drop-down shows fields that can be used to filter all components. (To see equivalent fields for your selection, click )
3. Give your filter a display label to identify it. If your filter has many equivalent fields, we recommend using a label that works for all components.
4. Under Filter Options, select an operator and provide one or more values to filter by.

Use the **Group Name** field to give your filter a name. For example, on a sales dashboard, you might gather several stages of Opportunities into a group called "Early." This lets users quickly filter the dashboard to show only data relevant to deals that are in the early stages of development.

Deals for Different Account Segments

Show how different types of deals are performing across different account segments by creating a dashboard with two filters. Create a filter for **Annual Revenue** that contains several ranges that reflect how your organization segments accounts, then create a filter on opportunity **Type**, and finally add a filter to show deals by **Region**. Create this as a dynamic dashboard to let the entire sales organization use it: managers can use it to view the performance of their teams, while reps can use it to monitor their own performance.

Share a Dashboard

A dashboard is the best way to share a curated, interactive set of data with colleagues.

Note: As you work with folders, keep these Lightning Experience limitations in mind.

Features Not Available in Lightning Experience

Feature	Notes about Lightning Experience Availability
Standard Folders	
Move Reports and Dashboards between Folders	
Create and Delete Report and Dashboard Folders	Folders created in Salesforce Classic and their contents are available in Lightning Experience. Users can save inside these folders when creating or cloning a report or dashboard.
Share Report and Dashboard Folders	Sharing permissions set on folders in Salesforce Classic are obeyed in Lightning

EDITIONS

Available in: **All** editions except **Database.com**

Feature	Notes about Lightning Experience Availability
	Experience, but sharing permissions can't be set nor changed.
Search for Report and Dashboard Folders	Users can't search for report and dashboard folders in Lightning Experience. Global search results include reports and dashboards, but not report and dashboard folders.

IN THIS SECTION:

1. [Manage Access to Reports and Dashboards](#)

Access to reports and dashboards is controlled through settings for the folder they are stored in. To give others access to your reports or dashboards, place them in a shared folder. To prevent others from accessing your reports, place them in personal folders that only you can access.

2. [Print a Dashboard](#)

Print dashboards using your browser's print option.

Manage Access to Reports and Dashboards

Access to reports and dashboards is controlled through settings for the folder they are stored in. To give others access to your reports or dashboards, place them in a shared folder. To prevent others from accessing your reports, place them in personal folders that only you can access.

To access report or dashboard folders go to the Reports tab. On the tab, in the folders pane, click  and select **New Report Folder** or **New Dashboard Folder** to create a folder, or click  on a folder to edit.

Consider the following when you edit reports or dashboards you didn't create or when you're try to share reports with others:

- You can modify the contents of a folder only if the folder access level is set to Read/Write. Only users with the "Manage Public Reports" or "Manage Public Dashboards" can delete or change a Read Only folder. Regardless of permissions or folder settings, you can't edit any unfiled folders or others' personal folders.
- Administrators, or users with the "Manage Public Reports" and "Create and Customize Reports" permissions, can create custom reports that all users can view. They can also organize reports by creating custom report folders and configuring which groups of users have access to them. Note that public reports and report folders are not available with Personal, Contact Manager, and Group Editions.
- To make a report public, run the report and click **Save As**. Give the report a name and choose a public report folder.

IN THIS SECTION:

1. [Access to Report Folders](#)

Folder access is controlled by permissions. Users must have certain permissions to access public, hidden, or shared report folders.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Report folders not available in: **Contact Manager, Group, and Personal Editions**

USER PERMISSIONS

To create, edit, and delete public report folders:

- "Manage Public Reports"

To create, edit, and delete public dashboard folders:

- "Manage Dashboards" AND "View All Data"

2. [Access to Dashboard Folders](#)

Folder access is controlled by permissions. Users must have certain permissions to access public, hidden, or shared dashboard folders.

SEE ALSO:

[Access to Dashboard Folders](#)

[Access to Report Folders](#)

Access to Report Folders

Folder access is controlled by permissions. Users must have certain permissions to access public, hidden, or shared report folders.

The following tables show the permissions that users must have to access the three different types of report folders: public, hidden, and shared.

 **Note:** The “View Reports in Public Folders” permission is available only in organizations with enhanced sharing for reports and dashboards. Organizations without enhanced sharing for reports and dashboards use “View All Data.”

Public Folders

The following permissions apply to folders with these visibility settings:

- This folder is accessible by all users, including portal users
- This folder is accessible by all users, except for portal users

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Report folders not available in: **Contact Manager, Group, and Personal Editions**

Print a Dashboard

Print dashboards using your browser's print option.

- Set the paper orientation to print in landscape format so that it is wide enough for all three columns of dashboard components.
- If necessary, resize your columns and remove the browser-imposed headers and footers.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To print dashboards:

- "Run Reports" AND access to dashboard folder

Organize Dashboards

Keep your dashboards at your fingertips by sorting them into folders and deleting unused reports. If you have a lot of reports, you can use the search field to find the one you need.

IN THIS SECTION:

1. [Delete a Dashboard](#)

It's a good idea to delete dashboards that you no longer need.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

Delete a Dashboard

It's a good idea to delete dashboards that you no longer need.

Deleting a dashboard also deletes the components within it. It doesn't delete the custom reports used by the components.

Deleted dashboards are moved to the Recycle Bin.

To delete a dashboard in Lightning Experience, open the dashboard and then click **Delete**.

To delete a dashboard in Salesforce Classic:

1. Click the Dashboards tab.
2. Click **Go To Dashboards List**.
3. Choose the folder where the dashboard is stored.
4. Click **Del** next to the name of the dashboard.

Dashboard Limits

As you build dashboards of your Salesforce data, be aware of these limits, restrictions, and differences between dashboards in Lightning Experience and Salesforce Classic.

Salesforce Reports and Dashboards Limits

¹ These limits apply to the report builder. If you're using the report wizard, the limit is 10.

² Up to a possible maximum of 200, total.

³ Off-peak hours are between 6 PM and 3 AM local time.

Salesforce retains historical data for the previous three months, plus the current month.

The following Salesforce Reports and Dashboards limits apply to all supported editions.

Report Limits

- The report builder preview shows a maximum of 20 rows for summary and matrix reports, and 50 rows for tabular.
- You can't have more than 250 groups or 4,000 values in a chart. If you see an error message saying that your chart has too many groups or values to plot, adjust the report filters to reduce the number. In combination charts, all groups and values count against the total.

- Reports display a maximum of 2,000 rows. To view all the rows, export the report to Excel or use the printable view for tabular and summary reports. For joined reports, export is not available, and the printable view displays a maximum of 20,000 rows.
 - Summary and matrix reports display the first 2,000 groupings when Show Details is disabled.
 - Matrix reports display a maximum of 400,000 summarized values.
 - Matrix reports display a maximum of 2,000 groupings in the vertical axis when Show Details is disabled. If there are more than 400,000 summarized values, rows are removed until the 2,000 groupings limit is met, then columns are removed until the number of summarized values moves below 400,000.
- When reports that have groupings are viewed in Salesforce1, they're converted to tabular reports.
- By default, reports time out after 10 minutes.
- In a joined report, each block can have up to 100 columns. A joined report can have up to 5 blocks.
- You can add up to 10 custom summary formulas to each block in a joined report. A joined report can have a total of 50 custom summary formulas.
- Each joined report can have up to 10 cross-block custom summary formulas.
- When you filter on standard long text area fields, such as Description or Solution Details, only the first 1000 characters of the field are searched for matches in reports.
- Only the first 254 characters in a rich text area or a long text area are displayed in a report.
- Summary fields on tabular, summary, and matrix reports can display up to 21-digits.
- Reports can't be filtered on custom long text area fields.
- Joined reports require that the new user interface theme is enabled. Users without the new theme are unable to create, edit, or run joined reports.
- Forecast reports include only opportunities that are set to close within the forecast period, except those assigned to the Omitted forecast category.
- Internet Explorer 6 is not supported for joined reports.

Dashboard Limits

- A dashboard filter can have up to 50 options. By default, 10 options are enabled. Contact Salesforce to extend your limit.
- Each dashboard can have up to 20 components.
- It's not possible to filter on bucket fields. However, it is possible to use a report filtered on a bucket field on the dashboard page.
- A dashboard table or chart can display up to 20 photos.
- You must wait at least one minute between dashboard refreshes.

Report Type Limits

- A custom report type can contain up to 60 object references. For example, if you select the maximum limit of four object relationships for a report type, then you could select fields via lookup from an additional 56 objects. However, users will receive an error message if they run a report from a custom report type and the report contains columns from more than 20 different objects.
- You can add up to 1000 fields to each custom report type.

Reporting Snapshot Limits

- The maximum number of rows you can insert into a custom object is 2,000.
- The maximum number of runs you can store is 200.
- The maximum number of source report columns you can map to target fields is 100.

Filtering Limits

Only the first 255 characters in a custom text field count for filtering purposes.

Embedded Report Charts Limits

- You can have two report charts per page.
- You can only add report charts from the enhanced page layout editor. The mini console and the original page layout editor are not supported.
- On detail pages, users can refresh up to 100 report charts every 60 minutes.
- Your organization can refresh up to 3,000 report charts every 60 minutes.

Acceptable range for values: The maximum value allowed is 9999999999999999. The minimum value allowed is -9999999999999999.

Reports and Dashboards API Limits

The following limits apply to both the Reports and Dashboards REST API and Reports and Dashboards API via Apex.

- Cross filters, standard report filters, and filtering by row limit are unavailable when filtering data.
- Historical trend reports are only supported for matrix reports.
- The API can process only reports that contain up to 100 fields selected as columns.
- A list of up to 200 recently viewed reports can be returned.
- Your organization can request up to 500 synchronous report runs per hour.
- The API supports up to 20 synchronous report run requests at a time.
- A list of up to 2,000 instances of a report that was run asynchronously can be returned.
- The API supports up to 200 requests at a time to get results of asynchronous report runs.
- Your organization can request up to 1,200 asynchronous requests per hour.
- Asynchronous report run results are available within a 24-hour rolling period.
- The API returns up to the first 2,000 report rows. You can narrow results using filters.
- You can add up to 20 custom field filters when you run a report.
- Your organization can request up to 200 dashboard refreshes per hour.
- Your organization can request results for up to 5,000 dashboards per hour.

SEE ALSO:

[Reports and Dashboards: Lightning Experience Limitations](#)

Why doesn't my dashboard display the data I expect?

If you're not seeing data you expect, refresh for latest data, check that you have the right running user, and verify whether data sources on the dashboard are correct.

If your dashboard data doesn't look as you expect, check the following:

- **Running user.** Remember that you're viewing the dashboard from the perspective of the running user. What you see is based on that user's access rights. For dynamic dashboards, you can only see what you yourself can access.
- **Last dashboard refresh.** You may be viewing older data. Click **Refresh** to refresh your dashboard.
- **Data sources.** Verify that your data sources (reports, s-controls, or Visualforce pages) contain the information you want displayed in the dashboard components.

Dashboards Help You Visualize Complex Information

Dashboards help you make decisions based on real-time data you've gathered with reports. Use dashboards to help users identify trends, sort out quantities, and measure the impact of their activities.

Watch a Demo:  [An Overview of Dashboards](#)

 **Note:** Dashboards in Group Edition organizations are view-only.

IN THIS SECTION:

1. [Get Started with Dashboards](#)
After you've found the data that you need, use a dashboard to find patterns, stay up-to-the-minute on changes, and share knowledge that you and your coworkers can act on in real time.

Get Started with Dashboards

After you've found the data that you need, use a dashboard to find patterns, stay up-to-the-minute on changes, and share knowledge that you and your coworkers can act on in real time.

- Users with a Salesforce Platform or Salesforce Platform One user license can only view a dashboard if the dashboard running user also has the same license type. Consider creating separate dashboards for users with different license types.
- Dashboards in Group Edition organizations are view-only.

Clicking the Dashboards tab displays the dashboard you viewed most recently. The top of the page shows the time the dashboard was refreshed last and the user whose permissions determine what data is visible on the dashboard. If you can't access a dashboard, verify your folder permissions.

Use Dashboards on the iPad

Salesforce Mobile Dashboards for the iPad, available from the Apple App Store, lets you access dashboards you recently viewed or are following when you're on the go.

 **Important:** As of Summer '15, the Mobile Dashboards for iPad app is no longer supported. You can continue to use the app, but Salesforce no longer provides support in the form of bug fixes or enhancements for any issues you may encounter. Talk to your Salesforce administrator about migrating to the Salesforce1 app, the new Salesforce mobile experience.

The mobile dashboards app keeps you in touch with your organization's data, performance, and trends, whether you're in the office or on the road. Use this app to:

- Browse recently viewed dashboards, or ones you're following
- Search for dashboards

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To view and refresh dashboards:

- "Run Reports" AND access to dashboard folder

To create dashboards:

- "Run Reports" AND "Manage Dashboards"

To edit and delete dashboards you created:

- "Run Reports" AND "Manage Dashboards"

To edit and delete dashboards you didn't create:

- "Run Reports," "Manage Dashboards," AND "View All Data"

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

- View individual dashboard components, highlight their values, and drill into reports for each
- Modify your report view
- Email a dashboard or an individual component to others
- View, post, and comment on a dashboard's Chatter feed
- When offline, access some dashboards and reports you recently viewed in the app

 **Note:** The app doesn't support dynamic dashboards or dashboard filters.

You can download the app for free from the [Apple App Store](#) or from the [AppExchange](#). You can use the mobile dashboards app on all iPad models with iOS 5 or higher. The app is available in Salesforce Enterprise, Unlimited, Performance, and Developer Editions, and additionally in any organization that has enabled REST API.

If you can access your Salesforce organization from your iPad, you can use the mobile dashboards app. Open the app and log in using your Salesforce email and password. If you don't have a Salesforce account, you can still explore the app by tapping **Demo**.

 **Note:** Dashboard access for your iPad is available by default for your organization. If it isn't, an administrator must enable it before you can log in to the app.

In the Salesforce Classic Mobile client application, the Dashboards tab displays if your Salesforce administrator has added the tab to your mobile configuration.

View Dashboard Lists

The dashboard list contains all the dashboards you can view.

1. From the Dashboards tab, click **Go to Dashboard List**.
The enhanced Reports tab lists your recently viewed dashboards in that dashboard's folder.
2. On the dashboard list page, select a folder to view a list of dashboards stored in that folder, or search with filters.
3. Click a dashboard name to display the dashboard.
4. If you're working in Salesforce Classic, Click  next to a dashboard name to edit or delete a dashboard.

 **Note:** Dashboards in Group Edition organizations are view-only.

5. If Chatter is enabled, click  or  to follow or stop following a dashboard in your Chatter feed.

Let Users View Dashboards on the iPad

The Mobile Dashboards for iPad app is automatically enabled for your organization so your users can access the app without any configuration on your part.

Important: As of Summer '15, the Mobile Dashboards for iPad app is no longer supported. You can continue to use the app, but Salesforce no longer provides support in the form of bug fixes or enhancements for any issues you may encounter. Talk to your Salesforce administrator about migrating to the Salesforce1 app, the new Salesforce mobile experience.

You can disable the app if you don't want users accessing Salesforce data from mobile devices and you can easily re-enable it if you change your mind later.

To configure access to Mobile Dashboards for iPad:

1. From Setup, enter *Mobile Dashboards* in the Quick Find box, then select **Mobile Dashboard Settings**.
2. Select or deselect *Enable the Mobile Dashboards iPad app for all users*.
3. Click **Save**.

Users can download and install the Mobile Dashboards for iPad app from the [Apple App Store](#) or [AppExchange Mobile](#).

Aside from editions noted, the app is available to organizations enabled with REST API.

STREAMLINE SALES AND SERVICE WITH THE SALESFORCE CONSOLE

Salesforce Console

A Salesforce console is designed to boost productivity for users in fast-paced environments.

Watch a Demo:  [Introducing the Salesforce Console](#)

The console's dashboard-like interface reduces clicking and scrolling so that you can quickly find, update, or create records. Use a console to easily access data and features you use most. For example, support agents can use multiple applications at once and keep the context of cases as priorities change. Sales reps can immediately contact leads, assess companies, identify key contacts, and access sales intelligence. You can set up a console for service or sales.

The console's tab-based interface makes it easy for you to see records and their related items on one screen, and work on multiple items simultaneously.

EDITIONS

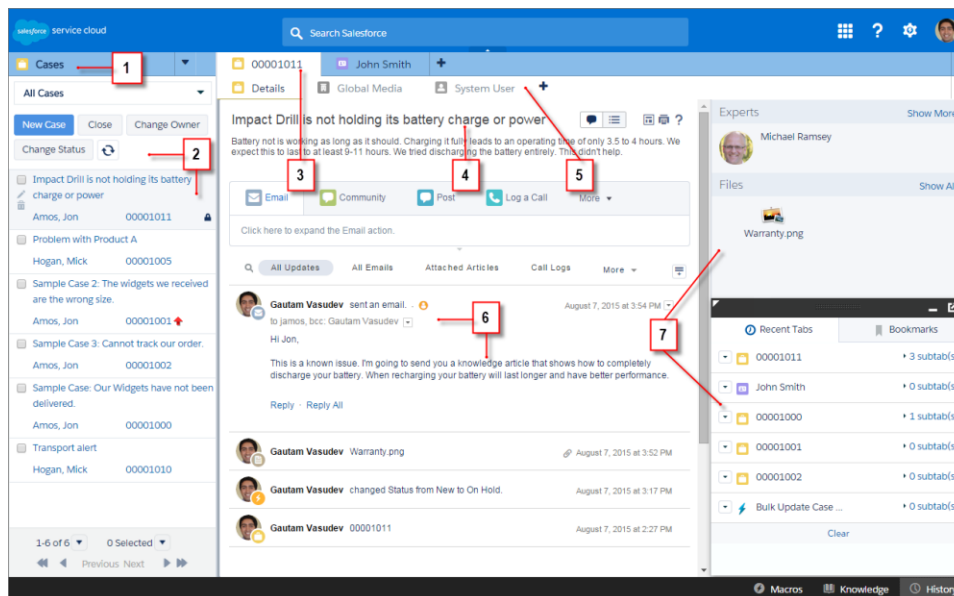

Available in: Salesforce Classic

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions with the Service Cloud

Available in: **Performance** and **Developer** Editions with the Sales Cloud

Available in: **Enterprise** and **Unlimited** Editions with the Sales Cloud for an extra cost

Salesforce Console User Interface

- (1) Select objects and records from the navigation tab.
- (2) Records display in a list, which you can pin at the left of the top of the screen.
- (3) Selected records appear as primary tabs, and tabs let you work on several items at once.
- (4) A highlights panel shows key information related to records.
- (5) Records related items appear as subtabs, and subtabs let you quickly switch between related information without losing context.
- (6) View and interact with content in the feed or detail area.
- (7) Access custom component data in sidebars and footers.

Administrators can customize a console to determine everything from the objects in the navigation tab, to whether you can place phone calls with a SoftPhone. More customizations can include displaying knowledge base articles alongside cases, creating custom actions with keyboard shortcuts, or chatting with customers over the Web with Live Agent (Service Cloud only). Advanced administrators and developers can solve more unique business problems with custom console components, and use code with an API named the Salesforce Console Integration Toolkit, to add third-party integrations, or expand console customizations to new levels.

Tip: If you're already using a console for service, you can create a console for sales without purchasing separate licenses.

Note: The Salesforce console improves upon the Agent console by providing you with more options and more advanced technologies.

[Salesforce Console Limitations](#)

[Prepare to Set up a Salesforce Console](#)

Salesforce Console Limitations

Learn about display, access, and customization limitations for a console.

Display Limitations

A Salesforce console is only available in Microsoft® Internet Explorer® 7, 8, 9, 10, or 11; Mozilla® Firefox® 3.5 and above, and the most recent stable version of Google Chrome™. Some console features are unavailable in Internet Explorer versions 7 and 8 because they require more advanced browser performance and recent Web technologies.

Unavailable in Internet Explorer 7	Unavailable in Internet Explorer 8
Pinned tabs	Pinned tabs
Bookmarks	Bookmarks
History component	History component
Multi-monitor components	Most Recent Tabs component
The resizable highlights panel	
Most Recent Tabs component	
Multiple custom console components on sidebars	
The full-width feed option on feed-based page layouts	
Vertical auto-sizing for stacked console components in sidebars	
Font and font color for console components' Button CSS	

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Available in: **Performance** and **Developer** Editions with the Sales Cloud

Available in: **Enterprise** and **Unlimited** Editions with the Sales Cloud for an extra cost

 **Tip:** For best performance, we recommend that console users adopt the Google Chrome™ browser and machines with 8 GB of RAM.

A console offers limited support for right-to-left languages, such as Arabic or Hebrew. Since right-to-left languages aren't fully supported, some features don't appear as expected in a console, such as Case Feed, Live Agent, and Salesforce Knowledge. The console doesn't support right-to-left languages in Internet Explorer 7 or 8, as Salesforce no longer supports those browsers.

All Salesforce CRM Content items display as primary tabs in a console.

When using Social Accounts, Contacts, and Leads, the Social Viewer window doesn't align properly within a console.

Record home pages, including their standard Tools sections, don't display in a console.

Behavior and Access Limitations

Back buttons on browsers are not supported for a console and don't work as expected.

A Salesforce console doesn't meet accessibility requirements.

Visualforce pages don't refresh when you click  and select **Refresh all primary tabs** or **Refresh all subtabs**.

You can't directly edit the fields on the highlights panel; however, when you change those fields on a record, the highlights panel is automatically updated.

Some objects haven't been fully adapted to a console, such as reports, dashboards, and Chatter. These and other objects are marked with an asterisk (*) in the console setup area and might cause unexpected behaviors. For example: (1) When viewing opportunity splits, clicking **Cancel** doesn't close the subtab; instead, the page detail information is opened in a subtab; (2) opportunity line items and quote line items don't automatically refresh when changed—you might need to refresh the page to see the latest changes.

If you leave a console and return to it, any subtabs that were displayed might not automatically reload. Also, if you leave a console by selecting an app from the Force.com app menu, your browser's **Back** and **Forward** buttons might not work as expected.

If you save changes in a lookup component, and you have unsaved changes in another lookup component, the unsaved changes are lost without a warning message.

If you click a custom link or a link in a text field, such as <http://www.salesforce.com/> in a case `Description`, the link appears in a popup window instead of a tab.

If you refresh the Change Case Status page in a console, an `Unable to Access Page` error appears.

Customization Limitations

A console doesn't support Chatter Messenger or the App Launcher.

Some Visualforce pages won't display correctly in a console unless they're updated to show in it.

If you enable clickjack protection for Visualforce pages in your organization's security settings, Visualforce pages won't work correctly.

Call center users can only use a SoftPhone in a Salesforce console if they're using a CTI adapter built with version 3.0 or 4.0 of the CTI Toolkit; or if they're using a call center built with [Open CTI](#).

Live Agent is only available for a console with the Service Cloud.

The highlights panel for Live Agent Transcripts is editable, but you can't turn it on for users.

[Salesforce Console](#)

Set Up a Salesforce Console

Prepare to Set up a Salesforce Console

Before you set up a console, determine if it's for service or sales.

A Salesforce console is a type of custom app that you can customize for support agents or sales reps. You can set up multiple consoles in your organization as long as you don't exceed your edition's custom apps limit. For example, you can set up one console for customer service, and another for telesales. Consoles for service and sales are almost identical, except that consoles for service can include Live Agent—a Web chat tool for support agents and customers.

As you prepare to set up a console, think about who will use it and what information they access most. For each console, determine which objects are available to users, which fields users should quickly spot in highlights panels, and which licenses you should assign to users so that they can access various Salesforce features. You should also think about which records display as primary tabs and subtabs.

Pick the center of your business process as a primary tab, and related items as subtabs. For example, you might set accounts as a primary tab, and cases and contacts as subtabs. When you set up a console, we recommend giving it a name that represents its function so that users can easily recognize it. For example, Customer Service Desk.

 **Tip:** If you are assigned the Service Cloud User feature license, you can review and customize an out-of-the-box console by selecting Sample Console from the Force.com app menu.

Salesforce Console Implementation Tips

Before you implement a console, review these tips.

General Implementation Tips

A console respects all of the security and sharing settings in your Salesforce organization.

For best performance, we recommend that console users adopt the Google Chrome™ browser and machines with 8 GB of RAM.

Even if the new user interface theme isn't enabled for your organization, console users still see the new interface on all pages inside a console.

To see any setup changes to a console, you must refresh your browser.

You can't add a console to customer portals or partner portals.

Salesforce Console for Service Implementation Tips

To use a console for service, users must be assigned the Service Cloud User feature license.

To use Live Agent in a console, users must be assigned the Live Agent User feature license.

Configure Highlights Panels for a Salesforce Console

The highlights panel is a customizable table of up to four columns at the top of every primary tab in a console. It helps console users see key information at a glance.

To edit a highlights panel, hover over the panel on any page layout and click  or double-click the panel. To add or change fields, click the appropriate column and select fields from the `Top Field` and `Bottom Field` lists. If the fields you want to add aren't listed, you must first add them to the detail page layout. Fields can appear once on each highlights panel, and fields already in use appear as gray in the field selection list. Highlights panel don't support rich text area (RTA) fields, custom long-text area fields, or the Transcript object.

To remove fields, click the appropriate column and select `-None-` from the field lists. To add columns, click **Add Column**. To remove columns, hover over the column and click .

To save highlights panel changes, click **OK** in the Highlights Panel Properties dialog box. When you've finished editing the page layout, click **Save**. To display highlights panels in a console, you must turn them on.

 **Important:** If you leave a page layout before clicking **Save**, you'll lose your highlights panel changes.

Highlights Panel Fields and Format

Before you configure a highlights panel for a Salesforce console, review these formatting rules.

A highlights panel can include any standard or custom fields that've already been added to a page layout. Each panel can have a minimum of one column of fields and a maximum of four columns. Each column can have one or two fields in top or bottom positions.

When users see a highlights panel, top fields appear in bold and in a larger font than bottom fields. Users can only see fields that they have permission to view—otherwise fields appear blank. When both fields appear blank in a column, the column appears blank.

Create a Salesforce Console App

To create a console, administrators must create a console app.

[Walk Through It \(Requires the "Sales Console" user permission or the Service Cloud User license\)](#)

Watch a Demo:  [Prepare to Set up a Salesforce Console](#)

Each console is a custom app that users select from the Force.com app menu. The number of console apps you can create is based on your organization's custom app limits.

1. From Setup, enter `Apps` in the `Quick Find` box, then select **Apps**, then click **Next**.
2. Click **New**, select `Console`, and click **Next**. Optionally, to copy an existing console, click **Clone** on the console's detail page. Save a console that you've copied before you can update its cloned push notifications or keyboard shortcuts.
3. Type a label for the app, then click **Next**. The label can have a maximum of 40 characters, including spaces. This label is the app's name in the Force.com app menu.
4. Optionally, add a custom logo. Click **Insert an image**, choose a file image from the document library, then click **Next**.
5. Select the items to include in the navigation tab, then click **Next**. You can't add the following to the navigation tab: forecasts, ideas, answers, connections, portals, console, activities (tasks and events), the App Launcher, or buttons for customizing your organization. Tab visibility settings, and the `Overwrite users' personal tab customizations` setting, don't apply to the navigation tab. For example, you can access `Accounts` from the navigation tab even if `Accounts` are Tab Hidden on user profiles.
6. Choose how items that aren't selected from a primary tab or subtab display, then click **Next**. For example, choose whether cases display as primary tabs or as subtabs on parent records when selected from list views, search results, or screen pops. Click:
 - `As a primary tab` to display the object's records as primary tabs.
 - `As a subtab of` to display the object's records as subtabs. From the drop-down list, choose the parent record where the subtabs appear. For example, if you want cases to appear as subtabs on contacts, select `Contact Name (Contact)` in the `Cases` row. If parent records don't apply, subtabs appear as primary tabs. For example, if you make campaigns a subtab of leads but a lead doesn't belong to a campaign, that campaign appears as a primary tab.
7. Optionally, if your organization has Service Cloud and [Live Agent](#), select `Include Live Agent in this App`, and click **Next**. If you choose to include a chat workspace for Live Agent in your console, you can:
 - Choose records or pages to open as subtabs of chat sessions.
 - Select `Include Suggested Articles from Salesforce Knowledge in Live Agent` to display the articles tool in the chat workspace.
8. Assign the Salesforce console to user profiles:
 - a. Check the `Visible` box to choose the user profiles for which the app is available.
 - b. Check the `Default` box to set the app as that profile's default app, meaning that new users with the profile see this app the first time they log in. Profiles with limits are excluded from this list.
9. Click **Save**.

Choose How Lists Display in a Salesforce Console

Administrators can change how lists appear to console users.

In a console, you can display lists in one of three ways:

List Type	Description
Full screen, unpinned	Lists are visible only when the navigation tab is selected. When you select a record from the list, it opens in a new tab.
Pinned to top	Lists appear at the top of the page and are always visible. When you select a record from the list, it opens in a new tab below the list.
Pinned to left	Lists appear on the left side of the page and are always visible. When you select a record from the list, it opens in a new tab to the right of the list.

To change how lists display:

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. Select a console app.
3. Click **Edit**.
4. Choose how you want lists to display. If you choose pinned lists, specify a default size, in pixels or percentage of screen space.
5. Click **Save**.

Turn on the History Component for a Salesforce Console

If a console is set up, you can add the History component to the footer so that users can quickly access recent primary tabs or bookmarks without having to search Salesforce.

 **Note:** With Summer '15, Most Recent Tabs was renamed History and bookmarks were added to it to give you a more streamlined experience for finding and retrieving tabs. These features aren't available in Internet Explorer® 7 and 8.

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. Select a Salesforce console app.
3. Click **Edit**.
4. In *Choose Console Components*, add History to *Selected Items*.
5. In *Align Custom Console Component*, choose whether the component will appear in the footer's right or left side.
6. Click **Save**.

Customize Keyboard Shortcuts for a Salesforce Console

Create or customize keyboard shortcuts so that users can quickly perform actions by pressing keys instead of having to use a mouse.

If a console is set up, several default keyboard shortcuts are automatically turned on and available for customization. For example, pressing keys to open and close tabs, move between tabs, and save records. Before you can create custom shortcuts, a developer must define the shortcut's action with the `addEventListener()` method in the Salesforce Console Integration Toolkit. You can only create shortcuts for actions performed inside of a console.

1. From Setup, enter `Apps` in the `Quick Find` box, then select **Apps**.
2. Click **Edit** next to a Salesforce console app.
3. Click **Customize keyboard shortcuts**.
4. Click **Edit** on the top of the page.
5. Click **Edit** to customize an existing shortcut, or click **+Add Keyboard Shortcut** to create a new one. When creating a new shortcut, you must add a `Console Event Name`, which is a unique identifier for the key commands, and then send the event name to the developer who defined the shortcut's action so that he or she can add it to the method that will trigger the shortcut. You can't delete the default shortcuts, but you can edit or deactivate them.
6. Click **Save**.

After you customize or create shortcuts, notify users assigned to a console about the new actions they can perform.

 **Note:** You can have up to 144 shortcuts for each console, which includes the default shortcuts and any that you create. If you create or customize keyboard shortcuts that include standard browser shortcuts, such as CTRL+F, your shortcuts might not work as intended.

Keyboard shortcuts aren't case sensitive, even when you press SHIFT before a letter key. For example, SHIFT+b is the same as SHIFT+B. If CTRL, ALT, or SHIFT is in a keyboard shortcut, the sequence of those keys doesn't matter. For example, CTRL+ALT+A is the same as ALT+CTRL+A.

 **Tip:** You can include as many keys in a shortcut as you want, but we recommend that you limit a shortcut to three keys so that users can remember it. Console users can press SHIFT+K to view an overlay with a list of all console shortcuts.

Turn on Multi-Monitor Components for a Salesforce Console

If a console is set up, multi-monitor components are turned on so that you can move portions of a console to different areas of your screens to help you work best.

With multi-monitor components, you can pop out primary tabs or Open CTI SoftPhones from browsers and drag them across multiple monitors. You can also move the History component, Live Agent chats (but not the footer component), and any console components included in a console's footer.

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. Select a console app.
3. Click **Edit**.
4. If multi-monitor components are turned off, click *Enable Multi-Monitor Components*.
5. Click **Save**.

 **Note:** Popped out items close and lose their positions on screen when you log out of Salesforce, click **Setup**, click a link to leave a console, or refresh or close browsers.

 **Tip:** To pop out components, you might need to update these settings in your browser: (1) allow popup windows; (2) set links to open in new windows, not tabs.

Whitelist Domains for a Salesforce Console

Administrators can let console users access domains outside of Salesforce. For example, you can add `www.example.com` to a console's whitelist so that console users can access that domain.

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. Select a console app.
3. Click **Edit**.
4. In *Whitelist Domains*, type the domains you want users to access, and separate multiple domains by commas. You don't need to add `http://` or `https://` because those are part of a URL, not a domain.
5. Click **Save**.

SEE ALSO:

- [Salesforce Console Configurable Features](#)

Configure Push Notifications for a Salesforce Console

Administrators can set up push notifications in a console so that users can see when a record they're working on has been changed by others.

Push notifications are visual indicators on lists and detail pages in a console that show when a record or field has changed during a user's session. For example, if two support agents are working on the same case, and one agent changes the *Priority*, a push notification appears to the other agent so he or she spots the change and doesn't duplicate the effort.

Choose when push notifications appear and which objects and fields trigger them:

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. Select a console app, and click **Edit**.
3. In *Choose How Lists Refresh*, select when push notifications appear.

Option	Description
None	Lists don't refresh and push notifications don't appear.
Refresh List	The entire list refreshes when there are any changes to it. Records are added or removed from the list based on the list's criteria, but new records added to queues only refresh the record owner's list.

EDITIONS

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions with the Service Cloud

Available in: **Performance** and **Developer** Editions with the Sales Cloud

Available in: **Enterprise** and **Unlimited** Editions with the Sales Cloud for an extra cost

USER PERMISSIONS

To configure push notifications:

- "Customize Application"

Option	Description
Refresh List Rows	Rows in the list refresh when there are any changes to fields selected for push notifications.

4. In `Choose How Detail Pages Refresh`, select when push notifications appear.

Option	Description
Do Not Refresh	Detail pages don't refresh and push notifications don't appear.
Automatically Refresh	The detail page automatically refreshes when a record is changed.
Flag	A message appears on the detail page when a record is changed.

- Click **Select objects and fields for notifications**, and select **Edit**. The push notification settings you choose here will apply to all of your console apps.
- Select the objects that will trigger push notifications. For example, if you want any changes to cases or case fields to trigger push notifications, move Cases from Available Items to Selected Items.
- Under Fields, click **Edit** and choose the fields you want to trigger push notifications.
- Click **OK**, then select **Save**.
- Grant push notification users at least the "Read" permission on the Push Topics standard object. See [User Permissions and Access](#) on page 468.

 **Important:** When the `Require HttpOnly` attribute is turned on for session security, push notifications don't appear.

 **Note:** These objects and their fields are available for push notifications: accounts, contacts, cases, leads, opportunities, campaigns, tasks, and custom objects.

- [Salesforce Console](#)

Set Up Interaction Logs for a Salesforce Console

An interaction log lets Salesforce console users write notes on records that appear on primary tabs.

For example, when cases appear on primary tabs, an interaction log can appear so that users can take notes on cases. You can create multiple interaction logs and customize them to display specific task fields for different users to update.

1. From Setup, enter `Interaction Log Layouts` in the `Quick Find` box, then select **Interaction Log Layouts**.
2. Click **New**.
3. Name the interaction log.
4. Select task fields to add to the interaction log and click **Add**.
 - * indicates required fields.
 - You can only add editable task fields to interaction logs.
 - The `Enter your notes here...` field is automatically added to all interaction logs; you can't remove it.
5. If you want this interaction log to be the default for all users, select `Set as default layout`.

You can't delete a default interaction log; you must first mark another interaction log as the default for your organization.

6. Click **Save**.

After you set up or customize interaction logs, you can assign them to different user profiles and turn them on to display.

Add Live Agent to the Salesforce Console

Adding Live Agent to the Salesforce console enables agents and supervisors to chat with customers and access other customer service tools in one place.

Before you add Live Agent to a Salesforce console app, you need to create a Salesforce console app if you don't have one set up.

After you set up Live Agent, add it to a Salesforce console app. After Live Agent is set up in the console, your agents can interact with chat customers. With the Salesforce console, your agents and supervisors can access Live Agent and other Service Cloud products in one place to provide customers fast and efficient customer service.

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. Click **Edit** next to the name of the Salesforce console app in which you want to set up Live Agent.
3. Select *Include Live Agent in this App*.
4. Choose the records or pages that you want to open as subtabs of chat sessions in the chat workspace.
5. Optionally, if your organization has Knowledge enabled, select *Include Suggested Articles from Knowledge in Live Agent* to display the Knowledge One widget in the chat workspace.
6. Click **Save**.

You can run multiple Salesforce apps at the same time. However, if you log in to another Salesforce app while you're logged in to a Salesforce console app, you can't accept new chat requests.

Using Macros in Service Console

Macros Overview

Support agents who use Case Feed now can run macros to automatically complete repetitive tasks—such as selecting an email template, sending an email to a customer, and updating the case status—all in a single click. Macros save time and add consistency to support agents' work.

You can create macros to perform multiple actions on the Case Feed. For example, a macro can enter the subject line of an email and update the case status. A single macro can perform multiple actions on different parts of the Case Feed at the same time.

 **Note:** Macros are only supported on Feed-based layouts for Accounts, Contacts, Leads, and Cases Objects.

IN THIS SECTION:

[Getting Started with Macros](#)

Before you can create and run macros, set up the Salesforce Console for Service environment.

Tips for Creating Macros

How you name and design your macro can impact its usefulness to support agents. Keep these tips in mind when creating macros.

EDITIONS

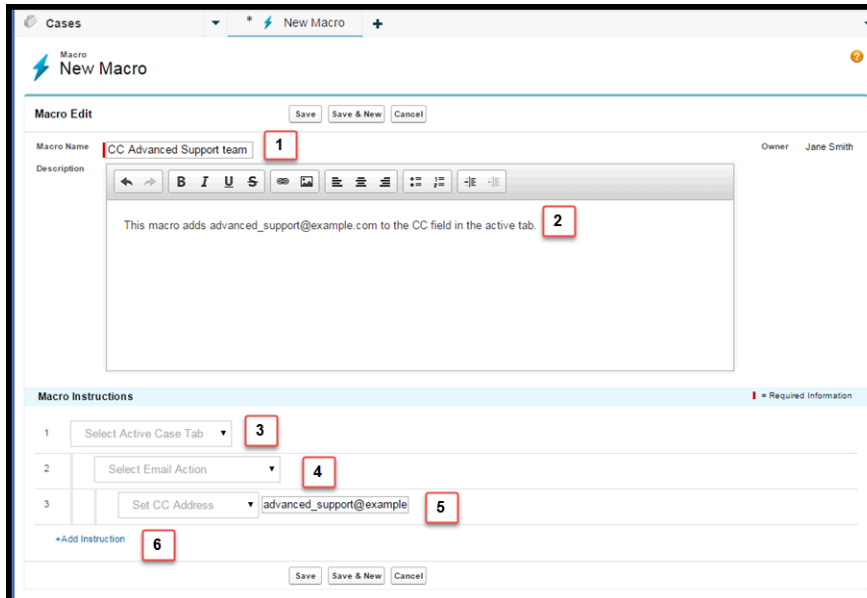

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with a Service Cloud license

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with a Service Cloud license

1. The `Macro Name` helps support agents decide which macro to use. The name is used when agents search for macros, so it's useful to use a short name (so that agents can see it in the macros list) that succinctly identifies the macro's purpose.
2. Although `Description` is optional, it is useful for helping support agents to understand what the macro does.
3. The macro instructions are like a little computer program, so you must tell the macro each step, or instruction, to perform. Each instruction is equivalent to a click that the support agent makes when manually performing the task. The first macro instruction selects the object that the macro acts upon, such as the Active Case Tab.
4. The second macro instruction specifies the context, or component of the Salesforce Console for Service, in which the macro works. For example, the Email Action context allows the macro to set fields and perform actions within the Email Publisher.

 **Note:** If a Salesforce Console for Service component isn't enabled and configured, then you can't create a macro for it.

5. The third macro instruction specifies the action that the macro performs. For example, the macro in the screenshot changes the value for the CC Address field in an email action in the active case tab.
6. You can add an additional set of instructions in the same context or in a different context. A simple macro just performs one task. Create more complex macros by adding instructions.

Create Macros

You can create a macro by specifying the instructions for actions that the macro performs. A macro is like a little computer program. You need to tell the macro each step that it performs. This example shows how to create a simple macro.

User Permissions Needed

To view macros:	"Read" on Macros
To create and edit macros:	"Create" and "Edit" on Macros
To create and run irreversible macros:	"Manage Macros That Users Can't Undo"

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions with a Service Cloud license

To create this example macro, the Email Publisher must be enabled in your organization.

1. Create a macro.
 - a. In the Salesforce for Service Console, click the **Macros** widget.
 - b. Click **+ Create Macros**.
 - c. For **Macro Name**, enter a name that makes it easy to understand what this macro does.
For example, *Replace email subject with "Steps for Resetting Your Password"*.
 - d. For **Description**, explain the purpose for this macro. The optional **Description** field helps support agents understand what this macro does and distinguish it from similar macros.
2. Add the instructions for the macro.
 - a. Select a context for the macro. The context specifies the part of case feed that the macro interacts with.
For example, selecting **Select Active Tab** tells the macro that it's performing an action on the active case tab in Case Feed.
 - b. Click **Done**. After every instruction, click **Done** to move to the next line.
 - c. Select the object that the macro interacts with.
For example, selecting **Select Email Action** tells the macro to interact with the Email Publisher in Case Feed.
 - d. Select the action that you want the macro to perform.
For example, suppose that you want to replace the subject line of an email in the case, so you select **Replace Subject**. This instruction tells the macro to change the subject field in the email. It also displays a text field, where you can specify the subject that you want to replace.
 - e. In the text field, enter the subject line. This instruction clears the original subject and replaces it with the value you specified in the macro.
For example, you enter *Steps for Resetting Your Password* in the text field. Suppose the customer's original email contained the subject "Password Problems." The agent runs the macro, automatically replacing the original subject with the new subject.
 - f. Finally, select **Submit Action** to tell the macro to execute these instructions.

3. Save the macro.

You've created a macro that replaces the original subject line in an email in Case Feed with a new subject line.

After creating a macro, it's a good idea to run it to make sure that it works the way you want. To test this macro, go to the Salesforce Console for Service and open a case record. Open the Macros widget. Select and run this macro.

Run a Macro in the Salesforce Console for Service

Macros automate a series of repetitive keystrokes that support agents make in the Salesforce Console for Service. You can quickly complete repetitive tasks, such as updating the case status, by running a macro.

User Permissions Needed

To view macros:	"Read" on Macros
To create and edit macros:	"Create" and "Edit" on Macros
To create and run irreversible macros:	"Manage Macros That Users Can't Undo"

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with a Service Cloud license

 **Note:** You need the Manage Macros That Users Can't Undo permission only if you want to run macros that contain a Submit Action instruction. All bulk macros contain a Submit Action instruction. The lightning bolt icon (⚡) indicates that the macro performs an action—such as sending an email—that cannot be undone.

1. Open the Macros widget.
2. Search for a macro and select it from the macros list.
To search for a macro, enter some letters from its name in the Search Macros box. Salesforce lists macros that contain the search keywords or letters in the results. If the Search Macros box is empty, the list displays your 25 most recently used macros. If you ran a macro or viewed its detail page, then it is considered to be recently used.
3. Optionally, review the macro's description and instructions to make sure that this macro does what you expect.
The instructions show you the steps that the macro performs. Reviewing the instructions is helpful when running a macro for the first time.
4. Click **Run** (▶) to start the macro.
A message displays indicating whether the macro ran successfully. A green dot appears next to each instruction that ran successfully. A red dot and an error message appear next to each instruction that could not be performed, so you can troubleshoot the issue.

IN THIS SECTION:

[Irreversible Macros](#)

Some macros perform actions that can't be undone, such as sending outbound emails to customers or updating a case status. A macro that contains a Submit Action instruction is irreversible. You must have the Manage Macros Users Can't Undo user permission to create, edit, and run macros that contain instructions for performing irreversible actions.

Irreversible Macros

Some macros perform actions that can't be undone, such as sending outbound emails to customers or updating a case status. A macro that contains a Submit Action instruction is irreversible. You must have the Manage Macros Users Can't Undo user permission to create, edit, and run macros that contain instructions for performing irreversible actions.

The lightning bolt icon (⚡) indicates that a macro is irreversible.

If you don't have the Manage Macros Users Can't Undo permission, you can still:

- Create and edit macros that don't contain instructions for performing irreversible actions
- Clone, delete, and share macros that do contain instructions for performing irreversible actions

 **Example:** Macros that perform the following types of actions are considered to be irreversible:

- Send email
- Update a case status

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions with a Service Cloud license

Shortcuts for Macros

You can use the keyboard shortcuts to work even more efficiently with macros.

Table 45: Macro Shortcuts

Press:	To:
M	Open the Macros widget.
S	Put your cursor in the search bar.
E	Edit the selected macro.
V	View the Macro Details page.
Enter	Run the selected macro.
Space bar	Expand or collapse the selected macro's instructions.
Up Arrow	Scroll up the macros list.
Down Arrow	Scroll down the macros list.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with a Service Cloud license

Bulk Macros

A bulk macro is a macro that you can run on multiple records at the same time. Bulk macros let support agents quickly address spikes in customer cases involving the same issue. Macros must meet certain criteria to be run as bulk macros.

Bulk macros are supported for the:

- Email Publisher in Case Feed on the Salesforce Console for Service
- All Quick Actions except for Social Quick Actions

Bulk macros are not supported for:

- Salesforce Knowledge actions
- Community actions
- Social post actions
- "Add" and "Insert" instructions (such as the Add to Subject instruction or the Insert into HTML Body instruction for the Email Publisher)

If the bulk macro interacts with the Email Publisher, it can contain only one Email Publisher action.

A bulk macro must contain at least one Submit Action instruction.

 **Example:** For example, suppose that your company has a service outage and lots of customers have contacted customer support. You want support agents to send an email to customers who have opened cases about the outage telling them when the service outage will end. You can create a bulk macro that uses an email template to create and send an email to these customers.

IN THIS SECTION:

[Create a Bulk Macro](#)

This example shows you how to create a bulk macro that sends an email to the contact person for the selected customer cases.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with a Service Cloud license

[Tips for Creating Bulk Macros](#)

The key to successfully using bulk macros is to select the right records to run the macro on. Support agents can filter the list views to identify which records to select.

[Run a Bulk Macro on Multiple Records](#)

You can run a bulk macro on only one record at a time, or you can run it on multiple records at the same time. Use bulk macros to quickly address similar customer cases or records.

Create a Bulk Macro

This example shows you how to create a bulk macro that sends an email to the contact person for the selected customer cases.

User Permissions Needed

To view macros:	"Read" on Macros
To create and edit macros:	"Create" and "Edit" on Macros
To create and run irreversible macros:	"Manage Macros That Users Can't Undo"
To run bulk macros:	"Run Macros on Multiple Records"

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions with a Service Cloud license

For example, suppose that your company has a service outage and lots of customers have contacted customer support. You want support agents to send an email to customers who have opened cases about the outage telling them when the service outage will end. You can create a bulk macro that uses an email template to create and send an email to these customers.

These steps show you how to create a bulk macro that sends an email to the contact person on the selected cases. To recreate this example in your organization, enable the Email Publisher.

1. Create a macro.
2. Add the instructions for the macro.
 - a. Select a context for the macro. The context specifies the object that the macro interacts with. For example, selecting **Select Active Tab** tells the macro that it's performing an action on the active case tab in Case Feed.
 - b. Click **Done**. After every instruction, click **Done** to move to the next line.
 - c. Select the publisher that the macro interacts with. For example, selecting **Select Email Action** tells the macro to interact with the Email Publisher in Case Feed.
 - d. Select the action that you want the macro to perform. You can select **Apply Email Template** and specify which email template to use.
 - e. Finally, select **Submit Action** to tell the macro to perform these instructions.
3. Save the macro.

You've created a macro that creates and sends an email to the contact person for the selected cases. This macro can be run as a bulk macro because it meets all the criteria for a bulk macro. It interacts with the Email Publisher, it uses a supported instruction, and it includes a Submit Action instruction. You can run this macro as a bulk macro on multiple records at the same time. You also can run it on a single record at a time.

When you look at the macros list, an icon showing a green lightning bolt with two underlines () appears next to bulk macros. Make sure that this icon appears next to your macro.

Tips for Creating Bulk Macros

The key to successfully using bulk macros is to select the right records to run the macro on. Support agents can filter the list views to identify which records to select.

When you create a bulk macro, it's a good practice to add an instruction that changes a field value on the record. Agents can filter records in the list view based on the field value. Updating a field value lets agents distinguish the records on which the macro has been run from the cases on which the macro hasn't been run.

Example: For example, suppose many customers open cases about the same issue in a short time. The support agent can run a bulk macro that emails these customers to tell them that the company knows of the issue and is fixing it. But what happens two days later, when the agent wants to run the bulk macro a second time on new cases about the same issue?

Because agents use filtering to determine which cases to apply the macro to, it's helpful to add instructions to the bulk macro that change a field value. This way, when the macro runs, it automatically updates the field value. Later on, when the agent has new cases to respond to, the agent can filter cases based on this field.

Run a Bulk Macro on Multiple Records

You can run a bulk macro on only one record at a time, or you can run it on multiple records at the same time. Use bulk macros to quickly address similar customer cases or records.

User Permissions Needed

To view macros:	"Read" on Macros
To create and edit macros:	"Create" and "Edit" on Macros
To create and run irreversible macros:	"Manage Macros That Users Can't Undo"
To run bulk macros:	"Run Macros on Multiple Records"

Note: You need the Manage Macros That Users Can't Undo permission only if you want to run macros that contain a Submit Action instruction. All bulk macros contain a Submit Action instruction. The lightning bolt icon (⚡) indicates that the macro performs an action—such as sending an email—that cannot be undone.

You can run bulk macros on records from the Accounts, Cases, Contacts, and Leads objects. However, you can run a bulk macro only on records in one object list view at a time. For example, you can run a bulk macro on multiple cases in the Cases list view, but not on cases and accounts at the same time.

An icon showing a green lightning bolt with two underlines (⚡) indicates whether a macro is a bulk macro.

Bulk macros are processed in increments of 10 macros at a time. You can run a bulk macro on more than 10 cases, but the system processes the macro in groups of 10 at a time.

1. In the Case list view, select the cases that you want to run the macro on.
You can filter the cases to identify which cases you want to run the macro on.
2. Open the Macros widget.
3. In the Macro widget, select a macro with the green lightning bolt icon (⚡) and click **Run**.
4. In the confirmation window, click **OK** to continue.

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with a Service Cloud license

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with a Service Cloud license

The macro runs on the selected cases. In the list view, the cases on which the macro ran successfully are highlighted in green and denoted by a green check mark icon. Cases that the macro didn't run successfully on are highlighted in red and denoted by a red X icon. To see an explanation about why the macro didn't work on a case, hover over the red X icon.

Examples of Macros

These examples show how you can create different types of macros based on your business needs.

IN THIS SECTION:

[Add and Replace Field Values in a Case Using Macros](#)

Suppose that your support agents often add the same field values to a record, or that they often replace a field value. You can create a macro that automatically adds content to a field or that replaces the values in a field. Using a macro saves agents time because it automates repetitive and routine actions, freeing them to focus on helping customers.

[Insert Quick Text in a Social Post](#)

Suppose that support agents often respond to customer questions on social networks, such as Twitter or Facebook. You can use a macro to automatically insert a reply into the post using Quick Text or text. This type of macro enables agents to quickly respond to customers without interrupting their workflow.

[Automatically Attach a Salesforce Knowledge Article to an Email in Case Feed Using Macros](#)

Perhaps your support agents often send customers the same article in Salesforce Knowledge. This example explains how to create a macro that automatically selects a specific article and inserts it into an email in Case Feed. This macro lets agents answer a common customer question by clicking one button, instead of spending time searching for the article and copying it into the email.

Add and Replace Field Values in a Case Using Macros

Suppose that your support agents often add the same field values to a record, or that they often replace a field value. You can create a macro that automatically adds content to a field or that replaces the values in a field. Using a macro saves agents time because it automates repetitive and routine actions, freeing them to focus on helping customers.

The Email Publisher must be enabled in your organization.

These steps illustrate some ways that you can use Add, Replace, and Insert instructions in a macro.

1. Create a macro.
2. Add the instructions to tell the macro what email field value to replace. This example shows how to replace the Subject field in an email.
 - a. In the Macro Instructions section, click **+Add Instruction**.
 - b. The first instruction tells the macros which object to act upon. Here, select **Select Active Case Tab**.
 - c. The next instruction tells the macro which action in the Case Feed Publisher to interact with. Here, select **Select Email Action**.
 - d. Now, tell the macro what to do in the Email Action. Select **Replace Subject**. In the text field, specify the subject line.

Selecting a Replace instruction clears the existing value in the field, and replaces it with the value specified in the macro.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with a Service Cloud license

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with a Service Cloud license

USER PERMISSIONS

To view macros:

- "Read" on Macros

To create and edit macros:

- "Create" and "Edit" on Macros

To create an irreversible macro:

- "Manage Macros Users Can't Undo"

For example, enter *Update on Your Order*. Suppose that the subject line was Haven't Received My Order. The macro clears the old subject line and replaces it with *Update on Your Order*.

3. Add the instructions to tell the macro to replace an email field with a blank value. In this example, we clear the BCC field.
 - a. Select **Replace BCC Addresses**. Leave the text field empty.
Selecting a Replace instruction and leaving the text field empty clears the values in the field, so you end up with a blank field.
4. Add the instructions to tell the macro to insert values into a field. In this example, we add two email addresses to the CC field.
 - a. Select **Add CC Addresses**. In the text field, specify the email addresses. You can specify multiple email addresses by separating them with a comma.
Selecting an Add or Insert instruction adds the value specified in the macro to the field, but doesn't delete values that are already there.
For example, enter *shipping@example.com, invoices@example.com*. Suppose that the CC field already contains *support@example.com*. This macro appends the *shipping@example.com* and *invoices@example.com* after *support@example.com*.
5. Select **Submit Action**. This instruction tells the macro to execute the email action.
6. Save the macro.

Insert Quick Text in a Social Post

Suppose that support agents often respond to customer questions on social networks, such as Twitter or Facebook. You can use a macro to automatically insert a reply into the post using Quick Text or text. This type of macro enables agents to quickly respond to customers without interrupting their workflow.

The Email Publisher, Quick Text, and Social Customer Service must be enabled in your organization.

These steps illustrate one way that you can use Insert instructions in a macro.

1. Create a macro.
2. Add the instructions to tell the macro what to do. This example shows how to insert Quick Text into a social post.
 - a. In the Macro Instructions section, click **+Add Instruction**.
 - b. The first instruction tells the macros which object to act upon. Here, select **Select Active Case Tab**.
 - c. The next instruction tells the macro which action in the Case Feed publisher to interact with. Here, select **Select Social Action**.
 - d. Now, tell the macro what to do in the social action. Select **Insert into Body**. You can insert either **Quick Text** or **Text**.
Selecting an Insert instruction appends the Quick Text or Text specified in the macro to the end of the text already in the field. In social publisher actions, the Insert instruction is useful because you can retain the @mention and add text after it.
 - e. Specify which Quick Text you want to macro to use, or enter the text that you want it to use.
3. Select **Submit Action**. This instruction tells the macro to execute the social action.
4. Save the macro.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with a Service Cloud license

USER PERMISSIONS

To view macros:

Automatically Attach a Salesforce Knowledge Article to an Email in Case Feed Using Macros

Perhaps your support agents often send customers the same article in Salesforce Knowledge. This example explains how to create a macro that automatically selects a specific article and inserts it into an email in Case Feed. This macro lets agents answer a common customer question by clicking one button, instead of spending time searching for the article and copying it into the email.

You must have Salesforce Knowledge One enabled for your organization. The Salesforce Knowledge One component must be enabled and added as a component to the Salesforce Console for Service page.

1. Create a macro.
2. Add the instructions to tell the macro to search for a specific article.
 - a. In the Macro Instructions section, click **+Add Instruction**.
 - b. The first instruction tells the macros which case to act upon. Here, select **Select Active Case Tab**.
 - c. The next instruction tells the macro which part of the console to act upon. Here, select **Select Knowledge Sidebar Component**.
 - d. Now, let's tell the macro what do in the Knowledge Sidebar. Select **Select Articles Search**.
 - e. This step defines the keyword that the Knowledge search uses to find the right article. Select **Set Keywords**. In the text field, you can specify either the article number or a keyword.
 - Article number: The article number retrieves an article by its number, which is useful when you want to select a specific article. The syntax is `articlenumber:123456789`.

 **Note:** The syntax is case-sensitive and must be written in lower case.
 - Keywords: You also can search by keywords. Salesforce looks for these keywords in the title and body of the articles in the knowledge base. For example, enter "Reset Your Password."
 - f. Select **Run Search**. This instruction tells the macro to perform the search when someone runs this macro.
3. Add the instructions to tell the macro to insert the article into the email that is being edited in Case Feed.
 - a. Click **Select Most Relevant Article**. This instruction tells the macro to use the article that came up first in the search results.
 - b. Select **Insert into Email as HTML**. This instruction inserts the entire article, including text and images, into the email at the cursor position.
4. Save the macro.

Manage Macros

It's simple to clone, share, and delete macros.

IN THIS SECTION:

[Clone Macros](#)

You can quickly copy macros by cloning them. Cloning macros is useful for creating macros that are variants of the source macro.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with a Service Cloud license and a Salesforce Knowledge license

USER PERMISSIONS

To view macros:

- "Read" on Macros

To create and edit macros:

- "Create" and "Edit" on Macros

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with a Service Cloud license

[Share Macros](#)

Macros use the same sharing model as other objects in Salesforce. You can share macros with public groups and other users, allowing other support agents to increase their efficiency with macros.

[Delete Macros](#)

You can delete macros that you don't need anymore.

Clone Macros

You can quickly copy macros by cloning them. Cloning macros is useful for creating macros that are variants of the source macro.

User Permissions Needed

To view macros:	"Read" on Macros
To clone macros:	"Create" and "Edit" on Macros

Both administrators and support agents can clone macros if they have the appropriate user permissions.

1. Open the Macros widget.
2. Click the macro that you want to clone.
3. If you are using the Macros widget, click the **View Detail** icon ().
4. Click **Clone**.
5. In the `Macro Name` field, enter a unique name for the macro.
6. Optionally, modify the instructions for the macro. You can also modify the instructions at another time.
7. Click **Save**.

Share Macros

Macros use the same sharing model as other objects in Salesforce. You can share macros with public groups and other users, allowing other support agents to increase their efficiency with macros.

User Permissions Needed

To view macros:	"Read" on Macros
To share macros:	"Create" and "Edit" on Macros

1. Open the Macros widget.
2. Select the macro that you want to share.
3. Click the **View Detail** icon ().
4. Click **Sharing**.
5. In the New Sharing page, search for a public group or for a user by name.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with a Service Cloud license

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with a Service Cloud license

6. Share the macro by selecting a group or user from the **Available** list and clicking **Add**. To stop sharing a macro, select a group or user from the **Share With** list and click **Remove**.
7. If you're sharing the macro, set the `Access Level` to either *Read Only* or *Read/Write*.
 - *Read Only* allows support agents to view and run the macro.
 - *Read/Write* allows support agents to edit, view, and run the macro.
8. Click **Save**.

Delete Macros

You can delete macros that you don't need anymore.

User Permissions Needed	
To view macros:	"Read" on Macros
To delete macros:	"Delete" on Macros

Both administrators and support agents can delete macros, provided that they have the appropriate user permissions.

1. In the Salesforce Console Home Page, click **Macros** or **M** to open the Macros widget. You also can access macros from the Macros tab.
2. Click the macro that you want to delete.
3. If you are using the Macros widget, click the **View Detail** icon (). (This step is not necessary if you are using the Macros tab.)
4. Click **Delete**.
5. Click **OK** on the confirmation window.

Publishers and Actions Supported in Macros

The following publishers and actions are supported on macros in the Salesforce Console for Service.

IN THIS SECTION:

[Email Publisher Actions Supported in Macros](#)

These actions are available when you click **Select Email Action** in the macro instructions. Email actions let you modify text in emails in Case Feed. You can create and run macros to perform these actions on the Email Publisher in the Salesforce Console for Service.

[Salesforce Knowledge Actions Supported in Macros](#)

These actions are available when you click **Select Knowledge Sidebar Component** in the macro instructions. Knowledge actions let you search for knowledge articles and add articles to cases. You can create and run macros to perform these actions on the Salesforce Knowledge Publisher in the Salesforce Console for Service.

[Custom Quick Actions Supported in Macros](#)

These actions are available when you click **Select Name of Quick Action** in the macro instructions. You can create and run macros to perform custom quick actions in the Salesforce Console for Service.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with a Service Cloud license

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with a Service Cloud license

[Community Publisher Actions Supported in Macros](#)

These actions are available when you click **Select Community Action** in the macro instructions. Community actions let you update and post to Salesforce Communities. You can create and run macros to perform these actions on the Community Publisher in the Salesforce Console for Service.

[Social Actions Supported in Macros](#)

These actions are available when you click **Select Social Action** in the macro instructions. You can create and run macros to perform these actions on the Social Publisher in the Salesforce Console for Service.

Email Publisher Actions Supported in Macros

These actions are available when you click **Select Email Action** in the macro instructions. Email actions let you modify text in emails in Case Feed. You can create and run macros to perform these actions on the Email Publisher in the Salesforce Console for Service.

To use these actions, you must have the Email Publisher enabled in your organization and added as a console component to the case page layout.

Bulk macros are supported for Email Publisher actions.

Table 46: Email Publisher Actions Supported in Macros

Action	Description	Supported in Bulk Macros?
Replace To Addresses	Clears the email addresses in the To Address field and replaces them with the specified email addresses. To use multiple email addresses, separate them with a comma.	Yes
Add to To Addresses	Adds these email addresses to the To field, but does not delete any addresses already in the To field. To use multiple email addresses, separate them with a comma.	No
Replace CC Addresses	Clears the email addresses in the CC Address field and replaces them with the specified email addresses. To use multiple email addresses, separate them with a comma.	Yes
Add to CC Addresses	Adds these email addresses to the CC field, but does not delete any addresses already in the CC field. To use multiple email addresses, separate them with a comma.	No
Replace BCC Addresses	Clears the email addresses in the BCC Address field and replaces them with the specified email addresses. To use multiple email addresses, separate them with a comma.	Yes
Add to BCC Addresses	Adds these email addresses to the BCC field, but does not delete any addresses already in the BCC field. To use multiple email addresses, separate them with a comma.	No
Set From Address	Clears the email address in the From Address field and replaces it with the specified email address.	Yes
Replace Subject	Clears the Subject field and replaces it with the specified text.	Yes

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions with a Service Cloud license

Action	Description	Supported in Bulk Macros?
Add to Subject	Appends this text to the end of the Subject field, but does not delete any existing text already in the Subject field.	No
Replace HTML Body	Clears the contents of the email body and replaces it with the specified HTML content.	Yes
Insert into HTML Body	Adds a QuickText or Text into the HTML body text, but does not delete any existing text already there. The QuickText or Text is inserted at the cursor position.	No
Apply Email Template	Inserts the specified email template into an email in the active case tab.	Yes
Submit Action	<p>Tells the macro to perform these instructions when someone runs this macro.</p> <p>A macro that contains a Submit Action instruction is irreversible. You must have the Manage Macros Users Can't Undo user permission to create, edit, and run macros that contain instructions for performing irreversible actions.</p> <p>A macro that contains a Submit Action instruction can be run as a bulk macro. You must have the Run Macros on Multiple Records user permission to run bulk macros.</p>	Yes

Salesforce Knowledge Actions Supported in Macros

These actions are available when you click **Select Knowledge Sidebar Component** in the macro instructions. Knowledge actions let you search for knowledge articles and add articles to cases. You can create and run macros to perform these actions on the Salesforce Knowledge Publisher in the Salesforce Console for Service.

To use these actions, you must have Salesforce Knowledge enabled in your organization and added as a console component. Salesforce Knowledge actions, such as attaching an article to a case, must be enabled in the console.

 **Note:** The Knowledge Sidebar must be expanded when you run a Knowledge macro. If the sidebar is collapsed, the macro doesn't work.

Internet Explorer 7 and Bulk macros are not supported for Salesforce Knowledge actions.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with a Service Cloud license

Table 47: Salesforce Knowledge Actions Supported in Macros

Action	Description	Supported in Bulk Macros?
Select Knowledge Sidebar Component	Tells the macro that these instructions affect the Knowledge Sidebar in the console.	No
Select Article Search	Tells the macro that the instructions affect Knowledge search.	No
Set Keywords	<p>Specifies the keywords to use when searching the knowledge base. You can search by:</p> <ul style="list-style-type: none"> Article number: The article number retrieves an article by its number, which is useful when you want to select a specific article. The syntax is <code>articlenumber:123456789</code>. 	No

Action	Description	Supported in Bulk Macros?
	<ul style="list-style-type: none"> Keywords: You can search by keywords. The Salesforce Knowledge search looks for these keywords in the title and body of the articles in the knowledge base. For example, the phrase <i>Reset Your Password</i> returns articles that contain that phrase. 	
Run Search	Tells the macro to search the knowledge base using the criteria specified in the Set Keywords instruction.	No
Select Most Relevant Article	Selects the first article listed in the search results.	No
Attach to Case	Attaches the article to the case.	No
Attach to Email as PDF	Adds the article as a PDF attachment to the email in the case.	No
Insert into Email as HTML	Inserts the article text and links into the email in the case.	No

Custom Quick Actions Supported in Macros

These actions are available when you click **Select** *Name of Quick Action* in the macro instructions. You can create and run macros to perform custom quick actions in the Salesforce Console for Service.

To use these actions, you must have Quick Actions defined in your organization and added to the case feed page layout.

Bulk macros are not supported on Quick Actions for social actions.

Table 48: Custom Quick Actions Supported in Macros

Action	Description	Supported in Bulk Macros
Replace <text field>	Clears the contents of the text field and replaces it with the specified text.	Yes
Add to <text field>	Adds the specified text to the end of the text field, but does not delete any existing text already there. The Text is inserted at the cursor position.	No
Submit Action	<p>Tells the macro to perform these instructions when someone runs this macro.</p> <p>A macro that contains a Submit Action instruction is irreversible. You must have the Manage Macros Users Can't Undo user permission to create, edit, and run macros that contain instructions for performing irreversible actions.</p>	Yes

EDITIONS

Turn on Knowledge for a Salesforce Console

If Salesforce Knowledge is set up, you can turn on the Knowledge sidebar so that users working on cases can automatically see relevant knowledge articles that can help them close cases faster.

Important: You must have Salesforce Knowledge set up in your organization before you can add it to a console. Knowledge articles appear based on matching words typed into a case's **Subject**.

1. From the object management settings for cases, go to Page Layouts.
2. Click **Edit** next to a page layout.
3. Click **Layout Properties**.
4. Check **Knowledge Sidebar**, and click **OK**.
5. Click **Save**.

Repeat these steps for each case page layout assigned to console users.

[Find Object Management Settings](#)

Customize a Salesforce Console

Console Components

Create components to customize, extend, or integrate the Salesforce console with other systems.

Components let you display many types of data in the footer, sidebars, highlights panels, and interaction logs of a console. You can create components to solve a variety of business problems and to display items, such as:

- Third-party apps
- Chat or Softphone widgets
- Content when users view specific pages
- Contextual information alongside records
- Custom highlights panels or interaction logs
- Content when users click a customizable button in the footer

Components let you get creative with a console and build what your users need to do their jobs. To create components, you can use Visualforce, canvas apps, lookup fields, related lists, or report charts. You can also use Force.com Canvas or the Salesforce Console Integration Toolkit to build components. Both technologies are JavaScript APIs that let developers extend or integrate a console. The toolkit provides you with programmatic access to a console to do things like open and close tabs to streamline business processes, whereas Canvas helps you integrate a console with external applications that require authentication

methods. For more information (English only) about canvas apps or the toolkit, see [Force.com Canvas Developer's Guide](#) and the [Salesforce Console Integration Toolkit Developer's Guide](#).

SEE ALSO:

- [Process for Creating Console Components](#)
- [Console Component Implementation Tips](#)

Process for Creating Console Components

Developers and administrators typically follow these steps when creating components for a Salesforce console.

Even though you can create a variety of console components to solve many types of business problems, the process for creating components generally follows these steps.

1. Developers create a Visualforce page or a canvas app.
 2. Administrators add the Visualforce page or canvas app to either:
 - Page layouts to display content on specific pages or
 - Console apps to display content across all pages and tabs
 3. Administrators who add a component to page layouts:
 - Choose the sidebar in which the console displays, such as right, left, top, or bottom
 - Select whether to add multiple components to a sidebar and arrange them as either a stack, tabs, or accordion
 4. Administrators who add a component to apps:
 - Specify the look and feel of the button used to access the component from the console's footer
 - Assign the component to each console where they want users to access it
 5. Users view the component when they access page layouts or click a button in the footer of a console.
-  **Tip:** To add a lookup field or related list as a component, you can do so without creating a Visualforce page or canvas app. Just follow the steps in "Add Console Components to Page Layouts," and in the **Type** field, select Lookup or Related List to choose a specific field or list.

Available in: **Performance** and **Developer** Editions with the Sales Cloud

Available in: **Enterprise** and **Unlimited** Editions with the Sales Cloud for an extra cost

Console Component Implementation Tips

Before you create a component for a Salesforce console, review these tips.

Behavior and Access Tips

You can't add canvas app components to AppExchange packages.

When you update records on primary tabs or subtabs, components don't refresh automatically.

If you change the `Height` or `Width` of a console component, refresh your browser to see your updates.

Report chart components aren't available to developers using the Salesforce Metadata API or for migration between sandbox and production instances.

Page Layout Tips

You can add components to page layouts if you're assigned to a Sales Cloud User Permission or Service Cloud User feature license.

After you turn off the highlights panel or interaction log on a page layout, you can add a component to the Top Sidebar or Bottom Sidebar of primary tabs.

If you want a component to display across all of the subtabs on a primary tab, add the component to the Primary Tab Components section on page layouts. If you add a component to the Subtab Components section on page layouts, the component displays on individual subtabs.

If [Salesforce Knowledge is enabled](#) and the [Knowledge sidebar is turned on](#), don't add a component to the Right Sidebar of case page layouts, otherwise the Knowledge sidebar displays over components.

Visualforce Tips

For each page layout, you can use a Visualforce page as a component once.

If Visualforce pages are assigned to page layouts as components, you can't delete them.

Visualforce pages don't refresh when you click  and select **Refresh all primary tabs** or **Refresh all subtabs**.

If you enable clickjack protection for Visualforce pages in your organization's security settings, Visualforce pages won't display correctly.

Unlike other Visualforce pages, you don't have to set the standard controller on components to the object whose page layout you're customizing.

If you add `showHeader=true` to a Visualforce page, you can add a 15-pixel gap to the right and left sides of a component to visually indicate its location in a sidebar. For example, `<apex:page standardController="Contact" showHeader="false" title="List of Cases">`.

When Visualforce pages are used as components, two URL parameter values are passed automatically:

Parameter Name	Parameter Value	Description
<code>id</code>	A case-sensitive 15-character alphanumeric string that uniquely identifies a record.	The ID of the detail page in which the component displays. This parameter is only passed if the ID is available.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions with the Service Cloud

Available in: **Performance** and **Developer** Editions with the Sales Cloud

Available in: **Enterprise** and **Unlimited** Editions with the Sales Cloud for an extra cost

Parameter Name	Parameter Value	Description
<code>inContextPane</code>	<code>true</code>	Indicates the Visualforce page displays as a component in a Salesforce console.

SEE ALSO:

[Console Components](#)

Add Console Components to Page Layouts

After you create a console component, you can add it to page layouts so that users can access it from a sidebar in a Salesforce console.

- From the object management settings for the object whose page layout you want to edit, go to Page Layouts.
- Click **Edit** next to a page layout.
- Click **Custom Console Components**.
- Next to the sidebar in which you want to add your component, choose how to display and organize your components by `style`. See [Sidebar Styles for Console Components](#).
- Specify the size of the sidebar in the console by selecting height or width, and typing its percentage or number of pixels. When the height or width of the sidebar is below the following number of pixels, these components types automatically hide because they become too difficult to read:
 - Knowledge One - 250
 - Lookups - 150
 - Related lists - 200
 - Report charts - 150
- Under **Type**, choose whether your component is a Visualforce Page, Canvas App, Lookup, Related List, or Report Chart. Before you can choose a Report Chart, you must add it to the page layout and make sure it's in a folder that's shared with users who need access.
 - If the Knowledge tab is set up in your organization, add the Knowledge One component to case pages so agents can easily find and work with articles.
 - If your organization uses entitlement management, add the Milestone Tracker to case pages so agents can see the latest information on milestones related to cases they're working with.
 - If you have topics enabled for an object, add the Topics component so users can view, add, and delete topics on the records they're working with.
 - Add the Files component to case pages so support agents can use drag-and-drop to quickly attach files to cases, see files that are already attached, and include attached files to case emails.
 - If your organization uses Knowledgeable People and topics on objects, add the Case Experts component to case page layouts so agents can easily collaborate with colleagues who have expertise in specific areas.

 **Note:** Case Experts is currently available through a pilot program. For information on enabling Case Experts for your organization, contact Salesforce.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Available in: **Performance** and **Developer** Editions with the Sales Cloud

Available in: **Enterprise** and **Unlimited** Editions with the Sales Cloud for an extra cost

USER PERMISSIONS

To add custom console components:

- “Customize Application”

To create Visualforce pages:

- “Customize Application”

To manage canvas apps:

- “Customize Application”

Since page layouts are limited to two report charts, you can add up to two report charts to a sidebar. You can add up to five components to a sidebar and a maximum of eight components to a page layout. Any canvas app components you add can't be added to AppExchange packages.

7. For Visualforce pages or canvas apps, click  under **Component** to find and select your component. If your component is a lookup field, related list, or report chart, choose the field, list, or chart's name. Optionally, you can add more fields to lookup components by defining objects' mini page layouts. You can also hide report charts and related lists from pages where they appear as components to prevent duplicate information from showing. If you want to reorder related lists, you must do so from page layouts. Note that related list components don't display custom buttons.
8. Under **Label**, type the name for your component as it should display to console users from the sidebar. If you don't type a label for a report chart, the report chart's name is used.
9. Specify the size of the component in the sidebar by selecting height or width, and typing its percentage or number of pixels. If you don't specify a height or width, the component is automatically sized to appear correctly in a console.

Autosize Components is available for components with the **Stack** style. It's selected by default so that when users resize browsers, **Stack** components fit nicely in sidebars. Salesforce chooses a minimum height and width for **Stack** components, and you can't change those values. The fit-automatically option is unavailable for Visualforce pages, canvas apps, the Knowledge One component, and Internet Explorer® 7.

10. Click **Save**.

Add Quick Actions to the Console Sidebar

Add custom quick actions to the console sidebar to let support agents easily create, update, and search for records associated with cases. Quick actions are added as console components.

Create the quick actions before adding them to the Case page layouts in the console.

1. From Setup, enter *Page Layouts* in the **Quick Find** box, then select **Page Layouts** under **Cases**.
2. Select a page layout to work with.
3. Click **Custom Console Components**.
4. Scroll to the sidebar section where you want to add the quick action component. For example, to add it to the left sidebar, go to the **Left Sidebar** section.
5. Configure the quick action component:
 - **Field**: Select the record field that the quick action affects. For example, if the quick action creates a contact record, select the **Contact** field.
 - **Enable Linking**: If selected, support agents can associate this record with a case. For example, a support agent can create a contact and link it to a case.
 - **Create Action**: Select the "Create" quick action. This quick action lets support agents create a record.
 - **Update Action**: Select the "Update" quick action. This quick action lets support agents update a record.
6. Add more quick action components as needed.

Sidebar Styles for Console Components

When administrators add components to page layouts, they choose the sidebar style in which to display the components in a Salesforce console.

The following sidebar styles are available for console components on page layouts.

Multi-Component Type	Description
Stack	A content area with multiple frames. 
Tabs	A single content area with a list of multiple panels. 
Accordion	A collapsible content area.  This style is only available for vertical sidebars.

Add Console Components to Apps

After you create a console component, you can add it as a button in the footer of Salesforce console so users can access it.

1. From Setup, enter *Custom Console Components* in the **Quick Find** box, then select **Custom Console Components**.
2. Click **New**.
3. Type a name for your component.
4. In **Button Name**, type the label that will display on the button users click to launch your component. For example, *Live Chat*.
5. In **Button CSS**, enter the in-line style used to define how the button looks to users who click it to launch your component. The styles supported include font, font color, and background color. Font and font color isn't available for Internet Explorer® 7.
6. Type the width of the button as it should display in the console.
7. In **Component**, select **Visualforce Page** or **Canvas App**, and either type the name of your component, or click  to find and select it.
8. Type the height and width of the window used to display your component in the console.
9. Click **Fixed Width** or **Fixed Height** to prevent users from changing the dimensions of the window used to display your component.
10. Click **Save**.

Before users can access your component, you must assign it to a console. See [Assigning a Custom Console Component to an App](#).

Assign a Console Component to an App

After you add a console component to Salesforce console apps, you must assign it to each console for user access.

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. Select a console app.
3. Click **Edit**.
4. In *Choose Custom Console Components*, add any available components to your app.
1. In *Align Console Components*, choose whether to align components to the left or right of the console's footer.
5. Click **Save**.

SEE ALSO:

[Add Console Components to Apps](#)

Brand a Salesforce Console

You can brand a console by adding a custom logo to its header and specifying colors for its header, footer, and primary tabs.

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. Click **Edit** next to a console.
3. To add a custom logo, click **Insert an image**, and choose an image from the document library.

Consider these requirements when choosing a custom app logo from the document library:

- The image must be in GIF or JPEG format and less than 20 KB.
 - If the image is larger than 300 pixels wide by 55 pixels high, then it is scaled to fit.
 - For the best on-screen display, we recommend that you use an image with a transparent background.
 - The *Externally Available* checkbox must be selected on the document's properties so that users can view the image.
4. To specify a color, type a hex code in *Header Color*, *Footer Color*, or *Primary Tab Color*. For example, type #0000FF to define the header as blue.
 5. Click **Save**.

To verify that the correct colors display, view your console.

 **Note:** Defining header or footer colors is not yet available for the Metadata API.

Use a Salesforce Console

Use a Salesforce Console

Get more done faster using a console's enhanced interface to work with records.

Unlike standard Salesforce pages, all items you click in a console display as tabs. Along with the efficiency of tab-based navigation, a console helps you:

- [Work with many records simultaneously](#)
- [View most recently used tabs and bookmarks](#)
- [Resize pinned lists to see more information](#)
- [Navigate more quickly using keyboard shortcuts](#)
- [Work across multiple monitors](#)

A console's dashboard-like interface organizes related data all on one screen so that you can:

- [Search for records](#)
- [Jot notes on records using the interaction log](#)
- [See when records you're viewing have been edited by others](#)
- [Use a SoftPhone to make and receive calls](#)

Additionally, with a Salesforce console for service, you can:

- [Find Salesforce Knowledge articles to solve cases](#)
- [Chat with customers using Live Agent](#)

 **Note:** If your administrator adds [custom console components](#), additional functionality might be available for you in the sidebars and footers of a console.

Salesforce Console Tabs

Any items you click on in a console display as tabs. Tabs let you see all the information you need on one screen without losing context.

Available in: **Performance** and **Developer** Editions with the Sales Cloud

Available in: **Enterprise** and **Unlimited** Editions with the Sales Cloud for an extra cost

Console Tabs

(1) The navigation tab lets you select objects and records to work with. (2) Primary tabs display the main work items in a console, such as an account. (3) Subtabs display related items on a primary tab, such as an account's contact. Use tabs to navigate within the console as you do your work.

Warning: Browsers' back buttons aren't supported for a console and might not work as expected. Console tabs are saved in browser tabs until you close them.

When you close browser tabs, you lose any open console tabs. If your administrator sets up saved user sessions for a console, when you log back into Salesforce, any of your previously open console tabs and console components automatically appear again. Additionally, if you resize any sidebar components, interaction logs, or close the global search header, those customizations appear again too.

Available in: **Performance** and **Developer** Editions with the Sales Cloud

Available in: **Enterprise** and **Unlimited** Editions with the Sales Cloud for an extra cost

A Console's Primary Tabs and Subtabs

(1) A primary tab is the main item to work on, such as an account. (2) A subtab is a related item on a primary tab, such as an account's contact. Salesforce doesn't limit the number of tabs you can display.

When viewing tabs,  appears on tabs where you haven't saved changes, except for reports, Visualforce pages, or your organization's setup pages.  appears on tabs where you need to fix errors. If your administrator has added external domains to a console's whitelist, tabs can display pages outside of Salesforce. New tabs don't appear when you click a custom button or change a record's type, owner, or territory; instead, the current tab goes to the item you selected.

You can do a variety of things with tabs from the tab bar by clicking  and selecting an option, such as closing tabs, refreshing tabs, showing keyboard shortcuts, and more. To rearrange a tab, drag it to a new position along the tab bar. Tabs maintain their status as primary tabs or subtabs, meaning that you can't move primary tabs to the subtabs bar or vice versa. Rearranging tabs isn't available for Internet Explorer[®] 7.

If your administrator has turned on multi-monitor components, you can pop out primary tabs from your browser and drag them to any location on your screen to personalize the way you work. Just click  and select **Pop out primary tabs**. To return primary tabs to their original browser, click  and select **Pop tabs back into console**.

To copy the URL of a console tab and send it to another user, click  and select  next to the tab's name. If you're sending the URL to a non-console user, choose to create a standard Salesforce URL from the Link to Share dialog box. Then, press CTRL+C to copy the URL. To add a new tab to your console in which to paste a URL you've copied, click . In the text box, press CTRL+V to paste the URL, then click **Go!**. You can paste a console URL or a standard Salesforce URL into a new tab.

To pin a frequently visited primary tab to the tab bar for quick access, click  and select . When a tab is pinned, it's moved to the front of the tab bar and its text is removed to provide more screen space. To unpin a tab, click  and select .

To bookmark a favorite or occasionally visited tab for quick access, click  and select . When a tab is bookmarked, it's moved to the History component in the footer (formerly named Most Recent Tabs). To remove a bookmarked tab, click  and select , or click **Remove** next to the tab in the History component. See [View Bookmarks or Recently Used Tabs in a Salesforce Console](#) on page 3654.

 **Warning:** If you click **Cancel** on a newly created item that you haven't saved, the item and its tab are deleted and aren't sent to the Recycle Bin.

 **Note:** If your administrator adds [custom console components](#), additional functionality might be available for you to work with in the sidebars next to tabs.

 **Tip:** To reopen the last tab you closed, press SHIFT+C or click  and select **Reopen last-closed tab**. You can reopen up to ten closed tabs.

[Salesforce Console Tabs](#)

[Use a Salesforce Console](#)

View Bookmarks or Recently Used Tabs in a Salesforce Console

If set up by your administrator, you can quickly access any primary tabs that you've bookmarked or recently used in a console without having to search Salesforce.

 **Note:** With Summer '15, Most Recent Tabs was renamed History and bookmarks were added to it to give you a more streamlined experience for finding and retrieving tabs. These features aren't available in Internet Explorer® 7 and 8.

To view any bookmarked or recently used primary tabs, click **History** in the console's footer. Then click the Bookmarks or Recent Tabs column and select a tab. You can get each tab's URL to send it to another user, or remove bookmarks and clear recently used tabs to start from scratch. Next to each recent tab, you can access up to ten subtabs when they're available. Items that don't display as tabs, such as meeting request overlays, don't display in the History footer.

Work with Keyboard Shortcuts in a Salesforce Console

Keyboard shortcuts let you quickly perform actions by pressing keys instead of having to use a mouse.

Keyboard shortcuts can make working with a console more efficient. For example, instead of typing case details and then using a mouse to click **Save**, an administrator can create a shortcut so that you can type case details and press CTRL+S to save cases without switching to your mouse. Only administrators can create or customize shortcuts.

To view an overlay that lists shortcuts for a console, press SHIFT+K or click  and select **Show Keyboard Shortcuts**. If a shortcut appears dimmed on the overlay, it hasn't been enabled or it's been customized.

Keyboard shortcuts aren't case sensitive, even when you press SHIFT before a letter key. For example, SHIFT+b is the same as SHIFT+B. If CTRL, ALT, or SHIFT is in a keyboard shortcut, the sequence of those keys doesn't matter. For example, CTRL+ALT+A is the same as ALT+CTRL+A.

[Use a Salesforce Console](#)

Guidelines for Working with Salesforce Console Multi-Monitor Components

Move portions of a console to different areas of your computer screens so that you can view data in ways that help you work best.

After an administrator turns on multi-monitor components, you can pop out and drag primary tabs and Open CTI SoftPhones to other locations on your screens. You can also move the History component, Live Agent chats (but not the footer component), and any custom console components or Force.com Canvas components in a console's footer. To use multi-monitor components, you might need to update your browser's settings to: (1) allow popup windows; (2) open links in windows, not tabs.

To pop out and drag primary tabs, click  and select **Pop out primary tabs**. To return primary tabs to their original browser, click  and select **Pop tabs back into console**.

To pop out and drag components in a console's footer, click the items and select . To return items to their original browser, click . To refresh a popped out footer component, right-click on it and choose **Reload** or **Refresh**. When you refresh a popped out footer component, it's returned to the console's footer.

If pinned lists are set up, a playground appears as a blank area next to lists and it says `Drag Footer Components Here`. Use this area to keep track of Salesforce windows among several applications on your screens.

 **Important:** Popped out items close and lose their positions on your screens when you: (1) log out of Salesforce; (2) click **Setup**; (3) click a link to leave a console; (4) refresh or close your browsers.

 **Note:** You can't pop out SoftPhones built with versions 3.0 or 4.0 of the CTI Toolkit.

 **Tip:** Any items popped out of the console have blue headings to help you locate them among other windows on your screens. To use keyboard shortcuts from popped out components, focus on the correct window. For example, if you're focused on a window with the navigation tab, the default shortcut to go to primary tabs, key command P, won't work.

Add Notes to Records in a Salesforce Console

The interaction log helps you quickly add notes to records on a console's primary tabs.

If you're assigned to an interaction log layout, you can access the log from a console's footer. Logs appear on items that have an Activity History related list, such as accounts and contacts, but not solutions. Logs aren't available for reports, dashboards, Salesforce CRM Content, the Article Management tab, or Visualforce pages.

To show or hide the interaction log, hover over the log's border and click  or . To resize the interaction log and a detail page, drag the bar in between them. To help you quickly save notes on customers, when a contact appears on a subtab, the contact's name is added to the log's `Name`. However, you can change the `Name` before you save a log. When you click **Clear Log** to remove notes or a `Subject`, any saved notes aren't removed—they're stored on the record's Activity History related list. For easy review and retrieval, all logs are saved as tasks on records' Activity History related list.

 **Note:** Administrators can customize the fields that appear on logs.

 **Tip:** If you use a SoftPhone, click **Add Call Data** to add a call's date and time to the log. When screen popup windows appear from inbound calls, click **End Call** to end the call and save any updates that you've made to the log.

[Use a Salesforce Console](#)

Use a SoftPhone with a Salesforce Console

A SoftPhone in a console lets you view records related to phone calls, as well as receive, place, and transfer calls.

You can access a SoftPhone if you're assigned to a call center using a CTI adapter built with version 3.0 or 4.0 of the [CTI Toolkit](#), or if you're using a call center built with [Open CTI](#).

Click  to display a SoftPhone from the footer of a console. Use the interaction log to write notes in call logs. A call log is an activity record that automatically generates when you use a SoftPhone, and it tracks the phone number, caller, date, time, and duration of the call. You can view call logs in the Activity History related list of any record associated with the call.

 **Important:** Data might not save properly when you: (1) Refresh your browser during a call; (2) use a SoftPhone in multiple browsers simultaneously; (3) switch to a SoftPhone in a browser without a console.

 **Note:** If you're using a CTI adapter built with version 4.0 of the CTI Toolkit,  displays in the footer even when you're not connected to the adapter.

 **Tip:** You can hide the SoftPhone by clicking , but you can't move it away from the footer of a console. You can also resize the height of a SoftPhone by dragging the bar on top of it. When you click **End Call**, any updates you've made to the interaction log are saved before the call ends.

Find Knowledge Articles in a Salesforce Console

If Salesforce Knowledge and the Knowledge sidebar is set up by an administrator, articles automatically appear when you select a case in a console.

To help you solve cases faster, suggested articles appear in the sidebar as you type details into a case's `subject`. Only articles updated within the last 30 days appear, but you can view older articles by specifying a search term or filtering search results. To filter articles by a specific category, language, or validation status, click  and choose filter options. To access these filters, validation status and multilingual articles must be enabled. An administrator determines which languages are available for articles. The columns available in the sidebar are `New`, `Article Title`, and `Most Viewed`. You can drag the bar in between the columns to resize them, but you can't add, remove, or rearrange columns.

To find articles to help you solve a case, click , type keywords into `Search`, and click **Go**. To attach an article to a case, click the checkbox next to the article and click **Attach to Case**. You can only attach an article to a saved case.  displays next to an article already attached to a case.

To change the number of articles displayed, click the article count indicator in the lower left corner of the sidebar and choose a setting. You can view 10, 25, 50, 100, or 200 articles at a time. When you change this setting, you return to the first page of the list.

To show or hide the sidebar, hover over the scrollbar and click  or . You can drag the bar in between the articles sidebar and a detail page to resize the width of either one.

Live Chat for Support Agents

Welcome to Live Agent for support agents! Live Agent is a comprehensive chat solution that makes it easy for you to support customers.

As a support agent, you assist dozens of customers with their support issues every day. Live Agent is a chat solution that's fully integrated with the rest of Salesforce, making it easy for you to access all the information you need about your customers in a single workspace. In addition, Salesforce leverages the power of the Service Cloud, giving you access to important tools like a knowledge base and pre-defined support messages, that let you assist your customers and close cases more quickly.

Whether you're a seasoned veteran or new to Live Agent, there are several tools at your disposal that make it easy to assist multiple customers at the same time with chat. Let's get started.

IN THIS SECTION:

1. [Change Your Live Agent Status](#)

Change your Live Agent status to control when you're available to receive new and transferred chats.

2. [Assist Customers with Chat](#)

Use Live Agent chat in the Salesforce console to help customers with their issues with the support of robust customer service tools.

1. [Change Your Live Agent Status](#)

Assist Customers with Chat

Use Live Agent chat in the Salesforce console to help customers with their issues with the support of robust customer service tools.

Of course you can chat with customers using Live Agent, but using Live Agent in the Salesforce console gives you access to several other Service Cloud products that let you assist customers in a comprehensive way.

IN THIS SECTION:

[Chat with Customers](#)

Accept incoming chat requests to begin chatting with customers.

[Access Customer Details during a Chat](#)

When you accept a chat request, a details tab for that chat opens automatically. The details tab includes information about the visitor and lets you look up records related to the chat, such as contacts and cases.

[Send Quick Text Messages in Chats](#)

Send pre-written messages to chat customers to send common messages more quickly.

[Transfer Files During a Chat](#)

Give customers the ability to upload and transfer files during a chat so they can easily share more information about their issues.

[Transfer Chats](#)

There are several ways you can transfer chats to agents. Transfer a chat session to a specific agent, send a transfer request to all available agents with a particular skill, or send a transfer request to all agents who are associated with a particular chat button.

[Send a Chat Conferencing Request](#)

As wise as support agents are, sometimes a single support agent doesn't have all the information that's required to solve a customer's problem. Chat conferencing lets you invite one or more agents into your customer chats. That way, your agents can turn boring chats into veritable support parties for your customers—all without disrupting the flow of conversation! Send a chat conferencing request to ask another agent to join you in a customer chat.

[Attach Articles to Live Agent Chats](#)

Use the Knowledge One widget to find articles that help solve customer issues during chats.

[Attach Records to Chat Transcripts](#)

Search for or create records to attach to a chat transcript as you chat with customers.

[Request Help with a Chat](#)

When you need help with a chat, you can raise a virtual flag to alert a supervisor. Supervisors are alerted that you need help, and they can respond directly via the console.

[Block Unwanted Chat Customers](#)

You can block chats from troublesome customers right from the Salesforce console. For example, if a customer is using abusive language or sending spam messages, you can block that user from starting a new chat.

[End a Chat Session](#)

End a chat session after you've finished chatting with a customer and updating the records related to their chat.

Chat with Customers

Accept incoming chat requests to begin chatting with customers.

When you receive a new chat or transfer request, the pending request appears in your chat monitor. You can see the deployment or website the chat came from, the customer's name (if it's available), and the number of minutes the request has been waiting to be answered.

You can chat with several customers at the same time. Each chat session opens in a separate primary tab.

1. In the chat monitor, click **Accept** on the chat request.
The chat log opens in a new primary tab.
2. Type your message to the customer in the message field.
3. Click **Send** or hit ENTER on your keyboard to send your message to the customer.
4. Click **End Chat** when you're done assisting the customer.
If the customer ends the chat first, a notice appears in the chat log.

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

USER PERMISSIONS

To chat with visitors in Live Agent in the Salesforce console:

- Live Agent is enabled, set up, and included in a Salesforce console app

Access Customer Details during a Chat

When you accept a chat request, a details tab for that chat opens automatically. The details tab includes information about the visitor and lets you look up records related to the chat, such as contacts and cases.

- To search for a record, type a name in the relevant box in the Related Entities section of the page, then click . To associate a record you find to the chat, select it from the search results list and click **Save**.

In older organizations, you could access records and visitor details from the Related Entities panel during chats. However, starting with Summer '14, the Related Entities panel in the details tab isn't available for new Live Agent customers. Existing customers will continue to have access to the Related Entities panel.

- Once you associate an existing record to the chat, click the name of the record to open it in a new tab.
- To create a new record, click **New Case**, **New Lead**, **New Contact**, or **New Account**.

To delete a record:

- "Delete" on the object
- AND
- "Create" on Live Chat Transcripts

Send Quick Text Messages in Chats

Send pre-written messages to chat customers to send common messages more quickly.

Quick Text lets you respond to customers more efficiently by letting you insert predefined messages, such as greetings or common troubleshooting steps, into your chat messages.

 **Note:** If you don't have access to Quick Text, contact your administrator.

1. While chatting with a customer, type ; in the message field.
A list of Quick Text messages appears. The messages you've used most recently appear at the top of the list.
2. To see additional Quick Text messages that are available, type a word or phrase.
A list of messages that include those words appears.
3. To see the title and full text of a message, click it once or highlight it using the arrow keys on your keyboard.
The full message appears at the bottom of the Quick Text list.
4. To select a message and add it to your chat, double-click it or highlight it and hit ENTER on your keyboard.
5. To send the message, click **Send** or hit ENTER on your keyboard.

- "Read" on Quick Text

Transfer Files During a Chat

Give customers the ability to upload and transfer files during a chat so they can easily share more information about their issues.

For example, if a customer is receiving an error when they try to complete a process, they can upload and transfer a screenshot of the error message to the agent.

Before a customer can upload a file, you must associate the chat with a record, such as a case or a contact. Since the chat transcript isn't created until you end the chat, you can't attach a customer's file directly to the transcript during the chat.

1. Click  to search for or create a record to attach to the chat.
2. Click the file transfer icon ().
 **Note:** A customer can't upload a file until you initiate the file transfer by clicking the file transfer icon. This helps prevent customers from uploading unsolicited or potentially dangerous files into the chat.
3. Select the record you chose in the first step to attach the transferred file to.
The customer receives a prompt to upload their file to the chat window.
4. When the customer has sent the file through the chat, click the link in the chat log to view the file.

- AND
- Live Agent is set up in a Salesforce console app

Transfer Chats

There are several ways you can transfer chats to agents. Transfer a chat session to a specific agent, send a transfer request to all available agents with a particular skill, or send a transfer request to all agents who are associated with a particular chat button.

You may need to transfer chat sessions to other agents if a customer has an issue another agent can solve, or because you need to pass along some of your chat sessions to accept new requests. When you transfer a chat to a skill group, it's available to all online agents with that skill, regardless of their capacities and how many active sessions they're already engaged in.

When an agent transfers a chat, any records attached to the chat transcript will open in the other agent's workspace when another agent accepts the chat. This way, the agent who accepts the transferred chat has all the information to start assisting the customer right away, without having to search for related records.

If an agent tries to transfer a chat, but has open records that are unsaved or unattached to the chat transcript, the first agent will be prompted to save those changes before completing the chat transfer. This way, the agent who accepts the transfer will see the most up-to-date details about the customer.

If the accepting agent does not have permission to view certain records or objects, those items will not open in the transferred workspace.

1. While chatting with a customer, click **Transfer**.
2. Choose the skill group or chat button queue to which you want to transfer the chat.

Note: You can transfer a chat to a skill group or a chat button queue, but not both.

3. Select All Qualified Agents to send the transfer request to all online agents in the skill group, or choose the name of a specific agent.
4. If the transfer is accepted, you don't need to do anything else. If it's rejected, you can try transferring it to a different agent or skill group.

Warning: When another agent accepts your transfer request, your chat workspace closes automatically, including the chat log and any related subtabs. Make sure to save any changes to these records before you transfer the chat, since any unsaved changes will be lost when the workspace closes.

Live Agent is available in: **Performance** Editions and **Developer** Edition organizations that were created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

USER PERMISSIONS

To chat with visitors in Live Agent in the Salesforce console:

- Live Agent is enabled, set up, and included in a Salesforce console app

Send a Chat Conferencing Request

As wise as support agents are, sometimes a single support agent doesn't have all the information that's required to solve a customer's problem. Chat conferencing lets you invite one or more agents into your customer chats. That way, your agents can turn boring chats into veritable support parties for your customers—all without disrupting the flow of conversation! Send a chat conferencing request to ask another agent to join you in a customer chat.

 **Note:** You can conference in a single agent, or send a request to all agents and the first to accept will join the conference. You can conference multiple agents into a chat, but you need to send each request individually.

1. While you're chatting with a customer, click .
2. Select the skill group of the agents that you want to transfer into the chat.
3. Select whether to send the conference request to all agents with that skill or to a specific agent.
4. Click **Conference** to send the conference request.

If the agent accepts the conference request, you see a notification in the chat log, and that agent can start chatting with you and the customer. If the agent declines the request, you see a notification above the chat log. The customer receives a notification when an agent joins or leaves a conference.

5. If you decide to exit the conference, click **Leave**, and then click **Leave** again.
If the other agent leaves the conference, you'll see a notification in the chat log.

Any saved and attached records will open for other agents who join the conference. But only the originating or longest-attending agent will be able to attach other records. If the longest-attending agent attaches or removes records during the conference, other agents won't see these changes in their workspaces.

For more about transferring chats and workspaces, see [Transfer Chats](#).

Attach Articles to Live Agent Chats

Use the Knowledge One widget to find articles that help solve customer issues during chats.

The Knowledge One widget is only available if your organization uses Knowledge and your administrator has included the tool in your Salesforce console app.

1. When chatting with a visitor, click an article from the list in the Knowledge One widget. A tab with the full text of the article opens.
2. To search for a specific article in the list, type a word or phrase in the text box in the widget and click  or press ENTER.
 - Alternatively, click  at the top of the widget to search all articles, including those not in the list. The main widget search gives you the option of limiting your results to specific types of articles.
 - To filter your search results, click **Filters** and choose how you want to restrict your search.
3. When you find the article you want, click , then click **Share**. The text of the article appears in the chat text box.
4. Click **Send** or press ENTER on your keyboard to send the article to the visitor.

 **Note:** You can only send articles to visitors if your administrator has set up a Chat Answer field on articles. If this field isn't set up, you can view articles but can't include them in chats.

- "Read" on the article type

Attach Records to Chat Transcripts

Search for or create records to attach to a chat transcript as you chat with customers.

Find existing records or create new ones to associate with a transcript as you chat with customers. For example, you can create a new case based on the customer's issue, or search for the customer's existing contact record and attach these records to the transcript for later reference. You can attach standard or custom records to your chat transcripts.

1. While chatting with a customer, click  to attach a record to the transcript.
 -  **Note:** You can only attach one of each type of record to a chat transcript. For example, you can't attach more than one case to a single transcript.
2. To search for an existing record:
 - a. Click the search icon () in the records window next to the type of record you want to search for.
 - b. Type the name of the record and hit ENTER.
The record opens in a new tab.
 - c. Click the attach icon () again.
 - d. Select the check box next to the record you searched for to link it to the chat transcript.
3. To create a new record:
 - a. Click the create icon () next to the type of record you want to create.
 - b. Complete the information in the new record and save it.
The record will automatically link to the transcript once the record is created.
4. After you complete the chat with the customer, exit the chat.
5. If prompted, click **Save**.
The records you linked are now attached to the transcript. You can access them from the transcript's detail view.

Request Help with a Chat

When you need help with a chat, you can raise a virtual flag to alert a supervisor. Supervisors are alerted that you need help, and they can respond directly via the console.

1. In the interaction pane, click the  icon.
2. Enter a message briefly explaining what help you need.
3. Click **Raise Flag**.

Either you or a supervisor can lower the flag when your issue is resolved.

If you don't see the  icon in your console, contact your Salesforce administrator to enable it.

Block Unwanted Chat Customers

You can block chats from troublesome customers right from the Salesforce console. For example, if a customer is using abusive language or sending spam messages, you can block that user from starting a new chat.

Blocking a chat ends the chat and blocks any new chat requests coming from that user's IP (Internet Protocol) address.

If your organization is receiving many spam chats from a particular region, your administrator can block entire ranges of IP addresses.

1. In the interaction pane, click the  icon.
2. (Optional) Enter a comment explaining why you're blocking this visitor.
3. Click **Block**.

When you click **Block**, you immediately end the chat, and the visitor sees a notification that an agent ended the chat. If multiple agents are engaged in a conference, **Block** immediately ends the conference, and the other agents are also notified.

If you don't see the  icon in your console, contact your Salesforce administrator to enable it. Only an administrator can unblock an IP address.

USER PERMISSIONS

To chat with visitors in Live Agent in the Salesforce console:

- Live Agent is enabled, set up, and included in a Salesforce console app

End a Chat Session

End a chat session after you've finished chatting with a customer and updating the records related to their chat.

After you end a chat with a customer, the primary and secondary tabs related to that chat remain open in your console. Close them to save your work and free up space to take on more chats.

1. Close the primary tab for the chat.
2. If prompted, click **Save**.

View Customer Records

Salesforce automatically creates some records when a chat ends. These records store information about chat customers and their interactions with agents.

These records are mostly used internally to provide an audit trail about your customers and their chats with agents. However, you can access these records yourself if you ever need them.

1. To access customer records in the Salesforce console, select the type of record you want to view from the Salesforce console navigation list.
A list of those records will appear in the main window.

IN THIS SECTION:

[Live Agent Session Records](#)

Every time your agents log into Live Agent, a Live Agent session record is automatically created. These session records store information about your agents' and customers' interactions online, such as how many chat requests were processed, how long agents spent online, or how long agents were actively engaged in chats with customers.

[Live Chat Visitor Records](#)

Every time an agent chats with a customer, Salesforce automatically creates a visitor record that identifies the customer's computer.

[Live Chat Transcripts](#)

A live chat transcript is a record of a chat between a customer and an agent. Salesforce automatically creates a transcript for each chat session.

[Live Agent Session Records](#)

Every time your agents log into Live Agent, a Live Agent session record is automatically created. These session records store information about your agents' and customers' interactions online, such as how many chat requests were processed, how long agents spent online, or how long agents were actively engaged in chats with customers.

[Live Chat Visitor Records](#)

Every time an agent chats with a customer, Salesforce automatically creates a visitor record that identifies the customer's computer.

[Live Chat Transcripts](#)

A live chat transcript is a record of a chat between a customer and an agent. Salesforce automatically creates a transcript for each chat session.

Live Agent Session Records

Every time your agents log into Live Agent, a Live Agent session record is automatically created. These session records store information about your agents' and customers' interactions online, such as how many chat requests were processed, how long agents spent online, or how long agents were actively engaged in chats with customers.

Use Live Agent sessions to find and edit information about your support agents' chats with customers. For example, you can create a list called "Today's Sessions" to view chat activity that occurred in one day.

You can associate session records with cases, accounts, contacts, and leads or link them with other objects through custom lookup fields.

 **Note:** If you have the correct permissions, you can create, view, edit, or delete session records, just like other record types in Salesforce. However, session records are meant to provide a paper trail for the chats between your agents and customers, so we don't recommend tampering with these records in most cases.

Live Chat Visitor Records

Every time an agent chats with a customer, Salesforce automatically creates a visitor record that identifies the customer's computer.

Each new visitor is associated with a session key, which Salesforce creates automatically. A session key is a unique ID that is stored in the visitor record and on the visitor's PC as a cookie. If a customer participates in multiple chats, Salesforce uses the session key to link the customer to their visitor record, associating that record to all related chat transcripts.

 **Note:** If you have the correct permissions, you can create, view, edit, or delete visitor records, just like other record types in Salesforce. However, visitor records are meant to provide a paper trail that associates your customers with their chat transcripts, so we don't recommend tampering with these records in most cases.

Live Chat Transcripts

A live chat transcript is a record of a chat between a customer and an agent. Salesforce automatically creates a transcript for each chat session.

When a chat ends successfully—that is, when the chat is ended by a customer or an agent—the chat transcript is created as soon as the agent closes the chat window and any related tabs.

If a chat is disconnected or experiences another error, Salesforce still creates a chat transcript for it, though it takes up to 30 minutes to create the transcript after the chat is disconnected.

You can associate a transcript with cases, accounts, contacts, and leads, or you can link it to other objects.

 **Note:** If you have the correct permissions, you can create, view, edit, or delete chat transcripts, just like other record types in Salesforce. However, chat transcripts are meant to provide a paper trail for the chats between your agents and customers, so we don't recommend tampering with these records in most cases.

Live Chat Transcript Fields

Live chat transcript fields help you track information about your agents' chats with customers.

A live chat transcript has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields might not be visible or editable.

Field	Definition
Abandoned After	The amount of time in seconds an incoming chat request went unanswered by an agent before the chat was disconnected by the customer
Account Name	The name of the account associated with the transcript

EDITIONS

Available in: Salesforce Classic

Live Agent is available in: **Performance** Editions and **Developer** Edition organizations that were created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

EDITIONS

Available in: Salesforce Classic

Live Agent is available in: **Performance** Editions and **Developer** Edition organizations that were created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

Field	Definition
Agent Average Response Time	The average time that it took an agent to respond to a chat visitor's message
Agent Maximum Response Time	The maximum time it took an agent to respond to a chat visitor's message
Agent Message Count	The number of messages an agent sent during the chat
Agent Skill	The skill associated with the live chat button used to initiate the chat
Body	The transcribed chat between an agent and a visitor
Browser	The type and version of the browser used by the visitor
Browser Language	The visitor's browser language selection
Case	The case associated with the chat
Chat Button	The chat button that the visitor clicked to initiate the chat
Chat Duration	The total duration of the chat in seconds
Contact Name	The name of the contact that participated in the chat Note that contacts and visitors are not the same. See Live Chat Visitor for more information.
Created By	The user who created the transcript, including creation date and time (Read only)
Created Date	The date and time the transcript was created (Read only)
End Time	The time the chat ended
Ended By	Indicates whether the visitor or the agent ended the chat
Last Modified By	The user who last modified the transcript, including date and time (Read only)
Last Modified Date	The date and time the transcript was last modified (Read only)
Lead	The name of the lead that was generated by the chat or discussed during the chat
Deployment	The deployment from which the visitor initiated the chat
Live Chat Transcript	Unique, numerical identifier automatically assigned to the transcript. Administrators can modify the format and numbering for this field. Transcript numbers usually increase sequentially, but sometimes they can skip numbers in a sequence.
Live Chat Visitor	Unique, numerical identifier automatically assigned to the visitor. Administrators can modify the format and numbering for this field.

Field	Definition
Location	<p>Visitor numbers usually increase sequentially, but sometimes they can skip numbers in a sequence.</p> <p>Note that visitors and contacts are different: a visitor might be a contact, but this is not a requirement, and there is no relationship between contacts and visitors.</p>
Owner	<p>The name of the transcript owner. By default, the owner is the user who originally created the transcript (for example, the agent who answered the chat).</p> <p>You can select a different user as the owner, or assign the transcript to a queue. When assigning transcripts to other users, make sure those users have the "Read" permission on live chat transcripts.</p>
Platform	The user's operating system
Referring Site	<p>Site the visitor was on before they came to your website.</p> <p>For example, if the visitor used Google to search for your organization's website, the referring site is Google.</p>
Request Time	The time that the visitor initially requested the chat
Screen Resolution	The screen resolution used by the visitor
Start Time	The time that the agent answered the chat request
Status	Completed or Missed. A missed chat was requested but not answered
User Agent	A string that identifies the type of browser and operating system the visitor used
Visitor Average Response Time	The average time that it took a visitor to respond to an agent comment
Visitor Maximum Response Time	The maximum time it took a customer to respond to an agent's message
Visitor IP Address	The IP address of the computer that the visitor used during the chat
Visitor Message Count	The number of messages a visitor sent during the chat
Wait Time	The total amount of time a chat request was waiting to be accepted by an agent

Live Chat Transcript Events

Live chat transcript events automatically track events that occur between your agents and customers during chats.

You can edit live chat transcripts to track events that occur between your agents and customers during live chats. You can add the following events to a live chat transcript:

Event	Description
Chat Requested	Visitor requested a chat
Queued	Chat request was placed in queue
Routed (Push)	Chat request was routed to agent
Routed (Choice)	Chat request was routed to all available, qualified agents
Accepted	Chat request was accepted by agent
Critical Wait Alert Time Reached	Agent failed to respond to the customer's message before reaching the critical wait alert time
Critical Wait Alert Cleared	Agent responded to the customer's message after the critical wait alert was received
Transfer Requested	Agent requested chat transfer
Transfer Accepted	Chat transfer was accepted by agent
Transfer Request Canceled	Chat transfer request was canceled by the agent who sent the request
Transfer Request Declined	Chat transfer request was declined by the agent who received the request
Transferred to Button	Chat was transferred to a button
Transfer to Button Failed	Chat transfer to button was unsuccessful
Chat Conference Requested	Agent sent a request to start a conference
Chat Conference Canceled	Conference request was canceled
Chat Conference Declined	Conference request was declined by an agent
Agent Joined Conference	An agent joined the conference
Agent Left Conference	An agent left the conference
File Transfer Requested	A file transfer was requested
File Transfer Canceled by Agent	File transfer was canceled by an agent

Event	Description
File Transfer Canceled by Visitor	File transfer was canceled by the visitor
File Transfer Succeeded	File transfer was successful
File Transfer Failed	File transfer failed
Canceled (Blocked)	An attempted chat was blocked via an IP blocking rule
Blocked by Agent	An agent blocked an active chat (creating an IP blocking rule)
Declined (Manual)	Chat request was declined by agent
Declined (Time-Out)	Chat request timed out while assigned to agent
Canceled (No Agent)	Chat request was canceled because no qualified agents were available
Canceled (No Queue)	Chat request was canceled because there was no room in queue
Canceled by Visitor	Visitor clicked Cancel Chat
Agent Left	Agent left chat
Visitor Left	Visitor left chat
Ended by Agent	Agent clicked End Chat
Ended by Visitor	Visitor clicked End Chat

Live Chat for Support Supervisors

Welcome to Live Agent for support supervisors! Live Agent is a comprehensive chat solution that makes it easy for your agents to support customers. With Live Agent's supervisor tools, you can easily monitor your agents' activities, assist your agents in chats, and view data on your agents' chat sessions.

As a support supervisor, you oversee your employees to ensure that they provide the best customer support possible. Live Agent is a chat solution that's fully integrated with the rest of Salesforce, making it easy for you to access the information you need about your agents and their chat activity in a single workspace.

Whether you're a seasoned veteran or new to Live Agent, there are several tools at your disposal that make it easy to support and monitor your chat agents as they work with customers. Let's get started.

IN THIS SECTION:

[The Live Agent Supervisor Panel](#)

The Live Agent supervisor panel is your one-stop shop to find information about your department's chat buttons and chat agents. From the supervisor panel, you can monitor agents' chat activities as they chat with customers and view customer traffic on specific chat buttons, all in real time. The supervisor panel is conveniently located in the Salesforce console, so it's easy to access it without switching out of the app.

[Assign Skills to Agents](#)

Assign skills to your agents as the expertise of your team evolves.

[Report on Live Agent Sessions](#)

Gain insight into your agents' chat activities by building reports about Live Agent chat sessions.

Access the Supervisor Panel

Access the supervisor panel conveniently from the Salesforce console to easily monitor your agents' chat activity.

- To access the supervisor panel in the Salesforce console, select **Live Agent Supervisor** in the console's navigation list.
The supervisor panel appears in the main console window, giving you access to real-time information about your organization's chat buttons and agents.

Agent Status List

The agent status list in the supervisor panel gives you access to real-time information about your agents' chat activity.

Agent Detail	Description
Agent Name	The name of the agent.  Note: If a red flag appears next to the name, the agent has requested help. Respond via the chat detail module (far right).
Status	The agent's Live Agent status.
Action	The actions you can take to change the agent's status.
No. Chats in Progress	The number of chats that an agent is engaged in.
No. Requests Assigned	The number of pending chat requests that are currently assigned to the agent.
Time Elapsed Since Login	The amount of time the agent has been logged in to Live Agent.

EDITIONS

Available in: Salesforce Classic

Live Agent is available in: **Performance** Editions and **Developer** Edition organizations that were created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

USER PERMISSIONS

To use the Live Agent supervisor panel in the Salesforce console:

- Access to the Live Agent supervisor tab in a user profile or permission set, and included in a Salesforce console app

EDITIONS

Available in: Salesforce Classic

Live Agent is available in: **Performance** Editions and **Developer** Edition organizations that were created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

Agent Detail	Description
Time Elapsed Since Last Accept	The amount of time since the agent last accepted a chat request.
Message to Supervisor (optional)	The private message that the agent sent with a help flag.

Expand each agent's name to see details about the customers they're chatting with.

Customer Detail	Description
Visitor Name	The name of the customer, if available.
IP	The IP address of the customer's device.
Network	The customer's network, if available.
Browser	The type of internet browser the customer is using to connect to their chat window.
City	The city the customer is chatting from.
Country	The country the customer is chatting from.
Duration	The amount of time the customer has been engaged in a chat with the agent.
Action	The actions you can take to view the customer's chat with the agent.

Monitor Your Agents' Chats

View your agents' chats from the supervisor panel as they help customers. You can monitor agents' performance and give them real-time feedback and help as they serve customers.

1. In the Agent Status list, click  to expand the information about the agent whose chat you want to view. If an agent has requested help, you see a red flag next to the name and a private message (far right) if the agent entered one.
2. To view a chat, click **View** in the Action column of the chat you want to monitor.
The chat monitor opens in the Agent Status list.
3. To send a private message to an agent as the agent is chatting with a customer, type your message in the message field and press **Enter**.
The agent can see your message in the chat log, but the message is invisible to the customer.

When you finish monitoring your agent's chat, click  again to collapse the chat monitor.

To remove a flag after you've provided help, click **Lower Flag**.

USER PERMISSIONS

To use the Live Agent supervisor panel in the Salesforce console:

- Access to the Live Agent supervisor tab in a user profile or permission set, and included in a Salesforce console app

To view agents' chats:

- "Agent Sneak Peek Enabled" in your Live Agent configuration

To send whisper messages to agents:

- "Whisper Messages Enabled" in your Live Agent configuration

Assign Skills to Agents

Assign skills to your agents as the expertise of your team evolves.

1. In Setup, enter *Skills* in the **Quick Find** box, then select **Skills**.
2. Click the name of the skill you want to assign.
3. Click **Edit**.
4. Select either the profiles (recommended) or individual users who have this skill.
5. Click **Save**.

If you don't have access to the Skills page, ask your Salesforce administrator about enabling this permission. Only your administrator can create skills.

Report on Live Agent Sessions

Gain insight into your agents' chat activities by building reports about Live Agent chat sessions.

You can create a custom report type for Live Agent chat sessions and use it to run reports on your agents' sessions using the Report Builder. These Live Agent session reports can provide insight about your agents' chat activities—for example, whether or not your agent team is able to handle all chat requests from your customers.

1. Create a custom report type using Live Agent Sessions as the primary object.
2. Create a new Live Agent report using the Report Builder.
3. Customize your report to include the columns of information you want to feature.
4. Save or run the report.

ENHANCE SALESFORCE WITH POINT AND CLICK TOOLS

Welcome, Salesforce Point & Click Administrators

Ready to go beyond the basics of Salesforce administration? Want to customize your organization, push its boundaries, and enhance its functionality? You can do that and so much more without writing a single line of code. All you need is your mouse and a sense of adventure. Put on your fedora, it's time to explore!

Inside you'll find a multitude of features you can use to expand your organization. Enhance your objects, data, and fields, customize your organization's look and feel, augment your business processes, create websites, and even create apps—all using point-and-click tools.

Find Object Management Settings

Salesforce lets you personalize your object model with features like custom fields, page layouts, and validation rules. Depending on which experience of Salesforce you have enabled, these customizations are located in different areas of Setup.

IN THIS SECTION:

[Find Object Management Settings in Lightning Experience](#)

Salesforce lets you customize your object model with features like custom fields, page layouts, and validation rules. Most objects are available from the Object Manager in Setup.

[Find Object Management Settings in Salesforce Classic](#)

Salesforce lets you personalize your object model with features like custom fields, page layouts, and validation rules. Depending on which type of object you want to find, these customizations are located in different areas of Setup.

Find Object Management Settings in Lightning Experience

Salesforce lets you customize your object model with features like custom fields, page layouts, and validation rules. Most objects are available from the Object Manager in Setup.

Standard Objects and Custom Objects

A *standard object*, such as Account or Contact, comes out of the box with your Salesforce organization. A *custom object* is an object that you or another administrator created.

From Setup, enter *Object Manager* in the **Quick Find** box, then select **Object Manager**. Select one of the objects in the list, and then scroll to the section for the specific customization.

EDITIONS

Customizing Your Organization

Force.com Quick Access Menu

The Force.com quick access menu offers handy shortcuts to customization features.

When you're working on apps or objects, use this menu to jump to relevant app customization features. It's available from object list view pages and record detail pages.

 **Note:** If drag-and-drop scheduling on list views is enabled, the Force.com quick access menu isn't visible for list views on accounts, contacts, and custom objects.

- To expand or collapse the menu, click  (or press ALT+;).
- To scroll down the list of the menu, press TAB.
- To select an option on the menu, press ENTER.
- To remove the menu from all list views and record pages, click **Turn off menu**.

To restore the quick access menu:

1. From your personal settings, enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
2. Click **Edit**.
3. Select the **Force.com Quick Access Menu** checkbox.
4. Click **Save**.

Changing How Salesforce Looks

Rename Object, Tab, and Field Labels

You can change the name of almost any object, field, or tab in Salesforce. This simple adjustment lets you continue using the terminology your users already know and helps them transition to using Salesforce. However, be aware that Salesforce Help and most pages in Setup always display the original names for standard objects, fields, and tabs.

For example, you might change the name label for the "Accounts" object and related "Accounts" tab to "Companies", and change the field "Account Name" to "Company Name." When you rename an object, tab, or field, the new name appears on all pages the user sees, in Salesforce for Outlook, and in Connect Offline.

Before renaming tabs, objects, fields, and other related labels, review the [implementation tips](#) for administrators.

If you use person accounts in your Salesforce organization, see [Renaming Person Account Labels](#).

1. From Setup, enter *Rename Tabs and Labels* in the **Quick Find** box, then select **Rename Tabs and Labels**.

2. Select your default language from the **Select Language** drop-down list at the top of the page.

 **Note:** In Hebrew, we recommend keeping tab renaming to a minimum because variable gender in verbs is not supported and verbs can lose gender agreement.

3. Click **Edit** next to the tab you want to rename. Click **Reset** to revert to a tab's original name.

 **Note:** You can't reset custom object tab names.

4. Enter the singular and plural forms of the new tab name. Also, if applicable for the language, select **Starts with a vowel sound** for labels that start with a vowel to ensure that Salesforce uses the proper article (such as "a" or "an"). Then click **Next**.

When you rename a tab or an object, you can't use the name of another standard tab, custom object, external object, or custom tab.

5. Enter your labels for the standard field labels and other user interface elements. Be sure to enter both a singular and plural form for each label that requires it. Select **Starts with a vowel sound** for labels that start with a vowel.

 **Note:** Some standard fields, such as **Created By** and **Last Modified By**, are purposely omitted from renaming because they track system information.

6. Click **Save**.

Repeat this procedure to translate labels into all other languages used in your organization.

 **Tip:** After renaming a tab or object, rename any custom reports, dashboards, profiles, permission sets, custom fields, and list views that contain the original name. You can modify labels using the [Translation Workbench](#). To rename a standard report, click **Save As** and save it to a folder designed for your new name.

Other tab customization options include the following:

Person accounts available in: **Enterprise, Performance, Unlimited, and Developer Editions**

- Individual users can control which tabs and related lists display for their own logins.
- In addition to the standard tabs provided by Salesforce, users can create entirely new custom tabs depending on their Edition. For more information, see [Defining Custom Tabs](#) on page 3731.
- In Enterprise, Unlimited, Performance, and Developer Edition organizations, you can override the tab home page that is displayed when a user clicks a standard, custom, or external object tab. For more information, see [Override Standard Buttons and Tab Home Pages](#) on page 4590.

Renaming Person Account Labels

If your organization uses person accounts, you can rename the following standard fields:

Field	Tab	Description
Business Account	Accounts	An account that is not a person account because it does not have a record type specific to person accounts. This label is primarily used to clarify the type of accounts you are importing.
Person Account	Accounts	A person account. For more information, see below.
Business Contact	Contacts	A contact that is associated with a business account. This label is primarily used to clarify the type of accounts you are importing.

When you rename the `Person Account` field label, the renamed label appears in Salesforce as follows:

- As a prefix to differentiate person account fields such as `Birthdate` and `Home Phone` from business account fields. For example, `Person Account: Birthdate` is available as an account column in opportunity reports.
 - In the name of the `Is Person Account` field and icon. For example, if you rename the `Person Account` field to "Consumer," then `Is Person Account` becomes `Is Consumer`.
-  **Note:** The `Person Account` and `Business Account` field labels are independent from actual record type names.
- To customize person account record types, from the object management settings for person accounts, go to Record Types.
 - To customize business account record types, from the object management settings for accounts, go to Record Types.

- [Find Object Management Settings](#)

Considerations for Renaming Tab and Field Labels

Renaming standard and custom Salesforce tabs, objects, fields, and other related user interface labels is a valuable feature that has far-reaching implications for all your users. Before renaming anything for your organization, review the following considerations to determine how it will affect your users:

- Most standard tabs and objects can be renamed but not all. For example, the Forecasts tab is not available for renaming. From Setup, enter *Rename Tabs and Labels* in the **Quick Find** box, then select **Rename Tabs and Labels** to view a list of the tabs and objects you can rename.
- The renamed labels display on all user pages in Salesforce including Personal Setup. However, all pages in the Setup area use the default, original labels.
- Some standard fields, such as **Created By** and **Last Modified By**, are purposely omitted from renaming because they track system information.
- After renaming tabs, objects, or fields, check the following additional items that may need manual updates:
 - Review all list view names. List view names continue to display the original object name until you change them manually.
 - Check standard report names and descriptions for the objects you renamed.
 - Update the titles and descriptions of any email templates that contain the original object or field name.
 - Manually change any other items you customized with the new object or field name. For example, custom fields, page layouts, and record types may contain the original tab or field name.
- Connect Offline, Connect for Lotus Notes, Email Connect, and Salesforce for Outlook use your new names.
- If you have renamed tabs, objects, or fields, you can also replace the Salesforce online help with another URL. Users can view this URL whenever they click on any context-sensitive help link on an end-user page or within their personal settings. After you replace the help, the **Help & Training** link at the very top of every page and all Setup pages will continue to display Salesforce online help. For instructions on replacing the online help, see [Replacing Salesforce Online Help](#) on page 3743.
- In Hebrew, we recommend keeping tab renaming to a minimum because variable gender in verbs is not supported and verbs can lose gender agreement.

Customizing Your Pages

Page Layouts and Field-Level Security

Use field-level security to control the access that users have to certain fields. Use page layouts to control the layout and organization of detail and edit pages in Salesforce, the Self-Service Portal, and the Salesforce Customer Portal. Customize search layouts to change which fields display in search results and the buttons that display on list views.

Important: When using page layouts to hide fields from detail and edit pages, be aware that users can still access those fields by other means, including reports, search results, list views, and the API. To restrict all means of accessing a field, use field-level security. Field-level security doesn't prevent searching on the values in a field. When search terms match on field values protected by field-level security, the associated records are returned in the search results without the protected fields and their values.

Field-Level Security

- Restrict users' access to view and edit fields by any means, including reports, search results, list views, related lists, email and mail merge templates, custom links, Connect Offline, the API, and when synchronizing data or importing personal data.

- Override any less-restrictive field access settings in page layouts and mini page layouts.

For example, if a field is required in the page layout and read-only in the field-level security settings, the field-level security overrides the page layout and the field is read-only for the user.

- Override less-restrictive field settings in search layouts.

For example, if a field is visible in the search layout but hidden for certain users via the field-level security settings, the field-level security overrides the search layout and the field is hidden for those users.

Page Layouts

- Control the layout and organization of detail and edit pages.
- Control which fields, related lists, and custom links users see, on detail and edit pages only.
- Control which standard and custom buttons display on detail pages and related lists.
- Determine whether fields are visible, read only, or required, on detail and edit pages only.
- In Personal, Contact Manager, Group, and Professional Editions, control which fields users can access in related lists, list views, reports, Connect Offline, email and mail merge templates, custom links, and when synchronizing data or importing personal data.
- In Professional, Enterprise, Unlimited, Performance, and Developer Editions, determine some aspects of mini page layouts, including record type and profile associations, related lists, fields, and field access settings. The visible fields and related lists of the mini page layout can be further customized, but the other items inherited from the associated page layout cannot be changed on the mini page layout itself. Mini page layouts display selected fields and related lists of records in the mini view of the console.
- Should not be used to secure data. For example, removing the **Edit** button from a page layout doesn't prevent users from using inline editing to modify records. To prevent users from editing data, use any combination of sharing rules, field-level security, page layout field properties, validation rules, object permissions, and Visualforce pages.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Page layouts and search layouts available in: **All Editions**

Field-level security available in: **Enterprise, Performance, Unlimited, Developer, and Database.com Editions**

 **Note:** To automatically add a field to all page layouts and make it visible and required everywhere regardless of field-level security, make it a universally required field.

SEE ALSO:

[Page Layouts](#)

Feed-Based Layouts Overview

Feed-based page layouts make it easier to work with records by providing two separate views: one for the record's feed, and one for its details, including related lists.

Available in: **Enterprise, Performance, Unlimited**, and **Developer** Editions

Unlike standard page layouts, which include all of a record's information—the feed, details, and related lists—on one page, feed-based layouts let you switch between the feed view and the details view so you can focus on the type of information you need at any given moment. For example, to see comments others have made about a record or to create a new record that's related to it, you'd use the feed view. To delve into the record's related lists, attachments, and other in-depth information, you'd use the details view.

Feed-based layouts are available on account, asset, case, contact, lead, opportunity, and custom objects.

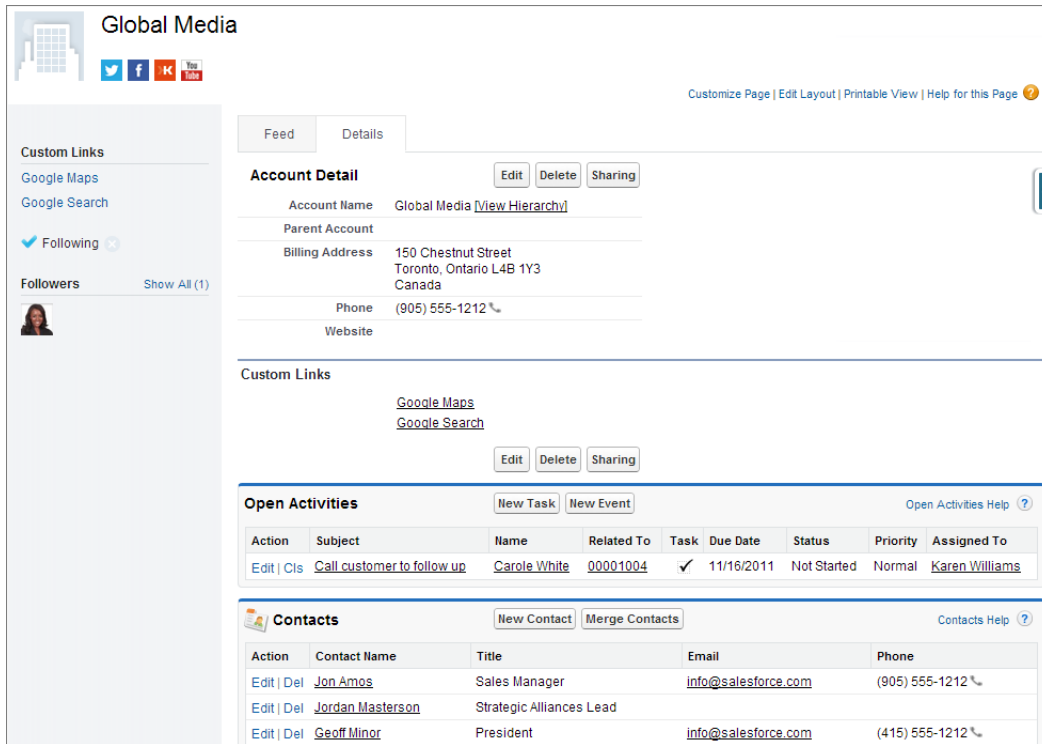

The feed view in these layouts includes:

1. Tabs or, if you're working in the Salesforce console, toggle buttons () to switch between the feed view and the detail view.
2. The publisher, which might include actions that let you do things like create related records or log calls, depending on how your administrator has set up your organization.
3. The record feed, which shows activity on the record, such as comments others have made about it.
4. Any custom buttons and links your administrator has added.

5. A follow button () or following indicator () and a list of people who follow the record. Depending on how your administrator has set up the page, these might appear on the left side or on the right side.
6. Feed filters, which let you choose which information from the feed you see. Depending on how your administrator has set up the page, the filters might appear on the left side of the page, in the center, or on the right.

Detail views show in-depth information about the record, including related lists.

The screenshot shows a Salesforce record page for 'Global Media'. The page is divided into several sections:

- Header:** 'Global Media' with social media icons (Twitter, Facebook, LinkedIn, YouTube) and utility links like 'Customize Page', 'Edit Layout', 'Printable View', and 'Help for this Page'.
- Left Sidebar:** 'Custom Links' (Google Maps, Google Search), 'Following' (checked), and 'Followers' (Show All (1)).
- Account Detail:** A section with 'Edit', 'Delete', and 'Sharing' buttons. It lists:
 - Account Name: Global Media (with a 'View Hierarchy' link)
 - Parent Account
 - Billing Address: 150 Chestnut Street, Toronto, Ontario L4B 1Y3, Canada
 - Phone: (905) 555-1212
 - Website
- Custom Links:** 'Google Maps' and 'Google Search' with 'Edit', 'Delete', and 'Sharing' buttons.
- Open Activities:** A table with columns: Action, Subject, Name, Related To, Task, Due Date, Status, Priority, Assigned To.

Action	Subject	Name	Related To	Task	Due Date	Status	Priority	Assigned To
Edit Cls	Call customer to follow up	Carole White	00001004	<input checked="" type="checkbox"/>	11/16/2011	Not Started	Normal	Karen Williams
- Contacts:** A table with columns: Action, Contact Name, Title, Email, Phone.

Action	Contact Name	Title	Email	Phone
Edit Del	Jon Amos	Sales Manager	info@salesforce.com	(905) 555-1212
Edit Del	Jordan Masterson	Strategic Alliances Lead		
Edit Del	Geoff Minor	President	info@salesforce.com	(415) 555-1212

[Create Feed-Based Page Layouts](#)

Create Page Layouts

1. From the management settings for the object type that you want to edit, go to Page.
2. Click **New**.
3. Optionally, choose an existing page layout to clone.
4. Type a name for the new layout.
5. Optionally, select **Feed-Based Layout** to create a layout that includes separate tabs for a record's feed and detail pages.
6. Click **Save**.
7. Modify the layout.
8. Assign the new layout to user profiles.

 **Tip:** You can create a new page layout by cloning an existing one.

- In the enhanced page layout editor, click **Edit** next to a layout, then click **Save As** on the layout page.
- In the original page layout editor, select a layout, then click **Clone** on the layout page.

[Find Object Management Settings](#)

Create Feed-Based Page Layouts

Make it easier for your users to work with account, contact, lead, opportunity, and custom object records by creating feed-based layouts. These layouts include two separate views: one for the record's feed and one for its details.

Feed-based layouts offer a more streamlined way of working with records, and don't require users to scroll through information they're not interested in to find what they're looking for. Users can easily switch back and forth between the feed view, which includes the publisher and important events on the record, shown in chronological order, and the details view, which shows in-depth information about the record, including related lists.

You can create feed-based layouts for account, asset, contact, lead, opportunity, and custom objects. To create feed-based layouts for cases, use Case Feed.

1. Be sure feed tracking is enabled for the object on which you want to create a feed-based layout. To enable feed tracking, from Setup, enter *Feed Tracking* in the **Quick Find** box, then select **Feed Tracking**.
2. [Create a new page layout](#) and select **Feed-Based Layout**.
 -  **Note:** Only new page layouts can be feed-based; you can't change an existing standard layout to a feed-based layout.
3. Click **Edit** next to your layout and [use the enhanced page layout editor to configure it](#).

USER PERMISSIONS

To create, edit, and delete page layouts:

- "Customize Application"

You can't configure feed-based layouts with the original page layout editor.

4. On the main page layout editor page, [customize the publisher](#) to include the actions you want to make available to users, and add any custom buttons or links.
5. Click **Feed View** in the page layout editor header to customize what appears on the feed page.
You can:
 - Enable full-width feed so the feed expands horizontally when users view records in Salesforce console tabs or subtabs.
 - Turn on compact feed so users see a cleaner, more streamlined feed view when working with records in Salesforce console tabs or subtabs.
 - Choose to automatically collapse the publisher when it's not in use so users can see more of the information below it on the page.
 - Add custom components, which are Visualforce pages with functionality you define.
 - Choose where on the page custom buttons and links and standard components like the Follow button and followers list appear.
 - Hide the standard sidebar.
 - Choose which feed filters are available, and where they appear.
6. [Assign the page layout to user profiles.](#)

[Case Feed Overview](#)

Page Layouts

Page layouts control the layout and organization of buttons, fields, s-controls, Visualforce, custom links, and related lists. They also help determine which fields are visible, read only, and required. Page layouts can include s-controls and Visualforce pages that are rendered within a field section when the page displays. You can control the size of the s-controls and Visualforce pages, and determine whether or not a label and scroll bars display.

Salesforce has two drag-and-drop tools for editing page layouts: the original page layout editor and an enhanced page layout editor. The enhanced page layout editor is enabled by default, and provides all the functionality of the original editor, as well as additional functionality and an easier-to-use WYSIWYG interface.

You can enable the original page layout editor in the User Interface settings. Your organization can use only one page layout editor at a time.

For Personal, Contact Manager, Group, and Professional Edition organizations, every user views the same layout. Enterprise, Unlimited, Performance, and Developer Edition organizations can create different page layouts for use by different profiles and record types and set field-level security settings to further restrict users' access to specific fields.

In Professional, Enterprise, Unlimited, Performance, and Developer Editions, you can set the mini page layouts and related objects that appear in the Console tab.

Tips and Considerations for Page Layouts

If you want to customize the user profile layout in Salesforce1, create a new layout or edit an existing layout in the User Profile Page Layouts section.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Page layouts are available in: **All** Editions

Creation and deletion of page layouts is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create, edit, and delete page layouts:

- "Customize Application"

Use field-level security as the means to restrict users' access to fields; then use page layouts primarily to organize detail and edit pages within tabs. This reduces the number of page layouts for you to maintain. Note that field-level security settings override the visible and read-only settings on the page layout if the field-level security has a more restrictive setting than the page layout.

A background process periodically runs that cleans up metadata associated with deleted custom fields. This process will affect the `Last Modified Date` and `Last Modified By` fields on page layouts, record types, and custom objects.

Customize Page Layouts with the Enhanced Page Layout Editor

The enhanced page layout editor is a WYSIWYG tool that allows you to customize your organization's page layouts for detail and edit pages in Salesforce, the Self-Service Portal, and the Salesforce Customer Portal. The enhanced page layout editor has all the functionality of the original page layout editor, but has more features and an easier-to-use interface.

The enhanced page layout editor has two parts: a palette on the upper portion of the screen and the page layout on the lower portion of the screen. The palette contains the user interface elements that you can add to your page layout, such as fields, actions, buttons, links, and related lists.

When working with the enhanced page layout editor:

- You can drag up to 20 s-controls, 20 Visualforce pages, 20 expanded lookups, and 100 related lists onto a page layout. There are no limits on fields and custom links. You can add one Wave Analytics dashboard per page layout.
 -  **Note:** You can't place a Visualforce page more than once on a page layout.
- To select multiple elements individually, use CTRL+click. To select multiple elements as a group, use SHIFT+click.
- To change the properties of an element on the page layout, double-click the element or click the wrench icon () next to it. You can't change the properties of elements in the palette.
- To make a field read-only or required, double-click the field in the page layout and select the appropriate checkbox.
- To access the other layouts for an object with multiple page layouts, click the page layout name at the top of the page and select another layout to view.
- To change the name of the page layout, add personal and public tags if available, and display standard object checkboxes on the page layout, click **Layout Properties**.
 -  **Note:** You can't rename a page layout if you're using Salesforce Professional Edition.
- In Enterprise, Unlimited, Performance, and Developer Editions, you can select a profile to preview how the pages will look for users with that profile. Most related lists' columns preview without data.
- If you're working with a feed-based page layout, click **Feed View** to customize the tools and components that appear when users are working in the feed on a record.
- To choose which fields display on the record detail page and the order in which they appear, click **Edit Multi-Line Layout**.
- When you're done customizing the page layout, save it. If you navigate away from your page layout before saving, you lose your changes.
 -  **Note:** Chatter group layout changes affect the Salesforce1 app only. Changes to the group publisher (actions and layout) reflect in both the full Salesforce site and the Salesforce1 app.
 -  **Tip:** Here are a few tips to keep your page layouts well organized and easy to use:
 - Remove unnecessary fields.
 - Keep the number of required fields to a minimum.
 - Group similar fields with sections.
 - Think about the right TAB key order for each section.
 - Check your layouts in Read and Edit modes.
 - Add help text to custom fields. Use it to explain to users what data you're looking for in the field.
 - In Enterprise, Unlimited, and Performance Editions, use record types to provide unique layouts for different records.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To customize page layouts:

- "Customize Application"

To view page layouts:

- "View Setup"

- Optimize related lists—adjust their overall order, the sorting of the records, and display of relevant columns and buttons.

SEE ALSO:

[Guidelines for Using the Enhanced Page Layout Editor](#)

[Customize Related Lists](#)

[Feed-Based Layouts Overview](#)

[Page Layouts](#)

Enhanced Page Layout Editor User Interface Elements

This list describes the enhanced page layout editor user interface elements and how you can use them in your page layout. To add elements, drag them from the palette to the layout. Valid drop locations show up in green. To remove elements, drag them off the layout and back to the palette.

Tip: Create the appropriate buttons, custom links, fields, custom s-controls, and Visualforce pages before editing your page layout.

Actions

Mobile smart actions appear as a single action element in the page layout editor. However, they appear in the action bar and action menu in Salesforce1 as distinct create actions. These distinct actions allow users to create records directly from the action bar. The create actions included in the set of mobile smart actions vary depending on the page layout's object.

Note: If you delete an action, the action is removed from all layouts it's assigned to.

Wave Analytics Assets

You can add and move an Wave Analytics dashboard to any section on the page layout, except Mobile Cards.

For an Wave Analytics dashboard element, use field mapping to map data fields in the dashboard to the object's fields so that the dashboard shows only the data that's relevant for the record being viewed. You can specify fields from multiple datasets. Identify each dataset by its system name, which is listed on the dataset's edit page. Identify the data fields by row, and for the values, specify either the field names from the Salesforce object or specific values. The JSON field mapping follows this format:

```
{
  "dataset1_system_name": {
    "row_name": ["$field_name"],
    "row_name": ["$field_name"]
  },
  "dataset2_system_name": {
    "row_name": ["$field_name"],
    "row_name": ["$field_name"]
  }
}
```

For example, if the dashboard shows data from a dataset named Service, with the dimensions Account and Industry, the field mapping would be defined as:

```
{
  "service": {
    "account": ["$Name"],
    "industry": ["$Industry"]
  }
}
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To customize page layouts:

- "Customize Application"

To view page layouts:

- "View Setup"

Blank Spaces

You can add and move blank spaces to any section on the page layout, except Mobile Cards. Use blank spaces to visually align and distinguish elements on the page.

-  **Note:** If you use the original page layout editor to view a page layout that was created in the enhanced page layout editor, the original page layout editor shows the blank spaces you added. You can't move or add blank spaces in the original page layout editor, but you can remove them by dragging them to the box on the right.

Blank spaces aren't supported in Lightning Experience.

Buttons

You can control which standard and custom buttons are displayed and the order in which the custom buttons appear. You can't rearrange the order of the standard buttons.

Standard and custom buttons are available as actions in Salesforce1 and Lightning Experience.

Canvas Apps

For the Canvas Apps category to appear in the palette, set the canvas app location to Visualforce Page when you create the canvas app in Salesforce.

- If you add a canvas app to any section other than the Mobile Cards section, the canvas app appears in the page layout in the full Salesforce site or in the record detail page in Salesforce1.
- If you add a canvas app to the Mobile Cards section, the canvas app appears as a card on the record related information page in Salesforce1.

Components

When you add a component to the Mobile Cards section of a page layout, it displays as a card on a record's related information page in Salesforce1. Components are supported only in the Mobile Cards section of a page layout, and they only appear in Salesforce1.

In organizations that are created after Spring '14, the Twitter component is added by default to the Mobile Cards section of page layouts for objects that support it.

-  **Note:** Social Accounts and Contacts must be enabled for your organization before you can add the Twitter component to a page layout.

The Twitter card that you see on account, contact, and lead record pages in Lightning Experience isn't the same as the Twitter component available as a mobile card in the page layout editor. The Twitter card in Lightning Experience is a Lightning component. You must have Social Accounts and Contacts enabled for it to appear.

Expanded Lookups

The Expanded Lookups category for the enhanced page layout editor contains fields with lookup relationships. These fields, when added to the Mobile Cards section of the layout, display as related lookup cards on a record's related information page in Salesforce1. A page layout can have up to 20 expanded lookups.

The Expanded Lookups category only contains fields with lookup relationships to objects that support [compact layouts](#).

Expanded lookups aren't supported in Lightning Experience.

Fields

A field can display one or more of these icons:

-  The field must have a value to save the record, but isn't required on the page layout itself.
-  The field must be included on the page layout because either an administrator configured the field as universally required or Salesforce automatically requires the field. Although you can't remove such fields, you can move them to different locations.
-  The field is a controlling field.

-  The field is a dependent field.
-  The field is read only.

To set which fields are required and read only, select one or more fields and click the wrench icon () on any of the selected fields.

- The field properties of some standard fields cannot be changed. Custom fields can only be changed if they are not universally required fields.
- Fields marked as read only are always editable by administrators and users with the “Edit Read Only Fields” permission.
- If you make a picklist field read only, all new records contain the default value for that picklist.
- Auto-number fields are always read only.
- If you mark the opportunity `PROBABILITY` field as read only, the `PROBABILITY` value is still updated when a user changes the `STAGE` value of an opportunity.

When working with fields:

- In Personal, Contact Manager, Group, and Professional Editions, page layouts control which fields users can access in related lists, list views, reports, Connect Offline, email and mail merge templates, custom links, and when synchronizing data. In Enterprise, Unlimited, Performance, and Developer Editions, field-level security controls this access. Field-level security settings override field properties that you set on the page layout if the field-level security is more restrictive than the page layout setting.
- In the organization-wide Data Import Wizard for accounts, contacts, and leads, administrators can import into any field, even if a field is hidden or read only in their page layout or field-level security settings. Individual users can import only into the fields that are accessible to them via their page layout or field-level security settings.

Related Lists

A page layout can have up to 100 related lists. You can place related lists at the bottom of the page layout. To move a related list on the page layout, drag the handle located above the related list.

To customize a related list, double-click the related list handle or click the wrench icon () inside the handle. Use the related list properties to:

- Specify which fields display as columns on the related list, the order in which they appear, and the sort order of the records in the related list. In Professional, Enterprise, Unlimited, and Performance Editions, you can also opt to apply the column information to other page layouts for the same type of object.
- Specify which standard and custom buttons appear on the related list.

When working with related lists on page layouts, note the following:

- The **View All** button only displays up to 2,000 items in a related list.
- Some related lists aren’t customizable because they link to data rather than store it. Salesforce denotes related lists that aren’t customizable on the page layout.
- You can’t add related lists to the page layouts for the User object.
- You can also enable related list hover links for your organization so that record detail pages include links for each related list at the top of the page. Users can hover the mouse over a related list hover link to display the corresponding related list in an interactive overlay that allows them to quickly view and manage the related list items. Users can also click a related list hover link to jump down to the content of the related list without scrolling down the page.
- In Professional, Enterprise, Unlimited, Performance, and Developer Edition, individual users can customize which related lists display for their personal use. Administrators can overwrite these user customizations and apply the related list configuration in the page layout to all users, even if they already customized their display. To overwrite users’ related list customizations, click **Yes** on the Overwrite Users’ Customized Related Lists popup window, which appears when saving a page layout if you moved or added a related list.
- Related lists show up on the record related information page in Salesforce1.

Custom S-Controls

A page layout can have up to 20 s-controls.

To change the properties of an s-control, double-click the s-control or click its wrench icon () and set the following attributes:

- `width` sets the horizontal size in pixels or a percent.
- `height` sets the vertical size in pixels.
- `show_scrollbars` determines whether the iFrame in which the s-control displays contains scroll bars when necessary.
- `show_label` determines whether the page layout includes the `Label` of the custom s-control. Remove the label to display the s-control in a wider area.

S-controls aren't supported in Lightning Experience.

Sections

You can add and move sections anywhere above the related lists on the page layout. The sections you add can contain fields, s-controls, and blank spaces. In addition, each page layout has a default section that can only contain custom links and blank spaces. You can change the location of the custom link section, but you can't remove it from the page.

The Section user interface element is the second option in the palette when you select the Fields or Custom S-Controls category on the palette.

To change the attributes of a section, double-click the section or select its associated wrench icon (). You can:

- Enter a name for the section. Names of some standard page sections cannot be changed.
- Specify whether the section has one or two columns.
- Specify the order in which users can tab through the items in that section.
- Specify whether the section heading is shown on the detail and edit pages.

Tags

If tags are enabled in your organization, click **Layout Properties** and use the checkboxes to indicate whether personal and public tags are included in the header section of the page layout. Users can't tag a record if neither personal nor public tags are included in the header section. Also, the positioning of personal and public tags in the header cannot be modified.

Tags aren't supported in Lightning Experience.

Visualforce Pages

Visualforce pages can be added to any section on the page layout except for sections reserved for custom links and related lists. A page layout can have up to 20 Visualforce pages.

You can add a Visualforce page to a page layout only if the standard controller on the Visualforce page is set to the object for which you are creating the page layout. If you don't have any Visualforce pages with a standard controller set to that object, the Visualforce Pages category doesn't appear in the palette.

Only Visualforce pages with the `Available for Salesforce mobile apps` checkbox selected will display in Salesforce1.

Mobile-enabled Visualforce pages show up as slightly differently colored elements in the palette than their non-mobile-enabled counterparts. Hovering your mouse over a Visualforce page element in the palette shows whether the Visualforce page is mobile-enabled.

SEE ALSO:

[Guidelines for Using the Enhanced Page Layout Editor](#)

[Customize Page Layouts with the Enhanced Page Layout Editor](#)

Guidelines for Using the Enhanced Page Layout Editor

- You can't rename a page layout if you're using Salesforce Professional Edition.
 - Elements that are already on the page layout still appear on the palette but are inactive. When you click an inactive element on the palette, Salesforce highlights the element on the page layout.
 - Removing a field from a page layout doesn't remove it from the object's compact layout. The two layout types are independent.
 - If the original page layout editor is enabled, users can click the page layout name to access the detail page of the page layout. The enhanced page layout editor doesn't have detail pages, as all the detail page functionality is always available on the enhanced editor. Salesforce displays a read-only version of the enhanced page layout editor to users with the "View Setup" permission.
-  **Note:** The read-only view of the page layout doesn't display field types and lengths in hover details.
- You can edit only certain attributes when you're working with a page layout that was installed from a managed app. Some changes that you make to managed page layouts, such as adding components, work when you're editing the page layout but aren't reflected on the record detail page.
 - You can't choose **Mini Console View** for the Close Case layout, Log a Case page, or View Cases page layouts on the Self-Service Portal. You can't choose **Mini Console View** for opportunity team page layouts.
 - You can't define mini page layouts for the Close Case layout, Log a Case page, or View Cases page layouts on the Self-Service Portal. You can't define mini page layouts for opportunity team page layouts.
 - The Custom Links, Custom S-Controls, and Visualforce Pages categories only appear in the palette if you have defined those types of elements for the object for which you are defining a page layout. When you create a custom link for an object, you add it to the Custom Links section on that object's page layout. In non-English Salesforce organizations, the "Custom Links" section title is not translated from English automatically for the Territory and Territory Model objects, but you can edit the section title.
 - The Canvas Apps category appears in the palette only if you defined at least one canvas app with a location of Visualforce Page.
 - The Components category appears in the palette only if the available components are supported by the object for which you are defining a page layout. For example, the Twitter component is supported only on account, contact, and lead page layouts.
 - Page layouts for the user object only include custom fields, custom links, s-controls, and Visualforce pages. Tagging, related lists, custom buttons, and standard field customizations are *not* included on page layouts for the user object. Also, field-level security is only available for custom fields on the user object. Only standard Chatter actions (Post, File, Link, Poll, and Thanks) appear on the user profile page, regardless of the actions in the User page layout.
 - Chatter group layout changes affect the Salesforce1 app only. Changes to the group publisher (actions and layout) reflect in both the full Salesforce site and the Salesforce1 app.
 - If a dependent lookup is above its controlling field on a page layout, make its lookup filter optional or redesign the page layout. Placing a required dependent lookup above its controlling field on a page layout could confuse users who typically start from the top of the page when entering data.
 - You can define mini page layouts for the user object; however, you cannot add standard fields or related lists. Also, a customized mini page layout won't display in the Agent console.
 - When editing a person account page layout:
 - If you add `Shipping Address` next to `Billing Address` in the Address Information section, a link displays on the person account edit page that allows you to copy the billing address to the shipping address. Also, an equivalent link appears if you add `Other Address` to the Address Information section.
 - Contact fields and related lists are available on person account page layouts, but contact custom links and custom buttons are not.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To customize page layouts:

- "Customize Application"

To view page layouts:

- "View Setup"

- Salesforce recommends creating no more than 200 page layouts. Although there is no limit, it can be difficult to manage your page layouts if you have more than 200.
- This table lists standard objects that have checkboxes that are specific to page layouts for that object. To configure how Salesforce displays the checkboxes, click **Layout Properties** when customizing the page layout. Use the `Select by default` checkbox associated with a checkbox if you want Salesforce to automatically select the option when a user accesses the edit page.

Object	Checkboxes
Account	<p>Evaluate this account against territory rules on save checkbox — Displays the Evaluate this account against territory rules on save checkbox on account edit pages.</p> <p>Territory assignment rules run automatically when the <code>Select by default</code> checkbox is selected.</p> <p>If both <code>Show on edit page</code> and <code>Select by default</code> are selected, users can uncheck the Evaluate this account against territory rules on save checkbox on the account edit page, and territory assignment rules will not be run.</p>
Case	<ul style="list-style-type: none"> – Case assignment checkbox — Displays the Assign using active assignment rules checkbox on case edit pages. <p>Case assignment rules run automatically when the <code>Select by default</code> checkbox is selected.</p> <p>If both <code>Show on edit page</code> and <code>Select by default</code> are selected, the assignment checkbox is selected by default, but users can deselect it to override the assignment rule.</p> <ul style="list-style-type: none"> – Email notification checkbox — Displays the Send notification email to contact checkbox on case edit pages.
Case Close	<ul style="list-style-type: none"> – Solution information section — Displays the solution information section on the case close edit pages. – Notify Contact — Displays the Notify Contact checkbox on case close edit pages.
Lead	<p>Lead assignment checkbox — Displays the Assign using active assignment rule checkbox appears on the lead edit page.</p> <p>Lead assignment rules run automatically when the <code>Select by default</code> checkbox is selected.</p> <p>If both <code>Show on edit page</code> and <code>Select by default</code> are selected, the assignment checkbox is selected by default, but users can deselect it to override the assignment rule.</p>

Person Account

Evaluate this account against territory rules on save checkbox — Displays the Evaluate this account against territory rules on save checkbox on person account edit pages.

Territory assignment rules run automatically when the Select by default checkbox is selected.

If both Show on edit page and Select by default are selected, users can uncheck the Evaluate this account against territory rules on save checkbox on the account edit page, and territory assignment rules will not be run.

Task

Email notification checkbox — Displays the Send Notification Email checkbox appears on the task edit page.

Note: A user's personal preference for defaulting the state of the checkbox takes precedence over the organization-wide setting.

Customizing Home Tab Page Layouts

You can customize the Home tab to include components such as sidebar links, a company logo, a dashboard snapshot, or custom components that you create. A dashboard snapshot is a clipping of the top row of a dashboard's components. Just like other tabs, you can also assign different home page layouts to different users based on profile.

You can add components to the sidebar or the main panel. You can also determine if custom sidebar components appear only on the Home tab or on all Salesforce pages.

To start customizing your home page layouts, see:

- [Create Custom Home Page Components](#) on page 3708
- [Design Home Page Layouts](#) on page 3709
- [Assigning Home Tab Page Layouts to Profiles](#) on page 3711

EDITIONS

Available in: Salesforce Classic

Create Custom Home Page Components

Before you begin:

- If you're creating custom link components, define your Home tab custom links first. See [Understanding Custom Buttons and Links](#) on page 4582.
 - If you're creating an image component, upload your image to the Documents tab first.
 - If you're creating a Visualforce Area component, create your Visualforce page first.
1. From Setup, enter *Home Page Components* in the **Quick Find** box, then select **Home Page Components**.
 2. Click **New**.
 3. Enter a name for the component. For custom links, this name is displayed as the section heading in the sidebar on the Home tab.
 4. Choose the type of component.
 5. Click **Next**.
 - For links, select the appropriate custom links, and then click **Add**.
 - For images, click **Insert an image**, choose the document folder, and then select the image file. Note that the image file must be in a public folder and the **Externally Available** checkbox must be selected on the document's properties so that users can view the image.
 -  **Tip:** Keep your image size smaller than 20 KB for optimum performance. If your image is too large to fit in the insert window, use an image editor to resize the image. Save your image in `.gif`, `.png`, or `.jpeg` format to reduce file size.
 - For an HTML Area component, choose where to display it—in the wide or narrow column—and then enter your content in the box below.
 -  **Note:** HTML Area home page components don't support JavaScript, CSS, iframes, and some other advanced markup. To use JavaScript or other advanced HTML elements in your home page component, we recommend that you use a Visualforce Area component instead.
 - For a Visualforce Area component, choose where to display it—in the wide or narrow column—then select the Visualforce page, and assign it a height.

6. Click **Save**.

After creating the home page component, you need to add it to a home page layout. See [Design Home Page Layouts](#) on page 3709.

-  **Note:** Components in the narrow column are displayed in the sidebar. They aren't displayed in the sidebar on other pages in Salesforce unless you specify that in your user interface settings or by assigning the "Show Custom Sidebar On All Pages" permission.

USER PERMISSIONS

To create or change home page layouts:

- "Customize Application"

Visualforce Area Home Page Component Overview

Use Visualforce Area home page components to add dynamic content to your home page. For example, you can present content from partner apps, display charts in conjunction with the Reports and Dashboards REST API, or add a canvas app to the home page.

The Visualforce page that you choose for the component can use a standard or custom controller. You can include JavaScript in your Visualforce page, but because the component is rendered in an iframe on the home page layout, the JavaScript can't interact with the page that contains the component.

Sample Usage

If your Visualforce Area home page component displays in the sidebar, you can dynamically get the record ID and top-level URL of the page that the component is being displayed on by using the `!currentPage` global variable in your Visualforce markup.

Using `!currentPage`, you can access the query string parameters for the page by specifying the `parameters` attribute, after which you can access each individual parameter:

```
!currentPage.parameters.parameter_name
```

The parameters for record ID and top-level page URL are, respectively, `id` and `sfdcIframeOrigin`. For more information, see "Getting Query String Parameters" in the [Visualforce Developer's Guide](#).

Design Home Page Layouts

After creating the components you want displayed on the Home tab, design your home page layouts. You can design your layouts based on your unique organizational and user needs.

1. From Setup, enter *Home Page Layouts* in the Quick Find box, then select **Home Page Layouts**.
2. Click to edit an existing layout or create one. Alternately, select a layout to copy and click **Clone**.
3. If you create a layout, give it a name and then click **Save**.
4. Select the components to display on the layout.
 - To add the Find Articles component, select **Article Search**. This component is only available for Salesforce Knowledge users.
 - To add the Customer Portal component, select **Customer Portal Welcome**. If the My Profile site Visualforce page has been enabled, this component contains a personalized welcome message and a link to the portal user's profile. The My Profile page enables users logged into either your Force.com site, or your Customer Portal from Force.com sites, to update their own contact information. When they make changes to this page, the corresponding portal user and contact records are updated.
 - To allow your users to resume flow interviews that they've paused, select **Paused Flow Interviews**. This component displays only flow interviews that the user has paused.
5. Click **Next**.
6. Customize the order in which the narrow and wide components appear. Move a component by selecting it and using the arrow buttons.

Home Page Components Tips and Considerations

- Standard components without an **Edit** link are read only.
- The components that you select for the narrow column display in the sidebar. They don't display in the sidebar on other pages within Salesforce unless you specify that in your user interface settings. If you only want certain users to view sidebar components on all pages, grant those users the "Show Custom Sidebar On All Pages" permission.
- When editing the standard Messages & Alerts component, enter the text that you want to display to users. If entering HTML code for your message, make sure that it's self-contained, well-formed HTML.
- When editing the standard Custom Links home page component, enter the link text to display to users in the `Bookmark` field. In the `URL` field, enter the complete website address, such as `http://www.yahoo.com`. To link to a Salesforce page, such as a frequently viewed report, enter only the part of the URL after `salesforce.com`, for example, `/000x0000000esq4`. These links always open within the main Salesforce window, not in a popup window.
- The standard Custom Links home page component is a quick way to add links to the sidebar, but it doesn't support merge fields, functions (such as URLFOR), executing JavaScript, or customizable window opening properties. If you need this additional functionality:
 1. From Setup, enter *Home* in the `Quick Find` box, then select **Custom Links**, and then create your home page custom links on that page.
 2. From Setup, enter *Home* in the `Quick Find` box, then select **Home Page Components**, and then create a custom home page component of type Links on that page that includes the custom links that you created in the first step. Note that creating a custom home page component for your links does not change the visual styling for your end users.
- The `Dashboard Snapshot` component displays the last dashboard the user accessed. Users can view a dashboard snapshot on their Home tab if they have access to at least one dashboard.
- When designing home page layouts for your Customer Portal, we recommend adding the following components: Search, Solution Search, Recent Items, Customer Portal Welcome, and a custom HTML Area component that includes your corporate branding in the wide column.

Assigning Home Tab Page Layouts to Profiles

Your home page layouts are only visible to users after you assign them to a user profile.

1. From Setup, enter *Home Page Layouts* in the **Quick Find** box, then select **Home Page Layouts**.
2. Click **Page Layout Assignment**.
3. Click **Edit Assignment**.
4. Choose the appropriate page layout for each profile.
Initially, all users, including Customer Portal users, are assigned to the Home Page Default layout.
5. Click **Save**.

 **Tip:** Users can customize the dashboard settings on their Home tab in their personal settings.

Setting Page Layouts and Field-Level Security

Use field-level security as the means to restrict users' access to fields; then use page layouts primarily to organize detail and edit pages within tabs. This reduces the number of page layouts for you to maintain.

 **Note:** Field-level security doesn't prevent searching on the values in a field. When search terms match on field values protected by field-level security, the associated records are returned in the search results without the protected fields and their values.

For Personal, Contact Manager, Group, and Professional Editions

1. Create custom fields.
2. Create any custom buttons or links.
3. Create any custom s-controls.
4. Define page layouts. All users automatically use the same page layout for each tab.
5. Set the related objects and the mini page layouts that display in the console.
6. Define search layouts. All users use the same search layouts.

For Enterprise, Unlimited, Performance, and Developer Editions

1. Create custom fields.
2. Create any custom buttons or links.
3. Create any custom s-controls.
4. Create any custom profiles.
5. Create record types for different business scenarios.
6. Assign which record types are available to users with different profiles.
7. Set the field-level security for each profile to restrict users' access to specific fields.
8. Define page layouts to organize your pages.
9. Set the related objects and the mini page layouts that display in the console.
10. Assign page layouts to users based on profiles and record types.

EDITIONS

Assigning Page Layouts

After defining page layouts, assign which page layouts users see. A user's profile determines which page layout he or she sees. In addition, if your organization is using record types for a particular tab, the combination of the user's profile and the record type determine which page layout is displayed.

You can assign page layouts from:

- The object's customize page layout or record type page
- The original or enhanced profile user interface.

To verify that users have the correct access to fields based on the page layout and field-level security, you can check the field accessibility grid.

[Assigning Record Types and Page Layouts in the Enhanced Profile User Interface](#)

[Record Types](#)

[Page Layouts and Field-Level Security](#)

Assign Page Layouts from a Customize Page Layout or Record Type Page

1. From the management settings for the appropriate object, go to Page Layouts or Record Types.
2. Click **Page Layout Assignment**.
3. Click **Edit Assignment**.
4. Use the table to specify the page layout for each profile. The table displays the page layout assignments for each profile. If your organization uses record types, a matrix displays a page layout selector for each profile and record type.

When selecting page layout assignments:

- Click a cell, column, or row heading to select all the table cells in that column or row.
- Press SHIFT+click to select multiple adjacent table cells, columns, or rows.
- Press CTRL+click to select multiple nonadjacent table cells, columns, or rows.
- Click any cell and drag to select a range of cells.
- Click **Next** or **Prev** to view another set of record types.

Selected page layout assignments are highlighted. Page layout assignments you change are italicized until you save your changes.

5. If necessary, select another page layout to assign from the `Page Layout To Use` drop-down list and repeat the previous step for the new page layout.

Edit Multi-Line Layouts for Opportunity Products

You can customize the columns that display when you click **Edit All** in the Products related list of an opportunity detail page.

1. From the object management settings for opportunity products, go to Page Layouts.
2. Next to the name of an opportunity product page layout, click **Edit**.
3. Click **Edit Multi-Line Layout**.
4. Move fields between Available Fields and Selected Fields.
 - To customize which fields display in the layout, select one or more fields in Available Fields and click **Add** or **Remove**.
 - To sort fields in the layout, select one or more fields in Selected Fields and click **Up** or **Down**.
 - To select multiple fields individually, use CTRL+click.
 - To select multiple fields as a group, use SHIFT+click.
5. Click **Save** to apply your changes.

Build Page Layouts for Custom Objects

Page layouts define which fields users can view and edit when entering data for a custom object record. You can use the default page layout that is created automatically when you create a custom object. You can also build your own page layout with related lists and custom links. If you do not use any page layout with your custom object, you can still interact with it by using the Force.com API to manage custom data or build a custom user interface.

How Page Layouts Work in Salesforce1

Use the enhanced page layout editor to customize the layout of an object's record detail pages, configure actions, and adjust which fields and related lists appear in Salesforce1.

In Salesforce1, page layouts drive these areas of the mobile experience.

Record Related Information and Detail Pages

When you view a record in Salesforce1, you see the fields, Visualforce pages, and related lists that are based on the record type and the user's profile. Related lists show up as single-line cards containing the name of the page or related list. Tapping the related list card displays its details.

Mobile Cards

You can add expanded lookups, components, canvas apps, and Visualforce pages to the Mobile Cards section of your page layout to have them show up as mobile cards in Salesforce1. The elements you place in this section don't show up on a record's detail page in the full Salesforce site. They appear only on the record's related information page in Salesforce1.

 **Note:** In organizations that are created after Spring '14, the Twitter component is added by default to the Mobile Cards section of page layouts for objects that support it.

EDITIONS

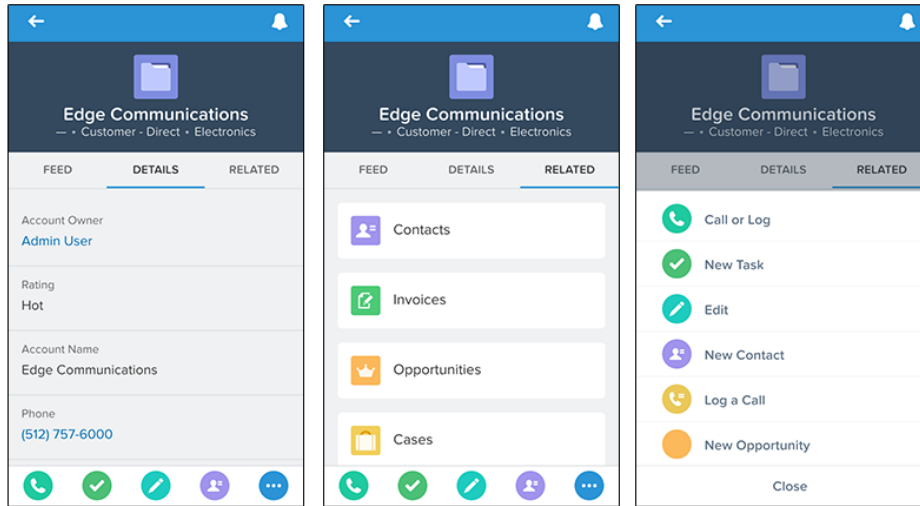

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except Database.com

Actions

In Salesforce1, actions in the Salesforce1 and Lightning Experience Actions section of a page layout appear in the action bar and action menu on the object’s record pages.

Here are the record detail page, related information page, and action menu for a sample account, Edge Communications:

Page Layouts in Lightning Experience

When you customize your object record pages in Salesforce Classic, they affect the content of object record pages in Lightning Experience. However, in Lightning Experience, the page elements display differently, and some aren’t supported.

If you’re in an organization that supports multiple page layouts, you can create page layouts directly from the Page Layouts related list on any object in the Object Manager. You can also edit or delete an object’s page layouts by clicking on a page layout in the Page Layouts related list.

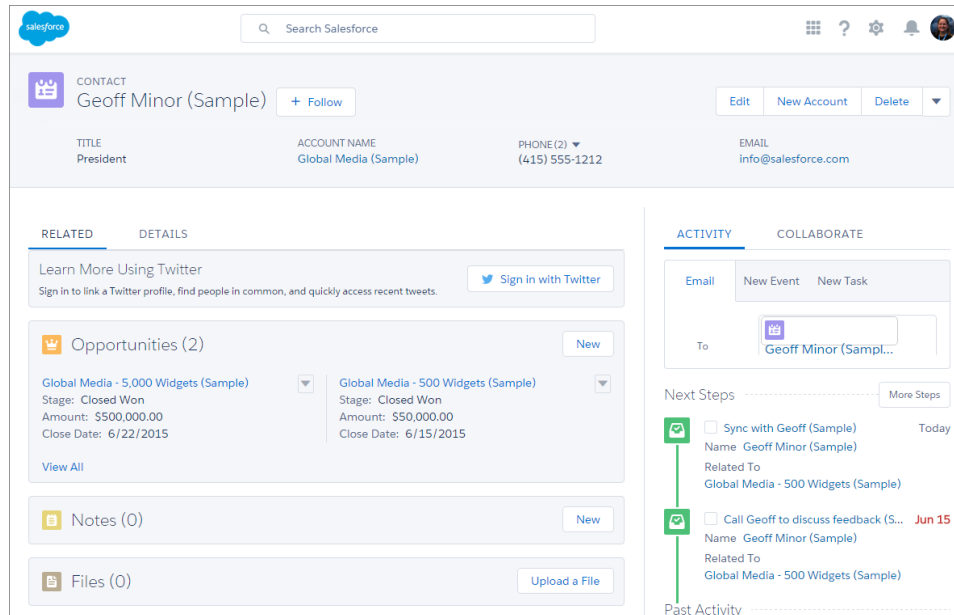

Here’s a sample contact record in Lightning Experience. The highlights panel, which contains key fields for the record, is the only part of a record page that you can’t customize using the page layout editor. The fields in the highlights panel are customized using a compact layout.

EDITIONS

Available in: Lightning Experience

Page layouts are available in: **All Editions**

Creation and deletion of page layouts is available in: **Enterprise, Performance, Unlimited, and Developer Editions**

These page layout elements are supported in Lightning Experience.

Actions

Actions display in different places, such as the highlights panel, Activity tab, and the Collaborate tab. The actions are derived from the list of actions in the Salesforce1 and Lightning Experience Actions section of the page layout. Some actions aren't supported in Lightning Experience.

For more information, see [Actions in Lightning Experience](#) on page 4567.

Canvas Apps

Canvas apps are supported in Lightning Experience.

Custom Links

Custom links display under the Details tab.

Fields

Fields display under the Details tab. You can remove or reorder fields on a page layout only via the page layout editor.

Related Lists

Related lists are included as Lightning components in Lightning Experience. The first eight related lists show related list buttons, the first several records from the list, and a link to open the full list of records. For any additional related lists, only the list name appears in the card. Users can still work with these related lists—simply click the related list name to access the full list. Here, users can see records in the list and use related list buttons (such as **New**) or row-level record actions. Not all related lists are supported in Lightning Experience. For example, the *Object* History related list isn't supported.

Standard and Custom Buttons

Standard and custom buttons are treated as actions in Lightning Experience, just like in Salesforce1.

Important: Custom buttons that point to a URL or call JavaScript aren't supported in Lightning Experience.

Visualforce Pages

Visualforce pages that you've added to the page layout appear under the Details tab. Only Visualforce pages with `Available for Salesforce mobile apps and Lightning Pages` enabled display in Lightning Experience.

Visualforce pages that have been put into the Mobile Cards section as components don't appear in Lightning Experience.

These page layout elements aren't supported in Lightning Experience:

- Blank spaces
- Expanded lookups
- Mobile cards

Note: The Twitter card that you see on account, contact, and lead record pages in Lightning Experience isn't the same as the Twitter component available as a mobile card in the page layout editor. The Twitter card in Lightning Experience is a Lightning component. You must have Social Accounts and Contacts enabled for it to appear.

- S-controls
- Sections
- Tags

Note: You can't use the enhanced page layout editor to customize the layout of Lightning Experience record home pages. All users see the same record layout in Lightning Experience, regardless of profile or record type.

Tips for Optimizing Page Layouts for Salesforce1

Here are some tips and tricks for making your existing page layouts more mobile-friendly.

Page layouts containing dozens of fields and lots of related lists might be manageable when viewing records on a computer screen, but on a small mobile device, viewing that same record can be overwhelming. People accessing information using a mobile device are looking for a quick way to get what they need, and making your users sift through hundreds of fields and related lists just doesn't make sense.

When optimizing a page layout, consider:

- What are the important things to see at a glance?
- What are the important moments for your users when they're working in Salesforce1?
- What actions or processes can you automate so that your users don't have to manually do them?

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except Database.com

The Key: Organize and Minimize Fields

- Use sections to organize information logically, putting the most important things at the top of the page so they show up first. Your users don't want to search for fields individually. Organizing similar fields in sections will help your users find what they need. They can then easily scroll down the page to the section they care about.
- For accounts, contacts, and leads, you don't need to put phone or email fields near the top. They're already quickly accessible via the  and  icons on each record page's action bar.
- You don't need to keep fields in one column, as the page will render dynamically based on the device that's viewing it. A phone will reorder the fields into a single column, and a tablet or desktop will show two columns.
- Put the most important fields into the compact layout—which drives record highlights and record preview cards in Salesforce1—so they're available right up front, and so your mobile users don't have to drill into the record detail. We'll get into compact layouts in more detail soon.
- Keep the number of required fields to a minimum. Setting a field to required means it must appear on the detail page of all page layouts, so consider whether each field is truly required. You might have to convince stakeholders that a field isn't actually necessary for a record to be saved.
- If available in your organization, think about using record types so that fields that aren't common to all records don't have to appear on all records.
- To reduce the number of fields on a screen, consider using default values for new records instead of having the user enter the data.

Manage Mobile Cards in the Enhanced Page Layout Editor

Add expanded lookups, components, and Visualforce pages to the Mobile Cards section of your page layout to have them show up as mobile cards in Salesforce1.

The items you place in the Mobile Cards section don't show up on a record's detail page in the full Salesforce site but only on the record's related information page in Salesforce1.

You can add these types of elements to the Mobile Cards section of a page layout.

- Components
- Expanded lookups
- Visualforce pages
- Canvas apps

Some standard objects have mobile cards that are added for you by default. Customize the page layout to remove them or add additional cards.

1. [Access the page layout editor](#).
2. From the Expanded Lookups, Components, Visualforce Pages, or Canvas Apps categories, drag an element into the Mobile Cards section.
3. Save the page layout.

After saving the layout, the items you added show up immediately in Salesforce1. You may need to refresh to see the changes.

Customize Related Lists

You can customize the buttons, columns displayed, column order, and record sort order of related lists on record detail pages in Salesforce and the Salesforce Customer Portal.

1. Access the page layout editor.
2. Double-click a related list on the layout to edit it. If you are using the enhanced page layout editor, you can also click the wrench icon ().

 **Note:** You can't customize the History related list because it doesn't store data. The History related list links to data stored elsewhere.

3. To customize the fields that display in the related list:
 - Select one or more fields and use the arrows to add or remove the fields to the related list columns on the page layout, and to define the order in which the related list columns display. You can include up to 10 fields per related list.

 **Note:** You can't move the first field of a related list, because it is a unique identifier for the record.

You can add custom fields of the long text area type to a related list. However, you can't add some standard fields of the long text area type. For example, you can't add the Description field on an Opportunity to a related list.

- Use CTRL+click to select multiple fields individually.
- Use SHIFT+click to select multiple fields as a group.
- Select a field from the **Sort By** drop-down list to sort the items in the related list, which will be displayed in ascending order unless you select *Descending*. The default sort order varies per record. The **Sort By** drop-down is not available for activities and opportunity products.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except Database.com

USER PERMISSIONS

To customize page layouts:

- "Customize Application"

To view page layouts:

- "View Setup"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** Editions except **Database.com**

USER PERMISSIONS

To customize related lists:

- "Customize Application"

- If necessary, select additional page layouts to apply your related list customizations to. Only layouts that include this related list appear in the list. Layouts that include related lists with the same customizations as the current layout had when you opened are selected by default.

Lookup fields are not available for display on their corresponding lookup related list. For example, the case lookup field on an account page layout is not available when editing the cases related list.

4. To customize which standard buttons display in the related list, select or deselect the checkbox next to any standard button name.

 **Note:** To view the buttons in the enhanced page layout editor, click the plus sign (+) in the Buttons section.

5. To customize which custom buttons display in the related list:

- To add or remove a custom button, select the button and click **Add** or **Remove**.
- Sort custom buttons by selecting them and clicking **Up** or **Down**.

The custom button must be defined for the object contained in the related list, instead of the parent object, and the button Type must be List Button. For example, to display a custom button on the Contacts related list of an account, define the custom button for contacts, not accounts.

6. If necessary, click **Revert to Defaults** to undo any customizations and use the default Salesforce settings in the related list.
7. Click **OK** to store your customizations. Changes are not saved until you click **Save** on the page layout.
8. Select the `Overwrite users' customized related lists` to apply the related lists in the page layout to all users, even if they have already customized their display.
9. Click **Preview** to review the page layout. From the preview in Enterprise, Unlimited, Performance, and Developer Editions, select a profile to see how the pages will look for users with different profiles.
10. Click **Save**.

 **Note:** You can enable related list hover links so that record detail pages include links for each related list at the top of the page. Users can hover the mouse over a related list hover link to display the corresponding related list in an interactive overlay that allows users to quickly view and manage the related list items. Users can also click a related list hover link to jump to the content of the related list without scrolling down the page.

[Page Layouts and Field-Level Security](#)

Customize Detail Page Buttons

When customizing page layouts, you can control which standard and custom buttons are displayed and the order in which the custom buttons are shown. To customize the buttons on record detail pages:

1. From the management settings for the object whose page layout you want to customize, go to Page Layouts.
2. Click **Edit** next to the page layout you want to customize.
3. Do one of the following.
 - In the original page layout editor, double-click the Detail Page Buttons item in the Button Section.
 - To hide any standard button, deselect the checkbox next to the button name.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To customize detail page buttons:

- "Customize Application"

- To add or remove a custom button, select the button in the Available Buttons list, and click **Add** or **Remove**.
 - Sort custom buttons by selecting them and clicking **Up** or **Down**.
 - To undo your customizations and restore default settings, click **Revert to Defaults**.
 - Click **OK** to close the popup when you are done.
- In the enhanced page layout editor, select the Buttons category on the palette and drag one or more buttons from the palette to the buttons section on the page layout. Standard buttons must go in the standard buttons area, and custom buttons must go in the custom buttons area. To remove a standard or custom button from the page layout, drag the button to the palette.
4. Click **Save** on the page layout.
 5. Click **Save**.

Customize Page Layouts with the Original Page Layout Editor

The original page layout editor allows you to customize page layouts for detail and edit pages in Salesforce, the Self-Service Portal, and the Salesforce Customer Portal.

 **Note:** Salesforce recommends using the enhanced page layout editor instead of the original page layout editor.

1. Access the page layout editor.
 - [Edit Page Layouts for Standard Objects](#)
 - [Edit Page Layouts for Custom Objects](#)
2. If tags are enabled, specify whether personal and public tags should be included in the header section of the page layout. Users can tag a record only if personal or public tags are included here.
 - To add personal or public tags, select Header Items from the View drop-down list and then drag the Personal Tags or Public Tags items to the header section. You can't change the order in which personal and public tags appear when both are in the header section at the same time.
 - To remove tags, drag the Personal Tags and Public Tags items from the header section to the area under the View drop-down list.
3. To customize buttons, double-click **Detail Page Buttons** in the Button section.
 - To hide any standard button, deselect the checkbox next to the button name.
 - To add or remove a custom button, select the button in the Available Buttons list, and click **Add** or **Remove**.
 - To sort custom buttons, select them and click **Up** or **Down**.
 - To undo your customizations and restore default settings, click **Revert to Defaults**.
 - To close the popup, click **OK**.
4. To arrange fields, custom s-controls, Visualforce pages, custom links, and related lists on the layout, select one or more items from the box on the right and drag them to the desired location. You can drag up to 20 s-controls, 20 Visualforce pages, 20 expanded lookups, and 100 related lists onto a page layout. There are no limits on fields and custom links.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To customize page layouts:

- "Customize Application"

- To select multiple items individually, use CTRL+click.
- To select multiple items as a group, use SHIFT+click..

**Note:**

- You can add a Visualforce page to a page layout only if the standard controller on the Visualforce page is set to the object for which you are creating the page layout. If you don't have any Visualforce pages with a standard controller set to that object, the Visualforce Pages category doesn't appear in the palette.
- Items that are not in the page layout are displayed in the scrolling box on the right-hand side.
- Use the legend to determine what fields are required, dependent, controlling, or have other attributes that may affect your page layout decisions.

5. To set which fields are required and read only, select one or more fields and click **Edit Properties**.

- The field properties of some standard fields cannot be changed. Custom fields can be changed only if they are not universally required fields.
- Fields marked as read only are always editable by administrators and users with the "Edit Read Only Fields" permission.
- If you make a picklist field read only, all new records will contain the default value for that picklist.
- Auto-number fields are always read only.
- If you mark the opportunity `PROBABILITY` field as read only, the `PROBABILITY` value will still be updated automatically when a user changes the `STAGE` value of an opportunity.
- In Enterprise, Unlimited, Performance, and Developer Editions, field-level security settings override any field properties you set here if the field-level security is more restrictive than the page layout setting.

6. To change the properties of an s-control or Visualforce page, double click it and set the following attributes.

- `width` sets the horizontal size in pixels or a percent.
- `height` sets the vertical size in pixels.
- `show_scrollbars` determines whether the iFrame in which the s-control displays contains scrollbars when necessary.
- `show_label` determines whether the page layout includes the `Label` of the custom s-control. Remove the label to display the custom s-control in a wider area.

7. To organize the page using sections, click **Edit** next to an existing page section, or click **Create New Section** to create a new page section.

- Enter a name for the section. Note that names of some standard page sections cannot be changed.
- Set whether the section should have one or two columns.
- Set the order in which users can tab through the items in that section.
- Set whether the section name should be shown on the detail and edit pages.

8. To customize related lists on the page layout, double-click a related list in the Related List section.

- To add or remove fields, select one or more fields and use the arrows to add or remove them to the related list columns on the page layout and to define the order in which the related list columns display. You can include up to 10 fields per related list.
- To select multiple fields individually, use CTRL+click.
- To select multiple fields as a group, use SHIFT+click.
- To sort the items in the related list, select a field from the Sort By drop-down list. Items are displayed in ascending order unless you select `Descending`. The default sort order varies per record. The Sort By drop-down is not available for activities and opportunity products.
- If necessary, select additional page layouts to which your related list customizations will apply.

- To customize which standard buttons display in the related list, select or deselect the checkbox next to the button name.
 - To customize which custom buttons display in the related list, select the button and click **Add** or **Remove**. To sort custom buttons, select them and click **Up** or **Down**.
-  **Note:** To create a custom button for the related list, see [Define Custom Buttons and Links](#). The custom button must be defined for the object contained in the related list, instead of the parent object, and the button `Type` must be List Button. For example, to display a custom button on the Contacts related list of an account, define the custom button for contacts, not accounts.

Some related lists are not customizable because they link to data rather than store it. You can move your cursor over any related list section to see if it is customizable. Also, lookup fields are not available for display on their corresponding lookup related list. For example, the case lookup field on an account page layout is not available when editing the cases related list.

-  **Note:** You can enable related list hover links so that record detail pages include links for each related list at the top of the page. Users can hover the mouse over a related list hover link to display the corresponding related list in an interactive overlay that allows users to quickly view and manage the related list items. Users can also click a related list hover link to jump to the content of the related list without scrolling down the page.

9. To apply the related lists in the page layout to all users, even if they have already customized their display, select `Overwrite users' customized related lists`.
10. To review the page layout, click **Preview**. From the preview in Enterprise, Unlimited, Performance, and Developer Editions, select a profile to see how the pages will look for users with different profiles. Note that most related lists' columns preview without data.
11. Click **Save** to finish. Alternatively, click **Quick Save** to save and continue editing the page layout.

In Professional, Enterprise, Unlimited, Performance, and Developer Editions:

- To choose which related records display in the Console tab's mini view, click **Mini Console View**.
- To define the mini page layouts of the records that appear in the Console tab's mini view, click **Mini Page Layout**.

-  **Note:** You cannot define mini console views or mini page layouts for the Close Case Layout or the Log a Case Page and View Cases Page layouts on the Self-Service Portal.

In Enterprise, Unlimited, Performance, and Developer Editions:

- You can assign page layouts for different profile and record type combinations.
- You can set field-level security to restrict field access further.

[Page Layouts](#)

Notes on Using the Original Page Layout Editor

- When customizing page layouts for tasks, you can select the following checkboxes. (These options are unavailable when user control over task assignment notifications is enabled.)
 - `Show Task Email Notification checkbox` displays the `Send Notification Email` checkbox when users create or edit a task.
 - `Select Task Email Notification checkbox by default` selects the `Send Notification Email` checkbox by default when users create or edit a task.

EDITIONS

Available in: **Salesforce Classic**

Available in all editions

Note that a user's personal preference for defaulting the state of the checkbox takes precedence over the organization-wide setting.

- When customizing page layouts for cases, you can select the following checkboxes. (These options are unavailable when user control over task assignment notifications is enabled.)
 - `Show on edit page Case Assignment checkbox` displays the `Assign using active assignment rules` checkbox when users create or edit a case.
 - `Default Case Assignment checkbox` automatically runs case assignment rules.

If both `Show on edit page` and `Select by default` are selected, the assignment checkbox is selected by default, but users can deselect it to override the assignment rule.
 - `Show Case Email Notification checkbox` displays the `Send Notification Email` checkbox when users create or edit a case.
 - `Select Case Email Notification checkbox by default` selects the `Send Notification Email` checkbox by default when users create or edit a case.
- Page layouts for the user object only include custom fields, custom links, s-controls, and Visualforce pages. Tagging, related lists, custom buttons, and standard field customizations are *not* included on page layouts for the user object. Also, field-level security is available only for custom fields on the user object.
- You can define mini page layouts for the user object; however, you cannot add standard fields or related lists. Also, a customized mini page layout won't display in the Agent console.
- In the organization-wide Data Import Wizard for accounts, contacts, and leads, administrators have access to import into any field, even if a field is hidden or read only in their page layout or field-level security settings. Individual users can import only into the fields that are accessible to them via their page layout or field-level security settings.
- In Personal, Contact Manager, Group, and Professional Editions, page layouts control which fields users can access in related lists, list views, reports, Connect Offline, email and mail merge templates, custom links, and when synchronizing data. In Enterprise, Unlimited, Performance, and Developer Editions, this access is controlled by field-level security.
- In Professional, Enterprise, Unlimited, Performance, and Developer Edition, individual users can customize which tabs and related lists display for their personal use.
- When editing a person account page layout, if you add `Shipping Address` next to `Billing Address` in the Address Information section, a link will display on the person account edit page that allows you to copy the billing address to the shipping address. Also, an equivalent link appears if you add `Other Address` to the Address Information section.
- Some items can only be moved to certain sections on the page layout. For example, you can drag a custom s-control to any field section on the page layout but not a related list section or button section.
- Create the appropriate buttons before editing your page layout. For example, create an account custom button for the detail page and a contact custom list button before putting them both on an account page layout.
- If you use the original page layout editor to view a page layout that was created in the new page layout editor, the original page layout editor will show any blank spaces you added. You cannot move or add blank spaces in the original page layout editor, but you can remove them by dragging them to the box on the right.

Compact Layouts

Compact layouts are used in Salesforce1 and Lightning Experience to display a record's key fields at a glance.

In the full Salesforce site, compact layouts determine which fields appear in the Chatter feed item that appears after a user creates a record with a quick action.

 **Note:** To avoid inadvertent sharing of information through the feed, the Task page layout determines the fields displayed in the Chatter feed items for tasks created using a quick action.

In Salesforce1, the first four fields that you assign to a compact layout appear in:

- An object's record highlights area
- Expanded lookup cards on a record's related information page

In Lightning Experience, the first five fields that you add to a compact layout display in an object's record highlights panel.

 **Note:** If a user doesn't have access to one of the fields that you assign to a compact layout, the next field on the layout is used.

If you don't create custom compact layouts for an object, all the object's record highlight fields, preview cards, and action-related feed items are driven by a read-only, system default compact layout that contains a predefined set of fields. After you create one or more custom compact layouts, you can set one as the primary compact layout for the object. The primary compact layout is then used as the default for that object.

If you have record types associated with an object, you can override the primary compact layout assignment and assign specific compact layouts to different record types.

Compact layouts support all field types except:

- text area
- long text area
- rich text area
- multi-select picklist

Available in: **All** editions except **Database.com**

Create Compact Layouts

Use compact layouts to customize the fields that display for object records when viewed in Salesforce1 and Lightning Experience.

The first four fields on your compact layout populate the record highlights section at the top of each record view in Salesforce1. The record highlights section in Lightning Experience uses the first five fields on the compact layout.

1. From the management settings for the object that you want to edit, go to Compact Layouts.
2. Create a new compact layout and give it a label.
3. Add up to 10 fields.

 **Tip:** Put the object's **Name** field first to provide context for your users when they view a record.

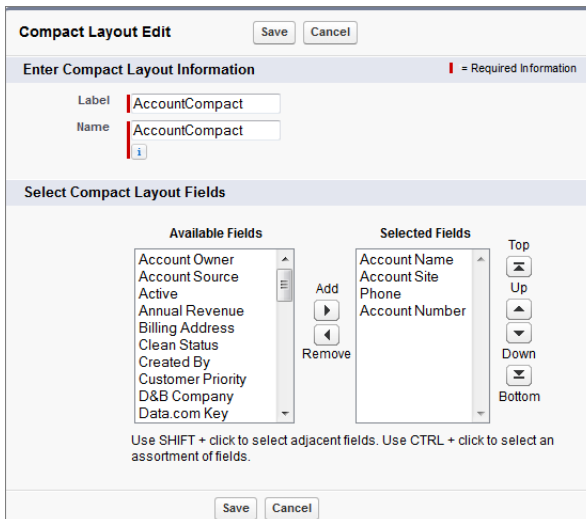

4. Sort the fields by selecting them and clicking **Up** or **Down**.

The order you assign to the fields determines the order in which they display. We recommend putting the object **Name** first.

5. Save the layout.

6. To set the compact layout as the primary compact layout for the object, click **Compact Layout Assignment**.

 **Example:** This image shows a sample edit compact layout page for the standard Account object:

Here is the detail page for a sample account in the Salesforce1 mobile app. You can see that the account's name, site, phone number, and account number are concisely displayed at the top of the page.

[Notes on Compact Layouts](#)

[Compact Layouts](#)

Assign Compact Layouts to Record Types

If you don't create custom compact layouts for an object, all the object's record highlight fields, preview cards, and action-related feed items are driven by a read-only, system default compact layout that contains a predefined set of fields. After you create one or more custom compact layouts, you can set one as the primary compact layout for the object. The primary compact layout is then used as the default for that object. If you have record types associated with an object, you can override the primary compact layout assignment and assign specific compact layouts to different record types.

1. From the management settings for the object that you want to edit, go to Compact Layouts.

Tip: For Salesforce Knowledge articles, from Setup, enter *Knowledge Article Types* in the Quick Find box, then select **Knowledge Article Types**, click the name of an article type, then scroll down to the Compact Layouts related list.

2. Click **Compact Layout Assignment**.
3. Select a compact layout to use as the primary compact layout for this object.
4. In the Record Type Overrides section, select one or more record types to which you want to assign a compact layout.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To customize compact layouts:

- "Customize Application"

To view compact layouts:

- "View Setup"

If you don't have record types set for the object, you won't see this section. If you don't set any record type overrides, all record types use the object's primary compact layout by default. Press SHIFT + click or click and drag to select a range of adjacent cells. Press CTRL + click to select individual, non-adjacent cells.

Note that some record types in the list might be inactive. You can assign a compact layout to an inactive record type.

5. Select a compact layout from the Compact Layout To Use drop-down list to assign it to the selected cells.
6. Click **Save**.

[Create Compact Layouts](#)

[Notes on Compact Layouts](#)

[Compact Layouts](#)

[Find Object Management Settings](#)

Notes on Compact Layouts

- Changes you make to a compact layout are reflected in both Salesforce1 and Lightning Experience.
- Each record type can have only one compact layout assigned to it. However, a compact layout can be associated with multiple record types.
- Users who don't have access to certain fields in Salesforce won't see them on the compact layout.
- A compact layout must contain at least one field.
- A compact layout can only contain fields from its object, including a formula field that is a cross-object reference to another object.
- Removing a field from a page layout doesn't remove it from the object's compact layout. The two layout types are independent.
- If you change a field on a compact layout to an unsupported type, the field is removed from the compact layout.
- Before you can delete a compact layout that's set as the primary compact layout for the object, you must choose another compact layout to replace it.
- In Salesforce1, tasks automatically show whether a task is open or closed and the due date (depending on a user's access to activity dates). When customizing a task compact layout, you don't need to add these fields to the Selected Fields list.
- Compact layouts aren't available for the Chatter Mobile for BlackBerry or Dashboards for iPad mobile apps.

Select Fields to Display in the Recently Viewed List on Object Home Pages in Lightning Experience

As a Salesforce admin, you can customize the Recently Viewed list that appears on the home page for most standard and custom objects. Choose and order the fields to display so that your users see the information that's most important for your company.

 **Note:** These steps work in Lightning Experience. If you see a navigation bar on the left side of your screen, you're in Lightning Experience. If you see a row of tabs across the top of the screen, you're in Salesforce Classic.

For most list views, your users can select which fields to display and how to order the view columns. However, they can't edit the recent records quick list on object home pages. Only Salesforce admins can select and order the fields to display for the recent records quick list. Admins can't make any other changes to this default list.

1. From Setup, enter *Object Manager* in the **Quick Find** box, then select **Object Manager**.
2. Click the label name of the object for the Recently Viewed list you want to modify.
3. From the menu of links at the top of the page, click **Search Layouts**.
4. In the far right of the Search Results column, click  and select **Edit**.
5. To add columns to the Recently Viewed list, select one or more fields from Available Fields and click **Add**. To remove columns, select one or more fields from Selected Fields and click **Remove**.
6. Order columns by selecting one or more fields from Selected Fields and clicking **Up** or **Down**.
7. Click **Save**.

 **Example:** Your users collaborate on opportunities. To make it easy to see who worked on a recent opportunity last, select **Last Modified By** from the Available Fields list. Click **Add** to move it to Selected Fields. Now this information appears on the Recently Viewed list on the Opportunities home page.

Customize Search Layouts

Customize which fields display for users in search results, search filter fields, lookup dialogs, the recent records lists on tab home pages in Salesforce Classic, and in lookup phone dialogs for Salesforce CRM Call Center.

You can specify a different set of fields to show in each search layout. The settings apply to all users in your organization and Salesforce Customer Portal.

You can also customize which buttons display in custom list views and search results. You can hide a standard list view button or display a custom button. Standard buttons aren't available on search result layouts. To display a custom button, create the custom button, giving it the *List Button Display Type*.

1. From the management settings for the appropriate object, go to Search Layouts.
2. Click **Edit** next to the layout you want to customize. Specify a different set of items to display. You can edit search results, lookup dialogs, recent records lists on tab home pages in Salesforce Classic, lookup phone dialogs, list views, and search filter fields.
3. For list view and search results layouts, select the standard or custom buttons you want to display. To hide a standard button on the list view, deselect it. Standard buttons aren't available on search result layouts.
4. Move fields between Available Fields and Selected Fields.

Available in all editions

USER PERMISSIONS

To change search layouts:

- "Customize Application"

- To customize which fields display in the layout, select one or more fields and click **Add** or **Remove**.
- To sort fields in the layout, select one or more fields in Selected Fields and click **Up** or **Down**.
- To select multiple fields individually, use CTRL+click.
- To select multiple fields as a group, use SHIFT+click.
- To customize which items display in the layout, select the item and click **Add** or **Remove**.
- To sort items in the layout, select the item and click **Up** or **Down**.

 **Note:** When editing a search results layout for an object, you can select the **Override the search result column customizations for all users** checkbox. If selected, all user column customizations within your organization are overwritten and restored to the organization-wide default settings.

5. Click **Save**.

SEE ALSO:

[Page Layouts](#)

[Notes on Search Layouts](#)

Notes on Search Layouts

- Search layouts don't apply to Salesforce CRM Content.
- Search layouts don't apply to campaign members, opportunity teams, or account teams.
- The search layout doesn't control which fields are searched for keyword matches. The list of fields searched is the same across Salesforce.
- You can add up to 10 fields to each search layout.
- You can't remove unique identifying fields, such as `Account Name` or `Case Number`, from the search layouts. These fields must be listed first in the order of fields in the search layout.
- You can't add long text fields such as `Description`, `Solution Details`, or custom long text area fields to search layouts.
- All fields are available to be added to the search layout even if some fields are normally hidden for the user customizing the search layout.
- For Enterprise, Unlimited, Performance, and Developer Edition organizations, search layouts don't override field-level security. If a field is included in the search layout but hidden for some users via field-level security, those users do not see that field in their search results.
- For Personal, Contact Manager, Group, and Professional Edition organizations, search layouts override page layout settings. If a field is included in the search layout but hidden in the page layout, that field will be visible in search results.
- The search results layouts for leads, accounts, contacts, and opportunities also apply to the search results displayed when finding duplicate leads.
- Formula fields are not available in search result layouts.
- Don't remove the `Phone` field from any lookup phone dialogs search layout. If you do, users can't use the directory search results to enter a phone number into a SoftPhone dial pad.
- To add a custom button to a list view or search layout, create the custom button for a standard or custom object, giving it the **List Button Display Type**. The custom button will be available in the list view and search result layouts for that object.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To change search layouts:

- "Customize Application"

 **Tip:** In account search results, you can visually differentiate business accounts from person accounts by adding the `Is Person Account` field, which displays as the person account icon ().

You may specify the `Is Person Account` field as the first column in account search layouts. Otherwise, `Account Name` must be the first column.

Setting Up Custom Tabs

Understanding Custom Tabs

Display custom object data or other Web content using custom tabs in Salesforce.

You can create any of these types of custom tabs.

- Custom Object tabs (available only at an app level and not on subtab apps) display the data of your custom object in a user interface tab. Custom object tabs look and function just like standard tabs.
- Custom Web tabs display any external Web-based application or Web page in a Salesforce tab. You can design Web tabs to include the sidebar or span across the entire page without the sidebar.
- Visualforce tabs display data from a Visualforce page. Visualforce tabs look and function just like standard tabs.
- Lightning Page tabs let you add Lightning Pages to the Salesforce1 navigation menu.

Lightning Page tabs aren't available in the full Salesforce site and don't work like other custom tabs in Salesforce. In Salesforce Classic, they don't show up on the All Tabs page when you click the plus icon () that appears to the right of your current tabs. Nor do Lightning Page tabs show up in the Available Tabs list when you customize the tabs for your apps. And Lightning Page tabs aren't available in Lightning Experience either.

- Lightning component tabs make Lightning components available in the Salesforce1 mobile app (via the navigation menu) or in Lightning Experience (via the App Launcher). Lightning components aren't supported in Salesforce Classic.

 **Note:** You must enable My Domain in your org if you want to expose Lightning components via Lightning component tabs.

Visualforce Tabs available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Lightning Page Tabs available in: **All** Editions except **Database.com**

Defining Custom Tabs

Custom tabs display custom object data or other web content embedded in the application.

- **Custom Object Tabs**—For your custom object data
- **Web Tabs**—For other web content
- **Visualforce Tabs**—For Visualforce pages
- **Lightning Component Tabs**—For Lightning components, to include them in the Salesforce1 mobile app (via the navigation menu) or in Lightning Experience (via the App Launcher).
- **Lightning Page Tabs**—For Lightning Pages, to include them in the Salesforce1 navigation menu.

Subtab apps support only Web Tabs and Visualforce Tabs.

Delegated administrators who can manage specified custom objects can also create and customize tabs for those custom objects.

Visualforce Tabs available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Lightning Page Tabs available in: **All** Editions except **Database.com**

USER PERMISSIONS

To create and edit custom tabs:

- “Customize Application”

Create Web Tabs

Build web tabs so that your users can use your web applications or other websites from within the application.

1. From Setup, enter `tabs` in the `Quick Find` box, then select **Tabs**.
2. Click **New** in the Web Tabs related list.
3. Choose a layout for the new tab. The full page width spans across the entire page without the sidebar while the column style allows users to view the sidebar.
4. Click **Next**.
5. Enter a label to display on the tab.
6. Click the `Tab Style` lookup icon to display the Tab Style Selector.

If a tab style is already in use, a number enclosed in brackets [] appears next to the tab style name. Hover your mouse over the style name to view the tabs that use the style. Click `Hide styles which are used on other tabs` to filter this list.

7. Click a tab style to select the color scheme and icon for the custom tab.

Optionally, click **Create your own style** on the Tab Style Selector dialog if you want to create a custom tab style and your organization has access to the Documents tab. To create your own tab style:

- a. Click the `Color` lookup icon to display the color selection dialog and click a color to select it.
- b. Click **Insert an Image**, select the document folder, and select the image you want to use. Alternatively, click **Search in Documents**, enter a search term, and click **Go!** to find a document file name that includes your search term.

 **Note:** This dialog only lists files in document folders that are under 20 KB and have the Externally Available checkbox selected in the document property settings. If the document used for the icon is later deleted, Salesforce replaces it with a default multicolor block icon (.

- c. Select a file and click **OK**. The New Custom Tab wizard reappears.
8. Change the content frame height if necessary.
 9. Optionally, select `Salesforce Classic Mobile Ready` to indicate that the web page displays and functions properly in the Salesforce Classic Mobile app.

Selecting this checkbox adds the tab to the list of available tabs for your Salesforce Classic Mobile configurations. Before mobilizing a web tab, review the Salesforce Classic Mobile tab considerations to ensure that the pages in your web tabs are compatible with mobile browsers.

 **Note:** The `Salesforce Classic Mobile Ready` checkbox is only visible if Salesforce Classic Mobile is enabled for your organization.

10. Optionally, choose a custom link to use as the introductory splash page when users initially click the tab. Don't use a splash page if you plan to mobilize the web tab, as splash pages don't display in the mobile application.
11. Enter a description of the tab, if desired, and click **Next**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Custom Object Tabs and Web Tabs available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Visualforce Tabs available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Lightning Page Tabs available in: **All** Editions except **Database.com**

USER PERMISSIONS

To create and edit custom tabs:

- "Customize Application"

12. Enter the URL or choose the custom s-control that you want to display in the tab. Optionally, copy and paste any merge fields for data that you want dynamically replaced in the link.

 **Note:** Only User, organization, and API merge fields are supported for web tabs.

Click **Preview Web Tab** to display your web tab.

13. For a URL, choose an encoding setting and click **Next**.
14. Add the web tab to the appropriate profiles. Choose Default On, Default Off, or Tab Hidden to determine whether the custom tab is visible to users with that profile. You can change this setting later.
15. Click **Next**.
16. Specify the custom apps that should include the new tab.
17. Check `Append tab to users' existing personal customizations` to apply the tab visibility settings to all users.
18. Click **Save**.

 **Note:** A Web tab or custom link might display a blank page if the embedded site:

- Has been set to deny the loading of its content in a frame.
- Has been set to allow the loading of its content in a frame, only if the same site is delivering the content.
- Contains a mix of secure and unsecure content, and the user's browser has been configured to block mixed active content.

To resolve this, try these workarounds:

- Set your custom link to either open in a new window or display in the existing window without the sidebar or header.
- Move the URL from a Web tab into a custom link instead, and set the URL to either open in a new window or display in the existing window without the sidebar or header.
- If the site you're embedding has an HTTP prefix and mixed active content, try changing the prefix to HTTPS instead. If the embedded site has a valid security certificate and it hasn't blocked itself from being displayed in frames, using HTTPS as the prefix should allow the site to display.

Creating Custom Object Tabs

Define a new tab to display the data stored in your custom object records.

1. From Setup, enter `Tab`s in the `Quick Find` box, then select **Tab**s.
2. Click **New** in the Custom Object Tabs related list.
3. Select the custom object to display in the custom tab. If you have not already created the custom object, click **create a new custom object now** and follow the instructions in [Define a Custom Object](#) on page 3772.

The label of the new tab is the same as the plural version of the custom object label.

4. Click the `Tab Style` lookup icon to display the Tab Style Selector.

If a tab style is already in use, a number enclosed in brackets [] appears next to the tab style name. Hover your mouse over the style name to view the tabs that use the style. Click `Hide styles which are used on other tabs` to filter this list.

5. Click a tab style to select the color scheme and icon for the custom tab.

Optionally, click **Create your own style** on the Tab Style Selector dialog if you want to create a custom tab style and your organization has access to the Documents tab. To create your own tab style:

- a. Click the `Color` lookup icon to display the color selection dialog and click a color to select it.
- b. Click **Insert an Image**, select the document folder, and select the image you want to use.

Alternatively, click **Search in Documents**, enter a search term, and click **Go!** to find a document file name that includes your search term.

 **Note:** This dialog only lists files in document folders that are under 20 KB and have the Externally Available checkbox selected in the document property settings. If the document used for the icon is later deleted, Salesforce replaces it with a default multicolor block icon ().

- c. Select a file and click **OK**. The New Custom Tab wizard reappears.
6. Optionally, choose a custom link to use as the introductory splash page when users initially click the tab.
 7. Enter a description of the tab, if desired, and click **Next**.
 8. Choose the user profiles for which the new custom tab will be available:
 - Select **Apply one tab visibility to all profiles** and choose Default On, Default Off, or Tab Hidden from the drop-down list.
 - Alternatively, select **Apply a different tab visibility for each profile** and choose Default On, Default Off, or Tab Hidden from the drop-down list for each profile.

For Professional Edition users and Salesforce Platform One license users, tab visibility is automatically set to Default On.

9. Specify `Tab Visibility`.

For Enterprise, Unlimited, Performance, and Developer Edition organizations, choose Default On, Default Off, or Tab Hidden in `Tab Visibility` to determine whether the custom tab is visible to users with that profile, and click **Next**. For Professional Edition organizations, tab visibility is automatically set to Default On. Salesforce Platform One license users, tab visibility is automatically set to Default On.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Custom Object Tabs and Web Tabs available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Visualforce Tabs available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Lightning Page Tabs available in: **All** Editions except **Database.com**

USER PERMISSIONS

To create and edit custom tabs:

- “Customize Application”

 **Note:** If you set a custom object tab's visibility to Tab Hidden, users can't search for that custom object's records.

If you choose Default On or Default Off, an option is added to the `Create New` drop-down list in the sidebar so that users with the "Create" permission can quickly create a new record. For example, if the custom object displayed in the custom tab is named Expenses, an **Expense** option appears in this list.

10. Specify the custom apps that should include the new tab.
11. Check `Append tab to users' existing personal customizations` to add the new tab to your users' customized display settings if they have customized their personal display.
12. Click **Save**.

To further customize the tab:

- Define the page layout for records displayed in the tab. The page layout controls which fields are visible and editable when users are entering data in the custom tab.
- Specify which fields display to users in the key lists section of the custom object tab home page.

[Understanding Custom Tabs](#)

[Guidelines for Making Search Faster](#)

Manage Custom Tabs

From Setup, enter *Tabs* in the **Quick Find** box, then select **Tabs** to display a list of your organization's tabs. Use this page to view, create, edit, or delete custom tabs.

- To enable Visualforce or web tabs for use in the Salesforce Classic Mobile app, edit the properties of the tabs and select the **Salesforce Classic Mobile Ready** checkbox.
- The custom tabs limit is a fixed number based on edition and can't be increased. For more information, contact Salesforce.

Customizing Help

Custom Help Overview

The **Help & Training** link at the top of every page opens the Salesforce Help & Training window which includes online help topics, solutions, and recommended training classes. Additionally, the **Help for this Page** link on any page opens a context-sensitive online help topic that describes that page.

Salesforce custom help functionality allows you to augment these standard help features with information on using fields and functionality unique to your organization or the Force.com AppExchange app you are developing.

Custom help allows you to:

- Override the standard Salesforce context-sensitive online help topics for your custom objects using [object-level help](#)

Getting Started with Field-Level Help

Field-level help lets you provide help text detailing the purpose and function of any standard or custom field. You can define custom help text for your organization's fields to provide users with a helpful description for any field on all detail and edit pages where that field displays. Users can view the field-level help text by hovering over the Info icon next to the field.

Before you begin defining field-level help, review these implementation tips and best practices.

Implementation Tips

- Field-level help is enabled by default for all editions.
- Field-level help is not available for some standard fields, including fields on the User object, system read only fields, auto-number fields, multi-currency fields, Ideas fields, and Community fields.
- The help text for a field is automatically added to a package when you add the associated field to any Force.com AppExchange package.
- In a managed package, the help text is locked to the developer, giving installers full capabilities to change it.

Best Practices

- Because your custom help text displays on both edit and detail pages, avoid instructions for entering data. Instead, construct help text that defines the field's purpose, such as:

The maximum discount allowed for this account.

- Provide information in your help text about the attributes of the field, such as:

A detailed description of the purpose for the expense report. Up to 32 KB of data are allowed. Only the first 255 characters display in reports.

- Provide examples in your help text that help users understand the field's meaning clearly, such as:

The four-digit promotional code used to determine the amount charged to the customer, for example, 4PLT (for level-four platinum pricing).

- If your organization uses more than one language, provide translations for your **Help Text** using the Translation Workbench.

Getting Started with Object-Level Help

Help your users by providing object-level help for your custom and external objects. This way, when your users click the **Help for this Page** link on your custom object, they'll find useful information that's relevant to your custom object.

 **Note:** If you don't create object-level help, the **Help for this Page** link provides information about standard objects that won't be relevant to your custom object.

You can override the **Help for this Page** links for a custom object or external object with help content contained in a Visualforce page. But don't worry! You don't have to learn Visualforce to add help content to your custom objects.

When you add custom help to a custom or external object, the **Help for this Page** link on those object pages displays your custom help instead of generic help. Your users can access the custom help content from the object home (overview), detail, and edit pages, list views, and related lists.

You can create object-level help for all custom objects and external objects in the Salesforce editions that support custom and external objects. For more information, see *Salesforce Limits*.

[Define Object-Level Help](#)

[Object-Level Help Best Practices and Considerations](#)

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To define or change field-level help:

- "Customize Application"

Define Object-Level Help

Object-level help overrides the **Help for this Page** links for a custom object or external object with your own help content contained in a Visualforce page. To make object-level help available to all your users, create a Visualforce page that contains your help content. Then edit the custom or external object definition to reference the page. Object-level help becomes available to all your users instantly.

1. Create a Visualforce page that contains your help content.
2. Edit the [custom object definition](#) or [external object definition](#) that uses the custom help when users click the **Help for this Page** link.
3. For `Context-Sensitive Help Setting`, select **Open a window using a Visualforce page**.
4. Select the Visualforce page that contains your help content.
5. Click **Save**.

IN THIS SECTION:

[Create a Custom Object Help Page with Static Content](#)

If you know HTML, it's easy to add help to your custom objects by writing the content in HTML and saving it in a Visualforce page. No need to learn Visualforce. Just use the template that we provide.

[Create Custom Object Help with a PDF File](#)

Add help to your custom objects by creating Visualforce pages that redirect to PDF help files or a URL. No need to learn Visualforce. Just use the template that we provide.

[Object-Level Help Best Practices and Considerations](#)

Before defining object-level help text for your custom or external objects, review these best practices and implementation considerations.

EDITIONS

Available in: Salesforce Classic

Custom objects are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Lightning Connect external objects are available in:

Developer Edition and for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

USER PERMISSIONS

To define or change object-level help:

- "Customize Application"

Create a Custom Object Help Page with Static Content

If you know HTML, it's easy to add help to your custom objects by writing the content in HTML and saving it in a Visualforce page. No need to learn Visualforce. Just use the template that we provide.

1. From Setup, enter *Visualforce Pages* in the **Quick Find** box, then select **Visualforce Pages**.
2. Click **New**.
The Visualforce page editor opens with a new page.
3. Complete the following fields.

Field	Description
Label	The human-friendly name of the page used to identify the page in Setup tools.  Tip: It's a great idea to have a naming convention for your custom help pages. For example, start all custom help pages with "Help_" and then the object name.
Name	The API name for the page. You can use the auto-filled value.
Description	An optional description of the page.
Available for Salesforce mobile apps and Lightning Pages	Select this option if your custom object is available in Salesforce1.

4. Click **Quick Save**.
5. In the **Visualforce Markup** tab code editor, select the default code and delete it.
6. Paste the following help template code into the code editor.

```
<apex:page showHeader="false">

  <!-- Add your help styles -->

  <h1>Help for {YourObjectName} Object</h1>

  <p>Your custom help message here.</p>

</apex:page>
```

7. Click **Quick Save**.
8. Edit the template to add your help content.
To add formatting to your page, use HTML markup. You can also use Visualforce markup if you know it.
9. Click **Save**.

EDITIONS

Available in: Salesforce Classic

Custom objects are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Lightning Connect external objects are available in: **Developer** Edition and for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

Visualforce is available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To define or change object-level help:

- "Customize Application"

To create or edit Visualforce pages:

- "Customize Application"

You can now add this page as custom help. When users click **Help for this Page**, they see this page in the Help & Training window.

SEE ALSO:

- [Define Object-Level Help](#)
- [Create Custom Object Help with a PDF File](#)
- [Object-Level Help Best Practices and Considerations](#)

Create Custom Object Help with a PDF File

Add help to your custom objects by creating Visualforce pages that redirect to PDF help files or a URL. No need to learn Visualforce. Just use the template that we provide.

You can write your help content in an authoring tool such as Microsoft Word and convert it to a PDF file.

1. Upload your PDF file as a static resource.
Users see this PDF file when they request help with the custom object.
2. From Setup, enter *Visualforce Pages* in the **Quick Find** box, then select **Visualforce Pages**.
3. Click **New**.
The Visualforce page editor opens with a new page.
4. Complete the following fields.

Field	Description
Label	The human-friendly name of the page used to identify the page in Setup tools.  Tip: It's a great idea to have a naming convention for your custom help pages. For example, start all custom help pages with "Help_" and then the object name.
Name	The API name for the page. You can use the auto-filled value.
Description	An optional description of the page.
Available for Salesforce mobile apps and Lightning Pages	Select this option if your custom object is available in Salesforce1.

5. Click **Quick Save**.
6. In the **Visualforce Markup** tab code editor, select the default code and delete it.
7. Paste the following help template code into the code editor.

```
<apex:page showHeader="false" action="{! URLFOR($Resource.YourCustomHelpResource) }">
```

EDITIONS

Available in: Salesforce Classic

Custom objects are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Lightning Connect external objects are available in: **Developer** Edition and for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

Visualforce is available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To define or change object-level help:

- "Customize Application"

To create or edit Visualforce pages:

- "Customize Application"

```
<!-- This page redirects to the URL in the action attribute above -->

<p>Redirecting to help content...</p>

</apex:page>
```

8. Replace `YourCustomHelpResource` in the action attribute with the name of the static resource that you uploaded.
9. Click **Save**.

You can now add this page as help. When users click **Help for this Page**, they're redirected to the resource you set in the action attribute.

-  **Note:** The user's browser controls the behavior of a PDF link, not your Visualforce page. The PDF content might display in the browser or be downloaded as a PDF file.

- [Create a Custom Object Help Page with Static Content](#)
- [Object-Level Help Best Practices and Considerations](#)

Object-Level Help Best Practices and Considerations

Before defining object-level help text for your custom or external objects, review these best practices and implementation considerations.

Best Practices

- The window that displays your object-level help has the same height and width dimensions as the standard Salesforce Help & Training window. To increase the usability of your help content, size and style your content appropriately.
- To give your custom help a professional tone using Salesforce terminology, follow the [Salesforce Style Guide for Documentation and User Interface Text](#).
- Your Visualforce help content pages can use merge fields or other functions to make the experience more personalized. For example, you can design the help to add the user's name when the help page is displayed.

Advanced Implementation Considerations

- Create custom help Visualforce pages without a controller, or use a custom controller. You can't use a standard controller.
- If you have defined object-level help for an object that you add to a Force.com AppExchange package, Salesforce adds the Visualforce page or static resource referenced in your `Context-Sensitive Help Settings` for that object.
- In managed packages, object-level help is locked to the developer, giving installers the ability to change it if needed.

- [Define Object-Level Help](#)
- [Getting Started with Object-Level Help](#)

EDITIONS

Available in: Salesforce Classic

Custom objects are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Lightning Connect external objects are available in: **Developer** Edition and for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

Visualforce is available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Replacing Salesforce Online Help

Organizations that have renamed standard tabs, objects, fields, and other related user interface labels can also replace the Salesforce online help with another URL. Users can view this URL whenever they click on any context-sensitive help link on an end-user page or within their personal settings. After you replace the help, the **Help & Training** link at the very top of every page and all Setup pages will continue to display Salesforce online help.

1. From Setup, enter *Help Settings* in the *Quick Find* box, then select **Help Settings**.
2. Enter the complete URL for your help file that you would like to replace the Salesforce online help.
3. Click **Save**.

Notes about Replacing Online Help

- When you replace the Salesforce online help with your own help file, the **Help & Training** link still displays Salesforce online help but the **Help for this Page** links on all pages other than within Setup are no longer context-sensitive. That is, your help file will open at the same place regardless of which page the user is viewing when they click the link.
- You can make your help context-sensitive by taking advantage of the context-specific parameters that are passed with each help link. For example, the help link from the Opportunities tab home page is constructed as follows (without any line breaks):

```
http://your_help_file.com?loc=help&body=%2Fhelp%2Fdoc%2Fen%2Fhelp2.jsp  
&target=opp_overview.htm&section=Opportunities
```

The values of the `target` and `section` parameters are unique for every page within the application. You can parse these parameters to display context-sensitive help content for your users.

- If your online help file is compatible with the Web browser on your users' mobile devices, you can contact Salesforce to enable a custom URL for the online help in Salesforce Classic Mobile. If you enable a mobile help URL, the **Help** link in the mobile application launches the custom help URL instead of the Salesforce Classic Mobile online help. Don't deploy customized mobile help without testing it thoroughly on all the device models carried by your users. Even if all of your users have the same type of mobile device, the experience can vary widely depending on which operating system version is installed on the device.

Using Record Types

Record Types

Customize business processes, picklist values, and page layouts for multiple groups of users.

Record types let you offer different business processes, picklist values, and page layouts to different users. Create record types for various reasons, like for:

- Opportunities to differentiate your regular sales deals from your professional services engagements and offer different picklist values for each.
- Cases to display different page layouts for your customer support cases versus your billing cases.

SEE ALSO:

[View and Edit Record Types](#)

[Create Record Types](#)

[How is record type access specified?](#)

[Administrator tip sheet: Tips & Hints for Record Types](#)

Considerations for Creating and Updating Record Types

Learn important details before you create and update record types.

- Before creating record types, include all of the possible record type values in your master list of picklists. The master picklist is a complete list of picklist values that can be used in any record type.
- The master picklist is independent of all record types and business processes. If you add a picklist value to the master picklist, you must manually include the new value in the appropriate record types. If you remove a picklist value from the master, it is no longer available when creating new records, but records assigned to that value are unchanged.
- The following special picklist fields are not available for record types because they are used exclusively for sales processes, lead processes, support processes, and solution processes:
 - Opportunity Stage
 - Case Status
 - Solution Status
 - Lead Status

You can use these fields to provide different picklist values for different record types by assigning a different process to each record type.

- Renaming a record type doesn't change the list of values included in it.
- Person accounts are account records to which a special kind of record type has been assigned. These record types are called *person account record types*. Person account record types allow contact fields to be available on the account and allow the account to be used in many situations as if it were a contact. A default person account record type named "Person Account" is automatically created when person accounts are enabled for your organization. You can change the name of this record type, and you can create additional person account record types.
- You cannot delete all the record types for an object if the object is referenced in Apex.
- You cannot deactivate a record type if it is in use by an email routing address for Email-to-Case or On-Demand Email-to-Case.
- To create record types for campaign members, from the object management settings for campaign members, go to Record Types.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create or change record types:

- "Customize Application"

Record types can only be assigned to campaign members using the `Campaign Member Type` field on new or existing campaigns. To assign record types to campaign members, add the `Campaign Member Type` field to the campaign page layout. You must have the `Marketing User` user permission to change the campaign member type. You can also add a read-only `Campaign Member Type` field to the campaign members page layout.

- The following campaign member picklists are not available for record types:
 - `Status`
 - `Salutation`
 - `Lead Source`
- Salesforce recommends creating no more than 200 record types. While there is no limit, organizations may have difficulty managing their record types if they exceed 200.
- Deleting a record type also deletes the related sales path.

When users convert, clone, or create records, the following special considerations apply.

- When a user converts a lead, the new account, contact, and opportunity records automatically use the default record type for the owner of the new records.
- When a user clones a record, the new record has the record type of the cloned record. If the record type of the cloned record isn't available in the user's profile, the new record adopts the user's default record type.
- When a user creates a new case or lead and applies assignment rules, the new record can keep the creator's default record type or take the record type of the assignee, depending on the case and lead settings specified by the administrator.

Create Record Types

 **Tip:** Before creating record types, include all of the possible record type values in your master list of picklists. The master picklist is a complete list of picklist values that can be used in any record type.

1. From the management settings for the appropriate object, go to Record Types.
2. Click **New**.
3. Choose `Master` from the `Existing Record Type` drop-down list to copy all available picklist values, or choose an existing record type to clone its picklist values.

 **Note:** When you create a new record type without cloning an existing one, the new record type automatically includes the master picklist values for both standard and custom picklists. You can then customize the picklist values for the record type.

4. Enter a `Record Type Label` that's unique within the object.
5. Enter a `Record Type Name`. The Record Type Name refers to the component when using the Web services API and prevents naming conflicts on package installation in managed packages.
6. For opportunity, case, lead, and solution record types, select a business process to associate with the record type.
7. Enter a description.
8. Select `Active` to activate the record type.
9. Select `Enable for Profile` next to a profile to make the record type available to users with that profile. Select the checkbox in the header row to enable it for all profiles.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create or change record types:

- "Customize Application"

 **Tip:** If each profile is associated with a single record type, users will never be prompted to select a record type when creating new records.

10. For enabled profiles, select `Make Default` to make it the default record type for users of that profile. Select the checkbox in the header row to make it the default for all profiles.
11. Click **Next**.
12. Choose a page layout option to determine what page layout displays for records with this record type:
 - To apply a single page layout for all profiles, select `Apply one layout to all profiles` and choose the page layout from the drop-down list.
 - To apply different page layouts based on user profiles, select `Apply a different layout for each profile` and choose a page layout for each profile.
13. Click **Save** to edit the values of the standard and custom picklists available for the record type, or click **Save and New** to create another record type.

SEE ALSO:

[View and Edit Record Types](#)

Edit Picklists for Record Types and Business Processes

Customize the values in record type or business process picklists based on your organization's unique needs.

1. Select a record type or business process and click **Edit** next to the picklist field to change its values.
2. Add or remove values as needed. Users can choose from these values when creating or editing records.
3. Optionally, choose a default picklist value. Some picklists require a default value. The default value in a dependent field is ignored.
4. Click **Save**.

Considerations When Creating Picklists

Refer to these considerations when you edit record type or business process picklists values. For example, after you create a picklist, update the appropriate page layouts so that users can access the picklist.

- The master picklist is independent of all record types and business processes. If you add a picklist value to the master picklist, you must manually include the new value in the appropriate record types. If you remove a picklist value from the master, it is no longer available when creating new records, but records assigned to that value are unchanged.
- Renaming a record type doesn't change the list of values included in it.
- The following special picklist fields are not available for record types because they are used exclusively for sales processes, lead processes, support processes, and solution processes:
 - Opportunity Stage
 - Case Status
 - Solution Status
 - Lead Status

You can use these fields to provide different picklist values for different record types by assigning a different process to each record type.

- The following campaign member picklists are not available for record types:
 - Status
 - Salutation
 - Lead Source
- To display the field on record detail and edit pages, add the `Record Type` field to your page layouts. A user can be associated with several record types. For example, a user who creates marketing campaigns for both U.S. and European divisions can have both U.S. and European campaign record types available when creating new campaigns.

Record types can only be assigned to campaign members using the `Campaign Member Type` field on new or existing campaigns. To assign record types to campaign members, add the `Campaign Member Type` field to the campaign page layout. You must have the `Marketing User` user permission to change the campaign member type. You can also add a read-only `Campaign Member Type` field to the campaign members page layout.

View and Edit Record Types

To view a list of record types, from the management settings for an object, go to Record Types.

- Click **New** to create a new record type.
- Click **Edit** to change the name of a record type or deactivate it by deselecting the `Active` checkbox. Deactivating a record type does not remove it from any user profiles or permission sets.
 - 📌 **Note:** When creating and editing record types for accounts, opportunities, cases, contacts, or custom objects, check for criteria-based sharing rules that use existing record types as criteria. A record type change may affect the number of records that the rule shares. For example, let's say you have a record type named "Service," and you created a criteria-based sharing rule that shares all Service record types with your service team. If you create another record type named "Support" and you want these records shared with your service team, you must update the sharing rule to include Support record types in the criteria.
- Click **Del** to delete an inactive record type and assign associated records a different record type. To leave the record type field blank on records associated with the deleted record type, select `None`.
 - 📌 **Note:** Deleting campaign member record types updates the `Campaign Member Type` field on campaign and campaign member records.
- Click the name of the record type to edit the picklists associated with it.
- Click **Page Layout Assignment** to set which page layouts users can see based on profiles and record types.
 - 📌 **Note:** You cannot edit or delete a record type for an object if the object is referenced in Apex.

Managing Multiple Business Processes

Use multiple business processes to display different picklist values for users based on their profile. Multiple business processes allow you to track separate sales, support, and lead lifecycles.

Sales Processes

Create different sales processes that include some or all of the picklist values available for the opportunity `Stage` field.

Lead Processes

Create different lead processes that include some or all of the picklist values available for the Lead `Status` field.

Support Processes

Create different support processes that include some or all of the picklist values available for the case `Status` field.

Solution Processes

Create different solution processes that include some or all of the picklist values available for the `Status` field.

After creating a sales, support, lead, or solution process, assign the process to a record type. The record type determines the user profiles that are associated with the business process.

To view a list of business processes, from Setup, enter `Processes` in the `Quick Find` box, then select the appropriate link.

- Click **New** to create a new business process.
- Click **Edit** to change the name or inactivate the business process.
- Click **Del** to delete an unused business process.
- Click the name of the business process to edit the picklist values associated with it.

- Developer

The Translation Workbench lets you specify languages you want to translate, assign translators to languages, create translations for customizations you've made to your Salesforce organization, and override labels and translations from managed packages. Everything from custom picklist values to custom fields can be translated so your global users can use all of Salesforce in their language.

 **Tip:** When creating a custom report type that will be translated into multiple languages via the Translation Workbench, we recommend that your personal language setting matches your organization's default language. This ensures that words that will be translated display in the correct language for translators.

When a customized component is translated, changes to that component are tracked and the “Out of Date” indicator is set when the translations need updating. You can manage translated values for any of the Salesforce supported languages.

 **Note:** Standard objects are not available in the translation workbench. Use the rename tabs and labels interface for standard object translation.

Translation Workbench is not available for single-language organizations. If you aren't sure whether you have a single-language or multi-language organization, contact Salesforce.

Enabling the Translation Workbench makes some changes to your Salesforce organization:

- Picklist values must be edited individually. This means you can't mass edit existing picklist values, though you can still mass add new values.
- When picklist values are sorted alphabetically, the values are alphabetical by the organization's default language.
- Reports have a `Filter Language` drop-down list in the Filters pane of the report builder. Selecting a language will filter on translated strings for any filter criteria that use the "starts with," "contains," or "does not contain" operator.
- Import files have a `Language` drop down and all records and values within the import file must be in that language.
- Web-to-Lead and Web-to-Case have a `Language` drop down before you generate the HTML.

 **Note:** Salesforce assumes all customizations are entered in the organization's default language—global administrators should work together in the organization's default language.

To enable the Translation Workbench:

1. From Setup, enter *Translation Settings* in the `Quick Find` box, then select **Translation Settings**.
2. On the welcome page, click **Enable**.

 **Note:** The “Manage Translation” permission is enabled by default in the System Administrator profile.

To disable the Translation Workbench, from Setup, enter *Translation Settings* in the `Quick Find` box, select **Translation Settings**, and then click **Disable**.

 **Note:** In a Developer organization with a managed package containing translations, once the Translation Workbench is enabled, it can't be disabled.

[Administrator tip sheet: Setting Up the Translation Workbench](#)

Adding and Editing Translated Languages and Translators

Use the Translation Workbench to add languages that you support, activate or deactivate a language, assign translators for that language, and enter translated terms for customizations you've made in your organization's default language.

 **Note:** The "Manage Translation" permission is enabled by default in the System Administrator profile.

To add or edit translated languages and translators:

1. From Setup, enter *Translation Settings* in the **Quick Find** box, then select **Translation Settings**.
2. Click **Add** to activate a new language or **Edit** to change an existing supported language.
3. If adding a new language, choose a language.
4. To make the entered translations available to your users - select **Active**. Users can change their personal language anytime whether or not it's active in the Translation Workbench. Selecting **Active** makes the translations available to the users in that language.

 **Tip:** We recommend you don't make a language active until the translators have translated all values.

5. To assign translators for this language, select them from the **Available List** and click **Add**. If you don't see the member you want to add, enter keywords in the search box and click **Find**.

 **Important:** Ensure all translators have the "View Setup and Configuration" permission so that they can begin translating. Users can only translate languages they're assigned to.

6. Click **Save**.

Entering Translated Terms

To enter translations:

1. From Setup, enter *Translate* in the **Quick Find** box, then select **Translate**.
2. Select the **Language** you're translating into.
3. Select a **Setup Component**. Click the pull-down menu to select from the list of translatable customizations. See [Translatable Customizations](#) for a complete list of possible customizations.
4. If necessary select an object and aspect. For example, workflow tasks have an object (Account, Contact, etc.) and aspect (Subject or Comment).
5. Double click in the translation column to enter new values. You can press TAB to advance to the next editable field or SHIFT-TAB to go to the previous editable field.

 **Note:** The **Out of Date** column indicates that the item has been updated and the term may need translating. When editing a button or link label, you see the **Button or Link Name** column, which is used to refer to the component when using the SOAP API.

6. Click **Save**.

[Adding and Editing Translated Languages and Translators](#)

Enter Overrides to Translations in Managed Packages

Although you can't edit labels or translations in a managed package, they are controlled by the developer, you can override them with the Translation Workbench. For example, if there is a custom field in a package you'd like to change, you can override it.

To enter overrides to managed packages:

1. From Setup, enter *Override* in the **Quick Find** box, then select **Override**.
2. Select the **Package** that you're overriding.
3. Select the **Language** that you're entering your overrides in.
4. Select a **Setup Component**. Click the pull-down menu to select from the list of translatable customizations. See [Translatable Customizations](#) for a complete list of possible customizations.
5. If necessary select an object and aspect. For example, workflow tasks have an object (Account, Contact, etc.) and aspect (Subject or Comment).
6. Double click in the override column to enter new values. You can press TAB to advance to the next editable field or SHIFT-TAB to go to the previous editable field.

 **Note:** The **Out of Date** column indicates that the item has been updated and the term may need to be changed. When editing a button or link label, you see the **Button or Link Name** column, which is used to refer to the component when using the SOAP API.

7. Double click in the translation column to enter new values. You can press TAB to advance to the next editable field or SHIFT-TAB to go to the previous editable field.

Translatable Customizations

To view the translatable customizations in your organization, from Setup, enter *Translate* in the `Quick Find` box, select **Translate**, and then select a `Setup Component`. Then, if needed, select **Object**, **Custom Report Type Entity**, or **Aspect**.

You can translate the following components.

- Apex Sharing Reasons
- Button and Link Labels
- Custom App Labels
- Custom Field Help
- Custom Fields
- Custom Report Types
- Data Categories
- Data Category Groups
- Divisions
- Layout Sections
- Navigation Menu Item (for Communities)
- Lookup Filters
- Picklist Values
- Record Types
- Related List Labels
- Reputation Levels (for Communities)
- S-Controls
- Solution Categories
- Standard Field Help
- Validation Error Messages
- Web Tabs
- Workflow Tasks

 **Important:** Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

Editing Translation Files

You use the following types of files to translate customization labels and review translations:

- **Source:** Use to translate labels for the first time.
- **Untranslated:** Use to translate labels after the first translation pass.
- **Bilingual:** Use to review and edit translations.

Translation files are identified by the extension `.stf`, to represent the Salesforce translation format. A translation filename includes the name of the export option used to create it, the language code for the file's content, and a date stamp.

Multiple `.stf` files created with the Untranslated and Bilingual options are compressed into zip files up to 5 MB in size. If multiple zip files are needed, the zip filenames are each date stamped and incremented. For example, `Untranslated_2010-09-20_05:13_1of2.zip`

 **Warning:** Consider the following when editing your `.stf` files:

- Don't change the `.stf` file extension.
- If you use tabs, new lines, or carriage returns in your text for translation, notice that they are represented with special characters in the `.stf` file format. Tabs are `\t`, new lines are `\n` and carriage returns are `\r`. To ensure consistency between your language versions, ensure these characters are maintained in your translations.

Working with the Source File

Use the Source file to translate an organization's labels for the first time. The Source file contains labels for all of an organization's translatable customizations in the organization's default language.

If you aren't using a standard translation tool such as Trados, work with the file using an application that supports tabs and word wrap, such as WordPad or MS Excel.

 **Note:** If you use MS Excel to enter translations in your `.stf` file, your file format may be corrupted. MS Excel automatically adds quotation marks around entries that have commas. We advise you open your files in a text editor before import and remove these quotation marks if they have been added. The import will fail if these quotation marks are not removed.

To prepare the Source file for your translators:

- Create one copy of the Source file for each language you are translating into.
- In the header of each Source file, change the language code from the organization's default language (such as `en_US`) to the translation language (such as `fr`).

Tell your translators to replace the untranslated values in the LABEL column with translated values.

 **Note:** Don't add columns to or remove columns from the translation file.

Column	Description	Edit Options
KEY	Unique identifiers for labels	Do not edit
LABEL	Labels that are visible to end users	Replace untranslated values with translated values

USER PERMISSIONS

To override terms:

- "View Setup and Configuration"
- AND
- "Customize Application"

Working with the Untranslated File

Use the Untranslated file to translate labels that haven't been translated. One Untranslated file is generated for each language. When multiple files are generated, they're exported to a `.zip` file containing `.stf` files for each translation language.

If you aren't using a standard translation tool such as Trados, work with the file using an application that supports tabs and word wrap, such as WordPad or MS Excel.

 **Note:** If you use MS Excel to enter translations in your `.stf` file, your file format may be corrupted. MS Excel automatically adds quotation marks around entries that have commas. We advise you open your files in a text editor before import and remove these quotation marks if they have been added. The import will fail if these quotation marks are not removed.

Tell your translators to replace the untranslated values in the LABEL column with translated values.

 **Note:** Don't add columns to or remove columns from the translation file.

Column	Description	Edit Options
KEY	Unique identifiers for labels	Do not edit
LABEL	Labels that are visible to end users	Replace untranslated values with translated values

Working with the Bilingual File

Use the Bilingual file to review translations, edit labels that have already been translated, and add translations for labels that haven't been translated. One Bilingual file is generated for each translation language.

The TRANSLATED section of the file contains the text that has been translated and needs to be reviewed. The UNTRANSLATED section of the file contains text that hasn't been translated.

Edit the file using an editing application that supports tabs and word wrap, such as WordPad or MS Excel.

 **Note:** If you use MS Excel to enter translations in your `.stf` file, your file format may be corrupted. MS Excel automatically adds quotation marks around entries that have commas. We advise you open your files in a text editor before import and remove these quotation marks if they have been added. The import will fail if these quotation marks are not removed.

- Identify labels that are out of date by scrolling through the OUT OF DATE column to locate values that have an asterisk (*). Update out of date labels as needed.
- Edit translated labels in the TRANSLATION column of the TRANSLATED section.
- Replace untranslated labels with translated values in the LABEL column of the UNTRANSLATED section.
- Delete a translation by replacing the desired value in the TRANSLATION column in either section with a left and right angle bracket pair (< >). When the Bilingual file is imported, the label reverts to its original value.

 **Attention:** Don't attempt to delete a translation by deleting a translated label from the file. Deleting a translation in the file doesn't remove the translation from the application after the file is imported.

 **Note:** Don't add columns to or remove columns from the translation file.

Column	Description	Edit Options
KEY	Unique identifiers for labels	Do not edit

Column	Description	Edit Options
LABEL	Labels that are visible to end users	<ul style="list-style-type: none">• Do not edit labels in the TRANSLATED section of the file• In the UNTRANSLATED section of the file, replace untranslated labels with translated values
TRANSLATION	Current translation	<ul style="list-style-type: none">• In the TRANSLATED section of the file, edit current translations• In the UNTRANSLATED section of the file, add translations
OUT OF DATE	<p>Indicates whether the source text has changed since the previous translation.</p> <p>The out of date indicators are:</p> <ul style="list-style-type: none">• An asterisk (*): The label is out of date. A change was made to the default language label and the translation hasn't been updated.• A dash (-): The translation is current.	Do not edit

[Exporting Translation Files](#)[Importing Translated Files](#)

About Updating Translated Terms

When translated components are changed, the translated value is marked `Out of Date`. Translators are responsible for keeping the translated terms updated.

For example, say you enter a translation for an error message on a lookup filter. Later, you edit the lookup filter and change the error message. When you go into the Translation Workbench and view the message translation column, it still shows the translation for the old error message and the checkbox in the `Out of Date` column is selected.

For best results, have your translators check their translations frequently, and be sure to notify them when changes occur. You can use the Translation Workbench **Export > All** feature to generate a list of all the translatable customizations and their associated `Out of Date` states.

SEE ALSO:

[Entering Translated Terms](#)

[Adding and Editing Translated Languages and Translators](#)

Exporting Translation Files

Use **Export** in the Translation Workbench to create files that contain your organization's translatable metadata, such as custom fields, report types, and picklist values. Send these files to your outside translators or translation agency for bulk translation activities, then use **Import** to update your labels.

1. From Setup, enter *Export* in the `Quick Find` box, then select **Export**.

2. Select which labels you want to export.

- **Source**—Used as the initial source for creating new translations.

Creates a single file that contains a list of all your translatable customizations. Typically, the content is in your organization's default language.

- **Untranslated**—Used to make updates.

Creates a set of files that contain only customizations that have not been translated, including new and modified customizations.

One file is created for each language. These files are then compressed into .zip files.

- **Bilingual**—Used for reference and reviewing all your untranslated and translated customizations.

Creates a list of all the translatable labels in their current translated or untranslated state.

One file is created for each language. These files are then compressed into .zip files.

The content in each file is divided into Untranslated and Translated sections. Each translatable label is in either the Untranslated or Translated section, according to its translation state.

In the Translated section, out of date status for the labels is included.

AND

"Create Documents"

3. Click **Export**.

A status message tells you that the export is being processed. When the export is complete an email is sent to the email address specified in your profile.

4. Locate the exported .stf or .zip file.

Go to **Your name** > **Documents** > **Document Folders** > **My Personal Documents** > **Go!**

All exported files indicate the Export option used to create them and are date and time stamped. Individual files end with the extension .stf. Multiple files are grouped into .zip files.

If you have a large number of documents in your personal documents area, you'll find the exported files under the sort letter:

- B—Bilingual export option, for example: `Bilingual_2010-09-23_11:20.zip`.
- S—Source export option, for example: `Source_en_US_2010-09-23_11:20.stf`.
- U—Untranslated export option, for example: `Untranslated_2010-09-23_11:20.zip`.

5. Save the files for translation by your translators or translation agency.

Click **View** > **Save File** > **OK**. The file is saved to the location specified by your browser. For example, `C:/Users/username/Downloads`.

SEE ALSO:

[Importing Translated Files](#)

[Setting Up the Translation Workbench](#)

Importing Translated Files

Use **Import** in the Translation Workbench to import and update the translations for your organization's metadata, such as custom fields, report types, and picklist values. Typically, the original files are created through the **Export** feature, then sent to your outside translators or translation agency for bulk translation activities and returned to you for importing.

 **Note:** Labels that are exported and left as is are not saved as translations on import.

1. Bundle multiple files into .zip files that are no larger than 5 MB. Create multiple .zip files as needed.

The zipped files don't have to be in the same order or grouping as the exported .zip files.

For example, you start with two exported .zip files. The first file includes French, Italian, and Japanese. The second file includes Russian, Simplified Chinese, and Greek. You can create:

- One .zip file with French, Greek, and Italian.
- One .zip file with Russian and Greek.
- One .zip file with Simplified Chinese.

2. From Setup, enter *Import* in the **Quick Find** box, then select **Import** under Translation Workbench.

3. Click **Browse** to locate and select the file you want to import.

4. Click **Import**.

After the import is complete:

Troubleshooting Issues with Exporting and Importing Translation Files

Use this table to troubleshoot issues you might encounter while exporting and importing files in the Translation Workbench.

Error Message	What It Means	Troubleshooting Steps
Bilingual File starts with non-section header row: {0}	The header rows of the file you're trying to import are missing, or there is extraneous text (such as notes that aren't commented out) in those rows.	Export your file again and make sure there are header rows for all sections, and that all extraneous text has been commented out or removed from the header rows.
Duplicate key: {0} exists in import file, please re-export.	The specified key appears in your imported file more than once. Each translated item needs to have its own unique key, and each key can only appear in the file one time.	Export your file again and make sure that each key in it is unique, and then re-import the file.
Invalid Key	During translation, Salesforce generates unique keys, or identifiers, for each object, picklist value, or page element you're translating. If these names or keys are changed after you export your file, Salesforce can't match the correct key with the correct name.	Export your file again and make sure the keys in it match those in the file you're trying to import.
Key: {0} could not be uniquely resolved. This is caused by a change to our Custom Report Type Column key format. Please re-export and use the new key format for those keys.	One of the keys in your Custom Report Type (CRT) column is in the wrong format.	Export your file again and make sure you're using the correct CRT key format.

Error Message	What It Means	Troubleshooting Steps
Maximum character limit {x} for {field type} translation exceeded in line:	Each type of field, such as a picklist value, can only have a certain number of characters. Your translated labels for the type of field at the line specified in the error message are too long.	Edit your translated labels so they're within the character limit listed for the field type and import your file again.
No data to import	The file you're trying to import is empty or does not contain any translation changes.	Make sure you're importing the correct file, and that it contains translated data.
No language code specified in file header	The file you're trying to import doesn't have a valid language code, or the language code is in the wrong place.	Make sure your language code is valid and isn't missing or commented out.
No translated or untranslated section header found in the bilingual file	The file you're trying to import is missing section headers.	Make sure your file has section headers and import it again.
No valid file type specified in file header	The file you're trying to import doesn't have a valid import/export type (Source, Untranslated, or Bilingual) specified in the file header. The file type should be in the default language for your organization.	Make sure your file has a valid import/export type in the file header, and that the header did not get translated.
Not a valid file to import. Please select a .stf or a .zip file for import.	You can only import files in .stf format or .zip files that contain .stf files.	Make sure your file is a .stf or a .zip file and try importing it again.
Some keys are appended with their sort order for uniqueness. Re-export your file and ensure that the keys in both files match.	The order of the picklist values in your source file don't match your setup.	Export your source file and match the order of the picklist values to your import file, then import again.
Wrong number of columns in line: {x}. Check that you have escaped tabs (\t), new lines (\n), and carriage returns (\r) in your files.	The file you're importing has extra tabs, new lines, or carriage returns in the line specified in the error message.	Edit your data to remove or escape any extra tabs, newlines, or carriage returns, and make sure the file you're importing has the same number of columns as the file you exported.
Your export request failed. Please retry or contact support.	Salesforce had an unexpected problem while exporting your file.	Contact Salesforce Customer Support.
Your import request failed. Please retry or contact support.	Salesforce had an unexpected problem while importing your file.	Contact Salesforce Customer Support.
Your organization does not have language permissions for {language}.	The file you're trying to import is in a language you haven't yet added to the Translation Workbench.	Add the language you want to use to the Translation Workbench and import your file again.

Enhancing Your Objects, Data, and Fields

Using Custom Object Records

Custom Object Record Overview

 **Important:** You might be viewing this page because your Salesforce administrator didn't create custom help. If you need information on a specific custom object, contact your administrator about [creating custom help](#) for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

Custom objects records store information that's unique and important to you and your organization. For example, your organization may use a custom object called "Merchandise" to store data about your company's merchandise. You can also use custom objects for custom applications, such as tracking software enhancements in a development life-cycle.

Your administrator first defines the custom object and its properties, such as custom fields, relationships to other types of data, page layouts, and a custom user interface tab. Once the custom object is created and deployed to users, you can enter data to create individual custom object records. If your administrator has created a tab for the custom object, the tab displays a home page that lets you quickly create and locate custom object records. You can also sort and filter your custom object records using standard and custom list views. In addition, the tab lets you view and edit detailed information on each custom object record to which you have access.

Administrators, and users with the "Modify All Data" permission, can import custom objects.

Custom Objects Home

Important: You might be viewing this page because your Salesforce administrator didn't create custom help. If you need information on a specific custom object, contact your administrator about [creating custom help](#) for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

Note: Clicking on a custom object tab displays the tab home page. The name of a custom object tab is the plural form of the custom object as defined by your administrator.

Use the home tab of a custom object to view records.

- To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. List views let you display a list of records that match specific criteria, such as all custom objects for a tab or just the ones you own. To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
- If custom objects are shared with external contacts via Salesforce to Salesforce, choose one of the list views under **[Custom Object Name] from Connections** to view the custom objects that your business partners have shared with you.
- In the **Recent** section, select an item from the drop-down list to display a brief list of the top custom object records matching that criteria. From the list, you can click any custom object name to go directly to the detail. Toggle the **Show 25 items** and **Show 10 items** links to change the number of items that display. The fields you see are determined by the "Custom Object Tab" search layout defined by your administrator and by your field-level security settings (available in Enterprise, Unlimited, Performance, and Developer Editions only). The key list choices are:

Recent Custom Objects Choice	Description
Recently Viewed	The last ten or twenty-five custom object records you viewed, with the most recently viewed item listed first. This list is derived from your recent items and includes records owned by you and other users.
Recently Created	The last ten or twenty-five custom object records you created, with the most recently created item listed first. This list only includes records owned by you.
Recently Modified	The last ten or twenty-five custom object records you updated, with the most recently updated item listed first. This list only includes records owned by you.

Creating Custom Object Records

 **Important:** You might be viewing this page because your Salesforce administrator didn't create custom help. If you need information on a specific custom object, contact your administrator about [creating custom help](#) for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

To create a custom object record:

1. Click **New**.
2. Enter the information for the custom object record.
3. Click **Save** when you are finished, or click **Save & New** to save the current record and add another.

If your administrator has defined relationships to other types of records, you can automatically associate the new custom object with another record. View the other record and select the custom object name from the Create New drop-down list in the sidebar, or click **New** *Object Name* in the custom object related list of the other record.

If your organization uses divisions to segment data, custom objects that are detail objects in a master-detail relationship inherit their division from the master object. Custom objects that are not related to other records are automatically in the global division.

SEE ALSO:

[Custom Object Record Fields](#)

Cloning Custom Object Records

 **Important:** You might be viewing this page because your Salesforce administrator didn't create custom help. If you need information on a specific custom object, contact your administrator about [creating custom help](#) for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

The **Clone** button on a custom object record creates a custom object record with the same information as the existing record.

 **Note:** When you clone a record, the new record has the record type of the original record. If the record type of the cloned record isn't available in your profile or permission sets, the new record adopts your default record type.

To clone a custom object record:

1. Click **Clone** on an existing custom object record.
2. Enter or change any information for the new record.
3. Click **Save**.

 **Note:** If you have read-only access to a field, the value of that field is not carried over to the cloned record.

Deleting Custom Object Records

 **Important:** You might be viewing this page because your Salesforce administrator didn't create custom help. If you need information on a specific custom object, contact your administrator about [creating custom help](#) for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

To delete a custom object record, click **Del** next to the record on the custom object's list page or in the custom related list of an associated record. You can also delete a custom object record by clicking **Delete** on the custom object record detail page.

When you delete a custom object record, all related events, tasks, notes, and attachments are also deleted. If the custom object is the master object in a master-detail relationship, any associated detail records are also deleted. If the custom object is the detail side of a master-detail relationship, any associated records are *not* deleted.

The deleted custom object record is moved to the Recycle Bin. If you undelete the record, any related items are also restored.

 **Note:** You can delete a custom object record if you are an administrator, the record owner, or a user above the record owner in the organization role hierarchy, and if you have the appropriate user permission. Custom objects that are on the detail side of a master-detail relationship do not have an `Owner` field and can be deleted by any user who has access to edit the associated master record.

Displaying and Editing Custom Object Records

 **Important:** You might be viewing this page because your Salesforce administrator didn't create custom help. If you need information on a specific custom object, contact your administrator about [creating custom help](#) for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

 **Note:** Clicking on a custom object tab displays the tab home page. The name of a custom object tab is the plural form of the custom object as defined by your administrator.

Displaying Custom Object Records

Once you have located a custom object record on the custom objects tab home or list pages, click the custom object record name to display detailed information.

If the Salesforce console is set up to include custom objects, select it from the [Force.com app menu](#) to find, view, and edit custom object records and their related items on one screen.

Editing Custom Object Records

To update custom object record details, click **Edit**, and then change the fields you want to update. When you have finished, click **Save**. You can also click **Save & New** to save the current custom object record and create another. Required fields are marked with red.

 **Note:** You cannot change the `Object Name` or `Data Type` if the custom object is referenced in Apex.

Custom Object Related Lists

The lower portion of the custom object record detail page provides information related to the custom object record, including activities, notes, attachments, and any other related records. The related lists you see are determined by your personal customization, and by any customization your administrator has made to page layouts or your permissions to view related data. You can click on individual items to display additional detail. Click **more** at the bottom of the page or **View More** below a related list to display more items. Clicking **New** lets you directly add new items.

 **Tip:** To help your users see record details and related lists more easily, enable Hover Details in the User Interface panel of Setup.

Printing Custom Object Records

On a custom object detail page, click **Printable View** to print the record.

To return to the last list page you viewed, click **Back to list** at the top of any custom object record detail page. If your organization has enabled collapsible page sections, use the arrow icons next to the section headings to expand or collapse each section on the detail page.

Sharing Custom Object Records

Important: You might be viewing this page because your Salesforce administrator didn't create custom help. If you need information on a specific custom object, contact your administrator about [creating custom help](#) for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

The administrator defines the default sharing model for an entire organization. You can change this model to extend sharing to more users than the default set. However, you cannot change the sharing model to make it more restrictive than the default.

To view and manage sharing details, click **Sharing** on the custom object record detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the record. On this page, you can:

- Grant access to the record to other users, groups, roles, or territories
 - Note:** You can't share a custom object record with another user unless that user has the "Read" permission on the custom object.
- View all users who have access to the record
- Edit or delete the record's access level

Custom Object Record Fields

Important: You might be viewing this page because your Salesforce administrator didn't create custom help. If you need information on a specific custom object, contact your administrator about [creating custom help](#) for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

Custom object record fields contain the data you enter for your custom object records. Here is a description of the fields (in alphabetical order) that make up a custom object record. Some of these fields may not be visible or editable depending on your page layout and field-level security settings.

Your administrator may also have defined additional custom fields.

Field	Description
Created By	User who created the record.
Currency	Currency of the record if multicurrency is enabled.
Division	Division to which the custom object record belongs. Custom objects that are "detail" objects in a master-detail relationship inherit their division from the master object. Custom objects that are not related to other records are automatically in the global division. Available only in organizations that use divisions to segment their data.
Last Modified By	User who most recently changed the record.

- Enterprise
- Performance
- Unlimited
- Developer

Field	Description
Name	Identifier for the custom object record. This name appears in page layouts, related lists, lookup dialogs, search results, and key lists on tab home pages. By default, this field is added to the custom object page layout as a required field.
Owner	<p>Assigned owner of the custom object record. If the custom object becomes the detail side of a master-detail relationship, this field is removed, as ownership of the data is controlled by the master object, or by the primary master object for a custom object with two master-detail relationships.</p> <p> Note: Custom objects on the “detail” side of a master-detail relationship can't have sharing rules, manual sharing, or queues, as these require the <code>OWNER</code> field.</p>

Using Custom Related Lists

Important: You might be viewing this page because your Salesforce administrator didn't create custom help. If you need information on a specific custom object, contact your administrator about [creating custom help](#) for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

Custom related lists display on the lower portion of the detail page for another record. They list the custom object records that are associated with that record.

From a custom related list, you can:

- Click the custom object record name to view detailed information.
- Click **Edit** or **Del** to edit or delete the custom object record.
- Click **New** to create a new custom object record that is associated with the record you are viewing.

SEE ALSO:

[Custom Object Record Overview](#)

EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To view custom object record related lists:

- "Read" on the custom object
- AND
- "Read" on the associated record

To change custom object records:

- "Edit" on the custom object

To create custom object records:

- "Create" on the custom object

To delete custom object records:

- "Delete" on the custom object

Viewing Custom Object Lists

Important: You might be viewing this page because your Salesforce administrator didn't create custom help. If you need information on a specific custom object, contact your administrator about [creating custom help](#) for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

The custom objects list page displays a list of custom object records in your current view. A list view includes custom object records of one type only; you cannot view more than one type of custom object in a single list view.

- Click a custom object name to view the custom object record detail. Click **Edit** or **Del** next to a custom object record name to [edit or delete the record](#).
- To take ownership of custom object records in a queue, view the queue list view, check the box next to one or more records, and then click **Accept**.

Note: You can view and accept records only from queues you belong to, or if you are higher in the role hierarchy than a queue member. Administrators, users with the "Modify All" object-level permission for the given object, and users with the "Modify All Data" permission, can view and take records from any queue.

- To transfer ownership of multiple records at once, select the box next to one or more custom object records and click **Change Owner**. Enter the new record owner, optionally select **Send Notification Email** to send an email to the new record owner, and click **Save**.
- Click **New Custom Object Name** or select the custom object name from the Create New drop-down list in the sidebar to [create a custom object of that type](#).

SEE ALSO:

[Custom Object Record Overview](#)

Administering Custom Objects

Custom Objects

Store information that's unique to your organization. Choose whether your custom objects are searchable, support sharing, or include access to the Bulk API and Streaming API.

Every custom object is classified as either an *Enterprise Application object* or a *Light Application object*. The difference between these two categories is that Light Application objects don't support sharing, access to the Bulk API, or access to the Streaming API.

If you need to track your organization's usage of each category, create a custom report type with a primary object of User Licenses and a child object of Custom Object Usage by User License Metrics.

By default, all custom objects are Enterprise Application objects. To make your custom object a Light Application object, disable **Allow Sharing**, **Allow Bulk API Access**, and **Allow Streaming API Access** on the object's detail page.

After you define a custom object, you can:

- Create custom fields.

EDITIONS

Available in: Salesforce Classic

Available in:

- Associate the custom object with other records and display the custom object data in custom related lists.
- Track tasks and events for custom object records.
- Build page layouts.
- Customize the search results and the custom object fields that display in them.
- Create a custom tab for the custom object.

 **Note:** To allow your users to find a custom object's records when they search, create a custom tab set to `Default On` or `Default Off`. Creating a custom tab enables the custom object's **Allow Search** setting.

- Create reports and dashboards to analyze custom object data.
- Share your custom objects, custom tabs, custom apps, and any other related components with other Salesforce users on Force.com AppExchange.
- Import custom object records.

SEE ALSO:

[Tip sheet: Building Custom Objects, Tabs, and Related Lists](#)

[Track Your Organization's Custom Object Usage by User License Type](#)

Manage Custom Objects

Create, customize, edit, delete, or truncate custom objects to extend the functionality that standard objects, like accounts and contacts, provide.

 **Note:** Your administrator may have created a tab without any help. If you need help to understand how a tab for a custom object works, contact your administrator.

Your object management settings list the custom objects that are defined for your organization. From this list, you can:

- Define a custom object.
- Display detailed information about a custom object.

Optional features you can customize include enabling search and reports, tracking activities, tracking field history, and making the object available for the Salesforce Customer Portal.

- To update the custom object definition, click **Edit** and update the desired fields.

 **Note:** The `Allow Reports`, `Allow Activities`, and `Allow Search` fields are not locked in Managed - Released and can be changed by the developer in future releases of a managed package.

- To [delete a custom object](#), click **Del**.
- To [truncate a custom object](#), click **Truncate**.
- To [view deleted custom objects](#), click the **Deleted Objects** link. The total number of deleted custom objects for your organization is listed in parentheses.

The detail page of the custom object provides information about various characteristics of the object, including standard fields, custom fields, field history tracking, relationships, custom links, search layouts, page layouts, and object limits. You can:

- Click individual items to display additional detail.
- To delete a custom field, click **Del** next to its name in the Custom Fields & Relationships section.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

Managed Packages are not available in **Database.com**.

USER PERMISSIONS

To create and edit custom objects:

- "Customize Application"

- Click **More** at the bottom of the page or **View More** below a related list to display more items.
 - Click **New** to directly add new items.
-  **Note:** The object limit percentages are truncated, not rounded. For example, if your organization uses 95.55% of the limit for a particular customization, the object limit displays 95%.

Deployment Status for Custom Objects and External Objects

While developing a custom object or external object, you might not want users to see and interact with it. Because users might get frustrated with changes in layout or lose data when you delete custom fields, control visibility of the new object until you are finished.

Use the `Deployment Status` setting in the object definition to control when users can see and use the object and its associated custom tab, related lists, and reports.

- Choose “In Development” as the `Deployment Status` when first creating your custom object or external object. Doing so hides it from users while you are designing and testing it. Only users with the “Customize Application” permission can see the object tab, search results, related lists, and report data types.
- Change the `Deployment Status` to “Deployed” when you want to allow all users to use the object and any associated custom tab, related lists, and reports.
- If you make more enhancements after deploying a custom object or external object, you can change the `Deployment Status` back to “In Development.”

-  **Note:** A custom report type's `Deployment Status` changes from `Deployed` to `In Development` if its primary object is a custom object whose `Deployment Status` similarly changes.

Fields for Defining Custom Objects

When you create a custom object, several fields are required to define how you can access the object.

 **Note:** If an administrator created a tab without including help, contact your administrator if you need help with how a custom object works.

Field	Description
Label	This name is used to refer to the object in a user interface page.
Plural Label	The plural name of the object. If you create a tab for this object, this name is used for the tab.
Gender	If it is appropriate for your organization's default language, specify the gender of the label. This field appears if the organization-wide default language expects gender. Your personal language preference setting does not affect whether the field appears. For example, if the organization's default language is English and your personal language is French, you aren't prompted for gender when creating a custom object.
Starts with a vowel sound	If it is appropriate for your organization's default language, indicate whether the label is preceded by "an" instead of "a."

EDITIONS

USER PERMISSIONS

To create and edit custom objects:

- "Customize Application"

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Field	Description
Object Name	A unique name used to refer to the object when using the API. In managed packages, this name prevents naming conflicts with package installations. Use only alphanumeric characters and underscores. The name must begin with a letter and have no spaces. It cannot end with an underscore nor have two consecutive underscores.
Description	An optional description of the object. A meaningful description helps you remember the differences between your custom objects when you are viewing them in a list.
Context-Sensitive Help Setting	<p>Defines what displays when a user clicks Help for this Page from the custom object record home (overview), edit, and detail pages, list views, and related lists.</p> <p>To display the standard Salesforce help available for any custom object record, select Open the standard Salesforce Help & Training window.</p> <p>To display custom object-level help for your custom object, select Open a window using a Visualforce page and then select the Visualforce page to use as the target of the context-sensitive help link from that custom object's pages.</p> <p> Note: This setting doesn't affect the Help & Training link at the top of a page. That link always opens the Salesforce Help & Training window.</p>
Record Name	The name used in page layouts, list views, related lists, and search results.
Data Type	The type of field (text or auto-number) for the record name. Records that have unique IDs instead of names are auto-numbered and always a read-only field.
Display Format	For an auto-numbered record name, enter the display format. You can have up to two sets of curly braces. For more information, see Custom Field Attributes on page 3825.
Starting Number	For an auto-numbered record name, enter the number to use when creating your first record for this custom object.
Allow Reports	<p>Makes the data in the custom object records available for reporting purposes.</p> <p>To create reports on custom objects, choose the Other Reports report type category unless the custom object has a relationship with a standard object. When the custom object has a master-detail relationship with a standard object, or is a lookup object on a standard object, select the standard object for the report type category instead.</p>

Field	Description
Allow Activities	Allows users to associate tasks and scheduled calendar events related to the custom object records.
Allow in Chatter Groups	Allows users to add records of this custom object type to Chatter groups.
Enable Divisions	If your organization has divisions enabled, select this option to enable the custom object for divisions. Divisions group records for simplified search results, list views, reports, and other areas within Salesforce. Salesforce adds a <code>Division</code> field to the custom object. If the custom object is the master in a master-detail relationship, custom objects on the detail side also get the <code>Division</code> field and inherit their division from the master record.
Available for Customer Portal	<p>Makes the custom object available to all portal users.</p> <p>This option is available only if your organization has a customer portal.</p> <p>If you enable Communities in your organization, this option no longer appears, and all custom objects are available in your communities. If, before enabling Communities, you had a Customer Portal and custom objects without this option selected, those objects become available in your Customer Portal.</p>
Track Field History	Enables your organization to track changes to fields on the custom object records. For example, it tracks who changed the field value and when, what the value was before the edit, and what it was changed to. History data is available for reporting, so users can easily create audit trail reports when this feature is enabled.
Allow Sharing	<p>When this setting is enabled, the custom object is an Enterprise Application object. When this setting isn't enabled, the custom object is a Light Application object.</p> <p>When this setting is enabled, you must also enable <code>Allow Bulk API Access</code> and <code>Allow Streaming API Access</code>.</p>
Allow Bulk API Access	<p>When this setting is enabled, the custom object is an Enterprise Application object. When this setting isn't enabled, the custom object is a Light Application object.</p> <p>When this setting is enabled, you must also enable <code>Allow Sharing</code> and <code>Allow Streaming API Access</code>.</p>
Allow Streaming API Access	<p>When this setting is enabled, the custom object is an Enterprise Application object. When this setting isn't enabled, the custom object is a Light Application object.</p> <p>When this setting is enabled, you must also enable <code>Allow Bulk API Access</code> and <code>Allow Sharing</code>.</p>

Field	Description
Deployment Status	Indicates whether the custom object is visible to other users.
Allow Search	To allow your users to find a custom object's records when they search, create a custom tab set to <code>Default On</code> or <code>Default Off</code> . Creating a custom tab enables the custom object's Allow Search setting. Custom object records are searchable in the Salesforce user interface only if the custom object is associated with a custom tab. Users aren't required to add the tab for display.
Add Notes & Attachments...	Allows users to attach notes and attachments to custom object records. You can attach external documents to any object record in much the same way that you can add a PDF file or photo as an attachment to an email. This option is available only when you are creating a new object.
Launch the New Custom Tab Wizard	Starts the custom tab wizard after you save the custom object.

SEE ALSO:

[Define a Custom Object](#)

Considerations for Creating Custom Objects

Before you create a custom object, make sure that you've reviewed the considerations.

Object Permissions

In Enterprise, Unlimited, Performance, and Developer Editions, when you create a custom object, the "Read," "Create," "Edit," and "Delete" permissions for that object are disabled for profiles that have "View All Data" or "Modify All Data" disabled. Enable access to custom objects in permission sets or custom profiles, and assign them to the users who need access.

In Contact Manager, Group, and Professional Editions, when you create a custom object, the "Read," "Create," "Edit," and "Delete" permissions for that object are enabled for all profiles.

Sharing Model

An organization-wide default setting controls the data sharing model for custom objects. For more information, see [Custom Object Security](#) on page 3796.

Delegating Custom Object Administration

After you create a custom object, you can delegate its administration to non-administrator users.

Queues

After you create a custom object, you can define queues to distribute ownership of custom object records to your users.

SEE ALSO:

[Define a Custom Object](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Modify Custom Objects

Customize the user interface for your custom objects by:

- Creating a custom tab; see [Defining Custom Tabs](#) on page 3731.
- Creating custom fields and relationships; see [Define Custom Object Fields](#) on page 3778.
- Adding customized buttons and links to perform actions or link to other pages or websites; see [Define Custom Buttons and Links](#) on page 4583.
- Defining which fields display for users on record detail and edit pages; see [Build Page Layouts for Custom Objects](#) on page 3713.
- Specifying which fields display for users in search results, lookup dialogs, and in the key lists on custom object tabs; see [Customize Search Layouts for Custom Objects](#) on page 3795.
- Creating record types to display different picklist values and page layouts to different users based on their profiles; see [Create Record Types for Custom Objects](#) on page 3794.

Define Custom Object Fields

Custom object fields store the data for your custom object records.

Custom Fields for Custom Objects

You can create custom fields to store information unique to your organization. You can also create custom relationship fields to associate your custom object with another object in Salesforce.

Standard Fields for Custom Objects

Custom objects automatically include the following standard fields. Click **Edit** to modify any of the editable fields.

Field	Description
Created By	User who created the record.
Currency	Currency of the record if multicurrency is enabled.
Division	Division to which the custom object record belongs. Custom objects that are "detail" objects in a master-detail relationship inherit their division from the master object. Custom objects that are not related to other records are automatically in the global division. Available only in organizations that use divisions to segment their data.
Last Modified By	User who most recently changed the record.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To customize custom objects:

- "Customize Application"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact**

Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer, and **Database.com** Editions

Divisions are not available in **Database.com**.

USER PERMISSIONS

To view and edit standard fields:

- "Customize Application"

To create custom fields:

- "Customize Application"

Field	Description
Name	Identifier for the custom object record. This name appears in page layouts, related lists, lookup dialogs, search results, and key lists on tab home pages. By default, this field is added to the custom object page layout as a required field.
Owner	Assigned owner of the custom object record. If the custom object becomes the detail side of a master-detail relationship, this field is removed, as ownership of the data is controlled by the master object, or by the primary master object for a custom object with two master-detail relationships. <p> Note: Custom objects on the “detail” side of a master-detail relationship can't have sharing rules, manual sharing, or queues, as these require the <code>Owner</code> field.</p>

Delete Custom Objects

When you delete a custom object, Salesforce does not add it to the Recycle Bin. Instead, deleted objects appear in the Deleted Objects list for 15 days. During this time, the object and its data are *soft deleted*, meaning you can restore or permanently erase (*hard delete*) the object and its data. After 15 days, the object and its data are automatically hard deleted.

Soft-deleted custom objects and their data count against your organization's limits; hard-deleted items do not.

To delete a custom object:

1. From the object management settings for custom objects, click **Del** next to object that you want to delete.
2. When prompted, select the *Yes, I want to delete the custom object* checkbox to confirm and click **Delete**.

Why Can't I Delete a Certain Custom Object?

You can't delete a custom object if it:

- Is on the master side of a master-detail relationship.
- Contains custom fields that are used in a roll-up summary field on another object.
- Is referenced in Apex, a Visualforce page, or an reporting snapshot.
- Is referenced by a duplicate rule or a matching rule.
- Contains more than 100,000 records. If the object you want to delete has more than 100,000 records, first delete an appropriate number of records and then delete the object.

Results of Deleting Custom Objects

When you delete a custom object, Salesforce:

- Displays an `Insufficient Privileges` message if someone clicks a bookmark to a deleted custom object record's URL.
- Removes the object from Force.com AppExchange packages.

EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

USER PERMISSIONS

To delete custom objects:

- “Customize Application”

- Changes the master-detail relationship to a lookup relationship, if the deleted object is on the detail side of a master-detail relationship.
- Removes or erases:
 - The object's custom tab
 - List views and workflow rules for the object
 - Mobile configuration settings, including data sets, mobile views, and excluded fields
 - Standard report types associated with the object, and reports based on standard report types if the deleted object is on the detail side of a master-detail relationship
- Hides, inactivates, or disables:
 - The custom object definition and related definitions
 - The object's records and related records, including any records in the Recycle Bin
 - Custom report types for which the deleted object is the main object
 - Custom reports for which the deleted object is the main object
 - Custom formula fields on the object
 - Custom validation rules and approval processes on the object

 **Note:** Many removed, hidden, inactive, or disabled items can be restored if you undelete the custom object. See [Manage Deleted Custom Objects](#) for information about restoring deleted custom objects.

Results of Hard Deleting Custom Objects

When a custom object is hard deleted, either manually, or automatically after 15 days:

- The custom object's definition and data are permanently deleted, and can't be restored.
- The custom object and its data no longer count against your organization's limits.
- If the deleted object is on the detail side of a master-detail relationship, master records currently in the Recycle Bin aren't restorable if one or more detail records were automatically deleted as a result of the master record being deleted. Attempting to undelete the master record results in an error.

 **Note:** This only happens when the deleted detail records have their custom object definition hard deleted while the master record is in the Recycle Bin.

SEE ALSO:

[Manage Deleted Custom Objects](#)

[Find Object Management Settings](#)

Manage Deleted Custom Objects

Deleted custom objects appear in the Deleted Objects list for 15 days. During this time, you can choose to permanently delete the object and its data, or you can undelete them. If you undelete a custom object, you might need to do some manual cleanup to restore list views and other customizations that use the object.

- To view a list of deleted custom objects:
 1. Go to the object management settings for custom objects.
 2. Click **Deleted Objects** at the bottom of the list.

The Deleted Objects link appears only when you have at least one deleted custom object in your organization. The number in parentheses indicates the total number of deleted custom objects.

- In the Deleted Objects list, you can do any of the following:
 - Click the object’s label to view details about it
 - Click **Erase** to permanently remove the object and its data
 - Click **Undelete** to restore the object and its data

Results of Hard Deleting Custom Objects

When a custom object is hard deleted, either manually, or automatically after 15 days:

- The custom object’s definition and data are permanently deleted, and can’t be restored.
- The custom object and its data no longer count against your organization’s limits.
- If the deleted object is on the detail side of a master-detail relationship, master records currently in the Recycle Bin aren’t restorable if one or more detail records were automatically deleted as a result of the master record being deleted. Attempting to undelete the master record results in an error.

 **Note:** This only happens when the deleted detail records have their custom object definition hard deleted while the master record is in the Recycle Bin.

Limitations for Restoring Truncated Custom Objects

Copies of truncated custom objects also appear in the list of deleted objects. Truncated custom objects can’t be restored to their original state, even from their copies in the Deleted Objects list. Undeleted copies of truncated objects have a new name and new URL, and some fields and data *cannot* be manually restored.

Restoring a Custom Object to Its Predeleted State

When you restore a deleted custom object, its records are also undeleted, including any that were in the Recycle Bin.

 **Note:** It might take several hours before you can search the undeleted object’s records.

To ensure that you return the object to its fully functional, predeleted state, check all affected conditions and customizations, and manually fix them if necessary.

AppExchange packages

Add the custom object to any appropriate Force.com AppExchange packages.

EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

USER PERMISSIONS

To restore deleted custom objects:

- “Customize Application”

To permanently delete custom objects:

- “Customize Application”

Custom tabs

Re-create a custom tab for the object and add it to any custom apps that use it.

List views, reports, and workflow rules

Re-create them.

Validation rules and approval processes

Re-activate them.

Formula fields

Open and save any custom formula fields on the object to re-enable them.

Page layouts

Page layouts are restored automatically on the undeleted object. Page layouts are also restored automatically on other objects that use the page layout in a related list—as long as the page layout wasn't edited while the object was deleted. Otherwise, you have to add the related list back to the other object.

Custom report types

For custom report types where the deleted object was not the main object, add the reference back to the restored object. Reports based on the custom report type are automatically restored if they weren't edited while the object was deleted. Re-create any reports that have been edited.

Relationships

If the deleted custom object was on the detail side of a master-detail relationship, Salesforce converted it to a lookup relationship. Change it back to master-detail.

Developer name

The developer name for the object was changed to *objectname_del*. Change it back to the original name, *objectname_c*, so that customizations using the name will work properly.

Deployment status

When the custom object was deleted, its `Deployment Status` field was set to In Development. When you've restored all affected customizations to the undeleted object, change its status back to Deployed.

Truncating Custom Objects

It's important to understand what truncating an object does before using it to remove records.

Truncating a custom object allows you to remove all of the object's records, while keeping the object and its metadata. Truncating custom objects is similar to the mass delete option available for standard objects.

When you truncate a custom object, Salesforce places a copy of the truncated object in the Deleted Objects list for 15 days. It appears in the list as `objectname_trunc [number]`. During this period, the object and its records continue to count against your organization limits.

After 15 days, the records are permanently erased and no longer count against your limits.

Important: Truncated custom objects can't be restored to their original state, even from their copies in the Deleted Objects list.

You can't truncate standard objects or custom objects that:

- Are referenced by another object through a lookup field or that are on the master side of a master-detail relationship
- Are referenced in a reporting snapshot
- Have a custom index or an external ID
- Have activated skinny tables

In addition, you can't truncate custom objects when your organization has reached its limit of the allowed number of custom objects.

Truncating a custom object erases:

- All records currently sitting in the custom object's Recycle Bin
- The custom object's history
- Related events, tasks, notes, and attachments for each deleted record

Truncating a custom object breaks:

- Bookmarks to the truncated objects and its records. If someone clicks a bookmark to the truncated custom object or to a deleted record's URL, Salesforce displays an `Insufficient Privileges` message.
- Apex scripts and Visualforce pages with references to a truncated object or record.

After truncating a custom object, you can continue to use the custom object and add new records. Salesforce preserves:

- The custom object definition and all related definitions
- Workflow rules, actions, and triggers
- Sharing rules associated with the custom object
- Validation rules and approval processes
- Master-detail relationships and formula fields
- Translations
- Mobile configuration settings

When working with truncated objects, keep in mind:

- The truncated object tab has a new URL, so new bookmarks need to be created.
- List views and reports need to be refreshed after truncation.
- Roll-up summary fields need to be recalculated after truncation.
- There is no support for truncation in the API.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

- To truncate objects that contain master-detail relationships, first truncate the detail (child) objects and then the (master) parent objects, working your way up the relationship tree.

[Truncate Custom Objects](#)

[Manage Deleted Custom Objects](#)

Truncate Custom Objects

Truncating custom objects allows you to permanently delete all of the object's records but preserve the empty object and its metadata.

-  **Important:** Truncating custom objects causes some irreversible changes to the truncated object and its records. Before truncating, see [Truncating Custom Objects](#). Then, enable it for your organization by entering *User Interface* in the *Quick Find* box, selecting **User Interface**, and then selecting the permission.

Truncating custom objects is a fast way to permanently remove all of the records from a custom object, while keeping the object and its metadata intact for future use. Truncating is useful, for example, if you have created a custom object and filled it with test records. When you're done with the test data, you can truncate the object to purge the test records, but keep the object and put it into production. This is much faster than batch-deleting records and possibly recreating the object.

1. Go to the object management settings for custom objects.
2. Click an object name to go to the object's detail page, and then click **Truncate**.
3. In the Confirm Custom Object Truncate window, review the warning and then enter the name of the object to truncate in the empty field.
4. Click **Truncate**.

USER PERMISSIONS

To truncate custom objects:

- "Customize Application"

Track Your Organization’s Custom Object Usage by User License Type

To keep track of how many custom objects your users are assigned to, create a custom report type with the User Licenses and Custom Object Usage by User License Metrics objects.

1. From Setup, enter *Report Types* in the *Quick Find* box, then select **Report Types**.
2. Click **New Custom Report Type**.
3. Fill out the fields.

For this field...	Enter or select...
Primary Object	User Licenses
Report Type Label	A label for this report type. The label appears when users create a report. For example, <i>Custom Object Usage by User License</i> .
Report Type Name	A unique name for this report type.
Description	A description for this report type. This description appears when users create a report.
Store in Category	Other Reports

4. (Optional) To make this report type available to other users, select a *Deployment Status* of *Deployed*.
5. Click **Next**.
6. Click the box under the primary object.
7. Select *Custom Object Usage by User License Metrics*.
8. Click **Save**.
9. Create a report using the new report type.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Custom objects are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Custom report types are available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create or update custom report types:

- “Manage Custom Report Types”

To delete custom report types:

- “Modify All Data”

Object Relationships Overview

Create relationships to link objects with each other, so that when your users view records, they can also see related data. For example, link a custom object called “Bugs” to cases to track product defects that are associated with customer cases.

You can define different types of relationships by creating custom relationship fields on an object. Before you begin creating relationships, determine the type of relationship that suits your needs.

Different types of relationships between objects in Salesforce determine how they handle data deletion, sharing, and required fields in page layouts. Let’s review the types of relationships.

Master-detail

Closely links objects together such that the master record controls certain behaviors of the detail and subdetail record. For example, you can define a two-object master-detail relationship, such as Account—Expense Report, that extends the relationship to subdetail records, such as Account—Expense Report—Expense Line Item. You can then perform operations across the master—detail—subdetail relationship.

Behaviors of master-detail relationships include:

- Deleting a detail record moves it to the Recycle Bin and leaves the master record intact; deleting a master record also deletes related detail and subdetail records. Undeleting a detail record restores it, and undeleting a master record also undeletes related detail and subdetail records. However, if you delete a detail record and later, separately, delete its master record, you cannot undelete the detail record, as it no longer has a master record to relate to.
- By default, records can’t be reparented in master-detail relationships. Administrators can, however, allow child records in master-detail relationships on custom objects to be reparented to different parent records by selecting the `Allow reparenting` option in the master-detail relationship definition.
- The `Owner` field on the detail and subdetail records is not available and is automatically set to the owner of the master record. Custom objects on the “detail” side of a master-detail relationship can’t have sharing rules, manual sharing, or queues, as these require the `Owner` field.
- The security settings for the master record control the detail and subdetail records.
- The master-detail relationship field (which is the field linking the objects) is required on the page layout of the detail and subdetail records.
- The master object can be a standard object, such as Account or Opportunity, or a custom object.
- As a best practice, don’t exceed 10,000 child records for a master-detail relationship.

Many-to-many

You can use master-detail relationships to model *many-to-many* relationships between any two objects. A many-to-many relationship allows each record of one object to be linked to multiple records from another object and vice versa. For example, you may have a custom object called “Bug” that relates to the standard case object such that a bug could be related to multiple cases and a case could also be related to multiple bugs.

Lookup

Links two objects together. Lookup relationships are similar to master-detail relationships, except they do not support sharing or roll-up summary fields. With a lookup relationship, you can:

- Link two different objects.
- Link an object with itself (with the exception of the user object; see [Hierarchical](#) on page 3787). For example, you might want to link a custom object called “Bug” with itself to show how two different bugs are related to the same problem.

 **Note:** Lookup relationships from objects related to the campaign member object aren’t supported; however, you can create lookup relationships from the campaign member object related to other objects.

EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

When you create a lookup relationship, you can set these options:

- Make the lookup field required for saving a record, requiring it on the corresponding page layout as well.
- If the lookup field is optional, you can specify one of three behaviors to occur if the lookup record is deleted:
 - `Clear the value of this field` This is the default. Clearing the field is a good choice when the field does not have to contain a value from the associated lookup record.
 - `Don't allow deletion of the lookup record that's part of a lookup relationship` This option restricts the lookup record from being deleted if you have any dependencies, such as a workflow rule, built on the relationship.
 - `Delete this record also` Available only if a custom object contains the lookup relationship, not if it's contained by a standard object. However, the lookup object can be either standard or custom. Choose when the lookup field and its associated record are tightly coupled and you want to completely delete related data. For example, say you have an expense report record with a lookup relationship to individual expense records. When you delete the report, you probably want to delete all of the expense records, too.

Warning: Choosing `Delete this record also` can result in a *cascade-delete*. A cascade-delete bypasses security and sharing settings, which means users can delete records when the target lookup record is deleted *even if they don't have access to the records*. To prevent records from being accidentally deleted, cascade-delete is disabled by default. Contact Salesforce to get the cascade-delete option enabled for your organization.

Cascade-delete and its related options are not available for lookup relationships to business hours, community, lead, price book, product, or user objects.

When you define a lookup relationship, you have the option to include a lookup field on the page layouts for that object as well as create a related list on the associated object's page layouts. For example, if you have a custom object called "PTO Requests" and you want your users to link a PTO request with the employee submitting the request, create a lookup relationship from the PTO Request custom object with the user object.

If the parent record in a lookup relationship is deleted, the field history tracking for the child record does not record the deletion. For example, if a parent account is deleted, the Account History related list for the child account does not show the deletion.

You can't delete an object or record in a lookup relationship if the combined number of records between the two linked objects is more than 100,000. To delete an object or record in a lookup relationship, first delete an appropriate number of its child records.

External lookup

An external lookup relationship links a child standard, custom, or external object to a parent external object. When you create an external lookup relationship field, the standard External ID field on the parent external object is matched against the values of the child's external lookup relationship field. External object field values come from an external data source.

Indirect lookup

An indirect lookup relationship links a child external object to a parent standard or custom object. When you create an indirect lookup relationship field on an external object, you specify the parent object field and the child object field to match and associate records in the relationship. Specifically, you select a custom unique, external ID field on the parent object to match against the child's indirect lookup relationship field, whose values come from an external data source.

Hierarchical

A special lookup relationship available for only the user object. It lets users use a lookup field to associate one user with another that does not directly or indirectly refer to itself. For example, you can create a custom hierarchical relationship field to store each user's direct manager.

 **Tip:** When creating a hierarchical field in Personal, Contact Manager, Group, and Professional Editions, you can select the `Restricted Field` checkbox so that only users with the “Manage Internal Users” permission can edit it. In Enterprise, Unlimited, Performance, and Developer Edition, use field-level security instead.

- [Define a Custom Object](#)

Create a Many-to-Many Relationship

You can use master-detail relationships to model *many-to-many* relationships between any two objects. A many-to-many relationship allows each record of one object to be linked to multiple records from another object and vice versa. For example, you may have a custom object called “Bug” that relates to the standard case object such that a bug could be related to multiple cases and a case could also be related to multiple bugs. When modeling a many-to-many relationship, you use a *junction object* to connect the two objects you want to relate to each other.

Junction Object

A custom object with two master-detail relationships. Using a custom junction object, you can model a “many-to-many” relationship between two objects. For example, you may have a custom object called “Bug” that relates to the standard case object such that a bug could be related to multiple cases and a case could also be related to multiple bugs.

Creating the many-to-many relationship consists of:

1. [Creating the junction object](#).
2. [Creating the two master-detail relationships](#).
3. [Customizing the related lists](#) on the page layouts of the two master objects.
4. [Customizing reports](#) to maximize the effectiveness of the many-to-many relationship.

Creating the Junction Object

1. [Create a custom object to be your junction object](#).
2. In the custom object wizard, consider these tips specifically for junction objects:
 - Name the object with a label that indicates its purpose, such as `BugCaseAssociation`.
 - For the `Record Name` field, it is recommended that you use the auto-number data type.
 - Do not launch the custom tab wizard before clicking **Save**. Junction objects do not need a tab.

Creating the Two Master-Detail Relationships

To create the two master-detail relationships:

1. Verify that the two objects you want to relate to each other already exist. For example, you may want to relate the standard case object to a custom bug object.
2. On the junction object, create the first master-detail relationship field. In the custom field wizard:
 - a. Choose `Master-Detail Relationship` as the field type.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

Reports are not available in **Database.com**.

USER PERMISSIONS

To create a many-to-many relationship:

- “Customize Application”

- b. Select one of the objects to relate to your junction object. For example, select *Case*.

The first master-detail relationship you create on your junction object becomes the *primary* relationship. This affects the following for the junction object records:

- Look and feel: The junction object's detail and edit pages use the color and any associated icon of the primary master object.
- Record ownership: The junction object records inherit the value of the `Owner` field from their associated primary master record. Because objects on the detail side of a relationship do not have a visible `Owner` field, this is only relevant if you later delete both master-detail relationships on your junction object.
- Division: If your organization uses divisions to segment data, the junction object records inherit their division from their associated primary master record. Similar to the record ownership, this is only relevant if you later delete both master-detail relationships.

- c. Select a `Sharing Setting` option. For master-detail relationship fields, the `Sharing Setting` attribute determines the sharing access that users must have to a master record in order to create, edit, or delete its associated detail records.
- d. For the `Related List Label` that will display on the page layout of the master object, do not accept the default. Change this to use the name of the other master object in your many-to-many relationship. For example, change this to *Bugs* so users will see a Bugs related list on the case detail page.

3. On the junction object, create the second master-detail relationship. In the custom field wizard:

- a. Choose `Master-Detail Relationship` as the field type.
- b. Select the other desired master object to relate to your junction object. For example, select *Bug*.

The second master-detail relationship you create on your junction object becomes the *secondary* relationship. If you delete the primary master-detail relationship or convert it to a lookup relationship, the secondary master object becomes primary.

- c. Select a `Sharing Setting` option. For master-detail relationship fields, the `Sharing Setting` attribute determines the sharing access that users must have to a master record in order to create, edit, or delete its associated detail records.
- d. For the `Related List Label` that will display on the page layout of the master object, do not accept the default. Change this to use the name of the other master object in your many-to-many relationship. For example, change this to *Cases* so users will see a Cases related list on the bug detail page.

Customizing Many-to-Many Relationship Related Lists

For a many-to-many relationship in Salesforce, each master object record displays a related list of the associated junction object records. To create a seamless user experience, you can change the name of the junction object related list on each of the master object page layouts to have the name of the other master object. For example, you might change the `BugCaseAssociations` related list to *Cases* on the bugs page layout and to *Bugs* on the cases page layout. You can further customize these related lists to display fields from the other master object.

To customize the fields that display in the junction object related list on each master object page layout:

1. Edit the page layout of each master object that is related to the junction object. For example, modify the `BugCaseAssociations` related list for case records by editing the page layout for cases.
2. Edit the properties of the related list you want to modify. For example, on cases the `BugCaseAssociations` related list was renamed to *Bugs*, so select the *Bugs* related list.
3. Add the fields to display in the related list. You can add fields from the junction object itself, but more importantly, you can add fields from the other master object.

Each field is prefixed with its object name in the popup window. In the related list itself, only fields from the junction object are prefixed with the object name; fields from the other master object are not.

 **Note:** The junction object related list does not include an icon on the master record's detail pages because the junction object does not have a custom tab. If you make a tab for the junction object, the icon is included.

Customizing Reports for Many-to-Many Relationships

Many-to-many relationships provide two standard report types that join the master objects and the junction object. The report types are:

- “Primary master with junction object and secondary master” in the primary master object's report category.
- “Secondary master with junction object and primary master” in the secondary master object's report category.

The order of the master objects in the report type is important. The master object listed first determines the scope of records that can be displayed in the report.

You can create custom reports based on these standard report types. In addition, you can create custom report types to customize which related objects are joined in the report.

SEE ALSO:

- [Object Relationships Overview](#)
- [Considerations for Relationships](#)
- [Define a Custom Object](#)
- [Find Object Management Settings](#)
- [Find Object Management Settings](#)

Considerations for Relationships

Review the following considerations before creating relationships between objects:

Relationship Limits

Each custom object can have up to two master-detail relationships and many lookup relationships. Each relationship is included in the maximum number of custom fields allowed.

Converting Relationships

You can convert a master-detail relationship to a lookup relationship as long as no roll-up summary fields exist on the master object.

You can convert a lookup relationship to a master-detail relationship, but only if the lookup field in all records contains a value.

Self Relationships

You can create a relationship from an object to itself, but it must be a lookup relationship, and a single record can't be linked to itself. However, a record can indirectly relate to itself. For example, the Holiday Promotion campaign can have the Direct Mail campaign selected in the lookup relationship, and the Direct Mail campaign can have the Holiday Promotion campaign selected in the lookup relationship.

You can't create a many-to-many self relationship, that is, the two master-detail relationships on the junction object can't have the same master object.

Icons for Custom Related Lists

The icon you select for the associated custom tab also displays in any custom related list you create based on a relationship.

Custom related lists do not include an icon if they are based on a relationship with a custom object that does not have a custom tab.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

Lightning Connect external objects are available in: **Developer** Edition and for an extra cost in: **Enterprise, Performance**, and **Unlimited** Editions

Master-Detail Relationships

To create multilevel master-detail relationships, you need the “Customize Application” user permission.

When you define a master-detail relationship, the custom object on which you are working is the “detail” side. Its data can appear as a custom related list on page layouts for the other object.

By default, records can't be reparented in master-detail relationships. Administrators can, however, allow child records in master-detail relationships on custom objects to be reparented to different parent records by selecting the `Allow reparenting` option in the master-detail relationship definition.

You can have up to three custom detail levels.

Standard objects can't be on the detail side of a custom object in a master-detail relationship.

An object can appear once in multilevel master-detail relationships. For example, a subdetail object in one multilevel master-detail relationship can't also be the owner of the master object in another multilevel master-detail relationship. A subdetail object can't also be the master object of the subdetail object's detail object.

Multilevel master-detail relationships do not support division transfers.

You can't create a master-detail relationship if the custom object already contains data. You can, however, create the relationship as a lookup and then convert it to master-detail if the lookup field in all records contains a value.

Converting relationships from lookup to master-detail, or from master-detail to lookup behaves the same as for two-object master-detail relationships. That is, the two linked objects in the detail-subdetail1, or subdetail1-subdetail2 relationship have the same conversion limits as the master-detail relationship.

Roll-up summary fields work as in two-object master-detail relationships. A master can roll up fields on detail records; however, it can't directly roll up fields on subdetail records. To achieve this, the detail record must have a roll-up summary field for the field on the subdetail record, allowing the master to roll up from the detail's roll-up summary field.

You can use multilevel master-detail relationships in custom report types. The `Allow Reports` checkbox must be checked when you create the custom object. Custom report types created for multilevel master-detail relationships count towards the organizations custom report type limit and no reports are generated if this limit is exceeded.

Custom junction objects can't have detail objects. That is, a custom junction object can't become the master object in a multilevel master-detail relationship.

You can't delete a custom object if it is on the master side of a master-detail relationship. If you delete a custom object that is on the detail side of a master-detail relationship, the relationship is converted to a lookup relationship.

Deleting a detail record moves it to the Recycle Bin and leaves the master record intact; deleting a master record also deletes related detail and subdetail records. Undeleting a detail record restores it, and undeleting a master record also undeletes related detail and subdetail records. However, if you delete a detail record and later, separately, delete its master record, you cannot undelete the detail record, as it no longer has a master record to relate to.

As a best practice, don't exceed 10,000 child records for a master-detail relationship.

Many-to-Many Relationships

Junction object records are deleted when either associated master record is deleted and placed in the Recycle Bin. If both associated master records are deleted, the junction object record is deleted permanently and can't be restored.

Sharing access to a junction object record is determined by a user's sharing access to both associated master records and the `Sharing Setting` option on the relationship field. See [Custom Object Security](#) on page 3796. For example, if the sharing setting on both parents is Read/Write, then the user must have Read/Write access to *both* parents in order to have Read/Write access to the junction object. If, on the other hand, the sharing setting on both masters is Read-Only, a user with Read-Only rights on the master records would have Read/Write access to the junction object.

In a many-to-many relationship, a user can't delete a parent record if there are more than 200 junction object records associated with it *and* if the junction object has a roll-up summary field that rolls up to the other parent. To delete this object, manually delete junction object records until the count is fewer than 200.

The first master-detail relationship you create on your junction object becomes the *primary* relationship. This affects the following for the junction object records:

- **Look and feel:** The junction object's detail and edit pages use the color and any associated icon of the primary master object.
- **Record ownership:** The junction object records inherit the value of the `OWNER` field from their associated primary master record. Because objects on the detail side of a relationship do not have a visible `OWNER` field, this is only relevant if you later delete both master-detail relationships on your junction object.
- **Division:** If your organization uses divisions to segment data, the junction object records inherit their division from their associated primary master record. Similar to the record ownership, this is only relevant if you later delete both master-detail relationships.

The second master-detail relationship you create on your junction object becomes the *secondary* relationship. If you delete the primary master-detail relationship or convert it to a lookup relationship, the secondary master object becomes primary.

Roll-up summary fields that summarize data from the junction object can be created on both master objects.

Formula fields and validation rules on the junction object can reference fields on both master objects.

You can define Apex triggers on both master objects and the junction object.

A junction object can't be on the master side of another master-detail relationship.

You can't create a many-to-many self relationship, that is, the two master-detail relationships on the junction object can't have the same master object.

Lookup Relationships

If the lookup field is optional, you can specify one of three behaviors to occur if the lookup record is deleted:

- `Clear the value of this field` This is the default. Clearing the field is a good choice when the field does not have to contain a value from the associated lookup record.
- `Don't allow deletion of the lookup record that's part of a lookup relationship` This option restricts the lookup record from being deleted if you have any dependencies, such as a workflow rule, built on the relationship.
- `Delete this record also` Available only if a custom object contains the lookup relationship, not if it's contained by a standard object. However, the lookup object can be either standard or custom. Choose when the lookup field and its associated record are tightly coupled and you want to completely delete related data.

Warning: Choosing `Delete this record also` can result in a *cascade-delete*. A cascade-delete bypasses security and sharing settings, which means users can delete records when the target lookup record is deleted *even if they don't have access to the records*. To prevent records from being accidentally deleted, cascade-delete is disabled by default. Contact Salesforce to get the cascade-delete option enabled for your organization.

Cascade-delete and its related options are not available for lookup relationships to business hours, community, lead, price book, product, or user objects.

In a chain of lookup relationships, these behaviors work independently on each target field at each level. Say, for example, field A is the target lookup of field B, which in turn is the target lookup of field C. You can have a delete restriction on A and none on B, which means that A can't be deleted but B can. Once B is deleted, the relationship between A and B no longer exists and C will hold an empty value for the lookup.

In a multilevel lookup relationship, these options might conflict. For example, in the scenario where field A is the target lookup of field B, which in turn is the target lookup of field C, you might specify that A can delete B, but B cannot be deleted because it's in a relationship with C. If you try to delete A, you'll get an error saying that B can't be deleted because it's linked to C.

If the parent record in a lookup relationship is deleted, the field history tracking for the child record does not record the deletion. For example, if a parent account is deleted, the Account History related list for the child account does not show the deletion.

Relationships on External Objects

Lookup, external lookup, and indirect lookup relationships have some special behaviors and limitations.

- Only lookup, external lookup, and indirect lookup relationships are available for external objects. No other relationship types are supported.
- Indirect lookup relationship fields can be created on external objects only.
- Depending on the availability of the external system, related lists of child external objects may load slowly when users view the parent record detail pages.
- With external lookup and indirect lookup relationships, the parent record appears as a clickable link in the relationship field on the child record. If the child record is viewed by a user who doesn't have access to the parent record, the parent record appears in the relationship field as plain text instead of a link.
- Only objects that have a custom field with the `EXTERNAL ID` and `UNIQUE` attributes are available as parent objects in indirect lookup relationships. If you don't see the desired object when you create an indirect lookup relationship field, add a custom unique, external ID field to that object.
- Lookup filters aren't available for external lookup relationship fields.
- Cascade-delete isn't available for external object relationships.

Impact of Relationships on Reports

The type of relationship you create affects which standard report types are available and how they are categorized. These report types determine which related objects can be included in the report:

- Lookup relationships allow data from the two related objects to be joined in one report.
- Master-detail relationships allow data from three objects to be joined in one report: the master object, the detail object, plus one other lookup object. If the detail object has multiple lookup relationships, a separate report type is available based on each lookup.
- Many-to-many relationships provide two standard report types that join the master objects and the junction object. The report types are:
 - “Primary master with junction object and secondary master” in the primary master object's report category.
 - “Secondary master with junction object and primary master” in the secondary master object's report category.

The order of the master objects in the report type is important. The master object listed first determines the scope of records that can be displayed in the report.

The reporting impact of each relationship type is summarized in the following table:

Relationship Type	Standard Report Types	Report Type Category
Lookup	Object by itself Object with first lookup Object with second lookup Object with third lookup	Based on the object
Master-Detail	Master object by itself Master object with detail object Master object with detail object and first lookup	Master object

Relationship Type	Standard Report Types	Report Type Category
	Master object with detail object and second lookup	
	Master object with detail object and third lookup	
Many-to-Many	Primary master object by itself	Primary master object
	Secondary master object by itself	and
	Primary master object with junction object and secondary master object	Secondary master object
	Secondary master object with junction object and primary master object	

Custom report types give you more flexibility to join data from multiple objects, including lookups as well as master-detail relationships.

Important: Converting a relationship from lookup to master-detail or vice versa can cause existing custom reports to become unusable due to the different standard report types available for each type of relationship. We recommend that you test your custom reports immediately after converting the relationship type. If you revert your relationship back to the original type, the reports are restored and become usable again.

Create Record Types for Custom Objects

Create record types for a custom object to display different picklist values and page layouts to different users based on their profiles.

1. From the object management settings for a custom object, go to Record Types.
2. Click **New** in the Record Types related list.
3. Choose **Master** from the **Existing Record Type** drop-down list to copy all available picklist values, or choose an existing record type to clone its picklist values.

Note: When you create a new record type without cloning an existing one, the new record type automatically includes the master picklist values for both standard and custom picklists. You can then customize the picklist values for the record type.

4. Enter a **Record Type Label** that's unique within the object.
5. Enter a description.
6. Select **Active** to activate the record type.
7. Select **Enable for Profile** next to a profile to make the record type available to users with that profile. Select the checkbox in the header row to enable it for all profiles.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create record types for custom objects:

- "Customize Application"

 **Tip:** If each profile is associated with a single record type, users will never be prompted to select a record type when creating new records.

8. For enabled profiles, select `Make Default` to make it the default record type for users of that profile. Select the checkbox in the header row to make it the default for all profiles.
9. Click **Next**.
10. Choose a page layout option to determine what page layout displays for records with this record type:
 - To apply a single page layout for all profiles, select `Apply one layout to all profiles` and choose the page layout from the drop-down list.
 - To apply different page layouts based on user profiles, select `Apply a different layout for each profile` and choose a page layout for each profile.
11. Click **Save** to edit the values of the standard and custom picklists available for the record type, or click **Save and New** to create another record type.

[Find Object Management Settings](#)

Customize Search Layouts for Custom Objects

You can customize which custom object fields display for users in search results, lookup dialogs, and the key lists on custom tab home pages. You can specify a different set of fields to show in each search layout. The settings apply to all users in your organization.

You can also customize which buttons display in custom list views and search results. You can hide a standard list view button or display a custom button. Standard buttons aren't available on search result layouts. To display a custom button, create the custom button, giving it the `List Button Display Type`.

1. From the object management settings for a custom object, go to Search Layouts.
2. Click **Edit** next to the search layout that you want to modify.

 **Note:** The fields you select for the key lists on the custom tab home page are also used as the columns displayed in the default All list view and as the default columns for any new list views. To view different columns, customize the list view itself.

3. Move fields between Available Fields and Selected Fields.
 - To customize which fields display in the layout, select one or more fields and click **Add** or **Remove**.
 - To sort fields in the layout, select one or more fields in Selected Fields and click **Up** or **Down**.
 - To select multiple fields individually, use CTRL+click.
 - To select multiple fields as a group, use SHIFT+click.
4. Click **Save**.

Custom Object Security

Learn how security settings work together so you can control access to your custom objects with great flexibility.

Set custom object security at the following levels

- **Tab**—display the custom tab for the appropriate users based on their user profiles.
- **Object**—set the access users have to create, read, edit, and delete records for each object.
- **Records**—set the default sharing model for all your users. This determines the access users have to custom object records that they do not own.
- **Relationship**—for objects on the detail side of a master-detail relationship, specify the sharing access that users must have to the master record in order to create, edit, or delete the associated detail records. This is specified in the `Sharing Setting` attribute of the master-detail relationship field on the detail object.
- **Fields**—set the level of access users have to fields on your custom object page layout.

These requirements apply to custom objects with no master-detail relationship.

Action	Required Privileges
Create a record	“Create” permission. The user must have the tab displayed to create a new record from the Create New drop-down list in the sidebar.
View a record	“Read” permission and Public Read Only or Public Read/Write sharing model if not the record owner.
Edit a record	“Edit” permission and Public Read/Write sharing model if not the record owner.
Delete a record	“Delete” permission and must be the record owner or above the record owner in the role hierarchy.

These requirements apply to custom objects that have a master-detail relationship with a standard or custom object.

Action	Required Privileges
Create a record	“Create” permission and either read or read/write access to the related master record, depending on the value of the <code>Sharing Setting</code> attribute of the master-detail relationship field on the detail object.
View a record	“Read” permission and read access to the related master record. If the record has two master records in a many-to-many relationship, the user must have read access to both master records.
Edit a record	“Edit” permission and either read or read/write access to the related master record, depending on the value of the <code>Sharing Setting</code> attribute of the master-detail relationship field on the detail object.
Delete a record	“Delete” permission and either read or read/write access to the related master record, depending on the value of the <code>Sharing</code>

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Tabs are not available in **Database.com**.

Action**Required Privileges**

Setting attribute of the master-detail relationship field on the detail object.

When a user deletes a record that has related custom object records, all related custom object records are deleted regardless of whether the user has delete permission to the custom object.

Delegated administrators can manage nearly every aspect of specified custom objects, but they cannot create or modify relationships on the object or set organization-wide sharing defaults.

Notes on Enabling Activities for Custom Objects

- If you enable activities when creating a custom object, the activity related lists are added to the default page layout automatically. If you enable activities later, after the custom object already exists, you must add the related lists to the page layout manually.
- Disabling activities for a custom object does not delete existing activity records. However, activity related lists are removed from custom object pages, and reports containing activities and the custom object are deleted.
- If a custom object has a master-detail relationship with accounts, the custom object's activities roll up to the account and cause the account's `Last Activity` date to be updated. For custom objects related to other types of records, the activities do not roll up.
- The ability to send emails or create mail merge documents is available for activities on custom objects. The email must be sent to a contact or lead.
- When you change the ownership of a custom object record, any open activities related to that custom object are also transferred to the new record owner.
- You cannot disable activity tracking for a custom object if any workflow tasks are associated with that custom object, or if tasks and events are child data sets of the custom object in a mobile configuration.
- Custom object records can only be associated with a call log in Salesforce CRM Call Center if activities are enabled for the object.

Managing Your Custom Objects and Fields With Schema Builder

Schema Builder Overview

Schema Builder provides a dynamic environment for viewing and modifying all the objects and relationships in your app. This greatly simplifies the task of designing, implementing, and modifying your data model, or schema.

You can view your existing schema and interactively add new custom objects, custom fields, and relationships, simply by dragging and dropping. Schema Builder automatically implements the

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: All Editions

changes and saves the layout of your schema any time you move an object. This eliminates the need to click from page to page to find the details of a relationship or to add a new custom field to an object in your schema.

Schema Builder provides details such as the field values, required fields, and how objects are related by displaying lookup and master-detail relationships. You can view the fields and relationships for both standard and custom objects.

Schema Builder is enabled by default and lets you add the following to your schema:

- Custom objects
- Lookup relationships
- Master-detail relationships
- All custom fields except: Geolocation

SEE ALSO:

[Working with Schema Builder](#)

[Custom Field Types](#)

Working with Schema Builder

To access Schema Builder, from Setup, enter *Schema Builder* in the **Quick Find** box, then select **Schema Builder**.

When working with Schema Builder:

- Click on an object and move it to any space on the canvas. Schema Builder saves the layout of your schema any time you move an object.
- Click **Auto-Layout** to automatically sort the layout of the objects in your schema.

 **Important:** Once you click **Auto-Layout**, you can't undo it.

- Click **View Options** to:
 - **Display Element Names** if you prefer system names, or **Display Element Labels** if you prefer text values.
 - **Show/Hide Relationships**
 - **Show/Hide Legend**
- The **Elements** tab lets you drag and drop new custom objects and fields onto the canvas.
 - To create a new custom object, see [Creating Objects with Schema Builder](#).
 - To create a new custom field, see [Creating Fields with Schema Builder](#).
- The **Objects** tab lets you select objects to display on the canvas.
 - Click the drop-down list in the sidebar to filter your list of objects:
 - All Objects
 - Selected Objects
 - Standard Objects
 - Custom Objects
 - System Objects

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: All Editions

USER PERMISSIONS

To view objects in Schema Builder:

- "Customize Application"

 **Note:** Objects created outside of Schema Builder, such as through an app or the API, don't automatically display on the canvas. Select the checkbox for the object created outside Schema Builder to display it on the canvas.

- To search for an object, type its name in the **Quick Find...** box.
- Hover over an object in your list of objects and click  to find it on the canvas.
- Hover over relationship lines to show relationship details such as lookup and master-detail relationships. Click the name of the object to find it on the canvas. You may want to hide relationships if your schema is taking too long to load.
- To view the details of a field in a new window, right-click the element name or label and select **View Field in New Window**.
- To edit properties of a custom field, click the element name or label and select **Edit Field Properties...**
- To manage permissions of a custom field, click the element name or label and select **Manage Field Permissions**. Use the dialog box that appears to manage the field's visibility and writability for all standard and custom profiles. By default, the field level security for custom fields is set to visible and editable for internal profiles—those not cloned from Partner User or Customer Portal Manager. Fields that are not normally editable, such as formulas and roll-up summary fields, are visible and read-only.
- Click  to:
 - **Hide Object on Canvas**
 - **View Object** detail in a new window
 - **View Page Layouts** detail in a new window
- For objects with a large number of fields (Lead or Campaign, for example), click **Show More Fields** to display all the fields.
- To zoom in, click . To zoom out, click .

 **Note:** You can't save the level of zoom when closing Schema Builder.

- To collapse the sidebar, click . To expand it, click .
- The map in the lower right corner shows the overall layout of your objects on the canvas. Click on the map to navigate the layout of your objects. To pan across the schema layout while zoomed in, click and hold the canvas while moving the mouse.
- To close the Schema Builder and save the layout of your objects, click **Close**.
-  **Important:** If your schema contains many objects and fields, it may cause long loading times. Click **Hide Relationships** to improve Schema Builder performance.

Creating Objects with Schema Builder

To create a new custom object with Schema Builder:

1. Click the **Elements** tab.
2. Click **Object** and drag it onto the canvas.
3. Enter information to define your object. For a list of object definitions, see [Schema Builder Custom Object Definition](#) on page 3801.
4. Click **Save**.

SEE ALSO:

[Schema Builder Custom Object Definition](#)

Creating Fields with Schema Builder

To create a new custom field with Schema Builder:

1. Click the **Elements** tab.
2. Click a field and drag it onto an object on the canvas.
3. Enter a `Field Label`.

Salesforce populates `Field Name` using the field label. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

Ensure that the custom field name and label are unique for that object.

- If a standard and custom field have identical names or labels, the merge field displays the custom field value.
- If two custom fields have identical names or labels, the merge field may display an unexpected value.

If you create a field label called `Email` and a standard field labeled `Email` already exists, the merge field may be unable to distinguish between the fields. Adding a character to the custom field name makes it unique. For example, `Email2`.

4. Enter a `Description` of the custom field.
5. Enter `Help Text` to detail the purpose and function of a custom field.
6. Enter a `Default Value` to automatically insert a value of a custom field when a new record is created.
7. Depending on the custom field type you choose, enter any remaining field attributes.
8. Click **Save**.

Any field you add through Schema Builder isn't automatically added to the page layout. You will need to edit the page layout to specify where the field should be displayed.

Deleting Custom Objects with Schema Builder

You can delete custom objects using Schema Builder.

Schema Builder displays a list of side effects when you try to delete a custom object. Be sure you're ready to accept these side effects before finalizing the deletion. See [Delete Custom Objects](#) on page 3779 and [Manage Deleted Custom Objects](#) on page 3781.

1. Click  on the custom object's icon.
2. Select **Delete Object...** A dialog box displays that explains the side effects of deleting an object. Read this information carefully.
3. If you accept the conditions, check **Yes, I want to delete the custom object.**
4. Click **Delete.**

Deleting Custom Fields with Schema Builder

You can delete custom fields using Schema Builder.

Schema Builder displays a list of side effects when you try to delete a custom field. Be sure you're ready to accept these side effects before finalizing the deletion.

1. Right click on the custom field.
2. Select **Delete Field...** A dialog box displays that explains the side effects of deleting a custom field. Read this information carefully.
3. If you accept the conditions, check **Yes, I want to delete the custom field.**
4. Click **Delete.**

Schema Builder Custom Object Definition

Field	Description
Label	A name used to refer to the object in any user interface pages.
Plural Label	The plural name of the object. If you create a tab for this object, this name is used for the tab.
Starts with a vowel sound	If it's appropriate for your organization's default language, check if your label should be preceded by "an" instead of "a".
Object Name	A unique name used to refer to the object when using the API. In managed packages, this unique name prevents naming conflicts on package installations. The Object Name field can contain only underscores and alphanumeric characters.

Field	Description
	It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Description	An optional description of the object. A meaningful description helps you remember the differences between your custom objects when you're viewing them in a list.
Record Name	The name used in page layouts, list views, related lists, and search results.
Data Type	The type of field (text or auto-number) for the record name. Records that have unique IDs instead of names use auto-numbers. An auto-number is a unique number assigned automatically. It is always a read-only field.
Allow Reports	<p>Makes the data in the custom object records available for reporting purposes.</p> <p>To create reports on custom objects, choose the Other Reports report type category unless the custom object has a relationship with a standard object. When the custom object has a master-detail relationship with a standard object, or is a lookup object on a standard object, select the standard object for the report type category instead.</p>
Allow Activities	Allows users to associate tasks and scheduled calendar events related to the custom object records.
Track Field History	Enables your organization to track changes to fields on the custom object records, such as who changed the value of a field, when it was changed, and what the value of the field was before and after the edit. History data is available for reporting, so users can easily create audit trail reports when this feature is enabled.
Enable Divisions	If your organization has divisions enabled, select this option to enable the custom object for divisions. Divisions group records for simplified search results, list views, reports, and other areas within Salesforce. Salesforce adds a <code>Division</code> field to the custom object. If the custom object is the master in a master-detail relationship, custom objects on the detail side also get the <code>Division</code> field and inherit their division from the master record.
Available for Customer Portal	This option makes the custom object available through the Salesforce Customer Portal.
Namespace Prefix	In a packaging context, a namespace prefix is a one to 15-character alphanumeric identifier that distinguishes your package and its contents from packages of other developers on AppExchange. Namespace prefixes are case-insensitive. For example, ABC and abc are not recognized as unique. Your namespace prefix must be

Field	Description
	globally unique across all Salesforce organizations. It keeps your managed package under your control exclusively.
Deployment Status	Indicates whether the custom object is visible to other users.
Add Notes & Attachments...	Allows users to attach notes and attachments to custom object records. This allows you to attach external documents to any object record, in much the same way that you can add a PDF or photo as an attachment to an email. This option is only available when you are creating a new object.

Creating Unique Sets of Data

Custom Settings

Custom settings are similar to custom objects and enable application developers to create custom sets of data, as well as create and associate custom data for an organization, profile, or specific user. All custom settings data is exposed in the application cache, which enables efficient access without the cost of repeated queries to the database. This data can then be used by formula fields, validation rules, flows, Apex, and the SOAP API.

 **Note:** If you're thinking of using List Custom Settings, consider using [Custom Metadata Types](#) on page 4948 instead. Unlike List Custom Settings, you can migrate the records of Custom Metadata Types using Packages or Metadata API tools.

There are two types of custom settings:

List Custom Settings

A type of custom setting that provides a reusable set of static data that can be accessed across your organization. If you use a particular set of data frequently within your application, putting that data in a list custom setting streamlines access to it. Data in list settings does not vary with profile or user, but is available organization-wide. Examples of list data include two-letter state abbreviations, international dialing prefixes, and catalog numbers for products. Because the data is cached, access is low-cost and efficient: you don't have to use SOQL queries that count against your governor limits.

Hierarchy Custom Settings

A type of custom setting that uses a built-in hierarchical logic that lets you "personalize" settings for specific profiles or users. The hierarchy logic checks the organization, profile, and user settings for the current user and returns the most specific, or "lowest," value. In the hierarchy, settings for an organization are overridden by profile settings, which, in turn, are overridden by user settings.

The following examples illustrate how you can use custom settings:

- A shipping application requires users to fill in the country codes for international deliveries. By creating a list setting of all country codes, users have quick access to this data without needing to query the database.
- An application calculates and tracks compensation for its sales reps, but commission percentages are based on seniority. By creating a hierarchy setting, the administrator can associate a different commission percentage for each profile in the sales organization.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Developer, Enterprise, Performance, Unlimited,** and **Database.com** Editions.

Packages are not available in **Database.com**.

USER PERMISSIONS

To manage, create, edit, and delete custom settings:

- "Customize Application"

Within the application, one formula field can then be used to correctly calculate compensation for all users; the personalized settings at the profile level inserts the correct commission percentage.

- An application displays a map of account locations, the best route to take, and traffic conditions. This information is useful for sales reps, but account executives only want to see account locations. By creating a hierarchy setting with custom checkbox fields for route and traffic, you can enable this data for just the “Sales Rep” profile.

Follow these steps to create and use custom settings:

1. [Create the custom setting.](#)
2. [Add fields to the custom setting.](#)
3. [Add data and set the access level for the custom setting data.](#)
4. [Reference the custom setting](#) data in your application, using formula fields, validation rules, Apex, or the SOAP API.

You can also include a custom setting in a package. The visibility of the custom setting in the package depends on the `visibility` setting.

 **Note:** Only custom settings definitions are included in packages, not data. If you need to include data, you must populate the custom settings using a standard Apex or API script run by the subscribing organization after they have installed the package.

Managing Custom Settings

Click **New** to create a new custom setting. After you create a custom setting, you must add fields to it.

After you create a custom setting, you can do any of the following:

- Click **Edit** next to the name of a custom setting to change the name, label, or description of a custom setting.
- Click **Del** to delete a custom setting.

 **Note:** A  icon indicates that the custom setting is in an installed managed package. You can't edit or delete a custom setting installed from a managed package.

- Click **Manage** to add data to a custom setting. You should add fields before you add data.

SEE ALSO:

[View Custom Settings](#)

[Custom Settings Limits and Considerations](#)

Accessing Custom Settings

You can access custom settings from formula fields, validation rules, Apex, and the SOAP API. Some sample code segments are provided below.

Formula Fields

Formula fields only work for hierarchy custom settings; they can't be used for list custom settings.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Developer, Enterprise, Performance, Unlimited,** and **Database.com** Editions.

Packages are not available in **Database.com**.

USER PERMISSIONS

To manage, create, edit, and delete custom settings:

- "Customize Application"

```
{!$Setup.CustomSettingName__c.CustomFieldName__c}
```

Apex

Apex can access both custom setting types.

Note: If **Privacy** for a custom setting is `Protected` and the custom setting is contained in a managed package, the subscribing organization cannot edit the values or access them using Apex.

Samples for List Custom Settings

When you add data to a custom setting, you must name each set of data. Then you can distinguish between the sets of data by the data set name. The following returns a map of custom settings data. The `getAll` method returns values for all custom fields associated with the list setting.

```
Map<String dataset_name, CustomSettingName__c> mcs = CustomSettingName__c.getAll();
```

The following example uses the `getValues` method to return all the field values associated with the specified data set. This method can be used with both list and hierarchy custom settings, using different parameters.

```
CustomSettingName__c mc = CustomSettingName__c.getValues(data_set_name);
```

Samples for Hierarchy Custom Settings

The following example uses the `getOrgDefaults` method to return the data set values for the organization level:

```
CustomSettingName__c mc = CustomSettingName__c.getOrgDefaults();
```

The following example uses the `getInstance` method to return the data set values for the specified profile. The `getInstance` method can also be used with a user ID.

```
CustomSettingName__c mc = CustomSettingName__c.getInstance(Profile_ID);
```

SOAP API

Custom settings that have **Privacy** defined as `Public` are exposed to the API in the same way custom objects are exposed.

 **Note:** If **Privacy** is defined as `Protected`, and the custom setting is contained in a managed package, the custom setting is not accessible using the API in either the developer organization or a subscribing organization.

Use any tool with API access to perform query or profile-permission-setting operations.

 **Note:** You can also access custom settings data through a Standard Object Query Language (SOQL) query, but this method doesn't make use of the application cache. It's similar to querying a custom object.

SEE ALSO:

[Custom Settings](#)

Define Custom Settings

To create or edit a custom setting:

1. From Setup, enter *Custom Settings* in the `Quick Find` box, then select **Custom Settings**.
2. Click **New** to create a new custom setting, click **Edit** next to the name of a custom setting, or click **Edit** while viewing the details of a custom setting.

 **Note:** A  icon indicates that the custom setting is in an installed managed package. You can't edit or delete a custom setting installed from a managed package.

3. Define the following:

- `Label`—Enter the label displayed in the application.
- `Object Name`—Enter the name to be used when the custom setting is referenced by formula fields, validation rules, Apex, or the SOAP API.

 **Note:** Salesforce recommends using ASCII for the `Object Name`. The name can't exceed 38 ASCII characters. If you use double byte, there are additional limits on the number of characters allowed.

- `Setting Type`—Select a type of List or Hierarchy. The List type defines application-level data, such as country codes or state abbreviations. The Hierarchy type defines personalization settings, such as default field values, that can be overridden at lower levels in the hierarchy.

 **Important:** After you save a custom setting, you cannot change this value.

- `Visibility`—Select a visibility of Protected or Public.
 - Protected—If the custom setting is contained in a managed package, subscribing organizations can't see the custom setting: it doesn't display as part of the package list. In addition, subscribing organizations can't access the custom setting using either Apex or the API, however, developer organizations can. If the custom setting is contained in an unmanaged package, the custom setting is available through the Enterprise WSDL like any custom object (as if the `Visibility` was Public.)
 - Public—The custom setting is available through the Enterprise WSDL like any custom object. You can package custom settings defined as public. The subscribing organizations can edit the values, as well as access them using Apex and the API, regardless of the type of package (either managed or unmanaged).

 **Important:** After you save a custom setting, you cannot change this value.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Developer, Enterprise, Performance, Unlimited,** and **Database.com** Editions.

Packages are not available in **Database.com**.

USER PERMISSIONS

To manage, create, edit, and delete custom settings:

- "Customize Application"

4. Enter an optional description of the custom setting. A meaningful description will help you remember the differences between your custom settings when you're viewing them in a list.
5. Click **Save**.

 **Note:** Only custom settings definitions are included in packages, not data. If you need to include data, you must populate the custom settings using a standard Apex or API script run by the subscribing organization after they have installed the package.

After you create a custom setting, you must also add fields to the custom setting.

Add Custom Settings Fields

After you define custom settings, add fields to them. The custom fields contain the data used by the custom setting.

1. From Setup, enter *Custom Settings* in the **Quick Find** box, then select **Custom Settings**.
2. Click the custom setting that you want to add fields to. (If you just created the custom setting, the Custom Setting Detail page appears.)
3. Click **New**.
4. Select a field type and click **Next**.

 **Note:** Record size is based on the maximum field size of each field type, not the actual storage that's used in each field. When adding fields to a custom setting definition, use the appropriate type and specify a length that doesn't exceed what's needed for your data. This action helps you avoid reaching the cached data limit. For example, if you create a US social security number (SSN) field, select the **Text** data type and specify a length of 9. If instead you selected a **Text Area** data type, the field would add 255 characters to the usage count for each record, regardless of the number of characters entered.

5. Enter the details for the field.
6. Confirm the information, and then click **Save** or **Save & New**.

After you add fields, you need to add data, and for hierarchy custom settings, specify the access level.

Manage Custom Settings Data

After [defining custom settings](#) and [adding fields](#), populate the fields:

1. From Setup, enter *Custom Settings* in the Quick Find box, then select **Custom Settings**.
2. Click **Manage** next to a custom setting, or from the detail page for a custom setting.
3. Provide or change values for the custom setting.
 - If you are managing a list setting:
 - Click **New** to add data to the fields.
 - Click **Edit** next to the name of an existing set of data to change the name of the data set or to change the data.
 - Click **Del** next to the name of an existing set of data to delete the data set.
 - If you are managing a hierarchy setting, decide where in the permission hierarchy you want to add default data (organization, profile, or user).

To add default data at the organization level, click **New** in the Default Organization Level Value section. If data has already been defined for the organization, you can only edit or delete it.

To add default data at the profile or user level, click **New** in the lower section of the page, near the Setup Owner.

After you have defined data, you can:

- Click **Edit** in the Default Organization Level Value section to change the default data set at the organization level, or **Delete** to delete it (this is only for hierarchical custom settings.)
- Click **View** next to the name of an existing set of data to view the data (this is only for hierarchical custom settings.)
- Click **Edit** next to the name of an existing set of data to change the name of the data set or to change the data.
- Click **Del** next to the name of an existing set of data to delete the data set.

- “Customize Application”

Add Custom Settings Data

After you define your custom settings and add fields, you need to populate the fields with data.

You can define one or more data sets. For list custom settings, each data set is named and can be accessed by that name using Apex, formula fields, and so on.

For custom settings that are hierarchies, the data is accessed based on the access level (user, profile, or organization). The lowest level is used first, which means if you defined a data set at the user level, unless otherwise specified in your application, that data is used. For example, you might want to specify different contact numbers for your application: one for the general user, and one that is only displayed for system administrators.

To add data to custom setting fields:

1. From Setup, enter *Custom Settings* in the **Quick Find** box, then select **Custom Settings**, then click **Manage** next to a custom setting. Or from the detail page for a custom setting, click **Manage**.
2. Click **New** or **Edit** next to an existing data set.
3. Add or change data.

For custom settings that are lists:

- a. Specify or change the name for the data set. This name is used by Apex, formula fields, and so on.
- b. Enter or change data for all fields.
- c. Click **Save**.

For custom settings that are hierarchies:

- a. For the default organization level values, enter or change the data for the fields. The default organization location is automatically populated.
- b. For profile or user level values, select either **Profile** or **User** from the **Location** picklist. Enter the name of the profile or user, or use the lookup dialog search. Then enter or change the data for the fields.
- c. Click **Save**.

 **Note:** For a hierarchy custom setting, you can add only one record for a profile or user. Adding two records for the same profile or user results in an error.

View Custom Settings Data

After you [add fields](#) and [add data](#) to those fields, you can view the data.

1. From Setup, enter *Custom Settings* in the **Quick Find** box, then select **Custom Settings**, then click **Manage** next to a custom setting that has already been defined. Or from the detail page for a custom setting, click **Manage**.
2. Click **View** next to the data set you want to view (this is only for hierarchical custom settings).

SEE ALSO:

[Add Custom Settings Fields](#)

[Add Custom Settings Data](#)

Custom Settings Limits and Considerations

When working with custom settings, be aware of the following considerations and limits on the amount of cached data.

- The total amount of cached data allowed for your organization is the **lesser** of these two values:
 - 10 MB
 - 1 MB multiplied by the number of full-featured user licenses in your organization

For example, if your organization has three full licenses, you have 3 MB of custom setting storage. If your organization has 20 full licenses, you have 20 MB of storage.

Each certified managed package gets a separate limit in addition to your organization limit. For example, let's say your organization has two certified managed packages installed and your organization has three full licenses. Each certified managed package can have 3 MB of custom setting storage in addition to your organization's 3-MB custom setting storage limit.

- You can add up to 300 fields per custom setting, unless your field limit for custom objects is lower than 300. If your custom objects field limit is lower than 300, your field limit for custom settings is equal to your custom objects field limit.
- You can't share a custom setting object or record.
- No owner is assigned when a custom setting is created, so the owner can't be changed.
- Custom settings are a type of custom object. Each custom setting counts against the total number of custom objects available for your organization.
- Accessing an undeleted custom setting in a formula field results in an error if the user doesn't have the "Customize Application" permission. To prevent this error, redeploy this custom setting to the organization. Alternatively, delete this custom setting, re-create it with the same name and data, and then delete and re-create all formula fields that use this setting.

- If a cross-object formula references a currency field from a custom setting, this field value isn't converted to the currency of the record containing the formula. The result of the formula could be inaccurate if the custom setting field's currency and the record's currency are different.

To see how much custom settings data your organization is using, from Setup, enter *Custom Settings* in the *Quick Find* box, then select **Custom Settings**. For each custom setting, this page lists the size of one record, the number of records created, and the total size used for each custom setting.

Record size is based on the maximum field size of each field type, not the actual storage that's used in each field. When adding fields to a custom setting definition, use the appropriate type and specify a length that doesn't exceed what's needed for your data. This action helps you avoid reaching the cached data limit. For example, if you create a US social security number (SSN) field, select the `Text` data type and specify a length of 9. If instead you selected a `Text Area` data type, the field would add 255 characters to the usage count for each record, regardless of the number of characters entered.

Working with Custom Fields

Customize Fields

Customize fields to tailor your organization's unique requirements. You can:

- Modify some aspects of standard fields
- Change or add values to custom picklist fields
- Define dependency rules between fields
- Create custom fields to capture additional information
- Create formula fields that automatically calculate values based on the contents of other fields
- Define default values for custom fields
- Define validation rules for your fields
- Make a field required
- Set fields to track changes, including the date, time, nature of the change, and who made the change
- Create page layouts to control the display of fields
- Set field-level security to control access to fields
- Create or modify field sets

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions**
Standard Fields and Page Layouts are not available in **Database.com**

USER PERMISSIONS

To create or change custom fields:

- "Customize Application"

Customize Standard Fields

You can customize several aspects of standard fields, such as the values in picklists, the format for auto-number fields, tracking field history, [lookup filters on relationship fields](#), and [field-level help](#).

In Enterprise, Unlimited, Performance, and Developer Editions, you can also view details about standard fields and set field-level security.

Modify Standard Auto-Number Fields

The unique identifiers for solutions, cases, and contracts are standard auto-number fields. Each record is assigned a unique number with a specified format upon creation. You can modify the format and numbering for these auto-number fields.

1. From the management settings for the object whose field you want to modify, go to the fields area.
2. Click **Edit** next to the name of the field.
3. Enter a `Display Format` to control such formatting details as the minimum number of leading zeros as well as any prefix or suffix for the number. See [Custom Field Attributes](#) on page 3824.

Format changes do not affect existing records; they are applied only to new records.

4. Enter the number to be assigned to the next record that is created after you save your changes.
5. Click **Save**.

 **Warning:** Salesforce warns you if the next number you enter is not higher than existing numbers. However, it may be possible to create duplicate numbers if you change the auto-number format multiple times using similar formats each time.

Creating and Enhancing Custom Fields

Create Custom Fields

Capture all your important business data and store it in fields you create.

Watch a Demo:  [How to Create a Custom Field in Salesforce](#)

Want to customize Salesforce so it captures all your business data? This short video walks you through how to create a custom picklist field, from choosing the correct field type to applying field level security.

Before you begin, determine the [type of field](#) you want to create.

1. From the management settings for the object you want to add a field to, go to Fields.

 **Note:** Custom task and event fields are accessible from the object management settings for Activities.

2. Click **New**.

 **Tip:** On custom objects, you can also set [field dependencies](#) and field history tracking in this section.

3. Choose the [type of field](#) and click **Next**. Consider the following.

- Some data types are available for certain configurations only. For example, the `Master-Detail Relationship` option is available for custom objects only when the custom object doesn't already have a master-detail relationship.
- Custom settings and external objects allow only a subset of the available data types.
- You can't add a multi-select picklist, rich text area, or dependent picklist custom field to opportunity splits.
- Relationship fields count towards custom field limits.
- Additional field types may appear if an AppExchange package using those field types is installed.
- The [Roll-Up Summary](#) option is available on certain objects only.
- Field types correspond to API data types.
- If your organization uses Platform Encryption, ensure you understand how to encrypt custom fields using the Platform Encryption offering.

4. For relationship fields, associate an object with the field and click **Next**.
5. For indirect lookup relationship fields, select a unique, external ID field on the parent object, and then click **Next**. The parent field values are matched against the values of the child indirect lookup relationship field to determine which records are related to each other.
6. Enter a field label.

Salesforce populates `Field Name` using the field label. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Use the field name for merge fields in custom links, custom s-controls, and when referencing the field from the API.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Lightning Connect external objects are available in: **Developer** Edition and for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

Custom fields aren't available on Activities in **Group** Edition

Custom settings aren't available in **Professional** Edition

Layouts aren't available in **Database.com**

USER PERMISSIONS

To create or change custom fields:

- "Customize Application"

Tip: Ensure that the custom field name and label are unique for that object.

- If a standard and custom field have identical names or labels, the merge field displays the custom field value.
- If two custom fields have identical names or labels, the merge field may display an unexpected value.

If you create a field label called *Ema i l* and a standard field labeled `Ema i l` already exists, the merge field may be unable to distinguish between the fields. Adding a character to the custom field name makes it unique. For example, *Ema i l 2*.

7. Enter [field attributes](#) and select the appropriate checkboxes to specify whether the field must be populated and what happens if the record is deleted.
8. For master-detail relationships on custom objects, optionally select **Allow reparenting** to allow a child record in the master-detail relationship to be reparented to a different parent record.
9. For relationship fields, optionally create a lookup filter to limit search results for the field. Not available for external objects.
10. Click **Next**.
11. In Enterprise, Unlimited, Performance, and Developer Editions, specify the field's access settings for each profile, and click **Next**.

Access Level	Enabled Settings
Users can read and edit the field.	Visible
Users can read but not edit the field.	Visible and Read-Only
Users can't read or edit the field.	None

Note:

- When you create a custom field, by default the field isn't visible or editable for portal profiles, unless the field is [universally required](#).
- Profiles with "View Encrypted Data" permission are indicated with an asterisk.

12. Choose the page layouts that will display the editable field and click **Next**.

Field	Location on Page Layout
Normal	Last field in the first two-column section.
Long text area	End of the first one-column section.
User	Bottom of the user detail page.
Universally required	Can't remove it from page layouts or make read only.

13. For relationship fields, optionally create an associated records related list and add it to page layouts for that object.
 - To edit the related list name on page layouts, click **Related List Label** and enter the new name.
 - To add the related list to customized page layouts, select `Append related list to users' existing personal customizations`.
14. Click **Save** to finish or **Save & New** to create more custom fields.

-  **Note:** Creating fields may require changing a large number of records at once. To process these changes efficiently, your request may be queued and you may receive an email notification when the process has completed.

[Specify Lookup Filter Fields](#)

Create a Custom Picklist Field

Create custom picklist fields to enable your users to select values from lists that you define.

Watch a Demo:  [Custom Fields: Picklists](#)

You can create two types of picklist fields:

- Picklist—Allows users to select a single value from a list that you define.
- Multi-select picklist—Allows users to select more than one picklist value from a list that you define. These fields display each value separated by a semicolon.

-  **Note:** Picklist fields aren't available for external objects. You can't add a multi-select picklist, rich text area, or dependent picklist custom field to opportunity splits.

1. From the object management settings for your object, go to the fields section.
 - For Knowledge validation status picklists, from Setup, enter *Validation Statuses* in the **Quick Find** box, then select **Validation Statuses**.
2. In the custom fields related list, click **New**.
3. Select **Picklist** or **Picklist (Multi-Select)**, and then click **Next**.
4. Enter a label for the picklist field.
5. To use the values from an existing global picklist, select **Use global picklist definition**. To use values that you create specifically for this picklist, select **Enter values for the picklist, with each value separated by a new line**.

-  **Important:** This setting is visible only to pilot participants. We provide this feature to selected customers through a pilot program that requires agreement to specific terms and conditions. To be nominated to participate in the program, contact Salesforce. Because pilot programs are subject to change, we can't guarantee acceptance. This pilot feature isn't generally available, as referenced in this document or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available features.

6. If you didn't use a global picklist, enter picklist values.
Put each value on a separate line. Values can be up to 255 characters long.
7. Choose to sort the values alphabetically or to use the first value in the list as the default value by selecting the appropriate option.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To create or change custom fields:

- "Customize Application"

 **Note:** Don't assign default values to fields that are both required and unique, because uniqueness errors can result. See [About Default Field Values](#) on page 3858.

If you select both checkboxes, Salesforce alphabetizes the entries and then sets the first alphabetized value as the default.

8. Choose whether to restrict this picklist's values to an admin-approved list. Selecting **Strictly enforce picklist values** prevents users from loading unapproved values through the API.

 **Important:** This setting is visible only to pilot participants. We provide this feature to selected customers through a pilot program that requires agreement to specific terms and conditions. To be nominated to participate in the program, contact Salesforce. Because pilot programs are subject to change, we can't guarantee acceptance. This pilot feature isn't generally available, as referenced in this document or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available features.

9. If you're creating a multi-select picklist, enter how many values you want displayed at a time on edit pages. The number of values determines the box height.
10. Enter description or help text if desired, and then click **Next**.
11. Set field-level security for the picklist field, and then click **Next**.
12. Choose the page layouts on which to include the picklist field.
13. Click **Save**.

SEE ALSO:

[Create Custom Fields](#)

[Update Picklists](#)

[Additional Options for Updating Picklists](#)

Create a Global Picklist (Pilot)

Use global picklists to share picklist values across objects and custom picklist fields, and to restrict the picklists to only the values that you specify.

 **Note:** We provide this feature to selected customers through a pilot program that requires agreement to specific terms and conditions. To be nominated to participate in the program, contact Salesforce. Because pilot programs are subject to change, we can't guarantee acceptance. This pilot feature isn't generally available, as referenced in this document or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available features.

A custom picklist is tied to a particular object as a field on the object. Unlike a custom picklist field, a global picklist exists independently as a master list of values. Its values are shared with any picklist that's based on it.

A global picklist is a "restricted" picklist by nature. Only a Salesforce admin can add to or modify its values; users can't add unapproved values, even through the API.

1. From Setup, enter *Picklists* in the **Quick Find** box, then select **Picklists**.
2. Next to Global Picklists, click **New**.
3. Enter a label for the global picklist. This name appears during creation of picklists based on this global picklist.

EDITIONS

Available in: Salesforce Classic Lightning Experience

Available in: **Developer Edition** and sandboxes

USER PERMISSIONS

To create or change custom fields:

- "Customize Application"

4. To tell admins what this set of values is for, enter a clear description of the global picklist. This text appears on the Picklists list page in Setup.
5. Click **Save**.
6. In the Picklist Values section, click **New**.
7. Add picklist values by clicking **New**, then entering the values one per line.
8. Click **Save**.
9. To reorder the values, click **Reorder**. Optionally, choose to sort values alphabetically or to use the first value as the default value.

Your global picklist definition is ready to be used as a master list of values. To create a picklist based on the global picklist, see [Create a Custom Picklist Field](#).

Known limitations for this pilot:

- After you create a custom picklist field based on a global picklist, the list of values doesn't appear on the custom picklist's detail page in Setup. However, the values are still inherited from the global picklist.
- For custom picklist fields based on a global picklist, you can't change the custom picklist from a single-select to a multi-select picklist.
- A global picklist can't be a dependent picklist, of a local picklist or of another global picklist. However, a global picklist can control a local picklist as its dependent.
- For a custom, multi-select picklist that's based on a global picklist, you can't do a replace operation. For more information, see [Replace Picklist Values](#) on page 3846.

Custom Field Types

When you have data that doesn't match any of the standard fields, your administrator can create a custom field for that data. For example, you might want a `Middle Name` field for contacts.

The first step in creating a custom field is choosing the type of the field. Below is a description of each custom field type. Additional field types may appear if an AppExchange package using those field types is installed.

Type	Description
Auto Number	Automatically assigns a unique number to each record. The maximum length of any auto-number field is 30 characters, 20 of which are reserved for prefix or suffix text. Not available for external objects.
Checkbox	Allows users to check a box, indicating a true or false attribute of a record. When using a checkbox field for a report or list view filter, use "True" for checked values and "False" for unchecked values. The import wizards and the weekly export tool use "1" for checked values and "0" for unchecked values.
Currency	Allows users to enter a currency amount. The system automatically formats the field as a currency amount. This can be useful if you export data to a spreadsheet application. Not available for external objects.  Note: Salesforce uses the round-half-to-even tie-breaking rule for currency fields. For example, 23.5 becomes 24, 22.5 becomes 22, -22.5 becomes -22, and -23.5 becomes -24. Values lose precision after 15 decimal places.

Type	Description
Date	Allows users to enter a date or pick a date from a popup calendar. In reports, you can limit the data by specific dates using any custom date field.
Date/Time	Allows users to enter a date or pick a date from a popup calendar and enter a time of day. They can also add the current date and time by clicking the date and time link next to the field. The time of day includes AM or PM notation. In reports, you can limit the data by specific dates and times using any custom date field.
Email	<p>Allows users to enter an email address of up to 80 characters, which is validated to ensure proper format. If this field is specified for contacts or leads, users can choose the address when clicking Send an Email. Note that you can't use custom email addresses for mass emails.</p> <p> Note: This field can be encrypted using Platform Encryption.</p>
External Lookup Relationship	An external lookup relationship links a child standard, custom, or external object to a parent external object. When you create an external lookup relationship field, the standard External ID field on the parent external object is matched against the values of the child's external lookup relationship field. External object field values come from an external data source.
Formula	<p>Allows users to automatically calculate values based on other values or fields such as merge fields. Not available for external objects.</p> <p> Note: Salesforce uses the round half up tie-breaking rule for numbers in formula fields. For example, 12.345 becomes 12.35 and –12.345 becomes –12.34.</p>
Geolocation	Allows users to specify a location by its latitude and longitude. Geolocation is a compound field that counts toward your organization's limits as three custom fields: one for latitude, one for longitude, and one for internal use. Not available for external objects.
Hierarchical Relationship	Creates a hierarchical lookup relationship between users. Allows users to use a lookup field to associate one user with another that does not directly or indirectly refer to itself. For example, you can create a custom hierarchical relationship field to store each user's direct manager.
Indirect Lookup Relationship	An indirect lookup relationship links a child external object to a parent standard or custom object. When you create an indirect lookup relationship field on an external object, you specify the parent object field and the child object field to match and associate records in the relationship. Specifically, you select a custom unique,

Type	Description
<p>Lookup Relationship</p>	<p>external ID field on the parent object to match against the child's indirect lookup relationship field, whose values come from an external data source.</p> <hr/> <p>Creates a relationship between two records so you can associate them with each other. For example, opportunities have a lookup relationship with cases that lets you associate a particular case with an opportunity.</p> <ul style="list-style-type: none"> On a standard or custom object, a lookup relationship creates a field that allows users to click a lookup icon and select another record from a popup window. On an external object, the lookup relationship field references 18-character Salesforce IDs that are stored in an external data source. Those IDs are matched against the parent object to determine which records are related to each other. <p>On the parent record, you can display a related list to show all of the records that are linked to it. You can create lookup relationship fields that link to users, standard objects, or custom objects. If a lookup field references a record that has been deleted, Salesforce clears the value of the lookup field by default. Alternatively, you can choose to prevent records from being deleted if they're in a lookup relationship.</p> <p>Lookup relationship fields are not available in Personal Edition.</p> <p>Lookup relationship fields to campaign members are not available; however, lookup relationship fields from campaign members to standard or custom objects are available.</p>
<p>Master-Detail Relationship</p>	<p>Creates a relationship between records where the master record controls certain behaviors of the detail record such as record deletion and security.</p> <p>Not available for standard objects or external objects, although you can create a master-detail relationship field on a custom object that links to a standard object.</p> <p>Master-detail relationships cannot be used with campaign members.</p>
<p>Number</p>	<p>Allows users to enter any number. This is treated as a real number and any leading zeros are removed.</p> <p> Note: Salesforce uses the round half up tie-breaking rule for number fields. For example, 12.345 becomes 12.35 and -12.345 becomes -12.34. Salesforce rounds numbers referenced in merge fields according to the user's locale, not the number of decimal spaces specified in the number field configuration.</p>

Type	Description
Percent	<p>Allows users to enter a percentage number as a decimal—for example, <i>0.10</i>. The system automatically converts the decimal to a percentage—for example, <i>10%</i>.</p> <p> Note: Values lose precision after 15 decimal places. Also, if you enter a value with more than 15 decimal places and add a percent sign to the number, a runtime error occurs.</p>
Phone	<p>Allows users to enter any phone number. Character limit is 40.</p> <p>Salesforce automatically formats it as a phone number.</p> <p>If you are using Salesforce CRM Call Center, custom phone fields are displayed with the  button, allowing click-to-dial functionality. Consequently, Salesforce recommends that you do not use a custom phone field for fax numbers.</p> <p> Note: This field can be encrypted using Platform Encryption.</p>
Picklist	<p>Allows users to select a single value from a list that you define. Not available for external objects.</p>
Picklist (Multi-select)	<p>Allows users to select more than one picklist value from a list that you define. These fields display each value separated by a semicolon. Not available for external objects.</p>
Roll-Up Summary	<p>Automatically displays the record count of related records or calculates the sum, minimum, or maximum value of related records. The records must be directly related to the selected record and on the detail side of a custom master-detail relationship with the object that contains the roll-up summary field. For example, a custom field called “Total Number of Guests” displays the number of guest custom object records in the Guests related list. Not available for external objects.</p>
Text	<p>Allows users to enter any combination of letters, numbers, or symbols. You can set a maximum length, up to 255 characters.</p> <p> Note: This field can be encrypted using Platform Encryption.</p>
Text (Encrypted)	<p>Allows users to enter any combination of letters, numbers, or symbols that are stored in encrypted form. You can set a maximum length of up to 175 characters. Encrypted fields are encrypted with 128-bit master keys and use the Advanced Encryption Standard (AES) algorithm. You can archive, delete, and import your master encryption key. To enable master encryption key management, contact Salesforce. Not available for external objects.</p>

Type	Description
	<p> Note: This field can be encrypted using Classic Encryption; if your organization uses Platform Encryption, use <code>Text</code> to create an encrypted text field.</p>
Text Area	Allows users to enter up to 255 characters that display on separate lines similar to a <code>Description</code> field.
Text Area (Long)	<p>Allows users to enter up to 131,072 characters that display on separate lines similar to a <code>Description</code> field. You can set the length of this field type to a lower limit, if desired. Any length from 256 to 131,072 characters is allowed. The default is 32,768 characters. Note that every time you press <code>Enter</code> within a long text area field, a line break and a return character are added to the text. These two characters count toward the 131,072 character limit. This data type is not available for activities or products on opportunities. Only the first 254 characters in a rich text area or a long text area are displayed in a report.</p> <p> Note: This field can be encrypted using Platform Encryption.</p>
Text Area (Rich)	With the use of a toolbar, users can format the field content and add images and hyperlinks. The toolbar allows the user to undo, redo, bold, italicize, underline, strike-out, add a hyperlink, upload or link to an image, modify alignment, add a numbered or non-numbered list, indent, and outdent. The maximum field size is 131,072 characters, inclusive of all the formatting and HTML tags. Only the first 254 characters in a rich text area or a long text area are displayed in a report. The maximum size for uploaded images is 1MB. Only <code>gif</code> , <code>jpeg</code> and <code>png</code> file types are supported. Not available for external objects.
URL	<p>Allows users to enter up to 255 characters of any valid website address. When users click on the field, the URL will open in a separate browser window. Note that only the first 50 characters are displayed on the record detail pages.</p> <p> Note: This field can be encrypted using Platform Encryption.</p>

[Custom Field Attributes](#)

What's the Difference between Standard Fields and Custom Fields?

You can add custom fields to standard and custom objects in Salesforce, allowing you to infinitely customize your organization. Although custom fields are similar to the standard fields that come built-in to Salesforce, there are some differences between standard fields and custom fields.

Custom objects and fields let you tailor which data is stored to fit your organization's needs. Though the Force.com database provides several standard objects and accompanying standard fields, you can easily customize how you track and report on your data.

Custom objects give you the flexibility to store any type of enterprise data that's relevant to your app, by creating objects. For example, if you're building a recruiting app, you can create custom objects called Position and Candidate to track information on job openings and candidates, respectively.

Categorize and track your data even more granularly by using custom fields. Like standard objects, custom objects have fields that define the data for those object records. You can, for example, add a custom number field `Years of Experience` to the custom candidate object or a custom text field `Description` to the custom position object. You can add custom fields to both custom and standard objects.

See the following for more information:

- [Create Custom Fields](#)
- [Edit Custom Fields](#)
- [View Fields for a Specific Object](#)
- [Building Formulas](#)
- [Define Default Field Values](#)
- [Additional Custom Field Options](#)
- [Custom Field Attributes](#)
- [Change the Custom Field Type](#)

Custom Field Attributes

Here is a description of the attributes (in alphabetical order) that make up a custom field entry:

Field	Description
# Visible Lines	For long text area fields, set the number of lines to be displayed on edit pages. You can display between 2 and 50 lines (the default is 6 lines). If the text does not fit in the specified number of visible lines, scroll bars will appear. Long text area fields are fully displayed on detail pages and printable views.
Calculation Options	Determines how a roll-up summary field is recalculated after its properties change. Choose <code>Automatic calculation</code> to recalculate a field the next time it's displayed. Choose <code>Force a mass recalculation of this field</code> as a safety net option to force recalculation of the roll-up summary field values.
Child Relationship Name	The name used in API SOQL relationship queries.
Data Type	The data type of a field determines what type of information is in the field. For example, a field with the Number data type contains a positive or negative integer. For more information on data types, see Custom Field Types on page 3819.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Field	Description
Decimal Places	For currency, geolocation, number, and percent fields, this field represents the number of digits you can enter to the right of a decimal point. Note that the system rounds the decimal numbers you enter, if necessary. For example, if you enter <code>4.986</code> in a field with <code>Decimal Places</code> set to <code>2</code> , the number rounds to <code>4.99</code> .
Default Value	The value to apply when a user creates a new record. For checkbox custom fields, choose Checked or Unchecked as the default value to indicate the default when creating new records. Don't assign default values to fields that are both required and unique, because uniqueness errors can result. See About Default Field Values on page 3858.
Description	Text that describes the custom field. This description is for administration purposes only and doesn't display to users on record detail and edit pages that include the field.
Display Format	<p>For auto-number fields, enter a <code>Display Format</code> to control formatting details such as the minimum number of leading zeros and any prefix or suffix for the number.</p> <p>Begin by entering the required minimum: <code>{0}</code>. This is a placeholder for the auto-number without any leading zeros. Add any prefix to your number before this placeholder and insert any suffix text after the placeholder. Insert any date prefixes or suffixes in the form of <code>{YY}</code>, <code>{YYYY}</code>, <code>{MM}</code>, or <code>{DD}</code>, which always represent the create date of the record.</p> <p>For information on using auto-number formats when entering your <code>Display Format</code>, see Auto-Number Formatting Examples on page 3829.</p>
Encrypted	<p>If checked, this custom field is encrypted using Platform Encryption.</p> <p> Note: This information applies to Platform Encryption and not to Classic Encryption.</p>
External Column Name	<p>Available on external objects only. Maps the custom field to an external data source's table column.</p> <p>For a lookup relationship field, specify the external table column that contains 18-character Salesforce IDs.</p>
External ID	<p>For each object that can have custom fields, you can set up to seven custom auto-number, email, number, or text fields as external IDs. An external ID field contains record identifiers from a system outside of Salesforce.</p> <p>You can use an external ID field to update or upsert records using the API. When using the API or the Data Import Wizard for custom objects and solutions, you can use this field to prevent duplicates by also marking the field as Unique.</p> <p> Note: Custom fields marked as Unique count against an object's limit of seven <code>External ID</code> fields. Custom indexing that occurs automatically in the background by Salesforce does <i>not</i> count against <code>External ID</code> limits.</p>

Field	Description									
	Not available for external objects. Each external object has an External ID standard field. Its values uniquely identify each external object record in your organization.									
Filter Criteria	The criteria used to select a group of records to calculate the value of a roll-up summary field .									
Formulas	Enter the formula for the custom formula field or custom summary formula for reports.									
Help Text	The text that displays in the field-level help hover text for this field.									
Is Name Field	<p>For external object fields of type text, specifies this custom field as the name field for the external object. Not available for text area fields. By default, the External ID standard field is the name field for the external object.</p> <p>If you select this checkbox, make sure that the External Column Name specifies a table column that contains name values. Each external object can have only one name field.</p> <p>For internal use only, Salesforce stores the value of the name field from each row that's retrieved from the external system. This behavior doesn't apply to external objects that are associated with high-data-volume external data sources.</p>									
Filtering Disabled	For custom fields on external objects, determines whether the field is available in filters.									
Label	The name of the custom field as you want it to appear.									
Latitude and Longitude Display Notation	<p>For geolocation fields, determines how the latitude and longitude notation appears in the Salesforce interface.</p> <p>Degrees, Minutes, Seconds A notation for angular measurement that is based on the number 60: there are 360 degrees to a circle, 60 minutes to a degree, and 60 seconds to a minute.</p> <p>Decimal Expresses the value as degrees, and converts the minutes and seconds to a decimal fraction of the degree. Decimal notation doesn't use cardinal points. North and East are positive values; South and West are negative values.</p> <p>For example, the coordinates for San Francisco can be expressed as follows:</p> <table border="1" data-bbox="678 1541 1446 1759"> <thead> <tr> <th></th> <th>Latitude</th> <th>Longitude</th> </tr> </thead> <tbody> <tr> <td>Degrees, Minutes, Seconds</td> <td>37° 46' 30" N</td> <td>122° 25' 5" W</td> </tr> <tr> <td>Decimals</td> <td>37.794016°</td> <td>-122.395016°</td> </tr> </tbody> </table> <p>Regardless of the notation you choose to display in the interface, latitude and longitude are stored in Salesforce as decimals.</p>		Latitude	Longitude	Degrees, Minutes, Seconds	37° 46' 30" N	122° 25' 5" W	Decimals	37.794016°	-122.395016°
	Latitude	Longitude								
Degrees, Minutes, Seconds	37° 46' 30" N	122° 25' 5" W								
Decimals	37.794016°	-122.395016°								

Field	Description
Length (for text fields)	For text fields, the maximum number of characters that a user can enter in a field (up to 255 characters).
Length (for number, currency, percent fields)	For number, currency, and percent fields, the number of digits you can enter to the left of the decimal point, for example, 123.98 for an entry of 3.
Mask Character	For encrypted text fields, determines the character to use for hidden characters. Available options are * and X.
Mask Type	<p>For encrypted text fields, determines which characters are hidden and the use of dashes in the field. Masked characters are hidden using the character selected in <code>Mask Character</code>. Available options are:</p> <p>Mask All Characters All characters in the field are hidden.</p> <p>Last Four Characters Clear All characters are hidden but the last four display.</p> <p>Credit Card Number The first 12 characters are hidden and the last four display. Salesforce automatically inserts a dash after every fourth character.</p> <p>National Insurance Number All characters are hidden. Salesforce automatically inserts spaces after each pair of characters if the field contains nine characters. Use this option for UK NINO fields.</p> <p>Social Security Number The first five characters are hidden and the last four display. Salesforce automatically inserts a dash after the third and fifth characters.</p> <p>Social Insurance Number All characters are hidden but the last three display. Salesforce automatically inserts a dash after the third and sixth characters.</p>
Master Object	The object on the master side of a master-detail relationship used to display the value of a roll-up summary field .
Related List Label	For relationship fields, the title for the related list that displays associated records on the parent record.
Related To	For relationship fields, the name of the associated object.
Required	<p>Makes the field required everywhere in Salesforce. Not available for external objects.</p> <p>You must specify a default value for required campaign member custom fields.</p> <p>Don't assign default values to fields that are both required and unique, because uniqueness errors can result. See Require Field Input to Ensure Data Quality on page 3901.</p>

Field**Description****Roll-Up Type**

For [roll-up summary fields](#), choose the type of calculation to make:

Type	Description
COUNT	Totals the number of related records.
SUM	Totals the values in the field you select in the <code>Field to Aggregate</code> option. Only number, currency, and percent fields are available.
MIN	Displays the lowest value of the field you select in the <code>Field to Aggregate</code> option for all directly-related records. Only number, currency, percent, date, and date/time fields are available.
MAX	Displays the highest value of the field you select in the <code>Field to Aggregate</code> option for all directly-related records. Only number, currency, percent, date, and date/time fields are available.

Starting Number

For auto-number fields, enter a `Starting Number` that's less than 1 billion. Select `Generate Auto Number for existing records` to automatically number all current records that begin with the starting number that you enter. If deselected, the next record that you enter is assigned the starting number and your older records are blank in this field. For leads, only unconverted leads are assigned a number.

When you create records, `Starting Number`'s value increments to store the number that will be assigned to the next auto-number field created. You can't edit `Starting Number` after creating an auto-number field. To edit a `Starting Number` value, change your auto-number field to a text field and then back to an auto-number field. To restart `Starting Number` values for fields on objects from a managed package, uninstall and then reinstall the package.

Warning: Be sure that you don't create records with duplicate auto-number values.

An auto-number field can contain up to 10 digits and up to 20 extra characters for your prefix or suffix.

Note:

- You can't retrieve the starting number of an auto-number field through Metadata API. To specify a `Starting Number` while deploying, add a `startingNumber` tag for your field to your `package.xml` file. For example:

```
<startingNumber>42</startingNumber>
```
- If you deploy without specifying a `Starting Number` value in your `package.xml` file, the default starting number for standard fields is 0. The default starting number for custom fields is 1.

Field	Description
Sharing Setting	For master-detail relationship fields, the <code>Sharing Setting</code> attribute determines the sharing access that users must have to a master record in order to create, edit, or delete its associated detail records.
Sorting Disabled	For custom fields on external objects, determines whether the field is sortable.
Summarized Object	The object on the detail side of a master-detail relationship used to provide the values calculated in a roll-up summary field .
Unique	<p>If checked, prevents duplicate field values.</p> <p>For text fields, you can control whether values that are identical except for their case are considered unique. Select <code>Treat "ABC" and "abc" as duplicate values</code> to enforce case-insensitive uniqueness, or select <code>Treat "ABC" and "abc" as different values</code> to enforce case-sensitive uniqueness.</p> <p> Note: Some characters have both single-byte and double-byte versions. For example, all of the following characters have single-byte and double-byte versions: <code>!"@#%&^&*(){}[]\ :; ',.<>?/~`</code>.</p> <p>For the purpose of unique field value comparison, the single-byte and double-byte versions of these characters are considered identical.</p> <p> Note: Custom fields marked as Unique count against an object's limit of seven <code>External ID</code> fields. Custom indexing that occurs automatically in the background by Salesforce does <i>not</i> count against External ID limits.</p>
Values	For picklist fields, a list of available values (up to 255 characters for each value). For picklists, select the appropriate checkbox to alphabetize the picklist entries. You can also set the first value as the default selection. If you select both checkboxes, Salesforce alphabetizes the entries and then sets the first alphabetized value as the default. For multi-select picklists, enter a list of values, select the sorting options that apply, and then enter how many values you want displayed at a time on edit pages. The number of values determines the box height.

Auto-Number Formatting Examples

Use these examples when setting the display format for auto-number fields.

Format	Displayed Values
{0}	3 66 103
{000}	003 066 103
Sample- {00000}	Sample- 00003 Sample- 00666 Sample- 10023
Value- {00} {MM} {DD} {YY}	Value- 03 12 02 04 Value- 76 03 03 04 Value- 123 11 09 04

Format	Displayed Values
PO #{0} {MM}-{DD}-{YY}	PO #12233 12-20-04 PO #25 06-07-04 PO #3 07-07-04

[Create Custom Fields](#)

[Create a Many-to-Many Relationship](#)

[Web Services API Developer's Guide](#)

Geolocation Custom Field

The geolocation custom field allows you to identify locations by their latitude and longitude and to calculate distances between locations.

You can calculate the distance between two geolocation fields, such as between a warehouse and a store. Or you can calculate the distance between a geolocation field and a pair of latitude and longitude coordinates, such as between a warehouse and 37.794016°, -122.395016°—the location also known as San Francisco. Latitude values must be within -90 and 90 . Longitude values must be within -180 and 180 .

Geolocation is a compound field that counts toward your organization's limits as three custom fields: one for latitude, one for longitude, and one for internal use. Support for the compound field (geolocation) versus the field's components (latitude and longitude) varies depending on the functionality you're using in Salesforce. For example, you can create list views that show the field and its components, but you can't select the compound geolocation field in Apex. You can run SOQL queries only on a geolocation field's components.

Compound fields, including geolocation fields, have the following limitations.

- Compound fields are read-only. To update field values, modify the individual field components.
- Compound fields are accessible only through the SOAP and REST APIs. The compound versions of fields aren't accessible anywhere in the Salesforce user interface.
- Although compound fields can be queried with the `Location` and `Address` Apex classes, they're editable only as components of the actual field. Read and set geolocation field components by appending "`__latitude__s`" or "`__longitude__s`" to the field name, instead of the usual "`__c`." For example:

```
Double theLatitude = myObject__c.aLocation__latitude__s;
myObject__c.aLocation__longitude__s = theLongitude;
```

You can't access or set the compound value.

- You can't use compound fields in Visualforce—for example, in an `<apex:outputField>`. To access or update field values, use the individual field components.
- If you select compound fields for export in the Data Loader, they cause error messages. To export values, use individual field components.
- Geolocation fields and latitude and longitude on standard addresses aren't supported in the Data Import Wizard. Use the SOAP or REST APIs to import these fields. If you don't have a preferred tool for working with Salesforce APIs, Workbench is an easy way to get started.
- You can't use compound fields in lookup filters, except to filter distances that are within or not within given ranges. You can use distance lookup filters only in the Metadata API.
- The only formula functions that you can use with compound fields are `ISBLANK`, `ISCHANGED`, and `ISNULL`. You can't use `BLANKVALUE`, `CASE`, `NULLVALUE`, `PRIORVALUE`, or the equality and comparison operators with compound fields. The

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

equality and comparison operators include = and == (equal), <> and != (not equal), < (less than), > (greater than), <= (less than or equal), >= (greater than or equal), && (AND), and || (OR).

Other limitations of geolocation fields include:

- Geolocation fields aren't supported in custom settings.
- Geolocation fields aren't available in dashboards or Schema Builder.
- Geolocation fields are available in Visual Workflow and in formula-based workflow and approvals, but they can't be used in filter-based workflow updates and approvals.
- DISTANCE formulas are supported in:
 - Entry criteria for workflow rules and approval processes
 - Field update actions in workflow rules and approval processes
 - Custom validation rules
 - Lookup filters (in the Metadata API only)
- Geolocation fields and latitude and longitude on standard addresses aren't supported in Salesforce to Salesforce.
- The geolocation component of address fields isn't set automatically. Set values for latitude and longitude on your addresses by using SOQL, Workbench, the SOAP or REST API, or a geocoding service. You can then use address fields as locatable values. Search the AppExchange for "geocode" to find some possible solutions.
- Geolocation fields are supported in SOQL with the following limitations.
 - DISTANCE and GEOLOCATION are supported in WHERE and ORDER BY clauses in SOQL, but not in GROUP BY or SELECT.
 - DISTANCE supports only the logical operators > and <, returning values within (<) or beyond (>) a specified radius.
 - When using the GEOLOCATION function in SOQL queries, the geolocation field must precede the latitude and longitude coordinates. For example, DISTANCE(warehouse_location__c, GEOLOCATION(37.775,-122.418), 'km') works but DISTANCE(GEOLOCATION(37.775,-122.418), warehouse_location__c, 'km') doesn't work.
 - Apex bind variables aren't supported for the units parameter in DISTANCE or GEOLOCATION functions. This query doesn't work.

```
String units = 'mi';
List<Account> accountList =
  [SELECT ID, Name, BillingLatitude, BillingLongitude
   FROM Account
   WHERE DISTANCE(My_Location_Field__c, GEOLOCATION(10,10), :units) < 10];
```

For more information and examples, see the [Force.com SOQL and SOSL Reference](#).

[Custom Field Types](#)

[Custom Field Attributes](#)

View Fields for a Specific Object

1. From the object management settings for the object whose fields you want to view, go to Fields.
 2. Click the name of the field.
 3. To modify a custom field or change the data type, click **Edit**.
 4. If a custom field exists in a Managed - Released package, click **Delete** to delete the custom field component from future installations.
 5. To set users' access to the field, click **Set Field-Level Security**. Available in Enterprise, Unlimited, Performance, and Developer Edition organizations only.
 6. To view who can access the field based on permissions and record type, click **View Field Accessibility**. Available in Enterprise, Unlimited, Performance, and Developer Edition organizations only.
 7. If the field is a dependent picklist, view a list of the controlling fields on which it depends. Click **New** to define a dependent picklist. Click **Edit** to change the picklist dependency rules or **Del** to remove the picklist dependency.
 8. If the custom field is a dependent picklist, click **[Change]** next to the controlling field to edit the picklist dependency rules.
 9. To create a new validation rule for the field, click **New** in the Validation Rules related list. Click **Edit** to change a validation rule or **Del** to remove it. Not available for external objects.
 10. For picklist fields, you can add new values and edit, replace, or delete existing values.
 11. To change `External ID`, `Required`, or other attributes under the General Options section, see [Custom Field Attributes](#).
 12. To restore the field and its data, click **Undelete**. This is available only if the field has been deleted but not permanently erased. The field's behavior may be different after restoring it. To restore the field completely, see [Managing Deleted Custom Fields](#).
-  **Note:** If your organization uses person accounts, the Account Fields page lists both person account and business account fields. Person accounts use a combination of account and contact fields. The following contact fields are available for person accounts, but not for business accounts.
- Fields in the Account Standard Fields list that display with a person account icon.
 - Fields in the Contact Custom Fields & Relationships list.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

Standard fields are not available in **Database.com**

Lightning Connect external objects are available in: **Developer** Edition and for an extra cost in: **Enterprise, Performance**, and **Unlimited** Editions

SEE ALSO:

[Custom Settings](#)

Edit Custom Fields

1. From the management settings for the field's object, go to Fields.
2. Click **Edit** next to the field's name.
3. Modify the [field attributes](#). The attributes differ depending on the field type.

To change the type of your custom field, see [Change the Custom Field Type](#) on page 3855.

To make changes to picklists:

- Click **Edit** next to a value to change its name or make it the default picklist value.
- Click **Del** next to a value to remove it from the picklist.

Special picklists—such as `opportunity Stage`, `Task Priority`, `Task Status`, `Lead Status`, and `Case Status`—may prompt you to map the deleted value to another existing value in all of your organization's records. You can map the values or leave your existing data unchanged.

- Click **New** to add values to the picklist. If you use record types, select any record types that you want to include the new values.
- Click **Reorder** to [change the sequence of picklist values](#).
- Click **Replace** to [change the values of picklist fields in existing records](#).
- Click **Printable View** to open an easy-to-print list of your picklist values.
- Click **Chart Colors** and select an option to assign colors to picklist values for use in charts:
 - **Assign fixed colors to all values** assigns a fixed color to each value from the standard set of chart colors. The `Chart Colors` column shows the assigned colors. [Manually change assigned colors](#) by editing picklist values. For example, if you want Closed Lost values to always show up as red in charts grouped by Opportunity Stage, assign red to that picklist value.
 - **Assign colors to values dynamically** assigns colors when a chart is generated. When you select this option, all colors are assigned dynamically. Edit picklist values to assign fixed colors. For example, if you only need certain picklist values to show up as fixed colors in charts, manually assign colors to those values and leave the rest as "Assigned dynamically".

Manual assignments are overridden each time you click an option in **Chart Colors**.

 **Note:** Chart colors aren't available for multi-select picklists, currency picklists, or Task Subject, Event Subject, Knowledge Validation Status, and Opportunity Competitor picklists.

4. Optionally, define custom help text for the field.
5. For lookup and master-detail relationship fields, optionally define a lookup filter.
6. For formula fields, click **Next** to modify the formula.
7. In Enterprise, Unlimited, Performance, and Developer Editions, click **Next** to set the field-level security for the field.
8. Click **Save**.

 **Note:**

- Editing fields may require changing a large number of records at once. To process these changes efficiently, your request may be queued and you may receive an email notification when the process has completed.
- To customize the way a custom object's related list appears on a parent record's detail page, edit the parent record's page layout. For example, if you want to edit which fields appear on a custom object's related list on accounts, you would edit the account page layout.
- You cannot change the `Field Name` if a custom field is referenced in Apex.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions**

Standard Objects are not available in **Database.com**

USER PERMISSIONS

To create or change fields:

- "Customize Application"

- When editing fields for accounts, opportunities, cases, contacts, or custom objects, check for any criteria-based sharing rules that use the field in the rules. A field change may affect which records are shared.

[Define Default Field Values](#)

[Find Object Management Settings](#)

Delete Fields

1. From the management settings for the field's object, go to Fields.
2. Click **Del** next to the name of the field.
3. When prompted, select the `Yes, I want to delete the custom field` checkbox to confirm, and click **Delete**.

Deleted custom fields and their data are stored until your organization permanently deletes them or 15 days has elapsed, whichever happens first. Until that time, you can restore the field and its data. For information on restoring deleted custom fields and relationships, see [Managing Deleted Custom Fields](#) on page 3835.

Note:

- Before deleting a custom field, consider where it's referenced. You can't delete a custom field that's referenced elsewhere. For example, you can't delete a custom field that's referenced by a field update or Apex.
- You can't delete a field if that field is being updated by a background job, such as an update to a roll-up summary field. Wait until the background job finishes, and try again.
- When you delete a custom field, all of the field history data is deleted and changes are no longer tracked.
- A background process periodically runs that cleans up metadata associated with deleted custom fields. This process will affect the `Last Modified Date` and `Last Modified By` fields on page layouts, record types, and custom objects.

USER PERMISSIONS

To delete custom fields:

- "Customize Application"

Managing Deleted Custom Fields

Deleted custom fields and their data are stored until your organization permanently deletes them or 15 days has elapsed, whichever happens first. Until that time, you can restore the field and its data. However, the field still counts against the maximum number of custom fields allowed in your organization.

1. From the management settings for the field's object, go to Fields.
2. Click **Deleted Fields** at the bottom of the list of custom fields and relationships. The number in parentheses indicates the total number of deleted custom fields for this object. This link only displays when you have a deleted custom field.
3. Use the list of deleted fields to perform the following actions:
 - To view details about a field, click the field label.
 - To permanently remove the custom field and its data, click **Erase**.
 - To restore the field and its data, click **Undelete**. Some attributes of deleted fields are not restored automatically. To restore these attributes manually:
 - a. Add the field to any page layouts that changed during the time the custom field was deleted. If reports and page layouts were not edited, the restored field remains on them.
 - b. Make the field unique if necessary. Salesforce automatically removes the unique attribute from any deleted custom field.
 - c. Make the field required if necessary. Salesforce automatically removes the required attribute for any deleted custom field.
 - d. Add the custom field to any appropriate Force.com AppExchange packages. Salesforce automatically removes deleted custom fields from packages that contain them.
 - e. Convert any lookup relationships to master-detail relationships if necessary. Salesforce converts all relationships to lookup relationships when they are deleted. To convert a lookup relationship to a master-detail relationship, populate all the applicable records with the appropriate data.
 - f. [Redefine any field dependencies](#) that Salesforce removed when the field was deleted.
 - g. Edit and save any formula fields. Saving prompts a syntax check; if necessary, resolve errors.
 - h. Set up field history tracking if necessary. If the list of fields enabled for history tracking was modified during the deletion process, the restored field is no longer set up to track field history.

Notes on Restored Custom Fields

- When deleted, the following characters are appended to the end of a custom field's developer name unless a deleted field already has that developer name: "_del". These characters remain when you restore the custom field.
- Formula fields are restored in a disabled state, which means they do not contain updated data until you edit and save them. While a formula field is disabled, "#Error!" displays in place of the formula value.
- Restored fields do not display in search results immediately after you restore them. It can take a short time before the restored custom field and its data are available in search results.
- Lead fields that are mapped to account, contact, or opportunity fields for lead conversion are still mapped accordingly when restored.
- Auto number fields continue to increment after they are deleted and contain the correct values when restored.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Page Layouts and Lead Fields are not available in **Database.com**

USER PERMISSIONS

To restore deleted custom fields and relationships:

- "Customize Application"

To permanently delete custom fields or relationships:

- "Customize Application"

- Field history data for the deleted custom field is restored.

Additional Custom Field Options

Changing Page Layouts

To change the location of a new custom field, edit the page layout for the appropriate tab.

Using Record Types

If your organization uses record types, edit the record type to modify which picklist values are visible for the record type.

Tracking Custom Field History

You can select which custom fields to track on the History related list of custom objects and most standard objects. All entries include the date, time, nature of the change, and who made the change. History data does not count against your organization's storage limit.

Using the Translation Workbench

If your organization uses the Translation Workbench, notify your translators that new fields need translations.

Activity Custom Fields

Activity custom fields can apply only to tasks or only to events, or to both tasks and events. For example, you can create one `Time Spent` field and then add it to both the event page layout and the task page layout.

Mapping Custom Lead Fields

For lead custom fields, you can click **Map Lead Fields** to specify which custom lead fields to map to custom account, contact, and opportunity fields during a lead conversion.

Rich Text Area Field Tips and Limitations

Use rich area text fields to improve the appearance of text, including adding images and hyperlinks. Rich text area fields use the [Salesforce HTML editor](#) to format content.

 **Note:** The upgraded editor doesn't support Internet Explorer version 7 or version 8 in compatibility mode. If you are using these browsers, you will use the older editor.

Implementation Tips

- Specify how big the editor box should be for a rich text field by configuring the "Number of lines displayed" property in the field's setup.
- When you view or print content, Salesforce preserves the formatted version of the HTML in rich text area fields.
- Searches of content that contains rich text area fields ignore images and tags.
- Deleting a rich text area field moves it to the Deleted Fields section on the custom object or Salesforce Knowledge article types.
- You can only convert rich text area fields into long text area fields. Any images are deleted the next time the long text area field is saved. After converting, markup is hidden in the long text area field but it is not removed from the record until you save the record. That way, the markup can be restored if you change your mind.
- JavaScript or CSS is treated as text. For example, if you're creating an Idea through the API, any JavaScript or CSS code is removed without warning.

EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

USER PERMISSIONS

To create or change custom fields:

- "Customize Application"

- If you're creating an Idea through the API, some tags and attributes are filtered without warning. Salesforce supports a limited number of approved HTML tags.
- When a rich text area field is used in a formula, the HTML tags are stripped out before the formula is run. For example, when a rich text area field is used in a validation rule's criteria, the HTML tags are removed before the evaluation.
- The text part of rich text area fields counts towards data storage for the entity that contains the field.
- You can copy and paste text from external sources such as Microsoft® Word, but you may have to reapply formatting.

Images in Rich Text Area Fields

- The maximum size of an image that can be uploaded in a rich text area field is 1 MB. Only .gif, .jpg and .png file types are supported.
 - To upload many images, use API version 20 or later. For more information, see the *Force.com SOAP API Developer's Guide*.
-  **Note:** When you upload images via the API, the `alt` attribute isn't populated unless you specified it separately.
- Images uploaded within a rich text area field are extracted in the organization's weekly export and included in the exported data.
 - Uploaded images within the rich text area fields are counted towards file storage for the entity that contains the field.
 - You can't add a hyperlink to an image.

Reports and Rich Text Area Fields

- Rich text area fields can be filtered and summarized in reports, but the HTML tags are included as text.
- Only the first 254 characters in a rich text area or a long text area are supported with the "contains" operator in a report filter.
- Only the first 254 characters in a rich text area or a long text area are displayed in a report. If you download the report, the entire field is available.

Limits and Limitations

- Salesforce supports up to 131,072 characters for each rich text area field, including the HTML tags. If desired, you can set a lower limit.
- An object can contain an unlimited number of rich text area and long text area fields, although your Edition's limit for the total number of custom fields allowed on an object, regardless of field type, applies. Each object can contain a total of 1.6 million characters across long text area and rich text area fields. When you create a long text area or rich text area field, you set a character limit for the field—the maximum length of the text that can be entered. The default character limit for long text area and rich text area fields is 32,768 characters (32 KB). The maximum character limit for long text area and rich text area fields is 131,072 characters (128 KB). The minimum character limit is 256 characters.
- You can't paste special characters, such as bullets or curly quotes, into a rich text field from another application. It's best to type or paste in plain text and use the rich text editor to format it.
- You can't disable specific rich text area features. For example, you can't disable support for hyperlinks or images on certain fields.
- HTML code isn't supported in the [Salesforce HTML editor](#). HTML code is treated as text.
- Rich text area fields aren't available in self service portals.
- Rich text area fields aren't supported for external objects.

[Create Custom Fields](#)

Classic Encryption for Custom Fields

Restrict other Salesforce users from seeing custom text fields you want to keep private. Only users with the permission “View Encrypted Data” can see data in encrypted custom text fields.

 **Note:** This information applies to Classic Encryption and not to Platform Encryption. See the Salesforce Online Help for more information.

Before you begin working with encrypted custom fields, review these implementation notes, restrictions, and best practices.

Implementation Notes

- Encrypted fields are encrypted with 128-bit master keys and use the Advanced Encryption Standard (AES) algorithm. You can archive, delete, and import your master encryption key. To enable master encryption key management, contact Salesforce.
- You can use encrypted fields in email templates but the value is always masked regardless of whether you have the “View Encrypted Data” permission.
- If you have created encrypted custom fields, make sure that your organization has “Require secure connections (HTTPS)” enabled.
- If you have the “View Encrypted Data” permission and you grant login access to another user, the user can see encrypted fields in plain text.
- Only users with the “View Encrypted Data” permission can clone the value of an encrypted field when cloning that record.
- Only the `<apex:outputField>` component supports presenting encrypted fields in Visualforce pages.

Restrictions

Encrypted text fields:

- Cannot be unique, have an external ID, or have default values.
- For leads are not available for mapping to other objects.
- Are limited to 175 characters because of the encryption algorithm.
- Are not available for use in filters such as list views, reports, roll-up summary fields, and rule filters.
- Cannot be used to define report criteria, but they can be included in report results.
- Are not searchable, but they can be included in search results.
- Are not available for: Salesforce Classic Mobile, Connect Offline, Salesforce for Outlook, lead conversion, workflow rule criteria or formulas, formula fields, outbound messages, default values, and Web-to-Lead and Web-to-Case forms.

Best Practices

- Encrypted fields are editable regardless of whether the user has the “View Encrypted Data” permission. Use validation rules, field-level security settings, or page layout settings to prevent users from editing encrypted fields.
- You can still validate the values of encrypted fields using validation rules or Apex. Both work regardless of whether the user has the “View Encrypted Data” permission.
- Encrypted field data is not always masked in the debug log. Encrypted field data is masked if the Apex request originates from an Apex Web service, a trigger, a workflow, an inline Visualforce page (a page embedded in a page layout), or a Visualforce email template. In other cases, encrypted field data isn’t masked in the debug log, like for example when running Apex from the Developer Console.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Performance
- Unlimited
- Database.com

- Existing custom fields cannot be converted into encrypted fields nor can encrypted fields be converted into another data type. To encrypt the values of an existing (unencrypted) field, export the data, create an encrypted custom field to store that data, and import that data into the new encrypted field.
- `Mask Type` is not an input mask that ensures the data matches the `Mask Type`. Use validation rules to ensure that the data entered matches the mask type selected.
- Use encrypted custom fields only when government regulations require it because they involve more processing and have search-related limitations.

[Create Custom Fields](#)

Update Picklists

1. Navigate to the fields page for your object.
 - For Knowledge validation status picklists, from Setup, enter *Validation Statuses* in the `Quick Find` box, then select **Validation Statuses**.
2. In the Custom Fields & Relationships related list, click the name of the picklist field you want to update.
3. In the Picklist Values section, click **Edit** next to a value.
4. In the Picklist Edit page, you can change the name of the value and make the value the default for the master picklist. You can also assign a color for use in charts by clicking the  button. To assign a color dynamically when a chart is generated, click **Assign color dynamically**.

 **Note:** Chart colors aren't available for multi-select picklists, currency picklists, or Task Subject, Event Subject, Knowledge Validation Status, and Opportunity Competitor picklists.

 **Tip:**

- If you use record types, changing the default value of the master picklist does not affect the default value of the picklist for a record type.
- For Ideas, setting the default value of the Categories or Status picklists does not affect the default value on the Ideas pages.
- If you change the label for a picklist value that is used as a filter criterion, the picklist value is automatically removed from the filter criteria. For example, if your report contains a filter where *Lead Source equals Email or Web* and you change the picklist value Web to Referral, your report filter will change to *Lead Source equals Email*. If the changed picklist value was the only value specified for a particular filter, it will continue to show up in your filters, but an error will display.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To change picklists:

- “Customize Application”

5. Click **Save**.

-  **Note:** If your organization uses the Translation Workbench, notify your translators that the translations may be out of date whenever you change picklist values.

SEE ALSO:

[Additional Options for Updating Picklists](#)

[Picklist Limitations](#)

Additional Options for Updating Picklists

If you want to do more than update a picklist's values, go to the picklist field's detail page.

- Navigate to the fields page for your object.
 - For Knowledge validation status picklists, from Setup, enter *Validation Statuses* in the **Quick Find** box, then select **Validation Statuses**.
- In the Custom Fields & Relationships related list, click the name of the picklist field to update.
- Scroll down to the Picklist Values related list.

From the Picklist Values related list, you can:

- Click **Edit** next to a value to change its name or make it the default picklist value.
- Click **Del** next to a value to remove it from the picklist.

[Special picklists](#)—such as opportunity Stage, Task Priority, Task Status, Lead Status, and Case Status—may prompt you to map the deleted value to another existing value in all of your organization's records. You can map the values or leave your existing data unchanged.
- Click **New** to add values to the picklist. If you use record types, select any record types that you want to include the new values.
- Click **Reorder** to [change the sequence of picklist values](#).
- Click **Replace** to [change the values of picklist fields in existing records](#).
- Click **Printable View** to open an easy-to-print list of your picklist values.
- Click **Chart Colors** and select an option to assign colors to picklist values for use in charts:
 - Assign fixed colors to all values** assigns a fixed color to each value from the standard set of chart colors. The **Chart Colors** column shows the assigned colors. [Manually change assigned colors](#) by editing picklist values. For example, if you want Closed Lost values to always show up as red in charts grouped by Opportunity Stage, assign red to that picklist value.
 - Assign colors to values dynamically** assigns colors when a chart is generated. When you select this option, all colors are assigned dynamically. Edit picklist values to assign fixed colors. For example, if you only need certain picklist values to show up as fixed colors in charts, manually assign colors to those values and leave the rest as "Assigned dynamically".

Manual assignments are overridden each time you click an option in **Chart Colors**.

-  **Note:** Chart colors aren't available for multi-select picklists, currency picklists, or Task Subject, Event Subject, Knowledge Validation Status, and Opportunity Competitor picklists.

For organizations using record types, you can include some or all of the values from the master picklist in different record types to offer a subset of values to users based on their profile.

SEE ALSO:

[Update Picklists](#)

Picklists with Additional Information

These standard picklist fields have additional information that you can edit.

Picklist	Description
Partner Role (for accounts)	<p>Roles of account partners, for example, Consultant, Supplier. These options are available when you add an account to the Partners related list of an account or opportunity.</p> <p>To edit, from Setup, enter <i>Partner Roles</i> in the Quick Find box, then select Partner Roles.</p> <p>Enter the name of the partner role in the “Role” column. In the “Reverse Role” column, enter the corresponding reverse partner role. Assigning a partner role to an account creates a reverse partner relationship so that both accounts list the other as a partner.</p> <p>Each role and reverse role value can have up to 40 characters.</p>
Priority (for cases)	<p>Urgency of case, for example, Low, High.</p> <p>If you delete a value, you have the option to map the deleted value to another existing value in all of your organization’s cases.</p> <p>Each picklist value can have up to 40 characters.</p>
Status (for campaign members)	<p>State of a campaign member, for example, Sent or Responded.</p> <p>If you delete a Status value, you have the option to map the deleted value to another existing value. The new replacement value is automatically added to the member status for campaigns that contained the deleted value.</p> <p>If the deleted value is the default member status for a campaign, the new replacement value becomes the default status for that campaign.</p>
Status (for cases)	<p>State of case, for example, New, On Hold.</p> <p>If you delete a value, you have the option to map the deleted value to another existing value in all of your organization’s cases.</p> <p>Each picklist value can have up to 40 characters.</p>
Status (for contracts)	<p>State of the contract in the contract business process. You can add values to this picklist and organize each value into one of several categories, for example, “Draft”, “In Approval Process”, or “Activated”. Then sort your contracts using these categories in reports and views.</p>
Contact Role (for contracts)	<p>Role of a contact on a contract, for example, Business User, Decision Maker. These options are available when you add a contact to the Contact Roles related list of a contract.</p> <p>To edit, from Setup, enter <i>Contact Roles</i> in the Quick Find box, then select Contact Roles on Contracts.</p>

Picklist	Description
Lead Status (for leads)	<p>Each picklist value can have up to 40 characters.</p> <hr/> <p>State of the lead, for example, Open, Qualified.</p> <p>Select one value as the “Default Status” assigned to all new leads created manually, via the import wizard, or via your website. Select one or more values as the “Converted Status” assigned to converted leads. When you convert qualified leads into an account, contact, and opportunity, you can select one of the “Converted” statuses to assign to the lead. Leads with a “Converted” status type are no longer available in the Leads tab, although you can include them in reports.</p> <p>If you delete a value, you have the option to map the deleted value to another existing value in all of your organization’s leads.</p> <p>Each value can have up to 20 characters.</p>
Contact Role (for opportunities)	<p>Role of a contact for an opportunity, for example, Business User, Decision Maker. These options are available when you add a contact to the Contact Roles related list of an opportunity.</p> <p>To edit, from Setup, enter <i>Contact Roles</i> in the <i>Quick Find</i> box, then select Contact Roles on Opportunities.</p> <p>Each picklist value can have up to 40 characters.</p>
Stage (for opportunities)	<p>Sales process stages, for example, Prospect, Proposal. This picklist also affects the <i>Type</i> and <i>Forecast Category</i> values of an opportunity. Specifically, changing the <i>Type</i> or <i>Forecast Category</i> for a <i>Stage</i> picklist value updates all opportunities that have that stage value.</p> <p>To edit, from the management settings for opportunities, go to <i>Fields</i>, and then click Edit next to <i>Stage</i>.</p> <p>To deactivate an active stage, click Del next to the stage. On the mapping page, don't replace the stage with another existing value; just click Save. The stage now appears in the <i>Inactive Stage Picklist Values</i> related list. The stage is no longer in use but may exist in older opportunity records.</p>
Status (for solutions)	<p>Status of a solution, for example, Draft, Reviewed. Mark one or more values as “Reviewed”. When users solve cases using solutions, they can view which solutions have been reviewed and which have not.</p> <p>Each picklist value can have up to 40 characters.</p>
Priority (for tasks)	<p>Importance of the task, for example, High, Normal, Low. Set one value as the default priority of all new tasks, and one value as the highest priority.</p> <p>If you delete a value, you have the option to map the deleted value to another existing value in all of your organization’s tasks.</p>

Picklist	Description
	Each picklist value can have up to 20 characters.
Status (for tasks)	<p>State of a task, for example, Not Started, Completed. Choose at least one value as the “Closed” status and one value as the “Default” status for all new tasks.</p> <p>If you delete a value, you have the option to map the deleted value to another existing value in all of your organization’s tasks.</p> <p>Each picklist value can have up to 40 characters.</p>
Task Type (for tasks)	<p><code>Send Email Default</code> specifies the default task type assigned when the task is sending email or mass email, and when tasks are created via inbound email, such as Email to Salesforce. <code>Default</code> specifies the default picklist value when creating tasks.</p> <p>To edit, from the management settings for tasks, go to Fields, and then click Edit next to the picklist value that you want to specify as the default.</p>

SEE ALSO:

[Picklist Limitations](#)

Picklist Limitations

The maximum number of entries you can have in a picklist is determined by the total number of characters allowed in the picklist, which is 15,000 characters. Note that each entry includes a linebreak and a return character that are not visible. These two additional characters per entry are counted as part of the 15,000 character limit.

Additional limits apply to both standard and custom picklists.

Additional Limits for Standard Picklists

For standard picklists, entries can be up to 40 characters, not including linebreaks and returns. For standard multi-select picklists, the total number of characters for all entries cannot exceed 255.

For standard picklists in organizations that use record types or the Translation Workbench, you can have an unlimited number of entries with the following exceptions for special picklists.

Picklist Field	Maximum Number of Entries
Lead Status	100
Task Status	100
Task Priority	50
Case Status	100
Case Priority	50

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions**
 Standard Picklists are not available in **Database.com**

USER PERMISSIONS

To change picklists:

- “Customize Application”

Picklist Field	Maximum Number of Entries
Opportunity Stage	100

Additional Limits for Custom Picklists

Within the 15,000 total character limit, custom picklists can have:

- Up to 1,000 entries
- Up to 255 characters per entry

Custom multi-select picklists can have:

- Up to 500 values
- Up to 40 characters per value

Note that for multi-select picklists, users can select up to 100 values at a time on a record.

Functional Limitations for Custom Picklists

-  **Note:** Restricted picklists and global picklists are currently part of a pilot program. For each of these features: We provide this feature to selected customers through a pilot program that requires agreement to specific terms and conditions. To be nominated to participate in the program, contact Salesforce. Because pilot programs are subject to change, we can't guarantee acceptance. This pilot feature isn't generally available, as referenced in this document or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available features.
- Only new custom picklist fields can be designated as restricted picklists; an existing picklist can't be made into a restricted picklist. (A restricted picklist's values are restricted to only those values defined by a Salesforce admin. This restriction prevents users from loading redundant or erroneous values through the API.)
- Global picklists are always restricted picklists. (Global picklists are shared across objects. Reuse the values in a global picklist for any picklist that's based on it.)
- After you create a custom picklist field based on a global picklist, the list of values doesn't appear on the custom picklist's detail page in Setup. However, the values are still inherited from the global picklist.
- For custom picklist fields based on a global picklist, you can't change the custom picklist from a single-select to a multi-select picklist.
- A global picklist can't be a dependent picklist, of a local picklist or of another global picklist. However, a global picklist can control a local picklist as its dependent.
- For a custom, multi-select picklist that's based on a global picklist, you can't do a replace operation. For more information, see [Replace Picklist Values](#) on page 3846.

Replace Picklist Values

As your business needs change, replace picklist values with more relevant alternatives. For example, let's say that your status picklist has five values: Open, In Progress, Closed-red, Closed-yellow, and Closed-green. You want to simplify it to three values: Open, In Progress, and Closed. Replace the Closed-red, Closed-yellow, and Closed-green values with a new value: Closed.

 **Important:** If you replace a parent value in a controlling picklist, the picklist dependency on that value is lost. After replacing the parent value, [re-create the dependency](#) using the new parent value.

 **Note:** You can't replace a value in a custom multi-select picklist that's based on a global picklist.

To globally replace the values of picklist fields in existing records:

1. If necessary, create the replacement value in the picklist edit page. See [Update Picklists](#).
2. Navigate to the fields area of the appropriate object:
 - For Knowledge validation status picklists, from Setup, enter *Validation Statuses* in the *Quick Find* box, then select **Validation Statuses**.
3. Click **Replace** next to the picklist.
4. Type the value you want to change, and select a new replacement value.

 **Note:** Replacing an existing picklist value also changes the *Modified By* date and time for the record.

5. To apply the new value on any records with a blank value in this field, select *Replace all blank values*.
6. To update all occurrences of the value in your organization's records with the new value, click **Replace**. Occurrences in the Recycle Bin are also updated. Your replace job is queued. To check the job's status, from Setup, enter *Background Jobs* in the *Quick Find* box, then select **Background Jobs**. You receive an email when the job is complete.

 **Note:** If you replace the *Stage* picklist for opportunities, the *Probability*, *Forecast Category*, and *Expected Revenue* fields are also updated with the corresponding values.

SEE ALSO:

[Create a Global Picklist \(Pilot\)](#)

Sort Picklists

1. From the management settings for the picklist field's object, go to Fields.

 **Note:**

- For custom task or event fields, go to the object management settings for Activities.
- For standard task fields, go to the object management settings for Tasks. For standard event fields, go to the object management settings for Events.
- For Knowledge validation status picklists, from Setup, enter *Validation Statuses* in the *Quick Find* box, then select **Validation Statuses**.

2. Click **Edit** next to the picklist you want to update.
3. Click **Reorder**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To replace picklist values:

- "Customize Application"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To sort picklists:

- "Customize Application"

4. Use the arrows to arrange the field in the proper sequence.
5. Select a default, if desired.
6. Check the box to alphabetize the entries for users on edit pages. The entries will always appear in alphabetical order, regardless of the user's language.
7. Save your changes.

 **Note:** On record edit and detail pages and in reports, picklist and multi-select picklist fields may include inactive values. These inactive values are sorted last, unless you have chosen alphabetical sorting. In that case, all values are sorted alphabetically.

SEE ALSO:

[Find Object Management Settings](#)

Define Dependent Picklists

To define a dependent picklist:

1. From the management settings for the object you want to add a field to, go to Fields.

 **Note:** Custom task and event fields are accessible from the object management settings for Activities.

2. Click **Field Dependencies**.
3. Click **New**.
4. Choose a controlling field and dependent field.

 **Note:** Some picklist and checkbox fields may not be available as controlling fields.

5. Click **Continue**.
6. Use the [field dependency matrix](#) to specify the dependent picklist values that are available when a user selects each controlling field value.
7. Optionally, click **Preview** to test your selections. If your organization uses record types, choose a record type to test how it affects your controlling and dependent picklist values. The record type controls what values are available in the controlling field. The record type and the controlling field together determine what values are available in the dependent picklist. For example, a dependent value is only available if it is available in the selected record type as well as the selected controlling value.

 **Note:** The `Filter by Record Type` option does not appear in the Preview window for activity custom fields.

8. Click **Save**.
9. If your organization uses record types, make sure that your controlling and dependent picklist values are available in the appropriate record types.

Available in: **All Editions**
Standard Objects are not available in **Database.com**

USER PERMISSIONS

To define dependent picklists:

- "Customize Application"

Dependent Picklists

Use dependent picklists to help your users enter accurate and consistent data. A *dependent picklist* is a custom or multi-select picklist for which the valid values depend on the value of another field, called the *controlling field*. Controlling fields can be any picklist (with at least one and fewer than 300 values) or checkbox field on the same record.

For example, you can define a `Reason` custom picklist on opportunities and make its valid values depend on the value of the `Stage` picklist as follows:

- If `Stage` is `Closed Won`, the valid values for `Reason` are `Superior features` or `Lower price`.
- If `Stage` is `Closed Lost`, the valid values for `Reason` are `Inferior features`, `Higher price`, or `Company viability`.

SEE ALSO:

[Define Dependent Picklists](#)

[Dependent Picklist Considerations](#)

Using the Field Dependency Matrix

The field dependency matrix lets you specify the dependent picklist values that are available when a user selects each controlling field value. The top row of the matrix contains the controlling field values, while the columns list the dependent field values.

Use this matrix to include or exclude values. Included values are available in the dependent picklist when a value in the controlling field is selected. Excluded fields are not available in the dependent picklist for the selected controlling field value.

To include or exclude values:

- Double-click values to include them. Included values are indicated with highlighting. Double-click any highlighted values to exclude them.
- Click a value and use SHIFT+click on another value to select a range of adjacent values. Then click **Include Values** to make the values available, or **Exclude Values** to remove them from the list of available values.
- Click a value and use CTRL+click to select multiple values. Then click **Include Values** to make the values available, or **Exclude Values** to remove them from the list of available values.
- Click a column header to select all the values in that column. Then click **Include Values** to make the values available, or **Exclude Values** to remove them from the list of available values.

To change the values in your view:

- Click **View All** to view all available values at once.
- Click **Go To** and choose a controlling value to view all the dependent values in that column.
- Click **Previous** or **Next** to view the values in columns that are on the previous or next page.
- Click **View sets of 5** to view 5 columns at a time.

USER PERMISSIONS

To define picklist dependencies:

- "Customize Application"

Edit Dependent Picklists

1. From the management settings for the picklist's object, go Fields.
2. Click **Field Dependencies**.
3. Click **Edit** next to the field dependency relationship you want to change.
4. Use the [field dependency matrix](#) to specify the dependent picklist values that are available when a user selects each controlling field value.
5. Optionally, click **Preview** to test your selections.
6. Save your changes.

SEE ALSO:

[Find Object Management Settings](#)

Delete Picklist Dependencies

If you no longer want the values of a dependent picklist to depend on a controlling field, delete its dependency. Deleting the dependency removes the logic that defines how the values of the picklist depend on the controlling field, but doesn't delete the fields or affect their data.

1. From the management settings for the picklist's object, go to Fields.
2. Click **Field Dependencies**.
3. Click **Del** next to the field dependency relationship you want to delete.
4. Click **OK** to confirm.

SEE ALSO:

[Find Object Management Settings](#)

Dependent Picklist Considerations

Consider the following when defining dependent picklists:

Checkboxes

Checkbox fields can be controlling fields but not dependent fields.

Converting fields

When you convert existing fields to dependent picklists or controlling fields, it doesn't affect the existing values in your records. After conversion, the dependency rules apply to new records and to any changes to existing records.

Default values

You can set default values for controlling fields but not for dependent picklists.

Field-level security

Field-level security settings for a controlling field and dependent picklist are independent. Remember to hide a controlling field whenever its correlating dependent picklist is hidden.

Import

The import wizards do not consider field dependencies. Any value can be imported into a dependent picklist regardless of the value imported for a controlling field.

Database.com

USER PERMISSIONS

To define and edit dependent picklists:

- "Customize Application"

Lead conversion

If you create a dependency for lead fields that map to account, contact, and opportunity fields for lead conversion, create the same dependency on the account, contact, or opportunity.

Dependent picklists and controlling lead fields can be mapped to account, contact, or opportunity fields with different dependency rules.

Multi-select picklists

Multi-select picklists can be dependent picklists but not controlling fields.

Standard versus custom picklists

Custom picklist fields can be either controlling or dependent fields.

Standard picklist fields can be controlling fields but not dependent fields.

Picklist limitations

A controlling field can have up to 300 values. If a field is both a controlling field and dependent picklist, it can't contain more than 300 values.

The following fields are not available as controlling fields.

Activity Fields

Call Type

Create recurring series of events

Show Time As

Subject

Task

Type

Contact Fields

Salutation

Contact Currency

Custom Object Fields

Currency

Lead Fields

Converted

Unread By Owner

Dependency limitations

Before defining a dependency, make sure that your picklist has at least one value. Standard fields like `Product Family` do not contain values until you add them.

If a standard controlling field relies on functionality that your organization decides to disable, the dependency rules for the picklist go away. For example, if your organization disables the Self-Service portal and the `Closed by Self-Service User` is a controlling field, its dependent picklist displays all available values.

If you replace a parent value in a controlling picklist, the picklist dependency is lost. After replacing the parent value, re-create the dependency using the new parent value.

Connect Offline

While controlling fields and dependent picklists are available in Connect Offline, the logic between them is not.

Page layouts

Make sure that controlling fields exist on any page layout that contains their associated dependent picklist. When the controlling field is not on the same page layout, the dependent picklist shows no available values.

For visually impaired users, make sure the dependent picklist is lower on the page layout than its controlling field.

If a dependent picklist is required and no values are available for it based on the controlling field value, users can save the record without entering a value. The record is saved with no value for that field.

Record types

The values in your controlling fields are determined by the record type selected. The values in your dependent picklists are determined by the record type and controlling field value selected. In short, the values available in dependent picklists are an intersection of the record type and controlling field selections.

Using the HTML Editor

Available in: **Enterprise, Performance, Unlimited**, and **Developer** Editions

To improve the appearance of text in custom fields, use the Salesforce HTML editor to format custom fields that were defined with the [rich text area](#) custom field type. The Salesforce HTML editor provides a WYSIWYG interface, allowing you to perform basic formatting operations. You can:

- Format text as bold, italicized, or underlined
- Create bulleted and numbered lists
- Change paragraph indentation
- Insert hyperlinks to Web pages
- Insert an image

 **Note:** The upgraded editor doesn't support Internet Explorer version 7 or version 8 in compatibility mode. If you are using these browsers, you will use the older editor.

Some features, such as Salesforce Knowledge or Ideas, let administrators enable extra functions like the ability to [embed multimedia content](#), use drop-down lists, or select colors for text or backgrounds. Make sure that your browser security settings allow you to access these functions. For example, if browser security is set to high in Microsoft® Internet Explorer® 7, `<iframe>` content does not appear in the frame, drop-down lists are unavailable, and color cannot be selected for backgrounds or text.

Common scenarios for using the HTML editor include:

- Pasting a code sample into a Chatter Answers or Ideas post
- Adding a video to a knowledge article or an Idea Themes post
- Formatting resumes submitted by job candidates to create more readable and professional-looking versions for your users
- Emphasizing key points in a descriptions or comments by setting various font options, such as bold typeface and a larger font size
- Itemizing steps in a numbered or bulleted list to help users better understand a procedure
- Supporting your company's brand identity by specifying the URL of a logo on your website
- Including a link to a related and accessible page of your company's website

Notes on Using the Salesforce HTML Editor

When you use the editor, note the following:

- Because the Salesforce HTML editor provides a WYSIWYG interface only, you don't edit HTML tags.

USER PERMISSIONS

To create or change custom fields:

- "Customize Application"

- If you copy content from a Web page and paste it into the editor's window, Salesforce automatically removes unsupported tags and preserves the text that was enclosed in unsupported tags as plain text. Salesforce does not notify users when it removes unsupported or potentially malicious HTML.
- The maximum number of characters you can enter in the Salesforce HTML editor window is equal to the field length specified when creating or editing the field. The default is 32,768 characters.
- When clicked, hyperlinks open in a new browser window. The Salesforce HTML editor supports HTTP, HTTPS, and mailto hyperlinks.
- When a record is saved, the Salesforce HTML editor does not validate hyperlinks to Web pages. Be sure to confirm that you are specifying a URL that Salesforce can access.
- To insert an image, click  and either select:
 - **Web Address** tab and enter the URL of the image.
 - **Upload Image** tab and select an image from your localhost. You can upload only JPEG, PNG or GIF. The image you select cannot exceed 1 Megabyte. You can't add a hyperlink to an image.

Optionally, enter a description that appears when a user hovers over the image. The image must have a URL that Salesforce can access.

- The Salesforce HTML editor supports all languages that Salesforce Knowledge supports.
- The Salesforce HTML editor does not support JavaScript or Cascading Style Sheets (CSS).
- The Salesforce HTML editor is disabled for users who have accessibility mode enabled; it's replaced with a text box.

Supported HTML Tags and Attributes

The Salesforce HTML editor supports the tags listed in the following table.

<a>	<dt>	<q>
<abbr>		<samp>
<acronym>		<small>
<address>	<h1>	
	<h2>	<strike>
<bdo>	<h3>	
<big>	<h4>	<sub>
<blockquote>	<h5>	<sup>
 	<h6>	<table>
<caption>	<hr>	<tbody>
<cite>	<i>	<td>
<code>		<tfoot>
<col>	<ins>	<th>
<colgroup>	<kbd>	<thead>
<dd>		<tr>
		<tt>

<dfn>	<p>	
<div>	<pre>	<var>
<dl>		

The tags can include the following attributes:

alt	face	size
background	height	src
border	href	style
class	name	target
colspan	rowspan	width

The attributes can include URLs that begin with the following:

- http:
- https:
- file:
- ftp:
- mailto:
- #
- / for relative links

SEE ALSO:

[Rich Text Area Field Tips and Limitations](#)

[Add Videos Using the HTML Editor](#)

Add Videos Using the HTML Editor

Available in: Salesforce Classic.

Available in: **Enterprise, Performance, Unlimited**, and **Developer** Editions

Before you can add videos to the HTML editor in a Knowledge article, make sure that your browser security settings allow you to embed multimedia content. Some browser security settings can block `<iframe>` elements. For example, if browser security is set to high in Internet Explorer 7, `<iframe>` content does not appear in the frame.

When the option to embed multimedia content is enabled during the setup of your application, users can cut and paste `<iframe>` HTML elements into the editor using one of two options:

1. Copy the `<iframe>` element from one of the approved video sites.

USER PERMISSIONS

To create or change custom fields:

- "Customize Application"

Approved sites include Dailymotion, Vimeo, or YouTube.

2. Paste the code into the HTML editor by clicking one of these buttons:

Option	Description
	Lets you paste the <code><i f r a m e ></code> element into a text box on the Embed Multimedia Content dialog box. The frame and its contents are added to the editor window.
	Lets you paste the <code><i f r a m e ></code> element directly into the HTML code.

3. Click **Save**.

SEE ALSO:

[Using the HTML Editor](#)

Adding Code Samples to Posts

You can paste code samples into your posts in Chatter Answers and Ideas.

When you enable Chatter Answers and Ideas, users can add code samples to their posts. Code can be copied from any text editor and pasted into the body of a post with the formatting preserved.

1. Copy the code sample from a text editor to your clipboard.
2. In the editor, enter the text for your posts and click the  button to add the code sample.
3. Paste the code sample into the `Add a code sample` text box and click **OK**.
The code sample appears in the body of the post with its formatting intact.

Change the Custom Field Type

 **Note:** If you encrypt a custom field using Platform Encryption, you can't change the field type.

1. From the management settings for the field's object, go to Fields.

 **Note:** For fields on Salesforce Knowledge article types, from Setup, enter *Knowledge Article Types* in the **Quick Find** box, select **Knowledge Article Types**, and then select an article type.

2. Click **Edit** next to the custom field you want to change.

3. Click **Change Field Type**.

4. Select a new data type and click **Next**.

5. Enter a field label, name, and any other attributes, and then save your changes.

SEE ALSO:

[Notes on Changing Custom Field Types](#)

[Custom Field Types](#)

[Which Fields Can I Encrypt?](#)

[Find Object Management Settings](#)

Notes on Changing Custom Field Types

Consider the following before converting fields:

- Only convert custom fields for which no data exists or you risk losing your data. Changing the data type of an existing custom field can cause data loss in the following situations:
 - Changing to or from type Date or Date/Time
 - Changing to Number from any other type
 - Changing to Percent from any other type
 - Changing to Currency from any other type
 - Changing from Checkbox to any other type
 - Changing from Picklist (Multi-Select) to any other type
 - Changing to Picklist (Multi-Select) from any other type

Currently defined picklist values are retained when you change a picklist to a multi-select picklist. If records contain values that are not in the picklist definition, those values will be deleted from those records when the data type changes.
 - Changing from Auto Number to any other type
 - Changing to Auto Number from any type except Text
 - Changing from Text to Picklist
 - Changing from Text Area (Long) to any type except Email, Phone, Text, Text Area, or URL
- If data is lost, any list view based on the custom field will be deleted, and assignment and escalation rules may be affected.
- If you change the data type of any custom field that is used for lead conversion, that lead field mapping will be deleted.
- If you change the data type of a custom field that is set as an external ID, choosing a data type other than text, number, or email will cause the field to no longer act as an external ID.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions**

Standard Objects are not available in **Database.com**

Lightning Connect external objects are available in: **Developer Edition** and for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

USER PERMISSIONS

To change custom fields:

- "Customize Application"

- The option to change the data type of a custom field is not available for all data types. For example, existing custom fields cannot be converted into encrypted fields nor can encrypted fields be converted into another data type.
- In Salesforce Knowledge article types, the file field type can't be converted into other data types.
- You cannot change the data type of a custom field that is referenced by a Visualforce page.
- Changing a custom field type may require changing a large number of records at once. To process these changes efficiently, your request may be queued and you may receive an email notification when the process has completed.
- Before changing a custom field's type, make sure that it isn't the target of a workflow field update or referenced in a field update formula that would be invalidated by the new type.

The following data types have additional restrictions when you convert them:

Data Type	Description
Auto Number	The data in any auto-number field remains unchanged if you convert it into a text field. Also, you can safely convert a text custom field into an auto-number field without losing your data. Converting an auto-number field into any other data type results in data loss. Auto-number fields can contain a maximum of 30 characters. Before converting a text custom field into an auto-number field, change any records that contain more than 30 characters in that field.
Formula	Formula fields are special read-only fields that cannot be converted to any other data type. Likewise, you cannot convert any other field type into a formula field.
Picklist	Changing your custom picklists into custom checkboxes is simple. If you select Checkbox as the new data type, you can choose which picklist values to map to checked boxes and unchecked boxes. You can change custom picklists into multi-select picklists without losing any data. Since your records only contain a single value of that picklist, that value will still be selected but users can select additional values.
Relationships	<ul style="list-style-type: none"> • You can convert relationship fields to nonrelationship fields and vice versa, but only on external objects. • If your organization has a large number of records, Salesforce displays a waiting page after you have requested to change a master-detail into a lookup relationship or a lookup into a master-detail relationship. • After you have created a roll-up summary field on an object, you cannot convert the object's master-detail relationship into a lookup relationship. • A lookup cannot be converted to a master detail relationship if there are any existing records on the object that have a null value set for the lookup relationship. • If you are converting a master-detail relationship to a lookup for a custom object on the "detail" side, the organization-wide default for the object is automatically updated to Public Read/Write. Similarly, converting a lookup to a

Data Type	Description
Text Area (Long)	<p>master-detail-relationship changes the organization-wide default to Controlled by Parent</p> <p>When you convert a long text area field to an Email, Phone, Text, Text Area, or URL type field, the data in your records is truncated to the first 255 characters of the field.</p>
Text Area (Rich)	<p>You can only convert rich text area fields into long text area fields. Any images are deleted the next time the long text area field is saved. After converting, markup is hidden in the long text area field but it is not removed from the record until you save the record. That way, the markup can be restored if you change your mind.</p>

 **Note:** You cannot change the data type of a custom field if it is referenced in Apex.

SEE ALSO:

[Change the Custom Field Type](#)

Define Default Field Values

To define a default field value:

1. Begin by creating a custom field; see [Create Custom Fields](#) on page 3815. You can also define a default value for an existing custom field; see [Edit Custom Fields](#) on page 3833.
2. Choose the type of field to create and click **Next**. For a list of the types available for default values, see [About Default Field Values](#) on page 3858.
3. Enter the attributes for the field.
4. Enter a default value or [define a formula](#) to calculate the default value.

 **Note:** You can define a formula for default values only where appropriate. For example, the default value options for picklist and checkbox fields are limited to the options available for those types of fields, such as `Checked`, `Unchecked`, or `Use first value as default value`.

5. Click **Next**.
6. Set the field-level security to determine whether the field should be visible for specific profiles, and click **Next**.
7. Choose the page layouts that should display the field. The field is added as the last field in the first two-column section on the page layout. For user custom fields, the field is automatically added to the bottom of the user detail page.
8. Click **Save** to finish or **Save & New** to create more custom fields.

EDITIONS

USER PERMISSIONS

To view default field values:

- “View Setup and Configuration”

To define or change default field values:

- “Customize Application”

 **Note:** You must specify a [default value](#) for required campaign member custom fields.

Don't assign default values to fields that are both required and unique, because uniqueness errors can result.

SEE ALSO:

[About Default Field Values](#)

[Default Field Value Considerations](#)

[Useful Default Field Value Formulas](#)

About Default Field Values

Use default field values to make your users more productive by reducing the number of fields they need to fill in manually. Default field values automatically insert the value of a custom field when a new record is created. A default value can be based on a formula for some types of fields or exact values such as `Checked` or `Unchecked` for checkbox fields.

After you have defined default values:

1. The user chooses to create a new record.
2. Default field value is executed.
3. Salesforce displays the edit page with the default field value pre-populated.
4. The user enters the fields for the new record.
5. The user saves the new record.

The user can change the field's value but the initial default field value is only executed once, during record creation. For example, you can set the default field value on a custom lead field to seven days after the creation date to signify when to contact the lead again. You can change this value later, but you cannot automatically restore the value that was seven days after the creation date.

Set up default field values for the following types of custom fields:

- Checkbox
- Currency
- Date
- Date/Time
- Email
- Number
- Percent
- Phone
- Picklist (use the default option when setting up the picklist)
- Text
- Text Area
- URL

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

For a description of these types, see [Custom Field Types](#) on page 3819.

SEE ALSO:

[Define Default Field Values](#)

[Default Field Value Considerations](#)

Useful Default Field Value Formulas

Maximum Discount Rate

Your organization may apply different discount rates to opportunities based on the department of the person creating the opportunity. Use the following example to set a default value for a custom field called `Discount Rate` on opportunities.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To view default field values:

- "View Setup and Configuration"

To define or change default field values:

- "Customize Application"

```
CASE(User.Department, "IT", 0.25, "Field", 0.15, 0)
```

In this example, the formula inserts a discount rate of 25% on any opportunity created by a user in the "IT" department or 15% on any opportunity created by someone in the "Field" department. A zero is applied if the creator does not belong to either of these departments. This is a custom percent field on opportunities that uses the standard user field `Department`.

Product Language

You may want to associate a product with its language so that your users know the type of documentation or adapter to include. Use the following default value formula to automatically set the language of a product based on the country of the user creating the product. In this example, the default value is "Japanese" if the user's country is "Japan" and "English" if the user's country is "US." If neither is true, the default value "unknown" is inserted into the `Product Language` field.

```
CASE($User.Country, "Japan", "Japanese", "US", "English", "unknown")
```

Tax Rate

Use this default value formula to set the tax rate of an asset based on the user's city. Create a custom percent field with the following default value:

```
IF($User.City = "Napa", 0.0750,
  IF($User.City = "Paso Robles", 0.0725,
    IF($User.City = "Sutter Creek", 0.0725,
      IF($User.City = "Los Olivos", 0.0750,
        IF($User.City = "Livermore", 0.0875, null
      )
    )
  )
)
```

In this example, a tax rate of 8.75% is applied to an asset when the user's address is in the city of Livermore. When none of the cities listed apply, the `Tax Rate` field is empty. You can also use the `Tax Rate` field in formulas to automatically calculate taxable amounts and final sales prices.

SEE ALSO:

[Define Default Field Values](#)

[Default Field Value Considerations](#)

Default Field Value Considerations

Default field values automatically insert the value of a custom field when a new record is created. A default value can be based on a formula for some types of fields or exact values such as `Checked` or `Unchecked` for checkbox fields. Review the following considerations before incorporating default field values in your organization.

- If a default value is based on the value of a merge field, Salesforce uses the value of the merge field at the time the default value is executed. If the value of the merge field changes later, the default value is not updated.
- Users can change or remove the default field value on a record.
- Don't assign default values to fields that are both required and unique, because uniqueness errors can result.
- If you make an activity custom field universally required, you must also provide a default value.
- If an activity custom field is unique, you cannot provide a default value.
- Default field values are different from formula fields in the following ways: they are only executed once, at record creation; they are not read only; and the user can change the value but cannot restore the default field value.
- Since the default value is inserted before users enter any values in the new record, you cannot use the fields on the current record to create a default field value. For example, you cannot create a default field value on a contact that uses the first initial and last name because those values are not available when you click **New** to create a contact record. However, you can use the record type because it is selected before the record edit page displays.
- To apply a different default value for different record types, use the record type as a merge field in a CASE function within the default field value setup.
- Fields that are not visible to the user due to field-level security are still available in the formula for a default field value.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

- Connect Offline and Salesforce for Outlook do not display default values. However, Salesforce inserts the default values when a user syncs unless the user entered a value.
 - Default field values are not available in the Self-Service portal.
 - Lead conversion, Web-to-Lead, and Web-to-Case do not execute default field values.
-  **Note:** You can define a formula for default values only where appropriate. For example, the default value options for picklist and checkbox fields are limited to the options available for those types of fields, such as `Checked`, `Unchecked`, or `Use first value as default value`.

SEE ALSO:

[Define Default Field Values](#)

[Useful Default Field Value Formulas](#)

Validation Rules

Improve the quality of your data using validation rules. Validation rules verify that the data a user enters in a record meets the standards you specify before the user can save the record. A validation rule can contain a formula or expression that evaluates the data in one or more fields and returns a value of "True" or "False". Validation rules also include an error message to display to the user when the rule returns a value of "True" due to an invalid value.

After you have defined validation rules:

1. The user chooses to create a new record or edit an existing record.
2. The user clicks **Save**.
3. All validation rules are verified.
 - If all data is valid, the record is saved.
 - If any data is invalid, the associated error message displays without saving the record.
4. The user makes the necessary changes and clicks **Save** again.

You can specify the error message to display when a record fails validation and where to display it.

For example, your error message can be "The close date must occur after today's date." You can choose to display it near a field or at the top of the page. Like all other error messages, validation rule errors display in red text and are preceded by the word "Error".

-  **Important:** Validation rules apply to new and updated records for an object, even if the fields referenced in the validation rule are not included in a page layout or an API call. Validation rules don't apply if you create new records for an object with Quick Create. If your organization has multiple page layouts for the object on which you create a validation rule, verify that the validation rule functions as intended on each layout. If your organization has any integrations that use this object, verify that the validation rule functions as intended for each integration.

Managing Validation Rules

Validation rules verify that the data a user enters in a record meets the standards you specify before the user can save the record. A validation rule can contain a formula or expression that evaluates the data in one or more fields and returns a value of "True" or "False". Validation rules also include an error message to display to the user when the rule returns a value of "True" due to an invalid value.

From the validation rules page you can:

- [Define a validation rule.](#)
- Click **Edit** next to a rule name to update the [rule fields](#).
- Delete a validation rule.
- Click a validation rule name to view more details or to [clone the rule](#).
- [Activate a validation rule.](#)

SEE ALSO:

[Validation Rules](#)

[Examples of Validation Rules](#)

Define Validation Rules

Validation rules verify that the data a user enters in a record meets the standards you specify before the user can save the record. A validation rule can contain a formula or expression that evaluates the data in one or more fields and returns a value of "True" or "False". Validation rules also include an error message to display to the user when the rule returns a value of "True" due to an invalid value.

Before creating validation rules, review the [Validation Rule Considerations](#).

1. From the management settings for the relevant object, go to Validation Rules.
2. In the Validation Rules related list, click **New**.
3. Enter the [properties of your validation rule](#).
4. To check your formula for errors, click **Check Syntax**.
5. Click **Save** to finish or **Save & New** to create additional validation rules.

 **Note:** The detail page of a custom activity field does not list associated validation rules. To edit the validation rule for a custom activity field, select the validation rule from Setup by entering *Activities* in the **Quick Find** box, then selecting **Activities** and choose **Task Validation Rules** or **Event Validation Rules**.

- “Customize Application”

Activate Validation Rules

1. From the management settings for the relevant object, go to Validation Rules.
2. Click **Edit** next to the rule you want to activate.
3. To activate the rule, select **Active**, and save your changes.
4. To deactivate the rule, deselect **Active**, and save your changes.

 **Note:** The detail page of a custom activity field does not list associated validation rules.

Validation Rules Fields

Field	Description
Rule Name	Unique identifier of up to 40 characters with no spaces or special characters such as extended characters.
Active	Checkbox that indicates if the rule is enabled.
Description	A 255-character or less description that distinguishes the validation rule from others. For internal purposes only.
Error Condition Formula	The expression used to validate the field. See Building Formulas and Formula Operators and Functions .
Error Message	The message that displays to the user when a field fails the validation rule. If your organization uses the Translation Workbench, you can translate the error message into the languages Salesforce supports. See Setting Up the Translation Workbench .
Error Location	Determines where on the page to display the error. To display the error next to a field, choose <code>Field</code> and select the field. If the error location is a field, the validation rule is also listed on the detail

[Define Validation Rules](#)

Tips for Writing Validation Rules

- Consider all the settings in your organization that can make a record fail validation, including assignment rules, field updates, field-level security, or fields hidden on a page layout.
 - Be careful not to create contradicting validation rules for the same field; otherwise, users won't be able to save the record.
-  **Tip:** A poorly designed validation rule can prevent users from saving valid data. Make sure you thoroughly test a validation rule before activating it. You can also use the debug log to monitor the details of your rule implementation.
- When referencing related fields in a validation formula, make sure those objects are deployed.
 - Use the `RecordType.Id` merge field in your formula to apply different validations for different record types.
 - You don't have to begin a validation rule formula with the IF function. Any Boolean error condition expression works. For example:
 - Correct: `CloseDate < TODAY()`
 - Incorrect: `IF(CloseDate < TODAY(), TRUE, FALSE)`
 - Keep in mind that when a validation rule contains the `BEGINS` or `CONTAINS` function, it processes blank fields as valid. For example, if you have a validation rule that tests whether the serial number of an asset begins with "3", all assets with a blank serial number are considered valid.
 - When using a validation rule to ensure that a number field contains a specific value, use the `ISBLANK` function to include fields that don't contain any value. For example, to validate that a custom field contains a value of '1', use the following validation rule to display an error if the field is blank or any other number:

```
OR (ISBLANK (field__c), field__c<>1)
```

- Avoid using the `IsClosed` or `IsWon` opportunity merge fields in validation formulas. Instead, use the `ISPICKVAL` function to determine if the `Stage` contains the appropriate value. For example, the following validation formula makes a custom `Project Start Date` field required whenever the `Stage` is "Closed Won":

```
AND (ISPICKVAL (StageName, "Closed Won"),
      ISBLANK (Project_Start_Date__c))
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

- Simplify your validation formulas by using checkbox fields, which don't require any operator because they return true or false. For example, the following validation formula checks to be sure an opportunity has opportunity products using the `HasOpportunityLineItem` merge field before users can save a change to it:

```
NOT (OR (ISNEW ( ) , HasOpportunityLineItem )
```

Tips for Writing Validation Rule Error Messages

- Give instructions. An error message like “invalid entry” doesn't tell the user what type of entry is valid. Write something more specific, such as “Close Date must be after today.”
- Always include the field label. Users might not know what field is failing validation, especially if the error message appears at the top of the page.
 - 📌 **Note:** When defining validation rules, you can set the error location to `Top of Page` or `Field`. If the error location is set to a field that is later deleted, to a field that is read only, or to a field that isn't visible on the page layout, Salesforce automatically changes the location to `Top of Page`.
- If you have a multilingual organization, translate your error messages. You can translate error messages using the Translation Workbench.
- Assign corresponding numbers to validation rules and their error messages. This allows you to identify the source of the error.

SEE ALSO:

[Define Validation Rules](#)

[Validation Rule Considerations](#)

Validation Rule Considerations

Validation rules verify that the data a user enters in a record meets the standards you specify before the user can save the record. A validation rule can contain a formula or expression that evaluates the data in one or more fields and returns a value of “True” or “False”. Validation rules also include an error message to display to the user when the rule returns a value of “True” due to an invalid value. Review these considerations before implementing validation rules in your organization.

How Salesforce Processes Validation Rules

Salesforce processes rules in the following order:

1. Validation rules
2. Assignment rules
3. Auto-response rules
4. Workflow rules (with immediate actions)
5. Escalation rules

In addition:

- When one validation rule fails, Salesforce continues to check any additional validation rules on that field or any other field on the page and displays all appropriate error messages at once.
- If validation rules exist for activities and you create an activity during lead conversion, the lead converts but a task isn't created.
- Validation rules are only enforced during lead conversion if validation and triggers for lead conversion are enabled in your organization.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

- Campaign hierarchies ignore validation rules.
- Salesforce runs validation rules before creating records submitted via Web-to-Lead and Web-to-Case, and only creates records that have valid values.
- Validation rules continue to run on individual records if the owner is changed. If the Mass Transfer tool is used to change the ownership of multiple records, however, validation rules won't run on those records.

Validation Rule Field Restrictions

Validation rule formulas don't or can't refer to:

- Compound fields, including addresses, first and last names, and dependent picklists and lookups
 - Campaign statistic fields, including statistics for individual campaigns and campaign hierarchies
 - Merge fields for auto-number or compound address fields such as `Mailing Address`
-  **Note:** Merge fields for individual address fields, such as `Billing City`, are OK to use in validation rule formulas.

In addition, validation rules behave like this with regard to other fields and functions in Salesforce:

- The detail page of a custom activity field doesn't list associated validation rules.
- Because updates to records based on workflow rules don't trigger validation rules, workflow rules can invalidate previously valid fields.
- You can't create validation rules for relationship group members.
- Because roll-up summary fields aren't displayed on edit pages, you can use them in validation rules, but not as the error location.

Lookup Filters vs. Validation Rules

Validation rules and lookup filters achieve similar ends, but offer different advantages. Use a lookup filter if:

- You want to improve user efficiency by limiting the number of available options in a lookup search dialog.
- You want to improve user efficiency by automating filters on lookup search dialogs that your users manually set.

Use a validation rule if:

- You're close to the maximum number of lookup filters allowed.
- You must implement a complex business rule that requires you to use a formula. Formulas can reference fields that basic filter criteria can't reference, such as fields on the parent of the source object. Formulas can also use functions. For example, use `ISNEW` if the rule should only apply on record creation, or `ISCHANGED` if the rule should apply when a field changes.

Billing Zip Code Is in Billing State

Field	Value
Description:	Validates that the account <code>Billing Zip/Postal Code</code> is valid by looking up the first five characters of the value in a custom object called <code>Zip_Code__c</code> that contains a record for every valid zip code in the US. If the zip code is not found in the <code>Zip_Code__c</code> object, or the <code>Billing State</code> does not match the corresponding <code>State_Code__c</code> in the <code>Zip_Code__c</code> object, an error is displayed.
Formula:	<pre>VLOOKUP (\$ObjectType.Zip_Code__c.Fields.City__c , \$ObjectType.Zip_Code__c.Fields.Name , LEFT(BillingPostalCode,5)) <> BillingCity</pre>
Error Message:	Billing Zip Code does not exist in specified Billing State.
Error Location:	Billing Zip/Postal Code

US Billing Zip Code

Field	Value
Description:	Validates that the account <code>Billing Zip/Postal Code</code> is in 99999 or 99999-9999 format if <code>Billing Country</code> is USA or US.
Formula:	<pre>AND (OR(BillingCountry = "USA", BillingCountry = "US"), NOT (REGEX (BillingPostalCode, "\\d{5} (-\\d{4})?")))</pre> <p> Note: This example uses the REGEX function; see Shipping Zip Code if you are not familiar with regular expressions.</p>
Error Message:	Zip code must be in 99999 or 99999-9999 format.
Error Location:	Billing Zip/Postal Code

Shipping Zip Code

Field	Value
Description:	Validates that the account Shipping Zip/Postal Code is in 99999 or 99999-9999 format if Shipping Country is USA or blank.
Formula:	<pre> AND (OR(ShippingCountry = "USA", ISBLANK(ShippingCountry)), OR (AND(LEN(ShippingPostalCode) <>5, LEN(ShippingPostalCode) <> 10), NOT (CONTAINS ("0123456789", LEFT(ShippingPostalCode, 1))), NOT (CONTAINS ("0123456789", MID(ShippingPostalCode , 2, 1))), NOT (CONTAINS ("0123456789", MID(ShippingPostalCode , 3, 1))), NOT (CONTAINS ("0123456789", MID(ShippingPostalCode , 4, 1))), NOT (CONTAINS ("0123456789", MID(ShippingPostalCode , 5, 1))), AND (LEN(ShippingPostalCode) = 10, OR (MID(ShippingPostalCode , 6, 1) <> "-", NOT (CONTAINS ("0123456789", MID(ShippingPostalCode , 7, 1))), NOT (CONTAINS ("0123456789", MID(ShippingPostalCode , 8, 1))), NOT (CONTAINS ("0123456789", MID(ShippingPostalCode , 9, 1))), NOT (CONTAINS ("0123456789", MID(ShippingPostalCode , 10, 1))))))) </pre>
	<p> Note: This example interprets a blank country as US. To use this example with other countries, remove the clause that checks the length of the country field. Also, validation rule criteria are case sensitive, so this rule is only enforced when the country is blank or "USA" in all capital letters. The rule is not enforced when the country is "usa."</p> <p> Tip: You can also validate zip codes using a regular expression; for an example of a formula using a regular expression, see REGEX on page 3975.</p>
Error Message:	Zip code must be in 99999 or 99999-9999 format.
Error Location:	Shipping Zip/Postal Code

Valid Billing State (US)

Field	Value
Description:	Validates that the account <code>Billing State/Province</code> is a valid two-character abbreviation if <code>Billing Country</code> is US, USA, or blank.
Formula:	<pre>AND (OR(BillingCountry = "US", BillingCountry="USA", ISBLANK(BillingCountry)), OR(LEN(BillingState) < 2, NOT (CONTAINS ("AL:AK:AZ:AR:CA:CO:CT:DE:DC:FL:GA:HI:ID:" & "IL:IN:IA:KS:KY:LA:ME:MD:MA:MI:MN:MS:MO:MT:NE:NV:NH:" & "NJ:NM:NY:NC:ND:OH:OK:OR:PA:RI:SC:SD:TN:TX:UT:VT:VA:" & "WA:WV:WI:WY", BillingState))))</pre> <p> Note: This example interprets a blank country as US. To use this example with other countries, remove the clause that checks the length of the country field. Also, validation rule criteria are case sensitive, so this rule is only enforced when the country is blank or "USA" in all capital letters. The rule is not enforced when the country is "usa."</p>
Error Message:	A valid two-letter state code is required.
Error Location:	<code>Billing State/Province</code>

Valid Billing Province (Canada)

Field	Value
Description:	Validates that the account <code>Billing State/Province</code> is a valid two-character abbreviation if <code>Billing Country</code> is CA or CAN.
Formula:	<pre>AND (OR(BillingCountry = "CA", BillingCountry="CAN"), OR(LEN(BillingState) < 2, NOT (CONTAINS ("AB:BC:MB:NB:NL:NT:NS:NU:ON:PC:QC:SK:YT", BillingState))))</pre>
Error Message:	A valid two-letter province code is required.
Error Location:	<code>Billing State/Province</code>

Valid Shipping State

Field	Value
Description:	Validates that the account <code>Shipping State/Province</code> is a valid two-character abbreviation if <code>Shipping Country</code> is US, USA, or blank.
Formula:	<pre>AND (OR(ShippingCountry = "US", ShippingCountry="USA", ISBLANK(ShippingCountry)), OR(LEN(ShippingState) < 2, NOT (CONTAINS ("AL:AK:AZ:AR:CA:CO:CT:DE:DC:FL:GA:HI:ID:" & "IL:IN:IA:KS:KY:LA:ME:MD:MA:MI:MN:MS:MO:MT:NE:NV:NH:" & "NJ:NM:NY:NC:ND:OH:OK:OR:PA:RI:SC:SD:TN:TX:UT:VT:VA:" & "WA:WV:WI:WY", ShippingState))))</pre> <p> Note: This example interprets a blank country as US. To use this example with other countries, remove the clause that checks the length of the country field. Also, validation rule criteria are case sensitive, so this rule is only enforced when the country is blank or "USA" in all capital letters. The rule is not enforced when the country is "usa."</p>
Error Message:	A valid two-letter state abbreviation is required.
Error Location:	<code>Shipping State/Province</code>

Valid Shipping Province (Canada)

Field	Value
Description:	Validates that the account <code>Shipping State/Province</code> is a valid two-character abbreviation, if <code>Billing Country</code> is CA or CAN.
Formula:	<pre>AND (OR(ShippingCountry = "CA", ShippingCountry="CAN"), OR(LEN(ShippingState) < 2, NOT (CONTAINS ("AB:BC:MB:NB:NL:NT:NS:NU:ON:PC:QC:SK:YT", ShippingState))))</pre>
Error Message:	A valid two-letter province abbreviation is required.
Error Location:	<code>Shipping State/Province</code>

Valid Billing Country

Field	Value
Description:	Validates that the account <code>Billing Country</code> is a valid ISO 3166 two-letter code.
Formula:	<pre>OR (LEN(BillingCountry) = 1, NOT (CONTAINS ("AF:AX:AL:DZ:AS:AD:AO:AI:AQ:AG:AR:AM:" & "AW:AU:AZ:BS:BH:BD:BB:BY:BE:BZ:BJ:BM:BT:BO:" & "BA:BW:BV:BR:IO:BN:BG:BF:BI:KH:CM:CA:CV:KY:" & "CF:TD:CL:CN:CX:CC:CO:KM:CG:CD:CK:CR:CI:HR:" & "CU:CY:CZ:DK:DJ:DM:DO:EC:EG:SV:GQ:ER:EE:ET:FK:" & "FO:FJ:FI:FR:GF:PF:TF:GA:GM:GE:DE:GH:GI:GR:GL:" & "GD:GP:GU:GT:GG:GN:GW:GY:HT:HM:VA:HN:HK:HU:" & "IS:IN:ID:IR:IQ:IE:IM:IL:IT:JM:JP:JE:JO:KZ:KE:KI:" & "KP:KR:KW:KG:LA:LV:LB:LS:LR:LY:LI:LT:LU:MO:MK:" & "MG:MW:MY:MV:ML:MT:MH:MQ:MR:MU:YT:MX:FM:MD:MC:" & "MC:MN:ME:MS:MA:MZ:MM:MA:NR:NP:NL:AN:NC:NZ:NI:" & "NE:NG:NU:NF:MP:NO:OM:PK:PW:PS:PA:PG:PY:PE:PH:" & "PN:PL:PT:PR:QA:RE:RO:RU:RW:SH:KN:LC:PM:VC:WS:" & "SM:ST:SA:SN:RS:SC:SL:SG:SK:SI:SB:SO:ZA:GS:ES:" & "LK:SD:SR:SJ:SZ:SE:CH:SY:TW:TJ:TZ:TH:TL:TG:TK:" & "TO:TT:TN:TR:TM:TC:TV:UG:UA:AE:GB:US:UM:UY:UZ:" & "VU:VE:VN:VG:VI:WF:EH:YE:ZM:ZW", BillingCountry))</pre>
Error Message:	A valid two-letter country code is required.
Error Location:	<code>Billing Country</code>

Sample Account Validation Rules

For more information on any of the formula functions used in these examples, see [Formula Operators and Functions](#) on page 3934.

Account Number Is Numeric

Field	Value
Description:	Validates that the <code>Account Number</code> is numeric if not blank.
Formula:	<pre>AND (ISBLANK (AccountNumber) , NOT (ISNUMBER (AccountNumber)))</pre>
Error Message:	Account Number is not numeric.
Error Location:	<code>Account Number</code>

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

- Available in:
- Contact Manager
 - Group
 - Professional
 - Enterprise
 - Performance
 - Unlimited

 - Database.com

Account Number Length

Field	Value
Description:	Validates that the <code>Account Number</code> is exactly seven digits (if it is not blank). The number seven is simply illustrative. You can change this to any number you like.
Formula:	<pre>AND (ISBLANK (AccountNumber) , LEN (AccountNumber) <> 7)</pre>
Error Message:	Account Number must be seven digits.
Error Location:	<code>Account Number</code>

Annual Revenue Range

Field	Value
Description:	Validates that the account <code>Annual Revenue</code> is not negative and does not exceed \$100 billion. This limit is designed to catch typos.
Formula:	<pre>OR (AnnualRevenue < 0 , AnnualRevenue > 100000000000)</pre>
Error Message:	Annual Revenue cannot exceed 100 billion.
Error Location:	<code>Annual Revenue</code>

Sample Call Center Validation Rules

Conditionally Require Description When Case Reason is "Other"

Field	Value
Description:	Validates that a custom field called <code>Other Reason</code> contains a value if a case has a <code>Case Reason</code> of "Other."
Formula:	<pre>AND(ISPICKVAL(Reason, "Other"), ISBLANK(Other_Reason__c))</pre>
Error Message:	Description of Other Reason is required.
Error Location:	<code>Other Reason</code>

Prevent Open Cases from Being Reset to New

Field	Value
Description:	If a case is already open, prevents the <code>Status</code> from being changed back to "New."
Formula:	<pre>AND(ISCHANGED(Status), NOT(ISPICKVAL(PRIORVALUE(Status), "New")), ISPICKVAL(Status, "New"))</pre>
Error Message:	Open case Status cannot be reset to New.
Error Location:	<code>Status</code>

Restrict Status of Re-Opened Cases

Field	Value
Description:	Validates that the case <code>Status</code> is "Re-opened" when a closed case is opened again.
Formula:	<pre>AND(ISCHANGED(Status), OR(ISPICKVAL(PRIORVALUE(Status), "Closed"), ISPICKVAL(PRIORVALUE(Status), "Closed in SSP"), NOT(ISPICKVAL(Status, "Re-Opened"))))</pre>
Error Message:	Closed case can only be changed to "Re-opened."
Error Location:	<code>Status</code>

Prevent Case Milestone Completion After Cases Are Closed

Field	Value
Description:	Validates that a milestone's <code>Completion Date</code> can't occur after the case's <code>Status</code> is <code>Closed</code> .
Formula:	<code>Case.IsClosed = true</code>
Error Message:	You can't complete a milestone after a case is closed.
Error Location:	Top of Page

Prevent Case Milestone Completion Before Case Creation Dates

Field	Value
Description:	Validates that the milestone's <code>Completion Date</code> has occurred after the case's <code>Date/Time Opened</code> .
Formula:	<code>CompletionDate >= Case.CreatedDate && CompletionDate <= Case.ClosedDate</code>
Error Message:	The milestone <code>Completion Date</code> must occur after the date the case was created and before the case was closed.
Error Location:	Top of Page

Sample Community Validation Rules

For more information on any of the formula functions used in these examples, see [Formula Operators and Functions](#) on page 3934.

Preventing Offensive Language in Questions

Field	Value
Description:	Prevents users from entering offensive language in the <code>Title</code> and <code>Description</code> fields when asking a question.
Formula:	<code>OR (CONTAINS (Title, 'darn'), CONTAINS (Body, 'darn'))</code>
Error Message:	Question title or description contains offensive language.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Preventing Offensive Language in Replies

Field	Value
Description:	Prevents users from entering offensive language when replying to a question.
Formula:	<code>OR (CONTAINS (Body, 'darn'), CONTAINS (Body, 'dang'))</code>
Error Message:	Reply contains offensive language.

Preventing Offensive Language in Ideas

Field	Value
Description:	Prevents users from entering offensive language in the Title and Description fields when posting an idea.
Formula:	<code>OR (CONTAINS (Title, 'darn'), CONTAINS (Body, 'darn'))</code>
Error Message:	Idea title or description contains offensive language.

Preventing Offensive Language in Idea Comments

Field	Value
Description:	Prevents users from entering offensive language when posting a comment.
Formula:	<code>OR (CONTAINS (CommentBody , 'darn'), CONTAINS (CommentBody, 'dang'))</code>
Error Message:	Comment contains offensive language.

Sample Contact Validation Rules

For more information on any of the formula functions used in these examples, see [Formula Operators and Functions](#) on page 3934.

Mailing Address Fields Are Required

Field	Value
Description:	Validates that the contact <code>Mailing Street</code> , <code>Mailing City</code> , and <code>Mailing Country</code> are provided.
Formula:	<pre>OR (ISBLANK (MailingStreet), ISBLANK (MailingCity), ISBLANK (MailingCountry))</pre>
Error Message:	Mailing Street, City, and Country are required.
Error Location:	Top of Page

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Performance
- Unlimited
- Developer
- Database.com

Mailing Street Is Required

Field	Value
Description:	Validates that the contact <code>Mailing Street</code> is provided.
Formula:	<pre>ISBLANK (MailingStreet)</pre>
Error Message:	Mailing Street is required.
Error Location:	<code>Mailing Street</code>

Mailing Zip Code

Field**Value****Description:**

Validates that the contact Mailing Zip/Postal Code is in 99999 or 99999-9999 format if Mailing Country is USA or blank.

Formula:

```
AND(
  OR(MailingCountry = "USA", ISBLANK(MailingCountry)),
  OR(
    AND(LEN(MailingPostalCode) <>5,
      LEN(MailingPostalCode) <> 10),
    NOT (CONTAINS("0123456789",
      LEFT( MailingPostalCode, 1))),
    NOT (CONTAINS("0123456789",
      MID( MailingPostalCode , 2, 1))),
    NOT (CONTAINS("0123456789",
      MID( MailingPostalCode , 3, 1))),
    NOT (CONTAINS("0123456789",
      MID( MailingPostalCode , 4, 1))),
    NOT (CONTAINS("0123456789",
      MID( MailingPostalCode , 5, 1))),
    AND(
      LEN(MailingPostalCode) = 10,
    OR(
      MID( MailingPostalCode , 6, 1) <> "-",
      NOT (CONTAINS("0123456789",
        MID( MailingPostalCode , 7, 1))),
      NOT (CONTAINS("0123456789",
        MID( MailingPostalCode , 8, 1))),
      NOT (CONTAINS("0123456789",
        MID( MailingPostalCode , 9, 1))),
      NOT (CONTAINS("0123456789",
        MID( MailingPostalCode , 10, 1)))
    )
  )
)
```

 **Note:** This example interprets a blank country as US. To use this example with other countries, remove the clause that checks the length of the country field. Also, validation rule criteria are case sensitive, so this rule is only enforced when the country is blank or "USA" in all capital letters. The rule is not enforced when the country is "usa."

 **Tip:** You can also validate zip codes using a regular expression; for an example of a formula using a regular expression, see [REGEX](#) on page 3975.

Error Message:

Zip code must be in 99999 or 99999-9999 format.

Error Location:

Mailing Zip/Postal Code

Phone Number Has International Format

Field	Value
Description:	Validates that the <code>Phone</code> number begins with a plus sign (+) for country code. Note that this validation rule conflicts with the ten-digit rule.
Formula:	<code>LEFT(Phone, 1) <> "+"</code>
Error Message:	Phone number must begin with + (country code).
Error Location:	Phone

US Phone Number Has Ten Digits

Field	Value
Description:	Validates that the <code>Phone</code> number is in (999) 999-9999 format. This works by using the REGEX function to check that the number has ten digits in the (999) 999-9999 format.
Formula:	<code>NOT(Regex(Phone, "\\d*?(\\d\\d*?) {10}"))</code>
Error Message:	US phone numbers should be in this format: (999) 999-9999.
Error Location:	Phone

Sample Cross Object Validation Rules

For more information on any of the formula functions used in these examples, see [Formula Operators and Functions](#) on page 3934.

Discounts Must Be Within Range

This example consists of three validation rules on opportunity products. The examples below work together to help you manage discount amounts for products and require a custom percent field on opportunity products called `Line Discount`. The examples below also require you to use price books and customize the `Product Family` field to include the following values: *Software, Consulting, and Training*.

Software Discounts

Field	Value
Description:	Prevents users from saving software products with a discount over 10 percent.
Formula:	<code>AND(Line_Discount__c > 0.10, ISPICKVAL(Product2.Family, "Software"))</code>

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

Field	Value
Error Message:	The discount must be 10% or less for software products.
Error Location:	Line Discount

Consulting Discounts

Field	Value
Description:	Prevents users from saving consulting products with a discount over 15 percent.
Formula:	<pre>AND(Line_Discount__c > 0.15, ISPICKVAL(Product2.Family, "Consulting"))</pre>
Error Message:	The discount must be 15% or less for consulting products.
Error Location:	Line Discount

Training Discounts

Field	Value
Description:	Prevents users from saving training products with a discount over 20 percent.
Formula:	<pre>AND(Line_Discount__c > 0.20, ISPICKVAL(Product2.Family, "Training"))</pre>
Error Message:	The discount must be 20% or less for training products.
Error Location:	Line Discount

Prevent Changing Opportunity Products on Closed Opportunities

This example consists of two validation rules: one on opportunity products and another on opportunities.

Field	Value
Description:	Prevents users from editing opportunity products after an opportunity is closed. Create the following validation rule example on opportunity products.
Formula:	<pre>OR(ISPICKVAL(Opportunity.StageName, "Closed Won"), ISPICKVAL(Opportunity.StageName, "Closed Lost"))</pre>
Error Message:	Cannot change opportunity products for closed opportunities.

Field	Value
Error Location:	Top of Page

The following validation rule is on opportunities.

Field	Value
Description:	Prevents users from deleting opportunity products after an opportunity is closed. Create the following validation rule example on opportunities. It uses a custom roll-up summary field on opportunities that counts the number of opportunity products on an opportunity.
Formula:	<pre>AND(OR(ISPICKVAL(StageName, "Closed Won"), ISPICKVAL(StageName, "Closed Lost")), Number_of_Line_Items__c < PRIORVALUE(Number_of_Line_Items__c))</pre>
Error Message:	Cannot delete opportunity products for closed opportunities.
Error Location:	Top of Page

Prevent Saving a Case When Account Does Not Have Support

Field	Value
Description:	Prevents users from saving a case for an account that does not have support. This example assumes you have a custom checkbox field on accounts called <code>Allowed_Support</code> that tracks if the account has support.
Formula:	<pre>Account.Allowed_Support__c = FALSE</pre>
Error Message:	Unable to create cases for this account because it is not signed up for support.
Error Location:	Top of Page

Prevent Saving a Case When Contact is No Longer with the Company

Field	Value
Description:	Prevents users from saving an open case associated with a contact that is no longer with the company. This example uses a custom checkbox field on contacts called <code>No Longer With Company</code> .

Field	Value
Formula:	<code>AND(Contact.Not_Longer_With_Company__c, NOT(IsClosed))</code>
Error Message:	Unable to save this case because the related contact is no longer with the company. To continue, choose another contact.
Error Location:	Contact Name

Sample Date Validation Rules

For more information on any of the formula functions used in these examples, see [Formula Operators and Functions](#) on page 3934.

Date Must Be a Weekday

Field	Value
Description:	Validates that the value of a custom date field is a weekday (not Saturday or Sunday).
Formula:	<code>CASE (MOD(My_Date__c - DATE(1900, 1, 7), 7), 0, 0, 6, 0, 1) = 0</code>
Error Message:	Date must be a weekday.
Error Location:	My Date

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

Date Must Be a Weekend Day

Field	Value
Description:	Validates that the value of a custom date field is a Saturday or Sunday.
Formula:	<code>CASE(MOD(My_Date__c - DATE(1900, 1, 7), 7), 0, 1, 6, 1, 0) = 0</code>
Error Message:	Date must be a weekend day.
Error Location:	My Date

Date Must Be in the Current Month

Field	Value
Description:	Validates that a custom date field contains a date within the current month and year.
Formula:	<pre>OR (YEAR(My_Date__c) <> YEAR (TODAY()), MONTH(My_Date__c) <> MONTH (TODAY()))</pre>
Error Message:	Date must be in the current month.
Error Location:	My Date

Date Must Be in the Current Year

Field	Value
Description:	Validates that a custom date field contains a date within the current year.
Formula:	<pre>YEAR(My_Date__c) <> YEAR (TODAY())</pre>
Error Message:	Date must be in the current year.
Error Location:	My Date

Date Must Be the Last Day of the Month

Field	Value
Description:	Validates whether a custom field called My Date is the last day of the month. To do this, it determines the date of the first day of the next month and then subtracts 1 day. It includes special case logic for December.
Formula:	<pre>DAY(My_Date__c) <> IF(Month(My_Date__c)=12, 31, DAY (DATE (YEAR (My_Date__c), MONTH(My_Date__c)+1, 1) - 1))</pre>
Error Message:	Date must be the last day of the month.
Error Location:	My Date

Date Must Be Within One Year of Today

Field	Value
Description:	Validates whether a custom field called <code>Follow-Up Date</code> is within one year of today's date. This example assumes a 365 day year. (It does not handle leap years.)
Formula:	<code>Followup_Date__c - TODAY() > 365</code>
Error Message:	Follow-Up Date must be within one year of today.
Error Location:	Follow-Up Date

Day of Month Cannot Be Greater Than 15

Field	Value
Description:	Validates that a custom field called <code>Begin Date</code> contains a date in the first 15 days of the specified month.
Formula:	<code>DAY(Begin_Date__c) > 15</code>
Error Message:	Begin Date cannot be after the 15th day of month.
Error Location:	Begin Date

End Date Cannot Be Before Begin Date

Field	Value
Description:	Validates that a custom field called <code>End Date</code> does not come before another custom field called <code>Begin Date</code> .
Formula:	<code>Begin_Date__c > End_Date__c</code>
Error Message:	End Date cannot be before Begin Date.
Error Location:	Begin Date

Expiration Date Cannot Be Before Close Date

Field	Value
Description:	Validates that a custom field called <code>Expiration Date</code> does not come before <code>Close Date</code> .
Formula:	<code>Expiration_Date__c < CloseDate</code>
Error Message:	Expiration Date cannot be before Close Date.
Error Location:	<code>Expiration Date</code>

Sample Number Validation Rules

For more information on any of the formula functions used in these examples, see [Formula Operators and Functions](#) on page 3934.

Time Cards Must Total 40 Hours

Field	Value
Description:	Ensures that users cannot save a time card record with more than 40 hours in a work week. This example requires five custom fields on your custom object, one for each day of work.
Formula:	<code>Monday_Hours__c + Tuesday_Hours__c + Wednesday_Hours__c + Thursday_Hours__c + Friday_Hours__c > 40</code>
Error Message:	Your total hours cannot exceed 40.
Error Location:	Top of Page

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited

- Database.com

Number Cannot Be Negative

Field	Value
Description:	Validates that a custom field called <code>Hours Worked</code> is not a negative number.
Formula:	<code>Hours_Worked__c < 0</code>
Error Message:	Hours Worked cannot be less than zero.
Error Location:	<code>Hours Worked</code>

Number Must Be Even

Field	Value
Description:	Validates that a custom field called <code>Ark Passengers</code> is a non-negative even number.
Formula:	<pre>OR(Ark_Passengers__c < 0, MOD(Ark_Passengers__c, 2) <> 0)</pre>
Error Message:	Ark Passengers must be a positive even number.
Error Location:	<code>Ark Passengers</code>

Number Must Be Odd

Field	Value
Description:	Validates that a custom field called <code>Socks Found</code> is a non-negative odd number.
Formula:	<pre>OR(Socks_Found__c < 0, MOD(Socks_Found__c, 2) = 0)</pre>
Error Message:	Socks Found must be an odd number.
Error Location:	<code>Socks Found</code>

Number Must Be a Multiple of Five

Field	Value
Description:	Validates that a custom field called <code>Multiple of 5</code> is a multiple of five.
Formula:	<pre>MOD(Multiple_of_5__c, 5) <> 0</pre>
Error Message:	Number must be a multiple of five.
Error Location:	<code>Multiple of 5</code>

Number Must Be an Integer

Field	Value
Description:	Validates that a custom field called <code>My Integer</code> is an integer.
Formula:	<code>FLOOR(My_Integer__c) <> My_Integer__c</code>
Error Message:	This field must be an integer.
Error Location:	<code>My Integer</code>

Number Must Be Between -50 and 50

Field	Value
Description:	Validates that a custom field called <code>Volume</code> is between -50 and 50.
Formula:	<code>ABS(Volume__c) > 50</code>
Error Message:	Volume must be between -50 and 50.
Error Location:	<code>Volume</code>

Number Range Validation

Field	Value
Description:	Validates that the range between two custom fields, <code>Salary Min</code> and <code>Salary Max</code> , is no greater than \$20,000.
Formula:	<code>(Salary_Max__c - Salary_Min__c) > 20000</code>
Error Message:	Salary range must be within \$20,000. Adjust the Salary Max or Salary Min values.
Error Location:	<code>Salary Max</code>

Percentage Must Be Between Zero and 100

Field	Value
Description:	Validates that a custom field called <code>Mix_Pct</code> is between 0 and 100%. Note that percent fields are expressed divided by 100 in formulas (100% is expressed as 1; 50% is expressed as 0.5).
Formula:	<pre>OR (Mix_Pct__c > 1.0, Mix_Pct__c < 0.0)</pre>
Error Message:	Mix Pct must be between 0 and 100%.
Error Location:	<code>Mix_Pct</code>

Sample Opportunity Management Validation Rules

For more information on any of the formula functions used in these examples, see [Formula Operators and Functions](#) on page 3934.

Conditionally-Required Field Based on Opportunity Stage

Field	Value
Description:	Validates that a custom field called <code>Delivery Date</code> is provided if an opportunity has advanced to the Closed Won or Negotiation/Review stage.
Formula:	<pre>AND (OR (ISPICKVAL (StageName, "Closed Won"), ISPICKVAL (StageName, "Negotiation/Review"), ISBLANK (Delivery_Date__c)))</pre>
Error Message:	Delivery Date is required for this stage.
Error Location:	<code>Delivery Date</code>

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

Close Date Cannot Be Prior to Current Month

Field	Value
Description:	Validates that the <code>Close Date</code> of an opportunity is not within a month prior to the current month. Note the use of <code>ISNEW</code> and <code>ISCHANGED</code> in this formula to ensure the condition is only checked when the opportunity is being created or the <code>Close Date</code> field is modified subsequently.
Formula:	<pre>AND (OR (ISNEW(), ISCHANGED(CloseDate) , CloseDate < DATE(YEAR(TODAY()), MONTH(TODAY()), 1))</pre>
Error Message:	Close Date cannot be prior to current month.
Error Location:	Close Date

Close Date Must Be a Future Date

Field	Value
Description:	Ensures that users do not change the <code>Close Date</code> of an opportunity to a day in the past.
Formula:	<pre>SampleDate < TODAY()</pre>
Error Message:	Close Date cannot be a day in the past.
Error Location:	Close Date

Discounts on Opportunities

Field	Value
Description:	Validates that a custom discount percent field is between 0 and 40%.
Formula:	<pre>OR(Discount_Rate__c < 0, Discount_Rate__c > 0.40)</pre>
Error Message:	The Discount Rate must not exceed 40%.
Error Location:	Discount Rate

High-Value Opportunity Must Be Approved Before Closed

Field	Value
Description:	Opportunities with amounts greater than \$50,000 require that a custom checkbox field called <code>Approved</code> is checked in order to change the stage to Closed Won or Closed Lost. To automate this, set field-level security on the <code>Approved</code> checkbox so that it can only be checked via a custom approval process (Enterprise Edition, Unlimited Edition, or Performance Edition).
Formula:	<pre>AND (OR (ISPICKVAL (StageName, "Closed Won"), ISPICKVAL (StageName, "Closed Lost"), (Amount > 50000), NOT (ISPICKVAL (Approval_Status__c, "Approved"))))</pre>
Error Message:	All high-value opportunities must be approved for closure. Click the Request Close button.
Error Location:	Top of Page

Opportunity Amount Cannot Exceed \$10 Million

Field	Value
Description:	Validates that opportunity <code>Amount</code> is positive and no more than \$10 million. This limit is designed to catch typos.
Formula:	<pre>OR (Amount < 0, Amount > 10000000)</pre>
Error Message:	Amount cannot exceed \$10 million.
Error Location:	<code>Amount</code>

Opportunity Check for Products

Field	Value
Description:	Validates that an opportunity has at least one opportunity product before users can save a change to an opportunity.
Formula:	<pre>NOT (OR (ISNEW (), HasOpportunityLineItem))</pre>
Error Message:	You must add products to this opportunity before saving.
Error Location:	Top of Page

Opportunity Must Have Products if Beyond "Needs Analysis" Stage

Field	Value
Description:	Validates that an opportunity has opportunity products before the <code>Stage</code> can move beyond Needs Analysis.
Formula:	<pre>AND (CASE(StageName, "Value Proposition", 1, "Id. Decision Makers", 1, "Perception Analysis", 1, "Proposal/Price Quote", 1, "Negotiation/Review", 1, "Closed Won", 1, 0) = 1, NOT (HasOpportunityLineItem))</pre>
Error Message:	Opportunity products are required to advance beyond the Needs Analysis stage.
Error Location:	Top of Page

Opportunity Name Format

Field	Value
Description:	Validates that an opportunity contains a hyphen as a way of enforcing an "[Account] - [Amount]" opportunity naming convention.
Formula:	<pre>FIND(" - ", Name) = 0</pre>
Error Message:	Opportunity Name should use "[Account] - [Amount]" format.
Error Location:	Opportunity Name

Prevent Sales Reps from Moving Opportunity Stage Backwards

Field	Value
Description:	Prevent sales reps from changing opportunity Stage "backwards" to specific values, once they have accepted the opportunity via a custom approval process. The approval process sets the custom Accepted Flag checkbox to True.
Formula:	<pre>AND (Accepted_Flag__c, OR (ISPICKVAL(StageName, "Stage 1"), ISPICKVAL(StageName, "Stage 2")))</pre>
Error Message:	Invalid stage for accepted opportunity.
Error Location:	Stage

Probability Must Be 100% for Won Opportunities

Field	Value
Description:	Validates that the probability of a won opportunity is properly set to 100%. This is useful for data cleanliness and reporting purposes.
Formula:	<pre>AND (ISPICKVAL(StageName, "Closed Won"), Probability <> 1)</pre>
Error Message:	Probability must be 100% for won opportunities.
Error Location:	Probability

Probability Must Be Zero for Lost Opportunities

Field	Value
Description:	Validates that the probability of a lost opportunity is properly set to zero. This is useful for data cleanliness and reporting purposes.
Formula:	<pre>AND (ISPICKVAL(StageName, "Closed Lost"), Probability <> 0)</pre>
Error Message:	Probability must be 0% for lost opportunities.
Error Location:	Probability

Project Start Date

Field	Value
Description:	Validates that a field is conditionally required based on the values of other fields. Use this validation formula to ensure that users include a <code>Project Start Date</code> for an opportunity that is closed/won.
Formula:	<pre>AND(ISPICKVAL(StageName, "Closed Won"), ISNULL(Project_Start_Date__c))</pre>
Error Message:	Project start date is required for won opportunities.
Error Location:	<code>Project Start Date</code>

Sample Quote Validation Rules

For more information on any of the formula functions used in these examples, see [Formula Operators and Functions](#) on page 3934.

Display Error if Quote Line Item Discount Exceeds 40%

Field	Value
Description:	Shows an error if a quote line item's discount exceeds 40%.
Formula:	<pre>Discount > .40</pre>
Error Message:	The discount on this quote line item cannot exceed 40%.
Error Location:	<code>Discount</code> on quote

Discount Percent Does Not Exceed Role-Based Limit

Field	Value
Description:	Validates that a custom field on opportunities called <code>Discount Percent</code> does not exceed a maximum value that varies depending on the user's role. The default maximum is 15%.
Formula:	<pre>Discount_Percent__c > VLOOKUP(\$ObjectType.Role_Limits__c.Fields.Limit__c, \$ObjectType.Role_Limits__c.Fields.Name, \$UserRole.Name)</pre>
Error Message:	Discount (%) exceeds limit allowed for your role.
Error Location:	<code>Discount Percent</code>

Expense Amount Does Not Exceed User's Max Allowed Expense

Field	Value
Description:	Validates a custom field called <code>Expense Amount</code> against a custom user field called <code>Max Allowed Expense</code> .
Formula:	<pre>Expense_Amount__c > \$User.Max_Allowed_Expense__c</pre>
Error Message:	Amount cannot exceed your maximum allowed expense.
Error Location:	<code>Expense Amount</code>

Only Record Owner Can Change Field

Field	Value
Description:	Ensures that only the record owner can make changes to a custom field called <code>Personal Goal</code> .
Formula:	<pre>AND(ISCHANGED(Personal_Goal__c), Owner <> \$User.Id)</pre>
Error Message:	Only record owner can change Personal Goal.
Error Location:	<code>Personal Goal</code>

Only Record Owner or Administrator Can Change Field

Field	Value
Description:	Ensures that a user can make changes to a custom field called <code>Personal_Goal</code> only if the user is the record owner or has a custom profile of "Custom: System Admin."
Formula:	<pre>AND(ISCHANGED(Personal_Goal__c), Owner <> \$User.Id, \$Profile.Name <> "Custom: System Admin")</pre> <p> Note: \$Profile merge fields are only available in Enterprise, Unlimited, Performance, and Developer Editions.</p>
Error Message:	Only record owner or administrator can change Personal Goal.
Error Location:	<code>Personal_Goal</code>

Opportunity Close Date Can Only Be Back-Dated by Administrator

Field	Value
Description:	Validates that the <code>Close Date</code> of an opportunity does not fall prior to the current month, except for users who have a custom profile called "Custom: System Admin."
Formula:	<pre>AND (OR (ISNEW(), ISCHANGED(CloseDate)), CloseDate < DATE(YEAR(TODAY()), MONTH(TODAY()), 1), \$Profile.Name <> "Custom: System Admin")</pre> <p> Note: \$Profile merge fields are only available in Enterprise, Unlimited, Performance, and Developer Editions.</p>
Error Message:	Close Date cannot be prior to current month.
Error Location:	<code>Close Date</code>

Miscellaneous Sample Validation Rules

For more information on any of the formula functions used in these examples, see [Formula Operators and Functions](#) on page 3934.

Allow Number to Be Increased but Not Decreased

Field	Value
Description:	Allows a custom field called <code>Commit Amount</code> to be increased but not decreased after initial creation. This rule uses the <code>PRIORVALUE()</code> function to compare the updated value of the field to its value prior to update.
Formula:	<pre>PRIORVALUE(Commit_Amount__c) > Commit_Amount__c</pre>
Error Message:	Commit Amount cannot be decreased.
Error Location:	<code>Commit Amount</code>

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Contact Manager

- Database.com

California Driver's License

Field	Value
Description:	Ensures that a custom field called <code>Drivers License</code> is in the correct A9999999 format when the <code>Mailing State</code> is "CA".
Formula:	<pre>AND(MailingState = "CA", NOT(REGEX(Drivers_License__c, "[A-Z]\\d{7}?")))</pre>
Error Message:	Invalid California driver's license format.
Error Location:	<code>Drivers License</code>

Force Users to Check "I Accept Terms" to Enter Certain Values

Field	Value
Description:	Uses a checkbox labeled "I accept terms" to force the user to select a checkbox in order to enter a value called <code>Number_of_Days</code> that exceeds their Paid Time Off (PTO) balance available.
Formula:	<pre>AND(NOT(I_accept_terms__c), Number_of_Days__c > \$User.PTO_Balance__c)</pre>
Error Message:	Request will cause a negative PTO balance. You must accept Negative PTO Balance terms.
Error Location:	I accept terms

Prohibit Changes to a Field After It Has Been Saved

Field	Value
Description:	Prevents users from changing a custom field called <code>Guaranteed_Rate</code> after it has been saved initially.
Formula:	<pre>AND(NOT(ISNEW()), ISCHANGED(Guaranteed_Rate__c))</pre>
Error Message:	Guaranteed Rate cannot be changed.
Error Location:	Guaranteed Rate

Social Security Number Format

Field	Value
Description:	<p>Validates that a custom text field called <code>SSN</code> is formatted in 999-99-9999 number format (if it is not blank). The pattern specifies:</p> <ul style="list-style-type: none"> • Three single digits (0-9):<code>\d{3}</code> • A dash • Two single digits (0-9):<code>\d{2}</code> • A dash • Four single digits (0-9):<code>\d{4}</code>
Formula:	<pre>NOT (OR (ISBLANK(Social_Security_Number__c), REGEX(Social_Security_Number__c , "[0-9]{3}-[0-9]{2}-[0-9]{4}")))</pre>
Error Message:	SSN must be in this format: 999-99-9999.
Error Location:	SSN

Valid Currency

Field	Value
Description:	<p>Validates selected currency against an explicit subset of active currencies in your organization using the <code>Currency</code> picklist. Use this example if you only allow some of the active currencies in your organization to be applied to certain types of records.</p>
Formula:	<pre>CASE (CurrencyIsoCode, "USD", 1, "EUR", 1, "GBP", 1, "JPY", 1, 0) = 0</pre>
Error Message:	Currency must be USD, EUR, GBP, or JPY.
Error Location:	Currency

Valid Credit Card Number

Field	Value
Description:	Validates that a custom text field called <code>Credit_Card_Number</code> is formatted in 9999-9999-9999-9999 or 9999999999999999 number format when it is not blank. The pattern specifies: <ul style="list-style-type: none"> • Four digits (0-9) followed by a dash: <code>\d{4}-</code> • The aforementioned pattern is repeated three times by wrapping it in <code>{3}</code> • Four digits (0-9) • The OR character (<code> </code>) allows an alternative pattern of 16 digits of zero through nine with no dashes: <code>\d{16}</code>
Formula:	<pre>NOT(REGEX(Credit_Card_Number__c , "(((\d{4}-){3}\d{4}) \d{16})?"))</pre>
Error Message:	Credit Card Number must be in this format: 9999-9999-9999-9999 or 9999999999999999.
Error Location:	Credit Card Number

Valid IP Address

Field	Value
Description:	Ensures that a custom field called <code>IP Address</code> is in the correct format, four 3-digit numbers (0-255) separated by periods.
Formula:	<pre>NOT(REGEX(IP_Address__c, "^((25[0-5] 2[0-4][0-9] [01]?[0-9][0-9]?)\.\.){3}(25[0-5] 2[0-4][0-9] [01]?[0-9][0-9]?)\$")</pre>
Error Message:	Error: IP Address must be in form 999.999.999.999 where each part is between 0 and 255.
Error Location:	IP Address

Website Extension

Field	Value
Description:	Validates a custom field called <code>Web Site</code> to ensure its last four characters are in an explicit set of valid website extensions.
Formula:	<pre>AND (RIGHT(Web_Site__c, 4) <> ".COM", RIGHT(Web_Site__c, 4) <> ".com", RIGHT(Web_Site__c, 4) <> ".ORG", RIGHT(Web_Site__c, 4) <> ".org", RIGHT(Web_Site__c, 4) <> ".NET", RIGHT(Web_Site__c, 4) <> ".net", RIGHT(Web_Site__c, 6) <> ".CO.UK", RIGHT(Web_Site__c, 6) <> ".co.uk")</pre>
Error Message:	Web Site must have an extension of .com, .org, .net, or .co.uk.
Error Location:	Web Site

Require Field Input to Ensure Data Quality

Improve the quality of data that users enter in Salesforce by creating universally required fields.

A universally required field is a custom field that must have a value whenever a record is saved within Salesforce, the Force.com API, Connect Offline, Salesforce for Outlook, the Self-Service portal, or automated processes such as Web-to-Lead and Web-to-Case. Making a field required on a page layout or through field-level security ensures users must enter a value, but making a field required universally gives you a higher level of data quality beyond the presentation level of page layouts.

You can make the following types of custom fields universally required:

- Currency
- Date
- Date/Time
- Email
- Master-Detail Relationship (always required)
- Number
- Percent
- Phone
- Text
- Text Area
- URL

To make a custom field universally required, select the **Required** checkbox when defining the custom field.

 **Note:** You must specify a [default value](#) for required campaign member custom fields.

If you make a user field universally required, you must specify a default value for that field.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Connect Offline, Salesforce for Outlook, the Self-Service portal, Web-to-Lead, and Web-to-Case are not available in **Database.com**

Relationship group members do not support universally required fields.

SEE ALSO:

[Considerations for Universally Required Fields](#)

Considerations for Universally Required Fields

A universally required field is a custom field that must have a value whenever a record is saved within Salesforce, the Force.com API, Connect Offline, Salesforce for Outlook, the Self-Service portal, or automated processes such as Web-to-Lead and Web-to-Case. Review the following considerations before making your custom fields universally required.

- Standard fields cannot be universally required.
- Universally required fields are required across all record types.
- Edit pages always display universally required fields, regardless of field-level security.
- When designing your page layouts, universally required fields:
 - Cannot be removed from a page layout
 - Are automatically added to the end of the first section of a page layout if not already on it
 - Cannot be read only or optional
 - Display in bold, indicating they are always visible
 - Are disabled on the field properties page because you cannot remove the required setting
- Universally required fields are only enforced during lead conversion if validation and triggers for lead conversion are enabled in your organization.
- Quick Create does not enforce universally required fields.
- If you make an activity custom field universally required, you must also provide a default value.
- You must include universally required fields in your import files or the import will fail.
- Don't assign default values to fields that are both required and unique, because uniqueness errors can result.
- You cannot make a field universally required if it is used by a field update that sets the field to a blank value.
- Required fields may be blank on records that existed before making the field required. When a user updates a record with a blank required field, the user must enter a value in the required field before saving the record.
- Web-to-Lead and Web-to-Case request data is not validated by Salesforce. Invalid data isn't saved when requests are submitted. For example, if your custom field is a currency field and a user enters alphabetic characters such as "Abc" instead of numbers, the request is still submitted but with no value saved in the custom currency field.

[Require Field Input to Ensure Data Quality](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Standard Objects, Page Layouts, Connect Offline, Salesforce for Outlook, the Self-Service portal, Web-to-Lead, and Web-to-Cases are not available in **Database.com**

About Field Sets

A field set is a grouping of fields. For example, you could have a field set that contains fields describing a user's first name, middle name, last name, and business title. When a field set is added to a Visualforce page, developers can loop over its fields and render them. If the page is added to a managed package, administrators can add, remove, or reorder fields in a field set to modify the fields presented on the Visualforce page without modifying any code. The same Visualforce page can present different sets of information, depending on which fields a subscriber prefers to keep.

As an administrator, you can create or edit field sets for your organization, or [edit any installed field set](#). Field sets are available on all standard objects that support [custom fields](#), and any organization that supports creating Visualforce pages.

Fields added to a field set can be in one of two categories:

- If a field is marked as `Available for the Field Set`, it exists in the field set, but the developer hasn't presented it on the packaged Visualforce page. Administrators can display the field after the field set is deployed by moving it from the `Available` column to the `In the Field Set` column.
- If a field is marked as `In the Field Set`, the developer has rendered the field on the packaged Visualforce page by default. Administrators can remove the field from the page after the field set is deployed by removing it from the `In the Field Set` column.

[Implementation guide: Force.com Quick Reference for Developing Packages.](#)

Creating and Editing Field Sets

Salesforce has a drag-and-drop WYSIWYG tool for creating and editing field sets. The enhanced field sets editor is enabled by default, and provides all of the functionality of the original editor, as well as additional functionality and an easier-to-use WYSIWYG interface.

1. From the management settings for the appropriate object, go to Field Sets, and then click **New**.
2. Enter a **Field Set Label**. This is the name presented to subscribers who install the field through a managed package.
3. Optionally, enter a name for your field set. This is used by your Visualforce page to reference the field set.
4. In the **Where is this used?** area, provide a brief description of which Visualforce pages use the field set, and for what purpose. This information helps a subscriber understand where and how an installed field set is being used, so that they can populate it with their own fields.
5. Save your changes.
6. To add fields to the field set, drag the fields from the object palette and drop them into the `Available for the Field Set` or the `In the Field Set` container. The fields in the `Available for the Field Set` container are not initially visible on the Visualforce page. The fields in the `In the Field Set` container are visible by default.

 **Note:** In the field set, you can span to fields that reference multiple objects. When you span a field into a field set that references multiple objects, the only field you can span to is the `Name` object.

You can drag and drop a field from one container to the other. The vertical order of the `In the Field Set` list indicates the order of how the fields render on Visualforce pages.

7. To remove a field from the field set, drag the element back to the object palette, or click the  icon next to the element.
8. To make a field required, double click the element or click the wrench icon () next to it and select the `Required` checkbox.

 **Note:** * Indicates the field is required and must have a value to save the record.

9. Save your changes.

 **Important:** The total number of cross object spans within the `In the Field Set` container can't exceed 25.

After a field set is deployed in your organization, you can always mark fields that are in the `Available for the Field Set` list as `In the Field Set`, or vice versa. To do so:

1. Find the field set that you want to edit. From Setup enter `Installed Packages` in the `Quick Find` box, select **Installed Packages**, click an installed package, and then click the field set you want to edit. Alternatively, if you know which object contains the field set you want to edit, go to the object detail page and click **Edit** in the field set related list.
2. If you didn't create the field set initially, you'll only be able to edit the fields within the field set. To move fields between containers, drag and drop a field from one container to the other. To change the order of a rendered field, drag a field up or down the list and drop the field in the order you want it to appear.
3. Save your changes.

Field Sets Required Bit

You can define a field as required when you create or edit field sets. You may want to define a field as required to ensure a user enters the necessary information on a field. The required field is only available in the `In the Field Set` container. If you define a field as required in the `In the Field Set` container, and remove the field from the `In the Field Set`, the required attribute is removed.

 **Note:** If you remove fields that were made required by an installed managed package from the `In the Field Set` container, the required attribute isn't removed from those fields.

To define a field as required in a field set, see [Creating and Editing Field Sets](#) on page 3903

Roll-Up Summary Field

A roll-up summary field calculates values from related records, such as those in a related list. You can create a roll-up summary field to display a value in a master record based on the values of fields in a detail record. The detail record must be related to the master through a master-detail relationship. For example, you want to display the sum of invoice amounts for all related invoice custom object records in an account's Invoices related list. You can display this total in a custom account field called Total Invoice Amount.

You can perform different types of calculations with a roll-up summary field. You can count the number of detail records related to a master record. Or, you can calculate the sum, minimum value, or maximum value of a field in the detail records.

Before you begin creating roll-up summary fields for your organization, review the implementation tips and best practices.

Implementation Tips

Administration

- Create roll-up summary fields on:
 - Any custom object that is on the master side of a master-detail relationship
 - Any standard object that is on the master side of a master-detail relationship with a custom object
 - Opportunities using the values of opportunity products related to the opportunity
 - Accounts using the values of related opportunities
 - Campaigns using campaign member status or the values of campaign member custom fields
-  **Note:** Campaign member custom formula fields that reference fields derived from leads or contacts are not supported.
- The types of fields you can calculate in a roll-up summary field depend on the type of calculation. For example,
 - Number, currency, and percent fields are available when you select *SUM* as the roll-up type.
 - Number, currency, percent, date, and date/time fields are available when you select *MIN* or *MAX* as the roll-up type.
- Sometimes you can't change the field type of a field that you reference in a roll-up summary field.
- Make sure that the filter for your roll-up summary does not encounter a formula field that results in "#Error!". If one of your filter criteria uses a formula field that results in an error, no matches are returned for that filter criterion. For example, your roll-up summary filter is "Formula Field equals 10". Two records contain errors, and one contains the value "10" in that field. In this case, your summary includes only the record with the value "10."
- Salesforce does not recalculate the value of campaign roll-up summary fields when leads or contacts are deleted. Select the `Force a mass recalculation on this field` option on the edit page of a campaign roll-up summary field to manually recalculate the value.
- You can't use long text area, multi-select picklist, `Description` fields, system fields like `Last Activity`, cross-object formula fields, and lookup fields in the field column of roll-up summary filters.
- Auto number fields are not available as the field to aggregate in a roll-up summary field.
- After you have created a roll-up summary field on an object, you cannot convert the object's master-detail relationship into a lookup relationship.
- Roll-up summary fields are not available for mapping lead fields of converted leads.

Management

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

- If a roll-up summary field doesn't contain cross-object field references or functions that derive values on the fly, such as NOW or TODAY, it can calculate the values of formula fields.
-  **Note:** The value of a formula field can result in "#Error!", which affects the summarized total. If your roll-up summary type is COUNT, records are included regardless of whether they contain a formula field with an error. However, when the `Field to Aggregate` is a formula field that results in "#Error!", calculations of type MIN, MAX, and SUM exclude those formula values.
- Changes to the value of a roll-up summary field can trigger assignment rules to run. If a roll-up summary field is part of the criteria in an assignment rule, the field's new value is used to evaluate whether to reassign the record.
- A roll-up summary field can trigger workflow rules and field validations. However, workflow rules and field validations do not fire when the following changes cause a mass recalculation of roll-up summary values:
 - Changing the roll-up summary definition (such as the object, function, or field being aggregated)
 - Changing the expression of a formula field referenced in a roll-up summary field
 - Replacing picklist values for picklist fields referenced in the roll-up summary filter
 - Changing picklist record type definitions
 - Changing currency conversion rates
 - Changing price book entries
- Calculating roll-up summary field values can take up to 30 minutes, depending on the number of records affected and other factors.
- You aren't prevented from creating roll-up summary fields that can result in invalid values, such as February 29 in a non-leap year. If a roll-up summary field results in an invalid value, the value is not recalculated. The field continues to display with an invalid roll-up summary icon  until you change the values being summarized.
- If your organization uses multiple currencies, the currency of the master record determines the currency of the roll-up summary field. For example, if the master and detail records are in different currencies, the detail record value is converted into the currency of the master record.
- Changing a conversion rate triggers roll-up summary fields to recalculate. If you're using multiple currencies, we recommend changing the conversion rate from Manage Currencies in Setup, and not from the API. If you change the rate from the API, related jobs that are less than 24 hours old can interfere with your change. For details, see [Edit Conversion Rates](#).
- If your organization has advanced currency management enabled, currency roll-up summary fields are invalid if they are on accounts and summarizing opportunity values, or on opportunities and summarizing custom object values.
- Salesforce prevents users from saving a record if it invalidates a related record. For example, a master record has a validation rule that requires the roll-up summary field value to be greater than 100. If the user's change to a related child record would put the value over 100, the user can't save the record.
- If a lookup field references a record that has been deleted, Salesforce clears the value of the lookup field by default. Alternatively, you can choose to prevent records from being deleted if they're in a lookup relationship.

To be used in a roll-up summary field with a `Roll-Up Type` of COUNT or SUM, the lookup field must have the `What to do if the lookup record is deleted?` option set to *Don't allow deletion of the lookup record that's part of a lookup relationship*. If the option *Clear the value of this field. You can't choose this option if you make the field required* is selected, you can't create a COUNT or SUM roll-up summary field that pulls data from your lookup field.

Best Practices

- Apply field-level security to your roll-up summary fields if they calculate values that you do not want visible to users. Fields that your users cannot see due to field-level security settings on the detail record are still calculated in a roll-up summary field.

- If you have validation rules, consider how they affect roll-up summary fields. The value in a roll-up summary field changes when the values in the detail records change. So, validation errors can display when saving either the detail or master record.
- Because roll-up summary fields are not displayed on edit pages, you can use them in validation rules but not as the error location for your validation.
- Avoid referencing a roll-up summary field from a child record. The roll-up summary fields referenced from child records can have outdated values, because their parent records have not been updated. Instead, reference roll-up summary fields from parent records. Your roll-up summary fields will always have updated values, because that rule runs after the parent value has been updated.

If you're trying to enforce a record limit of 25 on the parent roll-up summary field, create validation rules on your child objects. When you add a child record, your validation rule on the child object can check if the count is already 25 or greater.

```
AND(ISNEW(), Sample.Line_Count__c >= 25)
```

- Plan your implementation of roll-up summary fields carefully before creating them. Once created, you cannot change the detail object selected or delete any field referenced in your roll-up summary definition.
- Advanced currency management affects roll-up summary fields. If your organization enables advanced currency management, delete the currency roll-up summary fields on accounts that summarize opportunity values and on opportunities that summarize custom object values. Otherwise, the fields continue to display with an invalid roll-up summary icon because their values are no longer calculated.
- Automatically derived fields, such as current date or current user, aren't allowed in a roll-up summary field. Forbidden fields include formula fields containing functions that derive values on the fly, such as DATEVALUE, NOW, and TODAY. Formula fields that include related object merge fields are also not allowed in roll-up summary fields.

[Custom Fields Allowed Per Object](#)

[Defining Roll-Up Summaries](#)

[Create Custom Fields](#)

Defining Roll-Up Summaries

Define roll-up summary fields on the object that is on the master side of a master-detail relationship. If a relationship does not already exist, first create a master-detail relationship between the master object that displays the value and the detail object containing the records you are summarizing.

To define a roll-up summary field:

1. Create a custom field on the object where you want the field displayed. Summary fields summarize the values from records on a related object, so the object on which you create the field should be on the master side of a master-detail relationship. For instructions on creating a custom field, see [Create Custom Fields](#) on page 3815.
2. Choose the **Roll-Up Summary** field type, and click **Next**.
3. Enter a field label and any other attributes. Click **Next**.
4. Select the object on the detail side of a master-detail relationship. This object contains the records you want to summarize.
5. Select the type of summary:

Type	Description
COUNT	Totals the number of related records.
SUM	Totals the values in the field you select in the Field to Aggregate option. Only number, currency, and percent fields are available.
MIN	Displays the lowest value of the field you select in the Field to Aggregate option for all directly-related records. Only number, currency, percent, date, and date/time fields are available.
MAX	Displays the highest value of the field you select in the Field to Aggregate option for all directly-related records. Only number, currency, percent, date, and date/time fields are available.

6. Enter your filter criteria if you want a selected group of records in your summary calculation. If your organization uses multiple languages, enter filter values in your organization's default language.

When you use picklists to specify filter criteria, the selected values are stored in the organization's default language. If you edit or clone existing filter criteria, first set the **Default Language** on the Company Information page to the same language that was used to set the original filter criteria. Otherwise, the filter criteria may not be evaluated as expected.

7. Click **Next**.
8. Set the field-level security to determine whether the field should be visible for specific profiles, and click **Next**.
9. Choose the page layouts that should display the field. The field is added as the last field in the first two-column section on the page layout. For user custom fields, the field is automatically added to the bottom of the user detail page.
10. Click **Save** to finish or **Save & New** to create more custom fields.

Lookup Filters

Improve user productivity and data quality with lookup filters.

Lookup filters are administrator settings that restrict the valid values and lookup dialog results for lookup, master-detail, and hierarchical relationship fields. Administrators specify the restrictions by configuring filter criteria that compare fields and values on:

- The current record (source)
- The lookup object (target)
- The user's record, permissions, and role
- Records directly related to the target object

For example, you can:

- Restrict the `Account Name` field on opportunities to allow only accounts with a record type of Customer, filtering out Partner and Competitor.
- Restrict the `Account Name` field on opportunities to allow only active accounts.
- Restrict the `Contact` field on cases to allow only contacts associated with the account specified in the `Account Name` field on the case record.
- Restrict the `Account Name` field on cases to allow only users with the "International Sales" profile to create or edit cases for accounts outside the United States.

 **Tip:** When you define a lookup filter, optionally click `Insert Suggested Criteria` to choose from a list of lookup filter criteria that Salesforce suggests based on the relationships between objects in your organization.

Administrators can make lookup filters required or optional.

- For fields with required lookup filters, only values that match the lookup filter criteria appear in the lookup dialog. Also, users can't save invalid values manually typed in the field when editing the record. If a user tries to save an invalid value, Salesforce displays an error message, which administrators can customize.
- For fields with optional lookup filters, only values that match the lookup filter criteria appear in the lookup dialog initially; however, users can click the **Show all results** link in the lookup dialog to remove the filter and view all search result values for the lookup field. Also, optional lookup filters allow users to save values that don't match the lookup filter criteria, and Salesforce does not display an error message if a user tries to save such values.

Lookup filter criteria can compare fields on the source object with different types of fields on the target object as long as the fields are compatible.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except for **Database.com**.

USER PERMISSIONS

To manage lookup filters:

- "Customize Application"

Source Object Field Type	Compatible Target Object Field Types
Currency	Currency, Roll-Up Summary
Date	Date, Date/Time, Roll-Up Summary
Date/Time	Date, Date/Time, Roll-Up Summary
Hierarchy	Hierarchy, Lookup, Master-Detail
Lookup	Hierarchy, Lookup, Master-Detail
Master-Detail	Lookup, Hierarchy, Master-Detail
Number	Number, Percent, Roll-Up Summary
Percent	Number, Percent, Roll-Up Summary

Picklist	Text, Text Area, Email, URL
Roll-Up Summary	Currency, Number, Date, Date/Time, Roll-Up Summary

Supported Objects

Salesforce supports lookup filters on relationship fields that point to:

- Accounts
- Assets
- Campaigns
- Cases
- Contacts
- Contracts
- Entitlements
- Ideas
- Leads
- Opportunities
- Products
- Quotes
- Service contracts
- Social Personas
- Users
- Custom objects

[Notes on Lookup Filters](#)

[Lookup Filter Examples](#)

[Tip sheet: Creating Lookup Filters on Relationship Fields](#)

Define Lookup Filters

1. You can create lookup filters for new relationship fields in step 3 of the custom field wizard.
 - a. From the management settings for the field's object, go to Fields.
 - b. Click **Edit** next to the name of the lookup or master-detail relationship field to which you want to apply the filter.
2. In the Lookup Filter Options section, click **Show Filter Settings**.
3. Specify the filter criteria a record must meet to be a valid value. To specify criteria, click **Insert Suggested Criteria** and choose from a list of suggested criteria, or manually enter your own criteria. To enter your own criteria:
 - a. In the first column, click the lookup icon or start typing in the text box and select a field.
 - b. In the second column, select an operator.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except for **Database.com**.

USER PERMISSIONS

To define lookup filters:

- "Customize Application"

- c. In the third column, select `Value` if Salesforce should compare the field in the first column with a static value, or select `Field` if Salesforce should compare the field in the first column with the value of another field.
- d. In the fourth column, enter the value or select the field that Salesforce should compare with the field in the first column.

**Note:**

- Click **Add Filter Logic** to add Boolean conditions.
 - Select a suggested field from the Field text box. You can only select fields on the current record, the lookup object, or the user record. You can also choose related fields that are one relationship away from the lookup object. Salesforce assists you by listing the available fields and relationships when you click the lookup icon or click inside the text box.
 - Lookup filter criteria can compare fields of different types as long as they are compatible.
4. Specify whether the filter is required or optional. For fields with optional lookup filters, only values that match the lookup filter criteria appear in the lookup dialog initially; however, users can click the **Show all results** link in the lookup dialog to remove the filter and view all search result values for the lookup field. Also, optional lookup filters allow users to save values that don't match the lookup filter criteria, and Salesforce does not display an error message if a user tries to save such values.

For required lookup filters, specify whether you want Salesforce to display the standard error message or a custom message when a user enters an invalid value.
 5. Optionally, enter text to display in the lookup search dialog. Consider text that guides users in their searches and explains the business rule that the lookup filter implements.
 6. Leave `Enable this filter` selected.
 7. Save your changes.

SEE ALSO:

[Notes on Lookup Filters](#)

[Dependent Lookups](#)

[Lookup Filter Examples](#)

[Tip sheet: Creating Lookup Filters on Relationship Fields](#)

[Find Object Management Settings](#)

Delete or Deactivate Lookup Filters

1. From the managements settings for the relationship field's object, go to Fields.
2. Scroll to the Custom Fields & Relationships related list.
3. Click the name of the field containing the lookup filter.
4. Click **Edit**.
5. To deactivate the lookup filter, deselect `Enable this filter`, then save your changes.
Deactivating a lookup filter preserves the lookup filter configuration but:
 - Prevents it from applying to the relationship field
 - Prevents it from impacting the cross-object references limit
 - Removes it as a dependency for fields referenced in the lookup filter criteria
6. To delete the lookup filter, click **Clear Filter Criteria**, then save your changes.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except for **Database.com**.

USER PERMISSIONS

To define lookup filters:

- "Customize Application"

Deleting a lookup filter permanently removes it. You can't recover deleted lookup filters.

[Dependent Lookups](#)

[Notes on Lookup Filters](#)

[Find Object Management Settings](#)

View a List of Lookup Filters for a Target Object

You can quickly see a list of all of the lookup filters that restrict the values of each target object. This is useful when creating similar filters for a target object. Also, lookup filters that reference fields on related objects count against the cross-object reference limit, which is the number of unique relationships allowed for a target object. The Related Lookup Filters list lets you see which lookup filters might impact that limit.

To see which lookup filters affect the limit for a particular target object, from the management settings for the object, go to Related Lookup Filters.

SEE ALSO:

[Dependent Lookups](#)

[Notes on Lookup Filters](#)

Dependent Lookups

A *dependent lookup* is a relationship field with a [lookup filter](#) that references fields on the source object. For example, you can configure the case `CONTACT` field to only show contacts associated with the account selected in the case `ACCOUNT Name` field.

When a user changes the value of a referenced field on the source object, Salesforce immediately verifies that the value in the dependent lookup still meets the lookup filter criteria. If the value doesn't meet the criteria, an error message is displayed and users can't save the record until the value is valid.

If the referenced field on the source object is a lookup, master-detail, or hierarchy field, users can't change its value by typing. Instead, users must click the lookup icon and select a value in the lookup search dialog.

Tip: Dependent lookups are supported in Visualforce pages.

Notes on Lookup Filters

- On the Fields page, the  icon indicates all fields with active lookup filters. The  icon indicates that the lookup filter is required.
- The lookup filters you create in Salesforce also appear in the partner portal and Customer Portal.
- Lookup filters are case-sensitive.
- If you convert a required lookup filter with a custom error message to optional, Salesforce deletes the message.
- If you create a lookup filter that invalidates an existing value for that field, the value persists; however, when a user edits the record, Salesforce displays an error message and requires the user to change the invalid value before saving.
- Salesforce prevents you from saving changes that cause required lookup filters on related records to contain invalid values.
- Versions 16.0 and higher of the Salesforce API support lookup filters. Lookup filters are enforced when you load data through the API.
- If you configure a lookup filter to show inactive users only, the relationship field has no valid options because inactive users are never valid for relationship fields that point to the User object.
- If you create a filtered lookup on a field that looks up to another object, both objects must be deployed into the organization at the same time.
- Salesforce does not display an error message if the value of a controlling field invalidates the value of a dependent master-detail relationship field.
- Dependent lookups are supported in Visualforce pages.

EDITIONS

Available in: **All Editions** except for **Database.com**.

USER PERMISSIONS

To manage lookup filters:

- “Customize Application”

Spanning Relationships in Lookup Filters

Filter criteria can include fields directly related to the target object (one level only). For example, on a lookup field pointing to contacts, a lookup filter can reference fields on the account related to the contact via the `Account Name` relationship field. The lookup field can also reference fields on the contact related to the contact via the `Reports To` relationship field.

For required lookup filters, each field referenced on a related lookup object counts against the number of unique relationships allowed for the referenced object, not the source object. For example, the two unique relationships described above count against the number allowed for the Contact object. Optional lookup filters don't count against the limit on the number of unique relationships allowed per object.

To see which lookup filters affect the limit for a particular target object, from the management settings for the object, go to Related Lookup Filters.

Lookup Filters vs. Validation Rules

Validation rules and lookup filters achieve similar ends, but offer different advantages. Use a lookup filter if:

- You want to improve user efficiency by limiting the number of available options in a lookup search dialog.
- You want to improve user efficiency by automating filters on lookup search dialogs that your users manually set.

Use a validation rule if:

- You're close to the maximum number of lookup filters allowed.

- You must implement a complex business rule that requires you to use a formula. Formulas can reference fields that basic filter criteria can't reference, such as fields on the parent of the source object. Formulas can also use functions. For example, use `ISNEW` if the rule should only apply on record creation, or `ISCHANGED` if the rule should apply when a field changes.

SEE ALSO:

[Lookup Filters](#)

[Dependent Lookups](#)

[Tip sheet: Creating Lookup Filters on Relationship Fields](#)

Notes on Using Lookup Filters with Person Accounts

If your organization uses person accounts, note the following:

- Person Accounts don't support Contact filters; however, Person Accounts support Account filters. For example, if the `Account` field has a dependent lookup filter that's added to a Person Account, dependent lookups are supported. If the `Contact` field has a dependent lookup filter that's added to a Person Account, dependent lookups isn't supported.
- Lookup filter criteria on `Account Name` only apply to business accounts, not person accounts. For example, if your lookup filter criteria is `Account Name does not contain book`, business accounts with "book" in the name, such as John's Bookstore, are not valid, but person accounts with "book" in the name, such as John Booker, are valid and appear in the lookup dialog for the `Account` field. If you need to filter on the name for a person account, use the `First Name` or `Last Name` fields instead.
- Use the `Is Person Account` field in your lookup filter criteria to restrict the valid values of a lookup field to one type of account (either person accounts or business accounts). For example, to restrict a lookup to only person accounts, include the following in your lookup filter criteria: `Is Person Account equals True`.
- You can't package lookup filters that reference standard fields specific to person accounts, such as the `Email` and `Title` fields.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except for **Database.com**.

[Lookup Filters](#)

Lookup Filters Best Practices

Custom Help

Define custom help for fields with lookup filters to let users know about the business rule the filter enforces. For example, if the lookup filter restricts the `Account Name` on opportunities to only allow active accounts, define custom help that states *You can only associate active accounts with opportunities*.

Error Messages

Customize lookup filter error messages to guide users who type invalid values. For example, if the lookup filter restricts the `Account Name` on opportunities to only allow active accounts, define an error message that states *Value doesn't exist or isn't an active account*.

-  **Important:** Salesforce translates the standard error message for required lookup filters, but not custom error messages. Use the Translation Workbench to translate lookup filter custom error messages. To restore the standard error message after modifying it, click **Reset to default message**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except for **Database.com**.

Working with Master-Detail Relationship Fields

When creating a lookup filter on a master-detail relationship field, verify that the current values of the field on all of the detail records meet the criteria you specify. If you specify criteria that an existing value doesn't meet, Salesforce prevents the user from saving changes to the detail record. If this occurs, the user must first modify the value on the master record to meet the criteria. For example, consider a custom object with a master-detail relationship field that points to accounts. If you define a lookup filter that excludes all accounts with a `Create Date` before 01/01/2009, verify that no existing records of that custom object have a master-detail relationship with any account created before 2009. A quick way to do this is to create a report that shows all accounts with a `Create Date` before 01/01/2009.

Profile-Based Lookup Filters

Use `Current User Profile: ID` in filter criteria to define different filter criteria for different users, or to let administrators enter values that don't match the criteria. Avoid using `Current User Profile: Name` due to technical limitations on standard profiles.

If you enter `Current User Profile: Name` or `Profile: Name` in the Field column of your lookup filter criteria, Salesforce displays a lookup icon in that row. Click the lookup icon to select from a list of existing profiles rather than typing profile names.

Record IDs vs. Record Names

To reference a specific record in filter criteria, use the ID of the record instead of its name. IDs are always unique whereas names are not.

Testing

After creating a lookup filter, test it to make sure it is not too restrictive. Depending on their permissions, some users may have read-only access to some relationship fields; ensure your lookup filters don't prevent those users from editing records critical to their job functions.

Dependent Lookups on Page Layouts and Mini Page Layouts in the Console

When designing page layouts with dependent lookups:

- If a dependent lookup is above its controlling field on a layout, make its lookup filter optional or redesign the layout. Moving a required dependent lookup above its controlling field may confuse users who typically start from the top of a page when entering data.
- Ensure that both the controlling and dependent fields are visible so users can correct invalid values.

Lookup Filters and the Lookup Filter Fields Search Layout

Don't reference the same fields in both lookup filter criteria and the Lookup Filter Fields search layout. Users might assume that results from their custom search override administrator-controlled lookup filters.

Lookup Filter Examples

Record Types in Lookup Filters

If the value of a relationship field should only consist of records with a particular [record type](#), specify the record type in a lookup filter. For example, if the `Account Name` field on opportunities should only have accounts with a Customer Account custom record type, define the following lookup filter to restrict users to only creating or editing opportunities associated with accounts that have a Customer Account record type, excluding accounts with Partner Account and Competitor Account record types:

Filter Criteria

Account Name: Account Record Type equals value Customer Account

Custom Error Message

Account does not exist or is not a customer account.

Lookup Window Text

You can only associate customer accounts to an opportunity. Search results only display customer accounts.

Record Status in Lookup Filters

If the value of a relationship field should only consist of records with particular status, specify the status in a lookup filter. For example, consider a Job Application object with a relationship field that points to the `Position` object. If the relationship field should only have open positions, define the following lookup filter to restrict users to only creating or editing job applications for positions with the `status` field set to Open:

Filter Criteria

Position: Status equals value Open

Custom Error Message

Position does not exist or is not an open position.

Lookup Window Text

You can associate only open positions with job applications. Search results display open positions only.

Profiles in Lookup Filters

When a business rule does not apply to users with every profile, use the `Current User Profile` global variable fields to define lookup filters that only affect users with a particular profile.

For example, the following lookup filter on the Case object `Account Name` field restricts users with a "Domestic Sales" profile to only creating or editing opportunities associated with accounts that have a billing country of "USA" while allowing other users to associate opportunities with any account:

Filter Criteria

1. *Current User Profile: Name equals value Domestic Sales*
2. *Account Name: Billing Country equals value USA*
3. *Current User Profile: Name not equal to value Domestic Sales*

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except for **Database.com**.

USER PERMISSIONS

To define lookup filters:

- "Customize Application"

Filter Logic

(1 AND 2) OR 3

Custom Error Message

Account does not exist or the account billing country is not USA. Domestic sales reps can only create opportunities for accounts in the United States.

Lookup Window Text

Search results show only United States accounts in the for domestic sales representatives.

You can modify the above example to simultaneously restrict users with a “Global Sales” custom profile to only associating opportunities to accounts with a non-US billing country:

Filter Criteria

1. *Current User Profile: Name equals value Global Sales*
2. *Account Name: Billing Country not equal to value USA*
3. *Current User Profile: Name equals value Domestic Sales*
4. *Account Name: Billing Country equals value USA*
5. *Current User Profile: Name not equal to value Global Sales, Domestic Sales*

Filter Logic

(1 AND 2) OR (3 AND 4) OR 5

Custom Error Message

Account does not exist or the account billing country is not in your sales area. Sales reps can only create opportunities for accounts in their sales area.

Lookup Window Text

Search results only display accounts in your region.

 **Important:** If you do not include line 5 in the filter criteria, users who are not in Global Sales or Domestic Sales cannot select or save any values on account records.

Roles in Lookup Filters

When a business rule does not apply to users in every role, use the `Current User Role` global variable fields to define lookup filters that only affect users with particular roles. For example, in a recruiting application that has a `Position` object with a lookup field to a `Compensation Package` object, you can restrict users from editing or creating positions that have an executive compensation plan unless they are executive administrators or vice presidents. To do this, define the following lookup filter on the `Position` object `Compensation Package Name` field:

Filter Criteria

1. *Current User Role: Name does not start with value VP*
2. *Current User Role: Name does not equal value Executive Administrator*
3. *Compensation Package: Plan Type does not equal value Executive*
4. *Current User Role: Name starts with value VP*
5. *Current User Role: Name equals value Executive Administrator*

Filter Logic

((1 OR 2) AND 3) OR (4 OR 5)

Custom Error Message

The compensation plan does not exist, or you have selected an executive compensation plan but do not have access to create executive positions.

Lookup Window Text

Search results only display compensation plans that are relevant to positions you are allowed to create.

 **Important:** Include the condition you are testing and the opposite condition. In this example, lines 1, 2, and 3 of the filter criteria ensure that users who are not VPs or Executive Administrators *cannot* select Executive compensation plans, while lines 4 and 5 ensure that VPs and Executive Administrators *can* select Executive compensation plans.

Blank Values in Lookup Filters

Your lookup filter criteria might reference a field that users often leave blank. You can design your lookup filter criteria to accept blank values by using the **Add Filter Logic** in the filter criteria to create an OR condition. For example, if you have a `Partner Contact` custom field on opportunities, restrict the field to only allow contacts that are associated to an account with a `Partner Account` record type, or private contacts not associated with any account.

Filter Criteria

1. *Partner Contact: Account: Account Record Type equals value Partner Account*
2. *Partner Contact: Account: Account Name equals value*

Filter Logic

1 OR 2

Custom Error Message

The partner contact must be associated with a partner account, or must be a private contact.

Lookup Window Text

Search results only display contacts from partner accounts or your private contacts.

User IDs in Lookup Filters

Using user IDs in optional lookup filters can significantly improve user efficiency by first showing lookup search dialog results that are most relevant to the user while still allowing users to see all results if necessary. For example, on a lookup field to accounts, you can create an optional lookup filter that restricts the search results to accounts that the user owns in the search lookup dialog results. If the user is looking for an account that someone else owns, the user can remove the filter.

Filter Criteria

Current User: User ID equals Field Account: Owner ID

Lookup Window Text

By default, search results only display accounts you own. To search all accounts, click "Show all results."

Simple Dependent Lookups

If the value of a relationship field should depend on the value of another relationship field on the current record, specify the field to field comparison in the criteria. For example, if the case `Contact Name` field should only have contacts associated to the account specified in the case `Account Name` field, use the following lookup filter:

Filter Criteria

Contact Name: Account ID equals field Case: Account ID

Custom Error Message

Contact does not exist or is not associated to the case account.

Lookup Window Text

Search results only display contacts associated to the case account.

 **Note:** When comparing lookup fields in lookup filter criteria, Salesforce always uses the ID of the relationship field, not the name.

Complex Lookup Filters and Dependent Lookups

Achieving complex business rules with lookup filters often involves combing your rules with filter logic and fields of various types. For example, consider an app for booking conference rooms that has the following data model:

Object	Fields
Meeting	<ul style="list-style-type: none"> • Meeting Name • Office lookup to the Office object • Projector Required checkbox • Number of Participants number field • Conference Room lookup to the Conference Room object
Conference Room	<ul style="list-style-type: none"> • Conference Room Name • Has Projector checkbox • Number of Seats Available number field • Conference Room Location lookup to the Office object
Office	<ul style="list-style-type: none"> • Office Name

The following lookup filter on the meeting `Conference Room` field restricts the valid values to conference rooms that have a projector if the meeting requires one, as well as the necessary number of seats:

Filter Criteria

1. *Meeting: Projector Required equals field Meeting Conference Room: Has Projector*
2. *Meeting: Projector Required equals value False*
3. *Conference Room: Number of Seats Available greater or equal field Meeting: Number of Participants*

Filter Logic

(1 OR 2) AND 3

Custom Error Message

Conference room not found or is insufficient for your meeting.

Lookup Window Text

Search results only display conference rooms that can support your meeting requirements.

To refine the valid values even further, incorporate the office where the conference room is located:

Filter Criteria

1. *Meeting: Projector Required equals field Meeting Conference Room: Has Projector*
2. *Meeting: Projector Required equals value False*
3. *Conference Room: Number of Seats Available greater than field Meeting: Number of Participants*
4. *Meeting: Office equals Field Conference Room: Conference Room Location*

Filter Logic

(1 OR 2) AND 3 AND 4

Custom Error Message

Conference room not found or is insufficient for your meeting.

Lookup Window Text

Search results only display conference rooms that can support your meeting requirements.

[Tip sheet: Creating Lookup Filters on Relationship Fields](#)

Using Formulas

Formulas

Watch a Demo:  [Getting Started With Formulas](#)

This video gives a brief introduction to Salesforce formulas, accessing the formulas editor in the app, and how to use the editor tools to create formulas.

A formula is an algorithm that derives its value from other fields, expressions, or values. Formulas can help you automatically calculate the value of a field based on other fields.

Many areas in Salesforce use formulas. Before you begin using formulas, review the differences in their uses:

Use Formulas for:	To:
Approval Processes	Define the criteria a record must meet to enter the approval process.
Approval Steps	Define the criteria a record must meet to enter the approval step.
Assignment Rules for Leads and Cases	Define the criteria the lead or case must meet for it to be assigned.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions**

Reports and Approvals are not available in **Database.com**

Use Formulas for:	To:
Auto-Response Rules for Leads and Cases	Define the criteria a lead or case must meet to trigger an auto-response rule.
Case Escalation Rules	Specify criteria a case must meet for it to be escalated.
Custom Buttons and Links	Define the content for custom links and buttons.
Custom Fields	<p>Create custom formula fields that automatically calculate a value based on other values, merge fields, or expressions. Users can view formula fields on record detail pages but can't see the underlying algorithm or edit the value of a formula field.</p> <p> Note: Custom formula fields are not available in Connect Offline, Web-to-Lead forms, or Web-to-Case forms.</p>
Custom Summary Formulas in Reports	Automatically calculate more totals based on existing report summaries using the values, merge fields, or expressions you specify. Users can't change these totals.
Data Validations	Verify that the data a user enters in a record meets the standards you specify before the user can save the record. A validation rule can include a formula such as <code>CloseDate >= TODAY ()</code> .
Default Field Values	<p>Apply a value to a custom field when a user creates a record. Use formulas to define a default value such as <code>TODAY () + 7</code>.</p> <p>Users can change a default value. Default field values can be based on a formula using values, merge fields, or expressions you specify.</p>
Escalation Rules	Define the criteria that a case must meet to be escalated.
Formula Fields	Automatically calculate the value of a custom field using the values, merge fields, or expressions you specify. Users can't change the value of a formula field.
Reports	Create custom summary formulas in your reports to calculate more totals based on the existing summaries in that report.
S-Controls	Define the content for s-controls.
Validation Rules	Prevent users from entering an invalid value in a standard or custom field. Validation rules can be based on formulas and display an error message to users when the value they enter is not valid.
Workflow Field Updates	Automatically change the value of a field to a value you specify. The formula can include other values, merge fields, or expressions. You can set field updates to occur as a result of a workflow rule or an approval process.
Workflow Rules	Define the criteria a record must meet to trigger a workflow rule.
Visualforce Pages	Define the content for Visualforce pages.

Common Formula Processes

	When are they executed?	Read only?	Can include functions?	Can specify null handling?	Can include references to parent merge fields?
Default Field Values	Record creation	No	Yes	No	No
Formula Fields	Record display	Yes	Yes	Yes	Yes
Validation Rules	Record save	Not applicable	Yes	No	Yes
Workflow Rules	Record save	Not applicable	Yes	No	Yes
Approval Processes	Record submitted for approval	Not applicable	Yes	No	Yes
Field Updates	Workflow or approval process	Not applicable	Yes	No	Yes
Custom Summary Formulas for Reports	Report display	Yes	Yes, a limited subset of functions	Yes	No

SEE ALSO:

[Elements of a Formula](#)

[Formula Data Types](#)

Formula Data Types

The data type of a formula determines the type of data you expect returned from your formula. Review the following data types.

Data Type	Description
Checkbox	Returns a true or false value. The field appears as a checkbox in record detail pages and reports. Use <code>TRUE</code> for checked values and <code>FALSE</code> for unchecked values.
Currency	Returns a number in currency format of up to 18 digits with a currency sign.  Note: Salesforce uses the round-half-to-even tie-breaking rule for currency fields. For example, 23.5 becomes 24, 22.5 becomes 22, -22.5 becomes -22, and -23.5 becomes -24.
Date	Returns data that represents a day on the calendar. The current date can be acquired by calling the built-in function <code>TODAY ()</code> in a formula. This data type is not available for custom summary formulas in reports.
Date/Time	Returns data that represents a moment in time. A date/time field includes the date and also the time of day including hour, minutes, and seconds. You can insert the current date and time in a formula using the <code>NOW ()</code> function. This data type is not available for custom summary formulas in reports.
Number	Returns a positive or negative integer or decimal of up to 18 digits. Salesforce uses the round half up tie-breaking rule for numbers in formula fields. For example, 12.345 becomes 12.35 and -12.345 becomes -12.34.

Data Type	Description
Percent	Returns a number in percent format of up to 18 digits followed by a percent sign. Percent data is stored as a decimal divided by 100, which means that 90% is equal to 0.90.
Text	Returns a string of up to 3900 characters. To display text in addition to the formula output, insert that text in quotes. Use the text data type for text, text area, URL, phone, email, address, and auto-number fields. This data type isn't available for custom summary formulas in reports.

SEE ALSO:

[Building Formulas](#)

Elements of a Formula

A formula can contain references to the values of fields, operators, functions, literal values, or other formulas. Use any or all of the elements in the following table to build a formula. For more details about building formulas, see [Building Formulas](#).

Element Name	Description
Literal Value	<p>A text string or number you enter that is not calculated or changed. For example, if you have a value that's always multiplied by 2% of an amount, your formula would contain the literal value of 2% of that amount:</p> <pre>ROUND ((Amount * 0.02) , 2)</pre> <p>This example contains every possible part of a formula:</p> <ul style="list-style-type: none"> • A function called ROUND used to return a number rounded to a specified number of decimal places. • A field reference called Amount. • An operator, *, that tells the formula builder to multiply the contents of the <code>Amount</code> field by the literal value, 0.02. • A literal number, 0.02. Use the decimal value for all percents. To include actual text in your formula, enclose it in quotes. • The last number 2 in this formula is the input required for the ROUND function that determines the number of decimal places to return.
Field Reference	<p>Reference the value of another custom or standard field using a merge field. The syntax for a merge field is <code>field_name</code> for a standard field or <code>field_name__c</code> for a custom field. The syntax for a merge field on a related object is <code>object_name__r.field_name</code>. Use the Insert Field button or the drop-down list to insert a merge field in your formula where necessary.</p>
Function	<p>A system-defined formula that can require input from you and returns a value or values. For example, TODAY() does not require</p>

Element Name	Description
	input but returns the current date. The TEXT(value) function requires your percent, number, or currency input and returns text.
Operator	A symbol that specifies the type of calculation to perform or the order in which to do it. For example, the + symbol specifies two values should be added. The open and close parentheses specify which expressions you want evaluated first.
Comment	<p>An annotation within a formula that begins with a forward slash followed by an asterisk (/*) and concludes with an asterisk followed by a forward slash (* /). For example,</p> <pre data-bbox="820 619 1445 661">/*This is a formula comment*/</pre> <p>Comments are ignored when processing a formula.</p> <p>Comments are useful for explaining specific parts of a formula to anyone viewing the formula definition. For example:</p> <pre data-bbox="820 808 1445 1186">AND (/*competitor field is required, check to see if field is empty */ LEN(Competitor__c) = 0, /* rule only enforced for ABCD record types */ RecordType.Name = "ABCD Value", /* checking for any closed status, allows for additional closed picklist values in the future */ CONTAINS(TEXT(StageName), "Closed"))</pre> <p>You can also use comments to <i>comment out</i> sections of your formula when debugging and checking the syntax to locate errors in the formula.</p> <p> Note:</p> <ul style="list-style-type: none"> • Nesting comments causes a syntax error. For example, you cannot save a formula that has the following: <pre data-bbox="917 1459 1437 1501">/* /* comment */ */</pre> • Commenting out a whole formula causes a syntax error. • Comments count against the character and byte size limits in formulas.

[Quick Reference Guide: Formula Fields](#)

Formulas: How Do I ... ?

Common Math Calculations

- Add numbers?
- Convert text into a number?
- Divide numbers?
- Multiply numbers?
- Round numbers?
- Subtract numbers?

Common Text Functions

- Check if a field contains specified text?
- Check if a picklist field contains a specified value?
- Combine first and last names?
- Convert numbers into text?
- Create a hyperlink field?

Advanced Formulas

- Calculate Commission Amounts for Opportunities?
- Set Up Round-Robin Assignment of Cases or Leads?
- Set Up Opportunity Discount Rounded?

Custom Summary Formulas for Reports

- Calculate the sum of all leads that have **Email Opt Out** and **Do Not Call** fields selected?
- Calculate the difference of all **Amount** fields and all **Discounted Amount** fields on opportunities?
- Calculate the average age of all opportunities?
- Calculate what percent of all opportunities are closed won?
- Calculate the number of active Salesforce users to the 2nd power for administration?
- Calculate the duration of all activities (minutes) times the number of records per 24 hours?
- Calculate the average percent margin on a product-by-product level across many opportunities?
- Calculate the percentage of one product compared to all products in closed opportunities?
- Calculate the change in revenue from opportunities between months?

Cross-Object Formulas

- Display a `Percent` field from a parent object?
- Display a text field from a parent object?
- Display a phone number field from a parent object?
- Display a picklist field from a parent object?
- Display a URL field from a parent object?

EDITIONS

Some How Do I's are not relevant to **Database.com**

USER PERMISSIONS

To view formula field details:

- "View Setup and Configuration"

To create, change, or delete formula fields:

- "Customize Application"

Building Formulas

 **Note:** The [Getting Started with Formulas](#) help video includes a live demo of the steps in this document.

Your custom formula fields require special attributes. To build your formula:

1. Begin building a formula field the same way you create a custom field. See [Create Custom Fields](#) on page 3815.
2. Select the data type for the formula. Choose the appropriate data type for your formula based on the output of your calculation. See [Formula Data Types](#) on page 3922.

3. Choose the number of decimal places for currency, number, or percent data types. This setting is ignored for currency fields in multicurrency organizations. Instead, the `Decimal Places` for your currency setting apply.

 **Note:** Salesforce uses the round half up tie-breaking rule for numbers in formula fields. For example, 12.345 becomes 12.35 and -12.345 becomes -12.34.

4. Click **Next**.

5. Build your formula:

- a. If you are building a formula in the **Advanced Formula** tab or for approvals or rules, such as workflow, validation, assignment, auto-response, or escalation, click **Insert Field**, choose a field, and click **Insert**.

To create a basic formula that passes specific Salesforce data, select the **Simple Formula** tab, choose the field type in the `Select Field Type` drop-down list, and choose one of the fields listed in the `Insert Field` drop-down list.

 **Tip:** Build cross-object formulas to span to related objects and reference merge fields on those objects.

- b. To insert an operator, choose the appropriate operator icon from the `Insert Operator` drop-down list.
- c. Optionally, click the **Advanced Formula** tab to use functions and view additional operators and merge fields. Functions are prebuilt formulas that you can customize with your input parameters.
- d. To insert a function, double-click its name in the list, or select it and click **Insert Selected Function**. To filter the list of functions, choose a category from the `Functions` drop-down list. Select a function and click **Help on this function** to view a description and examples of formulas using that function.
- e. Consider adding comments to your formula, especially if it is complicated. Comments must begin with a forward slash followed by an asterisk (`/*`), and conclude with an asterisk followed by a forward slash (`*/`).

Comments are useful for explaining specific parts of a formula to anyone viewing the formula definition. For example:

```
AND (
  /*competitor field is required, check to see if field is empty */
  LEN(Competitor__c) = 0,
  /* rule only enforced for ABCD record types */
  RecordType.Name = "ABCD Value",
  /* checking for any closed status, allows for additional closed picklist values in
  the future */
  CONTAINS(TEXT(StageName), "Closed")
)
```

You can also use comments to *comment out* sections of your formula when debugging and checking the syntax to locate errors in the formula.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To view formula field details:

- "View Setup and Configuration"

To create, change, or delete formula fields:

- "Customize Application"

 **Note:**

- Nesting comments causes a syntax error. For example, you cannot save a formula that has the following:

```
/* /* comment */ */
```

- Commenting out a whole formula causes a syntax error.
- Comments count against the character and byte size limits in formulas.

 **Note:** Formula fields can contain up to 3,900 characters, including spaces, return characters, and comments. If your formula requires more characters, create separate formula fields and reference them in another formula field. The maximum number of displayed characters after an evaluation of a formula expression is 1,300 characters.

6. To check your formula for errors, click **Check Syntax**.
7. Optionally, enter a description of the formula in the `Description` box.
8. If your formula references any number, currency, or percent fields, choose an option for handling blank fields. To give any blank fields a zero value, choose `Treat blank fields as zeros`. To leave these fields blank, choose `Treat blank fields as blanks`.
9. Click **Next**.
10. Set the field-level security to determine whether the field should be visible for specific profiles, and click **Next**.
11. Choose the page layouts that should display the field. The field is added as the last field in the first two-column section on the page layout. For user custom fields, the field is automatically added to the bottom of the user detail page.
12. Click **Save** to finish or **Save & New** to create more custom fields.

 **Note:** Because formula fields are automatically calculated, they are read-only on record detail pages and do not update last modified date fields. Formula fields are not visible on edit pages.

In account formulas, all business account fields are available as merge fields. However, account fields exclusive to person accounts such as `Birthdate` and `Email` are not available.

[Formula Operators and Functions](#)

[Quick Reference Guide: Formula Fields](#)

Tips for Building Formulas

Watch a Demo:  [Formulas: Tips and Gotchas](#)

- Formula fields that a user can see may reference fields that are hidden or read only using field-level security. If the formula field contains sensitive information, use field-level security to hide it.
- You can add activity formula fields to task and event page layouts. Note that a task-related formula field on an event page layout may not be useful. Likewise, event-related formula fields on task page layouts may not be useful.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

- To determine if a record is a task or event, use the `IsTask` merge field. For example:

```
IF(IsTask, "This is a task", "This is an event")
```

- [Tips for Referencing Record Types in Formulas](#)
- [Tips for Working with Text Formula Fields](#)

SEE ALSO:

[Building Formulas](#)

[Formula Errors](#)

Tips for Working with Date and Date/Time Formula Fields

- Dates and times are always calculated using the user's time zone.
- Date and date/time fields can't be used interchangeably. The name alone may not indicate if a field is a date or date/time. For example, `Created Date` and `Last Modified Date` are date/time fields whereas `Last Activity Date` is a date field. Use the `DATEVALUE` function to convert a date/time field into a date field.

Note: The `Created Date` and `Last Modified Date` fields display only the date, not the date and time.

- Use addition and subtraction operators with date or date/time fields to calculate duration. For example, subtract a date from another date to calculate the number of days between the two. Likewise, you can subtract the date/time from another date/time to get the number of days between the two as a number. See `NOW` or `TODAY` for suggested use.
- Use addition and subtraction operators with numbers to return another date or date/time. For example, `{!CreatedDate} + 5` calculates the date and time five days after a record's created date. Note that the expression returns the same data type as the one given; a date field plus or minus a number returns a date, and a date/time field plus or minus a number returns a date/time.
- When calculating dates using fractions, Salesforce ignores any numbers beyond the decimal. For example:

`TODAY () + 0.7` is the same as `TODAY () + 0`, which is today's date.

`TODAY () + 1.7` is the same as `TODAY () + 1`, which is tomorrow's date.

`TODAY () + (-1.8)` is the same as `TODAY () + (-1)`, which is yesterday's date.

- To calculate the value of two fractions first, group them within parentheses. For example:

`TODAY () + 0.5 + 0.5` is the same as `TODAY () + 0 + 0`, which is today's date.

`TODAY () + (0.5+0.5)` is the same as `TODAY () + 1`, which is tomorrow's date.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

- Years can't be zero and must be between -4713 and 9999.

SEE ALSO:

[Tips for Building Formulas](#)

Tips for Using Merge Fields in Formulas

- Delegated administrators need to have access to custom objects to access the objects' merge fields from formulas.
- In account formulas, all business account fields are available as merge fields. However, account fields exclusive to person accounts such as `Birthdate` and `Email` are not available.
- You can't use formula fields that include related object merge fields in roll-up summary fields.
- Formulas and roll-up summary fields can't reference fields on external objects.
- Using `RecordType.Id` can make your formula less readable; when you do use it, write in-line comments into the formula to clarify.
- To determine if a record is a task or event, use the `IsTask` merge field. For example:

```
IF(IsTask, "This is a task", "This is an event")
```

- To reference the unique identifier for your Salesforce organization in a formula, insert the `$Organization.Id` merge field. This merge field can display anywhere formula fields can except in reports.
- Some merge fields display as radio buttons but function like picklist fields when referenced in a formula.

Use the values "Read," "Edit," and "None" in a formula when referencing:

- `$UserRole.CaseAccessForAccountOwner`
- `$UserRole.OpportunityAccessForAccountOwner`
- `CaseAccessLevel` (on Territory)
- `OpportunityAccessLevel` (on Territory)

Use the values "Read," "Edit," and "All" in a formula when referencing:

- `AccountAccessLevel` (on Territory)

- If you create a contacts formula field that references account merge fields, that field can be included in contact page layouts but should not be included in person accounts page layouts. The formula field will display a value of `#ERROR` on the person accounts page.

SEE ALSO:

[Tips for Building Formulas](#)

Tips for Working with Number Formula Fields

- Use the decimal version of a percent when working with percent fields in formulas. For example, `IF(Probability =1...)` for 100% probability or `IF(Probability =0.9...)` for 90% probability.
- Reference auto-number fields as text fields in formulas.
- The output of your formula must be less than 19 digits.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

- Formulas can contain a mix of numbers, percents, and currencies as in this example: `AnnualRevenue / NumberOfEmployees`.
- Salesforce uses the round half up tie-breaking rule for numbers in formula fields. For example, 12.345 becomes 12.35 and -12.345 becomes -12.34 .

SEE ALSO:

[Tips for Building Formulas](#)

Tips for Working with Picklist and Multi-Select Picklist Formula Fields

- You can use special picklist fields in your formulas, such as `IsEscalated` for cases and `IsWon` for opportunities.
- Picklist fields can only be used in these functions:
 - `ISPICKVAL`—Compares the value of a picklist to a single value.
 - `CASE`—Compares the value of a picklist to multiple values.
 - `TEXT`—Converts a picklist value into a text value so that you can work with the value in functions that support text value, such as `CONTAINS`. (Available in only flow formula resources, formula fields, validation rules, and workflow field updates.)
- The `TEXT` function always returns picklist values in your organization's master language, not the language of the current user.
- Multi-select picklist fields can only be used in these functions:
 - `INCLUDES`
 - `ISBLANK`
 - `ISNULL`
 - `ISCHANGED` (Only in assignment rules, validation rules, workflow field updates, and workflow rules in which the evaluation criteria is set to **Evaluate the rule when a record is: created, and every time it's edited**)
 - `PRIORVALUE` (Only in assignment rules, validation rules, workflow field updates, and workflow rules in which the evaluation criteria is set to **Evaluate the rule when a record is: created, and every time it's edited**)

EDITIONS

[Tips for Building Formulas](#)

Tips for Referencing Record Types in Formulas

Reference record types in formulas if you want different workflow rules, validation rules, and lookup filters to apply to different record types. For example, you can:

- Create a workflow rule on accounts that emails different teams based on the account record type the user selects when creating the account.
- Create a validation rule on opportunities that allows only members of the North American sales team to save opportunities with the Domestic record type.

When possible, use `RecordTypeId` instead of `RecordType.Name` to reference a specific record type. While `RecordType.Name` makes a formula more readable, you must update the formula if the name of the record type changes, whereas the ID of a record type never changes. Also, `RecordType.Name` requires a cross-object reference to the record type, while `RecordTypeId` doesn't. However, if you are deploying formulas across organizations (for example, between sandbox and production), use `RecordType.Name` because IDs are not the same across organizations.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Avoid using `$RecordType` in formulas, except in default value formulas. Instead, use the `RecordType` merge field (for example, `Account.RecordType.Name`) or the `RecordTypeId` field on the object.

Tips for Working with Text Formula Fields

- Before using the `HYPERLINK` function, consider the differences between hyperlinks and custom links.
 - Hyperlink formula fields are just like other custom fields that you can display in list views and reports.
 - Custom links display on detail pages in a predefined section; hyperlink formula fields can display on a detail page wherever you specify.
 - Using custom links, you can specify display properties such as window position and opening in a separate popup position; hyperlink formula fields open in a new browser window by default or you can specify a different target window or frame.
 - Your formulas can reference custom links. Before deleting a custom link, make sure it is not referenced in a formula field.
 - Hyperlink formula fields that contain relative URLs to Salesforce pages, such as `/rpt/reportwizard.jsp`, can be added to list views, reports, and related lists. However, use a complete URL, including the server name and `https://`, in your hyperlink formula before adding it to a search layout. Formula fields aren't available in search result layouts.
- To insert text in your formula field, surround the text with quotation marks. For example, to display "CASE: 123," use this formula `"CASE: "& CaseNumber__c`.
- Use the backslash (`\`) character before a quote or backslash to insert it as a literal value in your output. For example, `"Trouble\\Case \\"Ticket\\": "` in your formula displays `Trouble\Case "Ticket":` on detail pages.

What Are Cross-Object Formulas?

Cross-object formulas are formulas that span two related objects and reference merge fields on those objects. Cross-object formulas can reference merge fields from a master ("parent") object if an object is on the detail side of a master-detail relationship. Cross-object formulas also work with lookup relationships.

You can reference fields from objects that are up to 10 relationships away. Cross-object formulas are available anywhere formulas are used except when creating default values.

- ✔ **Note:** If you create a formula that references a field on another object and display that formula in your page layout, users can see the field on the object even if they don't have access to that object record. For example, if you create a formula field on the Case object that

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

references an account field, and display that formula field in the case page layout, users can see this field even if they don't have access to the account record.

[Build Cross-Object Formulas in the Advanced Formula Tab](#)

Building Cross-Object Formulas in the Simple Formula Tab

To create a cross-object formula when building a formula in the Simple Formula tab, enter the relationship names of the objects to which you are spanning followed by the field you want to reference. Separate the relationship names of each object and the field with periods.

 **Example:** For example, enter `Contact.Account.Name` to reference the `Account Name` for a contact associated with a case in a formula field on the Case object. Be sure to use the relationship names of the objects, not the labels. Although the relationship name is often the same as the object name, it is technically the field name of the relationship field.

To reference the parent account name from Account object, the syntax is `Parent.Name`, not `Account.Name`. When referencing a custom object, add two underscores and the letter *r* to its name. For example, `Position__r.title__c` references the `Job Title` field (`title__c`) on a Position custom object.

 **Note:** If you create a formula that references a field on another object and display that formula in your page layout, users can see the field on the object even if they don't have access to that object record. For example, if you create a formula field on the Case object that references an account field, and display that formula field in the case page layout, users can see this field even if they don't have access to the account record.

[What Are Cross-Object Formulas?](#)

Build Cross-Object Formulas in the Advanced Formula Tab

To create a cross-object formula when building a formula in the Advanced Formula tab or for approvals or rules, such as workflow, validation, assignment, auto-response, or escalation rules, click **Insert Field**, then click the related object to list its fields. Related objects are denoted by a ">" sign.

 **Note:** If you create a formula that references a field on another object and display that formula in your page layout, users can see the field on the object even if they don't have access to that object record. For example, if you create a formula field on the Case object that references an account field, and display that formula field in the case page layout, users can see this field even if they don't have access to the account record.

USER PERMISSIONS

To create or change cross-object formulas:

- "Customize Application"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To create or change cross-object formulas:

- "Customize Application"

 **Example:** The value of the `Profile.Name` merge field differs depending on the context of the cross-object formula field that references it. On detail pages, the value is the profile name, as expected; however, in list views and reports, the value is the internal value of the associated profile instead. If you use `Profile.Name` in a formula, use it within an `OR` function to ensure the formula always returns the intended result. For example:

```
IF
    (OR
        (LastModifiedBy.Profile.Name = "Standard User", LastModifiedBy.Profile.Name
        = "PT2"),
        "Standard", "Not Standard")
```

None of the above applies to profile names referenced by the `$Profile` global variable.

[What Are Cross-Object Formulas?](#)

Tips for Building Cross-Object Formulas

- Cross-object formulas that reference currency fields convert the value to the currency of the record that contains the formula. If the referenced currency field is from a custom setting, the field value isn't converted to the record's currency.
- Salesforce allows a maximum of 10 unique relationships per object in cross-object formulas. The limit is cumulative across all formula fields, rules, and lookup filters. For example, if two different formulas on opportunities reference two different fields of an associated account, only one unique relationship exists (from opportunities to accounts).
- You can't reference cross-object formulas in roll-up summary fields.
- In cross-object formulas, you can't reference merge fields for objects related to activities. For example, merge fields for contacts and accounts aren't available in task and event formulas.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

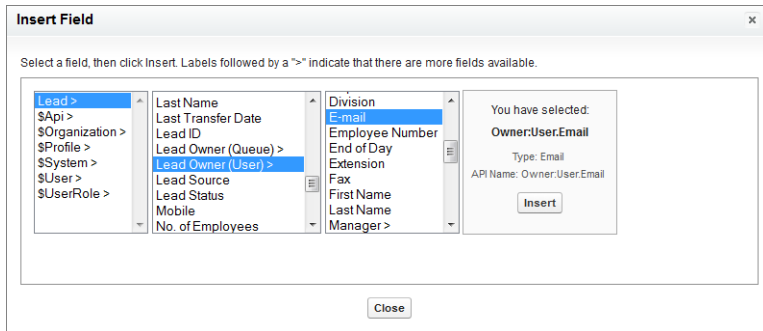

Using the Owner Field

Some objects support different object types for the Owner field, such as a User, Queue, or Calendar. On objects that support this behavior, when creating a cross-object formula using Owner, you must be explicit about the owner type you're referencing.

For example, if you need owner email and you don't use queues, your formula would be `Owner:User.Email`. If you do use queues, your formula could be

```
IF( ISBLANK( Owner:User.Id ), Owner:Queue.QueueEmail, Owner:User.Email )
```

Here's how you would select Owner object fields on a Lead in the Advanced formula tab:

Note:

- Owner references aren't supported in Visualforce pages. For example, on a page with Case as a controller, you can't include `{ !Case.Owner:User.FirstName }`. However, you can include an existing spanning formula on a Visualforce page. For example, if you have a custom text formula `MyFormula__c` on a Case with value `Owner:User.FirstName`, you can include `{ !Case.MyFormula__c }` on your Visualforce page.
- Owner references aren't supported on the Queue object. For example, you can't reference `Owner:Queue.Owner.Email`.
- If your formula has `Owner:User.fieldname` and `Owner:Queue.fieldname`, both of these count against the limit of 10 unique relationships per object in cross-object formulas.
- On objects that don't support Queues, User is implicit when referencing Owner. Your formula should be `Owner.fieldname`, not `Owner:User.fieldname`.

Using `Profile.Name`

The value of the `Profile.Name` merge field differs depending on the context of the cross-object formula field that references it. On detail pages, the value is the profile name, as expected; however, in list views and reports, the value is the internal value of the associated profile instead. If you use `Profile.Name` in a formula, use it within an `OR` function to ensure the formula always returns the intended result. For example:

```
IF
  (OR
    (LastModifiedBy.Profile.Name = "Standard User", LastModifiedBy.Profile.Name =
"PT2"),
    "Standard", "Not Standard")
```

None of the above applies to profile names referenced by the `$Profile` global variable.

Formula Operators and Functions

Use these operators and functions when building formulas. Click on the name of the operator or function to view more details. All functions are available everywhere that you can include a formula such as formula fields, validation rules, approval processes, and workflow rules, unless otherwise specified.

Note: Extraneous spaces in the samples below are ignored.

- [Informational Functions](#)
- [Logical Functions](#)
- [Math Functions](#)
- [Text Functions](#)
- [Summary Functions](#)
- [Advanced Functions](#)
- [Encoding Functions](#)

Math Operators

Operator	Description
+ (Add)	Calculates the sum of two values.
- (Subtract)	Calculates the difference of two values.
* (Multiply)	Multiplies its values.
/ (Divide)	Divides its values.
^ (Exponentiation)	Raises a number to a power of a specified number.
() (Open Parenthesis and Close Parenthesis)	Specifies that the expressions within the open parenthesis and close parenthesis are evaluated first. All other expressions are evaluated using standard operator precedence.

Logical Operators

Operator	Description
= and == (Equal)	Evaluates if two values are equivalent. The = and == operator are interchangeable.
<> and != (Not Equal)	Evaluates if two values are not equivalent.
< (Less Than)	Evaluates if a value is less than the value that follows this symbol.
> (Greater Than)	Evaluates if a value is greater than the value that follows this symbol.
<= (Less Than or Equal)	Evaluates if a value is less than or equal to the value that follows this symbol.
>= (Greater Than or Equal)	Evaluates if a value is greater than or equal to the value that follows this symbol.
&& (AND)	Evaluates if two values or expressions are both true. Use this operator as an alternative to the logical function AND.
 (OR)	Evaluates if at least one of multiple values or expressions is true. Use this operator as an alternative to the logical function OR.

Text Operators

Operator	Description
& (Concatenate)	Connects two or more strings.

Date and Time Functions

Function	Description
DATE	Returns a date value from year, month, and day values you enter. Salesforce displays an error on the detail page if the value of the DATE function in a formula field is an invalid date, such as February 29 in a non-leap year.
DATEVALUE	Returns a date value for a date/time or text expression.
DATETIMEVALUE	Returns a year, month, day and GMT time value.
DAY	Returns a day of the month in the form of a number between 1 and 31.
MONTH	Returns the month, a number between 1 (January) and 12 (December) in number format of a given date.
NOW	Returns a date/time representing the current moment.
TODAY	Returns the current date as a date data type.
YEAR	Returns the four-digit year in number format of a given date.

Informational Functions

Function	Description
BLANKVALUE	Determines if an expression has a value and returns a substitute expression if it does not. If the expression has a value, returns the value of the expression.
ISBLANK	Determines if an expression has a value and returns TRUE if it does not. If it contains a value, this function returns FALSE.
ISNULL	Determines if an expression is null (blank) and returns TRUE if it is. If it contains a value, this function returns FALSE.  Important: Use ISBLANK instead of ISNULL in new formulas. ISBLANK has the same functionality as ISNULL, but also supports text fields. Salesforce will continue to support ISNULL, so you do not need to change any existing formulas.
NULLVALUE	Determines if an expression is null (blank) and returns a substitute expression if it is. If the expression is not blank, returns the value of the expression.  Important: Use BLANKVALUE instead of NULLVALUE in new formulas. BLANKVALUE has the same functionality as NULLVALUE, but also supports text fields. Salesforce will continue to support NULLVALUE, so you do not need to change existing formulas.

Function	Description
PRIORVALUE	Returns the previous value of a field.

Logical Functions

Function	Description
AND	Returns a TRUE response if all values are true; returns a FALSE response if one or more values are false.
CASE	Checks a given expression against a series of values. If the expression is equal to a value, returns the corresponding result. If it is not equal to any values, it returns the <code>else_result</code> .
IF	Determines if expressions are true or false. Returns a given value if true and another value if false.
ISCHANGED	Compares the value of a field to the previous value and returns TRUE if the values are different. If the values are the same, this function returns FALSE.
ISNEW	Checks if the formula is running during the creation of a new record and returns TRUE if it is. If an existing record is being updated, this function returns FALSE.
ISNUMBER	Determines if a text value is a number and returns TRUE if it is. Otherwise, it returns FALSE.
NOT	Returns FALSE for TRUE and TRUE for FALSE.
OR	Determines if expressions are true or false. Returns TRUE if any expression is true. Returns FALSE if all expressions are false.

Math Functions

Function	Description
ABS	Calculates the absolute value of a number. The absolute value of a number is the number without its positive or negative sign.
CEILING	Rounds a number up to the nearest integer.
DISTANCE	Calculates the distance between two locations in miles or kilometers.
EXP	Returns a value for e raised to the power of a number you specify.
FLOOR	Returns a number rounded down to the nearest integer.
GEOLOCATION	Returns a geolocation based on the provided latitude and longitude. Must be used with the DISTANCE function.
LN	Returns the natural logarithm of a specified number. Natural logarithms are based on the constant e value of 2.71828182845904.
LOG	Returns the base 10 logarithm of a number.
MAX	Returns the highest number from a list of numbers.
MIN	Returns the lowest number from a list of numbers.

Function	Description
MOD	Returns a remainder after a number is divided by a specified divisor.
ROUND	Returns the nearest number to a number you specify, constraining the new number by a specified number of digits.
SQRT	Returns the positive square root of a given number.

Text Functions

Function	Description
BEGINS	Determines if text begins with specific characters and returns TRUE if it does. Returns FALSE if it does not.
BR	Inserts a line break in a string of text.
CASESAFEID	Converts a 15-character ID to a case-insensitive 18-character ID.
CONTAINS	Compares two arguments of text and returns TRUE if the first argument contains the second argument. If not, returns FALSE.
FIND	Returns the position of a string within a string of text represented as a number.
GETSESSIONID	Returns the user's session ID.
HYPERLINK	Creates a link to a URL specified that is linkable from the text specified.
IMAGE	Inserts an image with alternate text and height/width specifications.
INCLUDES	Determines if any value selected in a multi-select picklist field equals a text literal you specify.
ISPICKVAL	Determines if the value of a picklist field is equal to a text literal you specify.
LEFT	Returns the specified number of characters from the beginning of a text string.
LEN	Returns the number of characters in a specified text string.
LOWER	Converts all letters in the specified text string to lowercase. Any characters that are not letters are unaffected by this function. Locale rules are applied if a locale is provided.
LPAD	Inserts characters you specify to the left-side of a text string.
MID	Returns the specified number of characters from the middle of a text string given the starting position.
RIGHT	Returns the specified number of characters from the end of a text string.
RPAD	Inserts characters that you specify to the right-side of a text string.
SUBSTITUTE	Substitutes new text for old text in a text string.
TEXT	Converts a percent, number, date, date/time, or currency type field into text anywhere formulas are used. Also, converts picklist values to text in approval rules, approval step rules, workflow rules, escalation rules, assignment rules, auto-response rules, validation rules, formula fields, field updates, and custom buttons and links.
TRIM	Removes the spaces and tabs from the beginning and end of a text string.

Function	Description
UPPER	Converts all letters in the specified text string to uppercase. Any characters that are not letters are unaffected by this function. Locale rules are applied if a locale is provided.
VALUE	Converts a text string to a number.

Summary Functions

The following functions are available with summary, matrix, and joined reports.

Function	Description
PARENTGROUPVAL	This function returns the value of a specified parent grouping. A “parent” grouping is any level above the one containing the formula. You can only use this function in custom summary formulas for reports.
PREVGROUPVAL	This function returns the value of a specified previous grouping. A “previous” grouping is one that comes before the current grouping in the report. Choose the grouping level and increment. The increment is the number of columns or rows before the current summary. The default is 1; the maximum is 12. You can only use this function in custom summary formulas for reports.

Advanced Functions

Function	Description
GETRECORDIDS	Returns an array of strings in the form of record IDs for the selected records in a list, such as a list view or related list.
INCLUDE	Returns content from an s-control snippet. Use this function to reuse common code in many s-controls.
LINKTO	Returns a relative URL in the form of a link (href and anchor tags) for a custom s-control or Salesforce page.
REGEX	Compares a text field to a regular expression and returns TRUE if there is a match. Otherwise, it returns FALSE. A regular expression is a string used to describe a format of a string according to certain syntax rules.
REQUIRESRIPT	Returns a script tag with source for a URL you specify. Use this function when referencing the Force.com AJAX Toolkit or other JavaScript toolkits.
URLFOR	Returns a relative URL for an action, s-control, Visualforce page, or a file in a static resource archive in a Visualforce page.
VLOOKUP	Returns a value by looking up a related value on a custom object similar to the VLOOKUP() Excel function.

Encoding Functions

Function	Description
HTMLENCODE	Encodes text and merge field values for use in HTML by replacing characters that are reserved in HTML, such as the greater-than sign (>), with HTML entity equivalents, such as > ; .

Function	Description
JSENCODE	Encodes text and merge field values for use in JavaScript by inserting escape characters, such as a backslash (\), before unsafe JavaScript characters, such as the apostrophe (').
JSINHTML ENCODE	Encodes text and merge field values for use in JavaScript inside HTML tags by replacing characters that are reserved in HTML with HTML entity equivalents and inserting escape characters before unsafe JavaScript characters. <code>JSINHTML ENCODE (someValue)</code> is a convenience function that is equivalent to <code>JSENCODE (HTML ENCODE ((someValue))</code> . That is, <code>JSINHTML ENCODE</code> first encodes <code>someValue</code> with <code>HTML ENCODE</code> , and then encodes the result with <code>JSENCODE</code> .
URLENCODE	Encodes text and merge field values for use in URLs by replacing characters that are illegal in URLs, such as blank spaces, with the code that represent those characters as defined in <i>RFC 3986, Uniform Resource Identifier (URI): Generic Syntax</i> . For example, blank spaces are replaced with %20, and exclamation points are replaced with %21.

SEE ALSO:

[Formula Operators and Functions A–H](#)

[Formula Operators and Functions I–Z](#)

[Examples of Advanced Formula Fields](#)

Formula Operators and Functions A–H

Use the following operators and functions when building formulas. Click on the name of the operator or function below to view more details. All functions are available everywhere that you can include a formula such as formula fields, validation rules, approval processes, and workflow rules, unless otherwise specified.

 **Note:** Extraneous spaces in the samples below are ignored.

+ (Add)

Description:	Calculates the sum of two values.
Use:	<code>value1 + value2</code> and replace each <code>value</code> with merge fields, expressions, or other numeric values.
Formula Field Example:	<code>Amount + Maint_Amount__c + Services_Amount__c</code> This formula calculates the sum of the product <code>Amount</code> , maintenance amount, and services fees. Note that <code>Maint amount</code> and <code>Service Fees</code> are custom currency fields.
Report Example:	<code>EMAIL_OPT_OUT:SUM + DO_NOT_CALL:SUM</code> calculates all <code>Email Opt Out</code> fields plus all <code>Do Not Call</code> fields on the leads in your report. This formula is a number data type that returns a positive integer.

Validation Rule Example: You may have a custom object that allows users to track the total number of hours worked in a week. Use the following example to ensure that users cannot save a time card record with more than 40 hours in a work week.

```
Monday_Hours__c +
Tuesday_Hours__c +
Wednesday_Hours__c +
Thursday_Hours__c +
Friday_Hours__c > 40
```

Use a formula like this one in a validation rule to display the following error message when the total number of hours entered for each work day is greater than 40: "Your total hours cannot exceed 40." This example requires five custom fields on your custom object, one for each day of work.

- (Subtract)

Description: Calculates the difference of two values.

Use: `value1 - value2` and replace each *value* with merge fields, expressions, or other numeric values.

Example: `Amount - Discount_Amount__c`
This formula calculates the difference of the product `Amount` less the `Discount Amount`. Note that `Discount Amount` is a custom currency field.

Report Example: `AMOUNT:SUM - Product.Discount_Amount__c:SUM` calculates the difference of all `Amount` fields and all `Discounted Amount` custom fields on the products in your report. This formula is a currency data type that returns a currency sign and decimal places.

* (Multiply)

Description: Multiplies its values.

Use: `value1 * value2` and replace each *value* with merge fields, expressions, or other numeric values.

Example: `Consulting_Days__c * 1200`
This formula calculates the number of consulting days times 1200 given that this formula field is a currency data type and consulting charges a rate of \$1200 per day. Note that `Consulting Days` is a custom field.

Report Example: `RowCount * AGE:AVG` calculates the record count times the average age value of your report. This formula is a number data type that returns a positive or negative integer or decimal.

/ (Divide)

Description: Divides its values.

Use: `value1 / value2` and replace each *value* with merge fields, expressions, or other numeric values.

Example: `AnnualRevenue / NumberOfEmployees`

This formula calculates the revenue amount per employee using a currency field.

```
IF(NumberOfOpportunities > 0,
  NumberOfWonOpportunities / NumberOfOpportunities, null)
```

This formula calculates the win rate of opportunities on a campaign.

Report Example: **% Won Opportunities**

`WON:SUM / RowCount` calculates the percent of won opportunities using a record count representing the number of all opportunities in your report. This formula is a number data type that returns a positive or negative integer.

% Difference between Cost and Sales Price

`(TOTAL_PRICE:SUM - QUANTITY:SUM * Product2.Cost__c:SUM) / (QUANTITY:SUM * Product2.Cost__c:SUM)` calculates the average percent difference between what a product costs and its selling price on a product-by-product level. Note that `Product2.Cost__c:SUM` is a custom currency field named `Cost` on products, which includes the cost of each product. This formula is a percent data type that returns a positive or negative integer. For best results, use this on a summary Opportunities with Products report that is summarized by `Product Name` and includes summary totals for `Quantity`, `Total Price`, and `Cost`.

^ (Exponentiation)

Description: Raises a number to a power of a specified number.

Use: `number^integer` and replace *number* with a merge field, expression, or another numeric value; replace *integer* with a merge field that contains an integer, expression, or any integer.

Example: `NumberOfEmployees^4` calculates the number of employees to the 4th power.

Report Example: `ACTIVE:SUM ^ 2` calculates the number of active Salesforce users to the 2nd power for administration. This formula is a number data type that returns a positive integer.

Tips: Avoid replacing *integer* with a negative number.

() (Open Parenthesis and Close Parenthesis)

Description: Specifies that the expressions within the open parenthesis and close parenthesis are evaluated first. All other expressions are evaluated using standard operator precedence.

Use: `(expression1) expression2...` and replace each *expression* with merge fields, expressions, or other numeric values.

Example: `(Unit_Value__c - Old_Value__c) / New_Value__c` calculates the difference between the old value and new value divided by the new value.

Report Example: `(DURATIONHOURS:SUM * RowCount) / 24` calculates the duration of all event times the record count per 24 hours. This formula is a percent data type that returns a positive or negative integer or decimal, representing what percent of a day is spent on events.

= and == (Equal)

 **Important:** Don't use this function for a null comparison, such as `MyDateTime__c == null`. Use `ISBLANK` instead.

Description: Evaluates if two values are equivalent. The = and == operator are interchangeable.

Use: `expression1=expression2` or `expression1 == expression2`, and replace each `expression` with merge fields, expressions, or other numeric values.

Example:

Due Date

`Due Date = CreatedDate + 5` returns true if the due date is equal to five days following a record's created date.

Commission Amount

```
IF(Probability =1, ROUND(Amount*0.02, 2), 0)
```

This formula calculates the 2% commission amount of an opportunity that has a probability of 100%. All other opportunities will have a commission value of 0.

Possible results:

- An opportunity with a `Probability` of 90% will have a commission of 0.
 - An opportunity with a `Probability` of 100% and an `Amount` of \$100,000 will have a commission of \$2,000.
-

<> and != (Not Equal)

 **Important:** Don't use this function for a null comparison, such as `MyDateTime__c != null`. Use `ISBLANK` instead.

Description: Evaluates if two values are not equivalent.

Use: `expression1 <> expression2` or `expression1 != expression2`, and replace each `expression` with merge fields, expressions, or other numeric values.

Example:

```
IF(Maint_Amount__c + Services_Amount__c<> Amount,
"DISCOUNTED", "FULL PRICE")
```

This formula displays "DISCOUNTED" on product if its maintenance amount and services amount do not equal the product amount. Otherwise, displays "FULL PRICE." Note that this example uses two custom currency fields for `Maint Amount` and `Services Amount`.

< (Less Than)

Description:	Evaluates if a value is less than the value that follows this symbol.
Use:	<i>value1</i> < <i>value2</i> and replace each <i>value</i> with merge fields, expressions, or other numeric values.
Example:	IF (AnnualRevenue < 1000000, 1, 2) assigns the value "1" with revenues less than one million and the value "2" to revenues greater than one million.

> (Greater Than)

Description:	Evaluates if a value is greater than the value that follows this symbol.
Use:	<i>value1</i> > <i>value2</i> and replace each <i>value</i> with merge fields, expressions, or other numeric values.
Example:	IF (commission__c > 1000000, "High Net Worth", "General") assigns the "High Net Worth" value to a commission greater than one million. Note, this is a text formula field that uses a commission custom field.

<= (Less Than or Equal)

Description:	Evaluates if a value is less than or equal to the value that follows this symbol.
Use:	<i>value1</i> <= <i>value2</i> and replace each <i>value</i> with merge fields, expressions, or other numeric values.
Example:	IF (AnnualRevenue <= 1000000, 1, 2) assigns the value "1" with revenues less than or equal to one million and the value "2" with revenues greater than one million.

>= (Greater Than or Equal)

Description:	Evaluates if a value is greater than or equal to the value that follows this symbol.
Use:	<i>value1</i> >= <i>value2</i> and replace each <i>value</i> with merge fields, expressions, or other numeric values.
Example:	IF (Commission__c >= 1000000, "YES", "NO") assigns the "YES" value with a commission greater than or equal to one million. Note, this is a text formula field that uses a custom currency field called Commission.

&& (AND)

Description:	Evaluates if two values or expressions are both true. Use this operator as an alternative to the logical function AND.
---------------------	--

Use: `(logical1) && (logical2)` and replace *logical1* and *logical2* with the values or expressions that you want evaluated.

Example: `IF((Price<100 && Quantity<5),"Small", null)`
 This formula displays "Small" if the price is less than 100 and quantity is less than five. Otherwise, this field is blank.

|| (OR)

Description: Evaluates if at least one of multiple values or expressions is true. Use this operator as an alternative to the logical function OR.

Use: `(logical1) || (logical2)` and replace any number of logical references with the values or expressions you want evaluated.

Example: `IF((ISPICKVAL(Priority, "High")) || (ISPICKVAL(Status, "New")), ROUND(NOW()-CreatedDate, 0), null)`
 This formula returns the number of days a case has been open if the `Status` is new or the `Priority` is high. If the case was opened today, this field displays a zero.

Validation Rule Example:

```
(Discount_Rate__c < 0) || (Discount_Rate__c > 0.40)
```

This validation rule formula displays the following error message when the `Discount Rate` custom field is not between 0 and 40%: "Discount Rate cannot exceed 40%."

& (Concatenate)

Description: Connects two or more strings.

Use: `string1&string2` and replace each *string* with merge fields, expressions, or other values.

Example: `"Expense-" & Trip_Name__c & "-" & ExpenseNum__c`
 This formula displays the text "Expense-" followed by trip name and the expense number. This is a text formula field that uses an expense number custom field.

ABS

Description: Calculates the absolute value of a number. The absolute value of a number is the number without its positive or negative sign.

Use: `ABS(number)` and replace *number* with a merge field, expression, or other numeric value that has the sign you want removed.

Example: `ABS(ExpectedRevenue)` calculates the positive value of the `Expected Revenue` amount regardless of whether it is positive or negative.

AND

Description:	Returns a TRUE response if all values are true; returns a FALSE response if one or more values are false. Use this function as an alternative to the operator <code>&&</code> (AND).
Use:	<code>AND(logical1,logical2,...)</code> and replace <i>logical1,logical2,...</i> with the values that you want evaluated.
Formula Field Example:	<code>IF(AND(Price<1,Quantity<1),"Small", null)</code> This formula displays "Small" if the price and quantity are less than one. This field is blank if the asset has a price or quantity greater than one.

BEGINS

Description:	Determines if text begins with specific characters and returns TRUE if it does. Returns FALSE if it does not.
Use:	<code>BEGINS(text, compare_text)</code> and replace <i>text, compare_text</i> with the characters or fields you want to compare.
Example:	<code>IF(BEGINS(Product_type__c, "ICU"), "Medical", "Technical")</code> This example returns the text "Medical" if the text in any <code>Product Type</code> custom text field begins with "ICU." For all other products, it displays "Technical."
Tips:	<ul style="list-style-type: none"> • This function is case sensitive so be sure your <i>compare_text</i> value has the correct capitalization. • When using this function in a validation rule or workflow rule, fields that are blank are considered valid. For example, if you have a validation rule that tests to see if the serial number of an asset begins with "3," all assets that have a blank serial number are considered valid.

BLANKVALUE

Description:	Determines if an expression has a value and returns a substitute expression if it does not. If the expression has a value, returns the value of the expression.
Use:	<code>BLANKVALUE(expression, substitute_expression)</code> and replace <i>expression</i> with the expression you want evaluated; replace <i>substitute_expression</i> with the value you want to replace any blank values.
Example:	<p>Example 1</p> <code>BLANKVALUE(Department, "Undesignated")</code> This formula returns the value of the <code>Department</code> field if the <code>Department</code> field contains a value. If the <code>Department</code> field is empty, this formula returns the word <code>Undesignated</code> . <p>Example 2</p> <code>(BLANKVALUE(Payment_Due_Date__c, StartDate +5))</code>

This formula returns the date five days after the contract start date whenever `Payment Due Date` is blank. `Payment Due Date` is a custom date field.

Tips:

- Use `BLANKVALUE` instead of `NULLVALUE` in new formulas. `BLANKVALUE` has the same functionality as `NULLVALUE`, but also supports text fields. Salesforce will continue to support `NULLVALUE`, so you do not need to change existing formulas.
- A field is not empty if it contains a character, blank space, or zero. For example, a field that contains a space inserted with the spacebar is not empty.
- Use the `BLANKVALUE` function to return a specified string if the field does not have a value; use the `ISBLANK` function if you only want to check if the field has a value.
- If you use this function with a numeric field, the function only returns the specified string if the field does not have a value and is not configured to treat blank fields as zeroes.

BR

Description:	Inserts a line break in a string of text.
Use:	<code>BR ()</code>
Example:	<pre> CASE (ShippingCountry, "USA", ShippingStreet & BR() & ShippingCity & ", " & ShippingState & " " & ShippingPostalCode & BR() & ShippingCountry, "France", ShippingStreet & BR() & ShippingPostalCode & " " & ShippingCity & BR() & ShippingCountry, "etc") </pre> <p>This formula field displays a formatted mailing address for a contact in standard format, including spaces and line breaks where appropriate depending on the country.</p>
Tips:	<ul style="list-style-type: none"> • Do not remove the parentheses after the function name. • Keep the parentheses empty. They do not need to contain a value. • Remember to surround the <code>BR()</code> with concatenation operators: <code>&</code>. • Avoid using this function in mail merge templates. • This function is not available in custom buttons and links, s-controls, or reports.

CASE**Description:**

Checks a given expression against a series of values. If the expression is equal to a value, returns the corresponding result. If it is not equal to any values, it returns the `else_result`.

Use: `CASE (expression, value1, result1, value2, result2, ..., else_result)` and replace *expression* with the field or value you want compared to each specified value. Replace each value and result with the value that must be equivalent to return the result entry. Replace *else_result* with the value you want returned when the expression does not equal any values.

Formula Field Example: Days Open for Cases

Use this example of a custom formula field called `Days Open` to display different text depending on the number of days a case has been open:

```
CASE (Days_Open__c, 3,
      "Reassign", 2, "Assign Task", "Maintain")
```

The following text is displayed:

- "Reassign" for any case open three days.
- "Assign Task" for any case open two days.
- "Maintain" for all other cases.

Last Activity Month

This formula field displays the month of the last activity or "None" if there are no activities.

```
CASE (MONTH (LastActivityDate) ,
      1, "January",
      2, "February",
      3, "March",
      4, "April",
      5, "May",
      6, "June",
      7, "July",
      8, "August",
      9, "September",
      10, "October",
      11, "November",
      12, "December",
      "None")
```

Default Value Example: Discount Rate

Use the following default value formula to insert a different discount rate on an opportunity based on the department of the person creating the opportunity:

```
CASE (User.Department, "IT", 0.25, "Field", 0.15, 0)
```

In this example, the formula inserts a discount rate of 25% on any opportunity created by a user in the "IT" department or 15% on any opportunity created by someone in the "Field" department. A zero is applied if the creator does not belong to either of these departments. This is a custom percent field on opportunities that uses the standard user field `Department`.

Product Language

You may want to associate a product with its language so that your users know the type of documentation or adapter to include. Use the following default value formula to automatically set the language of a product based on the country of the user creating the product. In this example, the default value is "Japanese" if the user's country is "Japan" and "English" if the user's country is

"US." If neither is true, the default value "unknown" is inserted into the `Product Language` field.

```
CASE($User.Country , "Japan", "Japanese", "US",
"English", "unknown")
```

Tips:

- Be sure your *value1, value2...* expressions are the same data type.
- Be sure your *result1, result2...* expressions are the same data type.
- CASE functions cannot contain functions that return true or false. Instead, make true or false expressions return numbers such as:

```
CASE(1, IF(ISPICKVAL (Term__c, "12"), 1, 0),
12 * Monthly_Commit__c,
IF(ISPICKVAL(Term__c, "24"), 1, 0),
24 * Monthly_Commit__c, 0)
```

In this formula, `Term` is a picklist field that is multiplied by the `Monthly Commit` whenever it contains the value 1 for true.

- The *else_result* value is required.
- CASE functions return an error whenever any of the expressions return an error, regardless of which one should be returned. For example, `CASE(Field__c, "Partner", "P", "Customer", "C", LEFT(Field__c, -5))` returns an error even if the value of the field is "Partner" or "Customer" because the last statement is illogical.
- If the field in your CASE function is blank, it returns your *else_result* value. For example, this formula: `CASE(Days_Open__c, 3, "Reassign", 2, "Assign Task", "Maintain")` displays "Maintain" if the `Days Open` field is blank, 0, or any value other than 2 or 3.
- Use CASE functions to determine if a picklist value is equal to a particular value. For example the formula `CASE(Term__c, "12", 12 * Monthly_Commit__c, "24", 24 * Monthly_Commit__c, 0)` multiplies the `Monthly Commit` amount by 12 whenever the `Term` is 12 or multiplies the `Monthly Commit` amount by 24 whenever the `Term` is 24. Otherwise, the result is zero.

CASESAFEID

Description: Converts a 15-character ID to a case-insensitive 18-character ID.

Use: `CASESAFEID (id)` and replace *id* with the object's ID.

Example:

```
CASESAFEID (Id)
```

This formula replaces the 15-character ID with the 18-character, case-insensitive ID.

Tips:

- Convert to 18-character IDs for better compatibility with Excel.
- The CASESAFEID function is available everywhere that you can define a formula except reports and s-controls.

CEILING

Description: Rounds a number up to the nearest integer.

Use: `CEILING (number)` and replace *number* with the field or expression you want rounded.

Example: **Rounding Up (literal value)**

```
CEILING (2.5)
```

This formula returns 3, which is 2.5 rounded up to the nearest number.

Earthquake Magnitude

`CEILING (Magnitude__c)` returns the value of a formula number field that calculates the magnitude of an earthquake up to the nearest integer.

CONTAINS

Description: Compares two arguments of text and returns TRUE if the first argument contains the second argument. If not, returns FALSE.

Use: `CONTAINS (text, compare_text)` and replace *text* with the text that contains the value of *compare_text*.

Example:

```
IF (CONTAINS (Product_Type__c, "part"), "Parts", "Service")
```

This formula checks the content of a custom text field named `Product_Type` and returns "Parts" for any product with the word "part" in it. Otherwise, it returns "Service." Note that the values are case sensitive, so if a `Product_Type` field contains the text "Part" or "PART," this formula returns "Services."

Tips:

- This function is case sensitive so be sure your *compare_text* value has the correct capitalization.
- When using this function in a validation rule or workflow rule, fields that are blank are considered valid. For example, if you have a validation rule that tests to see if the serial number of an asset contains "A," all assets that have a blank serial number are considered valid.
- The CONTAINS function does not support multi-select picklists. Use [INCLUDES](#) to see if a multi-select picklist has a specific value.

DATE

Description: Returns a date value from year, month, and day values you enter. Salesforce displays an error on the detail page if the value of the DATE function in a formula field is an invalid date, such as February 29 in a non-leap year.

Use: `DATE (year, month, day)` and replace *year* with a four-digit year, *month* with a two-digit month, and *day* with a two-digit day.

Example: `DATE (2005, 01, 02)` creates a date field of January 2, 2005.

DATEVALUE

Description:	Returns a date value for a date/time or text expression.
Use:	DATEVALUE (<i>expression</i>) and replace <i>expression</i> with a date/time or text value, merge field, or expression.
Example:	<p>Closed Date</p> <p>DATEVALUE (ClosedDate) displays a date field based on the value of the Date/Time Closed field.</p> <p>Date Value</p> <p>DATEVALUE ("2005-11-15") returns November 15, 2005 as a date value.</p>
Tips:	<ul style="list-style-type: none"> • If the field referenced in the function is not a valid text or date/time field, the formula field displays #ERROR! • When entering a date, surround the date with quotes and use the following format: YYYY-MM-DD, that is, a four-digit year, two-digit month, and two-digit day. • If the <i>expression</i> does not match valid date ranges, such as the MM is not between 01 and 12, the formula field displays #ERROR! • Dates and times are always calculated using the user's time zone.

DATETIMEVALUE

Description:	Returns a year, month, day and GMT time value.
Use:	DATETIMEVALUE (<i>expression</i>) and replace <i>expression</i> with a date/time or text value, merge field, or expression.
Example:	<p>Closed Date</p> <p>DATETIMEVALUE (ClosedDate) displays a date field based on the value of the Date/Time Closed field.</p> <p>Date Value</p> <p>DATETIMEVALUE ("2005-11-15 17:00:00") returns November 15, 2005 5:00 PM GMT as a date and time value.</p>
Tips:	<ul style="list-style-type: none"> • DATETIMEVALUE is always calculated using GMT time zone and can't be changed. • When entering a specific date, surround the date with quotes and use the following format: YYYY-MM-DD, that is, a four-digit year, two-digit month, and two-digit day. • If the <i>expression</i> does not match valid date ranges, such as the MM is not between 01 and 12, the formula field displays #ERROR!

DAY

Description:	Returns a day of the month in the form of a number between 1 and 31.
---------------------	--

Use:	DAY (date) and replace <i>date</i> with a date field or value such as <i>TODAY()</i> .
Example:	DAY (Code_Freeze__c) returns the day in your custom code freeze date. Note this does not work on date/time fields.

DISTANCE

Description:	Calculates the distance between two locations in miles or kilometers.
Use:	DISTANCE (mylocation1 , mylocation2 , 'unit') and replace <i>mylocation1</i> and <i>mylocation2</i> with two location fields, or a location field and a value returned by the GEOLOCATION function. Replace <i>unit</i> with mi (miles) or km (kilometers).

Examples:	<p>Distance between two geolocation fields</p> <pre>DISTANCE(warehouse_location__c, store_location__c, 'mi')</pre> <p>This formula returns the distance, in miles, between the warehouse and the store. In this example, <code>warehouse_location__c</code> and <code>store_location__c</code> are the names of two custom geolocation fields.</p> <p>Distance between an address field and a geolocation field</p> <pre>DISTANCE(BillingAddress, store_location__c, 'mi')</pre> <p>This formula returns the distance, in miles, between an account's billing address and a store. In this example, <code>BillingAddress</code> is the standard billing address field on an Account object, and <code>store_location__c</code> is the name of a custom geolocation field.</p> <p>Distance between a custom geolocation field and fixed coordinates</p> <pre>DISTANCE(warehouse_location__c, GEOLOCATION(37.775,-122.418), 'km')</pre> <p>This formula returns the distance, in kilometers, between the warehouse and the known latitude and longitude 37.775°, -122.418° (San Francisco).</p> <p>Distances with conditions</p> <pre>IF(DISTANCE(warehouse_location__c, ShippingAddress, 'mi')<10, "Near", "Far")</pre> <p>This formula updates a text formula field to <code>Near</code> if the distance between the warehouse and the account shipping address compound field is less than 10 miles. Otherwise, it updates the text field to <code>Far</code>.</p> <p> Tip: Although DISTANCE can be calculated in miles or kilometers, the unit is not returned in the calculation. If possible, include the unit of measure in the name of your distance formula field, so users know whether the distance is in miles or kilometers.</p>
------------------	---

Tips:	<ul style="list-style-type: none"> • The DISTANCE function returns a number data type. Distance is always calculated in decimals, even if you're displaying the geolocation notation in degrees, minutes, and seconds in the user interface. Specify the number of decimal places to show when you create a custom field. • The DISTANCE function isn't available in reports, but it can be used in list views. To use DISTANCE in your reports, set up a formula field, and then reference the field in your reports.
--------------	--

- DISTANCE is the only formula function that can use [GEOLOCATION](#) parameters.
- There are limitations on DISTANCE accuracy and equality calculations.
 - DISTANCE supports only the logical operators > and <, returning values within (<) or beyond (>) a specified radius.
 - Distance is calculated as a straight line—as the crow flies—regardless of geography and topography between the two points.

For additional details, see “[How SOQL Calculates and Compares Distances](#)” in the *Force.com SOQL and SOSL Reference*.

EXP

Description: Returns a value for e raised to the power of a number you specify.

Use: EXP (*number*) and replace *number* with a number field or value such as 5.

Example: **Exponent of a Literal Value**

EXP (3)

This formula returns the value of e to the third power.

Compound Interest

Principal__c * EXP(Rate__c * Years__c)

This formula calculates the compound interest based on a custom currency field for principal, custom percent field for rate, and custom number field for years.

FIND

Description: Returns the position of a string within a string of text represented as a number.

Use: FIND (*search_text*, *text* [, *start_num*]) and replace *search_text* with the string you want to find, replace *text* with the field or expression you want to search, and replace *start_num* with the number of the character from which to start searching from left to right.

Example: **Street Address**

FIND (" ", Street) returns the character position of the first space in the *Street* field. You can use this number to find out the length of the street address as a means of separating a street address from street name in an address field.

Deriving Website Addresses

SUBSTITUTE(Email, LEFT(Email, FIND("@", Email)), "www.") finds the location of the @ sign in a person's email address to determine the length of text to replace with a "www." as a means of deriving their website address.

Tips:

- Be sure to remove the brackets, [and], from your formula before validating it.
- If the field referenced in your *text* parameter is blank, the formula field displays 0.
- Your *search_text* parameter is case sensitive and cannot contain any wildcard characters.

- If your search does not return any results, a 0 displays in the field.
- The *start_num* parameter is optional. If you do not enter a *start_num* value, the formula uses the value one, or the first character in the string.
- If your *start_num* is not greater than zero, a 0 displays in the field.
- If your *start_num* is greater than the length of the text, a 0 displays in the field.
- When entering your *start_num* parameter, remember that some fields like the *website* field are unique because a "http://" is automatically appended to the beginning of the text you enter.
- Note that the first character in a string is designated as one rather than zero.

FLOOR

Description: Returns a number rounded down to the nearest integer.

Use: FLOOR (*number*) and replace *number* with a number field or value such as 5.245.

Example: **Commission Amounts**
FLOOR (commission__c) rounds commission down to the nearest integer.

GEOLOCATION

Description: Returns a geolocation based on the provided latitude and longitude. Must be used with the DISTANCE function.

Use: GEOLOCATION (*latitude*, *longitude*) and replace *latitude* and *longitude* with the corresponding geolocation, numerical code values.

Examples: **Distance between a custom geolocation field and fixed coordinates**
DISTANCE (warehouse_location__c, GEOLOCATION (37.775, -122.418), 'km')
This formula returns the distance, in kilometers, between the warehouse and the known latitude and longitude 37.775°, -122.418° (San Francisco).

Tips:

- The GEOLOCATION function returns a location data type that can be used only by, and must be used with, the [DISTANCE](#) function. The GEOLOCATION function doesn't work on its own.

GETRECORDIDS

Description: Returns an array of strings in the form of record IDs for the selected records in a list, such as a list view or related list.

Use: { !GETRECORDIDS (*object_type*) } and replace *object_type* with a reference to the custom or standard object for the records you want to retrieve.

Custom Button Example:

```
{!REQUIRESRIPT ("/soap/ajax/13.0/connection.js")} var records =
    {!GETRECORDIDS($ObjectType.Sample)}; var
newRecords = []; if (records[0] == null) { alert("Please select
at least one row") } else {
    for (var n=0; n<records.length; n++) { var c =
new sforce.SObject("Case"); c.id = records[n]; c.Status = "New";
    newRecords.push(c); } result =
sforce.connection.update(newRecords); window.location.reload(); }
```

In this example, all selected case records are updated with a `Status` of "New." To set this up in your organization, create a custom list button for cases with the following attributes:

- `Display Type` is "List Button"
- `Behavior` is "Execute JavaScript"
- `Content Source` is "OnClick JavaScript"

Paste the sample code above into the content of your custom button. Finally, add the list button to the a page layout that contains the Cases related list, such as accounts or opportunities. Users can select any number of cases in the related list and click the list button to change the status of those cases at once. Notice the check for `records[0] == null`, which displays a message to users when they do not select at least one record in the list.

Tips:

- Use global variables to access special merge fields for s-controls, custom buttons, and links.
- Activities are special types of objects. Use `{!GETRECORDIDS($ObjectType.Task)}` when creating a task list button. Use `{!GETRECORDIDS($ObjectType.Event)}` when creating an event list button.
- This function is only available in custom buttons, links, and s-controls.

GETSESSIONID

Description: Returns the user's session ID.

Use: `GETSESSIONID()`

Example:

```
HYPERLINK
("https://www.myintegration.com?sId=" &
GETSESSIONID() & "?&rowID=" & Name & "action=CreateTask", "Create
a Meeting Request")
```

creates a link to an application outside of Salesforce, passing the parameters so that it can connect to Salesforce via the API and create the necessary event.

HTMLENCODE

Description: Encodes text and merge field values for use in HTML by replacing characters that are reserved in HTML, such as the greater-than sign (>), with HTML entity equivalents, such as `>`.

Use: `{!HTMLENCODE (text)}` and replace *text* with the merge field or text string that contains the reserved characters.

Example: If the merge field `foo__c` contains `Enter the user's name`, `{!HTMLENCODE (foo__c)}` results in: `Enter the user's name`

Tips: This function is only available in custom buttons and links, and in Visualforce.

HYPERLINK

Description: Creates a link to a URL specified that is linkable from the text specified.

Use: `HYPERLINK (url, friendly_name [, target])` and replace `url` with the Web address, replace `friendly_name` with the link text, and, optionally, replace `target` with the window or frame in which to display the content.

Example: **Creating Events**

```
HYPERLINK ("00U/e?
retURL=%2F006x0000001T8Om&what_id="
& Id,
"Create Event")
```

adds a link called "Create Event" that, when clicked, creates a new event that is associated with the current object.

Phone Dialer

`HYPERLINK ("http://servername/call?id=" & Id & "&phone=" & Phone, Phone)` creates a linkable phone number field that automatically dials the phone number when clicked. In this example, replace "servername" and "call" with the name of your dialing tool and the command it uses to dial. The merge field, `Id`, inserts the identifier for the contact, lead, or account record. The first `Phone` merge field tells the dialing tool what number to call and the last `Phone` merge field uses the value of the `Phone` field as the linkable text the user clicks to dial.

Tips:

- Hyperlink formula fields are of type text.
- Include the protocol and URL in quotes as in `HYPERLINK ("http://www.cnet.com", "cnet")`.
- Avoid using text functions such as `LEN`, `LEFT`, or `RIGHT` on `HYPERLINK` function results.
- When linking to Salesforce pages, use a relative link, such as `"00U/e?retURL=%..."`, for hyperlink formulas unless you want to add the formula field to a search layout. Use the complete URL, including the server name and `https://`, in a hyperlink formula to add it to a search layout. Note that formula fields are not available in search result layouts.
- Use the `$Api` variable to reference API URLs.
- Be sure to remove the brackets, `[` and `]`, from your formula before validating it.
- The `target` parameter is optional. If you do not specify a `target`, the link opens in a new browser window. Some common `target` parameters are:

blank

Displays link in a new unnamed window.

_self

Displays link in the same frame or window as the element that refers to it.

_parent

Displays link in the immediate frameset parent of the current frame. This value is the same as `_self` if the current frame has no parent.

_top

Displays link in the full original window, canceling any other frames. This value is the same as `_self` if the current frame has no parent.

For more information on basic HTML tags, consult an HTML reference on the Internet.

- The HYPERLINK function is available everywhere that you can define a formula except default values, field updates, s-controls, validation rules, approval processes, custom buttons and links, and workflow rules.

SEE ALSO:

[Formula Operators and Functions I–Z](#)

[Formula Operators and Functions](#)

Formula Operators and Functions I–Z

Use the following operators and functions when building formulas. Click on the name of the operator or function below to view more details. All functions are available everywhere that you can include a formula such as formula fields, validation rules, approval processes, and workflow rules, unless otherwise specified.

 **Note:** Extraneous spaces in the samples below are ignored.

IF

Description: Determines if expressions are true or false. Returns a given value if true and another value if false.

Use: `IF(logical_test, value_if_true, value_if_false)` and replace *logical_test* with the expression you want evaluated; replace *value_if_true* with the value you want returned if the expression is true; replace *value_if_false* with the value you want returned if the expression is false.

Formula Field Example: **Overdue Payments**

```
IF(AND(Payment_Due_Date__c < TODAY(), Payment_Status__c = "UNPAID"), "PAYMENT OVERDUE", null)
```

This formula determines if the payment due date is past and the payment status is "UNPAID." If so, returns the text "PAYMENT OVERDUE" and if not, leaves the field blank. This example uses a custom date field called `Payment Due Date` and a text custom field called `Payment Status`.

Insert Tax Rate

Use this default value formula to set the tax rate of an asset based on the user's city. Create a custom percent field with the following default value:

```
IF($User.City = "Napa", 0.0750,
  IF($User.City = "Paso Robles", 0.0725,
    IF($User.City = "Sutter Creek", 0.0725,
      IF($User.City = "Los Olivos", 0.0750,
        IF($User.City = "Livermore", 0.0875, null
      )
    )
  )
)
```

Custom Button Example:

```
{!
IF(Sample.BillingCountry = "US",
"http://maps.google.com/maps?q="&Sample.BillingStreet&
+"&Sample.BillingCity+"&Sample.BillingState+"&
"&Sample.BillingCountry,
(IF(Sample.BillingCountry = "UK",
"http://maps.google.co.uk/maps?q="&Sample.BillingStreet
&+"&Sample.BillingCity+"&Sample.BillingCountry,
"http://maps.google.com")))
}
```

This example uses the IF function to determine if an address is in the United States or United Kingdom so that it can use the appropriate type of Google map to display the address.

Tips:

- Make sure your *value_if_true* and *value_if_false* expressions are the same data type.
- When using an IF function with the \$Profile.UserType variable to determine the type of Salesforce user license the logged in user has, use the following values:
 - Standard for Salesforce
 - PowerPartner for PRM User
 - CustomerSuccess for Customer Portal User
 - PowerCustomerSuccess for Customer Portal Manager

For example, use the following formulas to determine if the logged in user has the license type in quotes:

```
IF(ISPICKVAL($Profile.UserType , "Standard"), 100, 0.1)
```

```
IF(ISPICKVAL($Profile.UserType , "PowerPartner"), 100, 0.1)
```

```
IF(ISPICKVAL($Profile.UserType , "CustomerSuccess"), 100, 0.1)
```

 **Note:** \$Profile merge fields are only available in Enterprise, Unlimited, Performance, and Developer Editions.

IMAGE

Description: Inserts an image with alternate text and height/width specifications.

Use: `IMAGE (image_url, alternate_text, height, width)` and replace *image_url* with the full path to the image; replace *alternate_text* with the string of text you want to appear when the image can't be rendered for some reason, and which can be used by screen reader software; replace *height* with the vertical size of the image in pixels; replace *width* with the horizontal size of the image in pixels.

Example:

```
HYPERLINK ("ymsgr:sendIM?" & Yahoo_Name__c,
IMAGE ("http://opi.yahoo.com/online?u=" & Yahoo_Name__c &
"&m;=g&t;=0", "Yahoo"))
```

This formula displays a clickable Yahoo! Messenger icon indicating if the person is logged on to the service. Users can click the icon to launch a Yahoo! Messenger conversation with the person. This example uses a custom text field called `Yahoo Name` on contacts where you can store the contact's Yahoo! Messenger ID.

Tips:

- The *height* and *width* parameters are optional.
- Use a text string to replace the *image_url* and *alternate_text* parameters. Surround each text string in quotes.
- Use numbers to replace the *height* and *width* parameters.
- Add images to your Documents tab if you want to display them elsewhere. For example, store the image of a product in a document folder, copy the URL to the document, and paste that URL in the *image_url* parameter of a formula field on the Products tab.
- If you use Internet Explorer, you may need to change your security settings so that it does not display a warning prompt when images use HTTP protocol. See the online help for Internet Explorer for instructions on changing your security settings.
- The IMAGE function cannot include the GETSESSIONID function as one of its arguments.
- The IMAGE function is available only in formula fields and email templates.

INCLUDE

Description: Returns content from an s-control snippet. Use this function to reuse common code in many s-controls.

Use: `{ ! INCLUDE (source, [inputs]) }` and replace *source* with the s-control snippet you want to reference. Replace *inputs* with any information you need to pass to the snippet.

S-Control Example: **Including Header Snippet**

```
<html> <body> { ! INCLUDE ($SControl.Header_Snippet, [title = "My
Title",
                        theme = "modern"]) } </body> </html>
```

This example references a snippet that provides a header for a page that you created to display in a Web tab. It displays the page title "My Title." Use the `$$Control` global variable to reference a custom s-control.

Including Input Parameters

Use the following two examples to see how you can create a reusable snippet and include it in an s-control.

```
<h2
                class="{!$Request.titleTheme}.title">
{!$Request.titleText}</h2>
```

This snippet requires two input parameters: *titleTheme* and *titleText*. It is a reusable HTML tag that presents a page title and theme based on input parameters. Next, create an s-control that includes this snippet:

```
<html> <head> </head> <body> {!
                INCLUDE($SControl.Title_Snippet, [titleTheme =
"modern", titleText = "My Sample Title"]) } ... Insert your page
specific content
                here ... </body> </html>
```

This s-control uses the snippet titled *Title_Snippet* to display the title of the page "My Sample Title" and modern theme. Replace *Insert your page specific content here* with your own HTML content and use the s-control as the source of a Web tab to create your own pages in Salesforce.

Tips:

- Because this function references an s-control snippet and does not copy it, it always runs the latest content of the s-control snippet. Remember when making a change to your s-control snippet that it affects all [INCLUDE](#) functions that refer to it.
 - Use the `$Request` global variable to access any information inside the snippet.
 - This function is only available in custom buttons, links, and s-controls.
-

INCLUDES

Description:

Determines if any value selected in a multi-select picklist field equals a text literal you specify.

Use:

`INCLUDES(multiselect_picklist_field, text_literal)` and replace *multiselect_picklist_field* with the merge field name for the multi-select picklist; and replace *text_literal* with the multi-select picklist value you want to match in quotes.

Examples:

`INCLUDES(Hobbies__c, "Golf")` returns TRUE if one of the selected values in the *Hobbies* custom multi-select picklist field is Golf.

Tips:

- The *text_literal* expression must be of type text and enclosed in quotes. It cannot be a merge field or the result of a function.
- Salesforce returns an error if any of the following occurs:
 - You do not provide a *text_literal* expression.
 - You provide an empty *text_literal* expression, such as "" or " ".
- Use [ISBLANK](#) to determine if a multi-select picklist field is empty.

- Use the PRIORVALUE function inside the INCLUDES function to check if the previous value of a multi-select picklist field included a specific value. For example:

```
INCLUDES (
    PRIORVALUE (multiselect_picklist_field),
    text_literal
)
```

ISBLANK

Description: Determines if an expression has a value and returns TRUE if it does not. If it contains a value, this function returns FALSE.

Use: ISBLANK (*expression*) and replace *expression* with the expression you want evaluated.

Example:

```
(IF(ISBLANK(Maint_Amount__c), 0, 1) +
IF(ISBLANK(Services_Amount__c), 0, 1) +
IF(ISBLANK(Discount_Percent__c), 0, 1) +
IF(ISBLANK(Amount), 0, 1) +
IF(ISBLANK(Timeline__c), 0, 1)) / 5
```

This formula takes a group of fields and calculates what percent of them are being used by your personnel. This formula field checks five fields to see if they are blank. If so, a zero is counted for that field. A "1" is counted for any field that contains a value and this total is divided by five (the number of fields evaluated). Note that this formula requires you select the **Treat blank fields as blanks** option under Blank Field Handling while the Advanced Formula subtab is showing.

Tips:

- Use ISBLANK instead of ISNULL in new formulas. ISBLANK has the same functionality as ISNULL, but also supports text fields. Salesforce will continue to support ISNULL, so you do not need to change any existing formulas.
- A field is not empty if it contains a character, blank space, or zero. For example, a field that contains a space inserted with the spacebar is not empty.
- Use the [BLANKVALUE](#) function to return a specified string if the field does not have a value; use the [ISBLANK](#) function if you only want to check if the field has a value.
- If you use this function with a numeric field, the function only returns TRUE if the field has no value and is not configured to treat blank fields as zeroes.

ISCHANGED

Description: Compares the value of a field to the previous value and returns TRUE if the values are different. If the values are the same, this function returns FALSE.

Use: ISCHANGED (*field*) and replace *field* with the name of the field you want to compare.

Validation Rule Example: The following validation rule prevents users from changing an object name after it has been created:
`NOT (ISCHANGED (Name)) .`

`NOT (AND (ISCHANGED (Priority) , ISPICKVAL (Priority, "Low")))` is a validation rule that ensures if a user changes the `Priority` of a case, the new priority cannot be "Low."

`NOT (AND (ISCHANGED (CloseDate) , OR (MONTH (CloseDate) <> MONTH (TODAY ()) , YEAR (CloseDate) <> YEAR (TODAY ()) , $Profile.Name <> "Sales Manager")))` is a validation rule that prevents a user from changing the `Close Date` of an opportunity to a date outside of the current month and year unless that user has the "Sales Manager" profile.

 **Note:** \$Profile merge fields are only available in Enterprise, Unlimited, Performance, and Developer Editions.

Tips:

- This function is available only in:
 - Assignment rules
 - Validation rules
 - Field updates
 - Workflow rules if the evaluation criteria is set to `Evaluate the rule when a record is: created, and every time it's edited.`
 - Formula criteria for executing actions in the Process Builder.
 - Use the NOT function to reverse the return values of TRUE and FALSE.
 - This function returns FALSE when evaluating any field on a newly created record.
 - If a text field was previously blank, this function returns TRUE when it contains any value.
 - For number, percent, or currency fields, this function returns TRUE when:
 - The field was blank and now contains any value
 - The field was zero and now is blank
 - The field was zero and now contains any other value
-

ISNEW

Description: Checks if the formula is running during the creation of a new record and returns TRUE if it is. If an existing record is being updated, this function returns FALSE.

Use: `ISNEW ()`

Validation Rule Example: Use the following validation rule to prevent users from creating a record with a close date in the past. `AND (ISNEW () , CloseDate < TODAY ())` checks if the user is creating a new opportunity and, if so, ensures that the `Close Date` is today or after today.

Use this validation rule to ensure users add at least one product to an opportunity after they have created it.

```
NOT (OR ( ISNEW ( ) , HasOpportunityLineItem ) )
```

In this example, the validation rule formula displays the following error message when an existing opportunity does not have any products: "You must add products to this opportunity before saving." This does not display an error on the initial save because they cannot add products until after saving the record initially; but it prevents them from resaving or closing an opportunity that does not contain products.

Tips:

- This function is available only in validation rules, field updates, workflow rules, assignment rules, and Process Builder formula criteria.
- Use the NOT function to reverse the return values of TRUE and FALSE.
- This function always returns FALSE when used in a workflow rule with a time-based trigger.
- This function always returns FALSE when used in a field update for an approval action.

ISNULL

 **Important:** Use ISBLANK instead of ISNULL in new formulas. ISBLANK has the same functionality as ISNULL, but also supports text fields. Salesforce will continue to support ISNULL, so you do not need to change any existing formulas.

Description:

Determines if an expression is null (blank) and returns TRUE if it is. If it contains a value, this function returns FALSE.

Use:

ISNULL (***expression***) and replace *expression* with the expression you want evaluated.

Example:

```
(IF(ISNULL(Maint_Amount__c), 0, 1) +
IF(ISNULL(Services_Amount__c), 0, 1) +
IF(ISNULL(Discount_Percent__c), 0, 1) +
IF(ISNULL(Amount), 0, 1) +
IF(ISNULL(Timeline__c), 0, 1)) / 5
```

This formula takes a group of fields and calculates what percent of them are being used by your personnel. This formula field checks five fields to see if they are blank. If so, a zero is counted for that field. A "1" is counted for any field that contains a value and this total is divided by five (the number of fields evaluated). Note that this formula requires you select the **Treat blank fields as blanks** option under Blank Field Handling while the Advanced Formula subtab is showing.

Validation Rule Example:

```
AND(ISPICKVAL(StageName, "Closed Won"),
ISNULL(Project_Start_Date__c))
```

This validation rule makes the **Project Start Date** custom date field conditionally required whenever the stage is "Closed Won."

Tips:

- Text fields are never null, so using this function with a text field always returns false. For example, the formula field `IF(ISNULL(new__c) 1, 0)` is always zero regardless of the value in the **New** field. For text fields, use the ISBLANK function instead.
- Multi-select picklist fields are never null in s-controls, buttons, and email templates, so using this function with a multi-select picklist field in those contexts always returns false.
- Empty date and date/time fields always return true when referenced in ISNULL functions.
- Don't use ISNULL for date/time fields.

- Choose `Treat blank fields as blanks` for your formula when referencing a number, percent, or currency field in an ISNULL function. Choosing `Treat blank fields as zeroes` gives blank fields the value of zero so none of them will be null.
- Merge fields can be handled as blanks, which can affect the results of components like s-controls because they can call this function.
- When using a validation rule to ensure that a number field contains a specific value, use the ISNULL function to include fields that do not contain any value. For example, to validate that a custom field contains a value of '1', use the following validation rule to display an error if the field is blank or any other number:

```
OR(ISNULL(field__c), field__c<>1)
```

ISNUMBER

Description: Determines if a text value is a number and returns TRUE if it is. Otherwise, it returns FALSE.

Use: ISNUMBER (*text*) and replace *text* with the merge field name for the text field.

Validation Rule Example:

```
OR(LEN(Bank_Account_Number__c) <> 10,
NOT(ISNUMBER(Bank_Account_Number__c)))
```

This validation rule ensures a custom text field called `Bank Account Number` is a number of 10 digits and is not blank.

Tips:

- This function returns FALSE for blank values.
- The ISNUMBER function is not aware of your locale. For example, ISNUMBER ("123,12") and ISNUMBER ("1 000") return FALSE even if the user's locale is "French."
- Chinese, Japanese, Korean, and special characters including a space return FALSE.
- The ISNUMBER function returns TRUE for scientific formatting such as "2E2" or "123.123."

ISPICKVAL

Description: Determines if the value of a picklist field is equal to a text literal you specify.

Use: ISPICKVAL (*picklist_field*, *text_literal*) and replace *picklist_field* with the merge field name for the picklist; replace *text_literal* with the picklist value in quotes. *text_literal* cannot be a merge field or the result of a function.

Examples:

Contract Activation

IF(ISPICKVAL(Status, "Activated"), NOW()-ActivatedDate, null) calculates the number of days since the contract was activated. If the contract status is not "Activated," this field is blank.

Commission Amounts

```
IF(ISPICKVAL(StageName, "Closed Won"),
  ROUND(Amount *0.02, 2), 0)
```

This example calculates the commission amount for any opportunity that has a "Closed Won" stage. The value of this field will be the amount times 0.02 for any closed/won opportunity. Open or lost opportunities will have a zero commission value.

Competitor-Triggered Workflow

```
ISPICKVAL(Stage, "Closed Lost") && INCLUDES(Competitor__c, "Acme")
```

In a workflow rule or the Process Builder, this formula configures Salesforce to trigger the associated actions if the `Competitor` multi-select picklist field on a lost business is Acme.

Tips:

- Replace `picklist_field` with a custom or standard field of type picklist.
- Your `text_literal` expression must be of type text and enclosed in quotes. It cannot be a merge field or the result of a function.
- Use `CASE` functions to determine if a picklist value is equal to a particular value.
- When using the `ISPICKVAL` function to return the previous value of a picklist field, include the `PRIORVALUE` function inside the `ISPICKVAL` function as in this example:

```
ISPICKVAL(PRIORVALUE
(picklist_field),
text_literal)
```

JSENCODE**Description:**

Encodes text and merge field values for use in JavaScript by inserting escape characters, such as a backslash (\), before unsafe JavaScript characters, such as the apostrophe (').

Use:

{ !JSENCODE (*text*) } and replace *text* with the merge field or text string that contains the unsafe JavaScript characters.

Example:

If the merge field `foo__c` contains `Enter the user's name`,
 { !JSENCODE (`foo__c`) } results in: `\u003CB\u003EEnter the user\'s name\u003C\/b\u003E`

Tips:

This function is only available in custom buttons and links, and in Visualforce.

JSINHTMLENCODE**Description:**

Encodes text and merge field values for use in JavaScript inside HTML tags by replacing characters that are reserved in HTML with HTML entity equivalents and inserting escape characters before unsafe JavaScript characters. `JSINHTMLENCODE (someValue)` is a convenience function that is equivalent to `JSENCODE (HTMLENCODE ((someValue)))`. That is, `JSINHTMLENCODE` first encodes *someValue* with `HTMLENCODE`, and then encodes the result with `JSENCODE`.

Use: `{ !JSINHTMLLENCODE (text) }` and replace *text* with the merge field or text string that contains the unsafe JavaScript characters.

Example: If the merge field `foo__c` contains `Enter the user's name`, `{ !JSINHTMLLENCODE (foo__c) }` results in: `Enter the user's name`

Tips:

- This function is only available in custom buttons and links, and in Visualforce.

LEFT

Description: Returns the specified number of characters from the beginning of a text string.

Use: `LEFT (text, num_chars)` and replace *text* with the field or expression you want returned; replace *num_chars* with the number of characters from the left you want returned.

Example: `TRIM(LEFT(LastName, 5)) & "-" & TRIM(RIGHT(SSN__c, 4))`
This formula displays the first five characters of a name and the last four characters of a social security number separated by a dash. Note that this example uses a text custom field called `SSN`.

Tips:

- Reference auto-number fields as text fields in formulas.
- If the *num_chars* value is less than zero, Salesforce replaces the value with zero.

LEN

Description: Returns the number of characters in a specified text string.

Use: `LEN (text)` and replace *text* with the field or expression whose length you want returned.

Example: `LEN (PartNumber__c)`
This formula returns the number of characters in a `Product Code` field.

LINKTO

Description: Returns a relative URL in the form of a link (href and anchor tags) for a custom s-control or Salesforce page.

Use: `{ !LINKTO (label, target, id, [inputs], [no override]) }` and replace *label* with the text for the link, *target* with the URL, and *id* with a reference to the record. Inputs are optional and can include any additional parameters you want to add to the link. The *no override* argument is also optional and defaults to "false." It applies to targets for standard Salesforce pages such as `$Action.Account.New`. Replace *no override* with "true" when you want to display a standard Salesforce page regardless of whether you have defined an override for it elsewhere.

S-Control Example:**New Account S-Control**

```
<html> <body> {!LINKTO("Create a New Account",
                        $Action.Account.New, $ObjectType.Account)}
</body> </html>
```

This example allows users to click a link to create a new account. It is useful in account list views or Web tabs where you want users to create an account directly from that page. Use the `$Action` global variable to access the new account page in Salesforce.

New Email Window S-Control

```
<html>
<body>
  {!LINKTO("Email link",
           "mailto:support@yourcompany.com?subject=Please%20Help")};
</body>
</html>
```

This example launches a new email window addressed to `support@yourcompany.com` with the subject "Please Help" whenever a user clicks "Mail link."

Link to Another S-Control

```
<html>
<body>
  {!LINKTO("Check for duplicates",
           $Scontrol.dedup_account, Account.Id)}
</body>
</html>
```

Use this example to generate a page containing a hyperlink labeled "Check for duplicates." When users click this link, Salesforce runs your custom s-control. This example assumes you have already created a custom s-control to find duplicate accounts and merge their information.

Tips:

- Avoid using this function in an inline s-control if you want it to open in a new window.
- Enclose multiple *inputs* in brackets to indicate they are together:

```
{!LINKTO("View Case", $Action.Case.View, Case.Id, [parm1="A",
parm2="B"])} 
```

- Set *inputs* to null if you do not have any to pass yet you want to set the *no override* argument:

```
{!LINKTO("View Case", $Action.Case.View, Case.Id, null, true)}
```

- When you override the tab home page for a standard or custom tab, set *target* to the "Tab" `$Action` global variable and *id* to the object type. For example, `LINKTO("Accounts Tab", $Action.Account.Tab, $ObjectType.Account)`
- This function is only available in custom buttons, links, and s-controls.

LN

Description:	Returns the natural logarithm of a specified number. Natural logarithms are based on the constant e value of 2.71828182845904.
Use:	LN (<i>number</i>) and replace <i>number</i> with the field or expression for which you want the natural logarithm. Note: the LN function is the inverse of the EXP function.
Example:	LN (10) returns the natural logarithm of 10, which is 2.30. LN (Value__c) returns the natural logarithm of a custom number field called Value.

LOG

Description:	Returns the base 10 logarithm of a number.
Use:	LOG (<i>number</i>) and replace <i>number</i> with the field or expression from which you want the base 10 logarithm calculated.
Example:	<p>Salary</p> <p>LOG (Salary__c) calculates the logarithm of a person's salary. In this example, Salary is a custom currency field.</p> <p>Hydrogen</p> <p>-LOG (Hydrogen__c) calculates the pH and acidity using the LOG function and a custom number field called Hydrogen, which represents the concentration of Hydrogen ions in the liquid measured in moles per liter.</p>

LOWER

Description:	Converts all letters in the specified text string to lowercase. Any characters that are not letters are unaffected by this function. Locale rules are applied if a locale is provided.
Use:	LOWER (<i>text</i> , [<i>locale</i>]) and replace <i>text</i> with the field or text you wish to convert to lowercase, and <i>locale</i> with the optional two-character ISO language code or five-character locale code, if available.
Example:	<p>MYCOMPANY.COM</p> <p>LOWER ("MYCOMPANY.COM") returns "mycompany.com."</p> <p>Ticker Symbol</p> <p>LOWER (TickerSymbol) returns the text in Ticker Symbol in lower case characters.</p> <p>Applying Turkish Language Locale Rules</p> <p>The Turkish language has two versions of the letter i: one dotted and one dotless. The locale rules for Turkish require the ability to capitalize the dotted i, and allow the dotless I to be lowercase. To correctly use the LOWER () function with the Turkish language locale, use the Turkish locale code <i>tr</i> in the LOWER () function as follows:</p> <p>LOWER (<i>text</i>, "tr")</p>

This ensures that Salesforce does not transform any dotted i in the *text* to a dotless i.

LPAD

Description: Inserts characters you specify to the left-side of a text string.

Use: `LPAD (text, padded_length [, pad_string])` and replace the variables:

- *text* is the field or expression you want to insert characters to the left of.
- *padded_length* is the number of total characters in the text that will be returned.
- *pad_string* is the character or characters that should be inserted. *pad_string* is optional and defaults to a blank space.

If the value in *text* is longer than *pad_string*, *text* is truncated to the size of *padded_length*.

Example:

Field Name: Padding

`LPAD (Name, 20)` truncates the *Name* field after 20 characters. For example, if the name is `mycompany.com`, the value returned is "mycompany.com."

My_Company: No Change

`LPAD ('my_company.com', 14, 'z')` returns "my_company.com" without change because it has 14 characters.

Field Name Padded with Z

`LPAD (Name, 15, 'z')` returns the name "zmycompany.com."

Field Name: Truncating

`LPAD (Name, 2)` truncates the name after the second character. For example, if the name is `mycompany.com`, the value returned is "my."

Tips: Leading blank spaces and zeros are omitted.

MAX

Description: Returns the highest number from a list of numbers.

Use: `MAX (number, number, ...)` and replace *number* with the fields or expressions from which you want to retrieve the highest number.

Example:

Service Charge

`MAX (0.06 * Total_Cost__c, Min_Service_Charge__c)`

In this example, the formula field calculates a service charge of 6% of the total cost or a minimum service charge, whichever is greater. Note that *Min Service Charge* is a custom currency field with a [default value](#) of \$15. However, you could make it a formula field if your minimum service charge is always the same amount.

Book Royalties

```
MAX(0.10 * Pages__c,
    (Retail_Price__c * 0.07) * Total_Sold__c)
```

This formula determines which amount to pay in royalties for a book. It displays the greater of two amounts: \$0.07 for each book sold or \$0.10 per page. It assumes you have custom number fields for `Pages` and `Total Sold` and a custom currency field for `Retail Price`.

Commissions

```
MAX($User.Commission_Percent__c * Price,
    Price * Account_Discount__c, 100)
```

This formula determines what commission to log for an asset based on which is greater: the user's commission percentage of the price, the price times the discount percent stored for the account or 100 dollars. This example assumes you have two custom percent fields on users and assets.

MID

Description: Returns the specified number of characters from the middle of a text string given the starting position.

Use: `MID(text, start_num, num_chars)` and replace `text` with the field or expression to use when returning characters; replace `start_num` with the number of characters from the left to use as a starting position; replace `num_chars` with the total number of characters to return.

Example: `MID(Division, 3, 4)` returns four characters of the `Division` name beginning with the third character from the left. On a user record, this represents the department code.

MIN

Description: Returns the lowest number from a list of numbers.

Use: `MIN(number, number, ...)` and replace `number` with the fields or expressions from which you want to retrieve the lowest number.

Example: **401K Matching**

```
MIN(250, Contribution__c / 2)
```

This example formula determines which amount to provide in employee 401K matching based on a matching program of half of the employee's contribution or \$250, whichever is less. It assumes you have custom currency field for `Contribution`.

Bonus

```
MIN(Gross__c * Bonus_Percent__c,
    Performance__c / Number_of_Employees__c)
```

This example determines an employee's bonus amount based on the smallest of two amounts: the employee's gross times bonus percent or an equally divided amount of the company's performance amount among all employees. It assumes you have custom number field for `Number of`

Employees, a custom percent field for Bonus Percent, and currency custom fields for the employee's Gross and company's Performance.

MOD

Description: Returns a remainder after a number is divided by a specified divisor.

Use: MOD (*number*, *divisor*) and replace *number* with the field or expression you want divided; replace *divisor* with the number to use as the divisor.

Example: MOD (3, 3) returns 0
 MOD (4, 3) returns 1
 MOD (123, 100) returns 23

You may want to prevent users from scheduling meetings on a Saturday or Sunday. Use the following example to apply a validation rule to a custom date field called My Date.

```
CASE (MOD (My_Date__c - DATE (1900, 1, 7), 7),
0, 0,
6, 0,
1) = 0
```

This example displays the following error message when the value of My Date is not Monday through Friday: "My Date is not a weekday."

MONTH

Description: Returns the month, a number between 1 (January) and 12 (December) in number format of a given date.

Use: MONTH (*date*) and replace *date* with the field or expression for the date containing the month you want returned.

Example: **SLA Expiration**
 MONTH (SLAExpirationDate__c) returns the month that your service-level agreement expires. This example uses a custom date field called SLA Expiration Date.

Current Month
 MONTH (TODAY ()) returns the current month in a number format. For example, the month of February would be the value "2."

NOT

Description: Returns FALSE for TRUE and TRUE for FALSE.

Use: NOT (*logical*) and replace *logical* with the expression that you want evaluated.

Example: `IF(NOT(ISPICKVAL(Status, "Closed")), ROUND(NOW()-CreatedDate, 0), null)` checks to see if a variable is open and if so, calculates the number of days it has been open by subtracting the date and time created from the current date and time. The result is the number of days open rounded to zero decimal places. If the variable is not open, this field is blank.

NOW

Description: Returns a date/time representing the current moment.

Use: `NOW()`

Example: `IF(ISPICKVAL(Status, "Open"), ROUND(NOW()-CreatedDate, 0), null)`
 This formula checks to see if a lead is open and if so, calculates the number of days it has been open by subtracting the date and time created from the current date and time. The result is the number of days open rounded to zero decimal places. If the lead is not open, this field is blank.

Tips:

- Do not remove the parentheses.
 - Keep the parentheses empty. They do not need to contain a value.
 - Use a date/time field in a NOW function instead of a date field. `Created Date` and `Last Modified Date` are date/time fields whereas `Last Activity Date` is a date field.
 - Use `TODAY` if you prefer to use a date field.
 - Dates and times are always calculated using the user's time zone.
 - Use addition and subtraction operators with a NOW function and other date/time fields to return a number, representing number of days. For example `NOW() - CreatedDate` calculates the number of days since the created date of a record. In this example, the formula field data type is a number.
 - Use addition and subtraction operators with a NOW function and numbers to return a date and time. For example `NOW() +5` calculates the date and time five days ahead of now. In this example, the formula field data type is a date/time.
-

NULLVALUE

 **Important:** Use `BLANKVALUE` instead of `NULLVALUE` in new formulas. `BLANKVALUE` has the same functionality as `NULLVALUE`, but also supports text fields. Salesforce will continue to support `NULLVALUE`, so you do not need to change existing formulas.

Description: Determines if an expression is null (blank) and returns a substitute expression if it is. If the expression is not blank, returns the value of the expression.

Use: `NULLVALUE(expression, substitute_expression)` and replace *expression* with the expression you want to evaluate; replace *substitute_expression* with the value you want to replace any blank values.

Example: `(NULLVALUE(Sample_Due_Date__c, StartDate +5))`
 This formula returns the date five days after the start date whenever `Sample Due Date` is blank. `Sample Due Date` is a custom date field.

Tips:

- Avoid using this function with text fields because they are never null even when they are blank. Instead, use the [BLANKVALUE](#) function to determine if a text field is blank.
- Don't use [NULLVALUE](#) for date/time fields.
- Choose `Treat blank fields as blanks` for your formula when referencing a number, percent, or currency field in a [NULLVALUE](#) function. Choosing `Treat blank fields as zeroes` gives blank fields the value of zero so none of them will be null.
- Use the same data type for both the *expression* and *substitute_expression*.

OR

Description:

Determines if expressions are true or false. Returns TRUE if any expression is true. Returns FALSE if all expressions are false. Use this function as an alternative to the operator `||` ([OR](#)).

Use:

OR (*logical1*, *logical2*...) and replace any number of logical references with the expressions you want evaluated.

Formula Field Example:

```
IF(OR(ISPICKVAL(Priority, "High"), ISPICKVAL(Status, "New")),
ROUND(NOW()-CreatedDate, 0), null)
```

This formula returns the number of days a case has been open if the `Status` is new or the `Priority` is high. If the case was opened today, this field displays a zero.

Validation Rule Example:

```
OR(Sample_Rate__c < 0, Sample_Rate__c > 0.40)
```

This validation rule formula displays the following error message when the `Sample Rate` custom field is not between 0 and 40%: "SampleRate cannot exceed 40%."

PARENTGROUPVAL

Description:

This function returns the value of a specified parent grouping. A "parent" grouping is any level above the one containing the formula. You can only use this function in custom summary formulas for reports.

Use:

Summary and Joined: PARENTGROUPVAL(summary_field, grouping_level)

Matrix: PARENTGROUPVAL(summary_field, parent_row_grouping, parent_column_grouping)

Where `summary_field` is the summarized field value, `grouping_level` is the parent level for summary reports, and `parent_row_level` and `parent_column_level` are the parent levels for matrix reports.

Example:

```
TOTAL_PRICE:SUM/PARENTGROUPVAL(TOTAL_PRICE:SUM, GRAND_SUMMARY)
```

This formula calculates, for each product, its relative size compared to the grand total. In this example, the report is a summary of opportunities and their products, grouped by `Product Name`.

PREVGROUPVAL

Description: This function returns the value of a specified previous grouping. A “previous” grouping is one that comes before the current grouping in the report. Choose the grouping level and increment. The increment is the number of columns or rows before the current summary. The default is 1; the maximum is 12. You can only use this function in custom summary formulas for reports.

Use:

```
PREVGROUPVAL(summary_field, grouping_level [, increment])
```

Where `summary_field` is the name of the grouped row or column, `grouping_level` is the summary level, and `increment` is the number of rows or columns previous.

Example:

```
AMOUNT:SUM - PREVGROUPVAL (AMOUNT:SUM, CLOSE_DATE)
```

This formula calculates, for each month, the difference in amount from the previous month shown in the report. In this example, the report is an opportunity matrix with columns grouped by Close Date and rows by Stage.

PRIORVALUE

Description: Returns the previous value of a field.

Use:

```
PRIORVALUE (field)
```

Validation Rule Example:

The following validation rule prevents users from changing the expected revenue of an opportunity after it is closed: `AND (PRIORVALUE (Amount) > Amount, IsClosed)`.

Tips:

- This function is available only in:
 - Assignment rules
 - Validation rules
 - Field updates
 - Workflow rules if the evaluation criteria is set to `Evaluate the rule when a record is: created`, and every time it's edited.
 - Formula criteria for executing actions in the Process Builder.
- This function does not return default values.
- When users create a new record, this function returns the value of the *field* referenced rather than null. For example, if you create an account named “Acme,” `PRIORVALUE (Account.Name)` returns Acme.
- When using the `ISPICKVAL` function to return the previous value of a picklist field, include the `PRIORVALUE` function inside the `ISPICKVAL` function as in this example:

```
ISPICKVAL (PRIORVALUE
(picklist_field),
text_literal)
```

- Use the PRIORVALUE function inside the INCLUDES function to check if the previous value of a multi-select picklist field included a specific value. For example:

```
INCLUDES (
  PRIORVALUE (multiselect_picklist_field),
  text_literal
)
```

REGEX

Description:

Compares a text field to a regular expression and returns TRUE if there is a match. Otherwise, it returns FALSE. A regular expression is a string used to describe a format of a string according to certain syntax rules.

Use:

REGEX (*text*, *regex_text*) and replace *text* with the text field, and *regex_text* with the regular expression you want to match.

Validation Rule Example:

This example ensures that a custom field called SSN matches a regular expression representing a valid social security number format of the form 999-99-9999.

```
NOT (
  OR (
    LEN (SSN__c) = 0,
    REGEX (SSN__c, "[0-9]{3}-[0-9]{2}-[0-9]{4}")
  )
)
```

Tips:

- Regular expression syntax is based on [Java Platform SE 6 syntax](#). However, backslash characters (\) must be changed to double backslashes (\\) because backslash is an escape character in Salesforce.
- The Salesforce regular expression engine matches an entire string as opposed to searching for a match within a string. For example, if you are searching for the name Marc Benioff, use the regular expression, `.*Marc Benioff.*`, to find a match in a string like the following:

```
According to Marc Benioff, the social enterprise increases
customer success.
```

If you use the regular expression, `Marc Benioff`, the only string that this regular expression will match is:

```
Marc Benioff
```

- Capture groups and substitutions are ignored.
 - This function is available everywhere formulas exist except formula fields and custom buttons and links.
-

REQUIRESCRIPT

Description: Returns a script tag with source for a URL you specify. Use this function when referencing the Force.com AJAX Toolkit or other JavaScript toolkits.

Use: `{!REQUIRESCRIPT(url)}` and replace *url* with the link for the script that is required.

For the AJAX Toolkit:

```
{!requireScript("/soap/ajax/13.0/connection.js")}
```

Returns:

```
<script src="/soap/ajax/13.0/connection.js"></script>
```

Custom Button Example:

```
{!REQUIRESCRIPT("/soap/ajax/13.0/connection.js")}
var c = new sforce.SObject("Case");
c.id = "{!Case.Id}";
c.Status = "New";
result = sforce.connection.update([c]);
window.location.reload();
```

This example sets the `Status` of a case to "New" whenever a user clicks a custom button from the case detail page. To set this up in your organization, define a custom button for cases that has the following attributes:

- `Display Type` is "Detail Page Button"
- `Behavior` is "Execute JavaScript"
- `Content Source` is "OnClick JavaScript"

Next, paste the content above into your custom button definition and add it to your case page layouts.

Tips:

- Use global variables to access special merge fields for s-controls.
- Use this function when creating custom buttons or links where you have set the `Behavior` to "Execute JavaScript" and `Content Source` to "OnClick JavaScript" because the script tag should be outside the OnClick code.
- This function is only available for custom buttons and links that have `Content Source` set to "OnClick JavaScript."
- When working in Visualforce, use `INCLUDESCRIPT` instead.

RIGHT

Description: Returns the specified number of characters from the end of a text string.

Use: `RIGHT(text, num_chars)` and replace *text* with the field or expression you want returned; replace *num_chars* with the number of characters from the right you want returned.

Example: `TRIM(LEFT(LastName, 5)) & "-" & TRIM(RIGHT(SSN__c, 4))` displays the first five characters of a name and the last four characters of a social security number separated by a dash. Note that this assumes you have a text custom field called `SSN`.

Tips:

- Reference auto-number fields as text fields in formulas.
- If the *num_chars* value is less than zero, Salesforce replaces the value with zero.

ROUND**Description:**

Returns the nearest number to a number you specify, constraining the new number by a specified number of digits.

Use:

ROUND (*number*, *num_digits*) and replace *number* with the field or expression you want rounded; replace *num_digits* with the number of decimal places you want to consider when rounding.

Example:

```
ROUND (1.5, 0) = 2
ROUND (1.2345, 0) = 1
ROUND (-1.5, 0) = -2
ROUND (225.49823, 2) = 255.50
```

Simple Discounting

```
ROUND (Amount - Amount * Discount_Percent__c, 2)
```

Use this formula to calculate the discounted amount of an opportunity rounded off to two digits. This example is a number formula field on opportunities that uses a custom percent field called *Discount Percent*.

Tips:

- Enter zero for *num_digits* to round a number to the nearest integer.
- Salesforce automatically rounds numbers based on the decimal places you specify. For example, a custom number field with two decimal places stores 1.50 when you enter 1.49999.
- Salesforce uses the round half-up rounding algorithm. Half-way values are always rounded up. For example, 1.45 is rounded to 1.5. -1.45 is rounded to -1.5.
- The decimal numbers displayed depend on the decimal places you selected when defining the field in the custom field wizard. The *num_digits* represents the number of digits considered when rounding.

RPAD**Description:**

Inserts characters that you specify to the right-side of a text string.

Use:

RPAD (*text*, *padded_length* [, '*pad_string*']) and replace the variables:

- *text* is the field or expression after which you want to insert characters.
- *pad_length* is the number of total characters in the text string that will be returned.
- *pad_string* is the character or characters that should be inserted. *pad_string* is optional and defaults to a blank space.

If the value in *text* is longer than *pad_string*, *text* is truncated to the size of *padded_length*.

Example:**Field Name: Padding Default**

`RPAD (Name, 20)` truncates the `Name` field after 20 characters. For example, if the name is `mycompany.com`, the value returned is "mycompany.com."

My_Company: No Change

`RPAD ('my_company.com', 14, 'z')` returns "my_company.com" without change because it has 14 characters.

Field Name: Padding with a Character

`RPAD (Name, 15, 'z')` returns "mycompany.comz".

Field Name: Truncating

`RPAD (Name, 2)` truncates the name after the second character. For example, if the name is `mycompany.com`, the value returned is "my."

Tips: Ending blank spaces are omitted.

SQRT

Description: Returns the positive square root of a given number.

Use: `SQRT (number)` and replace `number` with the field or expression you want computed into a square root.

Example: `SQRT (25)` returns the square root of 25, which is 5.

Amplitude

`SQRT (Amplitude__c)` returns the square root of a custom number field representing the amplitude of an earthquake.

Tips:

- Calculating the square root of a negative number results in an error on the detail page.
- Avoid division by zero errors by including an IF function such as: `IF (Amplitude__c >= 0, SQRT (Amplitude__c), null)`.

SUBSTITUTE

Description: Substitutes new text for old text in a text string.

Use: `SUBSTITUTE (text, old_text, new_text)` and replace `text` with the field or value for which you want to substitute values, `old_text` with the text you want replaced, and `new_text` with the text you want to replace the `old_text`.

Example: `SUBSTITUTE (Name, "Coupon", "Discount")` returns the name of an opportunity that contains the term "Coupon" with the opportunity name plus "Discount" wherever the term "Coupon" existed.

`SUBSTITUTE(Email, LEFT(Email, FIND("@", Email)), "www.")` finds the location of the @ sign in a person's email address to determine the length of text to replace with a "www." as a means of deriving their website address.

Tips:

- Each term provided in quotes is case sensitive.
- If the `old_text` appears more than once, each occurrence is replaced with the `new_text` value provided even when that results in duplicates.

TEXT**Description:**

Converts a percent, number, date, date/time, or currency type field into text anywhere formulas are used. Also, converts picklist values to text in approval rules, approval step rules, workflow rules, escalation rules, assignment rules, auto-response rules, validation rules, formula fields, field updates, and custom buttons and links.

Use:

`TEXT(value)` and replace `value` with the field or expression you want to convert to text format. Avoid using any special characters besides a decimal point (period) or minus sign (dash) in this function.

Example:**Expected Revenue in Text**

`TEXT(ExpectedRevenue)` returns the expected revenue amount of an opportunity in text format without a dollar sign. For example, if the `Expected Revenue` of a campaign is "\$200,000," this formula field displays "200000."

Asset ID

`SerialNumber &"-"& TEXT(Quantity)` returns an asset ID number starting with the serial number and ending with the quantity separated by a dash. The `Serial Number` field is already text but the `Quantity` field is a number, requiring the `TEXT` function before it.

Use Picklist Values in Math Equations

```
VALUE(LEFT(TEXT(Quantity), 5)) * Unit
```

This formula multiplies the first five numbers of the `Quantity` picklist by the `Unit` numeric field.

Compare Two Picklists

```
IF(TEXT(bug_status) = TEXT(case_status), "Match", "Out of Sync")
```

This formula compares the values of the `bug_status` picklist with values of the `case_status` picklist.

Display Picklist Values From Parent Records

```
TEXT(Account.Industry)
```

This formula field on opportunities shows the industry of the associated account.

Concatenate Picklist Values

```
TEXT(Account.Industry) & " - " & TEXT(Account.SubIndustry__c)
```

This formula field on opportunities shows the industry and subindustry of the associated account.

Validation Rule Examples: Block the Save of a Closed Opportunity

`CONTAINS(TEXT(Status), "Closed")` returns TRUE if the `Status` picklist contains the value "Closed," such as "Closed Won" and "Closed Lost." This validation rule formula blocks users from saving changes to a closed opportunity.

Use Numeric Functions on Numeric Picklist Values

`VALUE(LEFT(TEXT(Quantity), 5)) * Unit > 10000` multiplies the first five numbers of the `Quantity` picklist by the `Unit` numeric field, and returns TRUE if the result is greater than 10,000.

Directly Compare Two Picklists

`TEXT(bug_status) = TEXT(case_status)` compares the values of the `bug_status` picklist with values of the `case_status` picklist, and returns TRUE if they are equal.

Tips:

- The returned text is not formatted with any currency, percent symbols, or commas.
- Values are not sensitive to locale. For example, 24.42 EUR are converted into the number 24.42.
- Percents are returned in the form of a decimal.
- Dates are returned in the form of YYYY-MM-DD, that is, a four-digit year and two-digit month and day.
- Date/time values are returned in the form of YYYY-MM-DD HH:MM:SSZ where YYYY is a four-digit year, MM is a two-digit month, DD is a two-digit day, HH is the two-digit hour, MM are the minutes, SS are the seconds, and Z represents the zero meridian indicating the time is returned in UTC time zone.
- Picklist fields are supported in TEXT functions used in these kinds of formulas: validation rules, approval rules, approval step rules, workflow rules, escalation rules, assignment rules, auto-response rules, formula fields, field updates, and custom buttons and links. In other formulas, use `ISPICKVAL` or `CASE` when referencing a picklist field.
- The TEXT function always returns picklist values in your organization's master language, not the language of the current user.

TODAY

Description: Returns the current date as a date data type.

Use: `TODAY ()`

Example: `TODAY () - Sample_date_c` calculates how many days in the sample are left.

Validation Rule Example:

```
SampleDate < TODAY ()
```

This example ensures that users cannot change the `Sample Date` to any date in the past.

Tips:

- Do not remove the parentheses.
- Keep the parentheses empty. They do not need to contain a value.

- Use a date field with a TODAY function instead of a date/time field. `Last Activity Date` is a date field whereas `Created Date` and `Last Modified Date` are date/time fields.
- See [NOW](#) if you prefer to use a date/time field.
- Dates and times are always calculated using the user's time zone.
- Use addition and subtraction operators with a TODAY function and other date fields to return a number, representing number of days. For example `TODAY () -LastActivityDate` calculates the number of days since the last activity date. In this example, the formula field data type is a number.
- Use addition and subtraction operators with a TODAY function and numbers to return a date. For example `TODAY () +5` calculates the date five days ahead of today. In this example, the formula field data type is a date.

TRIM

Description:	Removes the spaces and tabs from the beginning and end of a text string.
Use:	<code>TRIM (<i>text</i>)</code> and replace <i>text</i> with the field or expression you want to trim.
Example:	<code>TRIM (LEFT (LastName, 5) & "-" & RIGHT (FirstName, 1)</code> returns a network ID for users that contains the first five characters of their last name and first character of their first name separated by a dash.

UPPER

Description:	Converts all letters in the specified text string to uppercase. Any characters that are not letters are unaffected by this function. Locale rules are applied if a locale is provided.
Use:	<code>UPPER (<i>text</i>, [<i>locale</i>])</code> and replace <i>text</i> with the field or expression you wish to convert to uppercase, and <i>locale</i> with the optional two-character ISO language code or five-character locale code, if available.
Example:	<p>MYCOMPANY.COM</p> <p><code>UPPER ("mycompany.com")</code> returns "MYCOMPANY.COM."</p> <p>MYCOMPANY.COM 123</p> <p><code>UPPER ("Mycompany.com 123")</code> returns "MYCOMPANY.COM 123."</p> <p>Applying Turkish Language Locale Rules</p> <p>The Turkish language has two versions of the letter i: one dotted and one dotless. The locale rules for Turkish require the ability to capitalize the dotted i, and allow the dotless I to be lowercase. To correctly use the <code>UPPER ()</code> function with the Turkish language locale, use the Turkish locale code <code>tr</code> in the <code>UPPER ()</code> function as follows:</p> <p><code>UPPER (<i>text</i>, "tr")</code></p> <p>This ensures that any dotted i in the <i>text</i> does not transform to a dotless I.</p>

URLENCODE

Description: Encodes text and merge field values for use in URLs by replacing characters that are illegal in URLs, such as blank spaces, with the code that represent those characters as defined in *RFC 3986, Uniform Resource Identifier (URI): Generic Syntax*. For example, blank spaces are replaced with %20, and exclamation points are replaced with %21.

Use: { !URLENCODE (*text*) } and replace *text* with the merge field or text string that you want to encode.

Example: If the merge field `foo__c` contains `Mark's page`, { !URLENCODE (`foo__c`) } results in: `%3CB%3EMark%27s%20page%3C%2Fb%3E`

Tips:

- This function is only available in custom buttons and links, and in Visualforce.
- Custom buttons and links with URL content sources have separate encoding settings. If you use the URLENCODE function to encode a custom button or link that has an encoding setting specified, Salesforce first encodes the URL according to the custom button or link setting, then encodes the result. For example, if the URL in a custom link contains a space and its encoding setting is UTF8, Salesforce first encodes the space to a plus sign (+), then the URLENCODE function converts the plus sign to its character code, %2B.
- When you include the standard `Account` field on opportunities (`Opportunity.Account`) in the URLENCODE function, the value of the field is the account ID, not the account name. To encode the account name, create a custom cross-object formula field on opportunities that spans to the account name, and use that field in the URLENCODE function instead of `Opportunity.Account`. For example, if the cross-object formula is `AccountNameFormula__c`, use the following:

```
http://www.google.com/search?q={ !URLENCODE
(Opportunity.AccountNameFormula__c) }
```

URLFOR

Description: Returns a relative URL for an action, s-control, Visualforce page, or a file in a static resource archive in a Visualforce page.

Use: { !URLFOR (*target*, *id*, [*inputs*], [*no override*]) } and replace *target* with the URL or action, s-control, or static resource merge variable, *id* with a reference to the record, and *inputs* with any optional parameters. The *no override* argument is also optional and defaults to "false." It applies to targets for standard Salesforce pages such as `$Action.Account.New`. Replace *no override* with "true" when you want to display a standard Salesforce page regardless of whether you have defined an override for it elsewhere.

To access a Visualforce page, simply enter the name of your page preceded by an "apex/." For example, if your Visualforce page is named `myTestPage`, you would use { !URLFOR ("/apex/myTestPage") }.

Visualforce Example:

```
<apex:image url="{!URLFOR($Resource.TestZip,
                    'images/Bluehills.jpg')}" width="50"
height="50"/>
```

In this example, the `<apex:image>` component references a .jpg file contained within a .zip file that has been uploaded as a static resource. When uploaded, the name of the static resource was defined as `TestZip`, and the path to the image within the resource is `images/Bluehills.jpg`.

Tips:

- Use global variables to access special merge fields for actions, s-controls, and static resources.
- If an input parameter name begins with any character other than a letter or dollar sign (\$), enclose it in quotation marks.
- Enclose multiple *inputs* in brackets to indicate they are together:

```
{!URLFOR($Action.Case.View, Case.Id, [parm1="A", parm2="B"])} 
```

- Set *inputs* to null if you do not have any to pass yet you want to set the *no override* argument:

```
{!URLFOR($Action.Case.View, Case.Id, null, true)}
```

- When you override a standard action, that action is no longer available in Salesforce. For example, if you override the new account action, that affects the **New** button on all pages such as the account detail page, account related lists on other detail pages, and the **Create New** drop down list in the sidebar. To override a standard action yet still access it, use the *no override* argument in your s-control to reference that action.
- When you override the tab home page for a standard or custom tab, set *target* to the "Tab" `$Action` global variable and *id* to the object type. For example, `URLFOR($Action.Account.Tab, $ObjectType.Account)`
- This function is only available in custom buttons, links, s-controls, and Visualforce pages.

VALUE

Description: Converts a text string to a number.

Use: `VALUE (text)` and replace *text* with the field or expression you want converted into a number.

Example:**Lead Number**

`VALUE (Lead_Number__c)` returns a number for the text value in the auto-number field `Lead Number`. This can be useful if you want to use the `Lead Number` field in a calculation. Note that auto-number fields are actually text fields and must be converted to a number for numeric calculations.

Round Robin Lead Assignment

```
MOD (VALUE (Lead_Number__c), 3)
```

This formula is for a custom formula field named `Round_Robin_ID` that assigns each lead a value of 0, 1, or 2. This formula uses a custom auto-number field called `Lead Number` that assigns each lead a unique number starting with 1. The `MOD` function divides the lead number by the

number of lead queues available (three in this example) and returns a remainder of 0, 1, or 2. Use the value of this formula field in your lead assignment rules to assign lead records to different queues. For example:

- Round_Robin_ID = 0 is assigned to Queue A
- Round_Robin_ID = 1 is assigned to Queue B
- Round_Robin_ID = 2 is assigned to Queue C

Tips:

Make sure the text in a VALUE function does not include any special characters other than a decimal point (period) or minus sign (dash). For example, the formula `VALUE (Text_field__c)` produces these results:

- If `Text field` is 123, the result is **123**
- If `Text field` is blank, the result is **#Error!**
- If `Text field` is \$123, the result is **#Error!**
- If `Text field` is EUR123, the result is **#Error!**

VLOOKUP**Description:**

Returns a value by looking up a related value on a custom object similar to the VLOOKUP() Excel function.

Use:

VLOOKUP (*field_to_return*, *field_on_lookup_object*, *lookup_value*) and replace *field_to_return* with the field that contains the value you want returned, *field_on_lookup_object* with the field on the related object that contains the value you want to match, and *lookup_value* with the value you want to match.

Validation Rule Example:

This example checks that a billing postal code is valid by looking up the first five characters of the value in a custom object called `Zip_Code__c` that contains a record for every valid zip code in the US. If the zip code is not found in the `Zip_Code__c` object or the billing state does not match the corresponding `State_Code__c` in the `Zip_Code__c` object, an error is displayed.

```
AND( LEN(BillingPostalCode) > 0, OR(BillingCountry = "USA",
BillingCountry = "US"),
    VLOOKUP (
$ObjectType.Zip_Code__c.Fields.State_Code__c,
$ObjectType.Zip_Code__c.Fields.Name, LEFT(BillingPostalCode,5))
<>
BillingState )
```

**Note:**

- Use this example when the billing country is US or USA.
- You can download US zip codes in CSV file format from <http://zips.sourceforge.net>.

Tips:

- The *field_to_return* must be an auto number, roll-up summary, lookup relationship, master-detail relationship, checkbox, date, date/time, email, number, percent, phone, text, text area, or URL field type.
- The *field_on_lookup_object* must be the `Record Name` field on a custom object.

- The *field_on_lookup_object* and *lookup_value* must be the same data type.
- If more than one record matches, the value from the first record is returned.
- The value returned must be on a custom object.
- You cannot delete the custom field or custom object referenced in this function.
- This function is only available in [validation rules](#).

YEAR

Description:	Returns the four-digit year in number format of a given date.
Use:	<code>YEAR (<i>date</i>)</code> and replace <i>date</i> with the field or expression that contains the year you want returned.
Example:	<code>YEAR(TODAY()) - YEAR(Initial_Meeting__c)</code> returns the number of years since your initial meeting with a client. This example uses a custom date field called <code>Initial_Meeting</code> .

Account Rating

This formula evaluates Annual Revenue, Billing Country, and Type, and assigns a value of "Hot," "Warm," or "Cold."

```
IF (AND (AnnualRevenue > 10000000,
CONTAINS (CASE (BillingCountry, "United States", "US", "America", "US", "USA", "US", "NA"),
"US")),
IF (ISPICKVAL (Type, "Manufacturing Partner"), "Hot",
IF (OR (ISPICKVAL (Type, "Channel Partner/Reseller"),
ISPICKVAL (Type, "Installation Partner")), "Warm", "Cold")),
"Cold")
```

In addition, you can reference this Account Rating formula field from the contact object using cross-object formulas.

```
Account.Account_Rating__c
```

Account Region

This formula returns a text value of "North," "South," "East," "West," or "Central" based on the Billing State/Province of the account.

```
IF (ISBLANK (BillingState), "None",
IF (CONTAINS ("AK:AZ:CA:HA:NV:NM:OR:UT:WA", BillingState), "West",
IF (CONTAINS ("CO:ID:MT:KS:OK:TX:WY", BillingState), "Central",
IF (CONTAINS ("CT:ME:MA:NH:NY:PA:RI:VT", BillingState), "East",
IF (CONTAINS ("AL:AR:DC:DE:FL:GA:KY:LA:MD:MS:NC:NJ:SC:TN:VA:WV", BillingState), "South",
IF (CONTAINS ("IL:IN:IA:MI:MN:MO:NE:ND:OH:SD:WI", BillingState), "North", "Other")))))
```

Contract Aging

This formula calculates the number of days since a contract with an account was activated. If the contract Status is not "Activated," this field is blank.

```
IF (ISPICKVAL (Contract_Status__c, "Activated"),
NOW () - Contract_Activated_Date__c, null)
```

Sample Account Media Service Formulas

"Marketwatch")
```

Google™ Search

This formula creates a link to a Google search site using the `Account Name`.

```
HYPERLINK(  
"http://www.google.com/#q=" & Name,  
"Google")
```

Google News Search

This formula creates a link to a Google news search site using the `Account Name`.

```
HYPERLINK(  
"http://news.google.com/news/search?en&q=" & Name,  
"Google News")
```

Yahoo!™ Search

This formula creates a link to a Yahoo! search site using the `Account Name`.

```
HYPERLINK (
"http://search.yahoo.com/search?p=" & Name,
"Yahoo Search")
```

Yahoo! News Search

This formula creates a link to a Yahoo! news search site using the `Account Name`.

```
HYPERLINK (
"http://news.search.yahoo.com/search/news?p=" & Name,
"Yahoo News")
```

Sample Case Management Formulas

For details about using the functions included in these samples, see [Formula Operators and Functions](#) on page 3934.

EDITIONS

Available in: Salesforce
Classic

Available in all editions

Autodial

This formula creates a linkable phone number field that automatically dials the phone number when clicked. In this example, replace `"servername"` and `"call"` with the name of your dialing tool and the command it uses to dial. The merge field, `Id`, inserts the identifier for the contact, lead, or account record. The first `Phone` merge field tells the dialing tool what number to call and the last `Phone` merge field uses the value of the `Phone` field as the linkable text the user clicks to dial.

```
HYPERLINK("http://servername/call?id=" & Id & "&phone=" &
Phone, Phone)
```

Case Categorization

This formula displays a text value of "RED," "YELLOW," or "GREEN," depending on the value of a case age custom text field.

```
IF(DaysOpen__c > 20, "RED",
IF(DaysOpen__c > 10, "YELLOW",
"GREEN") )
```

Case Data Completeness Tracking

This formula calculates the percentage of specific custom fields that contain data. The formula checks the values of two custom number fields: `Problem Num` and `Severity Num`. If the fields are empty, the formula returns the value "0." The formula returns a value of "1" for each field that contains a value and multiplies this total by fifty to give you the percentage of fields that contain data.

```
(IF(ISBLANK(Problem_Num__c), 0, 1) + IF(ISBLANK(Severity_Num__c), 0,1)) * 50
```

Suggested Agent Prompts

This formula prompts an agent with cross-sell offers based on past purchases.

```
CASE(Product_Purch__c,
"Printer", "Extra toner cartridges", "Camera", "Memory cards",
"Special of the day")
```

Suggested Offers

This formula suggests a product based on the support history for a computer reseller. When the `Problem` custom field matches a field, the formula field returns a suggestion.

```
CASE(Problem__c,
"Memory", "Suggest new memory cards", "Hard Drive failure", "Suggest new hard drive with
tape backup",
"")
```

Sample Commission Calculations Formulas

For details about using the functions included in these samples, see [Formula Operators and Functions](#) on page 3934.

Commission Amounts for Opportunities

The following is a simple formula where commission is based on a flat 2% of the opportunity Amount.

```
IF(ISPICKVAL(StageName, "Closed Won"),
ROUND(Amount *0.02, 2), 0)
```

This example calculates the commission amount for any opportunity that has a "Closed Won" stage. The value of this field will be the amount times 0.02 for any closed/won opportunity. Open or lost opportunities will have a zero commission value.

Commission Deal Size

This formula calculates a commission rate based on deal size, returning a 9% commission rate for deals over 100,000 and an 8% commission rate for smaller deals.

```
IF(Amount > 100000, 0.09, 0.08 )
```

Commission Greater Than or Equal To

This formula assigns the "YES" value with a commission greater than or equal to one million. Note, this is a text formula field that uses a custom currency field called `Commission`.

```
IF(Commission__c >=
1000000, "YES", "NO")
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Commission Maximum

This formula determines what commission to log for an asset based on which is greater: the user's commission percentage of the price, the price times the discount percent stored for the account or 100 dollars. This example assumes you have two custom percent fields on users and assets.

```
MAX($User.Commission_Percent__c * Price,
Price * Account_Discount__c, 100)
```

Sample Contact Management Formulas

For details about using the functions included in these samples, see [Formula Operators and Functions](#) on page 3934.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Contact's Account Discount Percent

This percent formula displays the account's `Discount_Percent` field on the contacts page.

```
Account.Discount_Percent__c
```

Contact's Account Name

This formula displays the standard `Account_Name` field on the contacts page.

```
Account.Name
```

Contact's Account Phone

This formula displays the standard `Account_Phone` field on the contacts page.

```
Account.Phone
```

Contact's Account Rating

Use this formula to display the `Account_Rating` field on the contacts page.

```
CASE(Account.Rating, "Hot", "Hot", "Warm", "Warm", "Cold", "Cold", "Not Rated")
```

Contact's Account Website

This formula displays the standard `Account_Website` field on the contacts page.

```
Account.Website
```

If the account website URL is long, use the `HYPERLINK` function to display a label such as "Click Here" instead of the URL. For example:

```
IF(Account.Website="", "",
IF(
OR(LEFT(Account.Website, 7) = "http://", LEFT(Account.Website, 8) = "https://"),
HYPERLINK( Account.Website , "Click Here" ),
HYPERLINK( "http://" & Account.Website , "Click Here" )
```

```
)
)
```

This formula also adds the necessary "http://" or "https://" before a URL if neither were included in the URL field.

Contact's LinkedIn™ Profile

You can configure a link that appears on your contacts' profile page that sends you to their LinkedIn profile. To do so:

1. From the object management settings for contacts, go to Buttons, Links, and Actions.
2. Click **New Button or Link**.
3. Enter a `Label` for this link, like `LinkedInLink`.
4. Enter this formula in the content box:

```
http://www.linkedin.com/search/fpsearch?type=people&keywords
={!Contact.FirstName}+{!Contact.LastName}
```

5. Click **Save**.

Remember to add this link to the Contact page layout in order for it to show up.

Contact Identification Numbering

This formula displays the first five characters of a name and the last four characters of a social security number separated by a dash. Note that this example uses a text custom field called `SSN`.

```
TRIM(LEFT(LastName, 5)) &
    "-" & TRIM(RIGHT(SSN__c, 4))
```

Contact Preferred Phone

This formula displays the contact's preferred contact method in a contact related list—work phone, home phone, or mobile phone—based on a selected option in a `Preferred Phone` custom picklist.

```
CASE(Preferred_Phone__c,
"Work", "w. " & Phone,
"Home", "h. " & HomePhone,
"Mobile", "m. " & MobilePhone,
"No Preferred Phone")
```

Contact Priority

This formula assesses the importance of a contact based on the account rating and the contact's title. If the account rating is `Hot` or the title starts with `Executive`, then the priority is high (P1). If the account rating is `Warm` or the title starts with `VP` then the priority is medium (P2), and if the account rating is `Cold` then the priority is low (P3).

```
IF(OR(ISPICKVAL(Account.Rating, "Hot"), CONTAINS(Title, "Executive")), "P1",
IF(OR(ISPICKVAL(Account.Rating, "Warm"), CONTAINS(Title, "VP")), "P2",
IF(ISPICKVAL(Account.Rating, "Cold"), "P3",
"P3")
```

```
)
)
```

Contact Yahoo! ID

This formula displays a clickable Yahoo! Messenger icon indicating if the person is logged on to the service. Users can click the icon to launch a Yahoo! Messenger conversation with the person. This example uses a custom text field called `Yahoo Name` on contacts where you can store the contact's Yahoo! Messenger ID.

```
HYPERLINK("ymsgr:sendIM?" & Yahoo_Name__c,
          IMAGE("http://opi.yahoo.com/online?u=" & Yahoo_Name__c &
              "&m;=g&t;=0", "Yahoo"))
```

Dynamic Address Formatting

This formula field displays a formatted mailing address for a contact in standard format, including spaces and line breaks where appropriate depending on the country.

```
CASE(ShippingCountry,
     "USA",
       ShippingStreet & BR() &
       ShippingCity & ", " &
       ShippingState & " " &
       ShippingPostalCode & BR()
       & ShippingCountry,
     "France",
       ShippingStreet & BR() &
       ShippingPostalCode & " " &
       ShippingCity & BR() &
       ShippingCountry, "etc")
```

Telephone Country Code

This formula determines the telephone country code of a contact based on the `Mailing Country` of the mailing address.

```
CASE(MailingCountry,
     "USA", "1",
     "Canada", "1",
     "France", "33",
     "UK", "44",
     "Australia", "61",
     "Japan", "81",
     "?")
```

Unformatted Phone Number

This formula removes the parentheses and dash characters from North American phone numbers. This is necessary for some auto-dialer software.

```
IF(Country_Code__c = "1", MID( Phone ,2, 3) & MID(Phone,7,3) & MID(Phone,11,4), Phone)
```

Sample Data Categorization Formulas

For details about using the functions included in these samples, see [Formula Operators and Functions](#) on page 3934.

Deal Size Large and Small

This formula displays “Large Deal” for deals over one million dollars or “Small Deal” for deals under one million dollars.

```
IF(Sales_Price__c > 1000000,
"Large Deal",
"Small Deal")
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Deal Size Small

This formula displays “Small” if the price and quantity are less than one. This field is blank if the asset has a price or quantity greater than one.

```
IF(AND(Price<1,Quantity<1),"Small", null)
```

Product Categorization

This formula checks the content of a custom text field named `Product_Type` and returns “Parts” for any product with the word “part” in it. Otherwise, it returns “Service.” Note that the values are case sensitive, so if a `Product_Type` field contains the text “Part” or “PART,” this formula returns “Services.”

```
IF(CONTAINS(Product_Type__c, "part"), "Parts", "Service")
```

Using Date and Date/Time Values in Formulas

Date formulas are useful for managing payment deadlines, contract ages, or any other features of your organization that are time or date dependent. Two data types are used for working with dates: Date and Date/Time. Most values that are used when working with dates are of the Date data type, which store the year, month, and day. Some fields, such as `CreatedDate`, are Date/Time fields, meaning they not only store a date value, but also a time value (stored in GMT but displayed in the users’ time zone). Date and Date/Time fields are formatted in the user’s locale when viewed in reports and record detail pages.

You can use operations like addition and subtraction on Date and Date/Time values to calculate a future date or elapsed time between two dates. If you subtract one date from another, for example, the resulting value will be the difference between the two initial values in days (Number data type). The same operation between two Date/Time values returns a decimal value indicating the difference in number of days, hours, and minutes.

For example, if the difference between two Date/Time values is 5.52, that means the two values are separated by five days, 12 hours (0.5 of a day), and 28 minutes (0.02 of a day). You can also add numeric values to Dates and Date/Times. For example, the operation `TODAY () + 3` returns three days after today’s date. For more information and examples of working with dates, see the list of [Common Date Formulas](#).

Throughout the examples, the variables `date` and `date/time` are used in place of actual Date and Date/Time fields or values.

Keep in mind that complex date functions tend to compile to a larger size than text or number formula functions, so you might run into issues with formula compile size. See [Tips for Reducing Formula Size](#) for help with this problem.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

TODAY() and NOW()

The `TODAY ()` function returns the current day, month, and year as a Date data type. This function is useful for formulas where you are concerned with how many days have passed since a previous date, the date of a certain number of days in the future, or if you just want to display the current date.

The `NOW ()` function returns the Date/Time value of the current moment. It's useful when you are concerned with specific times of day as well as the date.

For details on how to convert between Date values and Date/Time values, see [Converting Between Date/Time and Date](#).

The DATE() Function

The `DATE ()` function returns a Date value, given a year, month, and day. Numerical Y/M/D values and the `YEAR ()`, `MONTH ()`, and `DAY ()` functions are valid parameters for `DATE ()`. For example `DATE (2013, 6, 1)` returns June 6, 2013. Similarly, `DATE (YEAR (TODAY ()), MONTH (TODAY ()) + 3, 1)` returns the Date value of the first day three months from today in the current year, assuming the date is valid (for example, the month falls between 1 and 12).

If the inputted Y/M/D values result in an invalid date, the `DATE ()` function returns an error, so error checking is an important part of working with Date values. You can read about methods for handling invalid dates in [Common Date Formulas](#).

Converting Between Date/Time and Date

Date and Date/Time aren't interchangeable data types, so when you want to perform operations between Date and Date/Time values, you need to convert the values so they are both the same type. Some functions (such as `YEAR ()`, `MONTH ()`, and `DAY ()`) also only work on Date values, so Date/Time values must be converted first.

Use the `DATEVALUE (date/time)` function to return the Date value of a Date/Time. For example, to get the year from a Date/Time, use `YEAR (DATEVALUE (date/time))`.

You can convert a Date value to a Date/Time using the `DATETIMEVALUE (date)` function. The time will be set to 12:00 a.m. in Greenwich Mean Time (GMT), and then converted to the time zone of the user viewing the record when it's displayed. For a user located in San Francisco, `DATETIMEVALUE (TODAY ())` returns 5:00 p.m. on the previous day (during Daylight Saving Time) rather than 12:00 a.m. of the current day. See [A Note About Date/Time and Time Zones](#) for more information.

Converting Between Date and Text

If you want to include a date as part of a string, wrap the Date value in the `TEXT ()` function to convert it to text. For example, if you want to return today's date as text, use:

```
"Today's date is " & TEXT ( TODAY () )
```

This returns the date in the format "YYYY-MM-DD" rather than in the locale-dependent format. You can change the format by extracting the day, month, and year from the date first and then recombining them in the format you want. For example:

```
"Today's date is " & TEXT ( MONTH ( date ) ) & "/" & TEXT ( DAY ( date ) ) & "/" & TEXT ( YEAR ( date ) ) )
```

You can also convert text to a Date so you can use the string value with your other Date fields and formulas. You'll want your text to be formatted as "YYYY-MM-DD". Use this formula to return the Date value:

```
DATEVALUE ( "YYYY-MM-DD" )
```

Converting Between Date/Time and Text

You can include Date/Time values in a string using the `TEXT()` function, but you need to be careful of time zones. For example, consider this formula:

```
"The current date and time is " & TEXT( NOW() )
```

In this formula, `NOW()` is offset to GMT. Normally, `NOW()` would be converted to the user's time zone when viewed, but because it's been converted to text, the conversion won't happen. So if you execute this formula on August 1st at 5:00 PM in San Francisco time (GMT-7), the result is "The current date and time is 2013-08-02 00:00:00Z".

When you convert a Date/Time to text, a "Z" is included at the end to indicate GMT. `TEXT(date/time)` returns "Z" if the field is blank. So if the Date/Time value you're working with might be blank, check for this before converting to text:

```
IF (
  ISBLANK( date/time ),
  "",
  TEXT( date/time )
)
```

To convert a string to a Date/Time value, use `DATETIMEVALUE()` passing in a string in the format "YYYY-MM-DD HH:MM:SS". This method returns the Date/Time value in GMT.

A Note About Date/Time and Time Zones

Date and Date/Time values are stored in GMT. When a record is saved, field values are adjusted from the user's time zone to GMT, and then adjusted back to the viewer's time zone when displayed in record detail pages and reports. With Date conversions this doesn't pose a problem, since converting a Date/Time to a Date results in the same Date value.

When working with Date/Time fields and values, however, the conversion is always done in GMT, not the user's time zone. Subtracting a standard Date/Time field from another isn't a problem because both fields are in the same time zone. When one of the values in the calculation is a conversion from a Text or Date value to a Date/Time value, however, the results are different.

Let's say a San Francisco user enters a value of 12:00 AM on August 2, 2013 in a custom Date/Time field called `Date_Time_c`. This value is stored as 2013-08-02 07:00:00Z, because the time difference in Pacific Daylight Time is GMT-7. At 12:00 p.m. PDT on August 1st, the user views the record and the following formula is run:

```
Date_Time_c - NOW()
```

In the calculation, `NOW()` is 2013-08-01 19:00:00Z, and then subtracted from 2013-08-02 07:00:00Z, to return the expected result of 0.5 (12 hours).

Suppose that instead of `NOW()`, the formula converts the string "2013-08-01 12:00:00" to a Date/Time value:

```
Date_Time_c - DATETIMEVALUE( "2013-08-01 12:00:00" )
```

In this case, `DATETIMEVALUE("2013-08-01 12:00:00")` is 2013-08-01 12:00:00Z, and returns a result of 0.79167, or 19 hours.

There's no way to determine a user's time zone in a formula. If all of your users are in the same time zone, you can adjust the time zone difference by adding or subtracting the time difference between the users' time zone and GMT to your converted values. However, since time zones can be affected by Daylight Saving Time, and the start and end dates for DST are different each year, this is difficult to manage in a formula. We recommend using Apex for transactions that require converting between Date/Time values and Text or Date values.

Common Date and Date/Time Formulas

You can learn more about the practical applications of Date and Date/Time formulas in these examples:

- Finding the Day, Month, or Year from a Date
- Finding Out if a Year Is a Leap Year
- Finding Which Quarter a Date Is In
- Finding the Week of the Year a Date Is In
- Finding Whether Two Dates Are in the Same Month
- Finding the Last Day of the Month
- Displaying the Month as a String Instead of a Number
- Finding and Displaying the Day of the Week From a Date
- Finding the Next Day of the Week After a Date
- Finding the Number of Days Between Two Dates
- Finding the Number of Business Days Between Two Dates
- Adding Days, Months, and Years to a Date
- Adding Business Days to a Date
- Finding the Hour, Minute, or Second from a Date/Time
- Finding the Elapsed Time Between Date/Times
- Finding the Number of Business Hours Between Two Date/Times

SEE ALSO:

[Tips for Building Formulas](#)

Common Date Formulas

Watch a Demo:  [How to Calculate the Number of Days a Case is Open](#)

Finding the Day, Month, or Year from a Date

Use the functions `DAY (date)`, `MONTH (date)`, and `YEAR (date)` to return their respective numerical values. Replace *date* with a value of type Date (e.g. `TODAY ()`).

To use these functions with Date/Time values, first convert them to a date with the `DATEVALUE ()` function. For example, `DAY (DATEVALUE (date/time))`.

Finding Out if a Year Is a Leap Year

This formula determines whether or not a year is a leap year. A year is only a leap year if it's divisible by 400, or if it's divisible by four but NOT by 100.

```
OR (
  MOD ( YEAR ( date ), 400 ) = 0,
  AND (
    MOD ( YEAR ( date ), 4 ) = 0,
    MOD ( YEAR ( date ), 100 ) != 0
  )
)
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Finding Which Quarter a Date Is In

For standard quarters, you can determine which quarter a date falls in using this formula. This formula returns the number of the quarter in which *date* falls (1–4) by dividing the current month by three (the number of months in each quarter) and taking the ceiling.

```
CEILING( MONTH ( date ) / 3 )
```

The formula for shifted quarters is similar, but shifts the month of the date by the number of months between January and the first quarter of the fiscal year. The example below illustrates how you can find a date's quarter if Q1 starts in February instead of January.

```
CEILING( ( MONTH ( date ) - 1 ) / 3)
```

If you want to check whether a date is in the current quarter, add a check to compare the date's year and quarter with `TODAY()`'s year and quarter.

```
AND (
  CEILING( MONTH( date ) / 3 ) = CEILING( MONTH( TODAY() ) / 3 ),
  YEAR( date ) = YEAR( TODAY() )
)
```

Finding the Week of the Year a Date Is In

To find the number of a date's week of the year, use this formula:

```
IF (
  CEILING( ( date - DATE( YEAR( date ), 1, 1) + 1 ) / 7 ) > 52,
  52,
  CEILING( ( date - DATE( YEAR( date ), 1, 1) + 1 ) / 7 )
)
```

You can find the current week by determining how many days there have been in the current year and dividing that value by 7. The `IF()` statement ensures that the week number the formula returns doesn't exceed 52. So if the given date is December 31 of the given year, the formula returns 52, even though it's more than 52 weeks after the week of January.

Finding Whether Two Dates Are in the Same Month

To determine whether two Dates fall in the same month, say for a validation rule to determine whether an opportunity Close Date is in the current month, use this formula:

```
AND (
  MONTH( date_1 ) == MONTH( date_2 ),
  YEAR( date_1 ) == YEAR( date_2 )
)
```

Finding the Last Day of the Month

The easiest way to find the last day of a month is to find the first day of the next month and subtract a day.

```
IF (
  MONTH( date ) = 12,
  DATE( YEAR( date ), 12, 31 ),
  DATE( YEAR( date ), MONTH ( date ) + 1, 1 ) - 1
)
```

Displaying the Month as a String Instead of a Number

To return the month as a text string instead of a number, use:

```
CASE (
  MONTH( date ),
  1, "January",
  2, "February",
  3, "March",
  4, "April",
  5, "May",
  6, "June",
  7, "July",
  8, "August",
  9, "September",
  10, "October",
  11, "November",
  "December",
)
```

If your organization uses multiple languages, you can replace the names of the month with a custom label:

```
CASE (
  MONTH( date ),
  1, $Label.Month_of_Year_1,
  2, $Label.Month_of_Year_2,
  3, $Label.Month_of_Year_3,
  4, $Label.Month_of_Year_4,
  5, $Label.Month_of_Year_5,
  6, $Label.Month_of_Year_6,
  7, $Label.Month_of_Year_7,
  8, $Label.Month_of_Year_8,
  9, $Label.Month_of_Year_9,
  10, $Label.Month_of_Year_10,
  11, $Label.Month_of_Year_11,
  $Label.Month_of_Year_12
)
```

Finding and Displaying the Day of the Week From a Date

To find the day of the week from a Date value, use a known Sunday (e.g. January 7, 1900) and subtract it from the date (e.g. TODAY ()) to get the difference in days. The MOD () function finds the remainder of this result when divided by 7 to give the numerical value of the day of the week between 0 (Sunday) and 6 (Saturday). The formula below finds the result and then returns the text name of that day.

```
CASE (
  MOD( date - DATE( 1900, 1, 7 ), 7 ),
  0, "Sunday",
  1, "Monday",
  2, "Tuesday",
  3, "Wednesday",
  4, "Thursday",
  5, "Friday",
  "Saturday"
)
```

Note that this formula only works for dates after 01/07/1900. If you're working with older dates, use the same process with any Sunday prior to your earliest date (e.g. 01/05/1800).

You can also adjust this formula if your week starts on a different day. For example, if your week starts on Monday, you can use January 8, 1900 in your condition. The new formula looks like this:

```
CASE (
  MOD ( date - DATE ( 1900, 1, 8 ), 7 ),
  0, "Monday",
  1, "Tuesday",
  2, "Wednesday",
  3, "Thursday",
  4, "Friday",
  5, "Saturday",
  "Sunday"
)
```

Like the formula for getting the name of the month, if your organization uses multiple languages, you can replace the names of the day of the week with a variable like `$Label.Day_of_Week_1`, etc.

Finding the Next Day of the Week After a Date

To find the date of the next occurrence of a particular day of the week following a given Date, get the difference in the number of days of the week between a `date` and a `day_of_week`, a number 0–6 where 0 = Sunday and 6 = Saturday. By adding this difference to the current date, you'll find the date of the `day_of_week`. The `IF()` statement in this formula handles cases where the `day_of_week` is prior to the day of the week of the `date` value (e.g. `date` is a Thursday and `day_of_week` is a Monday) by adding 7 to the difference.

```
date + ( day_of_week - MOD ( date - DATE ( 1900, 1, 7 ), 7 ) )
+
IF (
  MOD ( date - DATE ( 1900, 1, 7 ), 7 ) >= day_of_week,
  7,
  0
)
```

You can substitute either a constant or another field in for the `day_of_week` value based on your needs.

Finding the Number of Days Between Two Dates

To find the number of days between two dates, `date_1` and `date_2`, subtract the earlier date from the later date: **`date_1`** – **`date_2`**

You can alter this slightly if you want to determine a date a certain number of days in the past. For example, say you want a formula to return true if some date field is more than 30 days prior to the current date and false otherwise. This formula does just that:

```
TODAY () - 30 > date
```

Finding the Number of Business Days Between Two Dates

Calculating how many business days passed between two dates is slightly more complex than calculating total elapsed days. The basic strategy is to choose a reference Monday from the past and find out how many full weeks and any additional portion of a week have

passed between the reference date and the date you're examining. These values are multiplied by five (for a five-day work week) and then the difference between them is taken to calculate business days.

```
( 5 * ( FLOOR( ( date_1 - DATE( 1900, 1, 8 ) ) / 7 ) ) + MIN( 5, MOD( date_1 - DATE( 1900, 1, 8 ), 7 ) ) )
-
( 5 * ( FLOOR( ( date_2 - DATE( 1900, 1, 8 ) ) / 7 ) ) + MIN( 5, MOD( date_2 - DATE( 1900, 1, 8 ), 7 ) ) )
```

In this formula, *date_1* is the more recent date and *date_2* is the earlier date. If your work week runs shorter or longer than five days, replace all fives in the formula with the length of your week.

Adding Days, Months, and Years to a Date

If you want to add a certain number of days to a date, add that number to the date directly. For example, to add five days to a date, the formula is **date** + 5.

Adding years to a date is fairly simple, but you do need to check that the future date is valid. That is, adding five years to February 29 (a leap year) results in an invalid date. The following formula adds *num_years* to *date* by checking if the date is February 29 and if the future date is not in a leap year. If these conditions hold true, the formula returns March 1 in the future year. Otherwise, the formula sets the Date to the same month and day *num_years* in the future.

```
IF (
  AND (
    MONTH( date ) = 2,
    DAY( date ) = 29,
    NOT (
      OR (
        MOD( YEAR( date ), 400 ) = 0,
        AND (
          MOD( YEAR( date ), 4 ) = 0,
          MOD( YEAR( date ), 100 ) != 0
        )
      )
    )
  ),
  DATE( YEAR( date ) + num_years, 3, 1 ),
  DATE( YEAR( date ) + num_years, MONTH( date ), DAY( date ) )
)
```

Adding months to a date is slightly more complicated as months vary in length and the cycle of months restart with each year. Therefore, a valid day in one month (January 31) might not be valid in another month (February 31). A simple solution is to approximate each month's length as 365/12 days:

```
date + ( ( 365 / 12 ) * Number_months )
```

While this formula is a good estimate, it doesn't return an exact date. For example, if you add two months to April 30 using this method, the formula will return June 29 instead of June 30. Returning an exact date depends on your organization's preference. For example, when you add one month to January 31, should it return February 28 (the last day of the next month) or March 2 (30 days after January 31)?

This formula does the following:

- Returns March 1 if the future month is a February and the day is greater than 28. This portion of the formula performs the same for both leap and non-leap years.

- Returns the first day of the next month if the future month is April, June, September, or November and the day is greater than 30.
- Otherwise, it returns the correct date in the future month.

This example formula adds two months to a given date. You can modify the conditions on this formula if you prefer different behaviors for dates at the end of the month.

```
DATE (
  YEAR ( date ) + FLOOR ( ( MONTH ( date ) + 2 - 1 ) / 12 ),
  MOD ( MONTH ( date ) + 2 - 1 +
    IF ( DAY ( date ) > CASE ( MOD ( MONTH ( date ) + 2 - 1, 12 ) + 1,
      2, 28,
      4, 30,
      6, 30,
      9, 30,
      11, 30,
      31 ), 1, 0 ), 12 ) + 1,
  IF ( DAY ( date ) > CASE ( MOD ( MONTH ( date ) + 2 - 1, 12 ) + 1,
    2, 28,
    4, 30,
    6, 30,
    9, 30,
    11, 30,
    31 ),
    1, DAY ( date )
  )
)
```

If you're using these formulas for expiration dates, you might want to subtract a day from the return value to make sure that some action is completed *before* the calculated date.

Adding Business Days to a Date

This formula finds three business days from a given *date*.

```
CASE (
  MOD ( date - DATE ( 1900, 1, 7 ), 7 ),
  3, date + 2 + 3,
  4, date + 2 + 3,
  5, date + 2 + 3,
  6, date + 1 + 3,
  date + 3
)
```

This formula finds the day of the week of the *date* field value. If the date is a Wednesday, Thursday, or Friday, the formula adds five calendar days (two weekend days, three weekdays) to the date to account for the weekend. If *date* is a Saturday, you need four additional calendar days. For any other day of the week (Sunday — Tuesday), simply add three days. You can easily modify this formula to add more or less business days. The tip for getting the day of the week might be useful if you need to adjust this formula.

Finding the Hour, Minute, or Second from a Date/Time

To get the hour, minute, and second from a Date/Time field as a numerical value, use the following formulas where *TZoffset* is the difference between the user's time zone and GMT. For hour in 24-hour format:

```
VALUE ( MID ( TEXT ( date/time - TZoffset ), 12, 2 ) )
```

For hour in 12-hour format:

```
IF(
  OR(
    VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) ) = 0,
    VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) ) = 12
  ),
  12,
  VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) )
  -
  IF(
    VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) ) < 12,
    0,
    12
  )
)
```

For minutes:

```
VALUE( MID( TEXT( date/time - TZoffset ), 15, 2 ) )
```

For seconds:

```
VALUE( MID( TEXT( date/time - TZoffset ), 18, 2 ) )
```

And, to get "AM" or "PM" as a string, use:

```
IF(
  VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) ) < 12,
  "AM",
  "PM"
)
```

To return the time as a string in "HH:MM:SS A/PM" format, use the following formula:

```
IF(
  OR(
    VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) ) = 0,
    VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) ) = 12
  ),
  "12",
  TEXT( VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) )
  -
  IF(
    VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) ) < 12,
    0,
    12
  )
  )
)
& ":" &
MID( TEXT( date/time - TZoffset ), 15, 2 )
& ":" &
MID( TEXT( date/time - TZoffset ), 18, 2 )
& " " &
IF(
```

```
VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) ) < 12,
"AM",
"PM"
)
```

When working with time in formula fields, you need to consider the time difference between your organization and GMT. See [A Note About Date/Time and Time Zones](#) on page 3995 for help understanding the time zone offset used in this formula.

Finding the Elapsed Time Between Date/Times

To find the difference between two Date values as a number, subtract one from the other like so: **date_1** - **date_2** to return the difference in days.

Finding the elapsed time between two Date/Time values is slightly more complex. This formula converts the difference between two Date/Time values, **datetime_1** and **datetime_2**, to days, hours, and minutes.

```
IF(
datetime_1 - datetime_2 > 0 ,
TEXT( FLOOR( datetime_1 - datetime_2 ) ) & " days "
& TEXT( FLOOR( MOD( (datetime_1 - datetime_2) * 24, 24 ) ) ) & " hours "
& TEXT( ROUND( MOD( (datetime_1 - datetime_2) * 24 * 60, 60 ), 0 ) ) & " minutes",
""
)
```

Finding the Number of Business Hours Between Two Date/Times

The formula for finding business hours between two Date/Time values expands on the formula for finding elapsed business days. It works on the same principle of using a reference Date/Time, in this case 1/8/1900 at 16:00 GMT (9 a.m. PDT), and then finding your Dates' respective distances from that reference. The formula rounds the value it finds to the nearest hour and assumes an 8-hour, 9 a.m. - 5 p.m. work day.

```
ROUND( 8 * (
( 5 * FLOOR( ( DATEVALUE( date/time_1 ) - DATE( 1900, 1, 8 ) ) / 7 ) +
MIN( 5,
MOD( DATEVALUE( date/time_1 ) - DATE( 1900, 1, 8 ), 7 ) +
MIN( 1, 24 / 8 * ( MOD( date/time_1 - DATETIMEVALUE( '1900-01-08 16:00:00' ), 1 ) )
)
)
)
-
( 5 * FLOOR( ( DATEVALUE( date/time_2 ) - DATE( 1900, 1, 8 ) ) / 7 ) +
MIN( 5,
MOD( DATEVALUE( date/time_2 ) - DATE( 1996, 1, 1 ), 7 ) +
MIN( 1, 24 / 8 * ( MOD( date/time_2 - DATETIMEVALUE( '1900-01-08 16:00:00' ), 1 ) )
)
)
),
0 )
```

You can change the eights in the formula to account for a longer or shorter work day. If you live in a different time zone or your work day doesn't start at 9:00 a.m., change the reference time to the start of your work day in GMT. See [A Note About Date/Time and Time Zones](#) for more information.

Sample Discounting Formulas

For details about using the functions included in these samples, see [Formula Operators and Functions](#) on page 3934.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Maintenance and Services Discount

This formula field uses two custom currency fields: `Maintenance Amount` and `Services Amount`. It displays "Discounted" on an opportunity if its maintenance amount and services amount do not equal the `opportunity Amount` standard field value. Otherwise, it displays "Full Price."

```
IF(Maintenance_Amount__c + Services_Amount__c <> Amount,
"Discounted",
"Full Price")
```

Opportunity Discount Amount

This formula calculates the difference of the product `Amount` less the `Discount Amount`. Note that `Discount Amount` is a custom currency field.

```
Amount -
Discount_Amount__c
```

Opportunity Discount Rounded

Use this formula to calculate the discounted amount of an opportunity rounded off to two digits. This example is a number formula field on opportunities that uses a custom percent field called `Discount Percent`.

```
ROUND(Amount-Amount* Discount_Percent__c,2)
```

Opportunity Discount with Approval

This formula adds a "Discount Approved" checkbox to an opportunity. It uses conditional logic to check the value of the approval flag before calculating the commission.

```
IF(Discount_Approved__c, ROUND(Amount - Amount * DiscountPercent__c, 2), Amount)
```

Sample Employee Services Formulas

For details about using the functions included in these samples, see [Formula Operators and Functions](#) on page 3934.

Bonus Calculation

This example determines an employee's bonus amount based on the smallest of two amounts: the employee's gross times bonus percent or an equally divided amount of the company's performance amount among all employees. It assumes you have custom number field for `Number_of_Employees`, a custom percent field for `Bonus_Percent`, and currency custom fields for the employee's `Gross` and company's `Performance`.

```
MIN(Gross__c * Bonus_Percent__c,
    Performance__c / Number_of_Employees__c)
```

Employee 401K

This example formula determines which amount to provide in employee 401K matching based on a matching program of half of the employee's contribution or \$250, whichever is less. It assumes you have custom currency field for `Contribution`.

```
MIN(250, Contribution__c / 2)
```

Hours Worked Per Week

This formula uses a custom tab to enable time tracking of hours worked per day. It uses a formula field to sum the hours per week.

```
MonHours__c + TuesHours__c + WedsHours__c + ThursHours__c + FriHours__c
```

Total Pay Amount

This formula determines total pay by calculating regular hours multiplied by a regular pay rate, plus overtime hours multiplied by an overtime pay rate.

```
Total Pay =
IF(Total_Hours__c <= 40, Total_Hours__c * Hourly_Rate__c,
40 * Hourly_Rate__c +
(Total_Hours__c - 40) * Overtime_Rate__c)
```

Sample Expense Tracking Formulas

For details about using the functions included in these samples, see [Formula Operators and Functions](#) on page 3934.

Expense Identifier

This formula displays the text "Expense-" followed by trip name and the expense number. This is a text formula field that uses an expense number custom field.

```
"Expense-" &
    Trip_Name__c & "-" & ExpenseNum__c
```

Mileage Calculation

This formula calculates mileage expenses for visiting a customer site at 35 cents a mile.

```
Miles_Driven__c * 0.35
```

Sample Financial Calculations Formulas

For details about using the functions included in these samples, see [Formula Operators and Functions](#) on page 3934.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Compound Interest

This formula calculates the interest, you will have after T years, compounded M times per year.

```
Principal__c * ( 1 + Rate__c / M ) ^ ( T * M )
```

Compound Interest Continuous

This formula calculates the interest that will have accumulated after T years, if continuously compounded.

```
Principal__c * EXP(Rate__c * T)
```

Consultant Cost

This formula calculates the number of consulting days times 1200 given that this formula field is a currency data type and consulting charges a rate of \$1200 per day. Note that `Consulting_Days` is a custom field.

```
Consulting_Days__c *  
1200
```

Gross Margin

This formula provides a simple calculation of gross margin. In this formula example, `Total_Sales` and `Cost_of_Goods_Sold` are custom currency fields.

```
Total_Sales__c - Cost_of_Goods_Sold__c
```

Gross Margin Percent

This formula calculates the gross margin based on a margin percent.

```
Margin_percent__c * Items_Sold__c * Price_item__c
```

Payment Due Indicator

This formula returns the date five days after the contract start date whenever `Payment_Due_Date` is blank. `Payment_Due_Date` is a custom date field.

```
(BLANKVALUE(Payment_Due_Date__c, StartDate +5)
```

Payment Status

This formula determines if the payment due date is past and the payment status is "UNPAID." If so, it returns the text "PAYMENT OVERDUE" and if not, it leaves the field blank. This example uses a custom date field called `Payment Due Date` and a text custom field called `Payment Status` on contracts.

```
IF(
AND(Payment_Due_Date__c < TODAY(),
ISPICKVAL(Payment_Status__c, "UNPAID")),
"PAYMENT OVERDUE",
null )
```

Sample Image Link Formulas

For details about using the functions included in these samples, see [Formula Operators and Functions](#) on page 3934.

Yahoo! Instant Messenger™ Image

This formula displays an image that indicates whether a contact or user is currently logged in to Yahoo! Instant Messenger. Clicking the image launches the Yahoo! Instant Messenger window. This formula uses a custom text field called `Yahoo Name` to store the contact or user's Yahoo! ID.

```
IF(ISBLANK(Yahoo_Name__c), "", HYPERLINK("ymsgr:sendIM?" & Yahoo_Name__c,
IMAGE("http://opi.yahoo.com/online?u=" & Yahoo_Name__c & "&m=g&t=0", " ")))
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Flags for Case Priority

This formula displays a green, yellow, or red flag image to indicate case priority.

```
IMAGE(
CASE( Priority,
"Low", "/img/samples/flag_green.gif",
"Medium", "/img/samples/flag_yellow.gif",
"High", "/img/samples/flag_red.gif",
"/s.gif"),
"Priority Flag")
```

Color Squares for Case Age

This formula displays a 30 x 30 pixel image of a red, yellow, or green, depending on the value of a `Case Age` custom number field.

```
IF( Case_Age__c > 20,
IMAGE("/img/samples/color_red.gif", "red", 30, 30),
IF( Case_Age__c > 10,
IMAGE("/img/samples/color_yellow.gif", "yellow", 30, 30),
IMAGE("/img/samples/color_green.gif", "green", 30, 30)
))
```

Traffic Lights for Status

This formula displays a green, yellow, or red traffic light images to indicate status, using a custom picklist field called `Project Status`. Use this formula in list views and reports to create a "Status Summary" dashboard view.

```
IMAGE (
CASE(Project_Status__c,
"Green", "/img/samples/light_green.gif",
"Yellow", "/img/samples/light_yellow.gif",
"Red", "/img/samples/light_red.gif",
"/s.gif"),
"status color")
```

Stars for Ratings

This formula displays a set of one to five stars to indicate a rating or score.

```
IMAGE (
CASE(Rating__c,
"1", "/img/samples/stars_100.gif",
"2", "/img/samples/stars_200.gif",
"3", "/img/samples/stars_300.gif",
"4", "/img/samples/stars_400.gif",
"5", "/img/samples/stars_500.gif",
"/img/samples/stars_000.gif"),
"rating")
```

Consumer Reports™—Style Colored Circles for Ratings

This formula displays a colored circle to indicate a rating on a scale of one to five, where solid red is one, half red is two, black outline is three, half black is four, and solid black is five.

```
IMAGE (
CASE(Rating__c,
"1", "/img/samples/rating1.gif",
"2", "/img/samples/rating2.gif",
"3", "/img/samples/rating3.gif",
"4", "/img/samples/rating4.gif",
"5", "/img/samples/rating5.gif",
"/s.gif"),
"rating")
```

Horizontal Bars to Indicate Scoring

This formula displays a horizontal color bar (green on a white background) of a length that is proportional to a numeric score. In this example, the maximum length of the bar is 200 pixels.

```
IMAGE("/img/samples/color_green.gif", "green", 15, Industry_Score__c * 2) &
IMAGE("/s.gif", "white", 15,
200 - (Industry_Score__c * 2))
```

Sample Integration Link Formulas

For details about using the functions included in these samples, see [Formula Operators and Functions](#) on page 3934.

Application API Link

This formula creates a link to an application outside Salesforce, passing the parameters so that it can connect to Salesforce via the SOAP API and create the necessary event.

```
HYPERLINK ("https://www.myintegration.com?sId=" & GETSESSIONID() & "?&rowID=" & Name & "action=CreateTask","Create a Meeting Request")
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Shipment Tracking Integration

This formula creates a link to FedEx, UPS, or DHL shipment tracking websites, depending on the value of a `Shipping Method` custom picklist field. Note that the parameters shown in this example for FedEx, UPS, and DHL websites are illustrative and do not represent the correct parameters for all situations.

```
CASE (Shipping_Method__c,
  "Fedex",
  HYPERLINK ("http://www.fedex.com/Tracking?ascend_header=1&clienttype=dotcom&cntry_code=us&language=english&tracknumbers= "& tracking_id__c, "Track"),
  "UPS",
  HYPERLINK ("http://wwwapps.ups.com/WebTracking/processInputRequest?HTMLVersion=5.0&sort_by=status&loc=en_US&InquiryNumber1= "& tracking_id__c & "&track.x=32&track.y=7", "Track") ,
  "DHL",
  HYPERLINK ("http://track.dhl-usa.com/TrackByNbr.asp?ShipmentNumber=" & tracking_id__c, "Track"), "")
```

Skype™ Auto Dialer Integration

This formula creates a linkable phone number field that automatically dials the phone number via the Skype VOIP phone application. It requires installation of the Skype application (a third-party product not provided by Salesforce) on your desktop.

```
HYPERLINK ("callto://+" & Country_Code__c & Phone_Unformatted__c, Phone)
```

Sample Lead Management Formulas

For details about using the functions included in these samples, see [Formula Operators and Functions](#) on page 3934.

Lead Aging (for open leads)

This formula checks to see if a lead is open and if so, calculates the number of days it has been open by subtracting the date and time created from the current date and time. The result is the number of days open rounded to zero decimal places. If the lead is not open, this field is blank.

```
IF (ISPICKVAL (Status,
  "Open"), ROUND (NOW () - CreatedDate, 0), null)
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Lead Data Completeness

This formula calculates the percent of certain lead fields that your sales personnel enter. The formula field checks the values of two custom number fields: `Phone` and `Email`. If the fields are empty, the formula returns the value "0." The formula returns a value of "1" for each field that contains a value and multiplies this total by fifty to give you the percentage of fields that contain data.

```
(IF(Phone = "", 0, 1) + IF(Email = "", 0, 1) ) * 50
```

Lead Numbering

This formula returns a number value for the text value in the auto-number field `Lead Number`. This can be useful if you want to use the `Lead Number` field in a calculation, such as round-robin or other routing purposes. Note that auto-number fields are text fields and must be converted to a number for numeric calculations.

```
VALUE(Lead_Number__c)
```

Round-Robin Assignment of Cases or Leads

The following formula example for leads assumes you have three lead queues and you want to assign an equal number of incoming leads to each queue. You can also assign cases using a similar formula.

```
MOD(VALUE(Lead_Number__c),  
3)
```

This formula is for a custom formula field named `Round_Robin_ID` that assigns each lead a value of 0, 1, or 2. This formula uses a custom auto-number field called `Lead Number` that assigns each lead a unique number starting with 1. The `MOD` function divides the lead number by the number of lead queues available (three in this example) and returns a remainder of 0, 1, or 2. Use the value of this formula field in your lead assignment rules to assign lead records to different queues. For example:

- `Round_Robin_ID = 0` is assigned to Queue A
- `Round_Robin_ID = 1` is assigned to Queue B
- `Round_Robin_ID = 2` is assigned to Queue C

Sample Metrics Formulas

For details about using the functions included in these samples, see [Formula Operators and Functions](#) on page 3934.

Temperature Conversion

This formula converts Celsius degrees to Fahrenheit.

```
1.8 * degrees_celsius__c + 32
```

Unit of Measure Conversion

This formula converts kilometers to miles.

```
Miles__c/.621371192
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Sample Opportunity Management Formulas

For details about using the functions included in these samples, see [Formula Operators and Functions](#) on page 3934.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Expected Product Revenue

This formula calculates total revenue from multiple products, each with a different probability of closing.

```
ProductA_probability__c * ProductA_revenue__c + ProductB_probability__c * ProductB_revenue__c
```

Maintenance Calculation

This formula calculates maintenance fees as 20% of license fees per year. `Maintenance_Years` is a custom field on opportunities.

```
Amount * Maint_Years__c * 0.2
```

Monthly Subscription-Based Calculated Amounts

This formula calculates an opportunity amount based on a monthly subscription rate multiplied by the subscription period.

```
Monthly_Amount__c * Subscription_Months__c
```

Monthly Value

This formula divides total yearly value by 12 months.

```
Total_value__c / 12
```

Opportunity Additional Costs

This formula calculates the sum of the product `Amount`, maintenance amount, and services fees. Note that `Maint_Amount` and `Service_Fees` are custom currency fields.

```
Amount + Maint_Amount__c +  
Services_Amount__c
```

Opportunity Categorization

This formula uses conditional logic to populate an `Opportunity_category` text field, based on the value of the `Amount` standard field. Opportunities with amounts less than \$1500 are "Category 1," those between \$1500 and \$10000 are "Category 2," and the rest are "Category 3." This example uses nested IF statements.

```
IF(Amount < 1500, "Category 1", IF(Amount > 10000, "Category 3", "Category 2"))
```

Opportunity Data Completeness

This formula takes a group of fields and calculates what percent of them are being used by your personnel. This formula field checks five fields to see if they are blank. If so, a zero is counted for that field. A "1" is counted for any field that contains a value and this total is

divided by five (the number of fields evaluated). Note that this formula requires you select the `Treat blank fields as blanks` option under `Blank Field Handling` while the `Advanced Formula` subtab is showing.

```
(IF(ISBLANK(Maint_Amount__c), 0, 1) +
IF(ISBLANK(Services_Amount__c), 0, 1) +
IF(ISBLANK(Discount_Percent__c), 0, 1) +
IF(ISBLANK(Amount), 0, 1) +
IF(ISBLANK(Timeline__c), 0, 1)) / 5
```

Opportunity Expected License Revenue

This formula calculates expected revenue for licenses based on probability of closing.

```
Expected_rev_licenses__c * Probability
```

Opportunity Revenue Text Display

This formula returns the expected revenue amount of an opportunity in text format without a dollar sign. For example, if the `Expected Revenue` of a campaign is "\$200,000," this formula field displays "200000."

```
TEXT(ExpectedRevenue)
```

Opportunity Total Deal Size

This formula calculates the sum of maintenance and services amounts.

```
Amount + Maint_Amount__c + Services_Amount__c
```

Opportunity Total Price Based on Units

This formula generates proposal pricing based on unit price and total volume.

```
Unit_price__c * Volume__c * 20
```

Professional Services Calculation

This formula estimates professional service fees at an average loaded rate of \$1200 per day. `Consulting_Days` is a custom field on opportunities.

```
Consulting_Days__c * 1200
```

Stage-Based Sales Document Selection

This formula identifies a relevant document in the `Documents` tab based on opportunity `Stage`. Use document IDs in the form of "001300000000j7AO."

```
CASE (StageName,
"Prospecting", "Insert 1st Document ID",
"Qualification", "Insert 2nd Document ID",
"Needs Analysis", "Insert 3rd Document ID",
"Value Proposition", ...
)
)
```

Sales Coach

This formula creates a hyperlink that opens a stage-specific document stored in the Documents tab. It uses the previously defined custom formula field that identifies a document based on opportunity `Stage`. See [Stage-Based Sales Document Selection](#) on page 4012.

```
HYPERLINK("/servlet/servlet.FileDownload?file=" & Relevant_Document__c, "View Document in New Window")
```

Shipping Cost by Weight

This formula calculates postal charges based on weight.

```
package_weight__c * cost_lb__c
```

Shipping Cost Percentage

This formula calculates shipping cost as a fraction of `total` amount.

```
Ship_cost__c / total_amount__c
```

Tiered Commission Rates

This formula calculates the 2% commission amount of an opportunity that has a probability of 100%. All other opportunities will have a commission value of zero.

```
IF(Probability = 1,  
ROUND(Amount * 0.02, 2),  
0)
```

Total Contract Value from Recurring and Non-Recurring Revenue

This formula calculates both recurring and non-recurring revenue streams over the lifetime of a contract.

```
Non_Recurring_Revenue__c + Contract_Length_Months__c * Recurring_Revenue__c
```

Sample Pricing Formulas

For details about using the functions included in these samples, see [Formula Operators and Functions](#) on page 3934.

Total Amount

This formula calculates a total amount based on unit pricing and total units.

```
Unit_price__c * Total_units__c
```

User Pricing

This formula calculates a price per user license.

```
Total_license_rev__c / Number_user_licenses__c
```

Sample Scoring Calculations Formulas

For details about using the functions included in these samples, see [Formula Operators and Functions](#) on page 3934.

Lead Scoring

This formula scores leads, providing a higher score for phone calls than website requests.

```
CASE (LeadSource, "Phone", 2, "Web", 1, 0)
```

Here's a formula that scores a lead based on his or her rating:

```
CASE (1, IF (ISPICKVAL (Rating, "Hot"), 1, 0), 3, IF (ISPICKVAL (Rating, "Warm"), 1, 0), 2, IF (ISPICKVAL (Rating, "Cold"), 1, 0), 1)
```

Customer Success Scoring

This formula uses a simple scoring algorithm to rank customers a high score for positive survey results in Salesforce.

```
Survey_Question_1__c * 5 + Survey_Question_2__c * 2
```

Formula Errors

- “#Error!” displays for a formula field whenever an error occurs while calculating the value of a formula. To resolve the error, check your formula.
 - Is the formula dividing by zero? If so, check if the denominator of your expression is zero and provide an alternative value. For example, the following campaign formula field is blank if the number of opportunities is zero:

```
IF (NumberOfOpportunities > 0,
    NumberOfWonOpportunities / NumberOfOpportunities, null)
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To view formula field details:

- “View Setup and Configuration”

To create, change, or delete formula fields:

- “Customize Application”

- Is the formula calculating a value larger than the maximum value of the current type? If so, you can append L to numeric values to make them Long so the intermediate products will be Long and no overflow occurs. For example, the following example shows how to correctly compute the amount of milliseconds in a year by multiplying Long numeric values.

```
Long MillsPerYear = 365L * 24L * 60L * 60L * 1000L;
Long ExpectedValue = 31536000000L;
System.assertEquals(MillsPerYear, ExpectedValue);
```

- Is the formula calculating the square root of a negative number? If so, use an IF function similar to the one above to check if the value is a positive number.
- Is the formula calculating the LOG of a negative number? If so, use an IF function similar to the one above to make sure that the number is positive.
- Is the formula using the VALUE function with text that contains special characters? For examples of special characters, see [Formula Operators and Functions](#) on page 3934.
- Make sure the formula does not contain a HYPERLINK function within a text function, such as LEFT (HYPERLINK ("http://MYCOMPANY.ORG ", "MYCOMPANY ") , 5).
- Is the formula disabled or referencing a disabled formula field? Salesforce disables formula fields when they are deleted and they remain disabled after they are restored. To enable disabled formula fields, edit and save the field. For more information on deleted custom fields and restoring them, see [Managing Deleted Custom Fields](#) on page 3835.
- “#Too Big!” displays if your formula output is over 18 digits. When this happens, check your formula for calculations that could result in more than 18 digits. Avoid multiplying large numbers, raising a large number to a power, or dividing by a very small number.
- CASE functions return an error whenever any of the expressions return an error, regardless of which one should be returned. For example, CASE(Field__c, "Partner", "P", "Customer", "C", LEFT(Field__c, -5)) returns an error even if the value of the field is “Partner” or “Customer” because the last statement is illogical.
- Prevent division by zero errors by including an IF function that determines if the value of a field is zero. For example, IF(Field__c =0,0, 25/Field__c).

Formula Field Limits and Restrictions

- Formula fields have these limits.
 - Character limit—Formula fields can contain up to 3,900 characters, including spaces, return characters, and comments. If your formula needs more characters, create separate formula fields and reference them in another formula field.
 -  **Note:** The maximum number of displayed characters after an evaluation of a formula expression is 1,300 characters.
 - Save size limit—Formula fields can’t exceed 4,000 bytes when saved. The save size is different from the number of characters if you use multi-byte characters in your formula.
 - Compile size limit—Formula fields can’t exceed 5,000 bytes when compiled. The compile size is the size of the formula (in bytes) including all of the fields, values, and formulas it references. There is no direct correlation between the compile size and the character limit. Some functions, such as TEXT, DATEVALUE, DATETIMEVALUE, and DATE significantly increase the compile size.
 -  **Tip:** For tips on how to rework your formulas to avoid these limits, see [Tips for Reducing Formula Size](#)
- Default value formulas for a record type can only reference fields for that record type. However, formula fields and formulas for approvals or rules for a record type can reference fields for that record type as well as any records that are related through a lookup or master-detail relationship. For example, a formula for a validation rule on opportunities can reference merge fields for accounts and campaigns as well as opportunities, and a formula field on accounts can reference fields for cases.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

- You can't use long text area, encrypted, or `Description` fields in formulas.
- The value of a field can't depend on another formula that references it.
- You can't delete fields referenced in formulas. Remove the field from the formula before deleting it.
- Campaign statistic fields can't be referenced in formulas for field updates, approval processes, workflow rules, or validation rules, but can be referenced in custom formula fields.

[Tips for Building Formulas](#)

[Building Formulas](#)

Merge Fields

Merge Fields Overview

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record. For example, you can place a merge field in an email template so that the greeting includes the recipient's name rather than a generic "Hello!". You can use merge fields within custom formula fields, s-controls, custom links, custom buttons, Visualforce pages, and when you create email or mail merge templates.

Merge field names are determined when you create a new custom field or object. `Field Name` is automatically populated based on what you type into `Field Label`. You can customize this field if you want, but keep in mind that the name must:

- Only use underscores and alphanumeric characters
- Begin with a letter and end with a letter
- Not include spaces
- Not contain two consecutive underscores

! **Important:** Ensure that the custom field name and label are unique for that object.

- If a standard and custom field have identical names or labels, the merge field displays the custom field value.
- If two custom fields have identical names or labels, the merge field may display an unexpected value.

If you create a field label called `Email` and a standard field labeled `Email` already exists, the merge field may be unable to distinguish between the fields. Adding a character to the custom field name makes it unique. For example, `Email2`.

To find the merge field name for an object or field in Salesforce, visit the object or field's detail page and refer to `Field Name`.

To incorporate merge fields, use the editor in the respective feature. Salesforce provides valid merge fields in each editor for all related standard and custom objects. If you're using the Connect for Office Word add-in to create mail merge templates, you'll see a complete list of valid merge fields to insert.

Syntax

The syntax for a merge field may differ, depending on where you're using it in Salesforce. To ensure that you're using the correct syntax, select merge fields from the drop-down list in the editor where you're using the merge field.

Custom objects and fields are always appended with `__c` when referenced. Field labels are preceded by the object, and all spaces are converted to underscores. For example, `Account.CreatedDate` references the `Created Date` standard field for the account object.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

The available merge fields vary according to which Salesforce edition you have.

In standard relationships, the name of the relationship is the master object. For example, you can reference the account name from a contact validation rule using `Account.Name`; you can reference the phone number of the account creator from an opportunity product formula field using `Opportunity.Account.CreatedBy.Phone`. In custom relationships, the name of the relationship is the value specified in `Field Name` with `__r` appended to it. For example, you can reference contact email from a custom object validation rule using `Contact__r.Email`.

General Tips

- To use a merge field as the destination of a link, insert the merge field after `http://`.
- Salesforce rounds numbers referenced in merge fields according to the user's locale, not the number of decimal spaces specified in the number field configuration.
- You can store the name of an account, contact, or lead in your organization's default language (the local name), in addition to the account or user's default language (the standard name). If the local name is blank, the standard merge field name is used.
- To reference a stand-alone file, use `$Resource.<resource_name>`, where `<resource_name>` is the name you specified when you uploaded the resource.
- If you're using the Translation Workbench to translate custom field names, users can look up merge fields in their chosen language.
- You can't use a lookup field as a merge field in an email template. You can, however, create a hidden formula field on the page layout that pulls the value from the lookup field. Then include the hidden field in the email template.

Merge Fields for Validation Rules

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Syntax and Formatting

When you insert a merge field in a validation rule, the syntax consists of the object, a period, and the field name. For example, `$User.State` corresponds with a user's state or province.

The syntax for a merge field may differ, depending on where you're using it in Salesforce. To ensure that you're using the correct syntax, select merge fields from the drop-down list in the editor where you're using the merge field. The merge fields for validation rules correspond directly with the fields in your app.

For a list of fields in an object, from the management settings for the object, go to the fields section.

Important:

- If a standard object and custom object have matching names or labels, only the standard object's fields display when you select from Available Merge Fields.

For example, if you have a custom object and a standard object both called `Quote`, you won't be able to select the custom object. To ensure that you can select merge fields from either object, add a character to make the custom object's name and label unique, such as `Quote2`.

- If two or more custom objects have matching names or labels, only one of the objects displays when you select from Available Merge Fields. Ensure that all custom objects have unique names and labels so that you can select merge fields from any of the objects.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

Limitations

Validation rules can't reference merge fields for:

- Auto number fields, such as `Requisition Number`
- Compound fields, such as addresses, first and last names, dependent picklists, and dependent lookups
 - 📌 **Note:** Validation rules can reference merge fields individual address fields, such as `Billing City`.
- Campaign statistic fields, including statistics for individual campaigns and campaign hierarchies

Tips

- Some merge fields display as radio buttons but function like picklist fields when referenced in a formula. Use the values "Read," "Edit," and "None" in a formula when referencing:
 - `$UserRole.CaseAccessForAccountOwner`
 - `$UserRole.OpportunityAccessForAccountOwner`
 - `CaseAccessLevel` (on Territory)
 - `OpportunityAccessLevel` (on Territory)
 Use the values "Read," "Edit," and "All" in a formula when referencing:
 - `AccountAccessLevel` (on Territory)
- Use the `RecordTypeId` merge field in your formula to apply different validations for different record types.

SEE ALSO:

[Find Object Management Settings](#)

Merge Fields for Formulas

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Syntax and Formatting

Merge fields for formulas aren't enclosed in curly braces or preceded by an exclamation point, nor are they preceded by the type of record. For example: `AccountNumber`. To ensure you're using the correct syntax, use the **Insert Field** button or the drop-down list in the formula editor.

[Tips for Using Merge Fields in Formulas](#)
[Building Formulas](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Merge Fields for Cross-Object Formulas

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Cross-object formulas are formulas that span two related objects and reference merge fields on those objects. Cross-object formulas can reference merge fields from a master (“parent”) object if an object is on the detail side of a master-detail relationship. Cross-object formulas also work with lookup relationships. For example, you can write a cross-object formula that references the `Account.Name` for a contact associated with a case. In this example, you would type `Contact.Account.Name` in a formula on the Case object.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Syntax and Formatting

Merge fields for formulas aren’t enclosed in curly braces or preceded by an exclamation point. Use the relationship names of the objects, not the labels. Although the relationship name is often the same as the object name, it is technically the field name of the relationship field.

To reference the parent account name from Account object, the syntax is `Parent.Name`, not `Account.Name`. When referencing a custom object, add two underscores and the letter *r* to its name. For example, `Position__r.title__c` references the `Job Title` field (`title__c`) on a Position custom object.

Limitations

You can’t reference:

- Merge fields for objects related to activities. For example, merge fields for contacts and accounts are not available in task and event formulas.
- The `$RecordType` global variable—it only resolves to the record containing the formula, not the record to which the formula spans. Starting with the Spring ’13 release, when you create a new formula the `$RecordType` global variable is only available for default value formulas.

The value of the `Profile.Name` merge field differs depending on the context of the cross-object formula field that references it. On detail pages, the value is the profile name, as expected; however, in list views and reports, the value is the internal value of the associated profile instead. If you use `Profile.Name` in a formula, use it within an `OR` function to ensure the formula always returns the intended result. For example:

```
IF
  (OR
    (LastModifiedBy.Profile.Name = "Standard User", LastModifiedBy.Profile.Name =
"PT2"),
    "Standard", "Not Standard")
```

None of the above applies to profile names referenced by the `$Profile` global variable.

Enhancing Your Business Processes

Which Automation Tool Should I Use?

Salesforce provides multiple tools to automate your organization's repetitive business processes: Approvals, Process Builder, Workflow, and Visual Workflow.

The best automation tool for your needs depends on the type of business process that you're automating.

- [How a record gets approved](#)
Example: Managers approve their direct reports' requests for vacation.
- [What to do when a record has certain values](#)
Example: Notify the account owner when a related case is escalated.
- [Collecting information from users or customers and then doing something with that information](#)
Example: Customer support uses a wizard to step through a call script, and cases are created based on the information that they enter.

How a Record Gets Approved

To automate your organization's processes for approving records, create approval processes.

What to Do When a Record Has Certain Values

Three of our tools can address this use case: Workflow, Process Builder, and Visual Workflow. Respectively, these tools create workflow rules, processes, and flows.

We recommend starting with Process Builder, especially for business processes that can be simplified to if/then statements. For example: if a case is escalated, then notify the account owner.

Process Builder includes almost all the functionality that's available in workflow rules, and more. In fact, a single process can do what it would normally take multiple workflow rules to do.

There are only two things that you can do with workflow that you can't do with processes.

- Configure actions to be executed at multiple intervals.
With a process, you can configure actions to be performed later, but all those actions are performed at the same time. If you need multiple "later"s, use workflow. For example, use multiple time triggers in a workflow rule to email an account manager one month, two weeks, one week, and three days before a related contract expires.
- Send outbound messages without code.
However, you can work around this limitation by calling Apex code from a process.

If the process is too complicated for the Process Builder or requires more advanced functionality, create a flow by using the Cloud Flow Designer. For example, create a flow to:

- Use complex branching logic (if certain conditions are true, evaluate for further conditions)
Example: First, check whether a case is escalated. If the case is escalated, check the account's region and route the case accordingly.
- Sort through, iterate over, and operate on several records

EDITIONS

Available in: Salesforce Classic

Processes and flows are available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Approvals are available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Workflow is available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Workflow tasks, email alerts, and flow triggers are not available in **Database.com**

Example: After an opportunity is closed and won, calculate the opportunity’s discount. Then apply that discount to all the related opportunity products.

Getting Information from Users or Customers and Then Doing Something with It

If you need to build a wizard to collect information, Visual Workflow is the tool for you. Create a flow that displays information to and requests information from a user. Then take the information that they enter and perform actions in Salesforce with it.

For example, create a flow that walks customer support representatives through a call script. The flow uses information that the representative entered, such as the caller’s name and account number, to create a case that’s assigned to the right person.

You can add more complexity to the flow to match your business process. For example:

- Route the representative to different screens, depending on earlier choices. This prevents the representative from doing things like trying to upsell a product to a customer who already bought that product.
- Check whether the reported problem is blocking the customer’s business and the account is high-value. If so, the flow notifies the region director.

Automation Tool Features

Here’s the breakdown of all the features and actions that are supported in each of our automation tools. Use it to figure out which tool is best for your business needs.

	Process Builder	Visual Workflow	Workflow	Approvals
Complexity	Multiple if/then statements	Complex	A single if/then statement	A single if/then statement
Visual designer	✔	✔		
Browser support	All (Chrome recommended)	All (Safari not recommended)	All	All
Starts when	Record is changed	<ul style="list-style-type: none"> • User clicks button or link • User accesses custom tab • Process starts • Apex is called 	Record is changed	<ul style="list-style-type: none"> • User clicks button or link • Process or flow starts that includes a “Submit for Approval” action • Apex is called
Supports time-based actions	✔ (only one time supported per criteria node)	✔	✔	
Supports user interaction		✔		
Supported Actions				
Call Apex code	✔	✔		

	Process Builder	Visual Workflow	Workflow	Approvals
Create records	✓	✓	Tasks only	Tasks only
Delete records		✓		
Launch a flow	✓	✓	✓ (Pilot) ¹	
Post to Chatter	✓	✓		
Send email (Email alerts only)	✓	✓	✓ (Email alerts only)	✓ (Email alerts only)
Send outbound messages without code			✓	
Submit for approval	✓	✓		
Update fields	Any related record	Any record	The record or its parent	The record or its parent

¹The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren't available for new organizations.

Using Process Builder

Lightning Process Builder Overview

Many of the tasks you normally assign, the emails you regularly send, and other record updates are vital parts of your organization's standard processes. Instead of doing this repetitive work manually, you can configure processes to do it automatically.

The Process Builder is a workflow tool that helps you easily automate your business processes by providing a powerful and user-friendly graphical representation of your process as you build it. The Process Builder's simple and powerful design allows you to:

- Create your processes using a convenient layout with point-and-click efficiency.
- Create your whole process in one place rather than using multiple workflow rules.
- Create processes by collaborating with different teams in your business.
- Stop using Apex code to automate simple tasks.

Automated processes in the Process Builder are based on records and consist of:

- Criteria that determine when to execute action groups.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

- Available in:
- Enterprise
 - Performance
 - Unlimited
 - Developer

- Immediate and scheduled actions to execute when those criteria are met.

Any change that causes a record to match the criteria can automatically trigger the action group.

You can use the more powerful and flexible Process Builder to perform the same actions as workflow. The process builder doesn't support outbound messages, but you can easily create one yourself with Apex. With the Process Builder, you can:

- Create a record
- Update any related record—not just the record or its parent
- Use a quick action to create a record, update a record, or log a call
- Launch a flow—you can't schedule this action with workflow
- Send an email
- Post to Chatter
- Submit for approval

If you need your process to do more than what those actions allow, don't worry. You can also call Apex from a process.

IN THIS SECTION:

[Sample Process: Opportunity Management](#)

This example automates a single business process by using the Process Builder instead of workflow rules.

Sample Process: Opportunity Management

This example automates a single business process by using the Process Builder instead of workflow rules.

The example demonstrates how you can use the Process Builder to automate a single process by adding multiple groups of criteria and then associating individual actions with those criteria. In addition, some actions are available with the Process Builder that you can't perform with workflow rules, such as creating records.

In this example, the process is defined to start when an opportunity record **(1)** is created or edited.

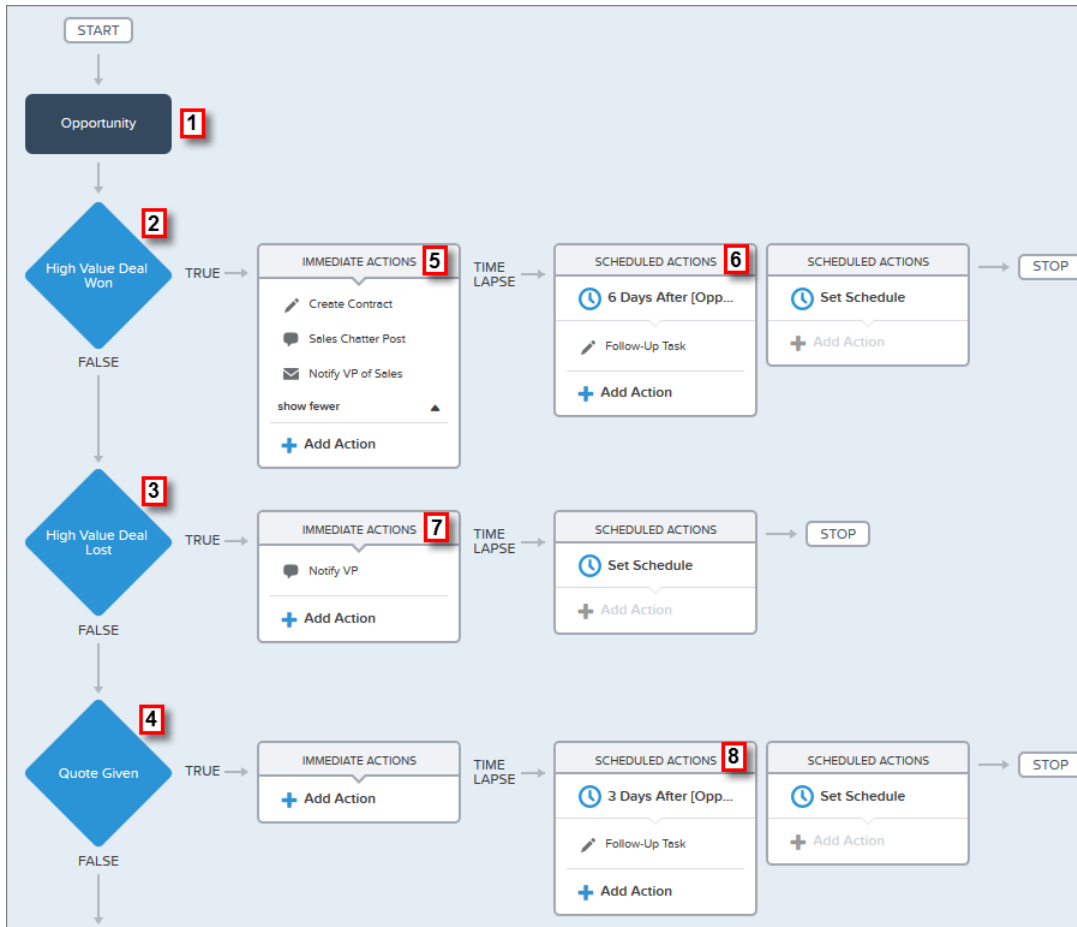

Three criteria nodes are then set up to check whether a high-value deal was won **(2)**, a high-value deal was lost **(3)**, or a quote was given **(4)**. For the first criteria node that evaluates to true, the associated action group is executed.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

The High Value Deal Won criteria checks whether the opportunity's stage is closed and won and also whether the opportunity's amount is greater than \$1,000,000.00. If both of these conditions are met, the associated action group is executed. For this criteria node, three immediate actions (5) and one scheduled action (6) are defined.

These actions:

- Create a draft contract record that's associated with the opportunity's account.
- Congratulate the opportunity owner for closing and winning the opportunity by posting to the Sales Chatter group.
- Notify the VP of sales via email that the opportunity was closed and won.
- Create a high priority follow-up task for the associated account's owner, which is scheduled to execute six days after the opportunity's Close Date.

If the High Value Deal Won criteria conditions aren't met, the associated group of actions doesn't execute and the next criteria node (High Value Deal Lost) is evaluated.

The High Value Deal Lost criteria node checks whether the opportunity stage is closed and lost and whether the opportunity amount is greater than or equal to \$1,000,000.00. If these conditions are true, we've set up an action (7) to notify the VP of sales by creating a chatter post on the opportunity record. The post identifies the opportunity and the opportunity amount that was lost.

If neither of the previous criteria conditions are met, the next criteria node defined in this process checks whether the opportunity stage is set to "Proposal/Quote Given." If this condition is true, a scheduled action (8) is executed three days after the record is updated. The scheduled action creates a follow-up task for the opportunity owner to make a call to inquire about the opportunity.

Using the Process Builder, we've combined three criteria nodes and associated actions into a single, automated process. To automate the same business process with workflow, you would have to create three different workflow rules and use Apex triggers to create the contract record and post to the Sales Chatter group.

Process Limits and Considerations

Before you start creating, managing, and activating processes, understand the limits and considerations.

 **Note:** We recommend that you use the most recent stable version of Google Chrome™, and your screen resolution must have a width of at least 1024.

IN THIS SECTION:

[Process Limits](#)

When using the Process Builder, keep shared limits and Apex governor limits in mind.

[Process Builder Accessibility Considerations](#)

Process Builder is 508-compliant, with one exception.

[Process Design Considerations](#)

Before you design a process, understand the limitations and guidelines.

[Process Chatter Considerations](#)

When creating a Chatter post from a process, consider the limitations.

[Process Scheduled Actions Considerations](#)

Before you add scheduled actions to a process, understand the limitations and guidelines.

[Process Setup Considerations](#)

When creating and managing processes, consider the administration and activation limitations.

[Process Activation Considerations](#)

Before you activate a process, understand when processes start evaluating records.

- Performance
- Unlimited
- Developer

Process Limits

When using the Process Builder, keep shared limits and Apex governor limits in mind.

Limits Shared with Other Features

Processes share some limits with rules and Visual Workflow.

In addition to the following limits, a process's `API Name` must be unique across all processes and flows in your organization.

Description	Per-Organization Limit
Total active rules and active processes. Rules include workflow rules, escalation rules, assignment rules, and auto-assignment rules.	50 per object
Total flows and processes	1000

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Description	Per-Organization Limit
Active flows and processes	500
Total number of criteria nodes that are evaluated and actions that are executed at runtime	2000
Total number of flow interviews that are resumed or groups of scheduled actions that are executed per hour	1000
Total number of flow interviews or groups of scheduled actions that are waiting to be processed	30,000
Total number of relative time alarms defined in flow versions or schedules based on a field value in processes	20,000

The daily limit for emails sent from email alerts is 1,000 per standard Salesforce license per organization—except for Developer Edition organizations, where the daily workflow email limit is 15 per standard Salesforce license. The overall organization limit is 2,000,000. This limit is shared across all features that use workflow email alerts: workflow rules, approval processes, flows, and processes.

Apex Governors and Limits for Processes

Salesforce strictly enforces limits to ensure that runaway processes don't monopolize shared resources in the multitenant environment. Processes are governed by the per-transaction limits that are enforced by Apex. If the process causes the transaction to exceed governor limits, the system rolls back the entire transaction. For details about the operations that are included in the transaction, see "Triggers and Order of Execution" in the *Force.com Apex Developer's Guide*.

Description	Per-Transaction Limit
Total number of SOQL queries issued	100
Total number of records retrieved by SOQL queries	50,000
Total number of DML statements issued	150
Total number of records processed as a result of DML statements	10,000

Each "Create a Record" action uses one DML statement. Each "Quick Action" action uses one DML statement. Each "Update Records" action uses one SOQL query and one DML statement. Each "Flows" action can use multiple SOQL queries and DML statements, depending on the elements that the flow executes. For details, see [Limits for Visual Workflow](#) on page 4179.

Process Builder Accessibility Considerations

Process Builder is 508-compliant, with one exception.

You can close modal dialogs using the ESC key on your keyboard, but you can't close side panels by using the ESC key.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Process Design Considerations

Before you design a process, understand the limitations and guidelines.

- Make sure that your processes aren't set up to create infinite loops. For example, if an Update Records action for Process1 triggers Process2 and a Create a Record action for Process2 triggers Process1, the looping might cause your organization to exceed its hourly limits.
- If you create processes to replace any workflow rules, make sure you delete those workflow rules when you activate the equivalent processes. Otherwise, both workflow rules and processes will fire and cause unexpected results, such as overwritten records or redundant email messages.
- If you create processes to replace any Apex triggers, make sure you delete those Apex triggers when you activate the equivalent processes. Otherwise, both workflow and processes will fire and cause unexpected results, such as overwritten records or redundant email messages.
- A process name must be 255 characters or fewer.
- A process's API name must be 77 characters or fewer.
- Each process is associated with a single object.
- If you have processes on converted leads and want to update the records that result from the conversion, you must enable the lead setting `Enable Validation and Triggers from Lead Convert`.
- You can't change the order of the criteria nodes or the order of the actions. After you add criteria nodes and actions, the only way to reorder them is to delete them and start over.
- Actions are executed in the order in which they appear in the Process Builder.
- If any of the actions fail, the entire transaction fails and an error message displays. For example, a Post to Chatter action fails if the Chatter group that it tries to post to is private. For details, see [Troubleshooting Your Processes](#) on page 4060.
- If a single action group includes multiple "Update Records" actions that apply different values to the same field, the last action's value is used.
- Processes that update owners don't also transfer associated items. To ensure transfer, use one "Update Records" action for each type of child record that you want to transfer. For example, if you're using a process to transfer an account to a new owner, use one action to update all the child contacts, one to update all the child opportunities, one to update all the child contracts, and so on.
- If your organization uses multiple currencies, currency fields are updated using the record's currency. If you choose to update a field based on a formula, any values in your formula are interpreted in the currency of the record.
- Email alerts aren't supported for task- or event-based processes.
- External objects aren't currently supported in the Process Builder.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Process Chatter Considerations

When creating a Chatter post from a process, consider the limitations.

- If your process creates a Chatter post to the feed of a specific user or group, and you deploy the process to another organization, the "Post to Chatter" action may not work because those IDs don't exist in the other organization.
- A Chatter action may fail to save if the `Message` starts with a field reference such as `{! [Account] . Name }`.

To work around this issue, add a space at the beginning of the message. For example, if a "Post to Chatter" action's `Message` starts with `{! [Account] . Name }` in an active process:

1. Open the active process.
2. Click **Clone**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

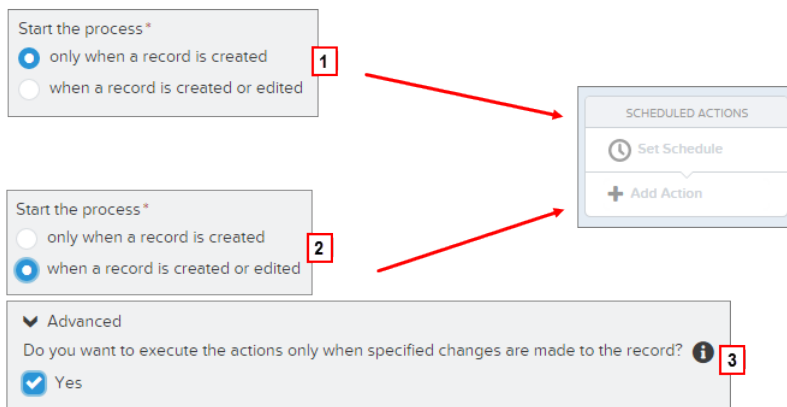

- Enterprise
- Performance
- Unlimited
- Developer

3. Choose whether to create a version of the current process or a completely new process with its own version history.
 4. Open the “Post to Chatter” action.
 5. In *Message*, enter a space before “{”.
 6. Save the action.
 7. Save and activate the process. Make sure to deactivate the original process.
- If you use Microsoft® Internet Explorer® version 11, you can’t paste text into a message. Copy and paste actions are allowed in all other supported browsers.
 - Post to Chatter actions aren’t supported if the action posts to a [Community](#) on page 2939 user or group. An error occurs when an activated process with this type of action evaluates a record.

Process Scheduled Actions Considerations

Before you add scheduled actions to a process, understand the limitations and guidelines.

- To add scheduled actions to your process, you have two options:
 - Start the process only when a record is created (1). Select this option when you choose an object for your process.
 - Start the process when a record is created or edited (2). In addition, select the advanced option to execute actions only when specified changes are made (3) when you add criteria to your process.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

- If scheduled actions fail to execute—for example, because the user who caused the process to start is inactive—the admin who created the process receives an email with details about the failure. Salesforce makes additional attempts to execute failed scheduled actions before removing them from the queue. For details about error notifications, see [Errors Received after a Process Starts Evaluating a Record](#).
- After you deactivate a process, any scheduled actions continue as usual.
- You can’t delete a process if it has unexecuted groups of scheduled actions. For details about deleting unexecuted groups of scheduled actions, see [Delete Unexecuted Scheduled Actions](#) on page 4060.
- An organization can process up to 1000 groups of scheduled actions per hour. Each group of scheduled actions is associated with a schedule, such as “3 days from now.” When a schedule is processed, the associated actions are executed. If an organization exceeds this limit, Salesforce processes the remaining schedules in the next hour. For example, if an organization has 1,200 groups of pending

actions scheduled to be processed between 4:00 PM and 5:00 PM, Salesforce processes 1000 groups between 4:00 PM and 5:00 PM and the additional 200 groups between 5:00 PM and 6:00 PM.

- An organization can have up to 30,000 pending schedules and waiting flow interviews at one time.
- For processes that are set to run when a record is created or edited, scheduled actions remain in the queue only as long as the criteria for those actions are still valid. If a record no longer matches the criteria, Salesforce removes the scheduled actions for that record from the queue.
- For processes that are set to run when a record is created, Salesforce never reevaluates the record with that process. Scheduled actions remain in the queue, even if the record no longer meets the associated criteria when the scheduled actions are executed.
- If you schedule an action for **0 Days Before** a date, save the process, and then reopen the process, the schedule in the process changes to **0 Days After** the date. The process still executes at the specified time.
- If you schedule an action for **0 Days After** a date, there may be a delay from the time represented by the date field before the action group executes.

Transactions and Scheduled Actions

Similar to workflow rules, immediate actions in processes are executed in the same transaction as the operation that caused the process to be triggered—when a user created or edited a record. For details about the operations that are included in that transaction, see Triggers and Order of Execution in the *Force.com Apex Developer's Guide*. Scheduled actions are included in a separate transaction.

Groups of scheduled actions aren't performed independently. They're grouped into a single batch that starts performing within one hour after the first group enters the batch. The batch can also include flow interviews that are resumed after a specified time occurs. This behavior can cause you to exceed your Apex governor limits if any actions in the group execute DML operations or SOQL queries. A DML operation is used each time a Salesforce record is created, updated, or deleted, such as when a process executes a "Create a Record" action. A SOQL query is used each time Salesforce looks up information about an existing record, such as when a process executes an "Update Records" action. For details on Apex governor limits, see [Process Limits](#) on page 4025.

If your process contains scheduled actions, make sure that the actions don't perform more DML operations or SOQL queries than are permitted by the Apex governor limits.

If a group of scheduled actions fails to be executed:

- Prior groups of scheduled actions in that batch's transaction are successful.
- The immediate actions for that process are successful.
- All the scheduled actions in that group fail to be executed.
- The remaining groups of scheduled actions in that batch are tried.

 **Example:** Salesforce is going to process a batch of 25 groups of scheduled actions in the same transaction. Up to 100 DML operations can be used across this batch. The first 22 groups each use five (5) DML operations, and the last three (3) groups don't use any DML operations.

The 21st group violates the Apex governor limits by trying to execute the 101st through 105th DML operations for this transaction. Only this group of scheduled actions fails to execute. This means that the first 20 groups of scheduled actions are successfully executed and the 21st group of scheduled actions fails. None of the actions in the 21st group is successful, no matter which action in the group violated the limit. Salesforce then tries to execute the remaining groups of scheduled actions in the batch. Because the 22nd group uses five (5) DML operations and the transaction has already used all of its allowed DML operations, the 22nd group also fails. Because the last three (3) groups don't use any DML operations, those groups are successfully executed.

Schedule Limitations

- If actions are scheduled for a time in the past, Salesforce executes that group of scheduled actions within one hour.

For example, if a process is configured to email an opportunity owner seven days before the close date and the process runs for an opportunity with the close date set to today, Salesforce executes the scheduled actions within an hour.

If actions are scheduled based on the current time (i.e. 3 days from now):

- The schedule is evaluated based on the timezone of the user who created the process.

If actions are scheduled based on a field value (i.e. 3 days after a case's `Created Date`):

- The schedule is evaluated based on the organization's timezone.
- If a deactivated process still has pending scheduled actions and the record whose field the schedule is based on is changed, Salesforce recalculates the schedule for those actions. Once a process is deactivated, Salesforce ignores all other changes to associated records.
- Across all of your processes and flow versions, your organization can have up to 20,000 schedules based on a field and relative time alarms.
- The referenced field can't be a:
 - DATE or DATETIME field that contains automatically derived functions, such as `TODAY` or `NOW`.
 - Formula field that includes related-object merge fields.
- If you change the referenced field value and the schedule hasn't been processed, Salesforce recalculates the schedule associated with that field.

For example, if a process is configured to email an opportunity owner seven days before the opportunity close date and the close date is set to 2/20/2014, Salesforce processes the schedule on 2/13/2014 and sends the email. If the close date is later updated to 2/10/2014 and the schedule hasn't been processed yet, Salesforce recalculates the schedule and sends the email on 2/3/2014. If Salesforce recalculates the schedule to a date in the past, Salesforce executes the associated actions shortly after you save the record.

- Salesforce ignores schedules that reference null field values.
- If the record or the object that the schedule is associated with is deleted, the schedule is never processed.
- The following limitations apply for converted leads.
 - You can't convert a lead if an unexecuted schedule is based on one of the lead's fields.
 - If `Validation and Triggers from Lead Convert` is enabled, scheduled actions on leads aren't executed during lead conversion.
 - If a campaign member based on a lead is converted before scheduled actions that are associated with that record finish, Salesforce still executes the scheduled actions.

Process Setup Considerations

When creating and managing processes, consider the administration and activation limitations.

- After you activate a process, you can no longer edit that process.
- A process can have up to 50 versions, but only one version of a process can be active.
- Before you change a custom field's type, make sure that it isn't referenced in a process that would be invalidated by the new type.
- You can't delete a custom field that is referenced by a process.
- To delete an active process, you must first deactivate it. If a process has any scheduled actions, it can't be deleted until those pending actions have been executed or deleted.

 **Note:** The Process Builder is supported in Microsoft® Internet Explorer® version 11. Previous versions aren't supported.

IN THIS SECTION:

[Setting Values in the Process Builder](#)

Throughout the Process Builder, you need to set values, for example, to set conditions in a criteria node, to set the fields on a new case in a Create a Record action, or to specify an Apex method to reference.

[Setting Advanced Options in the Process Builder](#)

The Process Builder allows you to choose some advanced options for executing actions in your processes.

[Process Formula Limitations](#)

Formulas that are used as conditions in a criteria node have some limitations. If a process contains an invalid formula, you can't save or activate the process.

[Process Change Sets and Packaging Considerations](#)

Keep these considerations in mind when deploying processes.

[Process Builder Error Messages](#)

Error or warning messages might refer to a "flow" instead of a "process." Those messages still apply to your process.

Setting Values in the Process Builder

Throughout the Process Builder, you need to set values, for example, to set conditions in a criteria node, to set the fields on a new case in a Create a Record action, or to specify an Apex method to reference.

IN THIS SECTION:

[Field Picker](#)

Use the field picker to reference fields on the record that started the process or fields on related records.

[Process Builder Value Types](#)

When setting a value for a given field—whether on the record that started the process or a related record—the available value types are filtered based on the field that you've selected.

[Multi-Select Picklists in the Process Builder](#)

The Process Builder lets you select multiple values for a multi-select picklist field.

Field Picker

Use the field picker to reference fields on the record that started the process or fields on related records.

To use fields on a related record, click a field with  next to the value. For example, use the Account ID field value on the case's contact's account.

The field picker displays only fields that are compatible with what's selected for Field or Flow and Apex Variables.

Process Builder Value Types

When setting a value for a given field—whether on the record that started the process or a related record—the available value types are filtered based on the field that you've selected.

The available value types are:

- **Currency**—manually enter a currency value.
- **Boolean**—choose a true/false boolean value.
- **DateTime or Date**—manually enter a date/time or date value.
- **Formula**—create a formula expression.
- **Global Constant**—choose a global constant to set a value to null or an empty string—for example, choose `$GlobalConstant.Null`.
- **ID**—manually enter a Salesforce ID value, for example, `00300000003T2PGAA0`.

 **Note:** If your process is based on a user ID (for example, when an `[Event].OwnerId` equals a specific ID value) make sure that the ID value is an 18-character ID and not a 15-character ID. You can convert a 15-character ID to 18 characters at www.adminbooster.com/tool/15to18.

- **MultiPicklist**—choose one or more multi-select picklist values.
- **Number**—manually enter a number value.
- **Picklist**—choose a picklist value.
- **Reference**—choose a field on the record or on a related record.
- **String**—manually enter a string value.

 **Note:** These global constant values aren't supported with the "is null" operator.

- `$GlobalConstant.Null`
- `$GlobalConstant.EmptyString`

Multi-Select Picklists in the Process Builder

The Process Builder lets you select multiple values for a multi-select picklist field.

For example, set multiple values for the `COUNTRY` field for a company record that operates in Ireland, the UK, and France.

You can use multi-select picklists in:

- Formulas
- Process criteria
- Create a Record actions
- Quick Actions
- Update Records actions

In process criteria, set multiple values by creating one condition for each individual multi-select picklist value. For example, if your process checks whether changes were made to an account's office locations, reference multiple values by choosing the same field for each multi-select picklist value.

Set Conditions

	Field*	Operator*	Type*	Value*
1	[Account].Offices...	Equals	MultiPicklist	Washington
2	[Account].Offices...	Equals	MultiPicklist	Oregon
3	[Account].Offices...	Equals	MultiPicklist	California

+ Add Row

Conditions*

All of the conditions are met (AND)
 Any of the conditions are met (OR)
 Customize the logic

Refer to [Tips for Working with Picklist and Multi-Select Picklist Formula Fields](#) for more information.

When you reference a multi-select picklist field in an action, enter values by clicking **Choose values...**

Add or remove values by dragging them between the Available (**1**) and Selected (**2**) columns.

Keep these considerations in mind when using operators with multi-select picklists.

- You can use the Equals operator if you select only one value from a multi-select picklist field.
- If you use the Equals operator with multiple multi-select picklist values and choose the **Any of the conditions are met (OR)** option, the condition matches on one value only. For example, if your process checks whether a `Region` field equals West or East, the condition evaluates to true when the value is West or when the value is East, but won't evaluate to true when both West and East are selected values.
- If you use **Contains** and **OR** to evaluate multiple multi-select picklist values, the condition evaluates to true on multiple values. For example, if your process checks whether a `Region` field contains West or East, the condition evaluates to true when a `Region` field contains West and East or when a `Region` field contains West or East values.

Setting Advanced Options in the Process Builder

The Process Builder allows you to choose some advanced options for executing actions in your processes.

Choose these options by expanding the **Advanced** area of the side panel when you:

- Add objects to your process
- Add criteria to your process

IN THIS SECTION:

[Process Builder Advanced Option Considerations](#)

Keep these considerations in mind when choosing advanced options.

[Reevaluate Records in the Process Builder](#)

When you add objects to your process, you can choose to evaluate a record multiple times in a single transaction.

[Avoid Unwanted Actions in Processes](#)

When you add criteria to your process, you can choose to execute actions only when specified criteria changes.

- Unlimited
- Developer

Process Builder Advanced Option Considerations

Keep these considerations in mind when choosing advanced options.

- Avoid creating an infinite loop when allowing your process to reevaluate records. For example, if your process checks whether an account description changes and then updates an account description and creates a Chatter post every time an account record is created or edited, the process will evaluate and trigger actions resulting in six Chatter posts.
- If you choose to evaluate a record multiple times in a single transaction when you specify an object for your process, we recommend not setting any of your criteria to No criteria—just execute the actions!
- We recommend that you don't use the advanced options if your process uses ISCHANGED, ISNEW, or PRIORVALUE formula functions. If you do use these options, keep these considerations in mind.

- When a record is first created, ISNEW evaluates to true throughout a process transaction. If your process uses the ISNEW formula function and reevaluates a record multiple times in a single transaction, the process may execute actions multiple times.

For example, your process checks whether an account is created or updated.

1. When ISNEW evaluates to true, the process updates the account's annual revenue and posts to Chatter.
2. When the process updates the account's annual revenue, the process then reevaluates the record (up to five additional times) because the record was changed.

Each time the criteria is evaluated, ISNEW evaluates to true. The results is six Chatter posts. This example is true only if the process is triggered because an account record is created.

- When a record is created, PRIORVALUE returns the current value as the prior value. When a record is updated, PRIORVALUE returns the field value that was set immediately before the transaction started. If your process uses the PRIORVALUE formula function and reevaluates a record multiple times in a single transaction, the process may execute actions multiple times. If your process reevaluates a record multiple times in a single transaction and executes actions only when specified criteria changes, the prior value returns the values that existed before the record was saved.

For example, your process checks whether an account is created or updated.

1. When $PRIORVALUE([Account].Type) = 'Prospect'$ evaluates to true, the process updates the account's annual revenue and posts to Chatter.
2. When an account is created with *Prospect* as the account type, the criteria is always true until the end of the process transaction.
3. If the process is changed to update the account type to *Other* when the criteria is true, then for an account created with *Prospect* as the account type, the formula $PRIORVALUE([Account].Type) = 'Prospect'$ will be true until the end of process transaction.

Each time the record is reevaluated, the prior value of the account's type is Prospect. The result is six Chatter posts.

- ISCHANGED always evaluates to false when a record is first created.

For example, your process checks whether an account description changes— $ISCHANGED([Account].Description)$ —and the process also reevaluates records multiple times in a single transaction. If an account is first created with a blank description value and another process updates the account description in the same transaction, ISCHANGED evaluates to true every time the record is reevaluated because it compares the account description value when the record was first created (a blank value) with whatever's set for the current value.

Let's say this same process creates a Chatter post every time $ISCHANGED([Account].Description)$ evaluates to true. This process would create a recursive loop resulting in six Chatter posts because ISCHANGED evaluates to true throughout the transaction.

Reevaluate Records in the Process Builder

When you add objects to your process, you can choose to evaluate a record multiple times in a single transaction.

If you choose this option, the process can evaluate the same record up to five additional times in a single transaction. It might reevaluate the record because a process, workflow rule, or flow updated the record in the same transaction.

For example, your sales review process includes multiple steps, approvals, notifications, and fields that need to be updated. Some of these changes may be part of your process, or they may be managed by other workflow rules or flows in your organization. If you allow the Process Builder to reevaluate a record multiple times in a single transaction, you can manage and evaluate all of these changes—even changes from other processes—in a single transaction in your process.

Avoid Unwanted Actions in Processes

When you add criteria to your process, you can choose to execute actions only when specified criteria changes.

For example, your process sends an email alert whenever a case has an Escalated status. Let's say your support team repeatedly updates the case description with new information. Whenever the case is saved with a new description, your process can check specifically whether the Escalated status changed instead of just repeatedly sending email alerts. This way, the process executes actions only if the status wasn't set to Escalated and was just changed to Escalated.

Tip: Check out this short video  [Avoid Unwanted Actions in Your Process](#) to learn more about this option.

This setting isn't supported if:

- Your process starts only when a record is created.
- Your process starts when a record is created or edited and the criteria node doesn't evaluate any criteria.
- The criteria node evaluates a formula, but the formula doesn't include a reference to the record that started the process.
- Your process uses the Is changed operator in a filter condition.

If Yes is...	Actions are executed if...	Actions are not executed if...
Selected	<ul style="list-style-type: none"> • The record was created. • The record was updated. Its current values meet the conditions, and its most recent previous values did not meet the conditions. 	<ul style="list-style-type: none"> • The record's current values meet the conditions, and the record's most recent previous values met the criteria. • The record's current values don't meet the conditions.
Deselected	<ul style="list-style-type: none"> • The record was created. • The record was updated, and its current values meet the conditions. 	The record's current values don't meet the conditions.

Process Formula Limitations

Formulas that are used as conditions in a criteria node have some limitations. If a process contains an invalid formula, you can't save or activate the process.

All formulas that are used in a criteria node must:

- Return `true` or `false`. If the formula returns `true`, the associated actions are executed.
- Not contain more than 3,000 characters.
- Not contain an unsupported function.

 **Tip:** Parentheses aren't included automatically when you insert a function. Be sure to add parentheses, for example, `TODAY ()`, when building a formula.

Unsupported Functions

If a formula in a process uses any of the following functions, the formula will return `null`.

- GETRECORDIDS
- IMAGE
- INCLUDE
- PARENTGROUPVAL
- PREVGROUPVAL
- REQUIRE SCRIPT
- VLOOKUP

For a complete list of operators and functions for building formulas in Salesforce, see [Formula Operators and Functions](#) on page 3934.

Note:

- If your process criteria uses a formula, don't create a formula that always evaluates to true, such as `2 < 5`.
- ISCHANGED is available as both a formula function and as an operator. When it's used as a formula function in process criteria, you can't reference a child record's related fields. For example, ISCHANGED isn't supported when referencing `[Case].Contact.AccountId` field, but it can be used when referencing `[Case].ContactId`.

Process Change Sets and Packaging Considerations

Keep these considerations in mind when deploying processes.

- The Metadata API allows you to deploy processes to another organization. However, keep in mind that:
 - If the process already exists in the target organization, it must be inactive or it won't deploy.
 - If the process doesn't exist in the target organization, it will deploy with an inactive status regardless of its status in the source organization.
- If a process is deployed to another organization in a managed package, you can only activate it or deactivate it. You can't view or edit the process.
- If you deploy a process through the Metadata API or change sets and the process contains any of the following actions, packageable components that they reference aren't included in the package or change set automatically. To deploy successfully, manually add those referenced components to the package or change set.

Process Builder Error Messages

Error or warning messages might refer to a “flow” instead of a “process.” Those messages still apply to your process.

Keep these considerations in mind when errors occur.

- If you create or edit a person account and your process uses an account field value (for example, *Account.Name Equals Acme*), users might see this error. "Workflow Action Failed to Trigger Flow The record couldn't be saved because it failed to trigger a flow." You can deactivate your process to avoid this error.
- A reference field contains an ID value that points to a unique record on another object. Errors occur if that ID value isn't set. For example:
 - Your process has a “Post to Chatter” action with a message that references an account name related to a contact record. *A new contact for account {[Contact].Account.Name} was created.* If the ID value for the account reference field on the contact record isn't set, an error occurs when the process runs.
 - Your process criteria checks whether the *Name* field on an account related to a contact record equals “Acme” (*[Contact].Account.Name Equals Acme*). If a user creates a contact record (related to an account) without setting the ID value, an error occurs. In this case, you can avoid the error by adding an additional filter condition above *[Contact].Account.Name Equals Acme* as follows: *[Contact].AccountId Is null False*.
- If your process criteria evaluates a lookup relationship field and that field value is empty, the process may fail.

For example, your process evaluates a custom lookup relationship field that references the status of a custom bug record related to a case. If the bug's status field is empty, the process fails and stops evaluating any remaining fields in the order listed in your process criteria. The process correctly evaluates the same lookup relationship field if you use an equivalent formula in your process criteria. If your process criteria doesn't use a formula, we recommend checking for *isNull* when referencing fields that traverse multiple related records.

Process Activation Considerations

Before you activate a process, understand when processes start evaluating records.

- Salesforce processes rules in the following order:
 1. Validation rules
 2. Assignment rules
 3. Auto-response rules
 4. Workflow rules and processes (and their immediate actions)
 5. Escalation rules

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

- Because updates to records based on processes don't trigger validation rules, processes can invalidate previously valid fields.
- Processes start automatically and are invisible to the user.
- Saving or creating records can trigger more than one process.

When Do Processes Start Evaluating Records?

- Processes can evaluate a record anytime a record is saved or created. However, processes that are created after records are saved don't evaluate those records retroactively.
- Processes can evaluate records up to five times in a single transaction if another process, workflow rule, or flow updates the record in the same transaction. See [Reevaluate Records in the Process Builder](#) on page 4036 for more details.
- Processes are triggered when a standard object in a master-detail relationship is re-parented.
- Processes only evaluate converted leads if validation and triggers for lead convert are enabled in your organization.
- Processes evaluate changes made to records while using Connect Offline when users synchronize.
- In a batch update, processes are only retriggered on the entities where there is a change.
- The following actions don't trigger processes:
 - Mass replacing picklist values
 - Mass updating address fields
 - Mass updating divisions
 - Changing the territory assignments of accounts and opportunities
 - Converting leads to person accounts
 - Deactivating Self-Service Portal, Customer Portal, or partner portal users
 - Converting state and country data by using the Convert tool
 - Making changes to state and country picklists using `AddressSettings` in the Metadata API

Creating Processes

To create a process, define its properties and which records it should evaluate, and then add criteria nodes and actions.

 **Tip:** Consider planning your process before you start. After you add criteria nodes and actions, the only way to reorder them is to delete them and start over.

IN THIS SECTION:

1. [Define the Process Properties](#)
Define the process properties to uniquely identify and help you manage your processes.
2. [Identify Which Records to Evaluate](#)
Associate the process with an object, and specify when to start the process.
3. [Add Process Criteria](#)
Define the criteria that must be true before the process can execute the associated actions.
4. [Add Actions to Your Process](#)
After you've defined a criteria node, define the actions that are executed when the criteria are met.

Define the Process Properties

Define the process properties to uniquely identify and help you manage your processes.

1. From Setup, enter *Process Builder* in the *Quick Find* box, select **Process Builder**, and then click **New**.

You can also modify an existing active process by cloning a new inactive copy of it. The copy can be a new process or a new version of the current process.

2. Fill out these fields to define your process.

Field	Description
Process Name	<p>The name for your process. <i>Process Name</i> must be 255 characters or fewer.</p> <p>This name appears in the process management page (from Setup, this page is located by entering <i>Process Builder</i> in the <i>Quick Find</i> box, then selecting Process Builder), so consider naming your process so that you can differentiate it from other processes.</p>
API Name	<p>The name that's used by the API and managed packages. <i>API Name</i> must be 79 characters or fewer.</p> <p>This name must be unique across all processes and flows. (In flows, this field is <i>Unique Name</i>.) The name must begin with a letter and use only alphanumeric characters and underscores. It can't include spaces, end with an underscore, or have two consecutive underscores.</p> <p>After it's saved, <i>API Name</i> can't be changed for the process.</p>
Description	<p>Optional. A description for your process.</p> <p>The description also appears in the process management page and is intended to help you differentiate between processes, such as to understand what the process does and when.</p>

3. Click **Save**.

- "View All Data"

Identify Which Records to Evaluate

Associate the process with an object, and specify when to start the process.

1. Click **Add Object**.
2. For `Object`, choose the object that you want to base this process on. Click **Find an object...** to open the drop-down list and type to filter the list.
After you save this panel, you can't change the selected object.
3. Select when you need the process to start.

If you want the process to start every time that...	Select
A record of the specified object type is created but not updated.	only when a record is created
A record of the specified object type is created or updated.	when a record is created or edited

 **Note:** If you're familiar with workflow rules and you're wondering what happened to the third option ("created, and any time it's edited to subsequently meet criteria"), don't worry! You'll get to that setting when you add criteria nodes if you select "when a record is created or edited" here.

4. To choose whether you want the process to evaluate a record multiple times in a single transaction, expand the **Advanced** area. If you select yes, the process can evaluate the same record up to five additional times in a single transaction. It might reevaluate the record because a process, workflow rule, or flow updated the record in the same transaction. See [Reevaluate Records in the Process Builder](#) on page 4036 for more information.
5. Click **Save**.

Add Process Criteria

Define the criteria that must be true before the process can execute the associated actions.

When criteria are met, the process executes the associated action group. When criteria aren't met, the process skips the action group and evaluates the criteria for the next action group. Remember that the process executes only one action group.

 **Tip:** Consider planning your process before you add criteria nodes and add actions to each node. After you add criteria nodes, the only way to reorder them is to delete them and start over. If you want to delete criteria, select the criteria in the canvas to open the side panel for that criteria. Then click **Delete** at the bottom of the side panel.

1. Click **Add Criteria**.

2. Enter a name for this criteria node.

The name appears on the canvas, so use a name that helps you differentiate between other criteria nodes.

3. Select the type of criteria that you need to define. This selection determines which fields appear later in the dialog box.

If you need...	Select
<p>The record to have certain field values.</p> <p>For example, to execute the associated actions on opportunity records with an amount greater than \$5,000, set the filter to:</p> <pre data-bbox="214 1024 906 1075">[Opportunity].Amount greater than \$5000.00</pre>	<p>Conditions are met</p>
<p>To evaluate the record by using a formula.</p> <p>For example, to execute the associated actions on accounts whose annual revenue is over \$1,000,000 when the account is changed by someone other than the owner, use this formula.</p> <pre data-bbox="214 1270 906 1375">AND (([Account].LastModifiedBy.Id <> [Account].Owner.Id) , ([Account].AnnualRevenue > 1000000))</pre>	<p>Formula evaluates to true</p>
<p>To simply execute the associated actions without evaluating the record.</p> <p>The process executes all the actions that are associated with this criteria node and doesn't evaluate any remaining criteria nodes in the process. Therefore, we recommend selecting this type of criteria only for the last criteria node in a process.</p>	<p>No criteria—just execute the actions!</p>

4. If you selected "Conditions are met":

a. Define the filter conditions by identifying the field values that the process needs to evaluate.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create, edit, or view processes:

- "Manage Force.com Flow"
- AND
- "View All Data"

Field	Select the field whose value you want to evaluate. You can also evaluate values for records that are related to the one that started the process. To do so, click on a related record with  next to the ID field. For example, if a contact record started the process, you can evaluate the value for the contact's account's Annual Revenue field. To access that field, click Account Id  , select Annual Revenue , and then click Choose .
Operator	The available operators depend on the field's data type.
Type	The available value types depend on the field's data type.
Value	Identify the value that you want to evaluate the field for. See Setting Values in the Process Builder on page 4031 for details.

- b. For **Conditions**, identify which conditions must be true for the process to execute the associated actions.

If you choose to use custom logic, enter a text string using:

- Numbers to refer to each condition
- AND or OR to identify whether all or just one of the conditions must true
- Parentheses to group parts of the string together

For example, if you enter 1 AND (2 OR 3), the outcome evaluates to true if the first condition is true and either the second or third outcome is true. The maximum length of the condition logic text is 1000 characters as per Flow restrictions.

 **Note:** Ambiguous logic separated by a parentheses may not cause a validation error. For example:

- 1 AND 2 OR 3 results in an error
- 1 AND (2 AND 3) OR 4 doesn't result in an error

Avoid creating ambiguous custom logic when grouping parts of a string or you may see unexpected results.

5. If you selected "Formula evaluates to true," define the formula.
6. Optionally, to specify whether you want to execute the actions only if the record was created or edited to meet criteria, click **Advanced** at the bottom of the panel.

For details, see [Avoid Unwanted Actions in Processes](#) on page 4036.

 **Note:** This setting is available only if the process starts when a record is created or edited and you selected "Filter conditions are met" or "Formula evaluates to true."

7. Click **Save**.

Add Actions to Your Process

After you've defined a criteria node, define the actions that are executed when the criteria are met.

An action group can consist of a combination of immediate and scheduled actions. Immediate actions are executed when evaluation criteria are met. Scheduled actions are executed at a specified time. For example, Salesforce can automatically send an email reminder to the account team if a high-value opportunity is still open ten days before the specified close date.

 **Tip:** Consider planning your process before you add criteria nodes and add actions to each node. After you add actions, the only way to reorder them is to delete them and start over. If you want to delete an action, select the action in the canvas to open the side panel for that action. Then click **Delete** at the bottom of the side panel.

Before you begin, consider whether you want this action to be executed immediately or at a specific time. If you want to execute the action at a specific time, [identify when those actions should be executed](#).

1. Click **Add Action**.
2. Select the type of action to create, and then fill out the fields to define the action.

IN THIS SECTION:

[Create a Record from a Process](#)

Create a record by manually entering values or by using the values of related records.

[Create a Chatter Post from a Process](#)

Post to the feed of a user, a Chatter group, or the record that started the process.

[Use a Quick Action from a Process](#)

Create a record, update a record, or log a call by using a quick action that you or another administrator created for your organization.

[Launch a Flow from a Process](#)

Start an autolaunched flow from your process to automate complex business processes—create flows to perform logic and have events trigger the flows via processes—without writing code.

[Send an Email from a Process](#)

Easily send an email from a process by using an email alert. Email alerts are configured outside of the Process Builder and contain the standard text, list of recipients, and template for an email.

[Submit a Record for Approval from a Process](#)

Submit the record that started the process for approval.

[Update Records from a Process](#)

Update one or more records—that are related to the record that started the process—by manually entering values or by using the values from related records.

[Call Apex Code from a Process](#)

Add customized functionality to your process by calling Apex from the process.

Specify When Your Actions Should Execute

If you want some actions to be executed at a specific time, first define the schedule for those actions.

 **Note:** Scheduled actions are complex features. See [Scheduled Actions Considerations](#) for more details.

Each action group that supports scheduled actions can have multiple schedules. For example, you can schedule some actions to be executed one day from now and other actions to be executed three days from now.

To identify when an action group's scheduled actions should be executed:

1. In an action group that supports scheduled actions, click **Set Schedule**.
2. If you need to schedule actions based on a date/time field on the record that started the process:
 - a. Leave the first radio button selected.
 - b. Click the drop-down list on the right side of the panel, and select the date that you want to use to schedule the action.
For example, if your process is based on an account record, choose the account's `Created Date`.
 - c. Specify a number of days or hours before or after the field.
If the criteria for this action group are still met when this time occurs, Salesforce executes the scheduled actions.
3. If you need to schedule actions to be executed a certain number of days or hours from when the process is executed:
 - a. Select the second radio button.
 - b. Specify the number of days or hours from when the process is executed.
If the criteria for this action group are still met when this time occurs, Salesforce executes the scheduled actions.
4. Click **Save**.

Create a Record from a Process

Create a record by manually entering values or by using the values of related records.

After you've created an action and selected "Create a Record" for the type, fill in the relevant fields to add the action to your process. The new record's `Created By` field will be set to the user who started the process—by creating or editing a record.

 **Warning:** If you create processes to replace any workflow rules, make sure you delete those workflow rules when you activate the equivalent processes. Otherwise, both workflow rules and processes will fire and cause unexpected results, such as overwritten records or redundant email messages. Do the same if you create processes to replace any Apex triggers.

1. Enter a name for this action.

This text appears on the canvas and helps you differentiate this action from others in your process. The name is truncated to fit on the canvas.

2. For `Record Type`, select the object that you want to create a record for. To filter the drop-down list, type the name of the object to filter the drop-down list.

When you select an object, at least one row appears to allow you to set field values for the new record.

 **Warning:** Rows appear automatically for fields that are required by the API. You might need to provide values for other fields. We recommend that you refer to your organization's page layouts to determine which fields are required.

3. Set the record's field values.

Field Select the field whose value you want to set. To filter the drop-down list, type the name of the field.

Type Select the type of value that you want to use. The available types depend on the field that you've selected.

Value Set a value for the field, by using the text entry field to manually enter a value or the field picker to use a field value from a related record. See [Setting Values in the Process Builder](#) on page 4031 for details.

4. Click **Save**.

Tip:

- If you set up your process to create an account record, `Name` appears as a required field. If you want to create a person account, you can add `LastName` as a field but it won't appear as required by default. You can enter a dummy value for the `Name` field.
- When you create a record, required fields normally appear at the top of the list. However, if you save a Create a Record action, close the process, and then re-open the action, required fields may not appear in the normal order.

Create a Chatter Post from a Process

Post to the feed of a user, a Chatter group, or the record that started the process.

This action is available only if your organization has Chatter enabled.

IN THIS SECTION:

[Post to a User's Chatter Feed from a Process](#)

Post to the feed of a user by identifying a specific user in your organization or a User lookup field on a record.

[Post to a Chatter Group from a Process](#)

Post to the feed of a specific Chatter group.

[Post to a Record's Chatter Feed from a Process](#)

Post to the feed of the record that started the process.

Post to a User's Chatter Feed from a Process

Post to the feed of a user by identifying a specific user in your organization or a User lookup field on a record.

After you've created an action and selected "Post to Chatter" for the action type, fill in the relevant fields to add the action to your process. The feed item will appear as if the user who started the process—by creating or editing a record—created the post.

 **Warning:** If the feed that the process tries to post to isn't available when the process is triggered (for example, because the user is now inactive), the user sees an error and the process fails.

1. Enter a name for this action.

This text appears on the canvas and helps you differentiate this action from others in your process. The name is truncated to fit on the canvas.

2. In the `Post to` field, select `User`.
3. For `User`, select where you want to find the user.
4. Based on your selection for `User`, search for or browse for the user whose feed you want to post to.

When you select a user from a record, you must ultimately select a field that contains a user's ID—for example, `Owner ID` or `User ID`.

5. Fill out the message that you want to post. Use the fields above the text box to mention a user or group and insert a merge field into the message. Use the field below the text box to add a topic. The message can contain up to 10,000 characters.

Post to a Record's Chatter Feed from a Process

Post to the feed of the record that started the process.

You can post to the record's Chatter feed only if feed tracking is enabled for the object that the process is associated with. The feed item will appear as if the user who started the process—by creating or editing a record—created the post.

After you've created an action and selected "Post to Chatter" for the action type, fill in the relevant fields to add the action to your process.

 **Warning:** If the feed that the process tries to post to isn't available when the process is triggered (for example, because the user is now inactive), the user sees an error and the process fails.

1. Enter a name for this action.
This text appears on the canvas and helps you differentiate this action from others in your process. The name is truncated to fit on the canvas.
2. In the `Post to` field, select This Record.
3. Fill out the message that you want to post. Use the fields above the text box to mention a user or group and insert a merge field into the message. Use the field below the text box to add a topic.
The message can contain up to 10,000 characters.
You can only reference topics that already exist. If you reference a merge field and that field doesn't have a value, it appears as a blank value.

4. Click **Save**.

Use a Quick Action from a Process

Create a record, update a record, or log a call by using a quick action that you or another administrator created for your organization.

Quick actions can be object-specific or global actions. Only "Create," "Update," and "Log a Call" actions are supported. To use a quick action from a process, the action must exist in your organization.

If your organization is using quick actions to help your users more easily create and update records, you can also use those actions in your process. When you use these quick actions in a process, you can only set values for fields that are part of the action's layout. If you don't already have one of these actions created, see [Create Global Quick Actions](#) on page 4542 or [Create Object-Specific Quick Actions](#) on page 4544 for details.

After you've created an action and selected "Quick Actions" for the type, fill in the relevant fields to add the action to your process. The new or updated record will appear as if the user who started the process—by creating or editing a record—created or updated it.

1. Enter a name for this action.
This text appears on the canvas and helps you differentiate this action from others in your process. The name is truncated to fit on the canvas.
2. Filter to specify the kind of action you want to use.

Filter Search By	Lets You Search Through
Global actions	All global actions in your organization. You then filter even further by selecting the Type of actions that you need to search through.
Object	All object-specific actions in your organization that are associated with a certain Object Name. Global actions can't be filtered by object.
Type	All object-specific and global actions in your organization based on the type, such as Create a Record or Log a Call.

- If you selected Global actions or Type, for `Type` select the specific type of quick action that you want to use.
- If you selected Object, for `Object` search for and select the object that you want to filter by.

3. For `Action`, search for and select the action that you want to use.

4. Set field values for the action.

Rows that appear automatically represent the action's required fields. To set values for the action's optional fields, add rows.

Field	Select the field whose value you want to set. To filter the drop-down list, type the name of the field. You can set values for fields that are included in the action's layout only.
Type	Select the type of value that you want to use. The available types depend on the field that you've selected.
Value	Set a value for the field. by using the text entry field to manually enter a value or the field picker to use a field value from a related record. See Setting Values in the Process Builder on page 4031 for details.

5. Click **Save**.

Launch a Flow from a Process

Start an autolaunched flow from your process to automate complex business processes—create flows to perform logic and have events trigger the flows via processes—without writing code.

In order to launch a flow from a process, you must create and activate the flow. The flow must be autolaunched. For details, see [Create a Flow](#) on page 4200.

1. Enter a name for this action.
This text appears on the canvas and helps you differentiate this action from others in your process. The name is truncated to fit on the canvas.
2. For **Flow**, search for and select the flow that you want to launch from this process.
Only active, autolaunched flows are available.
3. Optionally, click **Add Row** to set values for the flow’s variables.

Flow Variable	<p>Start typing the name of the flow variable whose value you want to set, or click <input type="text"/> to select a flow variable from the drop-down list.</p> <p>You can set values for any variables in the flow that have Input/Output Type set to Input Only or Input and Output.</p>
Type	<p>Select the type of value that you want to set. For example, select String to manually enter the values for a Text collection variable, or select Reference to use the value of a record for an sObject variable.</p>
Value	<p>Set a value for the flow variable.</p> <ul style="list-style-type: none"> • For collection variables, use the text entry field to specify a value. The value must match the collection variable's data type. • For sObject variables, use the field picker to select an ID field. The ID must correspond to a record whose object type matches the sObject variable's object type. • For sObject collection variables, use the field picker to select a related list. The selected records' object type must match the sObject collection variable's object type. For example, populate an sObject collection variable with all child contact records associated with the account that started the process. <p> Note: If the related list is empty when the flow tries to populate the sObject collection variable with field values from those records, the process fails.</p>

4. Click **Save**.

Send an Email from a Process

Easily send an email from a process by using an email alert. Email alerts are configured outside of the Process Builder and contain the standard text, list of recipients, and template for an email.

To send an email from a process, you must [create the email alert](#).

You can use only email alerts that are associated with the same object that the process is associated with. The record that started the process is used as the starting point for any merge fields that are used in the email alert.

After you've created an action and selected "Email Alerts" for the type, fill in the relevant fields to add the action to your process.

1. Enter a name for this action.

This text appears on the canvas and helps you differentiate this action from others in your process. The name is truncated to fit on the canvas.

2. For `Email Alert`, type two or more letters to search for the email alert that you want to use to send an email.

3. Click **Save**.

Submit a Record for Approval from a Process

Submit the record that started the process for approval.

After you've created an action and selected "Submit for Approval" for the type, fill in the relevant fields to add the action to your process.

Only the record that started the process will be submitted. You can't submit any related records for approval.

1. Enter a name for this action.

This text appears on the canvas and helps you differentiate this action from others in your process. The name is truncated to fit on the canvas.

2. For `Approval Process`, indicate whether you need to submit the record through the default approval process or through a specific approval process.

The process fails if:

- The record is submitted to the default approval process, and there are no active approval processes for the record's object type.
- The record is submitted to the default approval process, and it doesn't meet the criteria for any of the approval processes for the record's object type.
- The record is submitted to a specific approval process, and it doesn't meet the entry criteria.

3. If you need to submit the record to a specific approval process:

- a. Search for and select the approval process.
- b. Indicate whether you need to skip the entry criteria for the approval process.

4. For `Submitter`, identify who should receive notifications about the approval request.

Value	Description
Current User	The user who triggered the process by creating or editing a record.

Value	Description
User Field from a Record	The user ID that's stored in a field value on the record that's being submitted for approval or another record.
Other User	A specific user in your organization.

If the submitter isn't an allowed initial submitter on the approval process that runs, the process fails. Make sure that the initial submitters for the approval processes that are related to this object include all users who could trigger this process. For details about setting the initial submitters for an approval process, see [Create an Approval Process](#) on page 4123.

5. If necessary, enter submission comments.

Submission comments appear in the approval history for the specified record. This text also appears in the initial approval request email if the template uses the `{ !ApprovalRequest.Comments }` merge field.

6. Click **Save**.

Update Records from a Process

Update one or more records—that are related to the record that started the process—by manually entering values or by using the values from related records.

After you've created an action and selected "Update Records" for the action type, fill in the relevant fields to add the action to your process. The records' `Last Modified By` field will be set to the user who started the process—by creating or editing a record.

1. Enter a name for this action.

This text appears on the canvas and helps you differentiate this action from others in your process. The name is truncated to fit on the canvas.

2. For `Record Type`, select the record or records that you need to update, and then click **Choose**.

You can update only the record that started the process or records that are related to it. For example, you can reference `[Case].ContactId`, but not `[Case].Contact.AccountId`.

- To update the record that started the process, click the appropriate radio button. For example, if your process is based on a case record, click next to **Select the Case record that started your process**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create, edit, or view processes:

- "Manage Force.com Flow"
- AND
- "View All Data"

- To update a record that's related to the record that started the process, click the appropriate radio button and select one of the field names in the drop-down list.

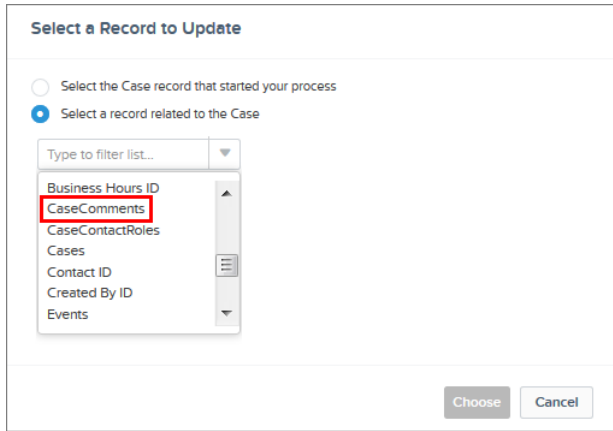

If you select a field that ends in "ID," you're selecting a single record. This field name corresponds to a lookup field on the original record. For details on lookup fields, see [Custom Field Types](#) on page 3819.

For example, if a case record started the process and you select `Account ID`, this action updates the account that's associated with the case.

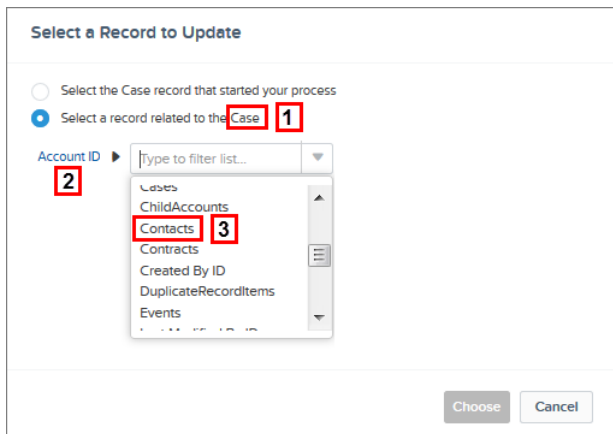

If you select a plural item that doesn't end in "ID," you're updating all the records of that object type that are related to the record that started the process. This plural item corresponds to child records of the original record, which might appear in a related list on the original record.

For example, if you select `CaseComments`, this action updates all the case comments that are related to the case.

- To update fields on a related record, click on a field with  next to it (ending in "ID") to access that record's fields. For example, let's say that, for a process that evaluates a case record (1), you want to update all contacts that are related to the case's parent account. Click **Account ID**  (2), then **Contacts** (3), and then **Choose**.

3. Optionally, specify conditions to filter the records you're updating.

For example, if your process updates the status of a parent case, specify conditions so that you won't update the parent case if its status is set to On Hold.

 **Note:** When you define conditions for updating records, you can't use filter logic (such as OR) or reference a child record's related fields. For example, you can reference `[Case].ContactId`, but not `[Case].Contact.AccountId`.

- Select **Updated records meet all conditions**.
- Set the conditions that you want to use to filter the updated records.

Field	Select the field whose value you want to evaluate.
Operator	The available operators depend on the field's data type.
Type	The available value types depend on the field's data type. See Process Builder Value Types on page 4032 for details.
Value	Identify the value that you want to evaluate the field for.

For example, if your process updates account records, you can choose to update only accounts with an annual revenue (1) greater than (2) \$1,000,000 (3).

4. Specify the new field values.

Field Select the field whose value you want to set. To filter the drop-down list, type the name of the field. You can assign values to fields only on the record or records that you identified in the `Object` field. Use a separate Update Records action to update fields on related records.

Type Select the type of value that you want to use. The available types depend on the field that you've selected.

Value Set a value for the field. For example, if you select a Formula value type, click **Build a formula...** to create a formula value for the field.

5. Click **Save**.

Call Apex Code from a Process

Add customized functionality to your process by calling Apex from the process.

After you've created an action and selected "Apex" for the type, fill in the relevant fields to add the action to your process.

Important: To use this action in a process, your developer needs to annotate one of the class's methods with `@InvocableMethod`. For details, see "InvocableMethod Annotation" in the *Force.com Apex Code Developer's Guide*.

The Apex class and the process are executed by the user whose action triggered the process.

1. Enter a name for this action.

This text appears on the canvas and helps you differentiate this action from others in your process. The name is truncated to fit on the canvas.

2. Choose an Apex class by entering the name of the Apex class to filter results or select an Apex class from the drop-down list.

3. If the class includes an invocable variable, you can manually enter values or reference field values from a related record.

The value must match the variable's data type. You can set values for `sObject` and primitive type list variables only.

- To set values for `sObject` variables and `sObject` list values, reference an object's related records, for example, all child contact records associated with the Account object that started the process.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create, edit, or view processes:

- "Manage Force.com Flow"
- AND
- "View All Data"

- To set a value for a primitive list variable (String, Integer, Time, and so on), select the String value type and enter a value in the text input field. You can't pass multiple values to lists.

4. Click **Save**.

 **Note:** If you define an Apex action in your process and then modify the Apex class by adding a standard field reference (for example, `User.Phone`), the Apex action is no longer visible in the process and must be re-added.

Manage Processes

The Process Builder allows you to see and manage all of your processes in one place. To manage a process, from Setup, enter *Process Builder* in the *Quick Find* box, then select **Process Builder**.

From the process management page, you can:

- [Create a process](#)
- Edit a process
- [Delete an inactive process](#)
- See the *statuses* of your existing processes
- Sort your processes by name, description, object, last modified date, or status

 **Note:** If you create a Salesforce Knowledge Article Type object and use that object to trigger a process, the object name won't display on the process management page.

When you open a process, you can:

- [Clone the process](#)
- [Activate or deactivate the process](#)
- [Edit the process properties](#)

From the Paused and Waiting Interviews list on the flow management page, you can:

- [Monitor scheduled actions](#) that haven't yet been executed
- [Delete groups of scheduled actions](#) that you no longer need to wait for

Process Status

Each process has a status that determines whether the process can be edited, activated, or deleted.

Status	Description	Editable?
Active	The process has been activated. You can't make changes to an active process. However, you can clone it. Make any necessary changes to the cloned process and then activate it. Don't forget to deactivate the original process if appropriate.	No
Inactive	The process is inactive and can be activated.	Yes

Clone a Process

If you want to make changes to an existing process, save a clone of that process. You can save the clone as either a new inactive process with its own version history, or as a new inactive version of the existing process.

To make changes to an active process, you have a few options.

- Deactivate it, make changes, and then reactivate it.
- Clone it as an inactive version, make changes, and then activate the new version. The original version is automatically deactivated.
- Clone it as a new inactive process, make changes and then activate it. The original process is not automatically deactivated, so consider whether it's appropriate for both processes to be active.

You can create up to 50 versions of a process, but only one version of a given process can be active.

1. From Setup, enter *Process Builder* in the **Quick Find** box, then select **Process Builder**.
2. Open the process or process version that you want to activate.
3. Click **Clone**.
4. You can create a version of the current process or a completely new process with its own version history.
5. Enter a name, API name, and description.
6. Click **Save**.

Activate a Process

Salesforce doesn't start using a process to evaluate records as they're created or edited until you activate it.

After you activate a process, you can no longer edit that process. However, you can click **Clone** to save the process as a new inactive process.

You can't activate a process unless it has:

- At least one defined criteria node
 - At least one defined immediate or scheduled action
1. From Setup, enter *Process Builder* in the **Quick Find** box, then select **Process Builder**.
 2. Open the process or process version that you want to activate.
 3. Click **Activate**.

If you activate a version of a process that already has an active version, the previously active version is automatically deactivated. To see that version later, refer to the process's version history.

After you've activated your process, consider creating or editing test records that will start the process to make sure it's working correctly. If you do, remember to delete those test records or return them to their previous values once you've confirmed that your process works as designed.

If you later want Salesforce to stop using a process to evaluate records as they're created or edited, open the active process and click **Deactivate**.

Delete a Process Version

If you no longer need to use a process version that you've defined, delete it.

To delete an active process, you must first deactivate it. You can't delete process versions with an Active status. If a process has any scheduled actions, it can't be deleted until those pending actions have been executed or [deleted](#).

1. From Setup, enter *Process Builder* in the *Quick Find* box, then select **Process Builder**.
2. Click the name of the process whose version you want to delete.
3. For the version that you want to delete, click **Delete**.
If your process has only one version and you delete that version, the whole process is deleted.
4. Click **OK**.

Monitor Your Processes' Pending Scheduled Actions

To see which of your processes are still waiting to execute scheduled actions, see the Paused and Waiting Interviews list on the flow management page.

1. From Setup, enter *Flows* in the *Quick Find* box, then select **Flows**.
2. Scroll down to the Paused and Waiting Interviews list.
3. Create a view to see scheduled actions in the Paused and Waiting Interviews list. We recommend displaying the following fields.

Action	Name	Flow Name 1	Paused Date 2	Current Element 3	Type 4	Created By
Del	00000002	opportunity_status	4/7/2015 4:34 PM	myWait_myRule_1	Workflow	AUser
Del	00000003	opportunity_status	4/7/2015 4:35 PM	myWait_myRule_1	Workflow	AUser
Del	00000004	Case_Escalation	4/7/2015 4:48 PM	myWait_myRule_2	Workflow	AUser

- Flow Name **(1)** corresponds to the process's *Process Name*.
- Paused Date **(2)** is the time at which the schedule started for the action group.
- Current Element **(3)** identifies the group of scheduled actions that Salesforce is waiting to execute.
- Type **(4)** indicates the type of a paused or waiting interview. Processes that are waiting to execute scheduled actions are of type Workflow.

Current Element displays *myWait_myRule_N*, where *N* is the number of the associated criteria and action group. For example, if Current Element displays *myWait_myRule_2*, Salesforce is waiting to execute the group of scheduled actions that are associated with the second criteria in the process.

- "View Setup and Configuration"

Delete Unexecuted Scheduled Actions

If you no longer need to wait for a process's scheduled actions to be executed—for example, because you need to delete the associated process—you can delete the unexecuted group of scheduled actions.

1. From Setup, enter *Flows* in the *Quick Find* box, then select **Flows**.
The Waiting Interviews related list displays any unexecuted scheduled actions in your organization, as well as any waiting flow interviews.
2. For each unexecuted group of scheduled actions that you want to delete, click **Del**.
You can identify the correct row by the *Flow Name* field, which corresponds to the process's *Process Name*.

Troubleshooting Your Processes

Use the error messages that appear in the Process Builder and the emails you receive when a process fails to help solve problems that arise when you're working with processes. When all else fails, look at the Apex debug logs for your processes.

IN THIS SECTION:

[Identifying Errors in the Process Builder](#)

The API names for criteria nodes and actions are created in the background. When you create or update processes, you might see error messages that reference those names to help you identify specifically where the problem occurred.

[Errors Received after a Process Starts Evaluating a Record](#)

When a user performs an action that triggers a process (such as creating a record) and that process fails, the user sees a page with this error: "Workflow Action Failed to Trigger Flow." In addition, the administrator who created the process receives an email with more details.

[Using Debug Logs to Troubleshoot Processes](#)

Use debug logs to find detailed information about your running processes after they finish running. For example, if a process doesn't seem to trigger when a record meets the process's criteria, or if you want to understand the sequence of processes being executed.

Identifying Errors in the Process Builder

The API names for criteria nodes and actions are created in the background. When you create or update processes, you might see error messages that reference those names to help you identify specifically where the problem occurred.

API Name	Description
<code>myVariable_current.field</code>	<p><i>field</i> is the name of the field that's referenced. <code>myVariable_current</code> refers to the field values that the record had when it started the process.</p> <p>For example, <code>myVariable_current.Id</code> corresponds to the record's field value for <code>Id</code> when the record started the process.</p>
<code>myVariable_old.field</code>	<p><i>field</i> is the name of the field that's referenced. <code>myVariable_old</code> refers to the most recent previous values of the record that started the process.</p> <p>For example, <code>myVariable_old.Id</code> corresponds to the record's field value for <code>Id</code> immediately before the record started the process.</p>

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Example:

The element has an invalid reference to `"myVariable_current.AnnualRevenue"`.

`myVariable_current.AnnualRevenue` refers to the value for the field `AnnualRevenue` when the record started the process.

 **Note:** Error or warning messages might refer to a "flow" instead of a "process." Those messages still apply to your process.

Errors Received after a Process Starts Evaluating a Record

When a user performs an action that triggers a process (such as creating a record) and that process fails, the user sees a page with this error: "Workflow Action Failed to Trigger Flow." In addition, the administrator who created the process receives an email with more details.

The email includes the element that failed, the error message from that failure, and a list of the criteria and actions that were executed in the process. The subject line is `Unhandled process fault from Company Name : Process_Name --- Error`.

Example:

```
Unhandled process fault from Acme Wireless : LeadConvert :
cannot reference converted...
// The error occurred when user 00DD00000007dHy triggered the
  LeadConvertEmail process
Encountered unhandled fault when running process
LeadConvertEmail/301D00000004HxZ
exception by user/organization: 00DD00000007dHy/{4}
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

```

Error
// The error occurred at the first action (A1) that's associated with the
// first criteria node (myRule_1).
An error occurred at element myRule_1_A1.
cannot reference converted lead .

This report lists the elements that the flow interview executed.

Flow Details
Flow Name: LeadConvertEmail
Type: Workflow
Version: 1
Status: ACTIVE

Flow Details
Start time(GMT): Thu Apr 09 21:52:14 GMT 2015
End time(GMT): Not Yet Finished
Duration: 0 seconds

// The process evaluated the first rule and tried to execute its action. The element
// that the process failed to executed, myRule_1_A1, is an Email Alert action.
Decision: myDecision
Email Alerts: myRule_1_A1
    
```

Using Debug Logs to Troubleshoot Processes

Use debug logs to find detailed information about your running processes after they finish running. For example, if a process doesn't seem to trigger when a record meets the process's criteria, or if you want to understand the sequence of processes being executed.

 **Tip:** Make sure that your filters include FINER events in the WORKFLOW category. For details, see [Debug Log Levels](#) on page 4977.

When using debug logs to troubleshoot a process, consider the following.

- Processes created in the Process Builder appear as flows and workflow rules in debug logs. The generated names have some resemblance to the process names, but they don't map one-to-one.
- Processes appear as flows of type Workflow.
- Immediate actions that may appear to be executed in a block are strung together in the flow. If one action fails in the middle, then the following actions might not run.
- Scheduled actions are executed after a Wait element. The actions are executed similarly to immediate actions after the process resumes.
- WF_CRITERIA_BEGIN and WF_CRITERIA_END refer to the workflow rule criteria that is always set to true and not the criteria defined in your process.
- Here's how Process Builder elements correspond to flow debug events.

EDITIONS

Example: Debugging a Process with an Immediate “Apex” Action

This example covers a process with an immediate “Apex” action.

Here’s what you can tell from this first snippet.

- The process is triggered by a lead with the name “L104”.
- The name of the process is “Apex Say Hello”, which corresponds with the name used in the log “Apex_Say_Hello301xx000000001Y”. The number appended to the end of the name is the process version’s ID.
- The process is set to trigger when a record is created or edited (ON_ALL_CHANGES).

```
17:07:29.086 (86806000) |EXECUTION_STARTED
17:07:29.086 (86928000) |CODE_UNIT_STARTED|[EXTERNAL]|Workflow:Lead
17:07:29.113 (113974000) |WF_RULE_EVAL_BEGIN|Assignment
17:07:29.114 (114043000) |WF_SPOOL_ACTION_BEGIN|Assignment
17:07:29.114 (114060000) |WF_ACTION|.
17:07:29.114 (114071000) |WF_RULE_EVAL_END
17:07:29.114 (114093000) |WF_RULE_EVAL_BEGIN|Workflow
17:07:29.114 (114178000) |WF_CRITERIA_BEGIN|
  [Lead: L104 00Qxx000002S8vh] |Apex_Say_Hello301xx000000001Y|
  01Qxx0000002nea |ON_ALL_CHANGES|0
```

In this section, the process compares the record’s current values to the values it had before it was changed. “myVariable_current” contains all of the record’s current field values. “myVariable_old” contains all of the field values of the record immediately before it was changed. “myVariable_old” has no values (null), so the process is evaluating a newly created lead.

Example: Debugging a Process with a Scheduled “Post to Chatter” Action

This example highlights parts of a debug log for a process with a scheduled “Post to Chatter” action.

A schedule is always indicated by “myWait_”. This section shows the process’s running schedule “myWait_myRule_2”. Any events that start with “FLOW_WAIT_” also correspond to a schedule in a process.

```
20:06:28.928 (928266000)|FLOW_ELEMENT_BEGIN|
 345ad8ae889702ab70b5df5712b14a3c990e9d-7ea5|WaitInfo|myWait_myRule_2
20:06:28.928 (928302000)|FLOW_ELEMENT_DEFERRED|
WaitInfo|myWait_myRule_2
20:06:28.928 (928361000)|FLOW_ELEMENT_END|
 345ad8ae889702ab70b5df5712b14a3c990e9d-7ea5|WaitInfo|myWait_myRule_2
20:06:28.929 (929671000)|FLOW_BULK_ELEMENT_BEGIN|
WaitInfo|myWait_myRule_2
20:06:29.005 (1005229000)|FLOW_WAIT_EVENT_WAITING_DETAIL|

20:06:30.225 (2225362000)|FLOW_BULK_ELEMENT_END|
WaitInfo|myWait_myRule_2|0|1296
```

...

```
20:06:30.234 (2234916000)|WF_TIME_TRIGGERS_BEGIN
20:06:30.248 (2248007000)|WF_ACTIONS_END|
Flow Trigger: 1;
20:06:30.248 (2248072000)|CODE_UNIT_FINISHED|
Workflow:Lead
20:06:30.250 (2250129000)|EXECUTION_FINISHED
```

For scheduled actions, the debug log shows an additional log when the scheduled actions are performed. This is a separate entry in the debug log, as shown in the following example for this scheduled “Post to Chatter” action. After the scheduled time occurs, an automated process executes the scheduled actions. The log uses coordinated universal time (UTC) instead of the user’s time zone. However, the actions are still executed as the user who originally caused the process to run.

“FLOW_WAIT_EVENT_RESUMING_DETAIL” indicates that the interview is being resumed so that the process can execute its scheduled actions. “alarmDateRef” indicates that this schedule is based on a field value. We then see that the “Post to Chatter” action is executed.

Workflow

Workflow

Your sales force operates more efficiently with standardized internal procedures and automated business processes. Many of the tasks you normally assign, the emails you regularly send, and other record updates are part of an organization's standard processes. Instead of doing this work manually, you can configure workflow rules and actions to do it automatically.

 **Note:** Consider using [processes](#) instead of workflow rules.

Each workflow rule consists of:

- Criteria that determine when Salesforce executes the workflow rule. Any change that causes a record to match this criteria can trigger the workflow rule—even changes to hidden fields.
- Immediate actions to take when the workflow rule executes. For example, Salesforce can automatically send an email that notifies the opportunity team when a new high-value opportunity is created.
- Time-dependent actions that Salesforce queues when the workflow rule executes. For example, Salesforce can automatically send an email reminder to the account team if a high-value opportunity is still open ten days before the specified close date. When Salesforce triggers a workflow rule that has time-dependent actions, you can use the [workflow queue](#) to monitor and cancel pending actions.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Workflow automates the following types of actions:

- [Email Alerts](#)—Send an email to one or more recipients. For example, automatically send sales management an email alert when a sales representative qualifies a large deal.
- [Tasks](#)—Assign a new task to a user, role, or record owner. For example, automatically assign follow-up tasks to a support representative one week after a case is updated.
- [Field Updates](#)—Update the value of a field on a record. For example, automatically change the Owner field on a contract three days before it expires.
- [Flow Triggers](#)—Trigger an autolaunched flow. The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren't available for new organizations.
- [Outbound Messages](#)—Send a secure configurable API message (in XML format) to a designated listener. For example, automatically initiate the reimbursement process for an approved expense report by triggering an outbound API message to an external HR system.

[Which Automation Tool Should I Use?](#)

[Create a Workflow Rule](#)

[Examples of Workflow Rules](#)

[Administrator tip sheet: Workflow: Automating The Process](#)

Create a Workflow Rule

Automate your organization's standard process by creating a workflow rule.

Watch a Demo:  [Creating a Workflow Rule](#)

IN THIS SECTION:

1. [Select the Object for Your Workflow Rule](#)
Get started with creating a new workflow rule by selecting the object the rule relates to.
2. [Configure Evaluation Criteria for Your Workflow Rule](#)
After selecting the object for your workflow rule, configure its settings and criteria.
3. [Add Automated Actions to Your Workflow Rule](#)
Add immediate and time-dependent actions to the workflow rule. Immediate actions trigger after evaluation criteria are met. Time-dependent actions specify when Salesforce executes the workflow action. For example, Salesforce can automatically send an email reminder to the account team if a high-value opportunity is still open ten days before the specified close date.
4. [Activate Your Workflow Rule](#)
Salesforce doesn't trigger a workflow rule until you activate it.

USER PERMISSIONS

To create or change workflow rules and actions:

- "Customize Application"

Select the Object for Your Workflow Rule

Get started with creating a new workflow rule by selecting the object the rule relates to.

1. From Setup, enter *Workflow Rules* in the **Quick Find** box, then select **Workflow Rules**.
2. On the workflow rules list page, click **New Rule**.
3. Choose an object to which you want this workflow rule to apply.

Note:

- If you have a workflow action that updates a field on a related object, that target object isn't the one that's associated with the workflow rule.
- To create workflow rules based on new case comments or incoming email messages that automatically update fields on their associated cases, choose Case Comment or Email Message. See [Considerations for Using Workflow Rules](#) for more information.
- To create a [site usage rule](#), choose one of the following:
 - **Organization** (for monthly page views allowed and monthly page views used fields)
 - **Site** (for site detail, daily bandwidth and request time, monthly page views allowed, and other fields)
 - **User License** (for the monthly logins allowed and monthly logins used fields)

The Organization and Site objects are only available if Force.com sites is enabled for your organization. The User License object isn't dependent on sites, and is only available if you have Customer Portals or partner portals enabled for your organization.

- You can't create email alerts for workflow rules on activities.
- This release contains a beta version of workflow on the User object that is production quality but has [known limitations](#).

4. Click **Next**.

IN THIS SECTION:

[Workflow for the User Object \(Beta\)](#)

You can create workflow rules and actions for the User object.

SEE ALSO:

[Create a Workflow Rule](#)

- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create or change workflow rules and actions:

- "Customize Application"

Workflow for the User Object (Beta)

You can create workflow rules and actions for the User object.

 **Note:** This release contains a beta version of workflow on the User object that is production quality but has known limitations. To provide feedback and suggestions, go to [IdeaExchange](#).

For the User object, you can set up workflow rules to:

- Send welcome email messages with training resources to newly created users.
- Send email alerts when users change roles or are deactivated.
- Use field updates to deactivate temporary employees after a specified period.
- Use outbound messages to sync user data with third-party systems.

 **Warning:** If you create workflow rules to replace any Apex triggers, make sure you delete those Apex triggers when you activate the equivalent workflow rules. Otherwise, both Apex triggers and workflow rules will fire and cause unexpected results, such as overwritten field updates or redundant email messages.

To use merge fields from user records in email templates, select from the following merge field types:

- **User Fields**—Use these merge fields to represent the sending user. Merge fields named `{!User.field_name}` return values from the user record of the person who created or updated the record that triggered the workflow rule.
- **Workflow Target User Fields**—Use these merge fields only in email templates for workflow rules on the User object. Merge fields named `{!Target_User.field_name}` return values from the user record that was created or updated to trigger the workflow rule.

Beta Limitations for Workflow on the User Object

Understand these limitations before you create workflow rules or workflow actions for the User object.

- Tasks are not supported as workflow actions for the User object.
- When setting the workflow rule criteria, you can't select `Current User` fields using the picklists. You can, however, use a formula to set the rule criteria and include fields from the current user. In the formula editor, click **Insert Field**, select `$USER`, select the field, and click **Insert**.
- Remember that custom validation rules run *before* workflow rules are executed. Refer to "Triggers and Order of Execution" in the *Force.com Apex Code Developer's Guide*.

SEE ALSO:

[Considerations for Using Workflow Rules](#)

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Configure Evaluation Criteria for Your Workflow Rule

After selecting the object for your workflow rule, configure its settings and criteria.

1. Give the rule a name and description.
2. Set the evaluation criteria.

Evaluate the rule when a record is:	Description
created	<p>Evaluate the rule criteria each time a record is created. If the rule criteria is met, run the rule. Ignore all updates to existing records.</p> <p>With this option, the rule never runs more than once per record.</p>
created, and every time it's edited	<p>Evaluate the rule criteria each time a record is created or updated. If the rule criteria is met, run the rule.</p> <p>With this option, the rule repeatedly runs every time a record is edited as long as the record meets the rule criteria.</p> <p> Note: If you select this option, you can't add time-dependent actions to the rule.</p>
created, and any time it's edited to subsequently meet criteria	<p>(Default) Evaluate the rule criteria each time a record is created or updated.</p> <ul style="list-style-type: none"> • For a new record, run the rule if the rule criteria is met. • For an updated record, run the rule only if the record is changed from not meeting the rule criteria to meeting the rule criteria. <p>With this option, the rule can run multiple times per record, but it won't run when the record edits are unrelated to the rule criteria.</p> <p>For example, suppose that for an opportunity record to meet the rule criteria, the opportunity probability must be greater than 50%. If you create an opportunity with a probability of 75%, the workflow rule runs. If you edit that opportunity by changing the probability to 25%, the edit doesn't cause the rule to run. If you then edit that opportunity by changing the probability from 25% to 75%, the edit causes the rule to run. With this last edit, the rule runs, because the record is changed from not meeting the rule criteria to meeting the rule criteria.</p>

3. Enter your rule criteria.

- Choose `criteria are met` and select the filter criteria that a record must meet to trigger the rule. For example, set the filter to "Opportunity: Amount greater than 5000" if you want opportunity records with an amount greater than \$5,000 to trigger the rule.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create or change workflow rules and actions:

- "Customize Application"

 **Note:**

- If your organization uses multiple languages, enter filter values in your organization's default language. You can add up to 25 filter criteria, of up to 255 characters each.
 - When you use picklists to specify filter criteria, the selected values are stored in the organization's default language. If you edit or clone existing filter criteria, first set the `Default Language` on the Company Information page to the same language that was used to set the original filter criteria. Otherwise, the filter criteria may not be evaluated as expected.
 - Workflow rules and entry criteria for approval processes and steps respect the user's locale and aren't triggered when the user is in a different language than that of the organization.
- Choose `formula evaluates to true` and enter a formula that returns a value of "True" or "False." Salesforce triggers the rule if the formula returns "True."

Examples of useful workflow formulas include:

- If the number of filled positions equals the number of total positions on a job, update the `Job Status` field to "Filled."
- If mileage expenses associated with visiting a customer site are 35 cents per mile and exceed a \$1,000 limit, automatically update the `Approval Required` field to "Required."
- If a monthly subscription-based opportunity amount is greater than \$10,000, create a task for an opportunity owner to follow up 60 days after the opportunity is closed.

The `$Label` variable isn't supported in workflow rule formulas. Also, some functions aren't available in workflow rule formulas.

 **Tip:** You can use merge fields for directly related objects in workflow rule formulas.

4. Click **Save & Next**.

SEE ALSO:

[Create a Workflow Rule](#)

Add Automated Actions to Your Workflow Rule

Add immediate and time-dependent actions to the workflow rule. Immediate actions trigger after evaluation criteria are met. Time-dependent actions specify when Salesforce executes the workflow action. For example, Salesforce can automatically send an email reminder to the account team if a high-value opportunity is still open ten days before the specified close date.

Tip: Time-dependent actions and time triggers are complex features with several [considerations](#).

If you plan on configuring workflow rules that have time-dependent actions, specify a default workflow user. Salesforce associates the default workflow user with a workflow rule if the user who initiated the rule is no longer active.

1. To add an immediate workflow action, click **Add Workflow Action** in the Immediate Workflow Actions section, and then select one of the following to associate with the rule.
 - `New Task` to create a [task](#)
 - `New Email` to create an [email alert](#)
 - `New Field Update` to define a [field update](#)
 - `New Outbound Message` to define an [outbound message](#)
 - `New Flow Trigger` to define a [flow trigger](#)

The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren't available for new organizations.

- `Select Existing Action` to select an [existing action](#)
2. To add a time-dependent workflow action, click **Add Time Trigger** in the Time-Dependent Workflow Actions section, and then:
 - a. Specify a number of days or hours before or after a date that's relevant to the record, such as the date when the record was created or modified. If the workflow rule is in effect when this time occurs, the time trigger fires the workflow action.
 - b. Click **Save**.

Note: The **Add Time Trigger** button is unavailable if any of the following conditions applies.

- The evaluation criteria is set to `Evaluate the rule when a record is: created`, and every time it's edited.
- The rule is activated.
- The rule is deactivated but has [pending actions](#) in the workflow queue.

3. Configure additional immediate or time-dependent actions.
4. Click **Done**.

Note: For all custom objects and some standard objects, you can create workflow and approval actions where a change to a detail record updates a field on the related master record. Cross-object field updates work for custom-to-custom master-detail

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Flow triggers are not available in Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited

- [Configure Evaluation Criteria for Your Workflow Rule](#)
- [Create a Workflow Rule](#)

Create an Email Alert Action for an Automated Process

Email alerts are supported in Process Builder, flows, workflow rules, approval processes, and milestones.

1. Enter *Email Alerts* in the `Quick Find` box, then select **Email Alerts**.
2. Click **New Email Alert**.
3. Configure the email alert.
 - a. Enter a description.
 - b. Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have actions of the same type with the same unique name, provided they are defined for different objects. The `Unique Name` field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
 - c. If available, choose the object for this email alert.

Salesforce uses this object when generating merge field values for email templates with workflow rules and approval processes. Also, you can define the recipients of this email alert using contact and user lookup fields that are relevant to that object. For example, if you select `Contract`, you can define the contract signer as a recipient. The object is read-only if the new email alert is associated with an approval process or workflow rule for a particular object.

 **Tip:** To create workflow rules for case comments so that comments added to cases send email alerts when a rule is triggered, select `Case Comment` in the `Object` drop-down list when creating a new workflow rule.

- d. Choose an email template.

 **Note:**

- With the exception of `{!ApprovalRequest.Comments}`, approval merge fields named `{!ApprovalRequest.field_name}` in email templates return values only in approval assignment emails and email alerts for approval processes. When used in other emails—including email alerts for workflow rules—the approval merge fields return `null`.
- The `{!ApprovalRequest.Comments}` merge field returns only the most recently entered comment in emails for an approval step that requires unanimous approval from multiple approvers.

- e. If available, select `Protected Component` to mark the alert as protected if it is part of a Managed - Released package.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Milestones are available in: **Enterprise, Performance, Unlimited, and Developer Editions**

Workflow and approvals are available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To create or change workflow rules:

- “Customize Application”

To create or change email alerts:

- “Customize Application”

- f. Select who should receive this email alert. Depending on your organization settings and the object you selected, some options in this list may not be available.
- **Account Owner**—The user listed as the account owner of either the account itself or the account associated with the record. This option only works for email alerts on accounts, opportunities, cases, contacts, contracts, and any custom object that is a child of the account object. Also, the associated account must have an account owner specified. If you select another object type or the associated account doesn't have an account owner, Salesforce sends the email alert to the record owner instead.
 - **Account Team**—All users assigned to a particular account team role.
 -  **Note:** The **Account Team** option is always available; however, emails are only sent when the rule is associated with the account object or any of its immediate child objects.
 - **Case Team**—All users assigned to a particular case team role.
 - **Creator**—The user who created the record.
 - **Customer Portal User**—All users associated with a Customer Portal.
 - **Email Field**—An email address field on the selected object, such as the **Email** field on lead records or custom email fields.
 -  **Note:** When creating email alerts for campaign members, **Email Field** refers to the email field on the lead or contact that the campaign member is based on.
 - **Owner**—The record owner.
 - **Partner User**—All users associated with a partner portal.
 - **Portal Role**—All users assigned to a particular portal role.
 - **Portal Role and Subordinates**—All users assigned to a particular portal role, plus all users in roles below that role.
 - **Public Groups**—The users in a particular public group.
 - **Related Contact**—An associated contact on the record. For example, you can select the **Customer Signed By** field for contracts that contain the name of the contract signer.
 - **Related Lead or Contact Owner**—A campaign member's lead or contact owner.
 - **Related User**—An associated user on the record. For example, contract records have an **Activated By** field that contains the name of the user that activated the contract.
 - **Role**—All of the users assigned a particular role.
 - **Role and Internal Subordinates**—All users in a particular role, plus all users in roles below that role, excluding partner portal and Customer Portal users.
 - **Role and Subordinates**—All users in a particular role, plus all users in roles below that role.
 - **User**—A particular user.
 - **Opportunity Team**—All users assigned to a particular opportunity team role. This option appears only when team selling is enabled.
 -  **Note:** The **Opportunity Team** option only works for email alerts configured for opportunities. It doesn't work for email alerts configured for child objects of opportunities.
- g. Select the recipients who should receive this email alert in the Available Recipients list and click **Add**.
- h. Enter up to five additional email addresses.
- i. You can change the **From Email Address** to:

- The email address of the default workflow user.
- A previously configured and verified organization-wide address. This allows you to use a standard global email address for your organization (such as `support@company.com`) instead of the default From field, which is the email address of the person who updates the record.

Only verified organization-wide email addresses display in the `From Email Address` picklist.

 **Note:**

- If you select **Make this the default From email address for this object's email alerts**, this email address overrides the `From Email Address` for all email alerts associated with that object. You can still customize individual email alerts to use a different `From Email Address`.
- The `From Email Address` in a workflow email alert changes to the current user when the email alert is installed by using a managed or unmanaged package. The `From Email Address` doesn't change when using other types of deployment such as the Metadata API or change sets.

j. Click **Save**.

4. To put email alerts into action, associate them with a workflow rule, approval process, or entitlement process.

Things to Keep in Mind

- If you change the object after selecting recipients, Salesforce clears the Selected Recipients list.
- If your email recipient is a record owner and the owner of the record is a queue, the queue email receives the email alert. If the queue is set up so that email is sent to all members, queue members are notified as well. If no queue email is specified, only queue members are notified.
- The daily limit for emails sent through email alerts is 1,000 per standard Salesforce license per organization—except for free Developer Edition and trial organizations, where the daily workflow email limit is 15 per standard Salesforce license. The overall organization limit is 2,000,000. This limit applies to emails sent through email alerts in workflow rules, approval processes, flows, processes, or the REST API.

SEE ALSO:

[Email Alerts](#)

[Daily Limit for Email Alerts](#)

Create an Automated Field Update Action

Field updates let you automatically specify a field value. Field updates are actions associated with workflow rules, approval processes, or entitlement processes.

Before you begin, review [Considerations for Field Update Actions](#).

 **Note:** For all custom objects and some standard objects, you can create workflow and approval actions where a change to a detail record updates a field on the related master record. Cross-object field updates work for custom-to-custom master-detail relationships, custom-to-standard master-detail relationships, and a few standard-to-standard master-detail relationships. For more information, see [Cross-Object Field Updates](#) on page 4089.

1. From Setup, enter *Field Updates* in the **Quick Find** box, then select **Field Updates**.
2. Click **New Field Update**.
3. Configure the field update.
 - a. Enter a name for this field update.
 - b. Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have actions of the same type with the same unique name, provided they are defined for different objects. The `Unique Name` field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
 - c. Enter a description.
 - d. Define the field update, including the object associated with the workflow rule or approval process, and the field to update. Note that the field to update may be on a related object in a master-detail relationship. Fields are shown only for the target object that you select.

 **Note:** You can use field updates on encrypted custom fields, but if you try to use a formula to set the new value, the encrypted field isn't available in the formula editor.
 - e. If available, check the `Protected Component` check box to mark the field update as protected.
 - f. Select the `Re-evaluate Workflow Rules After Field Change` checkbox if you want workflow rules on this object to be re-evaluated after the field value is updated. For more information, see [Field Updates That Re-evaluate Workflow Rules](#) on page 4090.
 - g. Specify the new field value. The available options depend on the type of field you are updating. You can:
 - Choose **A specific value**, and enter the value in the space provided.
 - Choose **A blank value (null)** if you want Salesforce to remove any existing value and leave the field blank. This option isn't available for required fields, checkboxes, and some other types of fields.
 - For record owners, choose the user to whom the record should be assigned. For case, lead, and custom object records, you can also choose a queue for this field. Select `Notify Assignee` to send an email to the new record owner (option unavailable when user control over task assignment notifications is enabled).
 - For checkboxes, choose `True` to select the checkbox and `False` to deselect it.
 - For picklists, select a specific value from the drop-down list, or select the value above or below the current value based on the sorting specified in the picklist definition. If you sort values alphabetically, the values above or below may be different for users in other languages.
 - Choose **Use a formula to set the new value** to calculate the value based on an expression, merge fields, or other values.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To define, edit, or delete field updates:

- "Customize Application"

- If you're building a formula for approvals or rules, such as workflow, validation, assignment, auto-response, or escalation, click **Insert Field**, choose a field, and click **Insert**.
- To insert case merge fields so that email messages update the associated case fields, click **Insert Field** on the Rule Criteria section and choose Email Message > Parent Case.
- To insert an operator, choose the appropriate operator icon from the `Insert Operator` drop-down list.
- You can insert a function from the Functions list. Functions are pre-built formulas that you can customize with your input parameters. See [Formula Operators and Functions](#) for a description of each operator and function.

h. Save your changes.

Tip: To create workflow rules so that case comments or emails automatically update fields on associated cases, select **Case Comment** or **Email Message** in the Object drop-down list when creating a new workflow rule and select **Case** in the Field to Update list. Email-to-Case or On-Demand Email-to-Case must be enabled for your organization to use the Email Message in a workflow rule.

When cases are updated by an email-triggered workflow rule, the updated case can trigger:

- Workflow rules
- Validation rules
- Updates to roll-up summary fields
- Escalation rules
- Apex triggers
- Entitlement processes

The updated case can't trigger:

- Assignment rules
- Auto-response rules

Create an Automated Outbound Message Action

When you associate an outbound message with a workflow rule, approval process, or entitlement process, the outbound message sends the selected information to the associated endpoint URL when the workflow rule or approval process is triggered. Once the endpoint URL receives the message, it can take the information from the message and process it, assuming that the Web service has been configured appropriately.

An outbound message is a workflow, approval, or milestone action that sends the information you specify to an endpoint you designate, such as an external service. Outbound messaging is configured in the Salesforce setup menu. Then you must configure the external endpoint. You can create a listener for the messages using the SOAP API.

For security reasons, Salesforce restricts the outbound ports you may specify to one of the following:

- 80: This port only accepts HTTP connections.
- 443: This port only accepts HTTPS connections.
- 1024–66535 (inclusive): These ports accept HTTP or HTTPS connections.

To define outbound messages:

1. Enter *Outbound Messages* in the **Quick Find** box, then select **Outbound Messages**.
2. Click **New Outbound Message**.

 **Note:** If you don't have this option, your organization doesn't have outbound messages enabled. Contact Salesforce to enable outbound messages.

3. Choose the object that has the information you want included in the outbound message, and click **Next**.

 **Tip:** To create workflow rules for case comments so that comments added to cases send outbound messages when a rule is triggered, select Case Comment in the **Object** drop-down list when creating a new workflow rule.

4. Configure the outbound message.
 - a. Enter a name for this outbound message.
 - b. Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have actions of the same type with the same unique name, provided they are defined for different objects. The **Unique Name** field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
 - c. Enter a description.
 - d. Enter an endpoint URL for the recipient of the message. Salesforce sends a SOAP message to this endpoint.
 - e. Select the Salesforce user to use when sending the message. The chosen user controls data visibility for the message that is sent to the endpoint.
 - f. Check the **Protected Component** check box to mark the outbound message as protected.
 - g. Select **Send Session ID** if you want the Salesforce session ID included in the outbound message. Include the session ID in your message if you intend to make API calls and you don't want to include a username and password. Never send a username and password in an unencrypted message, especially in a production environment. It isn't secure.
 - h. Select **Add failures to failed outbound message related list** if you want this message to move to the failed outbound messages related list after all retries have been attempted. If you don't see this option, failed outbound message notifications aren't enabled for your organization. Contact your Salesforce representative.

USER PERMISSIONS

To define, edit, or delete outbound messages:

- "Customize Application"
- AND
- "Manage Translation"
- AND
- "Manage Territories" (if territories are enabled)

Create an Automated Task Action for Workflow, Approvals, or Milestones

1. Enter *Tasks* in the **Quick Find** box, then select **Tasks**.
2. Click **New Task**.
3. Select an object and click **Next**. Remember, tasks can only be associated with workflow rules or approval processes for the same object type.

 **Note:** When creating tasks for custom objects, only custom objects that track activities are available.

Tasks aren't available for article types.

4. Configure the task:
 - a. Select an assignee. An assignee can be in the form of a user, role, record owner, record creator, opportunity team role, or account team role, depending on the type of record you chose.

 **Note:**

- If the assignee of a task is set to the record owner and the owner of a lead or case is a queue, the task is assigned to the person who triggered the rule.
- If the subject was translated, Salesforce creates the task in the assignee's language. If you checked **Notify Assignee** for the task, Salesforce sends the email in the assignee's language. However, if only the comments field was translated, Salesforce creates the task and sends the email in the language of the user who triggered the task.
- If a custom object has a master-detail relationship with a standard object, the owner of the custom object record is automatically set to the owner of the master standard object record. For example, if a custom object called "Expenses" has a master-detail relationship with Accounts, the owner of each expense record is the owner of the account for the expense.
- If the assignee of a workflow task is a role and more than one user belongs to that role, the record owner becomes the task assignee, regardless of their role. We recommend that you not assign tasks to roles with multiple users. Assigning tasks to roles with one user allows you to easily change the user in that role without modifying the workflow rule.
- When a lead is converted by someone who isn't the lead owner, all workflow tasks associated with the lead that are assigned to that user, except email alerts, are reassigned to the lead owner. Workflow tasks assigned to users other than the lead owner and lead converter aren't changed.

- b. Enter a subject for the task.
- c. Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have actions of the same type with the same unique name, provided they are defined for different objects. The **Unique Name** field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
- d. Choose a due date, status, and priority. Due dates appear in the time zone of the assignee.

EDITIONS

Workflow and approvals are available in: **Lightning Experience** and **Salesforce Classic**

Milestones are available in: **Salesforce Classic**

Workflow and approvals are available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Milestones are available in: **Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To create or change tasks:

- "Customize Application"

 **Note:** Configuring a task's `Due Date` to "Rule Trigger Date" sets time triggers and workflow task due dates based on the date that the workflow time trigger's action is executed. For example, if the task due date is "Rule Trigger Date plus 10 days" and the time trigger is executed on January 1, Salesforce sets the task due date to January 11.

- e. Check `Protected Component` to mark the task as protected.
- f. Enter any comments to add to the task.
- g. Click **Save**.

5. To put tasks into action, associate them with a workflow rule, approval process, or entitlement process.

 **Note:** You may notice that all your tasks include a `Created By` field. For tasks, this field contains the name of the person who saved the record that triggered the rule to assign the task.

Defining Flow Triggers for Workflow (Pilot)

Create a flow trigger workflow action to launch a flow from workflow rules. With flow triggers, you can automate complex business processes—create flows to perform logic, and have events trigger the flows via workflow rules—without writing code. For example, your flow looks up and assigns the relevant entitlement for a case. Create a flow trigger to launch the flow whenever a case is created, so that all new cases are automatically set with a default entitlement.

 **Note:** The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren't available for new organizations.

Before you begin:

- Create and activate the autolaunched flow that you want this workflow action to launch.
- Create the workflow rule that you plan to add this workflow action to.
- Understand the special behavior and limitations of flow triggers. See [Flow Trigger Considerations \(Pilot\)](#) on page 4101.

Complete these steps to create a flow trigger.

1. From Setup, enter `Flow Triggers` in the `Quick Find` box, then select **Flow Triggers**.
2. Click **New Flow Trigger**.
3. Select the same object as the workflow rule, and then click **Next**.
4. Configure the flow trigger.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To view workflow rules and actions:

- "View Setup and Configuration"

To create or change workflow rules and actions:

- "Customize Application"

Field	Description
Name	Name of the flow trigger.
Unique Name	Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have actions of the same type with the same unique name, provided they are defined for different objects. The <code>Unique Name</code> field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
<code>Protected Component</code>	Reserved for future use.

Field	Description
Flow	Unique name of the autolaunched flow that this workflow action launches.
Set Flow Variables	Whether to pass values into the flow's variables and sObject variables.

5. If you select `Set Flow Variables`, specify their names and values.

Click **Set Another Value** to set up to 25 variables.

Field	Description
Name	Select the name of the flow variable or sObject variable. Only variables whose <code>Input/Output Type</code> allow input access can be selected.

Value	<p>For a flow variable, you can:</p> <ul style="list-style-type: none"> • Enter a literal value. • Click , select a field, and click Insert. <p>For an sObject variable, you can:</p> <ul style="list-style-type: none"> • Click , select an sObject record, and click Insert. To help you distinguish between sObject records and fields, all sObject record options are marked with an asterisk (*) and appear at the top of each list. • Enter <code>{!this}</code> to use the current values of the record that was created or edited to cause the workflow rule to fire. • Enter <code>{!old}</code> to use the most recent previous values of the record that was edited to cause the workflow rule to fire. <p>In other words, <code>{!old}</code> identifies the same record as <code>{!this}</code> but uses the record's values from immediately before it was edited to cause the workflow rule to fire.</p> <p> Note:</p> <ul style="list-style-type: none"> • If the record was newly created, <code>{!old}</code> is <code>null</code>. • Unlike <code>{!this}</code>, <code>{!old}</code> can't be selected by clicking . You must manually enter <code>{!old}</code> in the Value column.
-------	---

6. To put the flow trigger in test mode, select `Administrators run the latest flow version`.

When selected and an administrator triggers the workflow rule, the flow trigger launches the latest version of the flow. For all other users, the flow trigger always launches the active version of the flow.

The same values are passed into the flow variables and sObject variables whether the flow trigger launches the active or latest flow version.

7. Click **Save**.

Don't forget to [associate the flow trigger to a workflow rule](#).

[Flow Triggers \(Pilot\)](#)

Identify Your Organization's Default Workflow User

Select a `Default Workflow User` that you want Salesforce to display with a workflow rule when the user that triggered the rule is not active.

If your organization uses time-dependent actions in workflow rules, you must designate a default workflow user. When the user who triggered the rule isn't active, Salesforce displays the username of the default workflow user in the `Created By` field for tasks, the `Sending User` field for email, and the `Last Modified By` field for field updates. Salesforce does not display this username for outbound messages. If a problem occurs with a pending action, the default workflow user receives an email notification.

When workflow email alerts approach or exceed certain limits, Salesforce sends a warning email to the default workflow user or—if the default workflow user isn't set—to an active system administrator.

1. From Setup, enter *Process Automation Settings* in the `Quick Find` box, then select **Process Automation Settings**.
2. For `Default Workflow User` select a user.
3. Click **Save**.

Selecting Existing Actions

Workflow actions created for a [workflow rule](#) or [approval process](#) can be associated with other workflow rules and approval processes.

To associate existing workflow actions with a workflow rule:

1. From Setup, enter *Workflow Rules* in the **Quick Find** box, then select **Workflow Rules**.
2. Select the workflow rule.
3. Click **Edit** in the Workflow Actions section.
4. Click **Add Workflow Action** in either the Immediate Workflow Actions or Time-Dependent Actions section, depending on when you want the action to occur, and choose **Select Existing Action**. See [Add Automated Actions to Your Workflow Rule](#) on page 4074.
5. Select the type of action to associate with the workflow rule. The **Available Actions** box lists all existing actions of that type.
6. Enter the name of a specific action in the text field and click **Find**.
7. Select the actions in the **Available Actions** box and use the right arrow to move them to the **Selected Actions** box. If necessary, select the left arrow to remove actions from the **Available Actions** box.
8. Click **Save**.

To associate existing workflow actions with an approval process:

1. From Setup, enter *Approval Processes* in the **Quick Find** box, then select **Approval Processes**.
2. Click the name of an approval process.
3. Depending on when you want the action to occur, do one of the following:
 - Click **Add Existing** in the Initial Submission Actions, Final Approval Actions, Final Rejection Actions, or Recall Actions section.
 - Click **Show Actions** in the Approval Steps section, then click **Add Existing** in the Approval, Rejection, or Recall Actions section.
 See [Selecting Approval Actions](#) on page 4132.
4. Select the type of action you want to associate with the approval process. The **Available Actions** box lists all existing actions of the selected type.
5. Enter the name of a specific action in the text field and click **Find**.
6. Select the actions in the **Available Actions** box that you want to associate with the approval process, and use the right arrow to move the actions to the **Selected Actions** box. If necessary, select the left arrow to remove actions from the **Available Actions** box.
7. Click **Save**.

Activate Your Workflow Rule

Salesforce doesn't trigger a workflow rule until you activate it.

To activate a workflow rule, click **Activate** on the workflow rule detail page. Click **Deactivate** to prevent a rule from triggering or if you want to edit the time-dependent actions and time triggers that are associated with the rule.

SEE ALSO:

[Create a Workflow Rule](#)

Workflow Actions

Task Actions

A *task action* determines the details of an assignment given to a specified user by an automated process, such as a workflow rule or approval process. When a workflow rule or approval process meets the business conditions you set up, any tasks associated with it are assigned to designated users with the *Subject*, *Status*, *Priority*, and *Due Date* of the workflow task.

To get started using tasks, enter *Tasks* in the *Quick Find* box, then select **Tasks**.

Note:

- Before you create a task for a custom object, make sure the custom object tracks activities.
- Tasks don't trigger task-based workflow rules if they're created automatically, such as by clicking the **Send An Email** button or by using the Email to Salesforce **BCC** address field.
- Tasks aren't available for article types.

Cross-Object Field Updates

For all custom objects and some standard objects, you can create workflow and approval actions where a change to a detail record updates a field on the related master record. Cross-object field updates work for custom-to-custom master-detail relationships, custom-to-standard master-detail relationships, and a few standard-to-standard master-detail relationships.

For example, in a custom recruiting application, create a workflow rule that sets the status of an application (the master object) to “Closed” when a candidate (the detail object) accepts the job. Or, for standard objects, create a rule to change the status of a case from “Awaiting Customer Response” to “In Progress” when a customer adds a case comment.

 **Note:** The cross-object field update function may depend on certain critical updates being active. From Setup, enter *Critical Updates* in the **Quick Find** box, then select **Critical Updates** to see if your organization requires any updates.

EDITIONS

Custom Object to Custom Object

You can use cross-object field updates for all custom objects that are children of custom objects in a master-detail relationship.

Custom Object to Standard Object

You can use cross-object field updates for custom objects that are children of certain standard objects in a master-detail relationship. The standard objects which support cross-object field updates from custom objects are:

- Account
- Asset
- Campaign
- Case
- Contact
- Contract
- Contract Line Item
- Entitlement
- Opportunity
- Order
- Question
- Quote
- Service Contract
- Solution

Standard Object to Standard Object

You can use cross-object field updates for standard objects that are children of standard objects in a master-detail relationship. However, only a few standard-to-standard relationships are supported:

- Case Comments updating Case
- Email updating Case

 **Tip:** To create workflow rules so that case comments or emails automatically update fields on associated cases, select **Case Comment** or **Email Message** in the Object drop-down list when creating a new workflow rule and select **Case** in the Field

to Update list. Email-to-Case or On-Demand Email-to-Case must be enabled for your organization to use the Email Message in a workflow rule.

- Opportunity Product updating Opportunity

 **Note:** Cross-object field updates to a parent opportunity's `Amount` and `Quantity` fields only work if the opportunity has no opportunity products associated with it.

- Opportunity updating Account—Supported for both business accounts and person accounts.

 **Note:** If you have workflow rules on converted leads and want to use cross-object field updates on the resulting accounts and opportunities, you must enable the lead setting `Enable Validation and Triggers from Lead Convert`.

When configuring standard-to-standard cross-object field updates, consider that:

- Standard-to-standard cross-object field update actions can't be used in, or assigned to, approval processes.
 - A standard-to-standard cross-object field update can still update a parent record even if the user doesn't have edit access to it.
-  **Note:** If you have Apex code in place that's updating parent fields in the same relationships supported by cross-object field updates, consider leveraging the functionality of the standard cross-object field updates and then removing your Apex code. Otherwise, both will fire, and since workflow rules run after Apex triggers, the workflow field update will override any change made by your Apex code.

SEE ALSO:

[Create an Automated Field Update Action](#)

[Considerations for Field Update Actions](#)

[Object Relationships Overview](#)

Field Updates That Re-evaluate Workflow Rules

Selecting the `Re-evaluate Workflow Rules After Field Change` checkbox on the Field Update Edit page allows you to set a workflow field update to re-evaluate all workflow rules on the object if the field update results in a change to the value of the field.

- If the field update changes the field's value, all workflow rules on the associated object are re-evaluated. Any workflow rules whose criteria are met as a result of the field update will be triggered.
- If any of the triggered workflow rules result in another field update that's also enabled for workflow rule re-evaluation, a domino effect occurs, and more workflow rules can be re-evaluated as a result of the newly-triggered field update. This cascade of workflow rule re-evaluation and triggering can happen up to five times after the initial field update that started it.
- Make sure that your workflow rules aren't set up to create recursive loops. For example, if a field update for Rule1 triggers Rule2, and a field update for Rule2 triggers Rule1, the recursive triggers may cause your organization to exceed its limit for workflow time triggers per hour.
- In a batch update, workflow is only retriggered on the entities where there is a change.
- Only workflow rules on the same object as the initial field update will be re-evaluated and triggered.
- Only workflow rules that didn't fire before will be retriggered.
- Cross-object workflow rules aren't candidates for re-evaluation.
- [Cross-object field updates](#) that cause a field value to change don't trigger workflow rule re-evaluation on the associated object.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

- An approval process can specify a field update action that re-evaluates workflow rules for the updated object. If, however, the re-evaluated workflow rules include a cross-object field update, those cross-object field updates will be ignored.
- Time-dependent actions aren't executed for a reevaluated workflow rule in the following situations:
 - The reevaluated workflow rule's immediate actions cause the record to no longer meet the workflow rule criteria.
 - An Apex `after` trigger that is executed as a result of a workflow or approvals action causes the record to no longer meet the workflow rule criteria.

SEE ALSO:

- [Create an Automated Field Update Action](#)
- [Considerations for Field Update Actions](#)

Outbound Messages

An outbound message is a workflow, approval, or milestone action that sends the information you specify to an endpoint you designate, such as an external service. Outbound messaging is configured in the Salesforce setup menu. Then you must configure the external endpoint. You can create a listener for the messages using the SOAP API.

To get started using outbound messages, from Setup, enter *Outbound Messages* in the Quick Find box, then select **Outbound Messages**.

 **Note:** If you don't have this option, your organization doesn't have outbound messages enabled. Contact Salesforce to enable outbound messages.

When working with outbound messages, note the following:

- A single SOAP message can include up to 100 notifications. Each notification contains an ID that uniquely identifies a record, and a reference to the data in the record. Therefore, if the information in the record changes after the notification is sent, but before the notification is delivered, only the updated information is delivered.
- Messages are queued until they are sent, to preserve message reliability.
- If the endpoint is unavailable, messages will stay in the queue until sent successfully or until they are 24 hours old. After 24 hours, messages are dropped from the queue.
- If a message can't be delivered, the interval between retries increases exponentially, up to a maximum of two hours between retries.
- Messages are retried independent of their order in the queue. This may result in messages being delivered out of order.
- You can't build an audit trail using outbound messages. While each message should be delivered at least once, it may be delivered more than once. Also, it may not be delivered at all if delivery cannot be done within 24 hours. Finally, as noted above, the source object may change after a notification is sent but before it is delivered, so the endpoint will only receive the latest data, not any intermediate changes.

IN THIS SECTION:

- [Outbound Message Notifications](#)

You can request that up to five users receive a notification listing all outbound messages that have failed for at least 24 hours. A fresh notification is sent every 24 hours until you cancel the request. Failed messages are deleted from the failed outbound messages related list after seven days. Before they are removed, you can delete them yourself or request that they be retried again.

From the detail page of an outbound message notification request:

- Click **Edit** to change the username for a notification request. This is simpler than deleting the request and then creating a new one.
- Click **Delete** to delete the notification request.
- Click **Clone** to create a new notification request with the same username.

Track the Delivery Status of an Outbound Message

To track the status of an outbound message, from Setup, enter *Outbound Messages* in the **Quick Find** box, then select **Outbound Messages**.

- *Next items for delivery* are awaiting delivery.
- *Oldest failures* have not yet been deleted because they have not been delivered and are not 24 hours old.
- *Failed outbound messages* failed to be delivered and are no longer being retried. Messages are listed here only if you configure the message when you create it by selecting **Add failures to failed outbound message related list**. If you do not see this related list, it has not been enabled for your organization.

You can perform several tasks here.

- Click any workflow or approval process action ID to view the action that triggered it.
- Click **Retry** to change the **Next Attempt** date to now. This causes the message delivery to be immediately retried. If you select **Retry** in the **Failed outbound messages** related list, the outbound message moves to the **Next items for delivery** related list and is retried for another 24 hours.
- Click **Del** to permanently remove the outbound message from the queue.

 **Note:** If you don't have this option, your organization doesn't have outbound messages enabled. Contact Salesforce to enable outbound messages.

Flow Triggers (Pilot)

A *flow trigger* is a workflow action that launches a flow. With flow triggers, you can automate complex business processes—create flows to perform logic, and have events trigger the flows via workflow rules—without writing code.

 **Note:** The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren't available for new organizations.

To get started using flow triggers, from Setup, enter *Flow Triggers* in the **Quick Find** box, then select **Flow Triggers**. From this page, you can:

SEE ALSO:

[Defining Flow Triggers for Workflow \(Pilot\)](#)

[Flow Trigger Considerations \(Pilot\)](#)

Considerations for Using Workflow Rules

Learn the intricacies of workflow rules before you begin working with them.

- Each workflow rule applies to a single object.
- For all custom objects and some standard objects, you can create workflow and approval actions where a change to a detail record updates a field on the related master record. Cross-object field updates work for custom-to-custom master-detail relationships, custom-to-standard master-detail relationships, and a few standard-to-standard master-detail relationships. For more information, see [Cross-Object Field Updates](#) on page 4089.
- The cross-object field update function may depend on certain critical updates being active. From Setup, enter *Critical Updates* in the **Quick Find** box, then select **Critical Updates** to see if your organization requires any updates.
- If you have workflow rules on converted leads and want to use cross-object field updates on the resulting accounts and opportunities, you must enable the lead setting **Enable Validation and Triggers from Lead Convert**.
- Workflow rules on custom objects are automatically deleted if the custom object is deleted.
- The order in which individual actions and types of actions are executed is not guaranteed. However, field update actions are executed first, followed by other actions.
- To create workflow rules that update case fields based on new case comments or incoming email messages, choose Case Comment or Email Message from the **Select Object** drop-down list; Email Message is only available if Email-to-Case or On-Demand Email-to-Case is enabled. You can only create email message workflow rules for field updates, and case comment workflow rules for field updates, email alerts, and outbound messages. For example, you can create a workflow rule so that an email marked as **Is Incoming** changes its case's **Status** from Closed to New.
- Changes you make to records while using Connect Offline are evaluated by workflow rules when you synchronize.
- Salesforce processes rules in the following order:
 1. Validation rules
 2. Assignment rules
 3. Auto-response rules

4. Workflow rules (with immediate actions)

5. Escalation rules

- If a lookup field references a record that has been deleted, Salesforce clears the value of the lookup field by default. Alternatively, you can choose to prevent records from being deleted if they're in a lookup relationship.

When Do Workflow Rules Get Triggered?

- Workflow rules can be triggered any time a record is saved or created, depending on your rule criteria. However, rules created after saving records aren't triggered by those records retroactively.
- Workflow rules are triggered when a standard object in a master-detail relationship is re-parented, even if the object's evaluation criteria is set to `Evaluate the rule when a record is: created`, and any time it's edited to subsequently meet criteria.
- Saving or creating records can trigger more than one rule.
- Workflow rules only trigger on converted leads if validation and triggers for lead convert are enabled in your organization.
- Workflow rules trigger automatically and are invisible to the user. Alternatively, approval processes allow users to submit records for approval.
- Workflow rules and entry criteria for approval processes and steps respect the user's locale and aren't triggered when the user is in a different language than that of the organization.

When you use picklists to specify filter criteria, the selected values are stored in the organization's default language. If you edit or clone existing filter criteria, first set the `Default Language` on the Company Information page to the same language that was used to set the original filter criteria. Otherwise, the filter criteria may not be evaluated as expected.

- If you use record types in your workflow rule criteria whose labels have been translated using the translation workbench, the translated label value won't trigger the workflow rule. Workflow criteria evaluate the master label value and ignore the translated value. To avoid this problem, set the workflow criteria to evaluate the master record type label value by entering it manually in the `Value` field.
- Workflow rules can't be triggered by campaign statistic fields, including individual campaign statistics and campaign hierarchy statistics.
- The following actions don't trigger workflow rules.
 - Mass replacing picklist values
 - Mass updating address fields
 - Mass updating divisions
 - Changing the territory assignments of accounts and opportunities
 - Converting leads to person accounts
 - Deactivating Self-Service Portal, Customer Portal, or Partner Portal users
 - Converting state and country data from the State and Country Picklists page in Setup
 - Making changes to state and country picklists using `AddressSettings` in the Metadata API

Workflow Rule Limitations

- You can't create email alerts for workflow rules on activities.
- You can't package workflow rules with time triggers.
- You can't create outbound messages for workflow rules on junction objects.

 **Tip:** You can use the Developer Console to debug workflow rules. The Developer Console lets you view debug log details and information about workflow rules and actions, such as the name of the user who triggered the workflow rule and the name and ID of the record being evaluated.

SEE ALSO:

[Workflow for the User Object \(Beta\)](#)

[Create a Workflow Rule](#)

Considerations for Field Update Actions

When creating field updates for workflow rules or approval processes, consider the following:

Field Update Processing

- Field updates occur before email alerts, tasks, and outbound messages.
- Field updates occur after case assignment, lead assignment, auto-response, and case escalation rules.
- Field updates function independently of field-level security. Therefore, a workflow rule can update fields even though they are hidden on the user's page layout.
- The result of a field update is unpredictable when a single workflow rule includes multiple field updates that apply different values to the same field.
- Field updates may affect the information in a related list. For example, if a field such as the `Amount` or `Close Date` of an opportunity is set to be updated, it will affect the Stage History related list on opportunities.
- If a user gets a field update error when saving a record, you can use the debug log to see which field update failed. The debug log stops when a failure occurs.
- For reminder fields on tasks and events:
 - Field updates can set the reminder for a task or event but they can't use the due date of a task or the scheduled time of an event.
 - Formulas for date/time values are calculated in days. Divide the value by 1440—the number of minutes in a day—to express the value in minutes. For example, the formula `Now () - 7` means seven *days* ago, while `Now () - 7 / 1440` means seven *minutes* ago.
- If your organization uses multiple currencies, currency fields are updated using the record's currency. If you choose to update a field based on a formula, any values in your formula are interpreted in the currency of the record.
- Field updates are tracked in the History related list if you have set history tracking on those fields.
- Because updates to records based on workflow rules don't trigger validation rules, workflow rules can invalidate previously valid fields.
- If you have person accounts enabled, you can use the `Is Person Account` field as part of the evaluation criteria for workflow rules. However, because the `Is Person Account` field is read-only, any field updates set up to modify it will fail.

 **Tip:** Salesforce processes rules in the following order:

1. Validation rules
2. Assignment rules
3. Auto-response rules

- "Customize Application"

4. Workflow rules (with immediate actions)
5. Escalation rules

Notes on Cross-Object Field Updates

- For all custom objects and some standard objects, you can create workflow and approval actions where a change to a detail record updates a field on the related master record. Cross-object field updates work for custom-to-custom master-detail relationships, custom-to-standard master-detail relationships, and a few standard-to-standard master-detail relationships. For more information, see [Cross-Object Field Updates](#) on page 4089.
- The cross-object field update function may depend on certain critical updates being active. From Setup, enter *Critical Updates* in the **Quick Find** box, then select **Critical Updates** to see if your organization requires any updates.
- Field update actions that update fields on related objects are supported only for use with workflow rules. Approval processes can't use cross-object field update actions.
- An approval process can specify a field update action that re-evaluates workflow rules for the updated object. If, however, the re-evaluated workflow rules include a cross-object field update, those cross-object field updates will be ignored.

Field Updates and Custom Fields

- Before changing a custom field's type, make sure that it isn't the target of a workflow field update or referenced in a field update formula that would be invalidated by the new type.
- You can't delete a custom field that is referenced by a field update.
- You can use field updates on encrypted custom fields, but if you try to use a formula to set the new value, the encrypted field isn't available in the formula editor.

Field Updates on Opportunities and Contracts

- You can define field updates for the `Stage` field on opportunities, but be aware of how this field affects the `Type` and `Forecast Category` fields.
- You can define field updates using the `Amount` field on opportunities but it will only apply to those opportunities that don't have products. Adding products to an opportunity changes the `Amount` field to a read-only field that is automatically calculated and not affected by that field update.
- You can define field updates for the `Status` field on contracts. However, the value of this field may affect the value of the `Status Category` field as well.
- Avoid creating a field update for contracts or orders that changes the `Status` field to any value other than `Approved`.

Field Update Limitations

- The results of a field update can't trigger additional rules such as validation, assignment, auto-response, or escalation rules.
- The results of a field update can trigger additional workflow rules if you have flagged the field update to do so. For more information, see [Field Updates That Re-evaluate Workflow Rules](#) on page 4090.
- Field updates that are executed as approval actions don't trigger workflow rules.
- Read-only fields like formula or auto-number fields aren't available for field updates.
- The `Language` picklist field on multilingual solutions isn't available for field updates.
- Email message workflow rules can only be associated with field updates.
- If a field update references a specific user, you can't deactivate that user. For example, if your field update is designed to change the owner of a record to Bob Smith, change the field update before deactivating Bob Smith.

- Some fields, such as `Related To` and `Private` fields on activities, aren't available for field updates.
- You can update long text area fields, but the option to insert `A specific value` restricts you to entering up to 255 characters.
- You can't make a field universally required if it's used by a field update that sets the field to a blank value.
- Workflow rules that update owners *do not* also transfer associated items. To ensure transfer, click **Change** next to the owner's name in a record and make your transfer selections.

Daily Limit for Email Alerts

The daily limit for emails sent through email alerts is 1,000 per standard Salesforce license per organization—except for free Developer Edition and trial organizations, where the daily workflow email limit is 15 per standard Salesforce license. The overall organization limit is 2,000,000. This limit applies to emails sent through email alerts in workflow rules, approval processes, flows, processes, or the REST API.

The limit restriction is based on activity in the 24-hour period starting and ending at midnight GMT. Adding or removing a user license immediately adjusts the limit's total. If you send an email alert to a group, every recipient in that group counts against your daily workflow email limit.

After your organization has reached its daily workflow email limit:

- Any emails in the workflow queue left over and not sent that day are discarded. Salesforce doesn't try to resend them later.
- If a workflow rule with an action and an email alert is triggered, only the email action is blocked.
- Final approval, final rejection, approval, rejection, and recall email actions are blocked.
- An error message is added to the debug log.

The following items don't count against the workflow email limit:

- Approval notification emails
- Task assignment notifications
- Lead assignment rules notifications
- Case assignment rules notifications
- Case escalation rules notifications
- Force.com sites usage alerts

When workflow email alerts approach or exceed certain limits, Salesforce sends a warning email to the default workflow user or—if the default workflow user isn't set—to an active system administrator.

When...	Salesforce Sends...	Warning Email Includes...
An email alert isn't sent because the number of recipients exceeds the limit for a single email	A warning email for each unsent email alert	The unsent email alert's content and recipients
The organization reaches 90% of the limit of emails per day	One warning email	The limit and the organization's usage

When...	Salesforce Sends...	Warning Email Includes...
The organization reaches 90% of the limit of workflow emails per day	One warning email	The limit and the organization's usage
An email alert isn't sent because the organization reaches the limit of emails per day	A warning email after every 100 attempted email alerts over the limit	The limit and the organization's usage
An email alert isn't sent because the organization reaches the limit of workflow emails per day	A warning email after every 100 attempted email alerts over the limit	The limit and the organization's usage

Considerations for Time-Dependent Actions and Time Triggers

When creating time-dependent actions and time triggers for workflow rules, consider the following.

Defining Time Triggers

- When defining a time trigger, use standard and custom date and date/time fields defined for the object. Specify time using days and hours. The valid range is 0 to 999 days or hours.
- You can modify existing time triggers by adding or removing actions.

Note: Removing all the actions from a time trigger does not remove the trigger. Empty triggers are still queued and count against your hourly workflow time trigger limit. To remove scheduled time triggers, delete them from the workflow queue.

Time Trigger Processing

- Time-dependent actions aren't executed independently. They're grouped into a single batch that starts executing within one hour after the first action enters the batch. Therefore, any Apex triggers that fire as a result of those grouped actions are also executed in a single batch. This behavior can cause you to exceed your Apex governor limits if you design your time-based workflow in conjunction with Apex triggers.
- Salesforce evaluates time-based workflow on the organization's time zone, not the user's. Users in different time zones might see differences in behavior.
- Salesforce doesn't necessarily execute time triggers in the order they appear on the workflow rule detail page. Workflow rules list time triggers that use the `Before` field first, followed by time triggers that use the `After` field.
- Salesforce doesn't display time-dependent action controls on the workflow rule edit page if you set the workflow rule evaluation criteria to `Evaluate the rule when a record is: created, and every time it's edited`.
- If you change a date field that is referenced by an unfired time trigger in a workflow rule that has been evaluated, Salesforce recalculates the unfired time triggers associated with the rule. For example, if a workflow rule is scheduled to alert the opportunity owner 7 days before the opportunity close date and the close date is set to 2/20/2011, Salesforce sends the alert on 2/13/2011. If the close date is updated to 2/10/2011 and the time trigger hasn't fired, Salesforce reschedules the alert for 2/3/2011. If Salesforce recalculates the time triggers to a date in the past, Salesforce triggers the associated actions shortly after you save the record.
- If a workflow rule has a time trigger set for a time in the past, Salesforce queues the associated time-dependent actions to start executing within one hour. For example, if a workflow rule on opportunities is configured to update a field 7 days before the close date, and you create an opportunity record with the close date set to today, Salesforce starts to process the field update within an hour after you create the opportunity.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

- Time-dependent actions remain in the workflow queue only as long as the workflow rule criteria are still valid. If a record no longer matches the rule criteria, Salesforce removes the time-dependent actions queued for that record.

For example, an opportunity workflow rule can specify:

- A criteria set to “Opportunity: Status not equals to Closed Won, Closed Lost”
- An associated time-dependent action with a time trigger set to 7 days before the opportunity close date

If a record that matches the criteria is created on July 1 and the `Close Date` is set to July 30, the time-dependent action is scheduled for July 23. However, if the opportunity is set to “Closed Won” or “Closed Lost” before July 23, the time-dependent action is removed from the queue.

- Salesforce ignores time triggers that reference null fields.
- Time-dependent actions can automatically be queued again if the record is updated and the evaluation criteria is set to `Evaluate the rule when a record is: created, and any time it's edited to subsequently meet criteria`. Using the previous example, if the opportunity status is changed from Closed Lost to Prospecting and the workflow rule evaluation criteria is `Evaluate the rule when a record is: created, and any time it's edited to subsequently meet criteria`, Salesforce reevaluates the time triggers and adds the appropriate actions to the workflow queue.
- Deleting a record that has pending actions removes the pending actions from the workflow queue. You can't restore the actions, even if you undelete the record.
- If the evaluation criteria is set to `Evaluate the rule when a record is: created`, the workflow rule evaluates its time triggers only once. If the record that fired the rule changes to no longer meet the evaluation criteria, Salesforce removes the pending actions from the queue and never reapplies the rule to the record.
- You can deactivate a workflow rule at any time. If the rule has pending actions in the workflow queue, editing the record that triggered the rule removes the pending actions from the queue. If you don't edit the record, the pending actions are processed even though the rule has been deactivated.
- Time-dependent actions aren't executed for a reevaluated workflow rule in the following situations:
 - The reevaluated workflow rule's immediate actions cause the record to no longer meet the workflow rule criteria.
 - An Apex `after` trigger that is executed as a result of a workflow or approvals action causes the record to no longer meet the workflow rule criteria.
- Configuring a task's `Due Date` to “Rule Trigger Date” sets time triggers and workflow task due dates based on the date that the workflow time trigger's action is executed. For example, if the task due date is “Rule Trigger Date plus 10 days” and the time trigger is executed on January 1, Salesforce sets the task due date to January 11.
- You can add a new active workflow rule with time triggers in a change set and deploy it. You can only change time triggers on a workflow rule in a change set if it's inactive. The rule must be activated in the destination organization manually or through another change set that only activates workflow rules and makes no time trigger changes.

For example, let's say you have an inactive workflow rule in your destination organization, and your change set contains an active workflow rule with the same name and new or different time triggers. The deployment fails because it activates the workflow rule first and then tries to add or remove the time triggers.

Note: You must add time-dependent actions manually when including a workflow rule in a change set. The **View/Add Dependencies** function doesn't detect time-dependent actions.

Using Time-Dependent Workflow with Leads

- You can't convert a lead that has pending actions.

- If Validation and Triggers from Lead Convert is enabled, existing time-based workflow actions on leads aren't triggered during lead conversion.
- If a campaign member based on a lead is converted before the completion of the time-based workflow actions associated with it, Salesforce still performs the time-based workflow actions.

Limitations

- Time triggers don't support minutes or seconds.
- Time triggers can't reference the following:
 - `DATE` or `DATETIME` fields containing automatically derived functions, such as `TODAY` or `NOW`.
 - Formula fields that include related-object merge fields.
- Salesforce limits the number of time triggers an organization can execute per hour. If an organization exceeds the limits for its Edition, Salesforce defers the execution of the additional time triggers to the next hour. For example, if an Unlimited Edition organization has 1,200 time triggers scheduled to execute between 4:00 PM and 5:00 PM, Salesforce processes 1,000 time triggers between 4:00 PM and 5:00 PM and the remaining 200 time triggers between 5:00 PM and 6:00 PM.
- You can't archive a product or price book that has pending actions.
- If time-based workflow actions exist in the queue, you can't add or remove time triggers or edit trigger dates without deleting the actions first. Because the deleted records can't be restored, carefully consider the implications of editing the workflow rules before you proceed. If you decide to edit the workflow rules, deactivate the workflow that you want to edit, edit the rules as needed, and then save your changes. For information about finding and deleting time-based workflow actions in the queue, see [View Pending Workflow Actions](#) on page 4113.

You also can't add or remove time triggers if:

- The workflow rule is active.
- The workflow rule is deactivated, but has pending actions in the queue.
- The workflow rule evaluation criteria is set to `Evaluate the rule when a record is: created, and every time it's edited.`
- The workflow rule is included in a package.

SEE ALSO:

[Add Automated Actions to Your Workflow Rule](#)

[Identify Your Organization's Default Workflow User](#)

Flow Trigger Considerations (Pilot)

Flow trigger workflow actions have special behaviors and limitations.

- 📌 **Note:** The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren't available for new organizations.

Understand these considerations before you create flow triggers or add them to workflow rules.

- Flow triggers are available only for workflow rules. You can't use them as actions elsewhere, for example, in approval processes.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

- Flow triggers are available on most—but not all—objects that are supported by workflow rules. You can see the list of supported objects when you create a new flow trigger. From Setup, enter *Flow Triggers* in the **Quick Find** box, then click **Flow Triggers**.
- Only active, autolaunched flows can be launched by flow triggers. However, if a flow trigger is in test mode, administrators run the latest flow version while other users run the active flow version.
- Flows that are launched from workflow rules are run in system context, which means that user permissions, field-level security, and sharing rules aren't taken into account during flow execution.
- If a flow trigger fails at run time, the user who created or edited the record to meet the workflow rule criteria won't be able to save the record. To troubleshoot run time issues, see the flow action events in the **Workflow** category of debug logs, which show the flow version and the values passed into flow variables.
- A flow trigger can set the values of up to 25 variables and sObject variables in the flow, with the following limitations.
 - Flow triggers can't use multi-select picklist fields to set flow variables or sObject variables.
 - When a flow trigger uses a currency field to set a flow variable, only the amount is passed into the flow. Any currency ISO code or locale information is ignored. If your organization uses multiple currencies, the flow trigger uses the amount in the currency of the record that contains the specified currency field.
 - Flow triggers can't pass values into sObject collection variables in flows.
- Always keep one version of the flow active if it's referenced by an active workflow rule's flow trigger.
- Once you activate a workflow rule using the flow trigger, don't modify or add a version of the flow to include screens or other elements that would violate the run restrictions for an autolaunched flow. If you modify a flow to no longer be autolaunched, it can't be launched by flow triggers. To work around this situation, you can save the non-autolaunched flow as a new flow and change the new flow to become autolaunched. Then update the flow triggers to launch the new flow.
- Flow triggers aren't available as time-dependent workflow actions. You can add flow triggers to workflow rules only as immediate workflow actions.
- When the system executes a workflow rule with multiple flow triggers, those flows aren't run in any particular order.
- In a transaction, flow triggers are executed after all workflow field updates, including any Apex triggers and standard validations that are executed as a result of those workflow field updates. After executing flow triggers, the system executes escalation rules.
- Flows that are launched from workflow rules are governed by the per-transaction limits already enforced by Apex.
- When flows are launched from workflow rules that are triggered by bulk loads or imports, the flows' data manipulation language (DML) operations are executed in bulk to reduce the number of calls required and to optimize system performance. The execution of any of the following flow elements qualifies as a DML operation: Record Create, Record Update, Record Delete, Fast Create, Fast Update, or Fast Delete.

For example, suppose that you use Data Loader or the Bulk API to update 50 records, and those updates meet the criteria of a workflow rule with a flow trigger action. In response, the system executes 50 instances of the flow within the same transaction. Each instance of a running flow is called an interview. The system attempts to execute each DML operation across all the interviews in the transaction at the same time. Suppose that five of those interviews are executing the same branch of the flow, which has a Record Update element called "SetEntitlement." The system waits for all five interviews to reach that element, and then executes all five record updates in bulk.

- Flow triggers aren't available in change sets.

- Flow triggers aren't packageable.

Follow Up Before Contract Expires

Object Contract

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Flow triggers are not available in Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Description	Send an email reminder to the renewal manager 20 days before a contract's end date.
Evaluation Criteria	Evaluate the rule when a record is: <code>created</code> , and any time it's edited to subsequently meet criteria.
Rule Criteria (Filter)	Run this rule if the following criteria are met: <pre>(Contract: Status equals Activated)</pre>
Immediate Actions	None
Time-Dependent Actions	20 Days Before Contract: End Date—Email Alert: Send an email reminder to the renewal manager to confirm whether the client would like an extension.

Follow Up when Platinum Contract Case Closes

This example assumes there is a `Contract Type` custom picklist used to identify the contract level on cases, and that the picklist contains the value "Platinum."

Object	Case
Description	Send a feedback request in email to the case contact seven days after a high-priority case is closed if the customer has a platinum contract agreement.
Evaluation Criteria	Evaluate the rule when a record is: <code>created</code> , and any time it's edited to subsequently meet criteria.
Rule Criteria (Filter)	Run this rule if the following criteria are met: <pre>(Case: Priority equals High) and (Case: Closed equals True) and (Case: Contract Type equals Platinum)</pre>
Immediate Actions	None
Time-Dependent Actions	7 Days After Case: Date/Time Closed—Email Alert: Send a feedback request to the case contact.

Assign Credit Check for New Customer

This example assumes there is a `New Customer` custom field on opportunities.

Object	Opportunity
Description	Assign the Accounts Receivable (AR) department a task to check the credit of a potential customer 15 days before the opportunity close date if the amount is greater than \$50,000.
Evaluation Criteria	Evaluate the rule when a record is: <code>created</code> , and any time it's edited to subsequently meet criteria.

Rule Criteria (Filter)	Run this rule if the following criteria are met: <pre>(Opportunity: Amount greater than 50000) and (Opportunity: Closed equals False) and (Opportunity: New Customer equals True)</pre>
Immediate Actions	None
Time-Dependent Actions	15 Days Before Opportunity: Close Date— Task : Create a task for users in the Accounts Receivable role to run a credit check.

Notify Account Owner About New, High-Priority Cases

This example assumes there is a Service Level Agreement custom picklist called SLA that identifies the agreement level on accounts and contains the value "Platinum."

Object	Case
Description	Notify the account owner when a high-priority case is created for accounts with a platinum service level agreement.
Evaluation Criteria	Evaluate the rule when a record is: <code>created</code> .
Rule Criteria (Filter)	Run this rule if the following criteria are met: <pre>(Case: Priority equals High) and (Account: SLA equals Platinum)</pre>
Immediate Actions	Email Alert : Email the details of the high-priority case to the account owner.
Time-Dependent Actions	None.

Set a Default Entitlement for Each New Case

This example assumes there is an active, autolaunched flow that looks up the relevant entitlement based on the account, asset, or contact associated with the new case and updates the case with the entitlement name.

The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren't available for new organizations.

Object	Case
Description	Set a default entitlement on each new case.
Evaluation Criteria	Evaluate the rule when a record is: <code>created</code> .
Rule Criteria (Filter)	Run this rule if the following criteria are met: <pre>(Case: Status not equal to Closed)</pre>
Immediate Actions	Flow Trigger : Look up and assign the relevant entitlement to the case. Pass the account, asset, or contact associated with the new case into the relevant flow variable to enable the entitlement lookup. Also pass the case ID into the relevant flow variable to enable the case update.

Time-Dependent Actions None.

Update Shipment Status if Shipment is Delayed

Object	Shipment
Description	Update the Shipment Status field to "Delayed" if a shipment has exceeded the expected delivery date and not reached the customer.
Evaluation Criteria	Evaluate the rule when a record is: <code>created</code> , and any time it's edited to subsequently meet criteria.
Rule Criteria (Filter)	Run this rule if the following criteria are met: <pre>(Shipment: Status not equal to Delivered)</pre>
Immediate Actions	None.
Time-Dependent Actions	1 day after Shipment: Expected Delivery Date—Field Update: Change Shipment Status field to "Delayed" on Shipment record.

Automatically Activate New Users

Object	User
Description	Make sure that each new user is active, so that the user can log in to Salesforce.
Evaluation Criteria	Evaluate the rule when a record is: <code>created</code> .
Rule Criteria (Filter)	Run this rule if the following criteria are met: <pre>(User: Active equals False)</pre>
Immediate Actions	Field Update: Set Active to True.
Time-Dependent Actions	None.

Notify Sales VP About Cases Filed for Top Accounts

Use the following workflow rule if your sales VP wants to know about any cases filed for top accounts, where top accounts are determined by size and revenue.

Object	Case
Description	Notify Sales VP about any cases filed for top accounts.
Evaluation Criteria	Evaluate the rule when a record is: <code>created</code> .
Rule Criteria (Filter)	Run this rule if the following criteria are met: <pre>AND (Account.AnnualRevenue > 500000, Account.NumberOfEmployees > 5000)</pre>

Immediate Actions Email Alert: Notify VP about cases for big accounts.

Time-Dependent Actions None.

Set Default Opportunity Name

The opportunity naming convention for some companies is *Account Name: Opportunity Name*. To automate the default name of each opportunity in your organization, create the following workflow rule.

Object Opportunity

Description Enforce opportunity naming convention.

Evaluation Criteria Evaluate the rule when a record is: created, and every time it's edited.

Rule Criteria (Filter) Run this rule if the following criteria are met:

```
NOT (CONTAINS ( Name, Account.Name ) )
```

Immediate Actions Field Update: Set opportunity name to the following formula:

```
Account.Name & ": " & Name
```

Time-Dependent Actions None.

Set Target Resolution Date for Cases

This example illustrates how to automatically set a case resolution date based on the value of a field on the associated account. It uses a custom picklist field on accounts called *Support Level*, which has three values—Basic, Standard, and Premium—as well as a custom date field on cases called *Target Resolution Date*.

Use the following three workflow rule examples to automatically set the target resolution date of a case based on the support level for the related account.

Set Resolution Date for Basic Support

Object Case

Description Sets the case target resolution date for accounts that have basic support level to 30 days from today.

Evaluation Criteria Evaluate the rule when a record is: created.

Rule Criteria (Filter) Run this rule if the following formula evaluates to true:

```
ISPICKVAL (Account.Support_Level__c , "Basic")
```

Immediate Actions Field Update: Set the Target Resolution Date to Today() + 30

Time-Dependent Actions None.

Set Resolution Date for Standard Support

Object	Case
Description	Sets the case target resolution date for accounts that have standard support level to 14 days from today.
Evaluation Criteria	Evaluate the rule when a record is: <code>created</code> .
Rule Criteria (Filter)	Run this rule if the following formula evaluates to true: <pre>ISPICKVAL (Account.Support_Level__c , "Standard")</pre>
Immediate Actions	Field Update: Set the Target Resolution Date to Today() + 14
Time-Dependent Actions	None.

Set Resolution Date for Premium Support

Object	Case
Description	Sets the case target resolution date for accounts that have premium support level to 5 days from today.
Evaluation Criteria	Evaluate the rule when a record is: <code>created</code> .
Rule Criteria (Filter)	Run this rule if the following formula evaluates to true: <pre>ISPICKVAL (Account.Support_Level__c , "Premium")</pre>
Immediate Actions	Field Update: Set the Target Resolution Date to Today() + 5
Time-Dependent Actions	None.

Update Application Record when Candidate Accepts Job

Use the following workflow rule if you want to close the Application record when a Candidate accepts a job. Cross-object field updates to the master record are supported between custom objects in a master-detail relationship.

Object	Candidate
Description	Changes the Application Status to "Closed" for the custom Application object when the Candidate Status for the custom Candidate object changes to "Accepted."
Evaluation Criteria	Evaluate the rule when a record is: <code>created</code> , and any time it's edited to subsequently meet criteria.
Rule Criteria (Filter)	Run this rule if the following criteria are met: <pre>(Candidate: Status equals Accepted)</pre>
Immediate Actions	Field Update: Change Application Status field to "Closed" on parent Application record.
Time-Dependent Actions	None.

Track Closed Opportunities

This example assumes there is a “Closed Opportunities” record type that provides additional information to certain profiles.

 **Note:** For information on record types, see [Record Types](#) on page 3744.

Object	Opportunity
Description	Change the record type of closed-won opportunities.
Evaluation Criteria	Evaluate the rule when a record is: <code>created</code> , and every time it's edited.
Rule Criteria (Filter)	Run this rule if the following criteria are met: <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <code>(Opportunity: Closed equals True) and (Opportunity: Stage equals Closed Won)</code> </div>
Immediate Actions	Field Update: Set the record type to “Closed Opportunities.”
Time-Dependent Actions	None.

Override Default Opportunity Close Date

Object	Opportunity
Description	Override the default close date from the close of the quarter to six months after the opportunity is created.
Evaluation Criteria	Evaluate the rule when a record is: <code>created</code> .
Rule Criteria (Filter)	Run this rule if the following criteria are met: <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <code>(Opportunity: Closed equals False)</code> </div>
Immediate Actions	Field Update: Use the following formula to set the opportunity close date to six months after the creation date: <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <code>DATE (YEAR (TODAY ()) , (MONTH (TODAY ()) + 6) , DAY (TODAY ()))</code> </div>
Time-Dependent Actions	None.

Report Lost Opportunities

Object	Opportunity
Description	Notify the VP of Sales when a deal is lost if the stage was “Proposal/Price Quote” and the amount was greater than \$1,000,000.
Evaluation Criteria	Evaluate the rule when a record is: <code>created</code> , and every time it's edited.

Rule Criteria (Filter)

Run this rule if the following formula evaluates to true:

```
AND( ISCHANGED(StageName), ISPICKVAL(PRIORVALUE(StageName) ,
"Proposal/Price Quote"), ISPICKVAL(StageName,"Closed Lost"), (Amount
>1000000))
```

Immediate Actions

Email Alert: Notify the VP of Sales role that the deal was lost.

Time-Dependent Actions

None.

Report Unassigned Leads

This example assumes that all unassigned leads are placed in an unassigned leads queue by a leads assignment rule.

Object

Lead

Description

Ensure that unassigned leads are tracked in a timely manner by notifying the manager if a lead is not accepted in two days.

Evaluation Criteria

Evaluate the rule when a record is created, and any time it's edited to subsequently meet criteria.

Rule Criteria (Filter)

Run this rule if the following criteria are met:

```
Lead Owner equals Unassigned Lead Queue
```

Immediate Actions

None.

Time-Dependent Actions

2 Days After Lead: Last Modified Date—Email Alert: Notify the manager role that there are unassigned leads in the queue that are older than two days.

Send Alert if Quote Line Item Discount Exceeds 40%

Object

Quote Line Item

Description

Ensure that an email alert is sent if a sales rep applies a quote line item discount that exceeds 40%.

Evaluation Criteria

Evaluate the rule when a record is created, and any time it's edited to subsequently meet criteria.

Rule Criteria (Filter)

Run this rule if the following criteria are met:

```
Quote Line Item: Discount is greater than 40
```

Immediate Actions

Email Alert: Notify the manager role that the quote line item discount exceeds 40%.

Time-Dependent Actions

None.

Notify Key People About Account Owner Changes

Object	Account
Description	Notify key people in the sales department when the owner of an account changes if the account's annual revenue is greater than \$1,000,000.
Evaluation Criteria	Evaluate the rule when a record is: <i>created, and every time it's edited.</i>
Rule Criteria (Filter)	Run this rule if the following formula evaluates to true: <pre>AND(ISCHANGED(OwnerId), AnnualRevenue > 1000000)</pre>
Immediate Actions	Email Alert: Notify the person in the sales operations role of the change in account ownership.
Time-Dependent Actions	None.

Set Reminder for Contact Birthday

This example assumes there is a `Next Birthday` custom formula field that uses the following formula to calculate the date of the contact's next birthday on contact records:

```
IF(MONTH(Birthdate) > MONTH(TODAY()), DATE(YEAR(TODAY()), MONTH(Birthdate), DAY(Birthdate)),
IF(MONTH(Birthdate) < MONTH(TODAY()), DATE(YEAR(TODAY())+1, MONTH(Birthdate), DAY(Birthdate)),
IF(DAY(Birthdate) >= (DAY(TODAY())), DATE(YEAR(TODAY()), MONTH(Birthdate), DAY(Birthdate)),
DATE(YEAR(TODAY())+1, MONTH(Birthdate), DAY(Birthdate))))
```

Object	Contact
Description	Send an email to the contact two days before the contact's birthday.
Evaluation Criteria	Evaluate the rule when a record is: <i>created.</i>
Rule Criteria (Filter)	Run this rule if the following formula evaluates to true: <pre>(Contact: Birthdate not equal to null) and (Contact: Email not equal to null)</pre>
Immediate Actions	None.
Time-Dependent Actions	2 Days Before Contact: Next Birthday—Email Alert: Send a birthday greeting to the contact's email address.

Set Reminder for High-Value Opportunity Close Date

Object	Opportunity
Description	Remind the opportunity owner and senior management when the close date is approaching for a large deal, an opportunity that has an amount greater than \$100,000. Also, create a follow-up task for the opportunity owner if the deal is still open when the close date passes.

Evaluation Criteria	Evaluate the rule when a record is: created, and any time it's edited to subsequently meet criteria.
Rule Criteria (Filter)	Run this rule if the following criteria are met: <pre>(Opportunity: Amount greater than 100000) and (Opportunity: Closed equals False)</pre>
Immediate Actions	None.
Time-Dependent Actions	<ul style="list-style-type: none"> • 30 Days Before Opportunity: Close Date—Email Alert: Notify the opportunity owner that 30 days remain. • 15 Days Before Opportunity: Close Date—Email Alert: Notify the opportunity owner that 15 days remain. • 5 Days After Opportunity: Close Date—Task: Create a follow-up task for the opportunity owner to update the deal. Email Alert: Notify senior management to involve executives.

Notify Account Owner of Updates by Others

Object	Account
Description	Notify the account owner when someone else updates the account if the account's annual revenue is greater than \$1,000,000.
Evaluation Criteria	Evaluate the rule when a record is: created, and every time it's edited.
Rule Criteria (Filter)	Run this rule if the following formula evaluates to true: <pre>AND((LastModifiedById <> CreatedById), (AnnualRevenue > 1000000))</pre>
Immediate Actions	Email Alert: Notify the account owner that someone else has updated the account.
Time-Dependent Actions	None.

[Create a Workflow Rule](#)

View Pending Workflow Actions

When a workflow rule that has time-dependent actions is triggered, use the workflow queue to view pending actions and cancel them if necessary.

1. From Setup, enter *Time-Based Workflow* in the `Quick Find` box, then select **Time-Based Workflow**.
2. Click **Search** to view all pending actions for any active workflow rules, or set the filter criteria and click **Search** to view only the pending actions that match the criteria. The filter options are:
 - **Workflow Rule Name:** The name of the workflow rule.
 - **Object:** The object that triggered the workflow rule. Enter the object name in the singular form.
 - **Scheduled Date:** The date the pending actions are scheduled to occur.
 - **Create Date:** The date the record that triggered the workflow was created.
 - **Created By:** The user who created the record that triggered the workflow rule.
 - **Record Name:** The name of the record that triggered the workflow rule.

The filter is not case-sensitive.

To cancel pending actions:

1. Select the box next to the pending actions you want to cancel.
2. Click **Delete**.

Workflow Terminology

The following terms are used when describing workflow features and functionality.

Workflow Rule

A workflow rule sets workflow actions into motion when its designated conditions are met. You can configure workflow actions to execute immediately when a record meets the conditions in your workflow rule, or set time triggers that execute the workflow actions on a specific day. If a workflow action hasn't executed yet, you can view and modify it in the workflow queue.

Workflow Action

A workflow action, such as an email alert, field update, outbound message, or task, fires when the conditions of a workflow rule are met.

Email Alert

Email alerts are workflow and approval actions that are generated using an email template by a workflow rule or approval process and sent to designated recipients, either Salesforce users or others. Workflow alerts can be sent to any user or contact, as long as they have a valid email address.

Field Update

Field updates are workflow and approval actions that specify the field you want updated and the new value for it.

Flow

A *flow* is an application that can execute logic, interact with the Salesforce database, call Apex classes, and collect data from users. You can build flows by using the Cloud Flow Designer.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Available for additional cost in: **Professional** Edition

Workflow tasks and email alerts are not available in **Database.com**

USER PERMISSIONS

To manage the workflow queue:

- "Modify All Data"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Flow triggers are not available in Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Flow Trigger

A *flow trigger* is a workflow action that launches a flow. With flow triggers, you can automate complex business processes—create flows to perform logic, and have events trigger the flows via workflow rules—without writing code.

The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren't available for new organizations.

Task

Assigns a task to a user you specify. You can specify the **Subject**, **Status**, **Priority**, and **Due Date** of the task. Tasks are workflow and approval actions that are triggered by workflow rules or approval processes.

Outbound Message

An outbound message is a workflow, approval, or milestone action that sends the information you specify to an endpoint you designate, such as an external service. Outbound messaging is configured in the Salesforce setup menu. Then you must configure the external endpoint. You can create a listener for the messages using the SOAP API.

Approvals

Approvals

Your business runs more efficiently with automated processes. For example, you may already have workflow rules that automatically send email alerts or assign tasks based on your internal processes. Approvals take automation one step further, allowing you to specify a sequence of steps that are required to approve a record.

An approval process is an automated process your organization can use to approve records in Salesforce. An approval process specifies the steps necessary for a record to be approved and who must approve it at each step. A step can apply to all records included in the process, or just records that meet certain administrator-defined criteria. An approval process also specifies the actions to take when a record is approved, rejected, recalled, or first submitted for approval.

Example: Suppose your organization has a three-tier process for approving expenses. With an approval process, you specify how to automatically handle each request and who in your organization must review the expense, based on the amount requested.

- If an expense record is submitted for approval, lock the record so that users cannot edit it and change the status to "Submitted."
- If the amount is \$50 or less, automatically approve the request.
- If the amount is greater than \$50, send an approval request to the direct manager.
- If the amount is greater than \$5,000 and the first approval request is approved, send an approval request to the Vice President.
- If all approval requests are approved, change the status to "Approved" and unlock the record.
- If any approval requests are rejected, change the status to "Rejected" and unlock the record.

In an approval process, you configure:

- Entry criteria, if you want to include only certain records in the process.
- Who can approve requests.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

- Who can change a record once it has been submitted for approval.
- Steps that determine the sequence of actions to take when a record matches the criteria. Each step can have up to 40 actions, 10 of each type: email alerts, field updates, tasks, and outbound messages.
- Up to 40 more actions to perform when a record is initially submitted, approved, rejected, or recalled.

[Create an Approval Process](#)

[Sample Approval Processes](#)

[Approval Process Terminology](#)

Get Started with Approvals

An approval process is an automated process your organization can use to approve records in Salesforce. An approval process specifies the steps necessary for a record to be approved and who must approve it at each step. A step can apply to all records included in the process, or just records that meet certain administrator-defined criteria. An approval process also specifies the actions to take when a record is approved, rejected, recalled, or first submitted for approval.

Before you begin creating an approval process:

- Review the [Approval Process Checklist](#) to prepare for your implementation and [determine what wizard to use](#).
- Optionally, enable the email approval response option. The email approval response feature gives users the ability to approve or reject email approval requests by replying to the email. Approvers must have the "API Enabled" system permission to approve or reject approval requests via email.

To automate your organization's processes:

1. [Create an approval process](#).
2. [Add steps to your approval process](#).
3. [Specify initial submission actions](#).
4. [Specify final approval actions](#).
5. [Specify final rejection actions](#).
6. [Specify recall actions](#).
7. If this is the first approval process you are creating:
 - Add the Approval History related list to the appropriate page layout. The Approval History related list lets users submit approval requests and track a record's progress through an approval process from the record detail page.
 - Consider adding the Items To Approve related list to your custom home page layouts. It gives users an instant view of the approval requests they need to approve or reject.
 - Populate all custom hierarchy fields with the appropriate values.
8. Use the Process Visualizer to display a graphical version of an approval process. The view-only diagram is presented as a flowchart. The diagram and informational sidebar can help you visualize and understand the defined steps, criteria, and actions that comprise your approval process.

EDITIONS

- Unlimited
- Developer

What email template do you want to use for approval requests?

The email template you specify on an approval process is used when notifying users that an approval request is assigned to them. You can use the default email template Salesforce offers if it is appropriate for your approval process, or you can create your own email template. Include the appropriate approval process merge fields to link directly to the approval request.

If your organization has enabled email approval response, the default email template includes instructions for replying to an email approval request by typing *approve*, *approved*, *yes*, *reject*, *rejected*, or *no* in the first line of the email body, and optionally adding comments in the second line.

What Chatter post template do you want to use for approval requests?

If your organization has Approvals in Chatter enabled, you can specify an approval post template to use when notifying users via Chatter that an approval request is assigned to them. You can use the default post template Salesforce offers if it is appropriate for your approval process, or you can create your own post template.

Who should be the sender of approval requests?

Approval request notifications are automatically sent from the user who submitted the record for approval. When you configure an email alert, you can set it to use a different return email address for these notifications. You can choose the email address of the default workflow user if you've created one, or a previously configured and verified organization-wide address. Determine what email address to use.

Who can approve requests?

Requests can be approved or rejected by any of the following:

- A user or queue that the approval request submitter chooses.
- A queue specified by the administrator.
- A user listed in the `Manager` standard field on the submitter's user detail page.
- A user listed in a custom hierarchy field on the submitter's user detail page.
- Any combination of users and related users (users listed in a standard or custom field on the submitted record) specified by the administrator.

Each step in your approval process can assign approval requests using any of these options.

Should approval requests be delegated to another user for approval?

An approval request can be approved by an approver's designated delegate. However, you can disable this option. Decide if you want to allow delegated users to approve requests. Then, for each user, populate the `Delegated Approver` field on the user's detail page.

What records should be included in this process?

Determine what attributes a record must have to be included in your approval process. If necessary, create the custom fields to store this information so that you can use it in your filter criteria. For example, if you want to include expense records from your headquarters office only, create a custom picklist field called `Office Location` that has two options: "HQ" and "Field." Then, you would specify in your filter criteria that records must have "HQ" in the `Office Location` field to be included in the approval process.

What should happen when a record is first submitted for approval?

When users submit a record for approval, Salesforce automatically locks the record so that other users cannot change it while it is awaiting approval. You can still add campaign members to campaigns locked for approval.

Decide if you want other workflow actions to happen when a record is first submitted, such as email alerts, tasks, field updates, and outbound messages. These actions become your [Initial Submission Actions](#).

Should users be able to approve requests from a mobile device?

Determine if you want to require users to log in to Salesforce to approve requests. You can also set up your approval process to allow users to approve requests remotely using a mobile browser.

Who can edit records that are awaiting approval?

Records submitted for approval are automatically locked. Users with the "Modify All" object-level permission for the given object, or the "Modify All Data" permission, can always unlock a record and edit it. However, you may also specify that the currently assigned approver can edit the record as well. You can still add campaign members to campaigns locked for approval.

Should records be automatically approved, rejected, or skipped based on certain criteria?

You can set entry criteria for each step of your process, and configure Salesforce to automatically approve, reject, or skip the process if a record does not meet that entry criteria. For example, all expenses submitted with an `Amount` less than \$15 are automatically approved.

How many people need to approve these requests?

An approval process can have several layers of approvals. Determine how many users need to approve requests and in what order.

Should any actions happen when a request is approved or rejected?

You can set up to 40 additional actions to take place when a request is recalled, approved, or rejected at each step, up to 10 of each of the following types:

Type	Description
Task	Assigns a task to a user you specify. You can specify the <code>Subject</code> , <code>Status</code> , <code>Priority</code> , and <code>Due Date</code> of the task.
Email Alert	Uses an email template you specify to send an email to a designated recipient.

Type	Description
Field Update	Changes the value of a selected field. You can specify a value or create a formula for the new value.
Outbound Message	Sends a message to an endpoint you designate. You can also specify a username and the data you want to include in the message.

You can also set up to 40 additional actions to take place when a record has received all necessary approvals or is completely rejected.

Choose the Right Wizard to Help You Create an Approval Process

Approval processes require planning and preparation. Before you create an approval process, determine which wizard is best for your needs.

Jump Start Wizard

For simple approval processes that use a single step, use the jump start wizard. It automatically chooses some [default options](#) for you.

Standard Wizard

For complex approval processes—when you want to fine tune the steps in your approval process, use the standard wizard. It allows you to define your process and then define each step in the process.

[Approvals](#)

[Get Started with Approvals](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create approval processes:

- "Customize Application"

Create an Approval Process with the Jump Start Wizard

The Approval Process Jump Start Wizard helps you create a simple one-step approval process in just a few clicks. It automates the process of creating an approval process by choosing some default options for you.

 **Note:** To make your process as functional and complete as possible, there are a few things you should do first:

1. If you would like to automate approval routing, use the standard manager field or create a custom hierarchy field on the User object.
2. Create email templates to:
 - Tell approvers that they need to approve or reject a record. Remember to add approval merge fields so the approver can go directly to the approval request from the email. If your organization has enabled email approval response, be sure the email template describes how to correctly use both response options: clicking the link and replying by email.
 - Confirm to the record owner that a step in the approval process has been approved or rejected.
3. Create the automated actions that you want to occur while a record is in the process of being approved.

To create an approval process with the jump start wizard:

1. From Setup, enter *Approval Processes* in the Quick Find box, then select **Approval Processes**.
2. Choose the object for the new approval process.
3. Click **Create New Approval Process** and choose **Use Jump Start Wizard** from the drop-down button.
4. Enter a name for the new approval process.
5. Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have actions of the same type with the same unique name, provided they are defined for different objects. The `Unique Name` field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
6. Choose a custom email template to use when notifying approvers that an approval request is assigned to them, or leave this field blank to use the default email template. Each approval process uses a single email template for all steps.

 **Note:**

- If email approval response is enabled, be sure the email template you use describes how to correctly use both response options: clicking the link and replying by email. If the user doesn't respond correctly (for example, if the user misspells *approve* or types it on the wrong line), Salesforce doesn't register the user's response.
 - With the exception of `{!ApprovalRequest.Comments}`, approval merge fields named `{!ApprovalRequest.field_name}` in email templates return values only in approval assignment emails and email alerts for approval processes. When used in other emails—including email alerts for workflow rules—the approval merge fields return `null`.
7. Select **Add Approval History Related List...** to update all the page layouts for this object to include a related list that allows users to submit approval requests and track them.
 8. If only certain types of records should enter this approval process, do one of the following:

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create approval processes:

- "Customize Application"

- Select `criteria are met` if you want to set a filter criteria that a record must meet to enter this approval process. For example, if only employees from headquarters should use this approval process to submit expense reports, enter the following filter criteria: "Current User: Office Location Equals Headquarters."
 - a. Enter filter criteria for records that you want included in this approval process. Leave the filter blank if you want all records submitted to be included in the approval process.
 -  **Note:** Select a current user field if you want to filter based on the user submitting an approval request.
 - b. Click **Next**. If you're editing an existing approval process and don't want to make further changes, click **Save** to store your changes.
- Select `formula evaluates to true` if you want a formula to determine what records enter the approval process.
 - a. Enter a formula that returns "True" or "False." A record enters the approval process if the formula returns "True." For example, use the following formula to require a record to enter this approval process when the record's discount approval cutoff date is less than 30 days away:

```
(Discount_Approval_CutoffDate__c < (CloseDate - 30))
```

- b. Click **Next**. If you're editing an existing approval process and don't want to make further changes, click **Save** to store your changes.

Some functions are not available in approval process formulas. For information on which functions you can use in approval process formulas, see [Formula Operators and Functions](#) on page 3934.

9. Select the assigned approver(s) for approval requests created by this step. The assigned approvers are the users or members of a queue responsible for approving records that enter this step. The options are:

Let the submitter choose the approver manually.

Prompts the user to manually select the next approver.

Automatically assign an approver using a standard or custom hierarchy field.

Assigns the approval request to the user in the field displayed in this option. For example, you may want approval requests automatically routed to a user's manager as specified in the `Manager` standard user hierarchy field. Alternatively, you may want approval requests automatically routed to an associate specified in a custom `Account Manager` user field.

To create a new custom field, click `Create New Field` from this option.

Automatically assign to a queue.

The option to assign approval requests to a queue is available only for objects that support queues.

Automatically assign to approver(s).

Assigns the approval request to one or more of the following:

User

Any user in your organization.

Queue

The option to assign approval requests to a queue is available only for objects that support queues.

Related User

A user specified in any user lookup field on the submitted record, such as the `Last Modified By` field.

Use `Add Row` and `Remove Row` to change the number of approvers. There is a limit of 25 approvers per step.

Note: When specifying approvers, note the following:

- Make sure the assigned approver has access to read the records for the approval requests. For example, a user who does not have read access to an Expenses custom object will not be able to view expense approval requests.
- You can't use email approval response with approval processes in which the assigned approver is a queue.
- Approvers must have the "API Enabled" system permission to approve or reject approval requests via email.
- You can assign an approval request to the same user multiple times in a single step; however, Salesforce recognizes such redundancies and only requests a single approval from the user.
- After a record enters an approval step, the designated approvers for that step don't change even if the approval process returns to that step and the values of related user fields that designate the approvers have changed. For example, consider an approval process in which the first step requests approval from a user's manager. If the approval request is rejected in the second step and sent back to the first step, the user's original manager receives the approval request again even if the user's manager has changed.
- When the assigned approver is a queue:
 - Any queue member can approve or reject an approval request that is assigned to the queue.
 - Approval request emails are sent to the queue email address. If the queue is set up to send email to members, then approval request emails are also sent to the queue members, except those whose approval user preferences are set to never receive approval request emails.
 - When an approval request is assigned to a queue, each queue member's delegated approver also receives an approval request email notification.
 - Because email notifications to a queue aren't intended for an external audience, any instances of the merge field `{!ApprovalRequest.External_URL}` in the email template are sent as the equivalent internal URL.
 - Salesforce1 notifications for approval requests aren't sent to queues. For each approval step involving a queue, we recommend adding individual users as assigned approvers, so at least those individuals can receive the approval request notifications in Salesforce1. To have both queues and individual users as assigned approvers, select `Automatically assign to approver(s)` instead of `Automatically assign to queue` in the approval step.
 - When an approval request is rejected and returned to the previous approver and the previous approver was a queue, the approval request is assigned to the user who approved it instead of the queue.
 - The Approval History related list displays the queue name in the `Assigned To` column and the actual user who approved or rejected the approval request in the `Actual Approver` column.

10. If you specify multiple approvers in the `Automatically assign to approver(s)` option, choose one of the following:

Approve or reject based on the first response.

The first response to the approval request determines whether the record is approved or rejected.

Require unanimous approval from all selected approvers.

The record is only approved if all of the approvers approve the request. The approval request is rejected if any of the approvers reject the request.

11. Click **Save** to return to the Approval Process Detail page.

12. Select approval actions. For more information, see [Selecting Approval Actions](#) on page 4132.

13. When you are ready to use the approval process, activate it:

- a. From Setup, enter `Approval Processes` in the `Quick Find` box, then select **Approval Processes**.

- b. Click **Activate** next to an inactive process to activate it.

Default Selections for the Approval Process Jump Start Wizard

The jump start wizard automates creating an approval process by automatically choosing some default options for you.

After creating an approval process using the jump start wizard, you can change any of the default options by editing any approval process, and you can add additional steps from the approval process detail page. The one exception is the Record Lock action on the Initial Submission Actions list.

- To edit records awaiting approval in the approval process, users must have the “Modify All” permission for the given object or the “Modify All Data” permission.
- The page layout for the approval request includes the record name (or number), owner, date created, and approval history.
- The security settings require approvers to log in to Salesforce to view the approval page.
- Only the owner of the record can submit the record for approval.
- Records are locked when submitted for approval.
- Records remain locked until approved or rejected.
- Rejected records are unlocked.
- Only admins can recall a record after it’s submitted.
- There are no auto-approve or auto-reject actions.
- No email notification is sent upon approval or rejection.
- No field values are automatically updated during the approval process.
- An approver cannot automatically delegate another user to approve his or her approval requests.
- The **Allow submitters to recall approval requests** option is not selected.

Create an Approval Process

An approval process is an automated process your organization can use to approve records in Salesforce. An approval process specifies the steps necessary for a record to be approved and who must approve it at each step. A step can apply to all records included in the process, or just records that meet certain administrator-defined criteria. An approval process also specifies the actions to take when a record is approved, rejected, recalled, or first submitted for approval.

1. [Launch the Approval Process Wizard.](#)
2. [Specify Name, Unique Name, and Description.](#)
3. [Specify Criteria for Entering Process.](#)
4. [Specify Approver Field and Record Editability.](#)
5. [Select Email or Chatter Post Notification Template.](#)
6. [Configure the Page Layout for Approval Requests.](#)
7. [Specify Initial Submitters.](#)
8. [Activate the Approval Process.](#)

Launch the Approval Process Wizard

1. From Setup, enter *Approval Processes* in the Quick Find box, then select **Approval Processes**.
2. Choose the object for the new approval process.
3. Click **Create New Approval Process** and choose one of the wizards. Not sure which one to use? Check out [Choose the Right Wizard to Help You Create an Approval Process](#).

Specify Name, Unique Name, and Description

1. Enter a name for the new approval process.
2. Enter a unique name, which will be used to refer to this approval process in the Force.com API. The requirement for uniqueness is only within the selected object type. You can have two approval processes with the same unique name, provided they are defined for different objects, such as one for Campaigns and one for Opportunities. The `Unique Name` field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
3. Optionally, enter a description.
4. Click **Next**. If you're editing an existing approval process and don't want to make further changes, click **Save** to store your changes.

Specify Criteria for Entering Process

If only certain types of records should enter this approval process, do one of the following:

- Select `criteria are met` if you want to set a filter criteria that a record must meet to enter this approval process. For example, if only employees from headquarters should use this approval process to submit expense reports, enter the following filter criteria: "Current User: Office Location Equals Headquarters."
1. Enter filter criteria for records that you want included in this approval process. Leave the filter blank if you want all records submitted to be included in the approval process.

 **Note:** Select a current user field if you want to filter based on the user submitting an approval request.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create approval processes:

- "Customize Application"

2. Click **Next**. If you're editing an existing approval process and don't want to make further changes, click **Save** to store your changes.
- Select `formula evaluates to true` if you want a formula to determine what records enter the approval process.
 1. Enter a formula that returns "True" or "False." A record enters the approval process if the formula returns "True." For example, use the following formula to require a record to enter this approval process when the record's discount approval cutoff date is less than 30 days away:

```
(Discount_Approval_CutoffDate__c < (CloseDate - 30))
```

2. Click **Next**. If you're editing an existing approval process and don't want to make further changes, click **Save** to store your changes.

Some functions are not available in approval process formulas. For information on which functions you can use in approval process formulas, see [Formula Operators and Functions](#) on page 3934.

Specify Approver Field and Record Editability

When you define approval steps, you can assign approval requests to different users. One option is to use a user field to automatically route these requests. The user field can be any custom hierarchical relationship field such as `Account Manager` or the `Manager` standard user field. To see some examples of specifying a user field as an approver field, see [Sample Approval Processes](#) on page 4147.

When a record is in the approval process, it is always locked; only an administrator can edit it. However, you can also allow the currently-assigned approver to edit the record. You can still add campaign members to campaigns locked for approval.

1. From the `Next Automated Approver Determined By` picklist, select a user field if you want Salesforce to automatically assign approval requests to an approver based on the value in the user field. For example, you may want approval requests automatically routed to a user's manager as specified in the `Manager` standard user hierarchy field. Or, you may want approval requests automatically routed to an associate specified in a custom `Account Manager` user field.

- To specify a user to approve all approval requests, leave this field blank. You can select a user, or users, as the approver when [creating an approval step](#).

Warning: If you leave the `Next Automated Approver Determined By` field blank, you can't automatically assign approval requests to the manager in any step you create for this approval process.

- Select `Use Approver Field of Record Owner` if you want the first executed approval step to use a standard or custom user hierarchy field on the record owner's user record—instead of the submitter's user record—as the approver. All remaining steps use the specified user hierarchy field in the user record of the preceding step's approver.

For example, suppose you want the approval process to automatically assign each step's approver using the `Manager` standard user hierarchy field. The first approval step that isn't skipped uses the record owner's manager as the approver. All the other steps use the preceding approver's manager as the approver.

Note: Make sure the assigned approver has access to read the records for the approval requests. For example, a user who does not have read access to an `Expenses` custom object will not be able to view expense approval requests.

2. Select `Administrators ONLY...` if you want only users with the "Modify All" object-level permission for the given object, or the "Modify All Data" permission, to be able to edit records that are pending approval. Select `Administrators OR...` if you want the assigned approver to be able to edit the records too. The assigned approver must also have edit access to the record through both their permissions and the organization-wide sharing defaults for the given object. When a record is submitted for approval, it is automatically locked to prevent other users from editing it during the approval process.
3. Click **Next**. If you're editing an existing approval process and don't want to make further changes, click **Save** to store your changes.

Select Email or Chatter Post Notification Template

When an approval process assigns an approval request to a user, Salesforce automatically sends the user an approval request email. The email contains a link to the approval page in Salesforce, where the user can approve or reject the request and add comments. If email approval response is enabled, the user can alternatively reply to the email by typing *approve*, *approved*, *yes*, *reject*, *rejected*, or *no* in the first line of the email body, and adding comments in the second line. This option is especially useful for users who might receive approval requests on a mobile device.

 **Note:** Approvers must have the “API Enabled” system permission to approve or reject approval requests via email.

If your organization has [Approvals in Chatter](#) enabled, you can also elect to send your approver a notification via Chatter.

 **Note:** Chatter post approval notifications are only available for approval processes associated with an object that has been enabled for feed tracking.

If the assigned approver has opted to receive approval requests as Chatter posts, they'll see a post on their Chatter feed in addition to getting the approval request email.

1. Choose a custom email template to use when notifying approvers that an approval request is assigned to them, or leave this field blank to use the default email template. Each approval process uses a single email template for all steps.

 **Note:**

- If email approval response is enabled, be sure the email template you use describes how to correctly use both response options: clicking the link and replying by email. If the user doesn't respond correctly (for example, if the user misspells *approve* or types it on the wrong line), Salesforce doesn't register the user's response.
- With the exception of `{!ApprovalRequest.Comments}`, approval merge fields named `{!ApprovalRequest.field_name}` in email templates return values only in approval assignment emails and email alerts for approval processes. When used in other emails—including email alerts for workflow rules—the approval merge fields return `null`.

2. If available, choose an approval post template to use when notifying approvers via a post in their Chatter feed. If you don't pick an approval post template, the approval post for the object uses either the system default template or, if you created one, the default template for the object.

 **Note:** Only users with access to the approval record can see the approval request post. Comments on approval posts aren't persisted to the approval record.

3. Click **Next**. If you're editing an existing approval process and don't want to make further changes, click **Save** to store your changes.

Configure the Page Layout for Approval Requests

The approval page is where an approver approves or rejects a request.

1. Select the fields you want to display on the approval request page and click **Add**.

If you enable notifications in Salesforce1, keep in mind that approvers may view this list of fields on a mobile device. Select only the fields necessary for users to decide whether to approve or reject records.

2. Sort the fields by selecting them and clicking **Up** or **Down**.
3. Select `Display approval history information...` to include the Approval History related list that lists such fields as `Date`, `Assigned To`, `Actual Approver`, and `Comments`.
4. Select `Add Approval History Related List...` to update all the page layouts for this object to include a related list that allows users to submit approval requests and track them.

5. Choose a security setting:
 - Allow approvers to access the approval page only from within the application
Users must log in to Salesforce to view the approval page.
 - Allow approvers to access the approval page only from within the application, or externally from a wireless-enabled mobile device
Users can access an external version of the approval page from any browser, including those on mobile devices, without logging in to Salesforce. If you select this option, you can't add approval steps that let users manually select the next approver.
6. Click **Next**. If you're editing an existing approval process and don't want to make further changes, click **Save** to store your changes.

Specify Initial Submitters

Specify which users are allowed to submit records for approval. For example, choose Owner if expense reports can only be submitted by record owners.

1. Select a **Submitter Type**, enter a search term, and click **Find**.
2. Select from the list of available submitters and click **Add**.
3. Optionally, select **Allow submitters to recall approval requests** to give submitters the option to withdraw their approval requests. If the **Allow submitters to recall approval requests** option is selected for the approval process, both submitters and administrators can see the **Recall Approval Request** button in the Approval History related list on the detail page of submitted records; otherwise, only administrators can see it. When a user clicks **Recall Approval Request**, the pending approval request for the record is withdrawn and recall actions are run. For more information, see [Recall Actions](#) on page 4136.

This option is useful for situations that can change on the submitter's side while waiting for an approval. For example, an opportunity might be lost after the user submits it for approval.
4. Save your changes.

Activate the Approval Process

After you have created at least one approval step for the approval process, activate the process. See [Creating Approval Steps](#) on page 4127.

1. Click **Next**. If you're editing an existing approval process and don't want to make further changes, click **Save** to store your changes.
2. Activate the approval process.

[Get Started with Approvals](#)

[Considerations for Approval Processes](#)

Creating Approval Steps

Approval steps assign approval requests to various users and define the chain of approval for a particular approval process. Each approval step specifies the attributes a record must have to advance to that approval step, the user who can approve requests for those records, and whether to allow the delegate of the approver to approve the requests. The first approval step in a process specifies the action to take if a record does not advance to that step. Subsequent steps in the process allow you to specify what happens if an approver rejects the request.

The actions you associate with an approval step can be reused in workflow rules. To create approval steps:

1. From Setup, enter *Approval Processes* in the Quick Find box, then select **Approval Processes**, and select the name of the approval process.
2. Click **New Approval Step** from the Approval Steps related list. If this button is not available, the approval process is active and you cannot add more steps. There is a limit of 30 steps.
3. Enter a name, a unique name, and description for this step.

 **Note:** The `Unique Name` field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. The unique name will be used to refer to this specific approval process step in the Force.com API. The requirement for uniqueness is only within a specific approval process. You can have two approval process steps with the same unique name, provided they are defined for different approval processes.

4. Enter a step number that determines the order of this step in relation to the other steps in this approval process.
5. Click **Next**.
6. If only records with certain attributes should enter this step, select `Enter this step if the following...` and choose one of the following options:
 - Select `criteria are met` and set the filter criteria a record must meet to enter this step. For example, if this step should only apply to records submitted by employees from headquarters, enter the following filter criteria: *Current User: Office Location Equals Headquarters*.
 - Select `formula evaluates to true` and enter a formula that returns a value of `True` or `False`. Records enter this step only if the formula returns `True`. For example, use the following formula to require a record to enter this approval step when the record's discount percentage is greater than the most recent approver's discount threshold:

```
(Discount_Percentage__c > $User.Discount_Threshold__c)
```

For information on which functions you can use in approval formulas, see [Formula Operators and Functions](#) on page 3934.

7. If you specified filter criteria or entered a formula, choose what should happen to records that do not meet the criteria or if the formula does not return `True`.

 **Note:** You can't change your selection after the approval process has been activated, even if you deactivate the approval process.

The options are:

approve record

Automatically approves the request and performs all final approval actions.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create approval steps:

- "Customize Application"

reject record

Automatically rejects the request and performs all final rejection actions. This option is only available for the first step in the approval process.

go to next step

Automatically skips this step and goes to the next step.

 **Important:**

- The `go to next step` option is only available when editing a step that already has an ensuing step. To select `go to next step`, create an ensuing step, then select this option in the preceding step.
- The `go to next step` option is unavailable for the final step in the approval process.
- If you select `go to next step` in a step and delete all the ensuing steps, Salesforce automatically removes the `go to next step` definition from that step and ends the process if the step criteria are not met. However, if you select `go to next step` in your first step and delete all the ensuing steps, Salesforce changes the first step to `automatically reject record` if the step criteria are not met.
- If you select `go to next step` in the first step and the record does not meet the criteria for any of the steps in the approval process, the record is rejected.

8. Click Next.**9. Specify who must approve the approval requests that enter this step. The options are:****Let the submitter choose the approver manually.**

Prompts the user to manually select the next approver.

Automatically assign using the user field selected earlier.

Assigns the approval request to the user in the custom field that is displayed next to this option. This custom field was selected during the configuration of the approval process.

Automatically assign to a queue.

The option to assign approval requests to a queue is available only for objects that support queues.

Automatically assign to approver(s).

Assigns the approval request to one or more of the following:

User

Any user in your organization.

Queue

The option to assign approval requests to a queue is available only for objects that support queues.

Related User

A user specified in any user lookup field on the submitted record, such as the `Last Modified By` field.

Use `Add Row` and `Remove Row` to change the number of approvers. There is a limit of 25 approvers per step.

 **Note:** When specifying approvers, note the following:

- Make sure the assigned approver has access to read the records for the approval requests. For example, a user who does not have read access to an Expenses custom object will not be able to view expense approval requests.
- You can't use email approval response with approval processes in which the assigned approver is a queue.
- Approvers must have the "API Enabled" system permission to approve or reject approval requests via email.
- You can assign an approval request to the same user multiple times in a single step; however, Salesforce recognizes such redundancies and only requests a single approval from the user.

- After a record enters an approval step, the designated approvers for that step don't change even if the approval process returns to that step and the values of related user fields that designate the approvers have changed. For example, consider an approval process in which the first step requests approval from a user's manager. If the approval request is rejected in the second step and sent back to the first step, the user's original manager receives the approval request again even if the user's manager has changed.
- When the assigned approver is a queue:
 - Any queue member can approve or reject an approval request that is assigned to the queue.
 - Approval request emails are sent to the queue email address. If the queue is set up to send email to members, then approval request emails are also sent to the queue members, except those whose approval user preferences are set to never receive approval request emails.
 - When an approval request is assigned to a queue, each queue member's delegated approver also receives an approval request email notification.
 - Because email notifications to a queue aren't intended for an external audience, any instances of the merge field `{!ApprovalRequest.External_URL}` in the email template are sent as the equivalent internal URL.
 - Salesforce1 notifications for approval requests aren't sent to queues. For each approval step involving a queue, we recommend adding individual users as assigned approvers, so at least those individuals can receive the approval request notifications in Salesforce1. To have both queues and individual users as assigned approvers, select `Automatically assign to approver(s)` instead of `Automatically assign to queue` in the approval step.
 - When an approval request is rejected and returned to the previous approver and the previous approver was a queue, the approval request is assigned to the user who approved it instead of the queue.
 - The Approval History related list displays the queue name in the `Assigned To` column and the actual user who approved or rejected the approval request in the `Actual Approver` column.

10. If you specify multiple approvers in the `Automatically assign to approver(s)` option, choose one of the following:

Approve or reject based on the first response.

The first response to the approval request determines whether the record is approved or rejected.

Require unanimous approval from all selected approvers.

The record is only approved if all of the approvers approve the request. The approval request is rejected if any of the approvers reject the request.

11. Optionally, select `The approver's delegate may also approve this request`. A delegate is the user listed in the `Delegated Approver` field on the assigned approver's user detail page. Delegated approvers can't reassign approval requests; they can only approve or reject approval requests.

12. If this is not the first step in the approval process, specify what will happen if the approver rejects a request in this step:

Perform all rejection actions...

Automatically rejects the request completely regardless of any previous steps that were approved. Salesforce performs all rejection actions specified for this step and all final rejection actions.

Perform ONLY the rejection actions for this step...

Automatically rejects the request and returns the approval request to the previous approver. Salesforce performs all rejection actions specified for this step.

 **Note:** If this is the first step in an approval process, the rejection behavior is determined by the final rejection actions for the approval process.

13. Click **Save**.

14. Specify any workflow actions you want to occur during this step:

Yes, I'd like to create a new approval action...

Select the [type of action](#) and click **Go!** to begin creating an action and associate it with this approval step.

Yes, I'd like to create a new rejection action...

Select the [type of action](#) and click **Go!** to begin creating an action and associate it with this approval step.

No, I'll do this later...

Select this option and click **Go!** to view the details of the approval process.

Approval actions execute when a record in this step of the approval process is approved. Rejection actions execute when a record in this step is rejected.

15. Optionally, add additional approval actions and rejection actions to the step. Click **Show Actions** next to a step to view the Approval Actions and Rejection Actions related lists.

[Enable Email Approval Response](#)

Managing Approval Steps

Approval steps assign approval requests to various users and define the chain of approval for a particular approval process. Each approval step specifies the attributes a record must have to advance to that approval step, the user who can approve requests for those records, and whether to allow the delegate of the approver to approve the requests. The first approval step in a process specifies the action to take if a record does not advance to that step. Subsequent steps in the process allow you to specify what happens if an approver rejects the request.

To manage the steps for an approval process, from Setup, enter *Approval Processes* in the **Quick Find** box, then select **Approval Processes** and then select the approval process.

The Approval Steps related list shows all the steps and actions for the approval process.

- If the actions for each step are not listed, click **Show Actions** to display the Approval Actions and Rejection Actions related lists. Use these related lists to:
 - Click **Edit** to change an action. Any changes you make to an action affect any other approval processes or workflow rules that use it. This option is only available for some types of actions.
 - Click **Remove** to remove the action from the approval process. This does not delete the action. This option is only available for some types of actions.
 - Click **Add Existing** to add another action to the list of actions. See [Selecting Approval Actions](#) on page 4132.
 - Click **Add New** and select the appropriate type to create a new action and associate it with the approval process. See [Creating Approval Actions](#) on page 4131.
- Click **Hide Actions** to collapse the list of approval steps.
- Click **Edit** to change the step. For information on approval step attributes, see [Creating Approval Steps](#) on page 4127.
- Click **Del** to remove a step. This option is not available when the approval process is active.

USER PERMISSIONS

To edit or delete approval steps:

- “Customize Application”

To view approval steps:

- “View Setup and Configuration”

- Click **New Approval Step** to create an additional step. This option is not available when the approval process is active. See [Creating Approval Steps](#) on page 4127.

SEE ALSO:

[Process Visualizer](#)

Creating Approval Actions

Create approval actions to associate with approval steps, initial submission, final approval, final rejection, or recall. For example, you may have an expense approval process in Salesforce that you want to send an outbound message to your Oracle accounting service to print expense checks when expense approval requests are approved.

To create an approval action:

1. From Setup, enter *Approval Processes* in the Quick Find box, then select **Approval Processes**.
2. Select the approval process you want associated with the action.
3. Click **Add New** from the appropriate related list. When creating actions for an approval step, click **Show Actions** if they are hidden.
4. Choose the type of action. The list of available actions differs depending on your settings and whether you have reached the limit for any type of action:
 - [Configure the email alert.](#)
 - [Configure the field update.](#)
 - [Configure the outbound message.](#)
 - [Configure the task.](#)

 **Note:** The actions you create for approval processes can be reused in workflow rules.

USER PERMISSIONS

To create approval actions:

- "Customize Application"

Selecting Approval Actions

There are four types of approval actions:

Type	Description
Task	Assigns a task to a user you specify. You can specify the <code>Subject</code> , <code>Status</code> , <code>Priority</code> , and <code>Due Date</code> of the task.
Email Alert	Uses an email template you specify to send an email to a designated recipient.
Field Update	Changes the value of a selected field. You can specify a value or create a formula for the new value.
Outbound Message	Sends a message to an endpoint you designate. You can also specify a username and the data you want to include in the message.

You can associate approval actions with approval steps, initial submission, final approval, final rejection, and recall. You can also reuse these actions for workflow rules. Before you begin, from Setup, enter *Approval Processes* in the `Quick Find` box, then select **Approval Processes** and select the approval process you want associated with the actions.

To select an approval action:

1. Click **Add Existing** from the appropriate related list on the detail page of any approval process. If the **Add Existing** button does not appear on an approval step, click **Show Actions**.

Alternatively, click **Add New** to create a new action and apply it to the selected approval process. For instructions on creating actions, see [Creating Approval Actions](#) on page 4131.

2. Choose the type of action.
3. Select the action in the list of available actions and click **Add** to add the action to the list of selected actions.
4. Click **Save**.

Initial Submission Actions

Initial submission actions are the actions that occur when a user first submits a record for approval. By default, an action to lock the record runs automatically on initial submission. Initial submission actions can include any approval actions such as email alerts, field updates, tasks, or outbound messages. For example, an initial submission action can update a custom approval status field to “In Progress.”

When a user submits a record for approval, Salesforce sends an approval request email to the approver as defined in the approval step, and then executes a default initial submission action called [Record Lock](#). You can select up to 40 additional actions to occur when a record is initially submitted for approval, 10 of each of the following types:

Type	Description
Task	Assigns a task to a user you specify. You can specify the <code>Subject</code> , <code>Status</code> , <code>Priority</code> , and <code>Due Date</code> of the task.
Email Alert	Uses an email template you specify to send an email to a designated recipient.
Field Update	Changes the value of a selected field. You can specify a value or create a formula for the new value.
Outbound Message	Sends a message to an endpoint you designate. You can also specify a username and the data you want to include in the message.

To manage the initial submission actions for an approval process, from Setup, enter *Approval Processes* in the `Quick Find` box, then select **Approval Processes** and select the approval process.

The Initial Submission Actions related list shows all the actions that take place when a record is submitted for approval.

- Click **Edit** to change an action. Any changes you make to an action affect any other approval processes or workflow rules that use it. This option is only available for some types of actions.
- Click **Remove** to remove the action from the approval process. This does not delete the action. This option is only available for some types of actions.
- Click **Add Existing** to add another action to the list of actions. See [Selecting Approval Actions](#) on page 4132.
- Click **Add New** and select the appropriate type to create a new action and associate it with the approval process. Next, configure the action:
 - [Configure the email alert.](#)
 - [Configure the field update.](#)
 - [Configure the outbound message.](#)
 - [Configure the task.](#)

Final Approval Actions

Final approval actions are the actions that occur when all required approvals have been given for a record. Final approval actions can include email alerts, field updates, tasks, or outbound messages. For example, a final approval action can change the status to “Approved” and send an email notification.

When a record has been approved by all approvers, Salesforce executes all final approval actions. A default final approval action called Record Lock is selected for you. You can modify it to automatically lock or unlock the record. You can select up to 40 additional actions to occur when a record is finally approved, 10 of each of the following types:

Type	Description
Task	Assigns a task to a user you specify. You can specify the <code>Subject</code> , <code>Status</code> , <code>Priority</code> , and <code>Due Date</code> of the task.
Email Alert	Uses an email template you specify to send an email to a designated recipient.
Field Update	Changes the value of a selected field. You can specify a value or create a formula for the new value.
Outbound Message	Sends a message to an endpoint you designate. You can also specify a username and the data you want to include in the message.

Final Rejection Actions

Final rejection actions are the actions that occur when an approver rejects the request and it goes to the final rejection state. Final rejection actions can include email alerts, field updates, tasks, or outbound messages. For example, a final rejection action can change the status to “Rejected,” send an email notification, and unlock the record so that users can edit it before resubmitting.

When a record has been rejected by all approvers, Salesforce executes all final rejection actions. A default final rejection action called Record Lock is selected for you. You can modify it to automatically lock or unlock a record. You can select up to 40 additional actions to occur when a record is rejected, 10 of each of the following types:

Type	Description
Task	Assigns a task to a user you specify. You can specify the <code>Subject</code> , <code>Status</code> , <code>Priority</code> , and <code>Due Date</code> of the task.
Email Alert	Uses an email template you specify to send an email to a designated recipient.
Field Update	Changes the value of a selected field. You can specify a value or create a formula for the new value.
Outbound Message	Sends a message to an endpoint you designate. You can also specify a username and the data you want to include in the message.

Recall Actions

Recall actions are the actions that occur when a submitted approval request is recalled. By default, an action to unlock the record runs automatically on recall. Recall actions can include email alerts, field updates, tasks, or outbound messages. For example, a recall action can change the status of a request from “In Progress” to “Not Submitted.”

If the **Allow submitters to recall approval requests** option is selected for the approval process, both submitters and administrators can see the **Recall Approval Request** button in the Approval History related list on the detail page of submitted records; otherwise, only administrators can see it. When a user clicks **Recall Approval Request**, the pending approval request for the record is withdrawn and recall actions are run.

When a record has been recalled after submission, Salesforce executes all recall actions, including unlocking the record. You can select up to 40 additional actions to occur when a record is recalled, 10 of each of the following types:

Type	Description
Task	Assigns a task to a user you specify. You can specify the <code>Subject</code> , <code>Status</code> , <code>Priority</code> , and <code>Due Date</code> of the task.
Email Alert	Uses an email template you specify to send an email to a designated recipient.
Field Update	Changes the value of a selected field. You can specify a value or create a formula for the new value.
Outbound Message	Sends a message to an endpoint you designate. You can also specify a username and the data you want to include in the message.

To manage recall actions for an approval process, from Setup, enter *Approval Processes* in the `Quick Find` box, then select **Approval Processes**, and select the approval process.

The Recall Actions related list shows all the actions that take place when a record is recalled.

- Click **Edit** to change an action. Any changes you make to an action affect any other approval processes or workflow rules that use it. This option is only available for some types of actions.
- Click **Remove** to remove the action from the approval process. This does not delete the action. This option is only available for some types of actions.
- Click **Add Existing** to add another action to the list of actions. See [Selecting Approval Actions](#) on page 4132.
- Click **Add New** and select the appropriate type to create a new action and associate it with the approval process. Next, configure the action:

Process Visualizer

Use the Process Visualizer to:

- Display a flow chart of each saved approval process.
- Improve communication about the approval process and gain buy-in from step owners.
- Reinforce your company's policies by documenting the decisions you reached when the approval process was designed.
- Print an annotated version of the approval process, where numbers added to the diagram correspond to details in a table, which is included in the printable view.
- Share approval process diagrams by saving annotated versions as PDF files (requires an Adobe® PDF print driver).
- Quickly locate key details by searching multi-step or complex diagrams for matching text.
- Visualize and understand graphically:
 - The steps necessary for a record to be approved.
 - The designated approvers for each step.
 - The criteria used to trigger the approval process.
 - The specific actions to take when a record is approved, rejected, recalled, or first submitted for approval.

Launch the Process Visualizer

Before you can use the Process Visualizer, you must:

- Enable or download the Adobe Flash Player plugin, version 9.0.115 or later, in your browser
- Have at least one approval process defined in your organization

After completing the prerequisites:

1. From Setup, enter *Approval Processes* in the Quick Find box, then select **Approval Processes**.
2. Click the name of the approval process you want to view.
3. On the detail page for the approval process, click **View Diagram**.

Each approval process diagram is for viewing purposes only. You cannot update an approval process from the Process Visualizer. After saving your changes to the approval process, click **View Diagram** to view the updates or, if the Process Visualizer window is still open, click **Refresh**.

Process Visualizer User Interface

The highlighted numbers in the illustration correspond to the following descriptions:

1. The main area contains the approval process diagram, helping you visualize the overall flow, rules, actions, and dependencies. The diagram's orientation is top-to-bottom, left-to-right. The entry criteria for the approval process are shown at the top of the diagram. Record processing moves down the flowchart until the final approval or rejection. Each [flowchart component](#) uses a shape, an icon, or both to represent the type of processing that may happen.
2. The diagram's legend summarizes the icons. When you first use the Process Visualizer, the legend is hidden. To display the legend, click **Show Legend**. When you subsequently open other diagrams, the Process Visualizer remembers your last setting (shown or hidden).
3. The banner has a find box so you can find matching text within the approval diagram. Use the **Previous** and **Next** buttons to scroll through your matches.
4. Next to the diagram is an informational sidebar. The top pane in the sidebar presents the Approval Process Properties, which is collapsed by default. The Approval Process Properties pane lists information such as the name of the approval and whether it has been activated. Expand the pane by clicking the arrow icon.
5. The bottom pane of the sidebar contains the hover details, which lists information about the currently selected component on the diagram. You can hover over or click a component to view its details.
6. In the lower right of the diagram pane is a navigator window. Drag the pane within the navigator to view different parts of the diagram.
7. In the upper left of the diagram pane is a zoom slider. Use it to zoom in and out of your process diagram.
8. In the left side of the banner, use the buttons to get a printable view of the diagram, to refresh the diagram, or to hide or show the legend and navigator.

Displaying Hover Details for an Approval Process Diagram

When you hover over or click a [flowchart component](#), the Process Visualizer displays information about it in the sidebar, which remains there until you hover over or click a different component.

The following table lists the type of information you can see in the hover details.

Component Type	Hover Detail Message Formats
Approval steps	<p>Approval required from:</p> <ul style="list-style-type: none"> User: <code>user-name</code> Role: <code>role-name</code> <p>Or if defined for the step, one of the following values:</p> <ul style="list-style-type: none"> Submitter can choose approver Automatically assigned to Manager field Unanimous approval required from: <code>approver-1, approver-n...</code> Approval based on first response from: <code>approver-1, approver-n...</code> Related User: <code>object-name Owner</code> The approver's delegate may also approve this request <p>Description:</p>
Field updates	<ul style="list-style-type: none"> Update <code>field-name</code> with lookup value: <code>lookup-value</code> Update <code>field-name</code> with value: <code>value</code> Update <code>field-name</code> with formula: <code>formula</code>
Email alerts	Send (<code>email-template</code>) email to <code>recipient-1, recipient-n...</code> and additional recipients: <code>cc email field of email alert</code>
Tasks	Assign task to <code>assignee</code> with due date: <code>date</code>
Outbound messages	Send to endpoint <code>endpoint-url</code> the following fields: <code>field-1, field-n, ...</code>

Displaying Approval Process Properties

In the sidebar, the Approval Process Properties pane lists the information shown in the following table. Click the arrow to expand or collapse it. When you subsequently open other diagrams, the Process Visualizer remembers your last setting (expanded or collapsed).

Property	Description
Process Name	A user-defined name of the approval process.
Entry Criteria?	Appears only when there are no entry criteria for the process, displaying with a "No" value.
Active?	Indicates whether the approval process is active.
Description	The description of the approval process.
Record Editability	Shows the defined value for this property. For example: Administrator or current approver.
Next Automated Approver Determined By	Shows the value for this property. For example: Manager of Owner

Property	Description
Approval Assignment Email Template	The name of the template used for email alerts. For example: Leads: New assignment notification (SAMPLE)
Initial Submitters	Shows the defined value for this property. For example: Record Owner
Allow Submitters to Recall Approval Requests?	Shows the defined value, Yes or No, for this property.
Created By	The <code>name</code> of the person who created the approval process.
Modified By	The <code>name</code> of the last person to modify the approval process.

Printing Diagrams and Saving PDFs

To print an annotated version of the diagram, click **Printable View**. In this view, the numbers on the diagram correspond to details shown in a table directly below it. Use the printed or PDF version of the diagram to communicate information about the approval process, get buy-in from the people who participate in the approval decisions, and help the approval process users understand the requirements and flow. Click **Print** and select a printer. If you have an Adobe PDF print driver installed, you can save the printable view as a PDF file. To return to the diagram, click **Exit Printable View**.

Finding Text in a Diagram

Use the find function in the Process Visualizer banner to find detailed information quickly. This is helpful when you view a diagram with ten or more steps, complex formulas, or the names of many people or roles on the approvers' lists. You can find matching text within the diagram and the Approval Process Properties pane, and view the results highlighted in the sidebar. The number of matches is displayed beside the **Previous** and **Next** buttons, which you can use to scroll through your matches. Find is case insensitive, and treats the search terms as a phrase in quotes.

Use the find filters to limit results to a specific parameter: Approval Steps, Tasks, Email Alerts, Field Updates, and Outbound Messages. Click the arrow next to the **Find** field to select a filter. For example, to find all tasks for *Jane Smith*, click the arrow next to the **Find** field, select **Tasks**, then enter *Jane Smith*.

Note: **All** is the only filter that includes Approval Process Properties, Entry Criteria, and **Go Back** steps in its search parameters. If you select a filter but don't enter any text, all instances of that filter item are highlighted in the diagram and navigation pane.

Refreshing an Approval Process Diagram

Each approval process diagram is for viewing purposes only. You cannot update an approval process from the Process Visualizer. After saving your changes to the approval process, click **View Diagram** to view the updates or, if the Process Visualizer window is still open, click **Refresh**.

Changing an Approval Process Diagram's Zoom Level

Use the zoom slider in the upper left to change the diagram's size. Click **+** to zoom in, and **-** to zoom out, or drag the slider tab up and down the bar. This feature is especially helpful when you are viewing large, complex approval processes in the Process Visualizer.

Note: The zoom feature is only visible for diagrams that exceed the dimensions of the display window.

Using the Navigator

Click and drag the pane around the navigator window to quickly view different areas of a large approval process diagram. When you use the find feature, the navigator window changes to highlight the matches, which allows you to see items not visible in the main diagram display area. The navigator also reflects changes to the size of the diagram in the main display when you use the zoom slider.

Icon and Shape Examples	Description
	<p>Near the top of the diagram, a <code>start</code> circle indicates the beginning of the approval process. If defined, an <code>Entry Criteria</code> diamond precedes the <code>Start</code> circle. When you hover over or click <code>Entry Criteria</code>, the Process Visualizer displays the entry criteria in the sidebar's hover details pane. For example, an approval process for a lead is triggered when <code>Lead.AnnualRevenue >= 10000</code>. The arrow below the <code>Start</code> circle leads to the next criteria in the approval process. If a recall action was defined for the entry criteria, a line to the right connects to the <code>Final Recall Actions</code> rectangle.</p>
	<p>The rectangle labeled <code>Initial Submission Actions</code> represents any actions you defined in initial submission. At a minimum, this element shows the record lock set automatically by Salesforce to prevent updates by other users. Later during the approval process, after the record is approved, rejected, or recalled, the record is unlocked.</p>

Near the top of the diagram, a `start` circle indicates the beginning of the approval process. If defined, an `Entry Criteria` diamond precedes the `Start` circle. When you hover over or click `Entry Criteria`, the Process Visualizer displays the entry criteria in the sidebar's hover details pane. For example, an approval process for a lead is triggered when `Lead.AnnualRevenue >= 10000`. The arrow below the `Start` circle leads to the next criteria in the approval process. If a recall action was defined for the entry criteria, a line to the right connects to the `Final Recall Actions` rectangle.

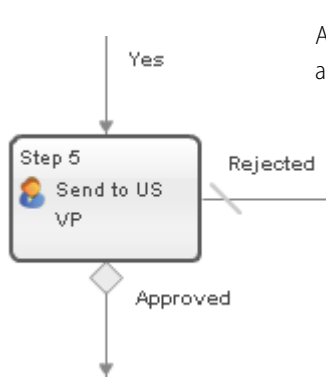

The rectangle labeled `Initial Submission Actions` represents any actions you defined in initial submission. At a minimum, this element shows the record lock set automatically by Salesforce to prevent updates by other users. Later during the approval process, after the record is approved, rejected, or recalled, the record is unlocked.

Icon and Shape Examples **Description**

A diamond with **Yes** or **No** branches represents the numbered step's criteria or formula that is evaluated before proceeding. Hover over or click the diamond to see the criteria or formula in the sidebar's hover details. For example, the criteria could be used to determine whether the *Lead.Rating = Hot*. If true, the approval process continues to the next step on the **Yes** branch. If false, the approval process continues to the next step on the **No** branch.

A rectangle containing a human icon, , represents an approval step. The **Approved** path includes a small diamond. The **Rejected** path uses a backslash.

A rectangle without a human icon or a plus sign represents a single action. The action types and icons are:

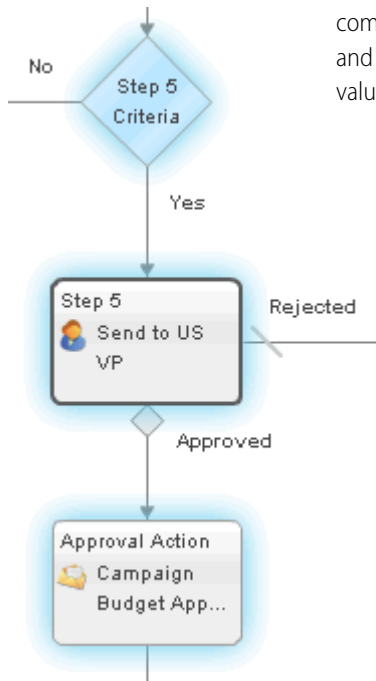

- Send an email alert: 
- Start a task: 
- Perform a field update: 
- Send an outbound message: 

In this example, a task has been assigned. When you hover over or click the rectangle, look for more information in the sidebar's hover details.

A rectangle with a plus sign (+) represents multiple actions. The actions shown inside are performed simultaneously, as a unit. To expand the display and view the individual actions, click the plus sign. In the expanded display, the Process Visualizer displays the individual actions, one per rectangle.

Icon and Shape Examples Description

When you hover over or click a shape on the diagram, and it is part of a step, all the elements that comprise the step use a glowing background color. This visual clue helps you locate all the decisions and actions that comprise each step, and how the processing may branch based on the record's values.

In the approval process definition, if the option was enabled to perform only the rejection actions for this step and send the approval request back to the most recent approver. (go back one step), the diagram displays a Go Back circle. When you hover over or click the Go Back circle, the hover details pane displays a message. For example:

On rejection send the request back to any one of the following steps, depending on the most recent approver: - *list-of-steps*. If no approvers are found, the request goes to Final Rejection.

The identified steps depend on where in the approval process the Go Back was defined. The possible steps are highlighted when you hover over the Go Back circle. In the diagram, the Process Visualizer displays the Go Back circle only for a step where its preceding step is defined as a skip.

The Final Approval Actions rectangle leads to a circle labeled Approved, as shown here. The Final Rejection Actions rectangle leads to a circle labeled Rejected. If a

Icon and Shape Examples Description

recall action was defined, the `Final Recall Actions` rectangle shows that the record is now unlocked, and the arrow leads to a circle labeled `Recalled`.

Considerations for Approval Processes

Before you implement an approval process for your organization, consider the following:

- *Active* approval processes can't be deleted. Before deleting an approval process, make sure it is inactive and that no records have been submitted for approval. If any records have been submitted, delete them and remove them from the Recycle Bin.
- You can enable email approval response. The email approval response feature gives users the ability to approve or reject email approval requests by replying to the email. Approvers must have the "API Enabled" system permission to approve or reject approval requests via email.
- If you make your approval object a detail object in a master-detail relationship, the `Owner` field isn't available for approval page layouts or approval post templates.
- Educate your users on the criteria for each approval process and what each of your approval processes does. Users can't tell what approval process is triggered when they click **Submit for Approval**.
- Records are locked while in an approval process. The ability to edit a locked record depends on the record editability setting of the approval process:
 - `Administrators ONLY`: Only users with the "Modify All" object-level permission for the given object, or the "Modify All Data" permission, can edit locked records.
 - `Administrators or the currently assigned approver...`: The current approver and users who match the `Administrators ONLY` criteria can edit locked records. The current approver must also have edit access to the record through their permissions and the organization-wide sharing defaults for the given object.

You can still add campaign members to campaigns locked for approval.

- Flows can delete records that are in an approval process.
- Approval processes that allow the user to select an approver manually also allow the user submitting a request to select himself or herself as the approver.
- An approval process can specify a field update action that re-evaluates workflow rules for the updated object. If, however, the re-evaluated workflow rules include a cross-object field update, those cross-object field updates will be ignored.
- Field updates that are executed as approval actions don't trigger workflow rules.

Error Messages

- An error message appears for the user submitting an approval request:
 - If the approval request needs to go to the user's direct manager and there is no direct manager for that user.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To use approvals:

- Various user permissions required depending on the action

- If the approval process has a field update that fails standard validation rules for the field. This could happen for a field that isn't visible on the user's page layout.

 **Note:** Field updates don't evaluate *custom* validation rules on fields.

- An error message appears for the user submitting an approval request for an entitlement or service contract if both these conditions are met:
 - The approval process includes Record Owner as an initial submitter.
 - The user submitting the approval request isn't the owner of the account associated with the entitlement or service contract.
- An error message appears for the user who's approving or rejecting multiple records if a next approver isn't specified and any of the related approval processes require the next approver to be selected manually. To avoid this error message, Salesforce recommends that users approve or reject each record individually.
- An error message appears if the next approver is a related user or a user in the role hierarchy and that same user is inactive or null. An administrator needs to review the approval process to identify inactive or null users.

Approvals and Queues

- The option to assign approval requests to a queue is available only for objects that support queues.
- You can't use email approval response with approval processes in which the assigned approver is a queue.
- You can't assign a group or queue as a delegated approver.
- When the assigned approver is a queue:
 - Any queue member can approve or reject an approval request that is assigned to the queue.
 - Approval request emails are sent to the queue email address. If the queue is set up to send email to members, then approval request emails are also sent to the queue members, except those whose approval user preferences are set to never receive approval request emails.
 - When an approval request is assigned to a queue, each queue member's delegated approver also receives an approval request email notification.
 - Because email notifications to a queue aren't intended for an external audience, any instances of the merge field `{!ApprovalRequest.External_URL}` in the email template are sent as the equivalent internal URL.
 - Salesforce1 notifications for approval requests aren't sent to queues. For each approval step involving a queue, we recommend adding individual users as assigned approvers, so at least those individuals can receive the approval request notifications in Salesforce1. To have both queues and individual users as assigned approvers, select `Automatically assign to approver(s)` instead of `Automatically assign to queue` in the approval step.
 - When an approval request is rejected and returned to the previous approver and the previous approver was a queue, the approval request is assigned to the user who approved it instead of the queue.
 - The Approval History related list displays the queue name in the `Assigned To` column and the actual user who approved or rejected the approval request in the `Actual Approver` column.

Limitations

- There is a limit of 30 steps.
- There is a limit of 25 approvers per step.
- You can't create outbound messages for approval processes on junction objects.
- After an approval process is activated, you can't add, delete, or change the order of the steps or change reject or skip behavior for that process, even if you make the process inactive.

Approvals and Merge Fields

- Approval process merge fields can be used in email templates, but not mail merge templates.
- With the exception of `{!ApprovalRequest.Comments}`, approval merge fields named `{!ApprovalRequest.field_name}` in email templates return values only in approval assignment emails and email alerts for approval processes. When used in other emails—including email alerts for workflow rules—the approval merge fields return `null`.
- The `{!ApprovalRequest.Comments}` merge field returns only the most recently entered comment in emails for an approval step that requires unanimous approval from multiple approvers.
- Merge fields in the approval request email are set to the submitter's name and the name of the first step.
- When the request is approved, the merge fields update to the most recent approver's name and the name of the second step, if applicable.
- For subsequent actions, merge field values are updated based on the previous completed step.
- When creating an approval process, the current user or creator of the process can specify a submitter. If you use custom email templates with merge fields, you need to account for the possibility that the current user and the submitter aren't the same user. For example, you may need to change current user references of `{!User.<field_name>}` to a specified submitter reference `{!ApprovalRequestingUser.<field_name>}`.

[Sample Approval Process: Job Candidates](#)

Sample Approval Process: PTO Requests

Most companies require employees to file a PTO (Paid Time Off) request and have their manager approve it. In three phases, here's how to automate a simple one-step PTO request process using Salesforce.

Prep Your Organization

Before creating the approval process:

- If you do not yet have a custom object to track your PTO requests, create a custom object and tab called PTO Requests. Add the appropriate fields for your PTO Requests such as `Start Date`, `End Date`, and `Employee Name`. See [Define a Custom Object](#) and [Defining Custom Tabs](#) on page 3731.
- Create an email template to notify approvers that an approval request needs to be reviewed. Be sure to include one of the approval process merge fields to take users directly to the approval page.

Create the Approval Process

Use the [jump start wizard](#) to create an approval process for the PTO Request custom object and specify the following:

- Select the email template you created for this approval process.
- Don't specify filter criteria if you want each user to submit PTO requests and have them included regardless of their attributes.
- Select the `Automatically assign an approver using a standard or custom hierarchy field` option, then choose `Manager`.
- The jump start wizard automatically chooses the record owner as the only person who can submit PTO requests.

 **Tip:** If you want the submitter to be able to withdraw a submitted PTO request:

1. Click **Edit** and choose **Initial Submitters**.
2. Select `Allow submitters to recall approval requests`.

If the **Allow submitters to recall approval requests** option is selected for the approval process, both submitters and administrators can see the **Recall Approval Request** button in the Approval History related list on the detail page of submitted records; otherwise, only administrators can see it. When a user clicks **Recall Approval Request**, the pending approval request for the record is withdrawn and recall actions are run. For more information, see [Recall Actions](#) on page 4136.

Wrap Things Up

After creating the approval process, add the Approval History related list to the PTO Request object page layout.

 **Tip:** Consider adding the Items To Approve related list to your custom home page layouts. It gives users an instant view of the approval requests they need to approve or reject. For instructions on adding this component to your home page layouts, see [Design Home Page Layouts](#) on page 3709.

If available, use your sandbox to test the approval process, then activate it.

Sample Approval Process: Expense Reports

If your company requires that employees file expense reports for managers to approve, you can automate this process in Salesforce. Use this example to create a two-step expense report approval process for all employees in your headquarters office. It specifies that expenses less than \$50 are automatically approved, those \$50 and over require manager approval, and those over \$5,000 require additional approval from two VPs. This example highlights the “else” option, as well as the parallel approvals feature.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Prep Your Organization

Before creating the approval process:

- If you do not yet have a custom object to track your expenses, create a custom object and tab called Expense Reports. See [Define a Custom Object](#) on page 3772 and [Defining Custom Tabs](#) on page 3731. Add the appropriate fields such as Amount, Description, Status, Start Date, and End Date.
- Create an email template to notify approvers that an approval request needs to be reviewed. Be sure to include one of the approval process merge fields to take users directly to the approval page.
- Create a custom field on the user object called `Office Location`. Assign the “HQ” value to users in the headquarters office location.

Create the Approval Process

[Create an approval process](#) using the Expense Report custom object and specify the following:

- The filter criteria for this approval process is `Current User: Office Location equals HQ`. Records must meet this criteria before they can be submitted to this approval process.
- Choose the `Manager` field as the next automated approver.
- Create an email template to notify approvers that an approval request needs to be reviewed. Be sure to include one of the approval process merge fields to take users directly to the approval page.
- Choose the record owner or any other user who you want to be able to submit expense reports.
- [Create two approval steps](#):
 1. Create a step named `Step 1: Manager Approval` with the following specifications:
 - Name this step `Step 1: Manager Approval`.
 - Select `Enter this step if the following` and choose **criteria are met**. Also, choose **approve record** for the `else` option.
 - Set the filter criteria to: `Expense: Amount greater or equal 50`.
 - In the `Automatically assign to approver(s)` option, select the manager of the user submitting the request.
 - If appropriate, choose `The approver's delegate may also approve this request` if you want to allow the user in the `Delegated Approver` field to approve requests.
 2. Create a second approval step named `Step 2: Multiple VP Approval` and specify the following:
 - Use the filter criteria `Expense Amount greater or equal 5000`.
 - Choose `Automatically assign to approver(s)` and select two users with a VP role.
 - Select the `Require UNANIMOUS approval from all selected approvers` option. The request will not be approved unless both designated users approve.

- If appropriate, choose `The approver's delegate` may also approve this request if you want to allow the user in the `Delegated Approver` field to approve requests.
- Choose `Perform ONLY the rejection actions for this step...` so that the request returns to the manager for changes if one of the VPs rejects the request.

 **Tip:** Consider creating the following [final approval actions](#):

- Define a field update to automatically change the `Status` field to "Approved."
- Send an approval notification to the user who submitted the expense report.
- Send an outbound message to your backoffice financial system to print a reimbursement check.

Wrap Things Up

After creating the approval process, add the Approval History related list to the Expense Report object page layout.

 **Tip:** Consider adding the Items To Approve related list to your custom home page layouts. It gives users an instant view of the approval requests they need to approve or reject. For instructions on adding this component to your home page layouts, see [Design Home Page Layouts](#) on page 3709.

If available, use your sandbox to test the approval process, then activate it.

Sample Approval Process: Discounting Opportunities

Opportunities that are discounted more than 40% require a CEO approval. Use this example to create a one-step approval process.

Prep Your Organization

Before creating the approval process:

- Create an email template to notify approvers that an approval request needs to be reviewed. Be sure to include one of the approval process merge fields to take users directly to the approval page.
- Create the following custom fields for opportunities:
 - A percent field called `Discount Percent` so that users can enter a percentage discount.
 - A checkbox field called `Discount Approved` to indicate whether the CEO approved the discount.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Create the Approval Process

Create an [approval process](#) on the Opportunity object and specify the following:

- The filter criteria for this approval process is `Discount Percent greater or equal 0.4`. Records must meet this criteria before they can be submitted to this approval process.
- You don't need to choose a custom field as the next automated approver because you will specify later in the process that the CEO must approve all requests.
- Select the email template you created for this approval process.
- Choose the record owner as the only user who can submit a discount request for approval.

- Create one approval step with no filter criteria because all records submitted will need to be approved or rejected. See [Creating Approval Steps](#) on page 4127.
- Choose `Automatically assign to approver(s)` and select the name of your CEO.
- If appropriate, choose `The approver's delegate may also approve this request` if you want to allow the user in the `Delegated Approver` field to approve requests.
- Consider creating the following [final approval actions](#):
 - Send an approval notification to the user who submitted the discount request.
 - [Define a field update](#) to automatically select the opportunity `Discount Approved` checkbox field.

Wrap Things Up

After creating the approval process, add the Approval History related list to the appropriate opportunity page layouts.

-  **Tip:** Consider adding the Items To Approve related list to your custom home page layouts. It gives users an instant view of the approval requests they need to approve or reject. For instructions on adding this component to your home page layouts, see [Design Home Page Layouts](#) on page 3709.

If available, use your sandbox to test the approval process, then activate it.

Sample Approval Process: Job Candidates

When your company interviews candidates for a position, you may have several levels of approval before you can send an offer letter. Use this example to create a three-step approval process that requires approval from multiple management levels.

Prep Your Organization

Before creating the approval process:

- If you don't yet have a custom object to track candidates, create a custom object and tab called Candidates. See [Define a Custom Object](#) and [Defining Custom Tabs](#) on page 3731. Add the appropriate fields such as `Salary`, `Offer Extended` (checkbox), and `Date of Hire`.
- Create an email template to notify approvers that an approval request needs to be reviewed. Be sure to include one of the approval process merge fields to take users directly to the approval page.

Create the Approval Process

[Create an approval process](#) on the Candidate custom object using the following specifications:

- Don't enter filter criteria because you want all submitted offers to be approved.
- Choose the `Manager` field as the next automated approver.
- Select the email template you created for this approval process.
- Choose the record owner or any other user that you want to be able to submit offer letters.
- [Create three approval steps](#):
 1. Create a step named *Step 1: Manager Approval*:
 - No filter is necessary as you want all records to advance to this step.
 - In the `Automatically assign to approver(s)` option, select the manager of the user submitting the request.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

- If appropriate, choose `The approver's delegate may also approve this request` if you want to allow the user in the `Delegated Approver` field to approve requests.
2. Create a second step named *Step 2: VP Approval*:
 - No filter is necessary as you want all records to advance to this step.
 - Choose `Let the user choose the approver` to allow the manager to select the appropriate VP to approve the request.
 - If appropriate, choose `The approver's delegate may also approve this request` if you want to allow the user in the `Delegated Approver` field to approve requests.
 - Choose `Perform ONLY the rejection actions for this step...` so that the request returns to the manager for changes if the VP rejects the request.
 3. Create a third step named *Step 3: CFO Approval*:
 - No filter is necessary as you want all records to advance to this step.
 - Choose `Automatically assign to approver(s)` and select the name of your CFO.
 - If appropriate, choose `The approver's delegate may also approve this request` if you want to allow the user in the `Delegated Approver` field to approve requests.
 - Choose `Perform all rejection actions for this step AND all final rejection actions. (Final Rejection)` so that offer letters rejected by your CFO are completely rejected.

 **Tip:**

- Consider creating the following [final approval actions](#):
 - Send an approval notification to the user who submitted the offer letter request.
 - Define a field update to select the `Offer Extended` checkbox field.
- Consider creating the following [final rejection actions](#):
 - Send a notification to the manager that the offer won't be extended.

Wrap Things Up

After creating the approval process, add the Approval History related list to the Candidates object page layout.

- Tip:** Consider adding the Items To Approve related list to your custom home page layouts. It gives users an instant view of the approval requests they need to approve or reject. For instructions on adding this component to your home page layouts, see [Design Home Page Layouts](#) on page 3709.

If available, use your sandbox to test the approval process, then activate it.

Enable Email Approval Response

The email approval response feature gives users the ability to approve or reject email approval requests by replying to the email. Approvers must have the “API Enabled” system permission to approve or reject approval requests via email.

Note:

- Before enabling email approval response, note that you cannot use this feature with approval processes in which the assigned approver is a queue, or in a multi-step approval process in which the next approver is manually chosen after the first step. Also, users that use Microsoft® Word® as their email editor must add the comments to the end of the first line of the reply email instead of the second.
- By enabling the email approval response feature, you agree to allow Salesforce to process email approval responses, update approval requests for all active users in your organization, and update the approval object on behalf of your organization's users.

1. From Setup, enter *Process Automation Settings* in the Quick Find box, then select **Process Automation Settings**.
2. Select **Enable Email Approval Response**.
3. Click **Save**.

When you enable email approval response, Salesforce uses the following default email template for approval processes unless you specify a custom email template:

[name of requesting user] has requested your approval for the following item.

To approve or reject this item, reply to this email with the word APPROVE, APPROVED, YES, REJECT, REJECTED, or NO in the first line of the email message, or click this link:

[link to approval page]

If replying via email you can also add comments on the second line. The comments will be stored with the approval request in Salesforce CRM.

Note: For salesforce.com to process your response the word APPROVE, APPROVED, YES, REJECT, REJECTED, or NO must be in the very first line of the reply email. Also, any comment must be in the second line.

If your organization has Approvals in Chatter enabled and the approver has opted to receive approval notifications as Chatter posts, the default email template is appended with:

You can also approve, reject and comment on this request from your Chatter feed:

[link to approval post in Chatter]

If you select a custom email template when configuring an approval response, be sure it contains the above information so users know how to correctly reply to the email approval request.

Approvals in Chatter

Get Started With Approvals in Chatter

Because it relies on both Chatter and Approvals, getting your organization set up for Approvals in Chatter involves more than just turning on the feature.

To be sure that everything works correctly and that your users will see their approval requests as Chatter posts, follow these steps when you're ready to turn Approvals in Chatter on for your organization:

1. Create an approval process.
2. Make sure Chatter feed tracking is enabled for the object that your approval process is associated with.
3. [Create an approval post template](#) for the object on which your approval process is based.
If you want to make this the default template for all approval processes on this object, be sure to check the `Default` checkbox when configuring your post template.
4. Repeat steps 1-3 for all approval processes, as needed.
5. [Enable Approvals in Chatter](#).
Doing this last ensures that all approval processes in your organization are properly configured to take advantage of it. After turning it on, all existing active approval processes will start generating Chatter posts.

SEE ALSO:

- [Where Do Approval Request Posts Appear?](#)
- [Considerations for Approvals in Chatter](#)

Enable Approvals in Chatter

If your organization has both Approvals and Chatter enabled, administrators can turn on Approvals in Chatter, which lets users receive approval requests as posts in their Chatter feeds.

1. From Setup, enter *Chatter Settings* in the `Quick Find` box, then select **Chatter Settings**.
2. Click **Edit**.
3. Select `Allow Approvals`.
4. Save your changes.

Users can update their own Chatter settings to opt out of receiving approval requests as posts in their Chatter feeds. Users who opt out of receiving approval request posts don't see them in their own feed but can see posts in the record's feed. Anyone with access to the approval record can

see approval posts in the record feed. Users who elect to receive approval requests via Chatter receive both an email notification and a post in their Chatter feed.

SEE ALSO:

[Where Do Approval Request Posts Appear?](#)

[Considerations for Approvals in Chatter](#)

[Get Started With Approvals in Chatter](#)

Considerations for Approvals in Chatter

Keep these issues in mind when working with Approvals in Chatter:

- After Approvals in Chatter is enabled in your organization, it is turned on for all users. Users can then update their own Chatter settings to opt out of receiving approval requests as posts in their Chatter feeds.
- Users who elect to receive approval requests via Chatter receive both an email notification and a post in their Chatter feed.
- To keep tabs on the progress of your submitted approval, we recommend you follow the approval record in Chatter.
- Different users see different configurations of the approval request post:
 - Only approvers see approval action buttons on their posts, and then only in their profile feed or their news feed.
 - Only approvers see approver names in the header.
- If a step requires unanimous approval from multiple approvers, the approval request post for that step doesn't list all selected approvers in its header. Approvers see only their own name in the post header.
- When an approval request is recalled, a new post is generated. It appears on the news feeds of the submitter, all approvers and followers of the object, as well as on the record feed.
- If you make your approval object a detail object in a master-detail relationship, the `OWNER` field isn't available for approval page layouts or approval post templates.
- If you change the approver, step name, or the routing type on an approval process while it's in progress, existing approval posts aren't updated.
- If you are an assigned approver and you opt out of receiving approval requests as posts while an approval is in progress, and you're not following the approval record, you won't see any new notification posts after opting out. However, if you are following the approval record, after opting out you will see approval posts from the record with non-approver content. Any approval notification posts you received prior to opting out are updated to show non-approver content, and the approve/reject buttons disappear from any existing posts in your feed.
- Approvals in Chatter works normally for approvals on Products, with one exception: If the product isn't active and the approver also doesn't have edit access to Products, approval post notifications for that product won't show up in the approver's feeds. The approver can only see approval posts in the product record's feed.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance

- Developer

Limitations

- Approvals in Chatter doesn't support delegated approvers or queues.
- You can't recall or reassign an approval request from a post. Both must be done from the approval record.
- Approval posts can't be deleted in the Salesforce user interface; you can only delete them through the API.

- Approval requests from Sites or portal users aren't supported.

SEE ALSO:

[Where Do Approval Request Posts Appear?](#)

[Get Started With Approvals in Chatter](#)

Where Do Approval Request Posts Appear?

When your organization has Approvals in Chatter enabled, posts for each approval request appear in multiple Chatter feeds.

-  **Note:** Only users with access to the approval record can see the approval request post. Comments on approval posts aren't persisted to the approval record.

Approval request posts show up:

- In the Chatter feed of the assigned approver
- On the submitter's profile
- In the Chatter feed of the submitter—only if the submitter is following the approval request record
- In the feed of the approval request record
- In the Chatter feed of anyone following the approval request record
- In the object-specific filter on the Chatter feed of anyone following the approval record.
- In the Company filter of every user with access to the approval record.

Users who opt out of receiving approval request posts don't see them in their own feed but can see posts in the record's feed. Anyone with access to the approval record can see approval posts in the record feed.

-  **Tip:** To keep tabs on the progress of your submitted approval, we recommend you follow the approval record in Chatter.

Configure Chatter Post Templates for Approval Requests

Customize which information to include in the approval request post when it displays in a Chatter feed.

 **Note:** You can only create an approval post template for an object that is both enabled for approvals and supported for Chatter feed tracking. You can't associate a post template to an approval process unless feed tracking for the object has been turned on.

1. From Setup, enter *Post Templates* in the **Quick Find** box, then select **Post Templates**.
2. Click **New Template**.
3. Select the object for your template.
4. Click **Next**.
5. Give the template a name and description.
6. Select the checkbox to make this the default template for the associated object.
7. Select up to four fields to display on the approval request post and click **Add**.
8. Sort the fields.
9. Save your changes.

To edit an approval post template, from the Post Templates page either:

- Click **Edit** in the Action column.
- Click a template name, then click the **Edit** button from the template detail page.

SEE ALSO:

[Considerations for Chatter Post Templates for Approval Requests](#)

Considerations for Chatter Post Templates for Approval Requests

If your organization has both Approvals and Chatter enabled, administrators can turn on Approvals in Chatter, which lets users receive approval requests as posts in their Chatter feeds. With approval post templates for Chatter, you can customize the information that is included in the approval request post when it displays in a Chatter feed. There are some things you should keep in mind when working with post templates.

 **Note:** Only users with access to the approval record can see the approval request post. Comments on approval posts aren't persisted to the approval record.

- You can set a post template as the default template for an object by clicking **Edit** from the template's detail page.
- You can only create an approval post template for an object that is both enabled for approvals and supported for Chatter feed tracking. You can't associate a post template to an approval process unless feed tracking for the object has been turned on.
- Deleting a custom field removes it from any approval post template that references it. Existing posts aren't affected. Undeleting the custom field restores it to the available fields list, but doesn't restore it to any approval post templates that previously contained it.
- Deleting (or undeleting) a custom object also deletes (or undeletes) its associated approval post templates and any of its approval request posts that are already in Chatter feeds.
- If you rename a custom object, approval post templates associated with it update accordingly.

- [Create a Custom Report Type for Approval History](#)

Fields Available for Approval History Reports

If you create a custom report type with Process Instance as the primary object and Process Instance Node as the related object, you can create approval history reports with various combinations of fields that enable you to view a detailed history of executed and in-progress approval processes and their individual steps.

Process Instance

A process instance represents one instance of an approval process. A new process instance is created each time a record is submitted for approval.

Field	Description
Approval Process Name	Name of the approval process.
Approval Process Instance ID	ID of the approval process instance.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional

Field	Description
Completed Date	Date and time when the approval process instance was completed or recalled. If no step criteria are met and the record is auto-approved or auto-rejected, Completed Date and Submitted Date have the same values.
Elapsed Days	Length of time between when the record was submitted for approval and when the approval process was completed or recalled.
Elapsed Hours	
Elapsed Minutes	
Last Actor: Full Name	Full name of the user who most recently participated in the approval process instance. If no step criteria are met and the record is auto-approved or auto-rejected, Last Actor: Full Name and Submitter: Full Name have the same values.
Object Type	Object type of the record that was submitted for approval.
Pending Step Name	Name of the approval step at which the record is awaiting approval or rejection.
Record Name	Name of the record that was submitted for approval.
Status	Status of the approval process instance.
Submitted Date	Date and time when the record was submitted for approval.
Submitter: Full Name	Full name of the user who submitted the record for approval.

Process Instance Node

A process instance node represents an instance of an approval step. A new process instance node is created each time a record enters a step in an approval process. No process instance node is created when the record doesn't meet the step criteria or if the approval process instance is otherwise completed without entering the step.

Field	Description
Step: Name	Name of the approval step.
Step: Completed Date	Date and time when the approval step instance was completed or recalled.
Step Elapsed Days	Length of time between when the record entered the approval step and when the approval step instance was completed or recalled.
Step Elapsed Hours	
Step Elapsed Minutes	
Step Last Actor: Full Name	Full name of the user who most recently participated in the approval step instance.
Step Start Date	Date and time when the record entered the approval step.

Field	Description
Step Status	Status of the approval step instance.

Report Example: Approvals—Elapsed Times

This sample report displays all approval process instances (1) and groups results by the approval process name (2). The results include the record name (3), approval process instance ID (4), status (5), submitted date (6), elapsed minutes (7), and completed date (8).

The screenshot shows the 'All Approvals—Elapsed Times' report in Salesforce. At the top, the report title is 'All Approvals—Elapsed Times' with a 'Help for this Page' link. Below the title is a 'Show Feed' button. The 'Report Generation Status' is 'Complete'. Under 'Report Options', there are two sections: 'Summarize information by:' and 'Time Frame'. The 'Summarize information by:' section has a dropdown for 'Approval Process: Name' and a 'Show' button with a red box labeled '1' next to it, and another dropdown for 'All process instance'. The 'Time Frame' section has a 'Date Field' dropdown set to 'Submitted Date' and a 'Range' dropdown set to 'Custom', with 'From' and 'To' input fields. Below these are buttons for 'Run Report', 'Hide Details', 'Customize', 'Save', 'Save As', 'Delete', 'Printable View', and 'Export Details'. The main report area is titled 'Grouped By: Approval Process: Name' and 'Sorted By: Approval Process: Name'. Below this is a table with columns: 'Record Name', 'Approval Process Instance ID', 'Status', 'Submitted Date', 'Elapsed Minutes', and 'Completed Date'. A red box labeled '2' is next to the 'Grouped By' dropdown. A red box labeled '3' is next to the 'Record Name' column header. A red box labeled '4' is next to the 'Approval Process Instance ID' column header. A red box labeled '5' is next to the 'Status' column header. A red box labeled '6' is next to the 'Submitted Date' column header. A red box labeled '7' is next to the 'Elapsed Minutes' column header. A red box labeled '8' is next to the 'Completed Date' column header. The table contains 13 records grouped under 'Approval Process: Name: Oppty Approval Process (13 records)'. The records include details like 'ABC Labs - 9 Spider 2 Series Laptops', 'Canson - 15 Spider Series 3 Laptops', etc., with their respective instance IDs, statuses (Pending, Recalled, Rejected, Approved), submitted dates, elapsed minutes, and completed dates.

Report Example: Approval Steps—Elapsed Times

This sample report displays all approval process instances (1) and groups results by approval process name (2) and record name (3). The results are sorted by step name (4) and include step status (5), step start date (6), step elapsed minutes (7), step completed date (8), and approval process instance ID (9).

Notice that the previous sample report doesn't include the approvers for each step and the elapsed time for each approval request. To get this information, you need to run a SOQL query by using the approval process instance ID from the report. The following sample SOQL query obtains the ActorID (user or queue that received the approval request) and the ElapsedTimeInHours (elapsed time since the approval request was sent) for the first pending step in the report.

```
SELECT ActorId, ElapsedTimeInHours FROM ProcessInstanceWorkitem where processInstanceId = '04gD0000000LvIV'
```

```
SELECT ActorId, ElapsedTimeInHours FROM ProcessInstanceWorkitem where processInstanceId = '04gD000000LvIV'
```

Query Results - Total Rows: 1	
ActorId	ElapsedTimeInHours
005D00000015vGGIAY	29.820833333333333

The sample query has only one result, and you can view that approver's user profile page by appending the resulting ActorID to the organization's base URL (<https://MyCompany.salesforce.com/005D00000015vGGIAY>), which gets redirected to the user profile page.

[Approval History Reports](#)

Considerations for Approval History Reports

Understand the limitations and special behaviors when you create or view approval history reports, which provide a detailed history of approval processes and steps.

Considerations for Approval Processes that were Completed Before or Pending During the Summer '14 Rollout

When Summer '14 became available for your organization, the approval history data was automatically populated for completed and pending approval processes. However, some approval

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

history field values are never populated or are populated only after the approval process instance is next acted upon—such as when a user approves, rejects, or reassigns an approval request—after the Summer '14 rollout.

Object	When Fields are Populated
Process Instance	<p>For approval process instances that were completed before the Summer '14 rollout, all Process Instance fields are automatically populated, with one exception: <code>Completed Date</code> is never populated for approval process instances that were completed before January 1, 2013.</p> <p>For approval process instances that were pending during the Summer '14 rollout, all Process Instance fields are automatically populated, with two exceptions: <code>Completed Date</code> and <code>Last Actor: Full Name</code> are populated only after the approval process instance is complete.</p>
Process Instance Node	<p>Never populated for approval process instances that were completed before the Summer '14 rollout.</p> <p>For approval process instances that were pending during the Summer '14 rollout, all Process Instance Node fields are populated only after the approval process instance is next acted upon after the Summer '14 rollout.</p>

Additional exceptions apply to approval history data that is available only via SOQL queries of certain objects. See `ProcessInstance`, `ProcessInstanceNode`, `ProcessInstanceStep`, and `ProcessInstanceWorkitem` in the *Object Reference for Salesforce and Force.com*.

Considerations for the Sandbox Environment

If you copy approval history data to a sandbox, some field values are overwritten and won't reflect the actual approval history.

Object	Field	When an Existing Process Instance or Process Instance Node Record is Copied to a Sandbox...
Process Instance	<code>Submitted Date</code>	This value is overwritten by the date and time when the process instance record is copied to the sandbox.
	<code>Submitter: Full Name</code>	This value is overwritten by the name of the user who copied the process instance record to the sandbox.
Process Instance Node	<code>Step Start Date</code>	This value is overwritten by the date and time when the process instance node record is copied to the sandbox.

Manage Multiple Approval Requests

Transfer multiple approval requests from one user to another or remove multiple approval requests from the approval process.

 **Note:** Before transferring an approval request, check that the user you're transferring the approval requests to has permission to read the records. For example, a user who doesn't have "Read" access to the Expenses custom object can't view approval requests for expense records.

1. From Setup, enter *Mass Transfer Approval Requests* in the Quick Find box, then select **Mass Transfer Approval Requests**.
2. Enter the search conditions that the approval requests you are transferring must match. For example, you could search for approval requests that were submitted by a particular user by specifying *Submitter equals jsmith*.
3. Click **Find** to search for approval requests that match.
4. Choose an option:
 - `Mass remove records from an approval process` unlocks the records and removes them from any approval process so they no longer appear on the approver's list of pending approval requests.
 - `Mass transfer outstanding approval requests to a new user` allows you to select a user and assign that user as the approver for all approval requests selected.
5. Optionally, enter any comments to be stored with the approval requests. The comments you enter are displayed on the Approval History related list if your administrator has customized it to include the `Comments` field.
6. Select the checkbox next to each approval request you want to transfer or remove from the approval process, depending on the option you selected previously.
7. Click **Transfer** or **Remove**, depending on the option you selected previously.

[Approval Process Terminology](#)

Work With Approval Requests

Respond to an Approval Request

Your administrator can set up an approval process that lets you and other users submit records for approval, which results in *approval requests*. When you receive an approval request, respond to it by approving, rejecting, or reassigning it. Depending on which Salesforce experience you're using, you have some options.

A single record may need to go through several layers of approval.

 **Note:** You must have read access on a record to approve, reject, reassign, or recall an approval request for that record.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To manage multiple approval requests:

- "Transfer Leads"

AND

"Transfer Record"

IN THIS SECTION:

[Respond to an Approval Request in Lightning Experience](#)

When you receive an approval request, respond to it by approving, rejecting, or reassigning it. In Lightning Experience, you can do so from the in-app notification, an email notification, the record, or your feed.

[Respond to an Approval Request in Salesforce Classic](#)

When you receive an approval request, respond to it by approving, rejecting, or reassigning it. In Salesforce Classic, you can do so from your home page, an email notification, the record, or your feed.

[Respond to an Approval Request in Salesforce 1](#)

When you receive an approval request, respond to it by approving, rejecting, or reassigning it. In Salesforce 1, you can do so from an in-app or push notification, the record, or your feed.

Respond to an Approval Request in Lightning Experience

When you receive an approval request, respond to it by approving, rejecting, or reassigning it. In Lightning Experience, you can do so from the in-app notification, an email notification, the record, or your feed.

Note: You must have read access on a record to approve, reject, reassign, or recall an approval request for that record.

From Your Notification

If notifications are enabled for your organization, you receive a notification whenever you receive an approval request email. This depends on the `Receive Approval Request Emails` field in your personal settings. Open the notification and approve or reject the request.

From Your Email

Depending on the `Receive Approval Request Emails` field in your personal settings, you can receive approval requests as email notifications. Click the link in the email and click **Approve** or **Reject**.

If email approval response is enabled, reply to the email notification by typing the word *approve*, *reject*, *approved*, *rejected*, *yes*, or *no* in the first line of the email body. You can also add comments in the second line.

Note:

- Approval request comments are limited to 4,000 characters. In Chinese, Japanese, or Korean, the limit is 1,333 characters.
- If the word in your response isn't recognized, you receive an error notification email. To submit another response, reply again to the original email notification. Replies to the error notification email won't be processed.

From the Record

If your administrator has added the Approval History related list to the record that was submitted for approval, use the related list to approve or reject the request.

From Your Feed

If your organization has Approvals in Chatter enabled, you can set your Chatter settings to receive approval requests as posts in your Chatter feed in addition to receiving them as emails. From the post, click the name of the record. Then navigate to the Approval History related list, and click **Approve** or **Reject**.

Note: Only users with access to the approval record can see the approval request post. Comments on approval posts aren't persisted to the approval record.

EDITIONS

USER PERMISSIONS

To approve, reject, or reassign approval requests:

- Permissions vary depending on the approval process settings

To approve and reject approval requests via email:

- "API Enabled"

Respond to an Approval Request in Salesforce Classic

When you receive an approval request, respond to it by approving, rejecting, or reassigning it. In Salesforce Classic, you can do so from your home page, an email notification, the record, or your feed.

 **Note:** You must have read access on a record to approve, reject, reassign, or recall an approval request for that record.

From Your Home Page

Refer to the home page's Items to Approve component for a list of all the approval requests that you need to respond to.

If you're using Aloha Experience and your admin has added the Items to Approve component to your home page, click the Home tab to see all of your pending approval requests.

From Your Email

Depending on the `Receive Approval Request Emails` field in your personal settings, you can receive approval requests as email notifications. Click the link in the email and click **Approve** or **Reject**.

If email approval response is enabled, reply to the email notification by typing the word *approve*, *reject*, *approved*, *rejected*, *yes*, or *no* in the first line of the email body. You can also add comments in the second line.

 **Note:**

- Approval request comments are limited to 4,000 characters. In Chinese, Japanese, or Korean, the limit is 1,333 characters.
- If the word in your response isn't recognized, you receive an error notification email. To submit another response, reply again to the original email notification. Replies to the error notification email won't be processed.

From the Record

If your administrator has added the Approval History related list to the record that was submitted for approval, use the related list to approve or reject the request.

From Your Feed

If your organization has Approvals in Chatter enabled, you can set your Chatter settings to receive approval requests as posts in your Chatter feed—in addition to receiving them as emails. From the post, click **Approve** or **Reject**.

 **Note:** Only users with access to the approval record can see the approval request post. Comments on approval posts aren't persisted to the approval record.

Respond to an Approval Request in Salesforce

When you receive an approval request, respond to it by approving, rejecting, or reassigning it. In Salesforce1, you can do so from an in-app or push notification, the record, or your feed.

 **Note:** You must have read access on a record to approve, reject, reassign, or recall an approval request for that record.

From Your Notification

If notifications are enabled for your organization, you receive a notification whenever you receive an approval request email. This depends on the `Receive Approval Request Emails` field in your personal settings. Open the notification and approve or reject the request.

From the Record

If your administrator has added the Approval History related list to the record that was submitted for approval, use the related list to approve or reject the request.

From Your Feed

If your organization has Approvals in Chatter enabled, you can set your Chatter settings to receive approval requests as posts in your Chatter feed in addition to receiving them as emails. From the post, tap **Approve** or **Reject**.

 **Note:** Only users with access to the approval record can see the approval request post. Comments on approval posts aren't persisted to the approval record.

Enable or Disable Approval Request Posts

If your organization has Approvals in Chatter enabled, you can receive approval requests as posts in Chatter.

1. From your personal settings, enter `My Feeds` in the `Quick Find` box, then select **My Feeds**.
2. Select or deselect the option to receive approval requests as posts.
By default, you automatically receive approval requests in posts when your administrator turns on Approvals in Chatter.
3. Save your changes.

 **Note:** Only users with access to the approval record can see the approval request post. Comments on approval posts aren't persisted to the approval record.

Items to Approve

The Items to Approve related list tracks the open approval requests assigned to you. If your administrator has created an approval process for your organization, you may see this related list on your home page.

- Click an approval request to view more details about it.
- To assign the approval request to another user, click **Reassign** next to an item.
- To display the approval request detail page and approve or reject a pending approval request, click **Approve / Reject** next to an item.

 **Note:** You must have read access on a record to approve, reject, reassign, or recall an approval request for that record.

- Click **Manage All** to manage all of your assigned approval requests. Next, select approval requests by checking the appropriate boxes. Optionally, check the box in the column header to select all currently displayed items.
 - Click **Reassign** to assign the selected approval requests to another user, choose the user, enter any comments, and click **Save**.
 - Click **Approve / Reject** to display the approval request detail page and click **Approve** or **Reject** to approve or reject all selected approval requests at once.

 **Note:** You must have read access on a record to approve, reject, reassign, or recall an approval request for that record.

- Permissions vary depending on the approval process settings

Approval History Related List

The Approval History related list tracks a record through the approval process. If an approval process exists for an object, you may see this related list on a record detail page.

- To submit a record for approval, click **Submit for Approval**.
Salesforce begins the approval process if any approval processes apply to the record. This option is not available after the record has been submitted. Depending on the approval process, you may be prompted to select the next approver.
 - To take a record out of the approval process, click **Recall Approval Request**.
This is only available if the record is in an approval process, and if the approval process is set up to allow submitters to recall approval requests. When a user clicks **Recall Approval Request**, the pending approval request for the record is withdrawn and recall actions are run. For more information, see [Recall Actions](#) on page 4136.
 - To assign the approval request to another user, click **Reassign** next to an item.
 - To display the approval request detail page and approve or reject a pending approval request, click **Approve / Reject** next to an item.
-  **Note:** You must have read access on a record to approve, reject, reassign, or recall an approval request for that record.

Depending on how your administrator customizes the Approval History related list, it can contain the following **Status** values:

Status	Definition
Submitted	The record has been submitted for a approval.
Pending	The record has been submitted for approval and is awaiting approval or rejection.
Approved	The record has been approved.
Rejected	The record has been rejected.
Reassigned	The record has been submitted for approval but assigned to a different approver.
Recalled	The record was submitted for approval but recalled from the approval process.

Before you can submit a record for approval, it must meet the criteria for an active approval process. Contact your administrator to find out about the attributes a record must have to be included in an active approval process for your organization.

Change Your Approval User Preferences

Set your preferences for receiving approval request emails, including opting not to receive them at all.

1. From your personal settings, enter *Approver Settings* in the **Quick Find** box, then select **Approver Settings**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
2. Optionally, select your *Delegated Approver*.

 **Note:** You can't assign a group or queue as a delegated approver.

3. Optionally, enter your *Manager*.
4. Set your preference for receiving approval request emails. This preference also affects whether you receive approval request notifications in Salesforce1. The options are:
 - *If I am an approver or delegated approver*
 - *Only if I am an approver*
 - *Only if I am a delegated approver*
 - *Never*—If you select this option, you don't receive any approval request notifications in Salesforce1 or by email, even if your organization has [email approval response](#) enabled. However, you still receive approval request emails from a queue, depending on how your admin set up the queue email.
5. Save your changes.

When an approval request email is sent, the assigned approver and delegated approver both receive an email notification about the approval request. Delegated approvers can't reassign approval requests; they can only approve or reject approval requests.

 **Note:** When an approval request is assigned to a queue, each queue member's delegated approver also receives an approval request email notification.

What is email approval response?

If your administrator has enabled email approval response, you can approve or reject approval requests by responding to the email notification.

When responding to an approval request, the first line of the email body may contain one of the following words:

- approve
- approved
- yes
- reject
- rejected
- no

Periods and exclamation marks are also allowed at the end of the word. You can also optionally add comments in the second line of the email body. Users can still click a link in the email to access the approval page as well. This feature is especially useful for organizations with users who receive approval requests on mobile devices.

Can I use a mobile device (such as a BlackBerry) to approve and reject approval requests?

Yes. Use the standard mobile device email client and respond to the approval request email by sending a reply with the word “approve,” “approved,” “yes,” “reject,” “rejected,” or “no” in the first line of the email body. You can also add comments in the second line.

I tried to reply but got this error message: “Your workflow approval message was not processed.” What should I do?

Make sure you reply using the same email address that received the email approval request.

I tried to reply but my email approval response wasn’t delivered. What should I do?

Approvers must have the “API Enabled” system permission to approve or reject approval requests via email. Contact your administrator.

Why am I not receiving any email approval requests?

You might not receive the email approval requests that you expect because:

- Your user preferences for receiving approval request emails might not be set to do so. For details, see [Change Your Approval User Preferences](#) on page 4172.
- Email delivery time can vary based on your ISP or connection.
- Your email content might be caught by a spam filter on your mail server. Contact your email administrator, who can check the logs of all inbound email to see if it's being delivered, rejected, or marked as spam.
- Your Salesforce email addresses might need to be white-listed by your email administrator.

Can a delegated approver respond to an email approval request?

Delegated approvers can approve or reject email approval requests by replying to the email.

The first line of the email body may contain one of the following words:

- approve
- approved
- yes

- reject
- rejected
- no

Periods and exclamation marks are also accepted at the end of the word. You can also optionally add comments in the second line of the email body. Users can still click a link in the email to access the approval page as well. This feature is especially useful for organizations with users who receive approval requests on mobile devices.

Can I respond to email approval requests in languages other than English?

Yes. Email approval response works in all languages that Salesforce supports. The response word or phrase is checked using the current user language dictionary. If no matches are found, the response word or phrase is checked in all other language dictionaries.

What if the approval request has already been approved or rejected by another user?

An email approval request can only be processed once. If another user has responded to the approval request before you do, you'll get an error.

Approval Process Terminology

The following terminology is used for approval processes in Salesforce:

Approval Actions

An approval action is an action that occurs as a result of an approval process. There are four types of approval actions:

Type	Description
Task	Assigns a task to a user you specify. You can specify the <code>Subject</code> , <code>Status</code> , <code>Priority</code> , and <code>Due Date</code> of the task.
Email Alert	Uses an email template you specify to send an email to a designated recipient.
Field Update	Changes the value of a selected field. You can specify a value or create a formula for the new value.
Outbound Message	Sends a message to an endpoint you designate. You can also specify a username and the data you want to include in the message.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Approval steps, initial submission, final approvals, final rejections, and recalls can execute approval actions. Both approval processes and workflow rules share actions.

Approval Process

An approval process is an automated process your organization can use to approve records in Salesforce. An approval process specifies the steps necessary for a record to be approved and who must approve it at each step. A step can apply to all records included in the process, or just records that meet certain administrator-defined criteria. An approval process also specifies the actions to take when a record is approved, rejected, recalled, or first submitted for approval.

Approval Request

An approval request is an email, Salesforce1 notification, or Chatter post notifying the recipient that a record was submitted for approval and that his or her approval is requested.

Approval Steps

Approval steps assign approval requests to various users and define the chain of approval for a particular approval process. Each approval step specifies the attributes a record must have to advance to that approval step, the user who can approve requests for those records, and whether to allow the delegate of the approver to approve the requests. The first approval step in a process specifies the action to take if a record does not advance to that step. Subsequent steps in the process allow you to specify what happens if an approver rejects the request.

Assigned Approver

The assigned approver is the user responsible for approving an approval request.

Delegated Approver

A delegated approver is a user appointed by an assigned approver as an alternate for approval requests. Delegated approvers can't reassign approval requests; they can only approve or reject approval requests.

Email Approval Response

The email approval response feature gives users the ability to approve or reject email approval requests by replying to the email. Approvers must have the "API Enabled" system permission to approve or reject approval requests via email.

When responding to an approval request, the first line of the email body may contain one of the following words:

- approve
- approved
- yes
- reject
- rejected
- no

Periods and exclamation marks are also allowed at the end of the word. You can also optionally add comments in the second line of the email body. Users can still click a link in the email to access the approval page as well. This feature is especially useful for organizations with users who receive approval requests on mobile devices.

To enable email approval response, see [Customizing Workflow and Approval Settings](#) on page 4315.

Note: Before enabling email approval response, note that you cannot use this feature with approval processes in which the assigned approver is a queue, or in a multi-step approval process in which the next approver is manually chosen after the first step. Also, users that use Microsoft® Word® as their email editor must add the comments to the end of the first line of the reply email instead of the second.

Initial Submission Actions

Initial submission actions are the actions that occur when a user first submits a record for approval. By default, an action to lock the record runs automatically on initial submission. Initial submission actions can include any approval actions such as email alerts, field updates, tasks, or outbound messages. For example, an initial submission action can update a custom approval status field to "In Progress."

Final Approval Actions

Final approval actions are the actions that occur when all required approvals have been given for a record. Final approval actions can include email alerts, field updates, tasks, or outbound messages. For example, a final approval action can change the status to "Approved" and send an email notification.

Final Rejection Actions

Final rejection actions are the actions that occur when an approver rejects the request and it goes to the final rejection state. Final rejection actions can include email alerts, field updates, tasks, or outbound messages. For example, a final rejection action can change the status to "Rejected," send an email notification, and unlock the record so that users can edit it before resubmitting.

Outbound Message

An outbound message is a workflow, approval, or milestone action that sends the information you specify to an endpoint you designate, such as an external service. Outbound messaging is configured in the Salesforce setup menu. Then you must configure the external endpoint. You can create a listener for the messages using the SOAP API.

Process Instance

A process instance represents one instance of an approval process. A new process instance is created each time a record is submitted for approval.

Process Instance Node

A process instance node represents an instance of an approval step. A new process instance node is created each time a record enters a step in an approval process. No process instance node is created when the record doesn't meet the step criteria or if the approval process instance is otherwise completed without entering the step.

Recall Actions

Recall actions are the actions that occur when a submitted approval request is recalled. By default, an action to unlock the record runs automatically on recall. Recall actions can include email alerts, field updates, tasks, or outbound messages. For example, a recall action can change the status of a request from "In Progress" to "Not Submitted."

Record Locking

Record locking is the process of preventing users from editing a record, regardless of field-level security or sharing settings. Salesforce automatically locks records that are pending approval. Users must have the "Modify All" object-level permission for the given object, or the "Modify All Data" permission, to edit locked records. The Initial Submission Actions, Final Approval Actions, Final Rejection Actions, and Recall Actions related lists contain Record Lock actions by default. You cannot edit this default action for initial submission and recall actions. You can still add campaign members to campaigns locked for approval.

Visual Workflow

Visual Workflow

Visual Workflow lets you automate business processes by building flows and distributing them to the right users or systems. A *flow* is an application that can execute logic, interact with the Salesforce database, call Apex classes, and collect data from users. You can build flows by using the Cloud Flow Designer.

You can also build autolaunched flows. An *autolaunched flow* can be launched without user interaction, such as from a process or the Apex `interview.start` method. Autolaunched flows run in bulk and without user interaction. They can't contain steps, screens, choices, or dynamic choices in the active or latest flow version.

Visual Workflow has three different aspects.

Design

Create flows using the Cloud Flow Designer. This drag-and-drop tool lets you diagram flow structure and configure how it runs, without writing any code.

Manage

Once you create a flow, you can manage it in Salesforce, edit its properties, activate, deactivate, delete, or run it at will.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Run

Flow users can then run the active flow from a custom button, tab, link, or directly from the flow URL. If you've enabled them to do so, systems can run active flows through an Apex class or process.

 **Example:** Use Visual Workflow to script calls for a customer support center or to generate real-time quotes for a sales organization.

SEE ALSO:

- [Which Automation Tool Should I Use?](#)
- [Flow Building Blocks](#)

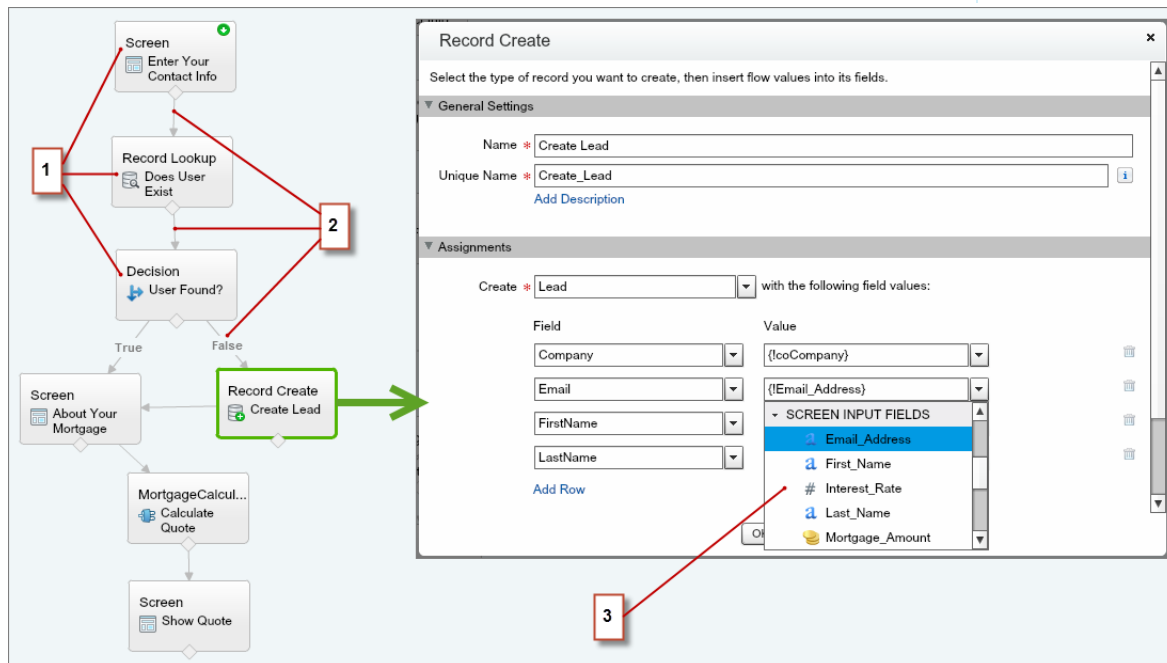

Flow Building Blocks

Use combinations of elements, connectors, and resources to build flows.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

- Available in:
- Enterprise
 - Performance
 - Unlimited
 - Developer

- Each element (1) represents an action that the flow can execute. Examples include reading or writing Salesforce data, displaying information to and collecting data from flow users, executing logic, or manipulating data.
- Each connector (2) defines an available path that the flow can take at run time.

- Each resource (3) represents a value that you can reference throughout the flow.

SEE ALSO:

[Flow Elements](#)

[Flow Resources](#)

[Flow Connectors](#)

What's the Difference Between Workflow and Visual Workflow?

Despite their similar names, Workflow and Visual Workflow are separate Salesforce features for automating business processes.

Workflow

Workflow enables you to set up *workflow rules*. A workflow rule identifies what kinds of record changes or additions trigger specified *workflow actions*, such as sending email alerts and updating record fields.

Workflow rules and actions are associated with a specific object (and can cross objects only to update fields on a related master record).

Visual Workflow

Visual Workflow enables you to create *flows*, which are triggered by users rather than events. Unlike Workflow, which always executes rules and actions behind the scenes, Visual Workflow offers screens for displaying and collecting information from the user running the flow.

Note: You can, however, participate in a pilot program that enables workflow rules to execute flows behind the scenes. The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren't available for new organizations.

Flows aren't tied to any one object. They can look up, create, update, and delete records for multiple objects.

In case you're wondering, the "visual" in Visual Workflow refers to the ability to visually build flows using the Cloud Flow Designer. Its drag-and-drop user interface lets you build flows without writing any code.

Limits for Visual Workflow

When using Visual Workflow, keep flow limits and Apex governor limits in mind.

Maximum number of versions per flow	50
Maximum number of executed elements at run time	2000
Maximum number of active flows and processes per organization	500
Maximum number of flows and processes per organization	1000
Maximum number of flow interviews or groups of scheduled actions (from processes) that are waiting at one time	30,000
Maximum number of flow interviews that are resumed or groups of scheduled actions that are executed per hour	1000
Maximum number of relative time alarms defined in flow versions or schedules based on a field value in processes	20,000

[Apex Governor Limits that Affect Flows](#)

Salesforce strictly enforces limits to ensure that any runaway flows don't monopolize shared resources in the multitenant environment. Per-transaction limits, which Apex enforces, govern flows. If an element causes the transaction to exceed governor limits, the system rolls back the entire transaction. The transaction rolls back even if the element has a defined fault connector path.

[Flows in Transactions](#)

Each flow interview runs in the context of a *transaction*. A transaction represents a set of operations that are executed as a single unit. For example, a transaction can execute Apex triggers and escalation rules in addition to a flow interview. If one interview in a transaction fails, all the interviews in the transaction are rolled back, as well as anything else the transaction did. The transaction doesn't retry any of the operations—including the flow interview.

[Flow Bulkification in Transactions](#)

Programmers can design their code so that similar actions are performed together in one batch. For example, one operation to create 50 records rather than 50 separate operations that each create one record. This process is called *bulkification*, and it helps your transaction avoid governor limits. If you're working with flows, you don't even have to think about bulkification. Flow interviews bulkify actions for you automatically.

SEE ALSO:

[Visual Workflow](#)

[Limits and Considerations for Visual Workflow](#)

Apex Governor Limits that Affect Flows

Salesforce strictly enforces limits to ensure that any runaway flows don't monopolize shared resources in the multitenant environment. Per-transaction limits, which Apex enforces, govern flows. If an element causes the transaction to exceed governor limits, the system rolls back the entire transaction. The transaction rolls back even if the element has a defined fault connector path.

Description	Per-Transaction Limit ¹
Total number of SOQL queries issued (Record Update, Record Delete, Record Lookup, and Fast Lookup element executions)	100
Total number of records retrieved by SOQL queries (across all Record Update, Record Delete, Record Lookup, and Fast Lookup elements executed in all interviews in the transaction)	50,000
Total number of DML statements issued (Record Create, Record Update, Record Delete, Fast Create, Fast Update, and Fast Delete executions)	150
Total number of records processed as a result of DML statements	10,000

¹ Autolaunched flows are part of the larger transaction through which they were launched. For example, flows launched from a process are executed with the process actions as part of the larger transaction. Flows with Screen elements can span multiple transactions. A new transaction begins each time the user clicks **Next** in a screen. Flows with Wait elements span multiple transactions. A transaction ends when a flow interview begins to wait for an event. When the flow interview resumes, a new transaction begins. Everything after the Wait element is executed as part of a batch transaction that includes other resumed interviews.

Flows in Transactions

Each flow interview runs in the context of a *transaction*. A transaction represents a set of operations that are executed as a single unit. For example, a transaction can execute Apex triggers and escalation rules in addition to a flow interview. If one interview in a transaction fails, all the interviews in the transaction are rolled back, as well as anything else the transaction did. The transaction doesn't retry any of the operations—including the flow interview.

In each transaction, Salesforce enforces governor limits to prevent shared resources from being depleted. Because multiple Salesforce organizations share the same resources, Salesforce prevents one organization from depleting all the resources and leaving the other organizations high and dry. It's similar to an apartment building that uses one cache of water to service every tenant. If your neighbor uses all the water, you can't take a shower. (It's trite, but hopefully you get the idea.) Per-transaction governor limits help prevent such things from happening.

IN THIS SECTION:

[When Does a Flow's Transaction Start?](#)

Depending on how the flow was distributed, a transaction that runs an interview for that flow starts in different ways.

[When Does a Flow's Transaction End?](#)

When a transaction ends depends on whether the flow contains certain elements and whether it originally started because a record was changed.

SEE ALSO:

[Flow Bulkification in Transactions](#)

When Does a Flow's Transaction Start?

Depending on how the flow was distributed, a transaction that runs an interview for that flow starts in different ways.

Distribution Method	Transaction starts when...
Process Builder ¹	A record is created or updated.
Flow URL	The URL is accessed.
Custom button or link	The button or link is clicked.
Visualforce page	The page is accessed.
<code>Interview.start()</code> method	<p>If the method starts via a <code>before</code> or <code>after</code> trigger, the transaction starts when a record is created or updated.</p> <p>Otherwise, the transaction starts when the method (or a parent method) is invoked.</p> <p>The <code>start()</code> method shares its limits with other operations in the transaction and other methods in the class.</p>
REST API (Custom Actions or Flows resource)	When the REST call is made. Depending on how the REST call is implemented, the limits can be shared with other operations.

¹The same also applies if the flow is distributed through a workflow rule. The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren't available for new organizations.

 **Note:** When a Screen or Wait element is executed, the existing transaction ends and a new one begins.

When Does a Flow's Transaction End?

When a transaction ends depends on whether the flow contains certain elements and whether it originally started because a record was changed.

The transaction ends when:

- A Screen or Wait element is executed
- The order of execution has completed—if the flow was triggered when a record was created or updated
- All the interviews in the transaction have finished

 **Tip:** If you think that a flow's interview is likely to hit governor limits within its transaction, consider adding a Wait element or a Screen element.

If the interview is one of many things being done in a given transaction, that interview shares the transaction's governor limits with the other operations.

 **Example:** You update 100 cases through Data Loader. Due to the order of execution in a transaction and the customizations in your organization, here's what happens.

	Transaction Operation	DML Statement Used	SOQL Query Used
1	Cases are saved to the database, but aren't committed yet.		
2	Case assignment rules are executed. Each case's owner is updated.		
3	Case escalation rules are executed. If any case has been open for 10 days, an email is sent to the owner.		
4	Process is started.		
5	Process looks up the case's account.		
6	If the account is hot, process uses Chatter to notify the account owner that there's a new case associated with the account.		
7	Process launches a flow interview.		
8	Flow interview looks up the parent account and how many cases it has.		
9	Flow interview checks whether the account has more than five open cases.		
10	If it does, flow interview looks up the account's division manager then posts on the account's Chatter feed to notify the division manager and account owner.		

	Transaction Operation	DML Statement Used	SOQL Query Used
11	If it doesn't, flow interview posts on the account's Chatter feed to notify only the account owner.	✔

Flow Bulkification in Transactions

Programmers can design their code so that similar actions are performed together in one batch. For example, one operation to create 50 records rather than 50 separate operations that each create one record. This process is called *bulkification*, and it helps your transaction avoid governor limits. If you're working with flows, you don't even have to think about bulkification. Flow interviews bulkify actions for you automatically.

IN THIS SECTION:

[How Does Flow Bulkification Work?](#)

Interview operations are bulkified only when they execute the same element. That means that the interviews must all be associated with the same flow.

[Which Flow Elements Can Be Bulkified?](#)

Flows can bulkify any element that performs a DML statement or SOQL query or does something else external to the flow, like sending an email.

[Example of Flow Bulkification](#)

This example demonstrates how operations are bulkified for a flow when 100 cases are updated through Data Loader.

SEE ALSO:

[Flows in Transactions](#)

How Does Flow Bulkification Work?

Interview operations are bulkified only when they execute the same element. That means that the interviews must all be associated with the same flow.

When multiple interviews for the same flow run in one transaction, each interview runs until it reaches a bulkifiable element. Salesforce takes all the interviews that stopped at the same element and intelligently executes those operations together. If other interviews are at a different element, Salesforce then intelligently executes those operations together. Salesforce repeats this process until all the interviews finish.

If, despite the bulkification, any interview hits a governor limit, all the interviews in the transaction fail. Any operations that the interviews performed are rolled back, and the transaction doesn't try to perform the operations again.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

 **Example:** When you upload 100 cases, the flow MyFlow_2 triggers one interview for each case.

- 50 interviews stop at Record Create element **Create_Task_1**.
- The other 50 interviews stop at Record Create element **Create_Task_2**.

The result? At least two groups of bulk operations to execute.

- One for the 50 interviews that execute **Create_Task_1**
- One for the 50 interviews that execute **Create_Task_2**

Which Flow Elements Can Be Bulkified?

Flows can bulkify any element that performs a DML statement or SOQL query or does something else external to the flow, like sending an email.

Elements that create, update or delete records

When a record is created, updated, or deleted, the transaction performs a DML statement.

- Create elements (Record Create, Fast Create)
- Update elements (Record Update, Fast Update)
- Delete elements (Record Delete, Fast Delete)
- Quick Action elements
- Post to Chatter elements
- Submit for Approval elements
- Apex elements—depending on your organization (invocable Apex only)

Elements that look up records

When fields on a record are looked up, the transaction performs a SOQL query.

- Lookup elements (Record Lookup, Fast Lookup)
- Record Update elements
- Record Delete elements
- Apex elements—depending on your organization (invocable Apex only)

Elements that send emails

- Send Email elements
- Email Alert elements
- Apex elements—depending on your organization (invocable Apex only)

 **Note:**

- Unlike invocable Apex, Apex Plug-in elements aren't bulkified.
- Although invocable Apex is bulkified, the flow has no way of knowing what the invoked methods' operations are. If you want those operations to also be bulkified, make sure the code follows bulkification best practices.

Example of Flow Bulkification

This example demonstrates how operations are bulkified for a flow when 100 cases are updated through Data Loader.

The Associated Flow

You'll understand the concepts better if you understand the design of the associated flow.

The flow:

1. Looks up the case's parent account and how many open cases that account has.
2. Checks whether the account has more than five cases open.
3. If the account has more than five open cases:
 - a. Looks up the division manager for the account.
 - b. Posts on the account's Chatter feed to notify the division manager and the account owner.
4. If the account has five or fewer open cases, posts on the account's Chatter feed to notify only the account owner.

The Bulkified Interviews

When you update the records, one flow interview is created for each case simultaneously. All of the interviews are associated with the same flow. Each interview runs until it gets to a bulkifiable element.

The first interview goes through the Record Lookup element **(1)**. Because Record Lookups can be bulkified, the interview waits there until all the other interviews have done the same. Then, Salesforce executes all the Record Lookup operations together (because they're all for the same element in the same flow). Instead of 100 SOQL queries, the transaction issues one SOQL query.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

The first interview is evaluated by the Decision element **(2)**. The account has six cases, so the interview is routed down the “More than 5” path. The interview proceeds to the second Record Lookup element **(3a)**. Because it’s a bulkifiable element, the interview waits there.

The second interview is evaluated by the Decision element **(2)**. This account has one case, so the interview is routed down the “5 or fewer” path. The interview proceeds to the Post to Chatter element **(4)**. This element is also bulkifiable, so the interview waits there.

After all the interviews have been processed, 30 are waiting to execute the second Record Lookup element **(3a)** and the remaining 70 are waiting to execute the Post to Chatter element **(4)**.

Salesforce executes all the Record Lookup **(3a)** operations for the first 30 interviews together. Instead of 30 separate SOQL queries, the transaction issues one.

Next, the transaction returns to the Post to Chatter element **(4)**, where the 70 interviews are ready to execute their Post to Chatter operations. Remember, these are the interviews whose accounts don’t have more than five cases. Salesforce executes the Post to Chatter operations together. Instead of 100 separate DML statements to create each Chatter post, the transaction issues one DML statement to create all 100 posts at one time. Because the Post to Chatter element isn’t connected to a subsequent element, those 70 interviews finish.

The 30 interviews—which looked up the relevant division manager—proceed to the final Post to Chatter element **(3b)**. When all 30 interviews are ready, Salesforce executes all 30 Post to Chatter operations together. Instead of issuing 30 separate DML statements for the individual Chatter posts, it issues one. Because the Post to Chatter element isn’t connected to another element, those 30 interviews finish.

Considerations for Designing Flows

When you design flows, keep certain guidelines in mind.

Deleting Variables

If you delete an sObject variable or sObject collection variable, any variable assignments that use the deleted variable are set to `null`.

Referring to Blank Fields or Resources

If you leave any field or resource value blank, that value is `null` at run time. To treat a text value as an empty string instead of `null`, set it to `{!$GlobalConstant.EmptyString}`.

Setting the Record Type

To set the record type for a record, use the ID of the record type. Look up the record type by its name and then store its ID in the flow.

For example, use a Record Lookup element to find the RecordType record whose Name is “Reduction Order”. Then store that record type’s ID in a variable. You can then use the variable to set the `Order_Record_Type` field on an order record.

External Objects

External objects aren’t supported in flows.

IN THIS SECTION:

[Limitations for Multi-Select Choice Fields](#)

Multi-select checkboxes and multi-select picklist fields let flow users select multiple choices in a screen field. Before you start using multi-select choice fields, understand how they work in flows, both when you design the flows and when your users run them.

[Limitations for Flow Formulas](#)

When you create a formula resource or add validation to a screen input field, understand the limitations of formulas in Visual Workflow.

[Limitations for Time-Based Flows](#)

Before you design flows that contain one or more Wait elements, understand the limitations and guidelines.

SEE ALSO:

[Create a Flow](#)[Flow Operators](#)[Limits and Considerations for Visual Workflow](#)[Cross-Object Field References in Flows](#)

Considerations for the Cloud Flow Designer

When you create a flow in the Cloud Flow Designer, familiarize yourself with its limitations and behaviors. For example, it supports a handful of locales and can't open flows from managed packages.

- At run time, time zones for date/time values can differ from what you see in the Cloud Flow Designer. During run time, date/time values reflect the running user's time zone settings in Salesforce. In the Cloud Flow Designer, date/time values reflect the time zone set on your computer. The Cloud Flow Designer appends the GMT offset to your date/time value.
- The Cloud Flow Designer doesn't support UTF-8 encoding for text in user input fields.
- The Cloud Flow Designer contains embedded fonts for all locales it supports. The supported locales are:
 - English (US)
 - French (France)
 - German (Germany)
 - Spanish (Spain)
 - Japanese (Japan)
 - Chinese (Traditional)
 - Chinese (Simplified)

If you enter unsupported characters for a supported locale, they're displayed using system fonts instead of the embedded fonts.

In unsupported locales, your system font settings are used to display all characters in the Cloud Flow Designer.

- The Cloud Flow Designer can't open flows that are installed from managed packages.
- Don't enter the string `null` as the value of a text field in the Cloud Flow Designer.
- The Cloud Flow Designer has access to information that exists when you open it. If you modify data or metadata in your organization and need to refer to it in a flow, close and reopen the Cloud Flow Designer. For example, if you add a custom field or modify an Apex class with the Cloud Flow Designer open, close and reopen the Cloud Flow Designer.
- The Cloud Flow Designer uses the permissions and locale assigned to the current user.
- If you open a flow that was last opened in Winter '12 or earlier, each Boolean decision is converted to a multi-outcome Decision element that:

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

- Uses the same name as the old decision.
- Takes the unique name of the old decision, appended with “_switch”.
- Has an outcome labeled “True”. This outcome’s unique name matches that of the old decision, and its conditions are migrated from the True outcome of the old decision.
- Has a default outcome labeled “False”.

Guidelines for Working with Large Flows

Business processes can be complex. When your flow is too large for the canvas, control the zoom, search in the Explorer tab, or collapse the left side panel.

Zoom

To zoom in and out of your flow, use the + and - buttons on the right side of the canvas.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

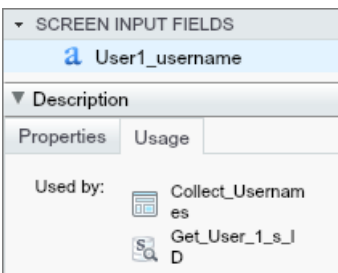

Search in the Explorer tab

Looking for a specific element or resource? Search for it in the Explorer tab.

- To find an element with a specific name, type in the search box.
- To find all instances of a certain element or resource, click the magnifying glass and select the type.

Once you find the right resource in the Explorer tab, see which elements are using the resource. In the Description pane, click the Usage tab.

Once you find the right element in the Explorer, find that element in your canvas. Hover over the element, and click the magnifying glass.

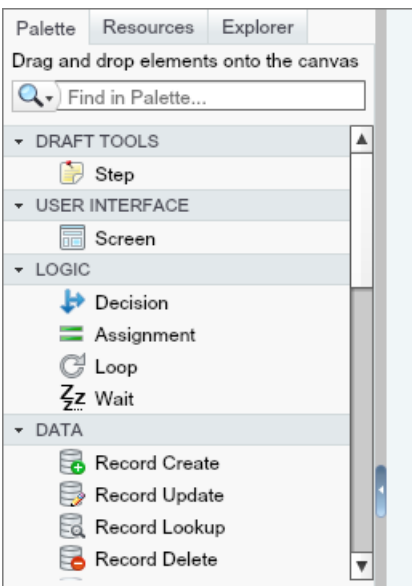

The element is highlighted in green in your canvas.

If the element wasn't in view, the Cloud Flow Designer automatically scrolls to show the element.

Collapse the left side panel

To hide the Palette, Resources, and Explorer tabs from your view, click the left arrow next to the side panel. That way, you get even more space in the canvas.

Limitations for Multi-Select Choice Fields

Multi-select checkboxes and multi-select picklist fields let flow users select multiple choices in a screen field. Before you start using multi-select choice fields, understand how they work in flows, both when you design the flows and when your users run them.

Configuring a Multi-Select Resource Field

- A multi-select choice field can have only one default value.
- A dynamic record choice resource can be configured to assign field values from a user-selected record to variables in the flow. When a multi-select choice field uses a dynamic record choice, only values from the last record that the user selects are stored in the flow variables. If multiple multi-select choice fields on one screen use the same dynamic record choice, the variable assignments obey the first of those fields.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

- Available in:
- Enterprise
 - Performance
 - Unlimited
 - Developer

Using Values from a Multi-Select Resource Field

- At run time, a multi-select field's value is a concatenation of the user-selected choice values, separated by semicolons. If any of the selected choices' values included semi-colons, those semi-colons are removed.
- If you referenced multi-select choice fields in flow conditions, follow these best practices.
 - Configure a stored value for each choice that you use in multi-select choice fields.
 - Don't use the same choice in multiple multi-select choice fields on the same screen.

SEE ALSO:

[Flow Screen Element: Choice Fields](#)

Limitations for Flow Formulas

When you create a formula resource or add validation to a screen input field, understand the limitations of formulas in Visual Workflow.

- Flow formulas can't contain more than 3,000 characters.
 - A formula returns `null` if:
 - The value that the formula returns doesn't match its data type.
 - The formula contains an unsupported function.
- For example, if your formula resource has a data type of Number, the output must be numeric.

- These functions aren't supported in a flow formula.
 - GETRECORDIDS
 - IMAGE
 - INCLUDE
 - ISCHANGED
 - ISNEW
 - PARENTGROUPVAL
 - PREVGROUPVAL
 - PRIORVALUE
 - REQUIRE SCRIPT
 - VLOOKUP

For a complete list of operators and functions for building formulas in Salesforce, see [Formula Operators and Functions](#) on page 3934.

- In a flow, the `CONTAINS` function checks all characters within its parentheses. For cross object field references, `CONTAINS` works like it does in the rest of Salesforce. It checks only the first 250 characters in the reference.

Here's an example. `varContract` refers to an sObject variable that contains the values of a contract record. This formula expression checks only the first 250 characters.

```
CONTAINS({!varContract.Account.Description}, "description")
```

This formula expression checks all characters in the field.

```
CONTAINS({!varContract.Description}, "description")
```

- If a Display Text screen field contains an invalid formula resource, the flow displays an empty string at run time.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

- If a flow contains an invalid formula resource, you can't activate the flow.

SEE ALSO:

[Flow Formula Resource](#)

[Flow Resources](#)

Limitations for Time-Based Flows

Before you design flows that contain one or more Wait elements, understand the limitations and guidelines.

- After you deactivate a flow or flow version, the associated waiting interviews continue as usual. You can't delete a flow or flow version if it has associated waiting interviews.
- An interview can execute only one event path per Wait element. After one of its events is processed, the remaining events are removed from the queue.
- An organization can process up to 1000 events per hour. When an event is processed, the interview that it's associated with is resumed and any other events for that interview are removed from the queue. If an organization exceeds this limit, Salesforce processes the remaining events in the next hour.

For example, an organization has 1,200 events scheduled to be processed between 4:00 PM and 5:00 PM. Salesforce processes 1000 events between 4:00 PM and 5:00 PM and the additional 200 events between 5:00 PM and 6:00 PM.

- An organization can have up to 30,000 interviews waiting at a given time.
- If the user who started the interview is deactivated when Salesforce tries to execute an event path, the interview fails to resume.

Transactions and Waiting Interviews

A transaction ends as soon as a flow interview begins to wait for an event. When the flow interview resumes, a new transaction begins. Everything after the Wait element is executed as part of a batch transaction that includes other resumed interviews.

Interviews aren't resumed independently. They're grouped into a single batch that starts resuming within one hour after the first interview enters the batch. Any actions that fire as a result of those grouped interviews are also executed in that transaction. This behavior can cause you to exceed your Apex governor limits if the resumed interview executes DML operations or SOQL queries through:

- Flow elements such as Record Create or Fast Lookup
- Apex Plug-in elements
- Apex triggers
- Immediate workflow actions

For details on Apex governor limits, see [Limits for Visual Workflow](#) on page 4179.

If a Wait element precedes any flow elements that execute DML operations or SOQL queries:

- Ensure that your flows don't perform more DML operations or SOQL queries between Wait elements than the Apex governor limits allow.
- Consider using multiple Wait elements so that the DML operations and SOQL queries are performed in multiple transactions.
- Add fault paths for those elements so that the flow returns to the Wait element if the fault message contains:

```
Too many SOQL queries
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

or

```
Too many DML operations
```

If an interview fails after it's resumed:

- Prior interviews in that batch's transaction are successful.
- Operations that the interview executed before it waited are successful.
- If a fault connector handles the failure, operations that the interview executed between when it resumed and when it failed are successful. The operation that caused the interview to fail isn't successful.
- If a fault connector doesn't handle the failure, operations that the interview executed between when it resumed and when it failed are rolled back. The operation that caused the interview to fail isn't successful.
- The remaining interviews in that batch are tried.

Limitations for General Alarms

- Alarms don't support minutes or seconds.
- If an interview is waiting for an event that's set for a time in the past, Salesforce resumes the interview within one hour.
For example, a flow is configured to email an opportunity owner seven days before the close date. An interview is started for an opportunity with the close date set to today. Salesforce resumes the interview within an hour.

Limitations for Absolute Time Alarms

- Absolute time alarms are evaluated based on the time zone of the user who created the flow.

Limitations for Relative Time Alarms

- Relative time alarms are evaluated based on the organization's time zone.
- Across all your flow versions, your organization can have up to 20,000 defined relative time alarms.
- Alarms can't reference the following:
 - `DATE` or `DATETIME` fields that contain automatically derived functions, such as `TODAY` or `NOW`.
 - Formula fields that include related-object merge fields.
- If you change a date field that's referenced by an unexecuted relative time alarm in a waiting interview, Salesforce recalculates the events associated with the interview.
For example, a flow is configured to email an opportunity owner seven days before the opportunity close date and the close date is 2/20/2014. The following things could happen.
 - The close date isn't updated before the interview resumes. Result: Salesforce resumes the interview on 2/13/2014 and sends the email.
 - The close date is updated to 2/10/2014 before the interview resumes. Result: Salesforce reschedules the relative time alarm and the interview resumes on 2/3/2014.
 - The close date is updated to a date in the past. Result: Salesforce recalculates the relative time alarm and resumes the interview shortly after you save the record.
- If a relative time alarm references a null date field when the interview executes the Wait element, Salesforce resumes the interview within an hour.

- If a relative time alarm references a date field that's that has a non-null value when the flow interview executes the Wait element and it's updated to null before the alarm is processed, Salesforce resumes the interview within an hour after the date field is updated.
- If a waiting interview has a relative time alarm and the referenced record or object is deleted, the alarm is removed from the queue. If the interview has no other events to wait for, the interview is deleted.
- You can't archive a product or price book that's referenced in a relative or absolute time alarm in a waiting interview.
- Lead Convert Limitations
 - You can't convert a lead that has associated relative time alarms in waiting interviews.
 - If Validation and Triggers from Lead Convert is enabled, existing operations on leads after a Wait element aren't executed during lead conversion.
 - If a campaign member based on a lead is converted before a waiting interview that's associated with that record finishes, Salesforce still executes the interview.

[Limits and Considerations for Visual Workflow](#)

[Operators in Flow Conditions](#)

[Flow Wait Element](#)

Considerations for Managing Flows

When managing flows, consider the administration and activation limits.

Activating Flows

When you activate a new version of a flow, the previously activated version (if one exists) is automatically deactivated. Any running flow interview continues to run using the version with which it was initiated.

Deleting Flows

To delete an active flow version, first deactivate it. If a flow has any paused or waiting interviews, it can't be deleted until those interviews are finished or deleted. Flows that have never been activated can be deleted immediately.

Flow Properties

The properties for a given flow's versions automatically match the active version's properties by default. In other words, if you have three versions and you activate version 2, Salesforce updates the properties for versions 1 and 3 to match version 2. However, if you edit the properties for an inactive version, that version's properties are no longer automatically updated to match the active version.

The flow's active (or latest) version determines the flow's type. For example, if a flow's active version contains a screen, its type is Flow. It can't be implemented through a system-based method, like the Process Builder.

IN THIS SECTION:[Considerations for Installed Flows](#)

Keep these considerations in mind when you distribute, upgrade, or remove a flow that you installed from a package.

SEE ALSO:[Manage Your Flows](#)[Limits and Considerations for Visual Workflow](#)**Considerations for Installed Flows**

Keep these considerations in mind when you distribute, upgrade, or remove a flow that you installed from a package.

- The Cloud Flow Designer can't open flows that are installed from managed packages.
- If you install a package that contains multiple flow versions in a fresh destination organization, only the latest flow version is deployed.
- If you install a flow from a managed package, error emails for that flow's interviews don't include any details about the individual flow elements. The email is sent to the user who installed the flow.
- If you install a flow from an unmanaged package that has the same name but a different version number as a flow in your organization, the newly installed flow becomes the latest version of the existing flow. However, if the packaged flow has the same name and version number as a flow already in your organization, the package install fails. You can't overwrite a flow.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Status

An active flow in a package is active after it's installed. The previous active version of the flow in the destination organization is deactivated in favor of the newly installed version. Any in-progress flows based on the now-deactivated version continue to run without interruption but reflect the previous version of the flow.

Distributing Installed Flows

- When you create a custom button, link, or Web tab for a flow that's installed from a managed package, include the namespace in the URL. The URL format is `/flow/namespace/flowuniqueName`.
- When you embed a flow that's installed from a managed package in a Visualforce page, set the name attribute to this format: `namespace.flowuniqueName`.

Upgrading Installed Flows

Upgrading a managed package in your organization installs a new flow version only if there's a newer flow version from the developer. After several upgrades, you can end up with multiple flow versions.

Removing Installed Flows

- You can't delete a flow from an installed package. To remove a packaged flow from your organization, deactivate it and then uninstall the package.
- You can't delete flow components from Managed - Beta package installations in development organizations.

- If you have multiple versions of a flow installed from multiple unmanaged packages, you can't remove only one version by uninstalling its package. Uninstalling a package—managed or unmanaged—that contains a single version of the flow removes the entire flow, including all versions.

SEE ALSO:[Flows in Change Sets and Packages](#)[Considerations for Deploying Flows with Packages](#)[Install a Package](#)

Considerations for Running Flows

When you run or test a flow, keep certain limits and guidelines in mind.

- Be careful when testing flows that contain delete elements. Even if the flow is inactive, it triggers the delete operation.
- At run time, time zones for date/time values can differ from what you see in the Cloud Flow Designer. During run time, date/time values reflect the running user's time zone settings in Salesforce.
- Interviews don't perform actions—such as sending emails or creating, editing, or deleting records—until the associated transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element. Record and Fast elements aren't the only ones to create or update records. Post to Chatter, Submit for Approval, and Quick Actions elements do, as well.
- Don't use your browser's Back or Forward buttons to navigate through a flow. Doing so can result in inconsistent data between the flow and Salesforce.
- A single flow can have up to 50 different versions. When you run a flow, you see the active version, but your admin could have a more recent version.
- For flows that interact with the Salesforce database, make sure that your users have permission to create, read, edit, and delete the relevant records and fields. Otherwise, users receive an insufficient privileges error when they try to launch a flow. For example, a flow looks up and updates a case record's status. The flow users must have "Read" and "Edit" permissions on the `STATUS` field of the Case object.
- When you distribute a flow, don't pass a currency field value from a Salesforce record into a flow Currency variable with a URL parameter. When a currency field is referenced through a merge field (such as `{!Account.AnnualRevenue}`), the value includes the unit of currency's symbol (for example, \$). Flow variables of type Currency can accept only numeric values, so the flow fails at run time. Instead, pass the record's ID to a flow Text variable with a URL parameter. Then in the flow, use the ID to look up that record's value for the currency field.
- If you resume a flow from Paused Flow Interviews in Salesforce1, the flow doesn't validate Currency or Number input fields when the value exceeds 18 digits.

SEE ALSO:[Test a Flow](#)[Flow Interviews](#)[Limits and Considerations for Visual Workflow](#)

Flow Accessibility

Visual Workflow is 508-compliant with a few exceptions.

- The title of the screen doesn't change when you click Next or Previous, so you might not realize you're on a new page.
- Radio button fields don't have labels. Screen readers can't distinguish between questions.
- Questions without defined prompts can read incorrectly.
- Errors are not noted when reading the fields.

Button Bar (1)

Manage your flow as you build it.

- **Run** runs the most recent saved version of the flow that you have open. If the flow contains subflow elements, each subflow runs the active version of its referenced flow. If the referenced flow has no active version, then the subflow element runs the latest version of its referenced flow.
- The status indicator on the right side displays whether:
 - The flow is active or not
 - The latest changes to the flow are saved or not
 - There are any warnings or errors in the last saved version of the flow
 To see a list of the warnings or errors, click the indicator.

Canvas (2)

The canvas is the working area, where you build a flow by adding elements. As you add elements to the canvas and connect them together, you see a visual diagram of your flow.

Palette Tab (3)

Add new elements, like Screens and Record Creates, to your flow from the Palette tab.

Resources Tab (4)

Create resources, like a variable or formula, to use in your flow from the Resources tab.

Explorer Tab (5)

The Explorer tab is a library of all elements and resources that you've added to the flow.

[Search Within a Flow](#)

Search Within a Flow

As a flow grows and becomes more complex, it becomes more challenging to find things within it. The Cloud Flow Designer offers tools for quickly finding flow elements and resources.

Open the flow in the Cloud Flow Designer. Then find an element or resource in the flow by using one or more of the following options.

- On the Explorer tab, enter search text.
The Explorer tab displays only the elements and resources whose properties contain the entered text.
- Filter the Explorer tab contents to one type of element or resource by clicking .
To remove the filter, click  and select **SEARCH ALL**.
- Dim all visible elements on the canvas other than the results by selecting **Highlight Results on Canvas**.
- Zoom in and out as desired using the controls near the top right corner of the canvas area.
- To see the location of an Explorer item on the canvas, complete one of the following procedures.
If the Explorer item is a canvas-visible element or a screen field:
 1. Hover over the item on the Explorer tab.

USER PERMISSIONS

To open, edit, or create a flow in the Cloud Flow Designer:

- "Manage Force.com Flow"

2. Click .

If the Explorer item is a resource that doesn't appear on the canvas:

1. Click the item on the Explorer tab.
2. Click the Usage tab in the Description pane.
3. Hover over an element listed on the Usage tab.
4. Click its .

The canvas shifts to display the element and momentarily highlights it.

SEE ALSO:

[Tour the Cloud Flow Designer User Interface](#)

Search Within the Palette

As you add more flows, actions, and Apex classes to your organization, it becomes more challenging to find a specific item in the Palette. You can, however, search in the Palette to quickly find the right element for your flow.

From the Palette tab, use the following options to find a specific item.

- Next to , enter search text.
The Palette displays only the items that contain the entered text.
- To filter the Palette tab contents to one type of element, click  and select what you want to see.
- To remove the filter, click  and select **SEARCH ALL**.

Design a Flow

Create a Flow

Once you understand the process that you want to automate, design a flow in the Cloud Flow Designer for that process.

 **Tip:** Before you start creating your flow, plan it out. It's much easier to automate a business process by using Visual Workflow when you fully understand the details of your business process.

If you're new to the Cloud Flow Designer, we recommend walking through one or more of the sample flow tutorials in the [Cloud Flow Designer Workbook](#). They're a great way to learn about the tool and discover how it works.

1. Open the Cloud Flow Designer. From Setup, enter *Flows* in the **Quick Find** box, then select **Flows**, and then click **New Flow**.

2. Drag the appropriate [elements](#) onto the canvas.

 **Tip:** If you're not sure which element you need for a node, add a Step element as a placeholder until you figure it out. You can always replace the Step later.

3. [Connect](#) the elements together so that it's clear what the order of the elements is.

4. Identify [which element the flow should start with](#) when it runs.

5. [Save](#) any changes that you made to the flow.

6. [Test](#) the flow to make sure it's working as you expect it to.

7. [Activate](#) the flow so that users can run it.

8. [Distribute](#) the flow to the appropriate users.

Common Tasks

Manage Flow Elements, Resources, and Connectors

Customize your flow by adding, editing, or removing elements, resources, and connectors.

	Add	Edit	Remove
Element	Drag from the Palette tab and drop it on to the canvas.	Double-click, or hover over it and click  .	Hover over it and click  .
Resource	From the Resources tab, double-click.	From the Explorer tab, double-click or hover over it and click  .	From the Explorer tab, hover over it and click  .
Connector	Click the node at the bottom of an element on the canvas and drag a line anywhere onto the target element.	n/a	Select it and press the DELETE key.

SEE ALSO:

[Flow Elements](#)

[Flow Resources](#)

[Flow Connectors](#)

Validate Users' Inputs with Flow Formulas

Just like with regular validation rules, you can validate what users enter in flow screens.

- The formula expression must return a Boolean value (TRUE or FALSE).
- If the expression evaluates to TRUE, the input is valid. If the expression evaluates to FALSE, the error message is displayed to the user.
- If the user leaves the field blank and the field isn't required, the flow doesn't validate the field.

When you configure a screen input field:

1. In the Input Validation section, select `Validate`.
2. Define the values allowed for the field by entering a Boolean formula expression.

Note:

- The formula expression must return a Boolean value.
 - If the formula expression evaluates to TRUE, the input is valid.
 - If the formula expression evaluates to FALSE, the error message is displayed to the user.
 - If the user leaves the field blank, and the field is *not* required, the flow doesn't validate.
3. Customize the error message that appears if the user's input fails validation.

USER PERMISSIONS

To open, edit, or create a flow in the Cloud Flow Designer:

- "Manage Force.com Flow"

Click  to switch between the plain text editor and the rich text editor. Using the rich text editor saves the content as HTML.

 **Example:**

- Validate the format of an email address:

```
REGEX({!Email_Address}, "[a-zA-Z0-9._%+-]+@[a-zA-Z0-9.-]+\.\.[a-zA-Z]{2,4}")
```

- Validate the format of a zip code:

```
REGEX({!Zipcode}, "\d{5}(-\d{4})?")
```

Define Flow Conditions

Control when a flow takes a specific decision outcome or waits for a specific wait event.

Before you begin, create the Decision or Wait element to add conditions to. To add conditions to a wait event, select **Wait for this event only if additional conditions are met**.

1. Set up the conditions.

At run time, the conditions are evaluated in the order you specify.

Column Header	Description
Resource	Flow resource whose value you want to evaluate.
Operator	The available operators depend on the data type selected for Resource. For details, see Operators in Flow Conditions on page 4267.
Value	<p>The Variable and Value in the same row must have compatible data types.</p> <p>Options:</p> <ul style="list-style-type: none"> • Select an existing flow resource, such as a variable, constant, or user input. • Select CREATE NEW to create a flow resource. • Manually enter a literal value or merge field. <p> Note: When you add or subtract a number from a date value, the date adjusts in days, not hours.</p>

2. Identify the logic between the conditions.

Option	Description
All conditions must be true (AND)	If one of the conditions is false, the flow evaluates the next outcome's conditions.
One condition must be true (OR)	If one of the conditions is true, the flow immediately takes this outcome's path.

- Developer

USER PERMISSIONS

To open, edit, or create a flow in the Cloud Flow Designer:

- "Manage Force.com Flow"

Option	Description
Advanced logic (Combination of ANDs and ORs)	<p>Custom logic.</p> <p>When you select this option, provide the customized <code>Logic</code> by entering a text string. Use:</p> <ul style="list-style-type: none"> • Numbers to refer to each condition • AND or OR to identify whether all or just one of the conditions must true • Parentheses to group parts of the string together <p> Tip: If you enter <code>AND</code>, it's the same as if you selected All conditions must be true (AND). If you enter <code>OR</code>, it's the same as if you selected One condition must be true (OR). If you enter any other logic, make sure that you include a number for each condition.</p> <p>For example, for <code>1 AND (2 OR 3)</code>, the flow evaluates whether the first condition is true and either the second or third condition is true.</p>

SEE ALSO:

[What Are Waiting Conditions?](#)[Flow Wait Element](#)[Flow Decision Element](#)

Send Email from a Flow

To send email from your flow, either call an email alert workflow action or create the email in the flow.

Email Alert element

Sends an email by using a workflow email alert to specify the email template and recipients. The flow provides only the record ID.

Send Email element

Sends an email by manually specifying the subject, body, and recipients in the flow.

SEE ALSO:

[Flow Elements](#)

Invoke Apex Code from a Flow

The Cloud Flow Designer comes with a lot of functionality, but sometimes your flow needs to do more than the default elements allow. In that case, call an Apex class from your flow by using one of two flow elements: Apex Plug-in and Call Apex.

Developers have two options when they're trying to make an Apex class available for a flow.

 **Tip:** We recommend using the `@InvocableMethod` annotation instead of the `Process.Plugin` interface.

While the `Process.Plugin` interface supports customizing how the class appears in the palette, the `@InvocableMethod` annotation provides more functionality. The following table describes the features supported by each option.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

	Process.Plugin Interface	@InvocableMethod Annotation
Apex data type support	Doesn't support: <ul style="list-style-type: none"> • Blob • Collection • sObject • Time 	Doesn't support: <ul style="list-style-type: none"> • Generic Object • Generic sObject • Sets • Maps • Enums <p>The Cloud Flow Designer doesn't support mapping an Apex method's input or output parameters to an sObject collection variable.</p>
Bulk operations	Not supported	Supported
Element name in the Cloud Flow Designer	Class name or the value of the name property.	Class name
Reusability	Classes with this interface implemented are available in flows	Classes with this annotation implemented are available in: <ul style="list-style-type: none"> • Flows • Processes • Rest API
Section in the Cloud Flow Designer	Apex Plug-in or the value of the tag property.	Apex
More Details in the Force.com Apex Code Developer's Guide	Passing Data to a Flow Using the Process.Plugin Interface	InvocableMethod Annotation and InvocableVariable Annotation

 **Example:** To illustrate the difference between these two implementation methods, here are two classes that do the same thing: get an account name from a flow and return that account's ID.

This class implements the @InvocableMethod annotation.

```
global class lookUpAccountAnnotation {
    @InvocableMethod
    public static List<String> getAccountIds(List<String> names) {
        List<Id> accountIds = new List<Id>();
        List<Account> accounts = [SELECT Id FROM Account WHERE Name in :names];
        for (Account account : accounts) {
            accountIds.add(account.Id);
        }
        return accountIds;
    }
}
```

This class implements the `Process.Plugin` interface.

```
global class lookupAccountPlugin implements Process.Plugin {

    global Process.PluginResult invoke(Process.PluginRequest request) {
        String name = (String) request.inputParameters.get('name');
        Account account = [SELECT Id FROM Account WHERE Name = :name LIMIT 1][0];

        Map<String, Object> result = new Map<String, Object>();
        result.put('accountId', account.Id);
        return new Process.PluginResult(result);
    }

    global Process.PluginDescribeResult describe() {
        Process.PluginDescribeResult result = new Process.PluginDescribeResult();
        result.Name = 'Look Up Account ID By Name';
        result.Tag = 'Account Classes';
        result.inputParameters = new
            List<Process.PluginDescribeResult.InputParameter>{
                new Process.PluginDescribeResult.InputParameter('name',
                    Process.PluginDescribeResult.ParameterType.STRING, true)
            };
        result.outputParameters = new
            List<Process.PluginDescribeResult.OutputParameter>{
                new Process.PluginDescribeResult.OutputParameter('accountId',
                    Process.PluginDescribeResult.ParameterType.STRING)
            };
        return result;
    }
}
```

Notice that `lookupAccountAnnotation` is less than half the length (11 lines) of `lookupAccountPlugin` (28 lines). In addition, because the annotation supports bulk operations, `lookupAccountAnnotation` performs one query per batch of interviews. `lookupAccountPlugin` performs one query per interview.

SEE ALSO:

[Flow Elements](#)

View Inputs and Outputs of Other Referenced Flow Versions

While configuring a subflow element, view the variables of a specified version of the referenced flow. Doing so lets you configure draft master and referenced flows at the same time.

From a subflow element, you can assign values to only the referenced flow’s variables that allow input access. Similarly, you can assign values from only the referenced flow’s variables that allow output access. The `Input/Output Type` of the variable determines this access. To change the variable’s `Input/Output Type`, open the referenced flow to [edit the variable](#).

By default, this drop-down list contains the variables of the currently active version of the referenced flow. If the referenced flow has no active version, the drop-down list contains the variables of the *latest* version of the referenced flow.

To populate the drop-down lists with the variables of another version of the referenced flow, complete the following steps. Do the same to view the descriptions of the referenced flow’s variables.

1. On the subflow overlay, expand the `Input/Output Variable Assignments` section.
2. Click **View input/output of other versions**.
3. Use one or more of the following options.

Option	Description
Select a <code>Version</code> number in the left pane.	The Inputs and Outputs tabs display the variables in the selected version of the referenced flow.
Select the Inputs tab or the Outputs tab.	The tab displays: <ul style="list-style-type: none"> • The variables available for input or output assignment in the selected <code>Version</code> of the referenced flow. • The data type of each variable. • The description, if any, of each variable.
Click OK .	The subflow overlay’s drop-down lists for selecting the referenced flow’s variables are populated with the variables of the selected <code>Version</code> of the referenced flow.

When you configure subflow input and output assignments, you can specify variables from any version of the referenced flow. This way, you can develop both the master flow and referenced flow in parallel, while keeping another version of the referenced flow active for its users. When you *save* the master flow, however, the Cloud Flow Designer validates against the currently active version of the referenced flow. If that flow doesn’t have an active version, the latest version is validated. If you see validation messages about variables that couldn’t be found or that were configured differently in the referenced flow, you can still save the flow. Nevertheless, resolve all validation errors before you *activate* the master flow.

Define the Path That a Flow Takes

Identify which elements the flow executes and in what order by connecting the elements on your canvas together.

1. On the canvas, find the node at the bottom of the source element.
2. Drag the node onto the target element.
3. If prompted, select which outcome to assign to the path.

SEE ALSO:

[Remove Connectors from a Flow](#)

[Flow Connectors](#)

[Customize What Happens When a Flow Fails](#)

Remove Connectors from a Flow

You can't modify a connector's target or source elements, so to change a path, delete the connector and then add a new one.

If you delete a connector for a specific outcome, the outcome isn't deleted from the source element. However, if you delete an outcome from a decision element, the outcome's connector is also deleted.

1. In your flow, select the connector to delete.
When you select a connector, its color changes from gray to green. If you're having trouble selecting a connector, click and drag an area on the canvas that includes the connector.
2. Press DELETE.

Customize What Happens When a Flow Fails

If your flow contains an element that interacts with the Salesforce database—such as a Record Update or Submit for Approval element, it can fail. Modify the default behavior by adding fault paths to all elements that can fail.

IN THIS SECTION:

[What Happens When a Flow Fails?](#)

When you're deciding whether to customize the error handling in your flow, consider how a failed flow behaves by default.

[Configure Every Fault Path to Send You an Email \(Best Practice\)](#)

As a best practice, we recommend configuring the fault connectors in your flow so that you always receive an email when a flow fails. In the email, include the current values of all your flow's resources. The resource values can give you insight into why the flow failed.

[Customize the Error Message for Running Flow Users \(Best Practice\)](#)

As a best practice, we recommend displaying a better message to your user than "An unhandled fault has occurred in this flow". Do this only if the distribution method you're using supports flows that contain screens. In other words, don't do it if your flow is distributed through a process.

[Other Examples of Error Handling in Flows](#)

Examples of using fault connectors to handle flow errors include requesting corrections from the user and bypassing the error.

SEE ALSO:

[Flow Connectors](#)

[Flow Elements](#)

[Define the Path That a Flow Takes](#)

What Happens When a Flow Fails?

When you're deciding whether to customize the error handling in your flow, consider how a failed flow behaves by default.

Here's what happens by default.

- This error message displays to the running user—the user who was running the flow.

An unhandled fault has occurred in this flow

An unhandled fault has occurred while processing the flow. Please contact your system administrator for more information.

- The running user can't proceed with the flow or return to a previous part of the flow.

[Customize What Happens When a Flow Fails](#)

Configure Every Fault Path to Send You an Email (Best Practice)

As a best practice, we recommend configuring the fault connectors in your flow so that you always receive an email when a flow fails. In the email, include the current values of all your flow's resources. The resource values can give you insight into why the flow failed.

1. Create a text template that includes the values of all the flow resources.

Doing so lets you see the exact values of flow variables when the interview failed. Also, if the flow contains screens, you see exactly what the user entered and selected.

Here's an example text template for the Customer Satisfaction Survey flow in the Cloud Flow Designer Workbook.

```
Error: {!$Flow.FaultMessage}

RESOURCE VALUES
Customer Response: {!Customer_Response}
Value of Decision's Yes outcome: {!Yes}
Company: {!Company_Name}
Satisfaction Choice Field: {!Satisfaction}
Service Choice Field: {!Service}
Other Comments:
{!OtherComments}
```

2. Configure a Send Email element. Use the text template as the body and your email address as the recipient. In this example, Body is set to the text template we created: `{!allVariableValues}`.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To open, edit, or create a flow in the Cloud Flow Designer:

- "Manage Force.com Flow"

Target	Source
Body	{!allVariableValues} i
Subject	An error occurred in the Customer Satis i
Email Addresses (comma-separated)	flowadmin@salesforce.com i

- From each element that can fail, draw a fault connector to the Send Email element. In this example, Record Create is the only element that supports fault connectors.

SEE ALSO:

- [Flow Text Template Resource](#)
- [Flow Send Email Element](#)
- [Customize What Happens When a Flow Fails](#)

Customize the Error Message for Running Flow Users (Best Practice)

As a best practice, we recommend displaying a better message to your user than “An unhandled fault has occurred in this flow”. Do this only if the distribution method you’re using supports flows that contain screens. In other words, don’t do it if your flow is distributed through a process.

1. Create a text template that contains a friendlier error message.

```
<FONT FACE="Arial" STYLE="font-size:14px">  
<B>Something went wrong with this flow.</B>  
</FONT>  
<P>Your admin has received an email about this error.</P>
```

2. Add a Screen element. In a Display Text field, reference the text template.
3. For every element that can fail, draw a fault connector to the Screen element.
In this example, Record Create is the only element that supports fault connectors. After the flow displays the better error message to the user, it sends an email to the admin with debugging information.

- “Manage Force.com Flow”

Other Examples of Error Handling in Flows

Examples of using fault connectors to handle flow errors include requesting corrections from the user and bypassing the error.

Request Corrections from Users

Draw a fault connector to a Screen element, where users can verify the values that they entered, make corrections, and proceed.

Display the Error Message

If the flow is used only internally, such as at a call center, use the fault path to display the error message to the running user. In the same Screen element, ask the user to report the error to the IT department. To do so, draw the fault connector to a Screen element with this Display Text field.

```
Sorry, but you can't read or update records at this time.  
Please open a case with IT and include this error message:  
{!$Flow.FaultMessage}
```

Create a Case

When an error occurs, automatically create a case that includes the error message and assign it to your IT department. Assign the created case's ID to a Text variable (`{! caseId}`, for example). Then, in a Screen, display this message to the running user.

```
Sorry, but you can't read or update records at this time.  
We filed a case for you.
```

Ignore Errors

To bypass errors for a given element in your flow, draw the fault connector to the same element as the normal connector.

Set a Flow's Start Element

Before you can save a flow, indicate which element to execute first.

1. Hover over the starting element in your flow.
2. Click .

SEE ALSO:

[Save a Flow](#)

Save a Flow

After you create a flow in the Cloud Flow Designer, you have some options for saving the flow.

Initial save

When you save a new flow for the first time, a dialog box appears. Enter values for each of the [flow's properties](#). Once you save the flow, the unique name can't be changed.

Quick save

After you've saved a flow once, the **Save** button works as a quick-save, overwriting your previous work. However, the **Save** button doesn't work when editing active flows. To save your changes as a new version or new flow, use **Save As**.

Save As

After you've saved your flow once, this button is enabled with two options:

- **Save as new flow** opens a dialog box where you can input a new name, unique name, and description, then save your changes as an entirely new flow.
- **Save as new version** saves the flow as a new version of the current flow. Use this option if you want to change a flow and keep the old configuration as a backup.

Each flow can have up to 50 versions. You can't update the unique name when you save a new version.

When saving a flow or flow version:

- If you have the flow detail page open in one browser tab, then edit a version in another tab, before you run the edited version:
 1. Save the version.
 2. Close the Cloud Flow Designer.
 3. Refresh the flow detail page in the first tab.

[Activate or Deactivate a Flow Version](#)

Flow Reference

Flow Elements

Each *element* represents an action that the flow can execute. Examples of such actions include reading or writing Salesforce data, displaying information and collecting data from flow users, executing business logic, or manipulating data.

In the Cloud Flow Designer, the canvas and Explorer tab display the elements that exist in the flow. The Palette tab displays the available element types that you can add to the flow by dragging them onto the canvas.

IN THIS SECTION:

[General Settings for Flow Elements](#)

Every flow element has three settings in common: name, unique name, and description.

[Flow Apex Plug-In Element](#)

Calls an Apex class that implements the `Process.Plugin` interface. If you used the Tag property in the `PluginDescribeResult` class, the Apex class appears under a customized section. Otherwise, it appears under the Apex Plug-ins section.

[Flow Assignment Element](#)

Sets or changes values in variables, collection variables, sObject variables, and sObject collection variables.

[Flow Call Apex Element](#)

Calls an Apex class's invocable method.

[Flow Decision Element](#)

Evaluates a set of conditions and routes users through the flow based on the outcomes of those conditions. This element performs the equivalent of an if-then statement.

[Flow Email Alert Element](#)

Sends an email by using a workflow email alert to specify the email template and recipients. The flow provides only the record ID.

[Flow Fast Create Element](#)

Creates Salesforce records using the field values from an sObject collection variable. Or creates one Salesforce record using the field values from an sObject variable.

[Flow Fast Delete Element](#)

Deletes Salesforce records using the ID values that are stored in an sObject collection variable. Or deletes one Salesforce record using the ID value that's stored in an sObject variable.

[Flow Fast Lookup Element](#)

Finds Salesforce records to assign their field values to an sObject collection variable. Or finds one Salesforce record to assign its field values to an sObject variable.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

[Flow Fast Update Element](#)

Updates Salesforce records using the field values from an sObject collection variable. Or updates one Salesforce record using the field values from an sObject variable. If a record's ID is included in the variable, its field values are updated to match the other values that are stored in the variable.

[Flow Loop Element](#)

Iterates through a collection one item at a time, and executes actions on each item's field values—using other elements within the loop.

[Flow Record Create Element](#)

Creates one Salesforce record by using individual field values that you specify.

[Flow Record Delete Element](#)

Deletes all Salesforce records that meet specified criteria.

[Flow Record Lookup Element](#)

Finds the first Salesforce record that meets specified criteria. Then assigns the record's field values to individual flow variables or individual fields on sObject variables.

[Flow Record Update Element](#)

Finds all Salesforce records that meet specified criteria and updates them with individual field values that you specify.

[Flow Quick Action Element](#)

Calls an object-specific or global quick action that's already been configured in your organization. Only "Create," "Update," and "Log a Call" actions are supported.

[Flow Post to Chatter Element](#)

Posts a message to a specified feed, such as to a Chatter group or a case record. The message can contain mentions and topics, but only text posts are supported.

[Flow Screen Element](#)

Displays a screen to the user who is running the flow, which lets you display information to the user or collect information from the user.

[Flow Send Email Element](#)

Sends an email by manually specifying the subject, body, and recipients in the flow.

[Flow Step Element](#)

Acts as a placeholder when you're not sure which element you need.

[Flow Submit for Approval Element](#)

Submits one Salesforce record for approval.

[Flow Subflow Element](#)

Calls another flow in your organization. Use this element to reference modular flows and simplify the overall architecture of your flow.

[Flow Wait Element](#)

Waits for one or more defined events to occur, which lets you automate processes that require a waiting period.

SEE ALSO:

[Flow Resources](#)

[Cloud Flow Designer](#)

General Settings for Flow Elements

Every flow element has three settings in common: name, unique name, and description.

Field	Description
Name	Helps you identify the element on the canvas.
Unique Name	Automatically populated if empty when you fill out the <code>Name</code> field and press TAB. The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Description	Appears after you click Add Description .

Flow Apex Plug-In Element

Calls an Apex class that implements the `Process.Plugin` interface. If you used the `Tag` property in the `PluginDescribeResult` class, the Apex class appears under a customized section. Otherwise, it appears under the Apex Plug-ins section.

Tip:

- Apex classes appear in the palette as Apex plug-ins only if the `Process.Plugin` interface has been implemented.
- If you have many plug-ins in your organization, ask your developer to use the `tag` property. The class appears under a special section header in the palette. Otherwise, the class appears with all the other Apex plug-ins.
- If your developer hasn't already implemented the `Process.Plugin` interface on the desired class, we recommend using the `@InvocableMethod` annotation instead. Unlike the `Process.Plugin` interface, the `@InvocableMethod` annotation supports `sObject`, `Collection`, `Blob`, and `Time` data types and bulkification. It's also much easier to implement. To see a complete comparison between the interface and the annotation, see [Invoke Apex Code from a Flow](#) on page 4203.

Inputs

Pass information from the flow to the invoked Apex method. The method determines the available input parameters.

Outputs

Pass information from the invoked Apex method to the flow. The method determines the available output parameters.

The flow assigns the values to the specified variables when the code is executed.

Flow Assignment Element

Sets or changes values in variables, collection variables, sObject variables, and sObject collection variables.

In each row, specify the `Variable` whose value you want to change and the new `Value` for that variable. At run time, the variable assignments occur in the order you specify.

Column Header	Description
Variable	Variable whose value you want to change.
Operator	The available operators depend on the data type selected for the <code>Variable</code> .
Value	<p>The <code>Variable</code> and <code>Value</code> in the same row must have compatible data types.</p> <p>Options:</p> <ul style="list-style-type: none"> • Select an existing flow resource, such as a variable, constant, or user input. • Select CREATE NEW to create a flow resource. • Manually enter a literal value or merge field.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

- Available in:

- [Cross-Object Field References in Flows](#)

Flow Call Apex Element

Calls an Apex class's invocable method.

Important: To use this element to call an Apex class from a flow, ask your developer to annotate one of the class's methods with `@InvocableMethod`. For details, see "InvocableMethod Annotation" in the *Force.com Apex Code Developer's Guide*.

Inputs

Pass information from the flow to the invoked Apex method. The method determines the available input parameters.

Outputs

Pass information from the invoked Apex method to the flow. The method determines the available output parameters. The flow assigns the values to the specified variables when the method is executed.

Usage

Note: If the invoked method creates, updates, or deletes a record, that action isn't performed until the interview's transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

SEE ALSO:

- [Invoke Apex Code from a Flow](#)
- [Customize What Happens When a Flow Fails](#)
- [Define the Path That a Flow Takes](#)
- [Cross-Object Field References in Flows](#)

Flow Decision Element

Evaluates a set of conditions and routes users through the flow based on the outcomes of those conditions. This element performs the equivalent of an if-then statement.

Outcomes

Create the outcomes for the decision. To rename the path that the flow takes when none of the other outcome conditions are met, click **[Default Outcome]**. Set up the conditions.

Field	Description
Name	Identifies the connector for this outcome on the canvas.
Unique Name	The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Conditions	Determines whether the flow takes this outcome's path.

EDITIONS

 **Example:** Using a Decision element, determine whether:

- To give customers a return shipping address (because an item is definitely faulty) or instructions on how to resolve the problem
- To offer a customer a loan or not (based on results of a credit scoring formula)

 **Tip:** Configure your flow so that it does different things based on which option a user selected for a screen's drop-down list. To do so, add a decision after the screen to create the branches of the flow based on the choices available in that drop-down list. Then you can represent each choice in your decision and connect it to a branch of your flow.

SEE ALSO:

[Flow Elements](#)

[Define Flow Conditions](#)

[Operators in Flow Conditions](#)

[Define the Path That a Flow Takes](#)

[Cross-Object Field References in Flows](#)

Flow Email Alert Element

Sends an email by using a workflow email alert to specify the email template and recipients. The flow provides only the record ID.

Before you begin:

- Make sure that the email alert you want to call from your flow exists. If not, [create the email alert](#).
- Understand the [daily limits](#) for emails sent from email alerts.
- Store the ID for the record that you want to reference in this email, such as by using a Fast Lookup element. If the email alert has any merge fields, the referenced record is the starting point for those fields.

The unique name for each email alert is prefixed with its object. The object type of the referenced record must match the object type of the email alert. For example, if you have an email alert with unique name "Owner_Changed" for accounts, that email alert appears in the Palette as `Account.Owner_Changed`. Because the email alert is associated with the Account object, it can reference only an account record.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Field	Description
Record ID	Select a variable that contains the ID for the record that you want the email to reference. If the email alert uses any merge fields, this record is the starting point for those merge fields. For example, if you stored the record ID in an sObject variable called <code>storeAccount</code> , the value is <code>{!storeAccount.Id}</code> .

Usage

 **Note:** At run time, the email isn't sent until the interview's transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

SEE ALSO:

[Send Email from a Flow](#)

[Customize What Happens When a Flow Fails](#)

[Define the Path That a Flow Takes](#)

[Cross-Object Field References in Flows](#)

Flow Fast Create Element

Creates Salesforce records using the field values from an sObject collection variable. Or creates one Salesforce record using the field values from an sObject variable.

To create a single record with field values from regular variables and other flow resources, such as constants, formulas, and screen fields, use [Record Create](#).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Field	Description
Variable	<p>The sObject variable or collection that you want to use to create the record or multiple records. The object types must match, and each ID field must not have a value.</p> <p>If you used an sObject variable to create a single record, the sObject variable's ID field is updated with the new record's ID value. If you used an sObject collection to create multiple records, the ID field of each collection item is updated with its matching new record ID value.</p>

 **Example:** Take a collection of new cases and use a Fast Create element to create records for each case in the collection. Make sure that your flow populates the sObject variable or collection with all required field values before executing the Fast Create element.

Usage

 **Note:** At run time, records aren't created until the interview's transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

SEE ALSO:

[Flow Elements](#)

[Customize What Happens When a Flow Fails](#)

[Define the Path That a Flow Takes](#)

[Flow sObject Variable Resource](#)

[Flow sObject Collection Variable Resource](#)

Flow Fast Delete Element

Deletes Salesforce records using the ID values that are stored in an sObject collection variable. Or deletes one Salesforce record using the ID value that's stored in an sObject variable.

 **Tip:** Make sure that the sObject variable or collection is populated with ID values before using the Fast Delete element.

Field	Description
Variable	Identifies the sObject variable or collection that you want to use to delete records. The variable must include the IDs of the records that you want to delete.

Usage

 **Warning:**

- Be careful when testing flows that contain delete elements. Even if the flow is inactive, it triggers the delete operation.
- To prevent deleting records by mistake, be as specific in your filter criteria as possible.
- Records are deleted from your organization the moment the flow executes the delete element.
- Deleted records are sent to the Recycle Bin and remain there for 15 days before they are permanently deleted.
- Flows can delete records that are in an approval process.

To delete one or more records that meet filter criteria specified by regular variables and other flow resources, such as constants, formulas, and screen fields, use [Record Delete](#).

 **Note:** At run time, the records aren't deleted until the interview's transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

SEE ALSO:

- Developer

Field	Description
Filter criteria	<p>Narrows down the scope of records that the flow looks up. Specify the filter criteria for selecting the record from the database.</p> <p> Tip: Make sure that your filter criteria sufficiently narrows the search. If you use an sObject variable to store the results, the Fast Lookup element returns only the first record from the filtered results.</p> <p>The available filter operators depend on the data type of the selected fields. For details, see Operators in Flow Record Filters. <code>value</code> must be compatible with the selected field's data type.</p>
Sort results by:	Sorts the filtered results before any records are stored in the variable. If you select this field, select the field that you want to sort the results by and the sort order. Only sortable fields are available.
Variable	<p>The variable to contain the returned field values.</p> <ul style="list-style-type: none"> • To contain the field values for the first returned record, use an sObject variable. • To contain the field values for all the returned records, use an sObject collection variable.
Assign null to the variable if no records are found.	Sets the variable to null if no records meet the filter criteria. By default, the variable's values are left unchanged.
Specify which of the record's fields to save in the variable.	Identifies which fields on the records that meet the filter criteria to store in the variable. Values for unselected fields are set to null in the variable.

 **Example:**

- Look up a product's name and description by using the bar code on its product tag.
- Look up all customers who live in a particular city.
- Look up customer transactions on a particular day.

Usage

To get a single record and store specified field values in regular variables and sObject variables, use [Record Lookup](#).

SEE ALSO:

- [Flow Elements](#)
- [Operators in Flow Record Filters](#)

- [Cross-Object Field References in Flows](#)

Flow Fast Update Element

Updates Salesforce records using the field values from an sObject collection variable. Or updates one Salesforce record using the field values from an sObject variable. If a record's ID is included in the variable, its field values are updated to match the other values that are stored in the variable.

Field	Description
Variable	Identifies the sObject variable or collection that you want to use to update records. The sObject variable or collection must be the same object type as the records being updated. That is, if you're updating several account records, use an sObject collection of type account. This practice ensures that the fields in the records match the fields in the sObject variable or collection.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Example: You're designing flows for a call center. To automatically update Salesforce with data collected from callers, such as new addresses or product preferences, use a Fast Update element. Have your flow populate the sObject variable or collection before using the Fast Update element. Then make sure that the sObject variable or sObject values within the collection contain the ID for the records that are being updated.

Usage

To update one or more records with field values from regular variables and other flow resources, such as constants, formulas, and screen fields, use [Record Update](#).

Note: At run time, records aren't updated until the interview's transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

SEE ALSO:

- [Flow Elements](#)
- [Customize What Happens When a Flow Fails](#)
- [Define the Path That a Flow Takes](#)
- [Flow sObject Variable Resource](#)
- [Flow sObject Collection Variable Resource](#)

Flow Loop Element

Iterates through a collection one item at a time, and executes actions on each item's field values—using other elements within the loop.

A *collection* is a list of items that contain, for example, field values from Salesforce records. A loop uses an sObject variable, referred to as the *loop variable*, to contain the values for the current item in the collection. Once the loop finishes examining an item, it copies the field values for the next item into the loop variable. Then the loop examines those values. The loop variable must have the same object type as the collection. For example, if your collection contains field values from accounts, your loop variable must also be of type Account.

Field	Description
Loop through	The collection that you want to loop through.
Order	<i>Ascending</i> begins at the start of the collection and moves to the end, while <i>Descending</i> begins at the end and moves to the start.
Loop variable	The variable that the flow uses to contain the current item's values during a loop iteration. If the loop is iterating over a non-sObject collection variable, this variable must have the same data type. If the loop is iterating over an sObject collection variable, this variable must have the same object type.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Usage

After you add a Loop element and the elements that you want the loop to include, from the Loop element:

- Determine which element to execute first when a new item's values are copied into the loop variable by adding a "Next element" connector.
- Determine which flow element to execute after the loop has processed all the items in the collection by adding an "End of loop" connector.

SEE ALSO:

[Sample Flow That Loops Through a Collection](#)

[Define the Path That a Flow Takes](#)

[Flow Elements](#)

[Flow sObject Collection Variable Resource](#)

Flow Record Create Element

Creates one Salesforce record by using individual field values that you specify.

Field	Description
Create	The object for which you want to create a record
Field values	Identifies the field values for the new record. Each value must match the selected field's data type.  Important: Ensure that all required fields are populated with values; otherwise the flow fails at run time. If you don't know which fields are required, check the object definition.
Variable	Assigns the ID of the new record to a variable so you can reference it later in the flow.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

 **Example:** A user enters a name and address into the flow. Verify that a matching user exists by using the Record Lookup element. If a matching contact doesn't exist, create a record for that user by using the Record Create element.

Usage

To create a single record with all field values from one sObject variable, or multiple records with all field values from an sObject collection, use [Fast Create](#).

 **Note:** At run time, the record isn't created until the interview's transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

SEE ALSO:

- [Operators in Flow Record Filters](#)
- [Customize What Happens When a Flow Fails](#)
- [Define the Path That a Flow Takes](#)
- [Flow Elements](#)

Flow Record Delete Element

Deletes all Salesforce records that meet specified criteria.

Field	Description
Delete	Identifies the object whose records you want to delete.
Filter Criteria	Narrows down the scope of records that the flow deletes.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Usage

Warning:

- Be careful when testing flows that contain delete elements. Even if the flow is inactive, it triggers the delete operation.
- To prevent deleting records by mistake, be as specific in your filter criteria as possible.
- Records are deleted from your organization the moment the flow executes the delete element.
- Deleted records are sent to the Recycle Bin and remain there for 15 days before they are permanently deleted.
- Flows can delete records that are in an approval process.

To delete a single record identified by the ID in one sObject variable, or delete multiple records identified by the IDs in an sObject collection, use [Fast Delete](#).

Note: At run time, the record isn't deleted until the interview's transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

Field	Description
reference them in your flow.	
Assign null to the variable(s) if no records are found.	Sets the variables to null if no records meet the filter criteria. By default, the variable's values are left unchanged.
Specify which of the record's fields to save in the variable.	Identifies which fields on the records that meet the filter criteria to store in the variable. Values for unselected fields are set to null in the variable.

Example: Use a Record Lookup element to:

- Input (or read) a bar code from a product tag. Use the code to find out the product name or description from the database.
- Look up item details to check your stock for availability.
- Look up a customer record to verify a caller's identity.

Usage

Use a [Fast Lookup](#) element to find:

- A single record and store specified field values in an sObject variable, or
- Multiple records and store specified field values in an sObject collection

SEE ALSO:

Flow Record Update Element

Finds all Salesforce records that meet specified criteria and updates them with individual field values that you specify.

Field	Description
Update	Identifies the object whose records you want to update.
Filter criteria	<p>Narrows down the scope of records that the flow updates.</p> <p> Important: Configure at least one filter, or the flow updates all the records for the object.</p> <p>The available filter operators depend on the data type of the selected fields. For details, see Operators in Flow Record Filters. <code>Value</code> must be compatible with the selected field's data type.</p>
Update record fields ...	Identifies which fields to update on the records that meet the filter criteria, as well as the new values.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

 **Example:** Automatically update Salesforce with data collected from customers, such as new addresses or product preferences.

Usage

Use [Fast Update](#) to:

- Update a single record with all field values from an sObject variable, or
- Update multiple records with all field values from an sObject collection

 **Note:** At run time, the record isn't updated until the interview's transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

SEE ALSO:

[Define the Path That a Flow Takes](#)

[Flow Elements](#)

Flow Quick Action Element

Calls an object-specific or global quick action that's already been configured in your organization. Only "Create," "Update," and "Log a Call" actions are supported.

The unique name for each object-specific action is prefixed with the object it's associated with. The unique name for each global action has no prefix.

Field	Description
Related Record ID	Only for object-specific actions. The ID of the record from which the action executes. For example, the action creates a case that's associated with a given account. Assign the ID for that account to <code>Related Record ID</code> .
Input Parameter	Varies for each action. Required parameters appear by default and can't be removed. The action layout determines which parameters are required. If a required field has a default or predefined value, that field is optional in object-specific and global actions in the flow. If you later remove the field's default or predefined value and you didn't set a value in the flow, the interview fails at run time.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

 **Example:** Your organization has an object-specific action that creates a case record on an account. The flow calls that action at run time and uses input assignments to transfer data from the flow to the action.

 **Note:** At run time, the record isn't created or updated until the interview's transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

Flow Post to Chatter Element

Posts a message to a specified feed, such as to a Chatter group or a case record. The message can contain mentions and topics, but only text posts are supported.

Inputs

Input Parameter	Description
Community ID	ID of a community to post to. Valid only if Salesforce Communities is enabled. Required if posting to a user or Chatter group that belongs to a Salesforce.com Community.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Input Parameter Description

Message	<p>The text that you want to post. Must be a string of no more than 10,000 characters.</p> <p>To mention a user or group, enter <code>@ [reference]</code>, where <i>reference</i> is the ID for the user or group that you want to mention. The reference can be a literal value, a merge field, or a flow resource. For example: <code>@ [{!UserId}]</code>.</p> <p>To add a topic, enter <code># [string]</code>, where <i>string</i> is the topic that you want to add. For example: <code># [Action Required]</code>.</p>
Target Name or ID	<p>Reference to the user, Chatter group, or record whose feed you want to post to.</p> <ul style="list-style-type: none"> To post to a user's feed, enter the user's ID or Username. For example: <code>jsmith@salesforce.com</code> To post to a Chatter group, enter the group's Name or ID. For example: <code>Entire Organization</code> To post to a record, enter the record's ID. For example: <code>001D000000JWBDx</code>
Target Type	<p>Required only if Target Name or ID is set to a username or a Chatter group name.</p> <p>The type of feed that you want to post to. Valid values are:</p> <ul style="list-style-type: none"> <i>User</i>—If Target Name or ID is set to a user's Username, enter this value. <i>Group</i>—If Target Name or ID is set to a Chatter group's Name, enter this value.
Visibility	<p>Specifies whether this feed item is available to all users or internal users only.</p> <p>Valid only if Salesforce Communities is enabled. Valid values are:</p> <ul style="list-style-type: none"> <i>allUsers</i> <i>internalUsers</i>

Outputs

Output Parameter Description

Feed Item ID	Assigns the created post's ID to a resource in the flow.
--------------	--

Usage

-  **Note:** At run time, the Chatter post isn't created until the interview's transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

Flow Screen Element

Displays a screen to the user who is running the flow, which lets you display information to the user or collect information from the user.

IN THIS SECTION:

[Flow Screen Element: General Info](#)

Identifies which navigation buttons are available for a given screen, as well as whether help text is available to the flow user.

[Flow Screen Element: User Input Fields](#)

Lets users manually enter information. A *flow user input field* is a text box, long text area, number, currency, date, date/time, password, or checkbox in a Screen element.

[Flow Screen Element: Choice Fields](#)

Lets users select from a set of choices. A *flow choice field* is a radio button, drop-down list, multi-select checkbox, or multi-select picklist in a Screen element.

[Flow Screen Element: Display Text Fields](#)

Displays information to users while they're running the flow.

SEE ALSO:

Field	Description
	displays a screen to tell the user to go back and try again. For that screen, select Don't show Finish button .
Show Pause button	Adds the Pause button to the navigation buttons for this screen, if <code>Let Users Pause Flows</code> is enabled in your organization's Workflow and Approvals settings. Once a user pauses a flow interview, only that user or an administrator can resume the interview.
Paused Message	The message that's displayed to flow users when they pause a flow.

Help Text

Field	Description
Text box	Information for users to see when they click Help for this form .

Usage

If you allow users to pause interviews of this flow:

- Customize the [interview label](#)
- Enable `Let Users Pause Flows` in your organization's Process Automation Settings
- Add the Paused Flow Interviews component to the Home page layout for relevant users

Flow Screen Element: User Input Fields

Lets users manually enter information. A *flow user input field* is a text box, long text area, number, currency, date, date/time, password, or checkbox in a Screen element.

Field	Description
Label	User-friendly text that displays to the left of the field. To format the label, click iii .
Unique Name	A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Input Type	Automatically populated based on the type of input field you selected.
Default Value	Pre-populated value for the input field. The data type of the default value must be compatible with the field's data type. For example, a checkbox's default value must be of type boolean.

EDITIONS

Field	Description
Scale	Controls the number of digits to the right of the decimal point. Can't exceed 17. If you leave this field blank or set to zero, only whole numbers display when your flow runs. Available for only Currency and Number input fields.
Required	Forces users to enter a value before they can move on to the next screen.
Validate	Enables input validation on this field.
Formula Expression	Boolean formula expression that evaluates whether the user entered an acceptable value.
Error Message	Displays underneath the field if the user didn't enter an acceptable value.
Help Text	Adds  next to the input field. In the text box, enter helpful information about this field.

SEE ALSO:

[Flow Screen Element](#)

Flow Screen Element: Choice Fields

Lets users select from a set of choices. A *flow choice field* is a radio button, drop-down list, multi-select checkbox, or multi-select picklist in a Screen element.

Field	Description
Label	Displays to the left of the field. To format the label, click  .
Unique Name	A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Value Data Type	Controls which choices are available in Choice Settings. For example, if you choose Number you can't use a choice that has a data type of Text.
Type	You can't change the value data type of multi-select choice fields; only text is supported.
Scale	Controls the number of digits to the right of the decimal point. Can't exceed 17. If you leave this field blank or set to zero, only whole numbers display when your flow runs. Available for only Currency and Number choice fields.
Required	Forces users to identify a choice before they progress to the next screen.
Default Value	The choice that's preselected for the user.
Choice	The choice options that the user can choose from. Select configured choices, dynamic record choices, or picklist choices.

 **Note:** You can't rearrange choices.

Options for Choice Fields in Flow Screen Elements

A key part of configuring choice fields in a flow screen is selecting the choice options to display in that field. These options appear as the individual radio buttons or checkboxes or options in a drop-down list. Create choice options with at least one of these resources: choices, dynamic record choices, or picklist choices.

Dynamic record choices and picklist choices are easier to configure and don't require as much maintenance as choices. We recommend using a flow choice resource (otherwise known as stand-alone choices) only when you can't use the other two.

If you want the user to select...	Use this resource
From a set of filtered records	Dynamic Record Choice
From a set of values that correspond to an existing picklist or multi-select picklist field	Picklist Choice
Something that can't be generated from a record, picklist field, or multi-select picklist field	Choice

Flow Screen Element: Display Text Fields

Displays information to users while they're running the flow.

Field	Description
Unique Name	A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Text box	The text to display to the flow user. Click  to switch between the plain text editor and the rich text editor. Using the rich text editor saves the content as HTML.

 **Example:** Welcome users to the flow or to display terms and conditions.

SEE ALSO:

[Flow Screen Element](#)

Flow Send Email Element

Sends an email by manually specifying the subject, body, and recipients in the flow.

 **Tip:**

- Store the text for the email body in a text template.
- To use an email template that exists in your organization, call an [email alert](#) instead.

Specify at least one recipient for the email. You can use both email address parameters, so long as the combined number of addresses is five or fewer.

Field	Description
Body	Text for the body of the email. Consider using a text template resource.
Subject	Text for the subject of the email.
Email Addresses (comma-separated)	Optional. Recipients of the email. This parameter accepts string values, which include variables of type Text, manually entered strings, and input fields from a Screen element. For the email to send successfully, enter a value for <code>Email Addresses (comma-separated)</code> or <code>Email Addresses (collection)</code> . You can use both parameters, so long as the combined number of email addresses is five or fewer.
Email Addresses (collection)	Optional. Recipients of the email. This parameter accepts only collection variables of type Text. For the email to send successfully, enter a value for <code>Email Addresses (comma-separated)</code> or <code>Email Addresses (collection)</code> . You can use both parameters, so long as the combined number of email addresses is five or fewer.

Flow Step Element

Acts as a placeholder when you're not sure which element you need.

Usage

Steps aren't valid elements for active flows. As a flow admin, you can run a draft flow with Step elements in it. Before you activate the flow, replace the Step elements with other elements or delete them entirely.

Convert a Step element into a Screen element at any time by hovering your mouse over the step and clicking .

-  **Note:**
- If you convert a step that has multiple connectors into a Screen, all its connectors are deleted.
 - Once a Step element has been converted, you can't use its original unique name.

Flow Submit for Approval Element

Submits one Salesforce record for approval.

 **Tip:** Before you begin, store the ID for the record that you want to submit for approval.

Inputs

Transfer data from the flow to the approval submission.

Input Parameter	Description
Record ID	The ID of the record that you want to submit for approval.
Next Approver IDs	The ID of the user to be assigned the approval request when the approval process doesn't automatically assign the approver. Must be a collection variable of type String that includes exactly one item.
Approval Process Name or ID	<p>The unique name or ID of the specific approval process to which you want the record to be submitted. The process must have the same object type as the record you specified in <code>Record ID</code>.</p> <p>This parameter is required if <code>Skip Entry Criteria</code> is set to <code>\$GlobalConstant.True</code>.</p> <p>If this parameter and <code>Submitter ID</code> aren't set, the flow succeeds only when:</p> <ul style="list-style-type: none"> The approver on submit is determined automatically, and The user who launched the flow is an allowed initial submitter <p>Make sure that:</p> <ul style="list-style-type: none"> The approver on submit is determined automatically, and The initial submitters (for the approval processes related to this object) include all users who could launch this flow <p>For details, see Create an Approval Process.</p>
Skip Entry Criteria	If set to <code>\$GlobalConstant.True</code> , the record isn't evaluated against the entry criteria set on the process that is defined in <code>Approval Process Name or ID</code> .
Submission Comments	<p>Text that you want to accompany the submission.</p> <p>Submission comments appear in the approval history for the specified record. This text also appears in the initial approval request email if the template uses the <code>{!ApprovalRequest.Comments}</code> merge field.</p>
Submitter ID	<p>The ID for the user who submitted the record for approval. The user receives notifications about responses to the approval request.</p> <p>The user must be one of the allowed submitters for the process.</p> <p>If you don't set this field, the user who launched the flow is the submitter. If a workflow rule triggers a flow that includes this element, the submitter is the user who triggered the workflow rule. Workflow rules can be</p>

EDITIONS

Input Parameter	Description
	triggered when a user creates or edits a record. When the record is approved or rejected, the user who launched the flow or triggered the workflow rule is notified.

Outputs

Transfer data from the approval request to the flow. Assignments occur when the approval request is created.

Optional Output Parameter	Description
Instance ID	The ID of the approval request that was submitted.
Instance Status	The status of the current approval request. Valid values are "Approved," "Rejected," "Removed," or "Pending".
New Work Item IDs	The IDs of the new items submitted to the approval request. There can be 0 or 1 approval processes.
Next Approver IDs	The IDs of the users who are assigned as the next approvers.
Record ID	The ID of the record that the flow submitted for approval.

Usage

 **Note:** At run time, the approval request isn't created until the interview's transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

Flow Subflow Element

Calls another flow in your organization. Use this element to reference modular flows and simplify the overall architecture of your flow.

A subflow element references another flow and calls that flow at run time. When a flow contains a subflow element, we call it the *master flow* to distinguish it from the *referenced flow*.

 **Tip:** Create smaller flows that perform common tasks. For example, build utility flows to capture address and credit card information, and authorize a credit card purchase amount. Then call those flows as needed from multiple product-ordering flows.

Assign values to variables in the referenced flow. Variable assignments occur when the master flow calls the referenced flow at run time.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Column Header	Description
Target	<p>Referenced flow's variable whose value you want to set.</p> <p>By default, this drop-down list contains the variables of the currently active version of the referenced flow. If the referenced flow has no active version, the drop-down list contains the variables of the <i>latest</i> version of the referenced flow.</p>
Source	<p>Master flow's resource or value to assign to the target.</p> <p>Options:</p> <ul style="list-style-type: none"> • Select an existing flow resource, such as a variable, constant, or user input. • Select CREATE NEW to create a flow resource. • Manually enter a literal value or merge field.

Assign values from the referenced flow's variables to the master flow's variables. Variable assignments occur when the referenced flow finishes running.

Column Header	Description
Source	<p>Referenced flow's variable whose value you want to assign to the target.</p> <p>By default, this drop-down list contains the variables of the currently active version of the referenced flow. If the referenced flow has no active version, the drop-down list contains the variables of the <i>latest</i> version of the referenced flow.</p>
Target	Master flow's variable whose value you want to set.

Usage

At run time, the master flow calls the *active* version of each referenced flow by default. If a referenced flow has no active version, then the master flow calls the *latest* version of the referenced flow. To run only the latest version of each referenced flow:

- Open the master flow, and click **Run with Latest** in the button bar, or
- Append the URL for the master flow with `?latestSub=true`

 **Note:** Only flow admins can run inactive flows. For other users, the flow fails at run time if a subflow element tries to call a flow with no active version.

[Cross-Object Field References in Flows](#)

Flow Wait Element

Waits for one or more defined events to occur, which lets you automate processes that require a waiting period.

Define the events that the flow waits for before it proceeds.

Field	Description
Name	The name appears on the connector that's associated with this event.
Unique Name	The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Event Type	Determines whether the flow is waiting for: <ul style="list-style-type: none"> • An absolute time (such as 3 days from now), or • A time relative to a date/time field on a Salesforce record (such as 3 days after an opportunity closes)
Event Conditions	Determines the exact event that the flow is waiting for. Parameters vary, based on the selected event type.
Wait for this event only if additional conditions are met	If selected, the flow waits for this event only when certain conditions are met.
Waiting Conditions	Determines which conditions must be true for the flow to wait for this event. Available only if <code>wait for this event only if additional conditions are met</code> is selected. <p>The flow waits for the event only if the waiting conditions evaluate to <code>true</code>. For details, see Define Flow Conditions on page 4202.</p>
Variable Assignments	Assigns the event's outputs to flow variables. Parameters vary, based on the selected event type.
[Default Path]	Determines what the flow does when all the events have unmet waiting conditions. If at least one event doesn't have waiting conditions, the default path is never executed. <p>The name displays on the Wait element's default connector. Provide a custom name for this path by replacing the predefined value.</p>

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Usage

Note:

- Flows that contain Wait elements must be autolaunched. If a flow includes Wait elements and screens, choice, or dynamic choices, you can't activate or run it.
- Before you add a Wait element to your flow, understand the special behavior and limitations. See [Limitations for Time-Based Flows](#) on page 4191 for details.

After you define your events, connect the Wait element to other elements on the canvas to indicate what the flow does when:

- Each event is the first to occur. One connector **(1)** is available for each event that's defined in the Wait element.
- There are no more events to wait for, because the waiting conditions for every event are unmet. One connector **(2)** is available for the Wait element's default path.
- An error occurs related to the Wait element. One connector **(3)** is available for the Wait element's fault path, and it's always labeled FAULT.

If the flow waits for multiple events, consider returning the flow path to the Wait element again so that the flow waits for the other events. If you return the flow path to the Wait element, consider using waiting conditions to control when the flow waits for each event. For an example, see [Sample Flow That Waits for Many Events](#) on page 4290.

IN THIS SECTION:

[What Are Waiting Conditions?](#)

Each event that you define in a flow Wait element has optional *waiting conditions*. These conditions must be met for the flow interview to wait for that event at run time.

SEE ALSO:

[Customize What Happens When a Flow Fails](#)

[Define the Path That a Flow Takes](#)

[Cross-Object Field References in Flows](#)

[Flow Elements](#)

What Are Waiting Conditions?

Each event that you define in a flow Wait element has optional *waiting conditions*. These conditions must be met for the flow interview to wait for that event at run time.

When an interview encounters a Wait element, it checks the waiting conditions for each event to determine which events to wait for. If the waiting conditions aren't met for an event, the interview doesn't wait for that event. If all events have unmet waiting conditions, the interview executes the default path.

 **Tip:** Add a default path if:

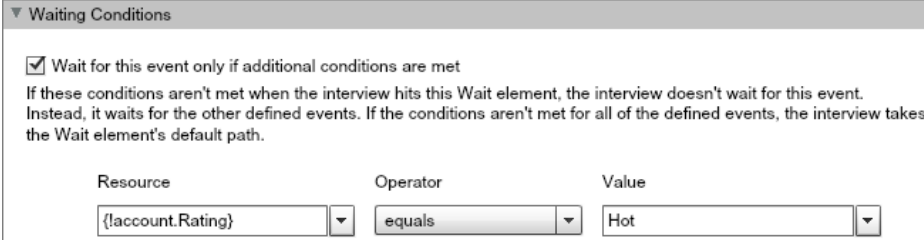

- All the events have waiting conditions set, and
- You want the flow to proceed when the waiting conditions for all events are met

 **Example:** Here are two scenarios in which you would use waiting conditions.

- The flow waits for different events based on a field value on a given record.

For example, send an email reminder to a contract's owner before the contract's end date. The date on which you send the email depends, however, on the rating of the contract's account. If the account is hot, send the email a month before the end date. If the account isn't hot, send the email two weeks before the end date.

In this example, you would create two events. The event for hot accounts occurs 30 days before the contract's end date. Its waiting conditions would check if the `Rating` for the contract's account is equal to "Hot."

▼ Waiting Conditions

Wait for this event only if additional conditions are met
 If these conditions aren't met when the interview hits this Wait element, the interview doesn't wait for this event. Instead, it waits for the other defined events. If the conditions aren't met for all of the defined events, the interview takes the Wait element's default path.

Resource	Operator	Value
{!account.Rating}	equals	Hot

The second event occurs 15 days before the contract's end date. Its waiting conditions would check if the `Rating` for the contract's account is not equal to "Hot."

When a flow interview executes the Wait element during run time, the interview checks the waiting conditions for each event. It only waits for the events whose waiting conditions are met. If the account is hot, the interview doesn't wait for the second event.

- The flow waits for multiple events to occur, such as to send periodic email reminders. For an example of this scenario, see [Sample Flow That Waits for Many Events](#) on page 4290.

Flow Resources

Each *resource* represents a value that you can reference throughout the flow.

In the Cloud Flow Designer, the Explorer tab displays the resources that are available in the flow.

You can create some types of resources from the Resources tab by double-clicking them. Some resources, such as global constants and system variables, are automatically provided by the system. Other resources are provided by the system when you add an element to the flow. For example, when you add a Decision element to your flow, the system creates a resource for each outcome.

Which resources are available depend on the specific field you're setting. Oftentimes you can create resources from within that field by expanding the CREATE NEW section of its drop-down list.

Flow Resource	Description	Creatable from the Resources Tab
Choice	Represents an individual value that can be used in choice screen fields.	Yes
Collection Variable	Stores multiple updatable values that have the same data type, such as a group of email addresses.	Yes
Constant	Stores a fixed value.	Yes
Dynamic Record Choice	Represents a set of choices that's generated from an object's records.	Yes
Element	<p>Any element that you add to the flow is available as a Resource with the <code>was visited</code> operator in outcome criteria. An element is considered visited if the element has already been executed in the flow interview.</p> <p>Any element that you add to the flow that supports a fault connector is available as a Boolean resource. If the element has already been successfully executed in the flow interview, the resource's value is <code>True</code>. If the element wasn't executed or was executed and resulted in an error, the resource's value is <code>False</code>.</p>	
Formula	Calculates a value by using other resources in your flow and Salesforce functions	Yes
Global Constant	Fixed, system-provided values, such as <code>EmptyString</code> , <code>True</code> , and <code>False</code> , that can be assigned as the values of flow resources.	
Global Variables	System-provided variables that reference information about the organization or running user, such as the user's ID or the API session ID. In Visual Workflow, global variables are available in only flow formulas.	
Outcome	If you add a Decision element to the flow, its outcomes are available as Boolean resources. If an outcome path has already

Flow Resource	Description	Creatable from the Resources Tab
	been executed in the flow interview, the resource's value is <code>True</code> .	
Picklist Choice	Represents a set of choices that's generated from the values of a picklist or multi-select picklist field.	Yes
Picklist Values	System-provided values for picklist fields in sObject variables and sObject collection variables. Available for only Assignment and Decision elements.	
Screen Field	Any screen field that you add to the flow is available as a resource. The resource value depends on the type of screen field. The value for a screen input field is what the user enters. The value for a screen choice field is the stored value of the choice that the user selects. The value for a screen output field is the text that's displayed to the user.	
SObject Collection Variable	Stores updatable field values for one or more Salesforce records.	Yes
SObject Variable	Stores updatable field values for a Salesforce record.	Yes
System Variable	System-provided values about the running flow interview, such as <code> {!\$Flow.CurrentDate}</code> , <code> {!\$Flow.CurrentDateTime}</code> , and <code> {!\$Flow.FaultMessage}</code> .	
Text Template	Stores formatted text.	Yes
Variable	Stores a value that can be updated as the flow executes.	Yes
Wait Event	If you add a Wait element to the flow, its events are available as Boolean resources. If an event's waiting conditions are met, the resource's value is <code>True</code> . If the event has no waiting conditions set, the resource's value is always <code>True</code> .

Flow Choice Resource

Represents an individual value that can be used in choice screen fields.

Field	Description
Label	A user-friendly label for the choice option.
Unique Name	A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Description	Helps you differentiate this choice option from other resources.
Value Data Type	Controls which choice fields this choice can be used in. For example, you can't use a Text choice in a Currency radio button field.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Field	Description
Scale	Controls the number of digits to the right of the decimal point. Can't exceed 17. If you leave this field blank or set to zero, only whole numbers display when your flow runs. Available for only Currency and Number choices.
Stored Value	If the user selects this choice, the choice field has this value. If a user leaves a choice blank or unselected, its stored value is set to null.
Show Input on Selection	Displays a text box below the choice option. This option isn't available if the choice's data type is Boolean.

These fields appear only if you select `Show Input on Selection`.

Field	Description
Label	A user-friendly label for the text box.
Required	Forces users to enter a value in the text box before they can progress or finish the flow.
Validate	Evaluates whether the user entered an acceptable value.

These fields appear only if you select `Validate`.

Field	Description
Formula	Boolean formula expression that evaluates whether the user entered an acceptable value.
Error Message	Displays if the user didn't enter an acceptable value.

 **Example:** If your flow asks users to choose a particular service level, create choices for Gold, Silver, and Bronze. In a screen, display the choices with a description of the features included. Then, in the same screen, let the user pick from a dropdown list.

Flow Collection Variable Resource

Stores multiple updatable values that have the same data type, such as a group of email addresses.

Field	Description
Unique Name	The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Description	Helps you differentiate this collection variable from other resources.
Data Type	Determines the type of values that can be assigned to the collection variable.
Input/Output Type	<p>Determines whether the collection variable can be accessed outside the flow.</p> <ul style="list-style-type: none"> • Private—Can be assigned and used only within the flow • Input—Can be set at the start of the flow using Visualforce controllers, or subflow inputs • Output—Can be accessed from Visualforce controllers and other flows <p>This field doesn't affect how variables are assigned or used within the same flow, for example, through these types of elements: Assignment, Record or Fast Create, Record or Fast Lookup, and Apex Plug-in.</p> <p>The default value of the field is <code>Private</code>.</p> <p> Warning: Disabling input or output access for an existing variable can break the functionality of applications and pages that call the flow and access the variable. For example, you can access variables from URL parameters, Visualforce controllers, subflows, and processes.</p>

[Flow Loop Element](#)

[Cross-Object Field References in Flows](#)

Flow Constant Resource

A flow constant represents a fixed value. Unlike variables, this value can't change throughout a flow.

Field	Description
Unique Name	The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Description	Helps you differentiate this constant from other resources.
Data Type	Determines the types of values that the constant can store.
Value	The constant's value. This value doesn't change throughout the flow.

SEE ALSO:

[Flow Resources](#)

Flow Dynamic Record Choice Resource

Represents a set of choices that's generated from an object's records.

Field	Description
Unique Name	The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Description	Helps you differentiate this resource from other resources.
Value Data Type	Data type of the choice's stored value.
Create a choice for each	Determines the object whose records you want to use to generate the choices
Filter Criteria	Determines which records are included in the generated list of choices. If you don't apply any filters, a choice is generated for <i>every</i> record of the selected object. For example, to generate a list of all accounts in San Francisco, use filters to include only accounts whose Billing City is San Francisco.

Field	Description
Choice Label	<p>Determines which field is used as the label for each generated choice. Select a field that enables users to differentiate between the generated choices.</p> <p> Tip: Make sure to choose a field that contains data. If the selected field has no value for a given record, the corresponding choice's label is blank at run time.</p>
Choice Stored Value	<p>Determines which field's value is stored when the user selects this choice at run time. <code>Value Data Type</code> determines the available options.</p> <p>By default, the stored value is null. The stored value is determined by the most recent user selection of a choice within the generated set.</p>
Sort results by	<p>Controls the order that the choices appear in.</p> <p>When <code>Sort results by</code> is selected, also select the field that you want to order the choices by. Then select which order the choices should appear in.</p>
Limit number of choices to	<p>Controls the number of options that appear in the screen field that uses this dynamic record choice.</p> <p>When <code>Limit number of choices to</code> is selected, also enter the maximum number (up to 200) of choices to include.</p>
Assign the record fields to variables...	<p>Takes field values from the record that the user chose and stores them in flow variables that you can reference later.</p> <p> Note: When a multi-select choice field uses a dynamic record choice, only values from the last record that the user selects are stored in the flow variables. If multiple multi-select choice fields on one screen use the same dynamic record choice, the variable assignments obey the first of those fields.</p>

 **Example:** In a support flow for a computer hardware manufacturer, users identify a product to find its latest updates. You create a dynamic record choice that displays all products whose product ID starts with a specific string of characters. However, the flow users are more likely to know the product's name than its ID, so for `Choice Label` select the field that contains the product name. Elsewhere in the flow, you want to display the associated product ID and description. To do so, you assign the ID and Description field values from the user-selected record to flow variables.

Flow Formula Resource

Calculates a value by using other resources in your flow and Salesforce functions.

Field	Description
Unique Name	The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Description	Helps you differentiate this formula from other resources.
Value Data Type	The data type for the value calculated by the formula.
Scale	Controls the number of digits to the right of the decimal point. Can't exceed 17. If you leave this field blank or set to zero, only whole numbers display when your flow runs. Appears when Value Data Type is Number or Currency.
Formula	The formula expression that the flow evaluates at run time. The returned value must be compatible with Value Data Type.  Note: Some formula operators are not supported in the Cloud Flow Designer.

SEE ALSO:

- [Formula Operators and Functions](#)
- [Limitations for Flow Formulas](#)
- [Flow Resources](#)
- [Cross-Object Field References in Flows](#)

Flow Global Constant Resource

Fixed, system-provided values, such as `EmptyString`, `True`, and `False`.

Global Constant	Supported Data Types
<code>{!\$GlobalConstant.True}</code>	Boolean
<code>{!\$GlobalConstant.False}</code>	Boolean
<code>{!\$GlobalConstant.EmptyString}</code>	Text

 **Example:** When you create a Boolean variable, `$GlobalConstant.True` and `$GlobalConstant.False` are supported. But when you create a Currency variable, no global constants are supported.

Null vs. Empty String

At run time, `{!$GlobalConstant.EmptyString}` and `null` are treated as separate, distinct values. For example:

- If you leave a text field or resource value blank, that value is `null` at run time. If you instead want the value to be treated as an empty string, set it to `{!$GlobalConstant.EmptyString}`.
- For flow conditions, use the `is null` operator to check whether a value is `null`. If the condition compares two text variables, make sure that their default values are correctly either set to `{!$GlobalConstant.EmptyString}` or left blank (`null`).

SEE ALSO:

[Flow Resources](#)

Global Variables in Visual Workflow

System-provided variables that reference information about the organization or running user, such as the user’s ID or the API session ID. In Visual Workflow, global variables are available in only flow formulas.

 **Example:** Use `{!$User.Id}` to easily access the ID of the user who’s running the flow interview.

The following global variables are supported in flow formulas. If a value in the database has no value, the corresponding merge field returns a blank value. For example, if nobody has set a value for your organization’s Country field, `{!$Organization.Country}` returns no value.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

- Available in:
- Enterprise
 - Performance
 - Unlimited
 - Developer

Global Variable	Description
<code>\$Api</code>	References API URLs or the session ID. The following merge fields are available. <ul style="list-style-type: none"> • <code>Enterprise_Server_URL_***</code>—The Enterprise WSDL SOAP endpoint where <code>***</code> represents the version of the API. • <code>Partner_Server_URL_***</code>—The Partner WSDL SOAP endpoint where <code>***</code> represents the version of the API. • <code>Session_ID</code>
<code>\$Label</code>	References custom labels. This global variable appears only if custom labels have been created in your organization. The returned value depends on the language setting of the contextual user. The value returned is one of the following, in order of precedence: <ol style="list-style-type: none"> 1. The local translation’s text 2. The packaged translation’s text 3. The master label’s text
<code>\$Organization</code>	References information about your company. <p> Note: <code>{!\$Organization.UiSkin}</code> returns one of these values.</p> <ul style="list-style-type: none"> • <code>Theme1</code>—Obsolete Salesforce theme • <code>Theme2</code>—Salesforce theme used before Spring ’10

Global Variable	Description
	<ul style="list-style-type: none"> • <code>Theme3</code>—Classic “Aloha” Salesforce theme, introduced in Spring ’10 • <code>PortalDefault</code>—Salesforce Customer Portal theme • <code>Webstore</code>—Salesforce AppExchange theme
<code>\$Permission</code>	References information about the running user’s current access to any of your organization’s custom permissions. This global variable appears only if custom permissions have been created in your organization.
<code>\$Profile</code>	<p>References information from the current user’s profile, such as license type or name.</p> <p> Tip:</p> <ul style="list-style-type: none"> • Use profile names to reference standard profiles in <code>\$Profile</code> merge fields. • Users don’t need access to their profile information to run a flow that references these merge fields.
<code>\$Setup</code>	<p>References custom settings of type “hierarchy”. This global variable appears only if hierarchy custom settings have been created in your organization. You can access custom settings of type “list” only in Apex.</p> <p>Hierarchical custom settings allow values at any of three different levels:</p> <ul style="list-style-type: none"> • Organization—the default value for everyone • Profile—overrides the Organization value • User—overrides both Organization and Profile values <p>Salesforce automatically determines the correct value for this custom setting field based on the running user’s current context.</p>
<code>\$System</code>	<code>\$System.OriginDateTime</code> represents the literal value of 1900-01-01 00:00:00. Use this merge field to perform date/time offset calculations.
<code>\$User</code>	<p>References information about the user who’s running the flow interview. For example, reference the user’s ID or title.</p> <p> Tip:</p> <ul style="list-style-type: none"> • The current user is the person who caused the flow to start. • When a flow is started because a Web-to-Case or Web-to-Lead process changed a record, the current user is the <code>Default Lead Owner</code> or <code>Default Case Owner</code>. <p><code>\$User.UITheme</code> and <code>\$User.UIThemeDisplayed</code> identify the look and feel the running user sees on a given Salesforce page. The difference between the two variables is that <code>\$User.UITheme</code> returns the look and feel the user is <i>supposed</i> to see, while <code>\$User.UIThemeDisplayed</code> returns the look and feel the user <i>actually</i> sees. For example, a user may have the permissions to see the new user interface theme look and feel, but if they are using a browser that doesn’t support that look and feel, for example, older versions of Internet Explorer, <code>\$User.UIThemeDisplayed</code> returns a different value. These merge fields return one of the following values.</p> <ul style="list-style-type: none"> • <code>Theme1</code>—Obsolete Salesforce theme • <code>Theme2</code>—Salesforce theme used before Spring ’10 • <code>Theme3</code>—Classic “Aloha” Salesforce theme, introduced in Spring ’10

Global Variable	Description
	<ul style="list-style-type: none"> • <code>PortalDefault</code>—Salesforce Customer Portal theme • <code>Webstore</code>—Salesforce AppExchange theme
<code>\$UserRole</code>	<p>References information about the current user's role, such as the role name or ID.</p> <p> Tip:</p> <ul style="list-style-type: none"> • The current user is the person who caused the flow to start. • When a flow is started because a Web-to-Case or Web-to-Lead process changed a record, the current user is the <code>Default Lead Owner</code> or <code>Default Case Owner</code>.

Flow Picklist Choice Resource

Represents a set of choices that's generated from the values of a picklist or multi-select picklist field.

Field	Description
<code>Unique Name</code>	The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
<code>Description</code>	Helps you differentiate this resource from other resources.
<code>Value Data Type</code>	Data type of the choice's stored value.
<code>Object</code>	The object whose fields you want to select from.
<code>Field</code>	The picklist or multi-select picklist field to use to generate the list of choices.
<code>Sort Order</code>	Controls the order that the choices appear in.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

 **Example:** In a flow that simplifies the process of creating an account, users need to identify the company's industry.

Rather than creating one choice for each industry, you add a picklist choice to the flow and populate a drop-down list with it. When users run this flow, the picklist choice finds all the values in the database for the Industry picklist field **(1)** on the Account object **(2)**.

On top of being easier to configure than the stand-alone choice resource, picklist choices reduce maintenance. When someone adds new options to the Account Industry picklist, the flow automatically reflects those changes; you don't have to update the flow.

Usage

Unlike with dynamic record choices, you can't:

Filter out any values that come back from the database.

The flow always displays every picklist value for that field—even if you're using record types to narrow down the picklist choices in page layouts.

Customize the label for each option.

The flow always displays the label for each picklist value.

Customize the stored value for each option.

The flow always stores the API value for each picklist value.

The following picklists aren't supported.

- Global picklists
- Picklists for Knowledge Articles

SEE ALSO:

- [Flow Screen Element: Choice Fields](#)

Flow sObject Collection Variable Resource

Stores updatable field values for one or more Salesforce records.

Field	Description
Unique Name	The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

- Available in:
- Enterprise
 - Performance
 - Unlimited
 - Developer

Field	Description
Description	Helps you differentiate this sObject collection variable from other resources.
Input/Output Type	<p>Determines whether the sObject collection variable can be accessed outside the flow.</p> <ul style="list-style-type: none"> • Private—Can be assigned and used only within the flow • Input—Can be set at the start of the flow using Visualforce controllers, or subflow inputs • Output—Can be accessed from Visualforce controllers and other flows <p>The default value is <code>Private</code>.</p> <p> Warning: Disabling input or output access for an existing variable can break the functionality of applications and pages that call the flow and access the variable. For example, you can access variables from URL parameters, Visualforce controllers, subflows, and processes.</p>
Object Type	Type of Salesforce records that the sObject collection represents in the flow.

Usage

After you populate the sObject collection, reference it to create, update, or delete records in the Salesforce database.

Examine every item in the collection by using a Loop element. When an item is being examined in the loop, the item's field values are copied into an sObject variable that you specify as the *loop variable*. If you want the loop to modify a collection item, such as to update an item's field values:

1. Configure the elements within the loop to update the loop variable.
2. Add the variable's field values to a separate collection.

You can add new items to the end of the collection (Assignment element) or replace all items in the collection (Fast Lookup element). However, you can't update existing collection items. To get around this limitation, have the loop iteratively add the contents of the loop variable to another collection. When the loop finishes, you can update the Salesforce records with values from the new collection.

SEE ALSO:

- [Sample Flow That Loops Through a Collection](#)
- [Flow Loop Element](#)
- [Flow Resources](#)

Flow sObject Variable Resource

Stores updatable field values for a Salesforce record.

Field	Description
Unique Name	The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Description	Helps you differentiate this sObject variable from other resources.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Field	Description
Input/Output Type	<p>Determines whether the sObject variable can be accessed outside the flow.</p> <ul style="list-style-type: none"> • Private—Can be assigned and used only within the flow • Input—Can be set at the start of the flow using Visualforce controllers, or subflow inputs • Output—Can be accessed from Visualforce controllers and other flows <p>This field doesn't affect how variables are assigned or used within the same flow, for example, through these types of elements: Assignment, Record or Fast Create, Record or Fast Lookup, and Apex Plug-in.</p> <p>The default value of the field is <code>Private</code>.</p> <p> Warning: Disabling input or output access for an existing variable can break the functionality of applications and pages that call the flow and access the variable. For example, you can access variables from URL parameters, Visualforce controllers, subflows, and processes.</p>
Object Type	Type of Salesforce record that the sObject variable represents in the flow.

Usage

When an sObject variable is created, its default value is `null`. Before you reference an sObject variable's values, make sure that the sObject variable has a value by using the `is null` operator in a Decision element.

SEE ALSO:

[Flow Resources](#)

System Variables in Flows

System-provided values about the running flow interview, such as `{!$Flow.CurrentDate}`, `{!$Flow.CurrentDateTime}`, and `{!$Flow.FaultMessage}`.

System Variable	Supported Resource Types	Description
<code>{!\$Flow.CurrentDate}</code>	Text, Date, and DateTime	Date when the flow interview executes the element that references the system variable.
<code>{!\$Flow.CurrentDateTime}</code>	Text, Date, and DateTime	Date and time when the flow interview executes the element that references the system variable.
<code>{!\$Flow.FaultMessage}</code>	Text	System fault message that can help flow administrators troubleshoot run time issues.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

 **Example:** A flow is used only internally by call center personnel. For each flow element that interacts with the Salesforce database, a fault connector leads to a screen. A Display Text field on the screen displays the system fault message and instructs the flow user to provide that message to the IT department.

```
Sorry, but you can't read or update records at this time.
Please open a case with IT, and include the following error message:
{!$Flow.FaultMessage}
```

SEE ALSO:

- [Customize What Happens When a Flow Fails](#)
- [Flow Resources](#)

Flow Text Template Resource

Stores HTML-formatted text.

Field	Description
Unique Name	The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Description	Helps you differentiate this text template from other resources.
Text Template	The text for the template. Use HTML to format the text and merge fields to reference information from other resources.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

- Available in:
- Enterprise
 - Performance
 - Unlimited
 - Developer

 **Example:** You're designing a flow that registers people for an event. You create a text template that includes a registrant's name, address, and other information. Then you use the template in an email confirmation that the flow sends when it finishes.

Flow Variable Resource

Stores a value that can be updated as the flow executes.

Field	Description
Unique Name	The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Description	Helps you differentiate this variable from other resources.
Data Type	Determines the types of values that can be assigned to the variable.
Scale	Controls the number of digits to the right of the decimal point. Can't exceed 17. If you leave this field blank or set to zero, only whole numbers display when your flow runs. Appears only when the <code>Data Type</code> is set to <code>Number</code> or <code>Currency</code> .
Input/Output Type	<p>Determines whether the variable can be accessed outside the flow.</p> <ul style="list-style-type: none"> • <code>Private</code>—Can be assigned and used only within the flow • <code>Input</code>—Can be set at the start of the flow using Visualforce controllers, or subflow inputs • <code>Output</code>—Can be accessed from Visualforce controllers and other flows <p>This field doesn't affect how variables are assigned or used within the same flow, for example, through these types of elements: Assignment, Record or Fast Create, Record or Fast Lookup, and Apex Plug-in.</p> <p>The default value of the field depends on the release or API version in which the variable is created:</p> <ul style="list-style-type: none"> • <code>Private</code> for a variable created in Summer '12 and later or in API version 25.0 and later. • <code>Input</code> and <code>Output</code> for a variable created in Spring '12 and earlier or in API version 24.0. <p> Warning: Disabling input or output access for an existing variable can break the functionality of applications and pages that call the flow and access the variable. For example, you can access variables from URL parameters, Visualforce controllers, subflows, and processes.</p>
Default Value	<p>Determines the variable value when the flow starts. If you leave this field blank, the value is <code>null</code>.</p> <p>Default values aren't available for Picklist and Picklist (Multi-Select) variables.</p>

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Usage

You can delete a variable at any time. Any variable assignments that use the deleted variable are set to `null`.

SEE ALSO:

[Flow Assignment Element](#)

[Flow sObject Variable Resource](#)

[Cross-Object Field References in Flows](#)

Cross-Object Field References in Flows

When building a flow, you can reference fields for records that are related to the values that are stored in an sObject variable. To do so, manually enter the references.

Cross-object field values are valid wherever you can reference a flow resource or manually enter a value.

Implementation Tips

If a flow interview encounters a null value at any point in the cross-object expression, the element containing the reference fails. The reference runs successfully if the last field value in the expression is `null`. For example, store a contact in `{!sObjContact}` and try to reference

`{!sObjContact}.Account.Name`. The flow fails if `AccountId` on the stored contact is `null` (because there isn't an account to look at), but it succeeds if `Name` on the related account is `null`.

If an element contains a cross-object reference that fails and the element doesn't have a fault path defined, the entire interview fails. To avoid this situation, you can:

- Make the fields that you want to reference in the expression required in Salesforce. For example, for the expression `{!sObjContact}.Account.Name`, you could require `AccountId` on contact page layouts. Then, using another flow, find any records with null values for that field and update them.
- Determine whether each field that's referenced in the expression has a value by using the `wasSet` operator in a Decision element.

Cross-object field references in flows don't count against your organization's limits for:

- Cross-object relationships per object
- DML operations per transaction

Syntax

To reference a field on a related record, use this syntax.

```
{!sObjectVariable.objectName1.objectName2.fieldName}
```

where:

- `sObjectVariable` is the unique name for the sObject variable that you want to start from.
- `objectName1` is the API name for an object that's related to `sObjectVariable`'s object type. The API names for all custom objects end in `__r`.
- (Optional) `objectName2` is the API name for an object that's related to `objectName1`.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

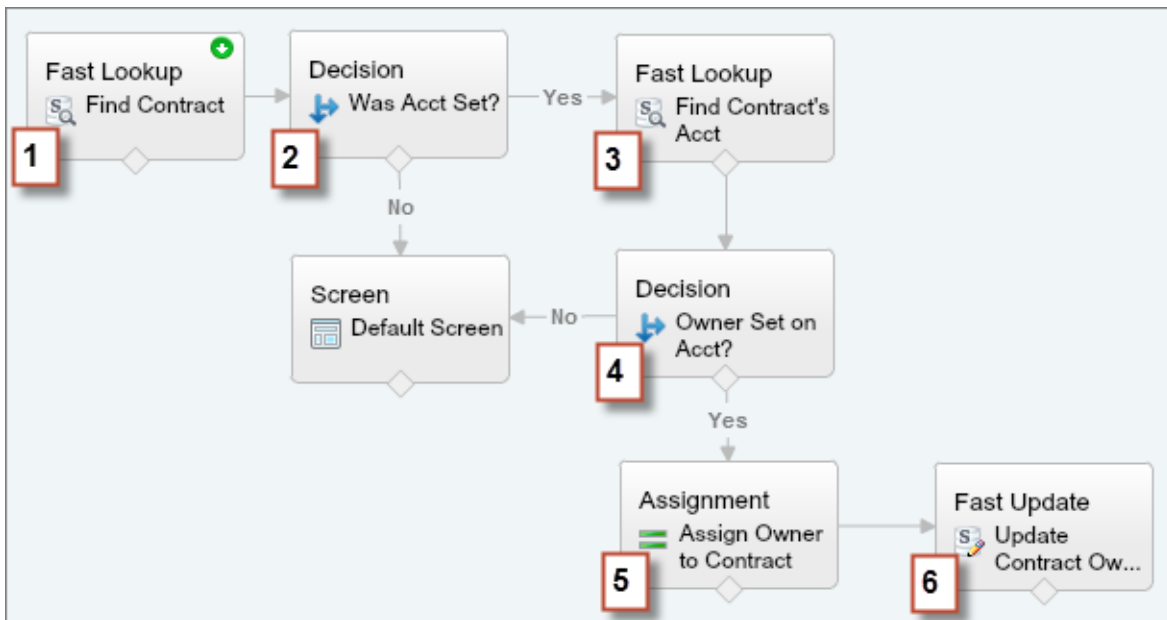

Your expression must include at least one object name, but you can add more objects as needed.

- *fieldName* is the name for the field that you want to reference on the last object in the expression. The API names for all custom fields end in `__c`.

For example, `{!sOv_Contact.Account.Id}` references Id of the account that's related to the contact record represented by an sObject variable in the flow.

When you create an sObject variable to reference fields on related records from, store the ID for the first related record in the variable. For example, to reference an opportunity's contract, store `ContractId` in the sObject variable or add a value for `ContractId` by using an Assignment element.

 **Example:** For example, to update a contract's owner to be the contract's account's owner:

1. Use a Fast Lookup element to store the contract's fields, including `Account Id`, in an sObject variable called `varContract`.
2. Use a Decision element to verify that the value of `Account Id` was set in `varContract`.
3. Use a Fast Lookup to store the fields for the contract's account, including `OwnerId`, in another sObject variable called `varAccount`.
4. Use a Decision element to confirm that the value of `OwnerId` was set in `varAccount`.
5. Use an Assignment element to specify `{!varContract.Account.OwnerId}` as the value for `{!varContract.OwnerId}`.
6. Use a Fast Update element to write the values in `varContract`, including the updated `OwnerId` value, to the contract in Salesforce.

Flow Connectors

Connectors determine the available paths that a flow can take at run time. In the Cloud Flow Designer canvas, a connector looks like an arrow that points from one element to another.

Label	Example	Description
<i>Unlabeled</i>		Identifies which element to execute next.
<i>Decision outcome name</i>		Identifies which element to execute when the criteria of a Decision outcome are met.
<i>Wait event name</i>		Identifies which element to execute when an event that's defined in a Wait element occurs.
FAULT		Identifies which element to execute when the previous element results in an error.
Next element		Identifies the first element to execute for each iteration of a Loop element.
End of loop		Identifies which element to execute after a Loop element finishes iterating through a collection.

[Flow Elements](#)

Flow Operators

Operators behave differently, depending on what you're configuring. In Assignment elements, operators let you change resource values. In flow conditions and record filters, operators let you evaluate information and narrow the scope of a flow operation.

IN THIS SECTION:

[Operators in Flow Assignment Elements](#)

Use Assignment element operators to change the value of a selected resource.

[Operators in Flow Conditions](#)

Use condition operators to verify the value of a selected resource. Conditions are used in Decision elements and Wait elements.

[Operators in Flow Record Filters](#)

A flow record filter narrows the scope of records that the flow operates on. For example, use a record filter to update only the contacts that are associated with the Acme Wireless account. When you add a Record Update element, use the record filters to narrow the scope to just the contacts whose parent account is Acme Wireless.

Boolean

Replace a boolean resource with a new value.

Operator	Description	Supported Data Types	Example
equals	What you enter or select for Value replaces the value of Variable.	Boolean	Before Assignment: <code>{!varBoolean}</code> is false. Assignment: <code>{!varBoolean} equals {!\$GlobalConstant.True}</code> After Assignment: <code>{!varBoolean}</code> is true.

Collection

Replace the value of a collection variable or sObject collection variable (equals) or add an item to the end of the variable (add).

Operator	Description	Supported Data Types	Example
equals	What you enter or select for Value replaces the value of Variable.	Collection of the same data type or object type Text, Picklist, and Multi-Select Picklist data types are compatible with each other.	Before the Assignment: <ul style="list-style-type: none"> • <code>{!collText}</code> is Yellow, Green, Blue • <code>{!collPicklist}</code> is Blue, Red, Orange Assignment: <code>{!collText} equals {!collPicklist}</code> . After the Assignment: <code>{!collText}</code> is Blue, Red, Orange.

Operator	Description	Supported Data Types	Example
add	What you enter or select for Value is added as a new item at the end of the collection.	Variable of the same data type or sObject variable of the same object type Text, Picklist, and Multi-Select Picklist data types are compatible with each other.	Before the Assignment: <ul style="list-style-type: none"> • <code>{!collText}</code> is Yellow, Green, Blue • <code>{!varPicklist}</code> is Red Assignment: <code>{!collText} add {!varPicklist}</code> . After the Assignment: <code>{!collText}</code> is Yellow, Green, Blue, Red.

Currency and Number

Replace (equals), add to (add), or subtract from (subtract) the value of a currency or number resource.

Operator	Description	Supported Data Types	Example
equals	The number that you enter or select for Value replaces the value of Variable.	<ul style="list-style-type: none"> • Currency • Number 	Before the Assignment: <code>{!varCurrency}</code> is 10. Assignment: <code>{!varCurrency} equals 7</code> . After the Assignment: <code>{!varCurrency}</code> is 7.
add	The number that you enter or select for Value is added to the value of Variable.	<ul style="list-style-type: none"> • Currency • Number 	Before the Assignment: <code>{!varCurrency}</code> is 10. Assignment: <code>{!varCurrency} add 7</code> . After the Assignment: <code>{!varCurrency}</code> is 17.
subtract	The number that you enter or select for Value is subtracted from the value of Variable.	<ul style="list-style-type: none"> • Currency • Number 	Before the Assignment: <code>{!varCurrency}</code> is 10. Assignment: <code>{!varCurrency} subtract 7</code> . After the Assignment: <code>{!varCurrency}</code> is 3.

Date

Replace (equals), add to (add), or subtract from (subtract) the value of a date/time resource.

Operator	Description	Supported Data Types	Example
equals	The date that you enter or select for Value replaces the value of Variable.	<ul style="list-style-type: none"> • Date • Date/Time 	Before the Assignment: <code>{!varDate}</code> is 1/16/2016. Assignment: <code>{!varDate} equals 1/15/2016</code> . After the Assignment: <code>{!varDate}</code> is 1/15/2016.

Operator	Description	Supported Data Types	Example
add	Value is added, in days, to the selected Variable's value.	<ul style="list-style-type: none"> Currency Number 	Before the Assignment: <code>{!varDate}</code> is 1/16/2016. Assignment: <code>{!varDate} add 7</code> . After the Assignment: <code>{!varDate}</code> is 1/23/2016.
subtract	Value is subtracted, in days, from the selected Variable's value.	<ul style="list-style-type: none"> Currency Number 	Before the Assignment: <code>{!varDate}</code> is 1/16/2016. Assignment: <code>{!varDate} subtract 7</code> . After the Assignment: <code>{!varDate}</code> is 1/9/2016.

Date/Time

Replace a date/time resource with a new value (equals).

Operator	Description	Supported Data Types	Example
equals	The date that you enter or select for Value replaces the value of Variable.	<ul style="list-style-type: none"> Date Date/Time 	Before the Assignment: <code>{!varDateTime}</code> is 1/16/2016 01:00. Assignment: <code>{!varDateTime} equals 1/16/2016 08:00</code> . After the Assignment: <code>{!varDateTime}</code> is 1/16/2016 08:00.

Picklist

Replace a picklist resource with a new value (equals) or concatenate a value onto the original value (add).

 **Note:** Before values are assigned or added to a picklist resource, they're converted into string values.

Operator	Description	Supported Data Types	Example
equals	What you enter or select for Value replaces the value of the selected picklist.	<ul style="list-style-type: none"> Boolean Currency Date Date/Time Multi-Select Picklist Number Picklist Text 	Before the Assignment: <code>{!varPicklist}</code> is Blue. Assignment: <code>{!varPicklist} equals Yellow</code> . After the Assignment: <code>{!varPicklist}</code> is Yellow.

Operator	Description	Supported Data Types	Example
add	What you enter or select for Value is added to the end of the selected picklist.	<ul style="list-style-type: none"> • Boolean • Currency • Date • Date/Time • Multi-Select Picklist • Number • Picklist • Text 	<p>Before the Assignment: <code>{!varPicklist}</code> is Blue.</p> <p>Assignment: <code>{!varPicklist} add -green.</code></p> <p>After the Assignment: <code>{!varPicklist}</code> is Blue-green.</p>

Multi-Select Picklist

Replace a multi-select picklist resource with a new value (equals), concatenate a value onto the original value (add), or add a selection to the resource (add item).

 **Note:** Before values are assigned or added to a multi-select picklist resource, they're converted into string values.

Operator	Description	Supported Data Types	Example
equal	What you enter or select for Value replaces the value of the selected multi-select picklist.	<ul style="list-style-type: none"> • Boolean • Collection • Currency • Date • Date/Time • Multi-Select Picklist • Number • Picklist • Text 	<p>Before the Assignment: <code>{!varMSP}</code> is Blue.</p> <p>Assignment: <code>{!varMSP} equals Yellow.</code></p> <p>After the Assignment: <code>{!varMSP}</code> is Yellow.</p>
add	<p>What you enter or select for Value is added to the last item selected in the multi-select picklist. It doesn't create a selection.</p> <p>Easily add items to a multi-select picklist resource by using the "add item" operator.</p> <p>To add semi-colon-delimited items to a multi-select picklist variable with the "add" operator, always add</p>	<ul style="list-style-type: none"> • Boolean • Currency • Date • Date/Time • Multi-Select Picklist • Number • Picklist • Text 	<p>Before the Assignment: <code>{!varMSP}</code> is Blue; Green. This value includes two separate selections.</p> <p>Assignment: <code>{!varMSP} add Yellow.</code></p> <p>After the Assignment: <code>{!varMSP}</code> is Blue; GreenYellow. This value includes two separate selections.</p>

Operator	Description	Supported Data Types	Example
	a single space after the semi-colon and don't include a space before the semi-colon. This way, you can compare the variable's values to the values of a multi-select picklist field from the Salesforce database. For example: ; Yellow		
add item	What you enter or select for Value is added as a new selection to the end of the multi-select picklist. The Assignment automatically adds ";" before the new item. That way, Salesforce reads it as a separate item selected by the multi-select picklist.	<ul style="list-style-type: none"> • Boolean • Currency • Date • Date/Time • Multi-Select Picklist • Number • Picklist • Text 	<p>Before the Assignment: {!varMSP} is Blue; Green.</p> <p>Assignment: {!varMSP} add item Yellow.</p> <p>After the Assignment: {!varMSP} is Blue; Green; Yellow. This value includes three separate selections.</p>

sObject

Replace an sObject variable with a new value (equals).

Operator	Description	Supported Data Types	Example
equals	The sObject that you select for Value replaces the value of Variable.	sObject with the same object type	<p>Before the Assignment:</p> <ul style="list-style-type: none"> • {!account1} contains field values for the Acme Wireless account • {!account2} contains field values for the Global Media account <p>Assignment: {!account1} equals {!account2}.</p> <p>After the Assignment: both {!account1} and {!account2} contain the field values for the Global Media account.</p>

Text

Replace a text resource with a new value (equals) or concatenate a value onto the end of the original value (add).

 **Note:** Before values are assigned or added to a text resource, they're converted into string values.

Operator	Description	Supported Data Types	Example
equals	The text that you enter or select for Value replaces the value of Variable.	<ul style="list-style-type: none"> • Boolean • Currency • Date • Date/Time • Number • Multi-select picklist • Picklist • Text 	<p>Before the Assignment: <code>{!varText}</code> is Blue.</p> <p>Assignment: <code>{!varText} equals Yellow.</code></p> <p>After the Assignment: <code>{!varText}</code> is Yellow.</p>
add	The text that you enter or select for Value is added to the end of Variable.	<ul style="list-style-type: none"> • Boolean • Currency • Date • Date/Time • Number • Multi-select picklist • Picklist • Text 	<p>Before the Assignment: <code>{!varText}</code> is Blue.</p> <p>Assignment: <code>{!varText} add Yellow.</code></p> <p>After the Assignment: <code>{!varText}</code> is BlueYellow.</p>

Operators in Flow Conditions

Use condition operators to verify the value of a selected resource. Conditions are used in Decision elements and Wait elements.

Use this reference, divided up by the data type that you select for Resource, to understand the supported operators.

- [Boolean](#)
- [Choice](#)
- [Collection](#)
- [Currency](#)

- [Text](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

- Available in:
- Enterprise
 - Performance
 - Unlimited
 - Developer

Boolean

Check whether a Boolean resource's value matches another value or resource.

Operator	True if...	Supported Data Types
does not equal	The value of the selected Resource doesn't match what you enter or select for Value.	Boolean
equals	The value of the selected Resource matches what you enter or select for Value. An outcome resolves to true if the flow interview took that outcome. A wait event resolves to true if all of the waiting conditions for that event are met.	Boolean
was set	The value for Resource is a field in an sObject variable, and that field has been populated with a value in the flow at least once.	Boolean
was visited	The selected Resource is an element in the flow, and it has been visited during the flow interview.	Boolean

Choice

Every choice resource has a data type and obeys the operator rules for that data type. However, choice resources support one extra operator that other resources don't, no matter what their data type is.

Operator	True if...	Supported Data Types
was selected	A user selected that choice or dynamic record choice in a screen choice input field. If your flow references the same choice option in multiple screens, was selected always evaluates to the most recent screen that the flow visited. If your flow references the same choice option with a user input in more than one place on the same screen, this operator always evaluates the first usage in the screen.	Boolean

Collection

Check whether a Collection resource's value contains or matches another value or resource.

Operator	True if...	Supported Data Types
contains	An item in the collection that's selected for Resource contains the exact same value as Value	Varies If the resource is an sObject collection variable, only sObject resources with the same object type are supported.

Operator	True if...	Supported Data Types
		Otherwise, only resources with the same data type are supported.
does not equal	The collection that's selected for Resource doesn't match the collection that's selected for Value Two sObject collection variables are unequal if they include different fields or if the fields have different values.	Collection If the resource is an sObject collection variable, only sObject collection variables with the same object type are supported. Otherwise, only collection variables with the same data type are supported.
equals	The collection that's selected for Resource matches the collection that's selected for Value Two sObject collection variables are equal if they include the same fields and those fields have the same values.	Collection If the resource is an sObject collection variable, only sObject collection variables with the same object type are supported. Otherwise, only collection variables with the same data type are supported.
is null	The collection that's selected for resource isn't populated with any values	Boolean

Currency and Number

Check whether a Currency or Number resource's value matches, is larger than, or is smaller than another value or resource.

Operator	True if...	Supported Data Types
does not equal	The value for Resource doesn't match what's entered or selected for Value	<ul style="list-style-type: none"> • Currency • Number
equals	The value for Resource matches what's entered or selected for Value	<ul style="list-style-type: none"> • Currency • Number

Operator	True if...	Supported Data Types
greater than	The value of the Resource is larger than what's entered or selected for Value	<ul style="list-style-type: none"> • Currency • Number
greater than or equal	The value of the Resource is larger than what's entered or selected for Value or is the same	<ul style="list-style-type: none"> • Currency • Number
less than	The value of the Resource is smaller than what's entered or selected for Value	<ul style="list-style-type: none"> • Currency • Number
less than or equal	The value of the Resource is smaller than what's entered or selected for Value or is the same	<ul style="list-style-type: none"> • Currency • Number
is null	Resource isn't populated with a value	Boolean
was set	The value for Resource is a field in an sObject variable, and that field has been populated with a value in the flow at least once	Boolean

Date and Date/Time

Check whether a Date or Date/Time resource's value matches, is before, or is after another value or resource.

Operator	True if...	Supported Data Types
does not equal	The value for Resource doesn't match what's entered or selected for Value	<ul style="list-style-type: none"> • Date • Date/Time
equals	The value for Resource matches what's entered or selected for Value	<ul style="list-style-type: none"> • Date • Date/Time
greater than	The value of the Resource is a later date or time than what's entered or selected for Value	<ul style="list-style-type: none"> • Date • Date/Time
greater than or equal	The value of the Resource is a later date or time than what's entered or selected for Value or is the same date or time	<ul style="list-style-type: none"> • Date • Date/Time
less than	The value of the Resource is an earlier date or time than what's entered or selected for Value	<ul style="list-style-type: none"> • Date • Date/Time
less than or equal	The value of the Resource is an earlier date or time than what's entered or selected for Value or is the same date or time	<ul style="list-style-type: none"> • Date • Date/Time

Operator	True if...	Supported Data Types
is null	Resource isn't populated with a value	Boolean
was set	The value for Resource is a field in an sObject variable, and that field has been populated with a value in the flow at least once	Boolean

Picklist

Check whether a Picklist resource's value matches or contains another value or resource.

 **Note:** These operators treat the resource's value as a text value.

Operator	True if...	Supported Data Types
contains	The value for Resource contains what's entered or selected for Value For example, if the value of <code>{!varPicklist}</code> is <code>yellow-green</code> , the condition <code>{!varPicklist} contains green</code> evaluates to true.	<ul style="list-style-type: none"> • Boolean • Currency • Date • Date/Time • Multi-select Picklist • Number • Picklist • Text
does not equal	The value for Resource doesn't match what's entered or selected for Value	<ul style="list-style-type: none"> • Boolean • Currency • Date • Date/Time • Multi-select Picklist • Number • Picklist • Text
equals	The value for Resource matches what's entered or selected for Value	<ul style="list-style-type: none"> • Boolean • Currency • Date • Date/Time • Multi-select Picklist • Number

Operator	True if...	Supported Data Types
		<ul style="list-style-type: none"> Picklist Text
was set	The value for Resource is a field in an sObject variable, and that field has been populated with a value in the flow at least once	Boolean

Multi-Select Picklist

Check whether a multi-select picklist resource's value matches or contains another value or resource.

 **Note:** These operators treat the resource's value as a text value. If the resource's value includes multiple items, the operators treat the value as one string that happens to include semi-colons. It doesn't treat each selection as a different value. For example, the operators treat `red; blue; green` as a single value rather than three separate values.

Operator	True if...	Supported Data Types
contains	<p>The value for Resource contains what's entered or selected for Value</p> <p> Tip: When you use this operator for a multi-select picklist resource, be aware of the values that a user can enter. If you want to check that a specific value is included and that value is also included as part of another value, create a flow formula resource that uses the INCLUDES function.</p> <p>For example, your organization has a Color multi-select picklist value. Among the possible values are "green" and "yellow-green". If both "green" and "yellow-green" are acceptable values, use the contains operator in a flow condition. If only "green" is an acceptable value, create a formula that uses the INCLUDES() function.</p>	<ul style="list-style-type: none"> Boolean Currency Date Date/Time Multi-select Picklist Number Picklist Text
does not equal	<p>The value for Resource doesn't match what's entered or selected for Value</p> <p> Note: Order matters. If you aren't sure which order the values that you're checking for will appear in, use the INCLUDES() function in a flow formula. For example, if you compare "red; blue; green" to "blue; green; red" using the does not equal operator, that condition resolves to true.</p>	<ul style="list-style-type: none"> Boolean Currency Date Date/Time Multi-select Picklist Number Picklist Text
equals	<p>The value for Resource exactly matches what's entered or selected for Value</p> <p> Note: Order matters. If you aren't sure which order the values that you're checking for will appear in, use the INCLUDES() function in a flow formula. For example, if you compare "red; blue; green" to "blue; green; red" using the equals operator, that condition will resolve to false.</p>	<ul style="list-style-type: none"> Boolean Currency Date Date/Time

Operator	True if...	Supported Data Types
		<ul style="list-style-type: none"> • Multi-select • Picklist • Number • Picklist • Text
was set	The value for Resource is a field in an sObject variable, and that field has been populated with a value in the flow at least once	Boolean

sObject

Check whether an sObject resource’s value matches another value or resource.

Operator	True if...	Supported Data Types
does not equal	The value for Resource doesn’t match what’s entered or selected for Value	sObject with the same object type
equals	The value for Resource matches what’s entered or selected for Value	sObject with the same object type
is null	Resource isn’t populated with a value	Boolean

Text

Check whether a Text resource’s value matches, contains, ends with, or starts with another value or resource.

 **Note:** Before values are compared to a text resource, they’re converted into string values.

Operator	True if...	Supported Data Types
contains	The value for Resource contains what’s entered or selected for Value	<ul style="list-style-type: none"> • Boolean • Currency • Date • Date/Time • Multi-select • Picklist • Number • Picklist • Text
does not equal	The value for Resource doesn’t match what’s entered or selected for Value	<ul style="list-style-type: none"> • Boolean

Operator	True if...	Supported Data Types
		<ul style="list-style-type: none"> • Currency • Date • Date/Time • Multi-select Picklist • Number • Picklist • Text
equals	The value for Resource matches what’s entered or selected for Value	<ul style="list-style-type: none"> • Boolean • Currency • Date • Date/Time • Multi-select Picklist • Number • Picklist • Text
ends with	The end of the value for Resource matches what’s entered or selected for Value	<ul style="list-style-type: none"> • Boolean • Currency • Date • Date/Time • Multi-select Picklist • Number • Picklist • Text
is null	Resource isn’t populated with a value	Boolean
starts with	The beginning of the value for Resource matches what’s entered or selected for Value	<ul style="list-style-type: none"> • Boolean • Currency • Date • Date/Time • Multi-select Picklist • Number • Picklist • Text

Operator	True if...	Supported Data Types
was set	The value for Resource is a field in an sObject variable, and that field has been populated with a value in the flow at least once	Boolean

Operators in Flow Record Filters

A flow record filter narrows the scope of records that the flow operates on. For example, use a record filter to update only the contacts that are associated with the Acme Wireless account. When you add a Record Update element, use the record filters to narrow the scope to just the contacts whose parent account is Acme Wireless.

Use this reference, organized by the data type of the field that you select, to understand the supported operators.

		<ul style="list-style-type: none"> • Date/Time • Multi-select Picklist • Number • Picklist • Text
equals	Matches what's entered or selected for Value	<ul style="list-style-type: none"> • Boolean • Currency • Date • Date/Time • Multi-select Picklist • Number • Picklist • Text
ends with	Ends with what's entered or selected for Value	<ul style="list-style-type: none"> • Boolean • Currency • Date • Date/Time • Multi-select Picklist • Number • Picklist • Text
is null	Hasn't been populated with a value yet (if you select True for Value)	Boolean
starts with	Begins with what's entered or selected for Value	<ul style="list-style-type: none"> • Boolean • Currency • Date • Date/Time • Multi-select Picklist • Number • Picklist • Text

Multi-Select Picklist Fields

When you select a multi-select picklist field under Field, these operators are available.

 **Tip:** Be careful when using these operators to filter records based on a multi-select picklist field. Even if two resources have the same items in a multi-select picklist, they can be mismatched if these cases differ.

- The spacing before or after the semi-colon. For example, one resource’s value is “red; green; blue” and the other’s value is “red;green;blue”
- The order of the items. For example, one resource’s value is “red; green; blue” and the other’s value is “red; blue; green”

For best results, use the INCLUDES function in a flow formula.

Flow Event Types

`Event Type` drives the fields that you use to define an event in a flow `Wait` element. The available event types are both alarms, which consist of a date/time value—the base time—and an optional offset from that time.

The *base time*, which is always required, is the date/time value from which the alarm is based. If there's no offset for the alarm, the alarm is set to the exact value of the base time. The base time can be composed of one or multiple fields, based on the event type that you choose.

The *offset*, which is optional, is the amount of time before or after the base time at which the alarm occurs. An offset is always composed of two fields: `Offset Number` and `Offset Unit`. For example, if you want your alarm to occur three days after the base time, the number is `3` and the unit is `Days`.

IN THIS SECTION:

[Absolute Time Alarms](#)

An *absolute time alarm* waits for a defined time that's based off an absolute date/time value. For example, you can use this event type in a `Wait` element to do something a day after the flow interview starts to wait.

[Relative Time Alarms](#)

A *relative time alarm* waits for a defined time that's based off a date/time field on a record. For example, you can use this event type to do something three days before a contract ends.

SEE ALSO:

[Flow Wait Element](#)

Absolute Time Alarms

An *absolute time alarm* waits for a defined time that's based off an absolute date/time value. For example, you can use this event type in a Wait element to do something a day after the flow interview starts to wait.

When you configure a Wait element in a flow:

- Define what the flow is waiting for
- Assign information from the event after it occurs to flow variables

Event Conditions

The following parameters are available to define events with an `Event Type` of Alarm: Absolute Time.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

- Available in:
- Enterprise
 - Performance
 - Unlimited
 - Developer

Parameter	Description	Example
<code>Base Time</code>	A date/time value. If you enter values for <code>Offset Number</code> and <code>Offset Unit</code> , this field value is the base for the offset. You can manually enter a date/time value or reference a merge field or flow resource.	<code>{!\$Flow.CurrentDate}</code>
<code>Offset Number</code>	Optional. The number of days or hours to offset <code>Base Time</code> . Required if you set a value for <code>Offset Unit</code> . The value must be a manually entered integer. You can't use a merge field or flow resource for this value. To set the alarm to occur before <code>Base Time</code> , use a negative number. To set the alarm to occur after <code>Base Time</code> , use a positive number.	<code>-3</code>
<code>Offset Unit</code>	Optional. The unit to offset <code>Base Time</code> . Required if you set a value for <code>Offset Number</code> . Manually enter <i>Days</i> or <i>Hours</i> . You can't use a merge field or flow resource for this value.	<code>Days</code>

For an example of a flow that waits for an absolute time alarm, see [Sample Flow That Waits for a Single Event](#).

Event Outputs

Reference information from the event in your flow by assigning its outputs to flow variables.

Parameter	Description	Example
<code>Base Time</code>	The actual time at which the event occurred and the flow interview resumed.	<code>11/26/2014 10:12 AM</code>

Parameter	Description	Example
Event Delivery Status	<p>The status of the event when the flow interview resumed. After an event occurs, Salesforce delivers the event to the flow that's waiting for it, so that the flow knows to resume. Valid values are:</p> <ul style="list-style-type: none"> Delivered: The event was successfully delivered. Invalid: An error occurred during delivery, but the flow successfully resumed. 	Delivered

SEE ALSO:

[Flow Event Types](#)

Relative Time Alarms

A *relative time alarm* waits for a defined time that's based off a date/time field on a record. For example, you can use this event type to do something three days before a contract ends.

When you configure a Wait element in a flow:

- Define what the flow is waiting for
- Assign information from the event after it occurs to flow variables

Event Conditions

The following parameters are available to define events with an `Event Type` of Alarm: Relative Time.

Parameter	Description	Example
Object Type	<p>The API name of the object whose field you want to base the alarm on. See Supported Objects, on page 4283</p> <p>You must manually enter a string. You can't use a merge field or flow resource for this value.</p>	<code>Contract</code>
Base Date/Time Field	<p>The API name for a date or date/time field on the specified object. If you enter values for <code>Offset Number</code> and <code>Offset Unit</code>, this field value is the base for the offset.</p> <p>Manually enter a string.</p>	<code>EndDate</code>
Record ID	<p>ID of the record that the alarm is based on. The record's object type must match <code>Object Type</code>.</p> <p>You can enter a string, merge field, or flow resource.</p>	<code>{!ContractId}</code>

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

Parameter	Description	Example
Offset Number	Optional. The number of days or hours to offset Base Date/Time Field. Required if you set a value for Offset Unit. The value must be a manually entered integer. You can't use a merge field or flow resource for this value. To set the alarm to occur before Base Date/Time Field, use a negative number. To set the alarm to occur after Base Date/Time Field, use a positive number.	-3
Offset Unit	Optional. The unit to offset Base Date/Time Field. Required if you set a value for Offset Number. Manually enter <i>Days</i> or <i>Hours</i> . You can't use a merge field or flow resource for this value.	<i>Days</i>

For examples of flows that wait for relative time alarms, see [Sample Flow That Waits for Only the First Event](#) or [Sample Flow That Waits for Many Events](#).

Event Outputs

Reference information from the event in your flow by assigning its outputs to flow variables.

Parameter	Description	Example
Base Time	The actual time at which the event occurred and the flow interview resumed.	11/26/2014 10:12 AM
Event Delivery Status	The status of the event when the flow interview resumed. After an event occurs, Salesforce delivers the event to the flow that's waiting for it, so that the flow knows to resume. Valid values are: <ul style="list-style-type: none"> Delivered: The event was successfully delivered. Invalid: An error occurred during delivery, but the flow successfully resumed. 	Delivered

[Flow Event Types](#)

Flow Types

A flow or flow version’s type determines which elements and resources are supported, as well as the ways that the flow can be distributed.

Standard Flow Types

The following flow types are supported in the Cloud Flow Designer.

Type	Description
Flow	<p>Requires user interaction, because it has one or more screens, steps, choices, or dynamic choices.</p> <p>This flow type doesn’t support wait elements.</p> <p>A flow can be implemented with a custom button, custom link, direct URL, Visualforce page, or Salesforce1 action.</p>
Autolaunched Flow	<p>Doesn’t require user interaction.</p> <p>This flow type doesn’t support screens, steps, choices, or dynamic choices.</p> <p>An autolaunched flow can be implemented any way that a flow can, as well as with a process action, workflow action (pilot), or Apex code.</p>
User Provisioning Flow	<p>Provisions users for third-party services. A user provisioning flow can only be implemented by associating it with a connected app when running the User Provisioning Wizard. Provisions users for third-party services. For example, use this flow type to customize the user provisioning configuration for a connected app to link Salesforce users with their Google Apps accounts.</p>

EDITIONS

Other Flow Types

Not all flow types are supported in the Cloud Flow Designer. Some flow types are used in other parts of Salesforce. You can’t create or edit these flows in the Cloud Flow Designer, so you don’t see them in the list of flows. However, the Paused and Waiting Interviews list on the flow management page can display interviews with one of these types.

For example, when you run a process (from the Process Builder), a flow interview is created. You can monitor that interview in the Paused and Waiting Interviews list by looking for the type “Workflow”.

Type	Description
Workflow	A running instance of a process created in the Process Builder.

SEE ALSO:

- [Flow Properties](#)
- [Flow and Flow Version Fields](#)
- [User Provisioning for Connected Apps](#)

Flow Properties

A flow’s properties consist of its name, description, interview label, and type. These properties drive the field values that appear on a flow or flow version’s detail page. The properties of a flow and its flow versions are separate.

 **Tip:** The properties for a given flow’s versions automatically match the active version’s properties by default. In other words, if you have three versions and you activate version 2, Salesforce updates the properties for versions 1 and 3 to match version 2. However, if you edit the properties for an inactive version, that version’s properties are no longer automatically updated to match the active version.

From the Cloud Flow Designer, click  to update the properties for a flow or a flow version.

Property	Description
Name	The name for the flow or flow version. The name appears in the flow management page and flow detail page. It also appears in the run time user interface. You can edit the name for inactive flows and flow versions.
Unique Name	The unique name for the flow. The unique name is used to refer to this flow from other parts of Salesforce, such as in a URL or Visualforce page. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. The unique name appears on the flow detail page. You can’t edit the unique name after the flow has been saved.
Description	The description for the flow or flow version. The description appears in the flow management page and flow detail page. You can edit the description for inactive flows and flow versions.
Type	The type for the flow or flow version. The type appears in the flow management page and flow detail page. It determines which elements and resources are supported in the flow or flow version, as well as the ways that the flow can be implemented. For details, see Flow Types on page 4286.

EDITIONS

Property	Description
	If the type is Login Flow, you can't update the type after the flow has been saved.
Interview Label	<p>The label for the flow's interviews. An <i>interview</i> is a running instance of a flow. This label appears in:</p> <ul style="list-style-type: none"> • The Paused and Waiting Interviews list on the flow management page • The Paused Interviews component on the Home tab • The Paused Interviews item in Salesforce1 <p>You can edit the interview label for inactive flows and flow versions. By default, the interview label contains the flow name and the <code>{!\$Flow.CurrentDateTime}</code> system variable.</p> <p>Use a text template to reference multiple resources in the label. For example, Flow Name - <code>{!Account.Name} - {!\$Flow.CurrentDateTime}</code>.</p>

SEE ALSO:

[Save a Flow](#)[Flow and Flow Version Fields](#)

Sample Flows

Sample Flow That Populates a Collection Variable

Populate a collection variable by populating an sObject collection variable. Then individually assign the sObject collection variable's values to the collection variable.

Scenario

In this scenario, you're designing a flow to send an email to every employee who lives in San Francisco.

The Send Email element allows you to easily send emails from a flow. However, the Recipients parameter only accepts text variables and text collection variables. Since multiple users live in San Francisco, use a collection variable (rather than entering the email address for each individual user).

You can't use a Fast Lookup or Record Lookup to populate collection variables. First populate a User-based sObject collection variable with field values, including `Email`, from the employees who live in San Francisco. Then add those emails to the collection variable.

Once the collection variable is populated, you simply use the collection variable as the value for the Send Email element's `Email Addresses (collection)` parameter.

Example: This flow already contains these resources.

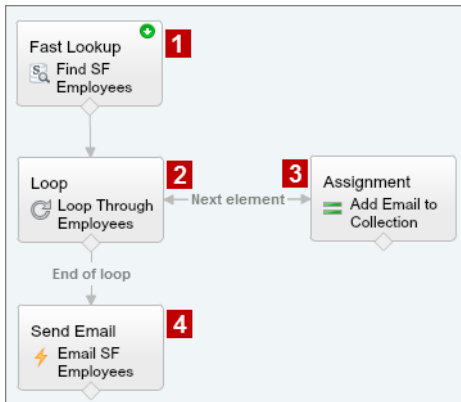

- A User-based sObject collection variable called `employeesInSF`
- A User-based sObject variable called `loopVariable`
- A Text-based collection variable called `emails_employeesInSF`

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

The example flow:

1. Finds all user records whose `City` is "San Francisco" and populates `employeesInSF` with those records' `Email`. Because `employeesInSF` is an `sObject` collection variable, use a Fast Lookup element to populate the variable.
2. Loops through the `sObject` collection variable so that it can look at each individual user record. The loop copies the values of each item in `employeesInSF` to `loopVariable`.
3. For each iteration, assigns the user's `Email` to a collection variable that has a Data Type of Text.
4. When the loop ends, the flow sends an email to the users whose emails are now stored in `emails_employeesInSF`.

Sample Flows That Wait for Events

Configure a flow to wait for events in one of three ways.

IN THIS SECTION:

[Sample Flow That Waits for Many Events](#)

This flow waits for many events to occur, rather than just the first event. The base times for these events are field values, so this example uses relative time alarms.

[Sample Flow That Waits for Only the First Event](#)

This flow waits for the first of multiple events to occur before proceeding. The base times for these events are field values, so this example uses relative time alarms.

[Sample Flow That Waits for a Single Event](#)

This flow waits for a single event. The base time for the event in this example, which is an absolute alarm, is the `{!$Flow.CurrentDateTime}` system variable.

SEE ALSO:

- [Flow Wait Element](#)

Sample Flow That Waits for Many Events

This flow waits for many events to occur, rather than just the first event. The base times for these events are field values, so this example uses relative time alarms.

You're designing a flow that reminds contract owners to follow up with their customers before the contract ends. Rather than sending just one reminder, however, the flow sends them regularly. This example shows how to use one Wait element to send a reminder two weeks before and then again one week before the contract ends. You could easily extend this flow to send reminders at more intervals, such as three days and one day before the contract ends.

Example

This flow already contains these populated variables.

- `{!contract}` is an sObject variable that contains the contract's `Id` and `OwnerId`
- `{!oneWeekVisited}` is a Boolean variable whose default value is `{!$GlobalConstant.False}`
- `{!twoWeeksVisited}` is a Boolean variable whose default value is `{!$GlobalConstant.False}`

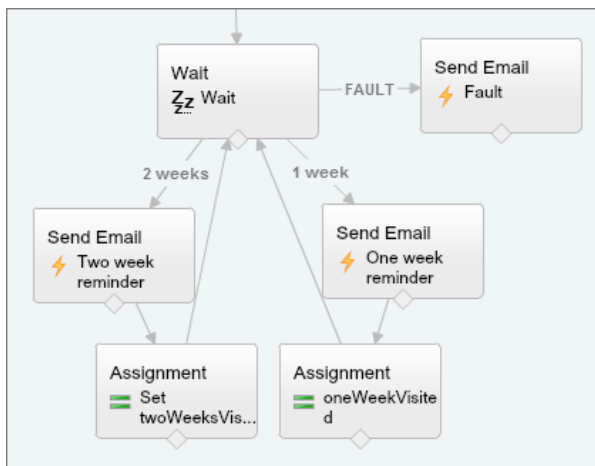

Before the flow executes the Wait element, it looks up and stores the contract's `Id` and `OwnerId`.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Because the flow sends the reminder emails both two weeks and a week before the contract's end date, the Wait element defines two relative alarm events.

Tip: Every alarm event consists of a base time and an offset. With relative time alarms, the flow needs three pieces of information to determine the base time: the object, the date/time field, and the specific record. The offset for relative time alarms works the same as it does for absolute time alarms. The flow needs to know the unit (either `Days` or `Hours`) and the number of those units. To wait for a number of days or hours before the base time, set `Offset Number` to a negative integer.

For both of these events, the offset is declared in `Days`, because weeks isn't an acceptable offset unit.

The base time for the first event ("2 Weeks") is the value of `Contract.EndDate` **(1)** on the record whose ID is stored in `{!contract.Id}` **(2)**. The offset is `-14 days` **(3)** to represent two weeks.

Record ID	{!contract.Id}	2
Base Date/Time Field	EndDate	1
Object Type	Contract	
Offset Number	-14	3
Offset Unit	Days	

You want to use the same Wait element for every reminder, so after a flow interview sends one email reminder, it returns to the Wait element. But first, to ensure that the interview doesn't send the same email again and again, use *waiting conditions*. When an interview executes a Wait element, it first checks the waiting conditions for each event to determine whether to wait for those events. If an event has waiting conditions set and those conditions aren't met, the interview doesn't wait for that event.

For the first event, the interview checks whether the Boolean variable `{!twoWeeksVisited}` is set to false. The variable's default value is set to `{!$GlobalConstant.False}`, so the flow waits for the event until the variable's value is changed.

Waiting Conditions

Wait for this event only if additional conditions are met
 If these conditions aren't met when the interview hits this Wait element, the interview doesn't wait for this event. Instead, it waits for the other defined events. If the conditions aren't met for all of the defined events, the interview takes the Wait element's default path.

Resource	Operator	Value
{!twoWeeksVisited}	equals	{!\$GlobalConstant.False}

Indicate what the flow does when the "2 Weeks" event occurs by connecting the Wait element to other elements. Then, before you return the flow path to the Wait element, change the value of `{!twoWeeksVisited}` to `{!$GlobalConstant.True}`. You can do so with an Assignment element. If the value for `{!twoWeeksVisited}` isn't false when the Wait element is executed, the flow doesn't wait for the "2 Weeks" event to occur. Essentially, the interview checks whether the first event has occurred yet, since the variable is changed to true only in that event's path. If that event has occurred (and the variable isn't set to false), the interview knows not to wait for that event.

The second event ("1 Week") has the same base time as the first event (4); the offset is -7 days (5) to represent a week.

Record ID	{!contract.Id}	4
Base Date/Time Field	EndDate	
Object Type	Contract	
Offset Number	-7	5
Offset Unit	Days	

For the second event, the flow checks whether the Boolean variable `{!oneWeekVisited}` is set to false. If it isn't, the flow doesn't wait for this event.

Waiting Conditions

Wait for this event only if additional conditions are met
 If these conditions aren't met when the interview hits this Wait element, the interview doesn't wait for this event. Instead, it waits for the other defined events. If the conditions aren't met for all of the defined events, the interview takes the Wait element's default path.

Resource	Operator	Value
{!oneWeekVisited}	equals	{!\$GlobalConstant.False}

Like with the first event, use an Assignment element to change the value of `{!oneWeekVisited}` to `{!$GlobalConstant.True}` before the flow path returns to the Wait element. As long as `{!oneWeekVisited}` isn't false, the flow doesn't wait for the "1 Weeks" event to occur.

Tip: When a flow executes a Wait element and all the events have waiting conditions that aren't met, the flow executes the *default event path*. Because this flow is finished after it sends the final reminder, don't connect the default path to another element.

Just in case something goes wrong, set a fault path. In this example, the fault path sends an email that contains the fault message to the user who created the flow.

Sample Flow That Waits for Only the First Event

This flow waits for the first of multiple events to occur before proceeding. The base times for these events are field values, so this example uses relative time alarms.

You're designing a flow that reminds account owners to follow up with their customers a week before either the account renews or the contract ends. The flow sends a reminder email for whichever date occurs first.

Example

This flow already contains these populated variables.

- `{!accountId}` contains the ID for the account
- `{!contractId}` contains the ID for the contract
- `{!accountOwner}` contains the ID for the account's owner
- `{!ownerEmail}` contains the account owner's email address

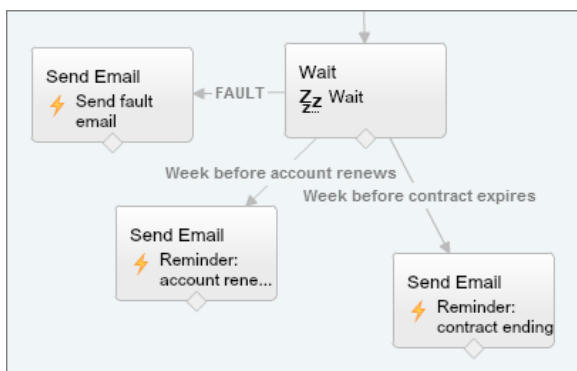

Before the flow executes the Wait element, it looks up and stores the contract's ID, its parent account's ID and OwnerId, and the account owner's Email.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance

- Developer

The Wait element defines two relative alarm events.

Tip: Every alarm event consists of a base time and an offset. With relative time alarms, the flow needs three pieces of information to determine the base time: the object, the date/time field, and the specific record. The offset for relative time alarms works the same as it does for absolute time alarms. The flow needs to know the unit (either *Days* or *Hours*) and the number of those units. For both of these events, the base time is offset by -7 days, because weeks isn't an acceptable offset unit.

The base time for the first event ("Week before account renews") is the value of `Account.Renewal_Date__c` (1) on the record whose ID is stored in `{!accountId}` (2). The offset is -7 days (3).

Record ID	<input type="text" value="{!accountId}"/>	2
Base Date/Time Field	<input type="text" value="Renewal_Date__c"/>	1
Object Type	<input type="text" value="Account"/>	
Offset Number	<input type="text" value="-7"/>	3
Offset Unit	<input type="text" value="Days"/>	

The base time for the second event ("Week before contract expires") is the value of `Contract.EndDate` (4) on the record whose ID is stored in `{!contractId}` (5). The offset is -7 days (6).

Record ID	<input type="text" value="{!contractId}"/>	5
Base Date/Time Field	<input type="text" value="EndDate"/>	4
Object Type	<input type="text" value="Contract"/>	
Offset Number	<input type="text" value="-7"/>	6
Offset Unit	<input type="text" value="Days"/>	

You only want to send one follow-up reminder and the flow always waits for both events, so neither of these events need waiting conditions. However, just in case something goes wrong, set a fault path. In this example, the fault path sends an email that contains the fault message to the user who created the flow.

- [What Are Waiting Conditions?](#)

Sample Flow That Waits for a Single Event

This flow waits for a single event. The base time for the event in this example, which is an absolute alarm, is the `{!$Flow.CurrentDateTime}` system variable.

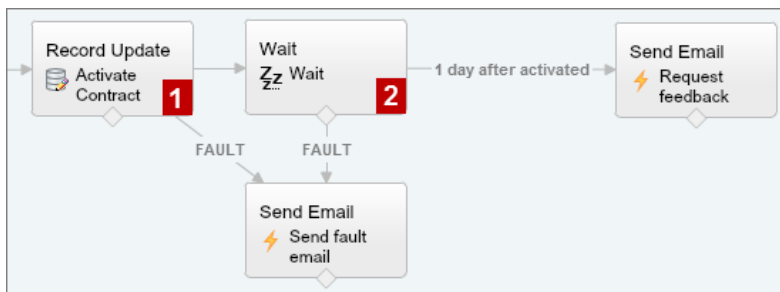

You're designing a flow that requests feedback from customers after a contract is activated, but you want to delay the email by a day.

Example

This flow already contains the following populated variables.

- `{!customerEmail}` contains the email address for the customer
- `{!creatorEmail}` contains the email address for the flow's creator

The flow activates a contract **(1)** and then waits **(2)**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Within the Wait element, a single event is defined (1 day after activated). The flow sends the feedback request one day after the contract is activated, so use an absolute time alarm. The base time is the `{!$Flow.CurrentDateTime}` system variable **(3)**, and the offset is one day **(4)**.

Because there's only one event and you only want the feedback request to be sent once, don't set any waiting conditions for this event. However, just in case something goes wrong, don't forget to set a fault path. In this example, the fault path sends an email that contains the fault message to the user who created the flow.

SEE ALSO:

[Flow Wait Element](#)

[Absolute Time Alarms](#)

Sample Flow That Loops Through a Collection

Transfer ownership of accounts from one user to another by using sObject variable collections and loops. The flow already has the required user IDs.

First, create an Account-based sObject collection variable called `collAcctJSmith` and populate it with all account records that John Smith owns.

Then create a loop that iterates through the collection. For each item in the collection, the loop does the following:

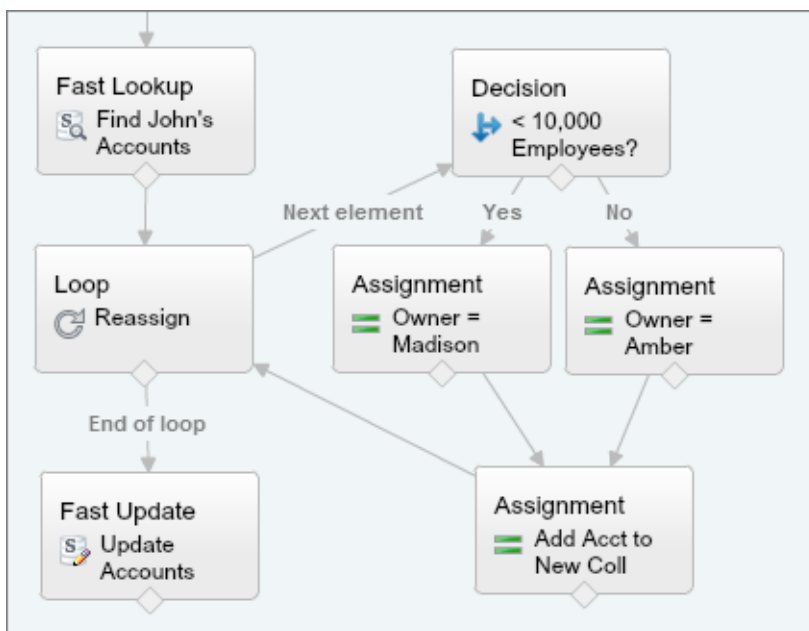

1. Assigns the collection item to the loop variable.
2. Evaluates whether the account has more than 10,000 employees.
3. If the account has more than 10,000 employees, assigns Madison's user ID to the `OwnerId` field in the loop variable.
4. If the account doesn't have more than 10,000 employees, assigns Amber's user ID to the `OwnerId` field in the loop variable.
5. Adds the loop variable's values as a new item in a second collection called `collReassignedAccts`.

Finally, create a Fast Update element to update the accounts in `collReassignedAccts` with the new `OwnerId` after the loop finishes iterating through the collection.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

- Available in:
- Enterprise
 - Performance
 - Unlimited
 - Developer

This section of the flow uses a single query to look up the list of accounts and a single DML statement to update those accounts. If you created a similar flow by using Record Update elements, you would use:

- One Record Update element to find all accounts that John owns and have more than 10,000 employees (1 query). Then update those records' `ownerId` to Madison's Id (1 DML statement).
- One Record Update element to find all accounts that John owns and don't have more than 10,000 employees (1 query). Then update those records' `ownerId` to Amber's Id (1 DML statement).

Manage Your Flows

Use the flow detail page to do anything with your flow outside of designing it—such as activating a flow, testing it, or viewing its properties.

To visit a flow's detail page, from Setup, enter `Flows` in the `Quick Find` box, select **Flows**, and then click a flow name.

IN THIS SECTION:

[Flow and Flow Version Fields](#)

View information about a flow and its versions on the flow detail page, like its name and URL.

[Open and Modify a Flow](#)

To modify a flow, open it in the Cloud Flow Designer.

[Test a Flow](#)

Test your flows before you activate them to make sure they're working as expected.

[Activate or Deactivate a Flow Version](#)

You can have several different versions of a single flow in Salesforce, but only one version of each flow can be active at a time. To activate or deactivate a version of a flow, go to that flow's detail page in Setup.

[Delete a Paused or Waiting Flow Interview](#)

If you no longer need to wait for a long-running flow interview to finish or for a user to resume a paused interview, delete the interview. For example, when you're updating or deleting the associated flow version.

[Delete a Flow Version](#)

To delete an active flow version, first deactivate it. If a flow has any paused or waiting interviews, it can't be deleted until those interviews are finished or deleted. Flows that have never been activated can be deleted immediately.

[Let Users Pause Flows](#)

Enable your users to pause a flow interview that they can't finish yet by customizing your organization's workflow and approval settings. A *flow interview* is a running instance of a flow. For example, a customer service representative can pause a flow interview when the customer doesn't have all the necessary information.

Flow and Flow Version Fields

View information about a flow and its versions on the flow detail page, like its name and URL.

Property	Description
Active Version	Identifies which version is active.
Description	The description for the flow or flow version
Flow Name	The name for the flow. It appears in the run time user interface.
Name	The name for the flow version. It becomes the <code>Flow Name</code> when this version is active.
Namespace Prefix	The flow's namespace prefix, if it was installed from a managed package. The Cloud Flow Designer can't open flows that are installed from managed packages.
Type	Determines which elements and resources are supported in the flow or flow version, as well as the ways that the flow can be distributed. For details, see Flow Types on page 4286.
Status	Identifies whether the flow version is active or not.
Unique Name	Lets you refer to the flow from other parts of Salesforce, such as in Visualforce page.
URL	The relative URL that you can use to run the flow, such as from a custom button or Web tab.
Version	The number of the flow version.

[Flow Properties](#)

Open and Modify a Flow

To modify a flow, open it in the Cloud Flow Designer.

You can't save changes to an active flow version. You can, however, open an active version of a flow, modify it, and then save as a new version or a new flow.

1. From Setup, enter *Flows* in the *Quick Find* box, then select **Flows**.
2. Click the name of the flow.
3. Open the flow.
 - To open a specific version, click the **Open** link next to that version number.
 - To open the active version of the flow, click the **Open** button. If there isn't an active version, the latest version opens.

[Activate or Deactivate a Flow Version](#)

Test a Flow

Test your flows before you activate them to make sure they're working as expected.

 **Warning:** Be careful when testing flows that contain delete elements. Even if the flow is inactive, it triggers the delete operation.

We recommend that you test all possible paths through the flow, so that you can find and fix any errors before activating the flow. For example, incomplete data in the flow can cause a data element (create, update, lookup, or delete) to fail at run time. Add a fault connector to a path that corrects the data and allows the flow to successfully finish.

1. From Setup, enter *Flows* in the *Quick Find* box, then select **Flows**.
2. Click the name of the flow you want to run.
3. Run the flow.
 - To run a specific version, click the **Run** link for that version.
 - To run the active version of the flow, click the **Run** button. If there isn't an active version, the latest version runs.
 - To run a flow version from the Cloud Flow Designer, open that version and then click **Run** from the button bar.

 **Tip:** If you recently modified the flow that you're testing, save it. Only the most recently saved changes are included when you run a flow.

USER PERMISSIONS

To run an active or inactive flow from the flow detail page:

To run a flow from within the Cloud Flow Designer:

- "Manage Force.com Flow"

Once you're confident that your flow is working as expected, activate the version that you tested and then distribute the flow.

SEE ALSO:

- [Activate or Deactivate a Flow Version](#)
- [Customize What Happens When a Flow Fails](#)
- [Considerations for Running Flows](#)
- [Manage Your Flows](#)

Activate or Deactivate a Flow Version

You can have several different versions of a single flow in Salesforce, but only one version of each flow can be active at a time. To activate or deactivate a version of a flow, go to that flow's detail page in Setup.

When you activate a new version of a flow, the previously activated version (if one exists) is automatically deactivated. Any running flow interview continues to run using the version with which it was initiated.

1. From Setup, enter *Flows* in the *Quick Find* box, then select **Flows**.
2. Click the name of the flow.
3. Click **Activate** or **Deactivate** next to the relevant version of the flow.

USER PERMISSIONS

To activate or deactivate a flow:

- "Manage Force.com Flow"

Delete a Paused or Waiting Flow Interview

If you no longer need to wait for a long-running flow interview to finish or for a user to resume a paused interview, delete the interview. For example, when you're updating or deleting the associated flow version.

1. From Setup, enter *Flows* in the **Quick Find** box, then select **Flows**.
If there are waiting interviews for any of your flows, the Paused and Waiting Interviews related list appears underneath the list of flows.
2. For each interview that you want to delete, click **Del**.

Delete a Flow Version

To delete an active flow version, first deactivate it. If a flow has any paused or waiting interviews, it can't be deleted until those interviews are finished or deleted. Flows that have never been activated can be deleted immediately.

1. From Setup, enter *Flows* in the **Quick Find** box, then select **Flows**.
2. Click the name of the flow.
3. To delete the flow completely, including all versions, click the **Delete** button.
4. To delete an individual version, click the **Del** link for that version.

USER PERMISSIONS

To delete a flow:

- "Manage Force.com Flow"

Let Users Pause Flows

Enable your users to pause a flow interview that they can't finish yet by customizing your organization's workflow and approval settings. A *flow interview* is a running instance of a flow. For example, a customer service representative can pause a flow interview when the customer doesn't have all the necessary information.

1. From Setup, enter *Process Automation Settings* in the **Quick Find** box, then select **Process Automation Settings**.
2. Select **Let Users Pause Flows**.
3. Click **Save**.

Screens don't automatically display the Pause button once **Let Users Pause Flows** is enabled. If you want your users to be able to pause at a given screen, select "Show Pause button" when you configure that screen.

SEE ALSO:

[Flow Screen Element: General Info](#)

Distribute Your Flow

Once you've created and activated a flow version, distribute it to users so that they can run it. The right distribution method depends on the users that you want to distribute the flow to: internal users, external users, systems, or other organizations.

Here are the ways that you can distribute your flows, based on the type of user that you're distributing to.

Internal users

- Distribute a flow URL directly or through a custom button, link, or Web tab.
- Embed the flow in a Visualforce page and incorporate that page into Salesforce with a custom button, link, or Visualforce tab.

External users

Embed the flow in a Visualforce page, and incorporate that page into a Force.com site, Customer Portal, or Partner Portal.

Systems

Start a flow automatically by:

- Using the Apex `start()` method.
- Using the Invocable Action resource in the Force.com REST API.
- Adding a flow trigger workflow action to a workflow rule—Pilot.
- Adding a flow action to a process in the Process Builder.

Other organizations

Deploy a flow with change sets or a package.

For details about distributing flows with each of these methods, see “Distribute Your Flow” in the [Visual Workflow Guide](#).

SEE ALSO:

- [Set Flow Variables with the Flow URL](#)
- [Add a Flow to a Visualforce Page](#)
- [Managing Force.com Site Visualforce Pages](#)
- [Create Web Tabs](#)

Set Flow Variables with the Flow URL

When you distribute a flow using a URL, you can set variables within that flow using parameters in the URL.

You can't set the values for sObject variables or sObject collection variables using URL parameters. The variable that you want to set must have its `Input/Output Type` set to allow input access.

1. From Setup, enter `Flows` in the `Quick Find` box, then select **Flows**.
2. Click the name of the flow.
3. Copy the URL for the flow.
4. At the beginning of the flow URL, prepend `http://instance.salesforce.com`, where `instance` is your organization's instance.
For example:

```
http://na1.salesforce.com/flow/MyFlow
```

5. At the end of the flow URL, append `?name=value`, where `name` is the unique name of the variable or collection variable in the flow that you want to set and `value` is the value you want to set it to. If you want to set multiple variable values, append `?name1=value1&name2=value2` to the end of the flow URL. If you want to set the values for multiple items in the same collection variable, append `?name=value1&name=value2`.
For example:

```
http://na1.salesforce.com/flow/MyFlow?varNumber=100&varString=Hello
```

Here are the valid values for each flow variable and collection variable based on its data type.

Variable Type	Acceptable Values
Date	Merge field of type Date or YYYY-MM-DD
DateTime	Merge field of type Date/Time or YYYY-MM-DDThh:mm:ssZ

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To view a flow's detail page:

- “View Setup and Configuration”

To create and edit custom buttons, links, and Web tabs:

- “Customize Application”

Variable Type	Acceptable Values
Text	Merge field of any type or a string
Number	Merge field of type Number or a numeric value
Currency	Merge field of type Number or a numeric value
Boolean	<ul style="list-style-type: none"> Merge field of type Checkbox True values: <code>true</code> or <code>1</code> False values: <code>false</code> or <code>0</code>

 **Note:** When you distribute a flow, don't pass a currency field value from a Salesforce record into a flow Currency variable with a URL parameter. When a currency field is referenced through a merge field (such as `{!Account.AnnualRevenue}`), the value includes the unit of currency's symbol (for example, \$). Flow variables of type Currency can accept only numeric values, so the flow fails at run time. Instead, pass the record's ID to a flow Text variable with a URL parameter. Then in the flow, use the ID to look up that record's value for the currency field.

 **Example:** The following example is a flow URL that is used in a custom button on a case page layout. When a user clicks that button, the flow launches with the `varID` variable (of type Text) set to the case record's `CaseNumber` field value.

```
http://na1.salesforce.com/flow/Case_Management?varID={!Case.CaseNumber}
```

The following example sets the `varUserFirst` and `varUserLast` variables (both of type Text) to the running user's `FirstName` and `LastName` field values.

```
http://na1.salesforce.com/flow/User_Info?varUserFirst={!$User.FirstName}&varUserLast={!$User.LastName}
```

The following example is a flow URL that is used in a custom button on a contact page layout. When a user clicks that button, the flow launches and adds text values from the contact as items in the `{!collNames}` text collection variable.

```
http://na1.salesforce.com/flow/Contact_Info?collNames={!Contact.FirstName}&collNames={!Contact.LastName}
```

SEE ALSO:

[Set Flow Finish Behavior with a Flow URL](#)

[Distribute Your Flow](#)

[Troubleshoot Flow URLs](#)

Set Flow Finish Behavior with a Flow URL

By default, when a flow interview that uses screens finishes, a new interview for that flow begins and the user is redirected to the first screen. If you want users to be redirected to another page within Salesforce when they click **Finish**, use the `retURL` parameter in the flow URL.

Format

To redirect users to a specific page in Salesforce after they click **Finish**:

```
http://instance.salesforce.com/flow/flowName?retURL=page_name
```

where *page_name* is the part of the URL that comes after `http://instance.salesforce.com/`.

Limitations

- You can't redirect flow users to a URL that's external to your Salesforce organization.
- You can't use a flow variable as the value for the `retURL` parameter. If you want to use a flow variable to redirect a user, such as to a specific record, distribute the flow by using Visualforce.
- `retURL` can cause nested top and side navigation bars to render on the destination page.

Examples

The following flow URL redirects the user to the home tab for cases (`http://na1.salesforce.com/500/o`).

```
http://na1.salesforce.com/flow/Case_Management?retURL=500/o
```

The following flow URL sets the `varUserFirst` and `varUserLast` variables (both of type Text) to the running user's `FirstName` and `LastName` field values. When the flow interview finishes, the user is redirected to

```
http://na1.salesforce.com/home/home.jsp.
```

```
http://na1.salesforce.com/flow/User_Info?varUserFirst={!$User.FirstName}  
&varUserLast={!$User.LastName}&retURL=home/home.jsp
```

- Unlimited
- Developer

IN THIS SECTION:

[Considerations for Deploying Flows with Change Sets](#)

Before you use change sets to deploy a flow, understand the limits and unexpected behaviors that are related to component dependencies, deployment, and flow triggers.

[Considerations for Deploying Flows with Packages](#)

Flows can be included in both managed and unmanaged packages. Before you deploy one, understand the limitations and behaviors of packages that contain flows.

SEE ALSO:

[Considerations for Installed Flows](#)[Limits and Considerations for Visual Workflow](#)[Distribute Your Flow](#)

Considerations for Deploying Flows with Change Sets

Before you use change sets to deploy a flow, understand the limits and unexpected behaviors that are related to component dependencies, deployment, and flow triggers.

Component Dependencies

- If you plan to deploy a flow with change sets, consider limitations in migration support. Make sure your flows reference only fields and components that are available in change sets.
- When you view the dependent components for the change set, the Component Dependencies page lists the dependencies for *all* versions of the flow. Add all interdependent components for the relevant flow version to the outbound change set.
- If a component is referenced by the following flow elements, the Component Dependencies page doesn't display that component. To deploy the flow successfully, manually add those referenced components to the change set.
 - Apex
 - Email Alerts
 - Post to Chatter
 - Quick Actions
 - Send Email
 - Submit for Approval

For example, if you use an email alert, manually add the email template that is used by that email alert.

Deployment

- You can include only one version of a flow in a change set.
- An active flow in a change set is deployed to its destination as inactive. Activate the flow manually after deployment.
- If the flow has no active version when you upload the outbound change set, the latest inactive version is used.
- Deploying or redeploying a flow with change sets creates a version of the flow in the destination organization.

Flow Triggers

Flow triggers aren't available in change sets.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren't available for new organizations.

SEE ALSO:

[Change Sets Overview](#)

Considerations for Deploying Flows with Packages

Flows can be included in both managed and unmanaged packages. Before you deploy one, understand the limitations and behaviors of packages that contain flows.

Component Dependencies

- If you plan to deploy a flow with packages, consider limitations in migration support. Make sure your flows reference only packageable components and fields.
- Referential integrity works the same for flows as it does for other packaged elements.
- If any of the following elements are used in a flow, packageable components that they reference aren't included in the package automatically. To deploy the package successfully, manually add those referenced components to the package.
 - Apex
 - Email Alerts
 - Post to Chatter
 - Quick Actions
 - Send Email
 - Submit for Approval

For example, if you use an email alert, manually add the email template that is used by that email alert.

Flow Status

You can package only active flows. The active version of the flow is determined when you upload a package version. If none of the flow's versions are active, the upload fails.

Updating Packages

- To update a managed package with a different flow version, activate that version and upload the package again. You don't need to add the newly activated version to the package. However, if you activate a flow version by mistake and upload the package, you'll distribute that flow version to everyone. Be sure to verify which version you really want to upload.
- You can't include flows in package patches.

Other Limitations

- If you register your namespace after you referenced a flow in a Visualforce page or Apex code, don't forget to add the namespace to the flow name. Otherwise, the package will fail to install.
- If someone installs a flow from a managed package, error emails for that flow's interviews don't include any details about the individual flow elements. The email is sent to the user who installed the flow.
- Flow triggers aren't packageable.

The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren't available for new organizations.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

- In a development organization, you can't delete a flow or flow version after you upload it to a released or beta managed package.

- Unlimited
- Developer

Emails About Flow Errors

Every time a flow interview fails, the admin who created the associated flow gets an email. The email includes the error message from the failure and details about every flow element that the interview executed.

-  **Note:** This release contains a beta version of the flow error email that is production quality but has [known limitations](#). You can provide feedback and suggestions for the flow error email on the [IdeaExchange](#).

If the interview failed at multiple elements, the admin receives multiple emails, and the final email includes an error message for each failure. If a flow uses fault connectors, its interviews can fail at multiple elements.

 **Example:**

```
An error occurred at element Apex_Plug_in_1.
List index out of bounds: 0.
```

```
An error occurred at element Fast_Delete_1.
DELETE --- There is nothing in Salesforce matching your delete
criteria.
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

```
An error occurred at element Email_Alert_1.
Missing required input parameter: SObjectRowId.
```

SEE ALSO:

- [Limitations of Emails About Flow Errors \(Beta\)](#)
- [Customize What Happens When a Flow Fails](#)
- [Why Did My Flow Interview Fail?](#)

Limitations of Emails About Flow Errors (Beta)

The email about errors in flow interviews has some limitations for Screen, Lookup, Create, and Subflow elements—as well as some general limitations.

-  **Note:** This release contains a beta version of the flow error email that is production quality but has known limitations. You can provide feedback and suggestions for the flow error email on the [IdeaExchange](#).

General

- If the user who started the flow doesn't have a first name, `null` replaces the user's first name in the "How the Interview Started" section.
- Variable assignments display in this pattern: `{!variable} (prior value) = field/variable (new value)`. If the variable had no prior value, the parentheses display as empty. For example: `{!varStatus} () = Status (Delivered)`
- If you install a flow from a managed package, error emails for that flow's interviews don't include any details about the individual flow elements. The email is sent to the user who installed the flow.

Screen elements

Password fields display in plain text, just like if you reference a password field in a Display Text field.

Lookup elements

The email displays lookup elements as "query" elements. Record Lookup displays as Record Query, and Fast Lookup displays as Fast Query.

Create elements

- If you don't assign the created record's ID to a specific variable, the email displays the following line in the Result section of Record Create and Fast Create elements.

```
{!null} = null
```

Subflow elements

- The merge field annotation (`{!variable}` as opposed to just `variable`) is missing for variables in a referenced flow. For example, when an interview enters a subflow and gives details about the inputs, the subflow's variable is `subVariable` instead of `{!subVariable}`.
- If the error occurs in a referenced flow, the email gets sent to the author of the master flow, but the subject references the name of the referenced flow.
- If you see multiple "Entered flow *ReferencedFlowName* version *ReferencedFlowVersion*" messages with no "Exited *ReferencedFlowName* version *ReferencedFlowVersion*" messages in between them, the flow user

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

navigated backwards. To prevent this scenario, adjust the navigation options in the first screen of the referenced flow so that the user can't click **Previous**.

SEE ALSO:

[Emails About Flow Errors](#)

[Why Did My Flow Interview Fail?](#)

Add Temporary Elements to a Flow

Add Screen or Send Email elements to the flow so you can check what the resources' values are at any given time. Once you've solved the problem, delete temporary Screen elements.

1. Create a single text template that contains the values of all resources and the fault message.
2. For each fault path, use the text template to configure one of the following elements.
 - A Screen element that uses the text template in a Display Text Field. (Only if the flow's type supports Screen elements.)
 - A Send Email element that uses the text template as the body and your email as the recipient.
 - A Post to Chatter element that uses the text template as the message. Consider creating a Chatter group specifically for flow errors.
3. Test the flow.

Example: Here's a text template for the Calculate Discounts on Opportunities flow in the Cloud Flow Designer Workbook.

```
RESOURCE VALUES for "Calculate Discounts on Opportunities"
opptyID: {!opptyID}
AccountID: {!AccountID}
AccountRevenue: {!AccountRevenue}
Full_Discount outcome: {!Full_Discount}
Partial_Discount outcome: {!Partial_Discount}
Discount: {!Discount}

ERROR
{!$Flow.FaultMessage}
```

After each element in the flow, add a temporary Post to Chatter element. Each Post to Chatter element is configured to use:

- The text template as the post's message
- The "Flow Troubleshooting" Chatter group as the post's target

Configure the Record Lookup and Record Update elements' fault connectors so that they route to the Post to Chatter elements.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

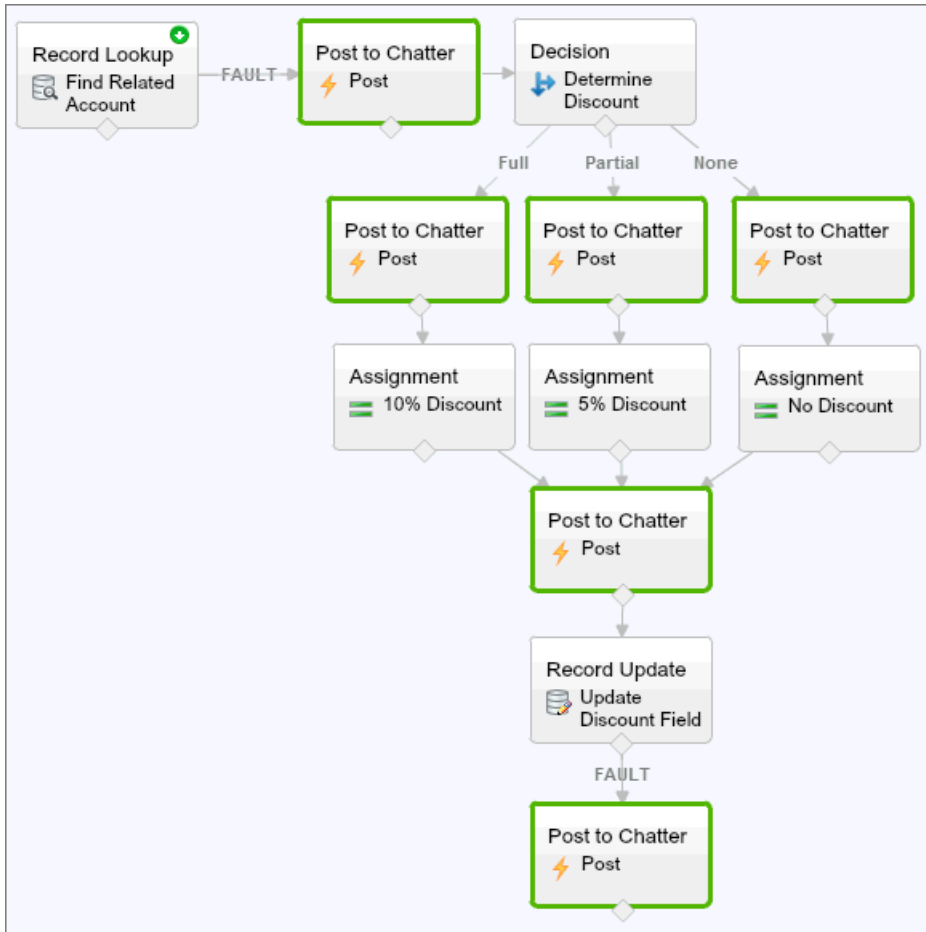

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To open, edit, or create a flow in the Cloud Flow Designer:

- "Manage Force.com Flow"

This way, the flow posts to the Chatter group after the Record Lookup, Decision, Assignment, and Record Update elements are executed. Each post provides insight into the values of each resource throughout the flow. If the flow fails, the error is included in the Chatter posts.

After you identify and fix the problem with the flow, remove the temporary elements.

SEE ALSO:

[Why Did My Flow Interview Fail?](#)

Troubleshoot Flow URLs

If you're distributing a flow and the custom button, custom link, or a direct flow URL isn't working as expected, verify the referenced flow. In addition, verify its variables if you're passing values into a flow from the URL.

To make sure that the URL can find the right flow, verify that:

- The flow that the URL references hasn't been deleted or deactivated.
- The flow name is spelled and capitalized correctly. It must be an exact, case-sensitive match to the flow's `Unique Name`.

If your flow URL references a specific flow version, verify that the version hasn't been deleted or deactivated.

If you're using the URL to pass values into the flow and the URL can't access the variable, the parameter that references the variable is ignored.

To make sure that the URL can find the right flow variable, verify that each variable you're trying to pass values into:

- Is spelled and capitalized correctly. It must be an exact, case-sensitive match to the variable.
- Allows input access. The variable's `Input/Output Type` must be set to "Input Only" or "Input and Output."
- Hasn't been renamed in the flow.
- Hasn't been removed from the flow.
- Isn't an sObject variable or an sObject collection variable.

In addition, make sure the value that you're trying to pass into the variable is compatible with the variable's data type and is correctly formatted.

SEE ALSO:

[Set Flow Finish Behavior with a Flow URL](#)

[Set Flow Variables with the Flow URL](#)

[Why Did My Flow Interview Fail?](#)

Flow Interviews

A *flow interview* is a running instance of a flow. A *flow* is an application built by your administrator that asks you for inputs and does something in Salesforce based on those inputs.

For example, a flow could provide a call script for customer support calls and use the information you provide to create a case. What the flow does with the information you provide is entirely up to your administrator.

When you run a flow interview, whether through a link, button, or tab, you're running a single instance of a flow. If the terminology is confusing, consider the difference between a record and an object. You create an account *record*, which is a single instance of the *Account object* that your administrator customized.

 **Note:** Keep these tips in mind when you run a flow.

- Don't use your browser's Back or Forward buttons to navigate through a flow. Doing so can result in inconsistent data between the flow and Salesforce.
- A single flow can have up to 50 different versions. When you run a flow, you see the active version, but your admin could have a more recent version.

IN THIS SECTION:

[Pause a Flow Interview](#)

If your administrator has configured a given flow to do so, you can pause its interviews. Pausing is useful, for example, when a call with a customer drops or the customer can't find their account number and plans to call you back.

[Resume a Flow Interview](#)

If you paused a flow interview, resume it after you have all the necessary information.

[Delete a Flow Interview](#)

If you paused a flow interview and don't plan to resume it, delete it. By removing unnecessary interviews, you make sure that your pending list includes only interviews that you still plan to act on.

SEE ALSO:

[Visual Workflow](#)

Pause a Flow Interview

If your administrator has configured a given flow to do so, you can pause its interviews. Pausing is useful, for example, when a call with a customer drops or the customer can't find their account number and plans to call you back.

1. In an open flow interview, click **Pause**.
2. Explain why you had to pause the flow.

This step is optional, but it helps differentiate between the different flow interviews that you've paused, especially if you paused multiple interviews of the same flow. This explanation can be up to 255 characters long.

3. Click **OK**.

The flow interview is saved until you resume or delete it later. Any valid values that you entered before you paused are saved with the interview, so you don't have to reenter that information when you resume.

SEE ALSO:

[Flow Interviews](#)

[Resume a Flow Interview](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To pause a flow interview:

- "Run Flows"

OR

Force.com Flow User field enabled on the user detail page

Resume a Flow Interview

If you paused a flow interview, resume it after you have all the necessary information.

 **Note:** If you pause an interview and the associated flow is updated before you resume, the resumed interview doesn't use the updated flow. Instead, it uses the version of the flow that was active when you paused.

1. Go to a place that lists all of your paused flow interviews.

Depending on your administrator's configurations, you can find all the flow interviews that you've paused in one of these places.

- "Paused Flow Interviews" on the Home tab in the full Salesforce site
- "Paused Flow Interviews" in the left navigation in Salesforce1

If you paused a flow interview and can't find the place where you're supposed to resume the interviews from, contact your administrator.

2. Resume the appropriate flow interview.

If you entered values before you paused, all valid values are restored to those fields when you resume. If you don't see something that you entered before you paused, that value was invalid and the flow didn't save it.

If you enter "Acme, Inc." for a field that only accepts numbers and then pause, that field is blank when you resume the flow interview.

 **Warning:** Once you resume a flow interview, that interview is removed from your Paused Flow Interviews list. If you resume an interview and then change your mind, click **Pause**. If you close the interview before pausing, you can't resume the interview later.

SEE ALSO:

Visual Workflow Terminology

The following terminology is used for Visual Workflow in Salesforce:

Cloud Flow Designer

Cloud-based application that lets administrators create a flow for use in Salesforce.

Connector

Connectors determine the available paths that a flow can take at run time.

Element

Each *element* represents an action that the flow can execute. Examples of such actions include reading or writing Salesforce data, displaying information and collecting data from flow users, executing business logic, or manipulating data.

Flow

A *flow* is an application that can execute logic, interact with the Salesforce database, call Apex classes, and collect data from users. You can build flows by using the Cloud Flow Designer.

Flow Interview

A *flow interview* is a running instance of a flow.

Master Flow

A master flow is a flow that contains a subflow element. The term "master" is used to distinguish it from the flow that is referenced and called by the subflow element.

Resource

Each *resource* represents a value that you can reference throughout the flow.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To resume a flow interview:

- "Run Flows"

OR

Force.com Flow User field enabled on the user detail page

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Subflow

A subflow element references another flow, which it calls at run time. The flow that contains the subflow element is referred to as the master flow.

Customizing Workflow and Approval Settings

To use time-based workflow, allow users to respond to approval requests via email, or allow users to pause flow interviews, update your workflow and approval settings.

From the Workflow and Approvals Settings page, you can:

- [Set the Default Workflow User for your organization](#)
- [Enable your users to respond to approval requests via email](#)
- Display the **Pause** button on flow screens

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Approvals are available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Workflow is available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Visual Workflow is available in **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To edit workflow and approval settings:

- "Customize Application"

Creating Websites

Domain Management

Domain Management Overview

The Domain Management page allows you to configure domains and their site associations with a high degree of flexibility.

Sites and domains can have a many-to-many relationship. Each domain can have up to 50 sites, and each site can be associated with up to 100 domains. For example, you might want to set up a single domain to host your Communities, Force.com, and Site.com sites. This simplifies your domain requirements. For Site.com sites, you might want to host them on the same domain as your Force.com sites because you can access Visualforce pages and have easier access to Apex code.

There are also reasons why you would have a site on more than one domain. For example, let's say you have a parent company with two distinct brands. Each brand has its own registered domain, but you want them both to point to the parent website. Because you can have a site exist on more than one domain, you can point both brand domains to a single parent website.

If you plan to host more than one site on a domain, you'll need to set up custom URLs for each site. Custom URLs are the way to uniquely distinguish the sites within that domain. Let's say you have a domain called `www.ourdomain.com` and you want to host two sites called `siteone` and `sitetwo`. You'll need to create custom URLs by associating `ourdomain.com` to each site using a custom path. This will result in two custom URLs: `http://www.ourdomain.com/siteone` and `http://www.ourdomain.com/sitetwo`. When a web user accesses the domain using one of the URLs, the custom path determines which site within the domain they see.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited

USER PERMISSIONS

To manage domains:

- You must have Site.com, Force.com Sites, or Communities enabled

Adding a Domain

You can add domains and attach certificates using the Domain Management page in Setup.

When you add a domain, you also have the option of attaching a certificate and key for connection security. If you're going to use a certificate, make sure you've already added it using Certificate and Key Management before you try to attach it to your domain. Only CA-signed certificates are supported, and they must be 2048 bits in length. To support all domains that are hosted by sites in your organization, use a wildcard or Subject Alternative Name certificate.

Custom domains are supported only in non-sandbox instances. You can configure a custom domain in a sandbox instance and then migrate it to a production instance, but the custom domain is only active in production.

To add domains in your organization:

1. From Setup, enter *Domains* in the **Quick Find** box, then select **Domains**.
2. Click **Add a Domain**.
3. Enter the Domain Name.
4. Add a certificate if you have already set up a CA-signed certificate that supports this domain.
5. Click **Save**. Alternatively, click **Save & New** to add multiple domains.

Before you switch the CNAME of your domain name to point to a new target name, ensure that the new target name exists in the DNS by using `dig` or `nslookup`. When you created your domain names affects the target of your CNAME:

- Domain names that were added before Summer '13, typically need to have their CNAME adjusted to point to the fully qualified domain followed by `.live.siteforce.com` instead of to the organization's `force.com` sub-domain. For example, if your pre-Summer '13 domain is `www.example.com`, then the target of its CNAME will need to be `www.example.com.live.siteforce.com` instead of `example.force.com` before HTTPS will work.
- Domain names that were added in or before Summer '13, don't have the 18-character organization ID in the CNAME target.
- Domain names that were added in or after Summer '13, already point to the proper place for setting up HTTPS in a custom domain.
- Domain names that were added in or after Winter '14, use a CNAME that points to the fully qualified domain followed by your organization's 18-character ID and `.live.siteforce.com`. For example, if your domain name is `www.example.com` and your 18-character organization ID is `00dxx0000001ggxeay`, then the target of its CNAME will need to be `www.example.com.00dxx0000001ggxeay.live.siteforce.com`.

USER PERMISSIONS

To view domains:

- "View Setup and Configuration"

To add domains:

- "Customize Application" or "View Setup and Configuration" plus either a Site.com Publisher license or "Create and Set Up Communities"

To edit or delete domains:

- "Customize Application"

To associate certificates with a domain:

- Contact Salesforce if you aren't using Communities. Organization with Communities can associate certificates with a domain.

Adding a Custom URL

Once you've added domains to the Domain Management page, you can select your domain and site relationships by creating a custom URL. A custom URL consists of the domain and a custom path. The same path name can be used on more than one domain, but it can't be used more than once within the same domain. When adding a custom URL, the / is required and indicates the root. You can add an additional path after the /, but you must at least use the / to indicate the root. For example, if the domain name is `https://oursite.com` and the path is `/products`, the site URL is `https://oursite.com/products`. If you added the custom URL to the root, the URL would be `https://oursite.com`.

If you want to set a preferred custom URL for authenticated pages and emails that links back to the site or community, then select **Site Primary Custom URL**. This is only available on the root path for Force.com and Communities sites and not available at all on Site.com sites. For Chatter Communities, if you don't select a primary URL, then the first `https` custom domain in the site is used for authenticated pages and emails. If there is no custom `https` domain, then your Force.com domain is used.

To add a custom URL:

1. From Setup, enter *Custom URLs* in the **Quick Find** box, then select **Custom URLs**. Alternatively, enter *Domains* in the **Quick Find** box, select **Domains**, and click the domain name.
2. Click **New Custom URL**.
3. Enter a Domain name.
4. Enter a Site name.
5. Enter a unique path.
6. Click **Save**. Alternatively, click **Save & New** to add multiple Custom URLs.

Example: In the Custom URLs table, even though the domain name and path show in separate columns in the table, it is the combination that make up the actual URL.

USER PERMISSIONS

To view domains:

- "View Setup and Configuration"

To add domains:

- "Customize Application" or "View Setup and Configuration" plus either a Site.com Publisher license or "Create and Set Up Communities"

To edit or delete domains:

- "Customize Application"

To associate certificates with a domain:

- Contact Salesforce if you aren't using Communities. Organization with Communities can associate certificates with a domain.

You can use Domain Management in Setup to manage all the certificates, custom URLs, and sites attached to a domain.

You might want to add a new custom URL to an existing domain, rename a domain, or delete a custom URL from a particular domain. The Domain Detail page allows you to manage the domains and URLs from one page. The top section contains information about the domain and certificates. The lower section contains the a Custom URL related list for the domain. Using this page you can:

- Edit the domain name and certificate — click **Edit** in the Domain Detail section.
- Delete the domain — click **Delete** in the Domain Detail section.
- Add new custom URLs — Click **New Custom URL**
- Edit existing custom URLs — Click **Edit** on a custom URL row.
- Delete custom URLs — Click **Del** on a custom URL row.
- View the site if it is published — Click **View** on a custom URL row.
- Jump to a site — Click the site name below the Site Label.
- Jump to an attached certificate — click the certificate name next to Certificate and Key.
- See whether the domain has External HTTPS enabled. Only domains that don't point to the `yourdomain.your18characterOrgId.live.siteforce.com` CNAME target have this option available.

 **Note:** You can't edit a domain name that is used by a community.

To access the Domain Detail page:

1. From Setup, enter *Domains* in the *Quick Find* box, then select **Domains**.
2. From the Domain Name column, click the domain name.

 **Note:** If you have your domain set to use `http`, and you edit the domain to use `https` instead, you must republish your Site.com sites.

Deleting a Domain

You can delete domains from your organization using the Domain Management page.

You can't delete a domain that is attached to a published site. You'll need to unpublish all sites attached to the domain before you can delete it. For Force.com sites, the domain is deleted immediately, and users no longer have access to any site connected to that domain. But with Site.com sites, the domain remains active until you republish the site.

To delete a domain from your organization:

1. From Setup, enter *Domains* in the **Quick Find** box, then select **Domains**.
2. Click **Del** next to the domain name.
3. Click **OK**.

When you delete a domain with an unpublished site attached, it also deletes the custom URL associated with that site.

SEE ALSO:

Enable External HTTPS on a Domain

Enabling External HTTPS on a domain allows Salesforce to use the domain in secure references to the sites that are associated with that domain, such as in URLs that appear within an email message from a Salesforce Community. This feature is useful for sites that require authentication, such as community sites, portal sites, or any type of site where confidentiality, protection from eavesdropping, or protection against spoofing are important.

This option is intended for domains that use a non-Salesforce content delivery network (CDN) or endpoint to serve HTTPS.

You can enable External HTTPS on any domain that doesn't point to the `yourdomain.your18characterOrgId.live.siteforce.com` CNAME target.

When enabled, and when the domain's DNS record is not a CNAME that points to the `live.siteforce.com` subdomain for that domain, Salesforce assumes that the domain supports secure connections.

When disabled or when the domain's DNS record is a CNAME that points to the expected `live.siteforce.com` subdomain for that domain, Salesforce assumes that the domain doesn't support secure connections.

You can't enable External HTTPS when you add a new domain, only when editing an existing one.

To enable External HTTPS on a domain, click **Edit** from the domain list page or from a domain's detail page, and then select `Enable External HTTPS`.

If the domain that you're enabling External HTTPS on comprises only noncommunity Site.com custom URLs, you must manually publish any affected Site.com sites via the Site.com Studio to have this change take effect for those sites. If at least one community site or at least one Force.com site exists on the same domain as a non-Community Site.com site, the publishing of changes to this Enable External HTTPS bit is automatic on that domain.

Community Builder (Site.com) and Force.com Sites Overview

Community Builder (Site.com)

Community Builder is an intuitive, convenient tool for customizing your community. Community Builder lets you create a community based on a preconfigured template, and then apply branding, edit pages, update your template, and publish changes all from one user-friendly interface.

Here's what you can achieve with Community Builder:

- Use one of the self-service templates—Koa, Kokia, or Napili—to easily create a responsive self-service community.
- Use the Aloha template to create a configurable App Launcher.
- Design pixel-perfect, branded pages.
- Create public pages that anyone can access, or add private pages that you can add as a tab within your community.
- Build and iterate quickly using drag-and-drop reusable page elements.
- Use ready-made forms to create web-to-lead forms or gather customer feedback.
- Create data-driven pages, such as product catalogs or other listings, using your organization's data.

- Set a home page and set up multilingual support for your community in Site.com Studio, a Web content management system that provides extra configuration options. Site.com Studio is easily accessible from Community Management.

Force.com Sites

Suitable for developers with experience using Visualforce, Force.com Sites lets you build custom pages and Web applications by inheriting Force.com capabilities including analytics, workflow and approvals, and programmable logic. So if you are looking to create sites programmatically using Apex and APIs, Force.com Sites is the product for you. Here's what you can achieve with Force.com:

- Create public, branded pages that anyone can access.
- Leverage Visualforce to create private pages that you can add as a tab within your community.
- Write your own controllers, or extensions to controllers, using Apex code.
- Create custom login or self-registration pages.
- Build dynamic web applications, such as an event management application.

Features At a Glance

Still unsure which product to choose? Take a look at this table to learn more about each product's features.

Feature	Community Builder	Force.com Sites
Public pages		
Community templates (Koa, Kokua, Napili, Aloha)*		
Authenticated pages*		
Visualforce pages		
Out-of-the-box login, logout, self-registration, and error pages		
Drag-and-drop environment		
Reusable components		
Pixel-perfect designs		
IP restrictions		
Access to data, such as cases, leads, and opportunities		
Ready-made forms		
CMS		
Programmatic page creation (using Apex, APIs, and controllers)		
Web applications		
Analytics, reports, and workflows		
Full Force.com platform capability		

*Available in Community Builder for Communities users only.

Site.com

Site.com Overview

Site.com is a Web content management system (CMS) that makes it easy to build dynamic, data-driven Web pages quickly, edit content in real time, and manage your websites. From the [Site.com tab](#) in the Site.com app, you can launch Site.com Studio, which provides a separate, dedicated environment for creating and editing pixel-perfect, custom websites. Site administrators and designers can create and style Web pages, and add features such as navigation menus, images, and text areas using drag-and-drop page elements, while ensuring the site's pages match the look and feel of the company's brand. And content contributors, such as marketing users, can browse and update website content directly in a simplified Site.com Studio environment. Additionally, websites built with Site.com benefit from running on Salesforce's trusted global infrastructure.

 **Note:** The features available in Site.com Studio vary depending on whether you're a [site administrator, designer, or contributor](#).

The following examples illustrate a few ways to use Site.com:

- Create an event site—Advertise upcoming events, such as grand openings, launches, or sales kick-offs on a public event site.
- Promote new products—Launch new products into the market with a promotional website that helps drive sales.
- Publish a support FAQ—Provide helpful information on a public website where customers can view solutions to their issues.
- Create microsites and landing pages—Create temporary landing pages or targeted microsites for marketing campaigns.
- Create a recruiting website—Post job openings to a public site and allow visitors to submit applications and resumes.
- Publish a catalog of products—List all of your company's products on a public website, with model numbers and current prices pulled dynamically from your organization.
- Post company press releases—Publish your company's press releases and sort by publication date.

System Requirements

To use Site.com Studio, we recommend:

- Mozilla[®] Firefox[®] or Google[®] Chrome for best performance. Windows[®] Internet Explorer[®] versions 6.0 and 7.0 are not supported.
- Disabling the Firebug extension for Firefox, if installed, as it can impact performance.
- A minimum browser resolution of 1024x768.

Setting Up Site.com Users

About Site.com Feature Licenses

To access Site.com, each user in your organization must have a Site.com feature license.

- The Site.com Publisher feature license allows the user to access Site.com Studio to create and style websites, control the layout and functionality of pages and page elements, and add and edit content.
- The Site.com Contributor feature license allows the user to access Site.com Studio to edit site content only.

Consider what your users need to do in a site and purchase feature licenses accordingly. See the [Site.com feature table](#) for a complete list of the capabilities that come with each feature license. After you purchase feature licenses, you can [set up Site.com users](#).

You can view the number of assigned feature licenses on your organization's profile.

 **Note:** Organizations using Performance, Unlimited, or Enterprise Editions must purchase Site.com Publisher and Site.com Contributor feature licenses separately. Additionally, a Site.com Published Site license is required for each site that's published to the Internet. For information on purchasing Site.com licenses, contact Salesforce.

Developer Edition organizations contain two Site.com Publisher feature licenses and one Site.com Contributor feature license. Developer Edition organizations can't publish sites.

Communities users with the "Create and Set Up Communities" permission are assigned the role of site administrator in a community's Site.com site. To let Communities users without the permission edit the site, you must purchase and assign either a Site.com Publisher or a Site.com Contributor feature license, and assign a user role at the site level.

SEE ALSO:

[About Site.com User Roles](#)

[Managing Site.com Users and Roles](#)

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Setting Up Site.com Users

Before users can access Site.com, you must allocate a Site.com feature license to each user and assign a user role at the site level. The features available when editing a site in Site.com Studio vary depending on these settings.

First, review the [Site.com feature table](#) for detailed information on the feature license, permissions, and role required for each user.

After you've determined the appropriate access level required:

1. Allocate a feature license to the user by editing the user's profile. To allocate:
 - A Site.com Publisher feature license, select the `Site.com Publisher User` checkbox.
 - A Site.com Contributor feature license, select the `Site.com Contributor User` checkbox.

After you allocate a feature license, users can access Site.com in the Force.com app menu in the Salesforce header.

Note: If the checkboxes don't appear, verify that Site.com is enabled for your organization. See [About Site.com Feature Licenses](#) on page 4325.

2. Ensure the "View Setup and Configuration" permission is enabled. All users who create or edit websites in Site.com Studio need this permission.
3. Additionally, ensure that at least one user in your organization has both a Site.com feature license and the "Manage Users" permission. This way, someone can always reallocate user roles if a site's users are accidentally deleted.

Warning: The "Manage Users" permission is powerful. It allows a user to manage all other users in your organization and not just Site.com.

4. [Add users and assign user roles](#) within a site. (When a user with the Site.com Publisher feature license creates a site, the user is automatically allocated the role of site administrator at the site level.)

The feature license, permissions, and user role all determine what a user can do in each site. For example, to create an administrative user who can manage all sites in your organization, assign a Publisher feature license and assign the role of site administrator at the site level.

For users who need only limited access to edit site content, but no administrative access, assign a Contributor feature license and a contributor role at the site level.

Alternatively, to create a user who can manage roles in a site, but without the ability to publish, assign a Publisher feature license, the "Manage Users" permission, and the designer role at the site level.

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To create or edit users:

- "Manage Internal Users"

About Site.com User Roles

Each Site.com user must have a user role assigned at the site level, which controls what each user can do in a site. Users can have only one role per site, but their roles can vary between sites. For example, a person can be a site administrator on one site and a contributor on another.

To manage user roles in a site, you must either be the site administrator for that site, or have a Site.com feature license and the “Manage Users” permission.

 **Note:** Communities users with the “Create and Set Up Communities” permission are assigned the role of site administrator in a community’s Site.com site. However, they don’t appear in the User Roles section on the Overview tab of Site.com Studio.

Users can have one of three roles at the site level:

- **Site administrator**—Site administrators are users who can create and manage all site content. They can create sites, templates, style sheets, and pages, and also set up domains, publish sites, and assign user roles. This role requires the Site.com Publisher feature license.
- **Designer**—Designers have the same control over site content as site administrators, but they can’t manage domains or publish sites. By default, they can’t assign roles unless they have the “Manage Users” permission. This role requires the Site.com Publisher feature license.
- **Contributor**—Contributors have the most restricted access to content and can typically just edit page text and images. By default, they can’t assign roles unless they have the “Manage Users” permission. This role requires the Site.com Contributor feature license.

See the [Site.com feature table](#) on page 4329 for a detailed list each user role’s capabilities.

Managing Site.com Users and Roles

After you create a site, you can add other users and assign roles to them. If you haven't [assigned Site.com feature licenses](#) to your users, you won't be able to add them to a site.

 **Note:** Communities users with the "Create and Set Up Communities" permission are assigned the role of site administrator in a community's Site.com site. However, they don't appear in the User Roles section on the Overview tab of Site.com Studio.

When assigning a user role, be sure to add one that's compatible with the user's Site.com license. When users log into Site.com, their licenses are checked against the role assigned to them at the site level. If the license doesn't allow the permissions associated with the role, then the user is given the permissions associated with the license. For example, if a user has a Site.com Contributor feature license, but is assigned a role of site administrator, they will only have Contributor permissions regardless of the assigned role.

To add users and assign roles:

1. On the Overview tab in Site.com Studio, click **Site Configuration > User Roles**.
2. Click **Add Users**.
3. In the Available Users section, highlight the user you want to add.
4. Select the role from the Add as drop-down list.
5. Click the arrow to move the user to the Selected Users section.
6. Click **Save**.

To delete users:

1. In the User Roles view, select the user.
2. Click  > **Remove**.
3. Click **OK**.

To change a user's role:

1. In the User Roles view, hover over the user's role.
2. Click the arrow to display all the roles.
3. Select the new role.

To delete or change the role of a group of users at the same time, use Bulk Actions.

1. In the User Roles view, select the check box beside each user's name.
2. Click **Bulk Actions**.
3. Select the action.
4. Click **Apply**.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To manage Site.com users:

- Site.com Publisher User field enabled on the user detail page
- AND
- Site administrator role assigned at the site level

 **Note:** When updating the roles of several users at once, you can only assign the same role to all selected users.

SEE ALSO:

Getting Started with Site.com

Planning and Implementing a Site.com Website

There are many approaches to building a website. The process that best suits you depends on many factors, such as the size of your team and the tasks you're responsible for.

If you're a site administrator or designer, you may be involved in every stage, including adding and maintaining the site's content. Alternatively, you may have contributors who add, edit, and maintain this content. And if you're a contributor, you may be responsible for editing and updating all of the site's content, or you may work with other contributors, designers, and site administrators to bring the site to completion.

This topic describes the various stages involved in creating a site with Site.com.

- **Plan the Site Design and Page Layout** (Site administrator or designer)—Before building the pages of the site, spend time planning the site design and basic layout. This stage is key to ensuring a consistent look and feel with the minimum amount of effort. From a hierarchical point of view, think about how many pages you need and whether they'll have subpages. Also consider how you want site visitors to navigate around your site.

Next, plan the layout of the pages and identify the common elements that every page will have. In this example, the site has a header section that includes the company's logo and menu (1), and a footer section (2). However, the main section of the home page (3) differs from the rest of the site pages (4). Take note of these similarities and differences, because they will affect how you create your site pages.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To create or import Site.com sites:

- Site.com Publisher User field enabled on the user detail page

To build, edit, and manage Site.com sites:

- Site.com Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

To edit only content in Site.com sites:

- Site.com Contributor User field enabled on the user detail page

AND

Contributor role assigned at the site level

- Create the Site** (Site administrator or designer)—Once you've completed the planning stage, you're ready to get started! Log into the Site.com app and go to the [Site.com tab](#), where you can [create your first site](#). Your new blank site opens in [Site.com Studio](#), a powerful environment for building the pages of your site.
 -  **Note:** Only users with the `Site.com Publisher User` field enabled on their user detail page can create and import sites.
- Import Assets** (Site administrator or designer)—If you're working with a design agency, they may provide all of the files and assets you need, including a CSS style sheet. If you've created your own design, cut up the design and collect the assets, images, and files you plan to use in the site. [Import the assets](#) into Site.com Studio, where they appear in the Assets section of the Overview tab.
- Create a Page Template** (Site administrator or designer)—Once you've decided on the layout, the quickest and most effective method is to use [page templates](#) to build the basic layout and then base your site pages on it. Try to keep the design of your main page template simple to make it easier to modify in the future. For more complicated site designs, such as the example graphic, you can use the main page template as the basis for a [child template](#) to achieve maximum flexibility. When you [create your page template](#), you can choose from predesigned layouts that include headers, footers, and columns, or you can create a blank page template.
- Lay Out the Page** (Site administrator or designer)—After you create the page template, you can [modify the layout](#) further to match the design of your site.
- Create the Site Pages** (Site administrator or designer)—Using the template as a base, you can quickly [create the site pages](#), which automatically inherit all the elements of the page template. Or if you need a standalone page that doesn't follow the site's overall design, you can create a blank page instead.
- Add Features and Page Elements** (Site administrator or designer)—Use Site.com's prebuilt [page elements](#) to add features such as [navigation menus](#), [images](#), and [data services](#), and include [content blocks](#) that contributors can edit. And add interactive, animated effects using [events and actions](#).
- Make Your Website Look Good** (Site administrator or designer)—Take advantage of [cascading style sheets \(CSS\)](#) to develop the look and feel of your website. If you're not completely up to speed with CSS, the [Style pane](#) provides an easy, visual way to create and manage styles. Or if you're a CSS expert who likes to get straight into the code, you can hand-code the site's [style sheets](#).
- Add and Edit Content** (Contributor)—At this stage, if you're a contributor, the site is usually ready for you to add and edit content such as [text](#), [images](#), [videos](#), and [hyperlinks](#). And as you work, you can [upload](#) any images or files you need.
- Review and Test the Site** (Contributor, designer, or site administrator)—Testing the changes to the pages of your site happens throughout the development cycle. As a contributor, designer, or site administrator, you should always [preview your changes](#) to ensure they display as expected in a browser. And if you're a site administrator or designer, you can send a preview link to the site's reviewers so they can review the finished product before it goes live.

- **Publish the Site** (Site administrator only)—After testing is complete, you're ready to go live with your new site. Just [set the site's domain information](#) and then [publish your changes](#) to make your site live!

Site.com Tab Overview

If you can't see the Site.com tab, go to the Site.com app. It's available in the Force.com app menu in the Salesforce header. Then click the Site.com tab to view the list of your Site.com sites. From this page you can:

- Click **New** to [create](#) or [import](#) a site. Only users with the `Site.com Publisher User` field enabled on their user detail page can create and import sites.
 - Filter the sites you see by selecting a predefined list from the drop-down list. My Sites shows the sites you can access and your role. All Sites shows all the sites in your organization even if you don't have access to some of them.
 - Click **Edit** next to a site to open it in Site.com Studio.
 - Click **Preview** next to a site to see how it looks when rendered in a browser window.
 - Click  next to a site to duplicate, export, or delete it. Only users with the `Site.com Publisher User` field enabled on their user detail page and the role of site administrator or designer can duplicate, export, and delete sites. If a site has been published, you can't delete it until you [take it offline](#).
 - See the status of your site.
 - In Development—The site has never been published.
 - Published—The site has been published at least once.
 - Click the title of any column to sort your site list. By default, sites are sorted by name.
-  **Note:** You can't create, delete, or duplicate community sites in Site.com.

[Site.com Overview](#)

Using Site.com with Communities

Use Community Builder (Site.com) Without Templates

Each community has one associated Site.com site that lets you add custom, branded pages to your community. By default, Site.com pages are publicly available and don’t require login, but you can also create private pages that only community members can access.

For more detailed information about using Site.com, check out the online help.

Before You Begin

Communities users with the “Create and Set Up Communities” permission automatically have full site administrator access to a community’s Site.com site. To let Communities users without the permission edit the site, you must purchase and assign either a Site.com Publisher or a Site.com Contributor feature license, and assign a user role at the site level.

See [About Site.com User Roles](#) on page 4327.

Tips and Considerations

- Communities users with the “Create and Set Up Communities” permission are assigned the role of site administrator in a community’s Site.com site. However, they don’t appear in the User Roles section on the Overview tab of Site.com Studio.
- You can’t create, delete, or duplicate community sites in Site.com.
- When working with data-bound components, such as data repeaters and forms, keep in mind that the objects listed may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site’s guest user profile.
- When adding forms to authenticated community pages in Site.com, set the current user for Salesforce objects that require the Owner ID field. Setting the current user (as opposed to the default guest user) lets you identify the authenticated user when the form is submitted. To set the current user for the Owner ID field, select the field in the form, click **Configure** under Field Properties in the Properties pane, select `Global Property` as the source, and select `Current userID` as the value.
- The home page, 404 page, login page, and self-registration page that you specify for Site.com Community sites in Site Configuration set the default pages for the Site.com Community site. These default URLs are used unless you specify different URLs in Community Management under **Administration > Pages** and **Administration > Login & Registration**. Community error pages are specified in Force.com Setup, under Error Pages.
- When your Site.com Community site is inactive, users are redirected to the Service Not Available page defined in Community Management under Pages.
- The contributor’s view is not available by default for Site.com Community sites. However, you can use a Site.com Contributor license to grant contributor access to a specific user. See *About Feature Licenses* in the Site.com help for details. Alternatively, a user can preview the Site.com Community site as a contributor by appending `?iscontrib` to the site’s URL. For example:
`https://sitestudio.na1.force.com/?iscontrib`

[Choosing Between Community Builder and Force.com Sites](#)

[Use Site.com to Customize Your Community](#)

[Salesforce Communities Overview](#)

Use Site.com to Customize Your Community

Communities users can use Site.com to build custom, branded pages for a community. There are many approaches to building custom pages for your community, but these are some of the typical stages involved:

- **Import Assets**—Collect the assets, images, and files you plan to use on your custom page. [Import the assets](#) into Site.com Studio, where they appear in the Assets section of the Overview tab.
- **Create Branded Pages**—The quickest and easiest way to create branded pages is to use the Community Template, which is automatically included with all Site.com community sites. When you [create a new page based on the Community Template](#), the page includes all of the branded styles in your community, including the community's header and footer. If you want even more control over the look and feel of your community page, you can [create your own page template](#), drag community headers and footers to it from the Widgets section of the Page Elements pane, and add other community styles.

 **Note:** As of Spring '15, the Community Template is no longer available for new communities. If you already have a Site.com community that's based on the Community Template, it will continue to work. For information on creating a community, see [Create Communities](#) on page 2952.
- **Use Branded Community Styles**—Develop the look and feel of your custom pages by using the [CommunityBranding style sheet](#), or by [creating branded community styles](#) in your own cascading style sheets (CSS). If you're not completely up to speed with CSS, the [Style pane](#) provides an easy, visual way to create and manage styles. Or if you're a CSS expert who likes to get straight into the code, you can hand-code community styles right in your own [style sheets](#).
- **Create Public Pages**—Using the template as a base, you can quickly [create pages](#), which automatically inherit all the elements of the page template. Or if you need a standalone page that doesn't follow the overall design, you can create a blank page instead.
- **Make Pages Private**—By default, any page you create in Site.com Studio is publicly available. However, you can [make pages private](#) so that only logged-in Communities users can access them.
- **Add Features, Page Elements, and Community Widgets**—Use Site.com's prebuilt [page elements](#) to add features such as [navigation menus](#), [images](#), [content blocks](#), and community [widgets](#). Retrieve data from your organization's objects and dynamically display it on your site pages using [data repeaters](#) and [data tables](#). Alternatively, gather and submit data from visitors using [forms](#).
- **Add and Edit Content**—At this stage, the page is usually ready for you to add and edit content such as [text](#), [images](#), [videos](#), and [hyperlinks](#). And as you work, you can [upload](#) any images or files you need.
- **Review and Test the Page**—Testing the changes to your page happens throughout the development cycle. You should always [preview your changes](#) to ensure they display as expected in a browser. You can also send a preview link to reviewers so they can review the finished product before it goes live.
- **Publish the Page**—After testing is complete, you're ready to make the page available to your community by [publishing your changes](#).
- **Add Authenticated Pages to Your Community's Tab**—Now that the page is tested and published, if you're working with authenticated pages, the final step is to [add the page to a tab](#) in your community.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage a community's custom pages:

- "Create and Set Up Communities"

OR

Site.com Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

- **Use Site.com in Sandbox**—Site.com is now available on sandbox. When you create a sandbox copy from a production organization, you can include your Site.com sites. You can also copy your sandbox site back to production using the [overwrite](#) feature.

Which Community Template Should I Use?

Community templates let you quickly and easily build a self-service community that gives customers the same visual and functional experience whether they use a tablet, a mobile device, or their desktop.

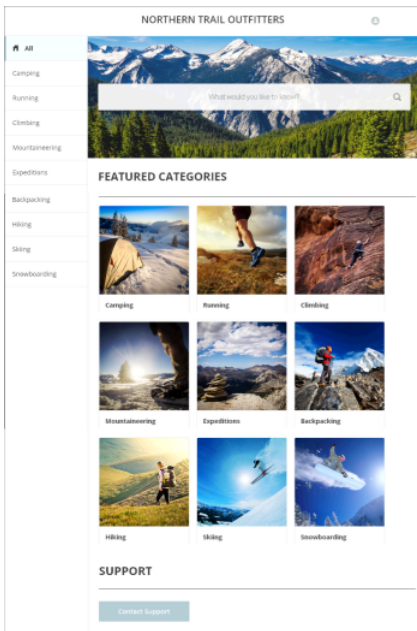

Your customers want an easy way to interact with your company whenever and wherever they are. A self-service community gives your customers an easy way access the information they need when they have questions. With communities built on the Koa and Kokua templates, customers can search for information using knowledge articles and contact support, if necessary. When they're in a community based on the Napili template, they can search for articles as well as ask questions and get crowd-sourced answers from the community. If they still can't find what they're looking for, they can contact support without having to log in. The self-service templates let you extend your community to various devices with a consistent user experience every time.

EDITIONS

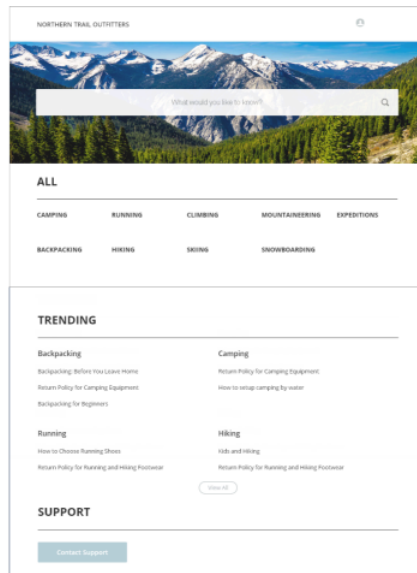

Available in: Salesforce Classic

Available in:

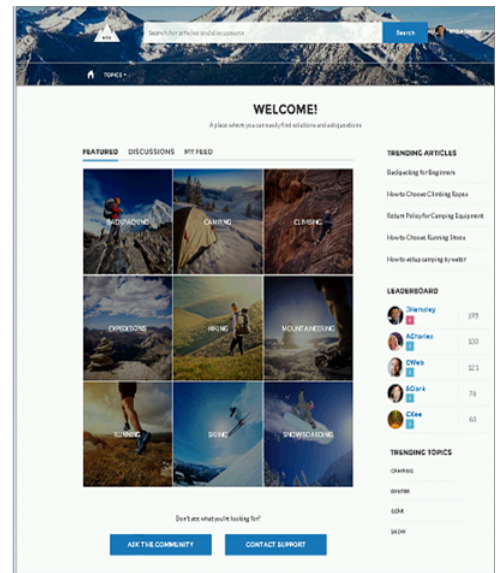

- Enterprise
- Performance
- Unlimited
- Developer

Kokua

Koa

Napili

A wizard guides you through selecting a template and then walks you through the initial setup for your data categories or topics—depending on which template you're using.

- Kokua is a visually rich self-service template that presents users with knowledge articles organized by data categories. Users can also submit cases to get help from agents.

- Koa is a text-based self-service template that's optimized for mobile devices. It lets users search for and view articles by text representations of data categories, and contact support if they can't find what they're looking for.
- Napili is a powerful support community template that lets your customers post questions to the community and search for and view articles. If they don't find what they're looking for, they can contact a support agent.

Community Builder makes it super easy to customize your community. Simply edit a few of the components to include information about your community, add a few images to extend your branding, and you're ready to go—without any coding! Additionally, if you want a more custom experience, you can create custom pages, add components to pages, use custom Lightning components, and expose additional Salesforce objects.

Communities are automatically displayed in a logged-in user's profile language, so you don't need to create and manage a separate community for each language. With Community Builder, you can extend the support for Guest users in communities so that if their language isn't supported, they can choose one from a language picker on each community page. And because all languages are maintained within the community, you don't need to create and manage a separate community for each language.

SEE ALSO:

[Create Communities](#)

[Configure and Customize Pages in Your Community](#)

[Implementation guide: Community Templates for Self-Service](#)

Configure and Customize Pages in Your Community

Pages are the building blocks of your community. They control how your users see and interact with the community.

Each page contains a collection of components that are organized around a task or function—whether it's opening a case or searching for an article. The pages that comprise each of the preconfigured community templates are ready for you to use with very little configuration or customizing needed. Additionally, you can create new pages or drag and drop other components on to existing pages as needed. If you create custom Lightning components, they appear in the list of available components on the left side of the page.

When you open a page for editing, you can set properties for how information appears, move components to different positions, or delete any components you don't need.

 **Note:** You can edit components within a page and delete inactive pages, but you can't rename pages.

For example, the Home page in the Napili template contains components that let customers see trending articles and topics, explore articles organized by category, read discussions from the community, search or information, ask a question, and contact support. If you're creating a community to deflect cases only and don't want to let customers open a case within the community, you can remove the component for contacting support.

To edit a page, go to Community Builder

1. From the Page drop-down, select the page to edit.
2. Click  to open the Page Editor.
3. Select the component you want to edit.
4. In the Property Editor, edit any of the properties of the component.
5. To add a component to the page, simply drag it from the Lightning Components menu and drop it where you want it on the page.
6. To delete a component from the page, hover over the component and click .
7. After you're done configuring the page, click **Publish**.

Creating Branded Pages in Site.com

Create Branded Pages Overview

When you create a Community site, Salesforce automatically creates a new Site.com site and associates it with your community.

With Site.com Community sites you can:

- Use the [branded Community template](#) to create Site.com pages for your community.
 -  **Note:** As of Spring '15, the Community Template is no longer available for new communities. If you already have a Site.com community that's based on the Community Template, it will continue to work. For information on creating a community, see [Create Communities](#) on page 2952.
- Use the [CommunityBranding style sheet](#) to style Site.com pages by using CSS.
- Create your own community CSS styles using a number of [available Network namespace expressions](#).

Create Branded Pages from the Community Template

Site.com Community sites include a branded template that you can use to create new community site pages.

The styles for the `Community Template` come from the `CommunityBranding` style sheet, which is automatically included for all new Site.com Community sites.

To create branded pages from the `Community Template`:

1. On the Site.com Overview tab, hover over Site Pages and click **New**.
2. Type the new community page name. Page names can't include spaces or special characters, such as #, ?, or @.
3. Make sure `Community Template` is selected for the page template.
4. Click **Create**.

-  **Note:**
 - Community branding options, such as headers, footers, and page colors, are set from the **Administration > Branding** section on the Community Management page.
 - Empty community headers and footers, or headers that contain only images, won't work in Site.com. Be sure to specify customized HTML blocks for your community headers and footers if you're creating Site.com pages from the `Community Template`, or creating community headers and footers using `Network namespace expressions`.

Apply Community Styles from the CommunityBranding Style Sheet

The `CommunityBranding` style sheet contains a set of CSS styles created from `Network` namespace expressions.

The `CommunityBranding` style sheet is attached to the `Community Template`, and is responsible for the template's branded look and feel. You can access the styles in the `CommunityBranding` style sheet and apply them directly to elements on any page.

To apply community styles using the `CommunityBranding` style sheet:

1. Make sure the `CommunityBranding` style sheet is attached to the Site.com page you want to brand. (See [Creating and Using CSS Style Sheets](#) on page 4416.)

 **Note:** All Site.com pages based on the `Community Template` automatically have the `CommunityBranding` style sheet attached to them.

2. Select the element on the page you want to style.
3. Open the Style pane.
4. Select Class.
5. Start typing "brand".
A list of all of the available styles in the `CommunityBranding` styles sheet appears.
6. Select the style you want to apply.

Create Community Styles in a CSS Style Sheet

Branded Community styles are available in Site.com Community sites through `Network` namespace expressions.

You can access a full list of available `Network` namespace expressions to create new community styles in any CSS style sheet. When you add an expression to a CSS rule, Site.com “pulls in” the style as it’s defined in the community, and displays it on your page.

To create community styles in a CSS style sheet:

1. Open an existing style sheet or create a new style sheet. (See [Creating and Using CSS Style Sheets](#) on page 4416.)
2. Click **Edit Style Sheet Code**.
3. Add a new community style rule by using any of the available `Network` expressions. You can create both ID styles and class styles. For example:

```
#main_content_block {
  background-color: {!Network.primaryColor};
  color: {!Network.primaryComplementColor};
}
.secondary_content_blocks{
  background-color: {!Network.zeronyColor};
  color: {!Network.zeronyComplementColor};
}
```

4. Apply the new styles to elements on other pages.

 **Note:** Remember, the style sheet that contains your community styles must be attached to the page containing your styled elements.

USER PERMISSIONS

To build, edit, and manage a community’s custom pages:

- “Create and Set Up Communities”

OR

Site.com
Publisher User
field enabled on the user
detail page

AND

Site administrator or
designer role assigned
at the site level

Expressions Available for Community Branding

You can use the `Network` namespace expressions listed on this page to [create your own Community styles](#).

Community branding options, such as headers, footers, and page colors, are set from the **Administration > Branding** section on the Community Management page.

Note:

- Empty community headers and footers, or headers that contain only images, won't work in Site.com. Be sure to specify customized HTML blocks for your community headers and footers if you're creating Site.com pages from the `Community Template`, or creating community headers and footers using `Network` namespace expressions.
- Community headers and footers are available as widgets in Site.com community pages. To add a community header or footer to a blank page, drag it to the page from the Widgets section of the Page Elements pane.

EDITIONS

Available in: **Salesforce Classic**

Adding Authenticated Pages

Site.com Authorization Overview

As part of your site design, you might want to control what content is public and private to your site visitors. New sites are initially set so that all site resources, such as folders and pages, are public. You can change the default setting from the Authorization view found under Site Configuration.

The global site authorization options are:

- No Authorization (default)—All resources are public.
- Requires Authorization—All resources are private.
- Custom—All resources are public by default, but can be made private.

The No Authorization and Requires Authorization options let you quickly make your site either all public or all private. But, if you want to control access to individual pages, folders, and other resources, use the Custom option. Selecting Custom enables a `Requires Authorization` checkbox on the Actions menu  for all resources throughout the site. You can define authorization at the site, folder, page, and individual resource level. As you mark items for authorization, a lock icon  appears on them. After a resource, like a page, is marked as private, users who aren't logged into Salesforce are asked to log in when they try to access it.

Resources can inherit their privacy setting from folders. For example, when a resource, such as a site folder, is marked for authorization, anything placed in that folder inherits the folder's authorization setting and becomes private. If you drag that resource into a public folder, it becomes public again. But, if you explicitly mark a resource as private using the Actions menu, and then drag it into a public folder, it still remains private because the privacy setting at the resource level dominates.

When you use the Custom option, an authorization table appears in the Authorization view that lets you manage your private resources/items marked as private. You can remove authorization from a resource by either deleting it from the authorization table, or by deselecting the Requires Authorization box on the item itself.

Setting Custom Authorization

When you select Custom authorization, you get a great deal of flexibility in controlling access to your site. Not only can you control who has access to top level resources, like folders and pages, but you can also set access at the individual resource level.

Using Custom authorization at the folder level is a great way to make a large number of resources private without having to mark them individually. Let's say you periodically run sale offers for your paid users. If you drag all the sale pages into a special folder you mark for authorization, they instantly inherit the folder's setting. Users will need to log in to access them. Plus, if you decide to make one of the sale pages available to everyone, you can simply drag it back into a public folder, or to the root of the All Site Content area.

1. Open your site for editing.
2. Click **Site Configuration > Authorization**.
3. Select **Custom**.
4. Click **All Site Content**.
5. Create a folder to hold the private pages if it doesn't already exist.
6. From the folder's Actions  menu, select **Requires Authorization**. You'll see the lock  appear on the folder. It is now private.
7. Drag any pages you want to make private into the folder. A lock  appears on them too.

 **Example:** Let's take another example. If you have a page that you'd like to keep private no matter where it resides, you can set its authorization using the Actions menu. After you set it at the individual resource level, it remains private even if you drag it into a folder that isn't set to private. In other words, a resource marked private is always private until you deselect **Requires Authorization** on the Actions menu.

If you check the Authorization page, you'll see all folders and resources marked private are listed in the authorization table where you can view and delete them.

USER PERMISSIONS

To manage authorization:

- You must be an administrative user on the site

Removing Site.com Authorization

You can remove authorization for a resource by either deleting it from the authorization table under Site Configuration, or by deselecting **Requires Authorization** from the  menu.

1. Open your site for editing.
2. Click **Site Configuration** > **Authorization**.
3. From the authorization table, click **Delete** next to the item you want to remove. Alternatively, navigate to the All Site Content view. Select the resource. From the Actions  menu, deselect **Requires Authorization**.

 **Example:** If a resource is explicitly marked as private using the Actions menu, then you must remove authorization from it using the Actions menu. For example, if a page marked private is dragged into a folder that's public, it remains private. Likewise, if you drag it into a folder that's already private, and remove the authorization on that folder, the page will still be private.

Displaying Current Community User Information in Site.com

Display Current Community User Information

Site.com designers creating authenticated pages for a community site can display the current user's information by accessing `CurrentUser` namespace expressions.

1. Open the page on which you want to display the current community user's information.
2. From the Page Elements pane, drag a **Content Block** or **Custom Code** page element onto the page.
3. Type `{!CurrentUser. }` and the value that you want to display.
For example, `{!CurrentUser.firstName}` .
Check the list of [available expressions for displaying current user information](#).
4. Add any additional text you require.
For example, `Welcome back { !CurrentUser.firstName} !`.
5. If you're in a Content Block, click **Save**. If you're in a Custom Code element, click **Save and Close**.

 **Note:** If an unauthenticated user views a page that contains `CurrentUser` expressions, the current user information does not appear. For example, if an unauthenticated user viewed a page that contained the above example, the user would see "Welcome back !" as the welcome message.

Expressions Available for Displaying Current User Information

Use these `CurrentUser` namespace expressions to [display authenticated user information](#) on a Site.com community page.

CurrentUser Expression	Displays
<code> {!CurrentUser.name} </code>	Combined first and last name of the user, as displayed on the user detail page.
<code> {!CurrentUser.firstName} </code>	First name of the user, as displayed on the user edit page.
<code> {!CurrentUser.lastName} </code>	Last name of the user, as displayed on the user edit page.
<code> {!CurrentUser.userName} </code>	Administrative field that defines the user's login.

EDITIONS

CurrentUser Expression	Displays
<code>{!CurrentUser.email}</code>	Email address of the user.
<code>{!CurrentUser.communityNickname}</code>	Name used to identify the user in a community.

Determine the URL of a Site.com Page

After you create a Site.com page, you can determine the page's URL to:

- Provide your users with a URL that lets them access a public page directly.
 - Create a link to the page from other pages, including Force.com Sites and Visualforce pages.
 - Make it the home page for your community using a URL redirect in Force.com Sites.
 - Add a private page to a web tab in your community.
1. To determine the correct URL for the page:
 - From the Create Community wizard, click **Customize**.
 - If you navigated away from the Create Community wizard, click **Customize > Communities > All Communities**, then click the **Manage** button next to the community name.
 2. Click **Administration > Settings**.
 3. Copy the URL displayed on the page and paste it into a text editor.
 4. To create a URL that points to:
 - The Site.com site's home page, append `/s/` to the URL. For example, `https://mydomain.force.com/mycommunity/s/`.
 - A specific Site.com page, append `/s/<page_name>`, where `<page_name>` is the name of the Site.com page. For example, `https://mydomain.force.com/mycommunity/s/promotion`.

The URL is case-sensitive and "s" must be lowercase.

OR

Site.com Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

Add Authenticated Site.com Pages to Community Tabs

After you create a private Site.com page, you can add the page to a tab in your community.

In this case, you need to create a Web tab that points to your Site.com page.

1. In the Properties pane for your page, select `Show Salesforce Header`.
Selecting this option ensures that you see tabs in your community.
 2. Enter the tab name as it should appear on the tab in your community.
The web tab you create must have the same name.
 3. [Determine the correct URL for the page](#).
The URL must be in the following format
`https://mydomain.force.com/mycommunity/s/<pagename>`, where `pagename` matches the name of your page.
 4. From Setup, enter `Tabs` in the `Quick Find` box, then select **Tabs**.
 5. In Web Tabs, click **New** and enter the name of the tab as it appears in the Tab Name field in your page properties.
 6. On the Step 3 screen, paste the URL you created in the Button or Link URL text box.
 7. Return to the Create Community wizard and add the new tab to your community.
- To preview the private page in your community, you must publish your Site.com site.

 **Note:** You can't publish your site from sandbox.

Publisher User
field enabled on the user
detail page

AND

Site administrator or
designer role assigned
at the site level

Add Chatter News or Group Feeds to Community Site.com Pages

Use the Chatter News Feed to display a Chatter feed on your site pages, or display the feeds of a particular group using the Chatter Group Feed.

1. Drag the **News Feed** or **Group Feed** from the Widgets section of the Page Elements pane onto the page.
When you add a widget to a page, it creates a copy or *instance* of the widget. You can't edit the content of a widget, but you can edit the properties.
2. If you're adding a group feed, enter the Group ID in the Properties pane.
The Group ID determines which group feed is displayed on your page. You can include more than one group feed on a page if you want to show the feeds for multiple groups.
3. Preview the page to test the feed, or use Live Mode to see how the feed renders in different mobile devices.

Consider the following limitations when using a news or group feed in your community Site.com sites:

- Chatter news and group feeds only appear if a user is logged in to the community. They don't appear to guest users or in anonymous preview mode.
- Chatter news and group feeds may not render appropriately on pages less than 700px wide. We recommend a minimum page width of 700px to view full content. We also recommend using a white background.
- Chatter news and group feeds only inherit some page branding elements.

Improve Performance with HTML Page Caching for Communities in Site.com

HTML caching lets you improve the performance and page rendering of your community's Site.com site by controlling how often the generated markup of the page is reloaded.

Lets say 100 people visit the page at the same time. Without caching, the page makes 100 separate requests for the same markup, slowing performance considerably. However, with caching enabled, the page markup is requested and retrieved only once—the first time someone visits the page. Any subsequent page requests during a set time period are returned from the cache. When the specified time period expires, the cache is refreshed.

 **Note:** The caching duration applies only to community pages that are accessed by guest users. When a user logs in to access the page, caching is disabled.

1. In Site.com Studio, open the page.
2. In the `Cache Duration (Minutes)` field of the `Cache` section of the `Properties` tab, specify the length of time to cache the page.

By default, the caching duration of a page is set to 30 minutes.

To disable caching, set the page's caching duration to 0.

Creating and Managing Sites

Creating a Site.com Site

To get started with Site.com, create a new blank site:

1. On the Site.com tab in the Site.com app, click **New**. Alternatively, in Site.com Studio, click **Create a New Site** in the site's drop-down menu.
2. Click **Create a Blank Website**.
3. Enter the site name.
4. Click **Create**. Your new website opens in Site.com Studio, where you can create page templates and site pages, and add functionality to it.

 **Note:** You can't create, delete, or duplicate community sites in Site.com.

SEE ALSO:

[Creating Site.com Page Templates](#)

Configuring Site Properties

Set properties for the site, such as the home page, site name, and error page, and create an anonymous preview URL that allows other users to review the site before it goes live. The URL is always valid (unless you disable it) and shows the latest work in progress. It's only available to the people you send it to, and can't be found by search engines.

1. On the Overview tab, click **Site Configuration**.
 2. Click **Edit**.
 3. In the Site Configuration view, you can:
 - Replace the name in the `Site Name` field to rename the site.
 - See the `Developer Name` of the site. This read-only field may differ from the `Site Name`. The `Developer Name` is used by the Metadata API.
 - Select **Enable Anonymous Preview** to create a URL that allows other users to preview the site before it goes live. (Click the **View Anonymous Preview** option that appears in the **Preview** menu to access the preview URL, which you can copy and send to other users to review and test your changes.) **Enable Anonymous Preview** is also available from the **Preview menu** on the Overview tab.
 - [Access the site's guest user profile.](#)
 - [Set the clickjack protection level.](#)
 - Select the home page for your website in the Home Page drop-down list.
 - *Site.com Community sites only:*
 - Select the login page for your Site.com Community site in the Login Page drop-down list.
 - Select the page that you've set up for Site.com Community site users who don't have accounts yet from the Registration Page drop-down list.
 - Select the Forgot Password page you've set up for your community using Site.com.
 - Select a user-friendly error page in the 404 Page drop-down list to display when a page can't be found. It's a good idea to create a user-friendly error page to assist site visitors if they encounter a broken link.
 4. Click **Save**.
-  **Note:**
- The home page, 404 page, login page, and self-registration page that you specify for Site.com Community sites in Site Configuration set the default pages for the Site.com Community site. These default URLs are used unless you specify different URLs in Community Management under **Administration > Pages** and **Administration > Login & Registration**. Community error pages are specified in Force.com Setup, under Error Pages.
 - When your Site.com Community site is inactive, users are redirected to the Service Not Available page defined in Community Management under Pages.

Site administrator or designer role assigned at the site level

Enabling Clickjack Protection

Clickjacking is a type of attack that tries to trick a user into clicking something, maybe a button or link, because they perceive they are clicking something safe. Instead, the button or link performs malicious actions on your site leading to data intrusion, unauthorized emails, changed credentials, or other site-specific actions.

Hidden iframes that load your site's pages can be placed maliciously by an unrelated page that entices the user to click a button or link that appears below the hidden iframe. With clickjack protection, you can configure whether your browser allows frames or iframes over your site pages. The default clickjack level for Site.com is set to Allow framing by the same origin only.

You can set the clickjack protection for a site to one of these levels:

- Allow framing by any page (no protection)
- Allow framing by the same origin only (recommended)
- Don't allow framing by any page (most protection)

 **Note:** Same-origin framing allows the site's page to be framed only by pages on the same domain name and protocol security.

1. On the Overview tab, click **Site Configuration**.
2. Click **Edit**.
3. Select the desired level of clickjack protection.

 **Note:** Salesforce Communities have two clickjack protection parts—one for the Force.com Communities site which is set from the Force.com site detail page and another for the Site.com Communities site which is set from the Site.com configuration page. It's recommended that both are set to the same value.

[Creating and Editing Force.com Sites](#)

Site.com Versioning Overview

Each time you publish your site, it's tracked as a version. You can restore your site back to one of the previously published versions. You can't select individual components when restoring; you must restore the complete site.

When working in Site.com Studio, you're always working on an unpublished version of your site. It's your *working copy*. When you restore a version, you overwrite your working copy, not your live site. You must publish the restored version before you see the change on your live site.

In Site.com Studio, you'll find your site versions in the Change History view on the Overview tab. Not all items in a site are reverted when you restore a version. Some things, like user roles, remain unchanged even when you restore from a previous version. Everything in a site is under version control except:

- Site name
- Anonymous preview setting
- Guest User Profile settings

[Restoring to a Previous Site Version](#)

Restoring to a Previous Site Version

The Change History list in Site.com Studio tracks all published versions of your site. You can select any previously published version and restore it. You can only restore an entire site, not parts of a site.

When working in Site.com Studio, you're always working on an unpublished version of your site. It's your *working copy*. When you restore a version, you overwrite your working copy, not your live site. You must publish the restored version before you see the change on your live site.

 **Warning:** You can't restore the working copy of your site after you revert to a previous version. Therefore, it's a good idea to back up the working copy of the site before reverting to ensure you don't lose any unpublished changes.

To revert to a previously published site version:

1. Select the Overview tab.
2. From the Change History view, select the version you want to restore.
3. Click  > **Restore Version**.
4. Click **OK** at the confirmation message.

After you restored your working site to a previous version, you can continue to make additional changes until you're ready to publish the site.

Creating URL Redirects in Site.com

If you move or reorganize pages in your site, search engines may have trouble finding the new page locations. To avoid this, set up URL redirects to inform users and search engines that site content has moved.

You can use URL redirects to:

- Maintain search engine ranking. For example, if you change a page’s name from “Gadgets” to “Widgets,” creating a redirect rule from /Gadgets to /widgets lets you restructure the site without affecting your page ranking.
- Make URLs more readable and memorable. For example, site visitors will find long or numeric page names, such as /widget65AD890004ab9923, difficult to remember. Instead, you can provide them with a short, friendly URL, such as /widget, and create an alias that redirects to the correct page when the user uses the short URL alias.
- Assist with migration from another system to Site.com if you’re still using the same domain. For example, if your old site ran on PHP, you can create a redirection rule from an old page, such as /index.php, to a new page in Site.com, such as /myNewPage.

To assign a redirect to a site page:

1. On the Overview tab, click **Site Configuration > URL Redirects**.
2. Click **Create a Redirect**.
3. Specify the `Redirect type`:

Option	Description
Permanent (301)	Select this option if you want users and search engines to update the URL in their systems when visiting the page. Users visiting a page redirected with this type are sent seamlessly to the new page. Using a permanent redirect ensures that your URLs retain their search engine popularity ratings, and that search engines index the new page and remove the obsolete source URL from their indexes.
Temporary (302)	Select this option if you want users and search engines to keep using the original URL for the page. Search engines interpret a 302 redirect as one that could change again at any time, and though they index and serve up the content on the new target page, they also keep the source URL in their indexes.
Alias	Select this option if you don’t want the URL to change in the user’s browser, but you want to redirect to a different page. Search engines won’t be aware of the change or update their records.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- Site.com Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

Option	Description
	Alias redirects only work when you redirect from one Site.com page to another. You can't create an alias to an external address.

4. Specify the former page location in the `Redirect from` field.
 - The page location must be a relative URL.
 - The page can have any valid extension type, such as `.html` or `.php`, and can contain parameters. Parameter order is irrelevant.
 - The URL can't contain anchors, such as `/siteprefix/page.html#target`.
 - You can create just one redirection rule *from* a particular URL. If you create a new rule with the same Redirect From information, the old rule is overwritten.
5. Specify the new page location in the `Redirect to` field. This can be a relative URL or a fully-qualified URL with an `http://` or `https://` prefix. Unlike pages you're redirecting from, pages you're redirecting to can contain anchors.
6. To immediately enable the redirection rule, ensure `Active` is selected. To enable it at a later stage, deselect the property.
7. Click **Save**.

The URL Redirects section displays all URL redirection rules you've created for your site.

- Edit an assigned redirect rule by clicking  > **Edit Redirect**.
- Delete a redirect rule by clicking  > **Delete Redirect**.

Importing External Websites into Site.com

With Site.com Studio, you can import your existing website and recreate it automatically as a Site.com site. This saves you the time of having to re-code existing HTML pages.

Create a zipped file of your website and the content with the desired folder structure. Create a new Site.com site and then [import](#) your zipped file.

During the creation of the new Site.com site, all your HTML pages and assets are copied into the new site in the same locations they are in the zipped file. Here are some guidelines for importing assets.

- Some code in style sheets may not convert properly to the Site.com format. If this happens, you'll receive a warning message. You can continue to import the zipped file or stop the import. If you continue, the style sheet imports and you can then manually attach it to your pages.
- You can edit the `<head>` section of a page using Edit Head Markup in scripts section on the properties pane. This is useful for manually editing the HTML.
- The maximum file size you can import is 50 MB unless you import and *unzip* a .zip file. In that case, you can import a .zip file of up to 200 MB if you select **Unzip files** during the import process. If your site is larger than 200MB when zipped, you can create more than one zipped file and import them individually.
- Site.com attempts to format links correctly when importing a page. Links are checked in content blocks, custom code, and head script markup. You can check for any links that might still be broken on your page using the link checker. Open the page, select  > **Find Broken Links**. A dialog displays showing any broken links. To fix the link, click **Edit**. The link opens in the HTML editor.

[Importing a Site.com Site](#)

Copying and Overwriting a Site

Sometimes, you might want to copy and replace your current production Site.com or Site.com community site with another site.

You'll first need to export a copy of your site from your . Once you have an exported `.site` file, import that file into your production organization using the overwrite feature. Overwrite replaces your production site with the imported site. You can only overwrite sites that are the same type. For example, you can't overwrite a Site.com site with a Site.com community site.

1. Create your `.site` file using the [export](#) feature in Site.com Studio.
2. From Site.com Studio in your production site, click **Site Actions** > **Overwrite This Site**. Alternatively, if you have access to the Site.com tab in your organization, you can click  next to the site name to find **Overwrite**.
3. Click **Browse** to find the `.site` file you exported.
4. Click **OK** at the overwrite warning.

 **Warning:** You can't revert once you have overwritten a site.

Here are a few tips when using overwrite.

- You'll need to publish the site you overwrote before changes take effect.
- When copying a site, the production site is overwritten. So, be sure to backup your production site by [exporting](#) a `.site` file.
- Overwrite does not copy data changes. For example, if you created a custom object to use in a repeater in the site you are copying from, that repeater won't work in the production site until you create the same custom object.
- If there are assets that exist in the production site that do not exist in the site you are copying from, they are moved to the trash can during the overwrite process so you can restore them if needed.
- If your copied site has a different name than your production site, the production name is preserved and only the contents are changed. For example, if your site is called Site One and you overwrite your production site called Site Two, the production site is still called Site Two.

[Exporting a Site.com Site](#)

[Using the Metadata API to Deploy a Site](#)

Using the Metadata API to Deploy a Site

As a user, you can migrate a site from sandbox to production. You can use the Metadata API to create a deployable package for Salesforce Communities sites and Site.com sites.

There are several tools that you can use to create a package:

- Change sets (for Site.com and Site.com Communities sites only). The component type is called `Site.com`.
- Workbench, which works for creating all site types. The metadata type is called `SiteDotCom`.
- Force.com migration tool for Ant, which works for creating all site types. The metadata type is called `SiteDotCom`.

If using change sets, select Site.com from the list and follow the prompts to create your package. If using Workbench or Force.com as your tool, you must create a `package.xml` file. That file is submitted to the Metadata API to create a package.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To overwrite sites:

- Site administrator or designer role assigned at the site level

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

 **Note:** You can include a Guest User Profile in your `package.xml` file. If you do so, that Guest User Profile is linked to the site during deployment.

The packaging process generates a folder that contains a content file and a metadata.xml file. The content file name is `[sitename].site`. The metadata.xml file name is `[sitename].site-meta.xml`.

If you deploy a package that doesn't include a `.site` file, an empty site is created. If the package contains a site file, and the organization already contains a site with the same name, the site is updated.

 **Note:** There is a file size limitation when using the Metadata API to deploy a site from sandbox to production. The assets in the `.site` file can't be larger than 40 MB. The site gets created, but the assets show in the new site as broken. To fix the assets, export the assets from the sandbox environment separately and then import them into your new site.

For help with the Metadata API, see the Metadata API Developer's Guide. You can find help for change sets in the online help and for the Force.com Migration Tool Guide at https://developer.salesforce.com/page/Migration_Tool_Guide.

Managing Site Assets

Importing and Managing Assets

Contributors, publishers, and site administrators can import a variety of assets, such as images, HTML pages, and PDFs, to use in a website. You can import assets and files individually, or use a zipped file. When importing entire websites or large numbers of assets, it's easier to create a zipped file of the content with the desired folder structure. When importing the zipped file for a website, Site.com recreates your website and places everything in the same folder structure.

Note:

- The maximum file size you can import is 50 MB unless you import and *unzip* a .zip file. In that case, you can import a .zip file of up to 200 MB if you select **Unzip files** during the import process.

The quickest way to import one or more files is to:

1. Select the files from your computer and drag them directly onto the Studio interface. This is supported for Mozilla® Firefox® and Google® Chrome only. You can drag individual files, or a zipped file.
 2. Depending on the types of files you're importing, a dialog box may appear that lets you:
 - Select **Unzip files** to extract the contents of a .zip file. If the .zip file includes folders, this structure is maintained in your site.
 - Select **Overwrite existing files** to replace a file that already exists in the site.
 - Select **Convert CSS files into style sheets**, if you're a site administrator or designer, to convert a CSS file into a style sheet that you can use to style your website.
-  **Note:** If you import a .zip file that includes CSS files, and they fail to convert, they may not be valid. Try unchecking this option and then re-importing the .zip file.
- Select **Convert HTML files into pages** to import HTML pages into your website. The structure of the HTML page is maintained in your site, but the HTML is not validated during import.

Alternatively, to import a single file:

1. Click **Import...**
2. Click **Browse...** to locate the file.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance,** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- Site.com Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

To edit only content in Site.com sites:

- Site.com Contributor User
- AND

Contributor role assigned at the site level

3. Select the file and click **Open**.
4. Depending on the type of file you're importing, you can:
 - Select **Unzip files** to extract the contents of a .zip file. If the .zip file includes folders, this structure is maintained in your site.
 - Select **Overwrite existing files** to replace a file that already exists in the site.
 - Select **Convert CSS files into style sheets**, if you're a site administrator or designer, to convert a CSS file into a style sheet that you can use to style your website.
 - 📌 **Note:** If you import a .zip file that includes CSS files, and they fail to convert, they may not be valid. Try unchecking this option and then re-importing the .zip file.
 - Select **Convert HTML files into pages** to import HTML pages into your website. The structure of the HTML page is maintained in your site, but the HTML is not validated during import.
5. Click **Import**. A message appears indicating whether the file was imported successfully.
6. Click .

You can [add images](#) and [videos](#) to the text areas of your site pages, or [create a hyperlink](#) to any imported asset. If you're a site administrator or designer, you can also [add images directly](#) to the page.

View the list of imported assets in the Assets view on the Overview tab. You can also access assets in the All Site Content view, which displays the folder hierarchy of your site.

- To view a thumbnail of an imported image, hover over it.
- To save an asset to your computer, hover over or select it and click  > **Download**.
- To remove an asset from your site if you're a site administrator or designer, hover over or select it and click  > **Delete**. If the asset is being used in your site, you see a confirmation message with a list of locations where that asset is in use.
- To rename an asset on your site if you're a site administrator or designer, hover over the asset and click  > **Rename**.

[Using Site.com Studio as a Contributor](#)

[Exporting Assets](#)

Exporting Assets

Designers and site administrators can export all site assets separately from the `.site` file. You can export assets together or individually.

When you export all assets, the assets are exported to a zipped file that is named after the site name—for example, `sitename-Assets.zip`.

Export your assets from the Overview tab by clicking  > **Export Site Assets**.

To export a single asset, hover over the asset and select **Download** from the Actions menu.

 **Note:** There is a file size limitation when using the Metadata API to deploy a site from sandbox to production. The assets in the `.site` file can't be larger than 40 MB. The site gets created, but the assets show in the new site as broken. To fix the assets, export the assets from the sandbox environment separately and then import them into your new site.

Site.com Page Templates Overview

Before you begin building the pages of your website, take some time to plan the pages you need, and in particular, which pages will have a similar layout. Once you've decided on the layout, the quickest method is to use a page template to build the basic layout.

About Page Templates

A page template lets you define the layout and functionality of site pages in one location. By adding common page elements to the template and then basing site pages on it, you can achieve a consistent look and feel throughout your site. Page templates don't appear on your public site.

As the template creator, you specify which elements users can edit in pages based on the template. By default, a page element in a template is “locked,” so users can't edit its contents in any template-based page unless you mark the page element as “editable.” Conversely, when users edit an editable page element in a template-based page, their changes are specific to that page and don't affect your template.

For example, this main page template contains a non-editable header and navigation menu that are common to all the pages in the site (1). The main template also has an editable center panel (2) to house the page-specific content of each page that's based on it.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Note:

- Page templates must contain at least one editable page element. Otherwise, users can't edit site pages that are based on the template.
- [Panels](#) are ideal for adding editable areas to page templates.

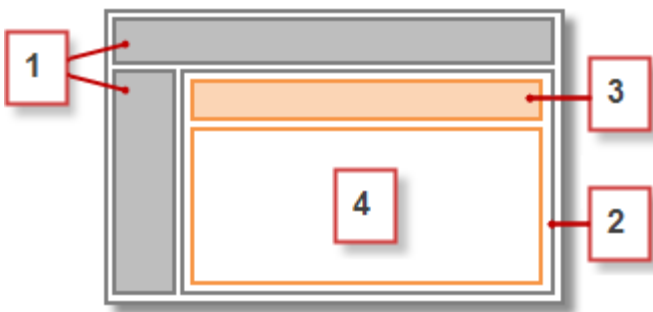

You can use page templates to:

- Save time and effort by laying out the page structure and using it as a starting point when you create site pages. For example, you could design a template with a fixed header panel and side menu, and an editable center panel, to which you add page-specific page elements and content.
- Quickly make global updates to the layout or style of your website, as any changes you make to the template's design are reflected immediately in all the pages that use it.
- Control how other users (such as contributors or other site administrators and designers) can modify site pages. For example, you may allow contributors to edit specific content blocks only.
- Ensure your template design remains pixel-perfect. When users edit a page that's based on a template, their changes don't affect your template.
- Reuse common design elements by creating child templates.
- Allow contributors to create site pages that are based on the template.

About Child Templates

Child templates are a useful way to reuse common design elements for more complicated page layouts. For example, your website will probably have elements that are the same on every page in your site, such as a navigation menu. However, several pages may have elements that are common only to them, such as pages in a subsection of your site that include a subsection header. By using a child template, which is a template that's based on another template, you can reuse the main template design.

Using our main page template as a base, the child template inherits the non-editable header and navigation menu (1), and an editable center panel (2) where we add the non-editable subsection header (3). We also need to add a new editable center panel (4) because the center panel of the main template is editable only in pages directly based on the main template.

Now, any page based on the child template includes the non-editable main header, navigation menu, and subsection header, and an editable center panel (5) for that page's content.

Best Practices

- Plan your site structure and the layout of your pages. Taking the time to plan your website first saves time when you build your site.
- Identify which elements are common to all the pages of your site, such as navigation menus or headers, as these are the elements you can add to the page template.
- Use page templates wherever possible to promote content reuse and save time.
- Try to keep the design of your main page template as simple as possible to make it easier to modify in the future. For more complicated site designs, use [child templates](#) to achieve maximum flexibility.

SEE ALSO:

[Creating Site.com Page Templates](#)

[Creating Site.com Pages](#)

[Setting Up the Contributor's Studio View](#)

[Identifying Which Template a Site.com Page Uses](#)

Creating Site.com Page Templates

A [page template](#) lets you define the layout and functionality of site pages in one location. By adding common page elements to the template and then basing site pages on it, you can achieve a consistent look and feel throughout your site. And because a template-based page inherits the template's elements, you can make site-wide changes from one location.

You can create a page template from a layout, or if you've already created a template, you can use it as a base to create a [child template](#), which lets you reuse the design of the main template.

Creating a Page Template from a Layout

To start from scratch with a completely blank template or use a basic page layout:

1. Hover over **Page Templates** on the Overview tab and click **New**, or click **New Page Template** in the Page Templates view.
2. Enter the page template name. Template names can't include special characters, such as #, ?, or @.
3. Click **Layouts** and select either a blank page or a predefined page layout, such as a page with a header and footer.

Note: Predefined page layouts use [panels](#) to create columns, headers, and footers. These panels use inline CSS to set their position, so you can easily modify the layout after the page is created. However, if you're familiar with CSS and prefer using CSS rules, you can remove the inline style by selecting the panel, deleting the code from the Code tab in the Style pane (), and clicking **Apply**.

4. Choose a layout mode:
 - To expand the page to fill the width of the browser window, click **Full width**.
 - To set the page width, click **Fixed width** and enter the width.
5. Click **Create**. The page template opens.

Next, you must [complete the template](#).

Tip:

- By default, any template you create is only available to other site administrators and designers in your organization. To let contributors create pages based on the template, select **Available to Contributor** in the Properties pane ().
- You can also create templates by [converting or duplicating other pages](#).

Creating a Child Template

To use an existing template as a base for a child template:

- The quickest option is to:
 1. Select the template in the Page Templates view on the Overview tab and click  > **Create Child Template**. Alternatively, click **Page Actions** > **Create Child Template** if the template is open.
 2. Enter the page template name. Template names can't include special characters, such as #, ?, or @.
 3. Click **Create**. The child template opens.
- Alternatively:

About Editable Page Elements

When you mark a page element as `Editable` on a page template, that page element becomes editable in any child pages or templates derived from the parent template.

Consider these tips when creating editable page elements.

- Editable page elements are highlighted with a blue border in child pages and templates.
- If you make a page element within a panel editable, you can't also make the container panel editable.
- Users can't alter the events, style, or properties of an editable page element in pages based on the template.
- Users can't resize, reposition, or delete editable page elements in pages based on the template. However, if the element's [Auto Height property](#) is enabled in the template, its height will adjust to fit the content of the template-based page.
- Deleting an editable element from a page template removes it from all child pages and templates.
- When you enable the `Editable` property of a page element, any pages or child templates based on the template also inherit the enabled status. In turn, the enabled status in the child template cascades to any of *its* children, and so on. If you don't want its editability to cascade to any lower levels, disable the `Editable` property of a page element in a child template.

Editable Page Elements for Contributors

- Contributors can modify editable content blocks in site pages based on the template. They can also edit content blocks that you place in an editable panel in template-based site pages.

Tip: To add a content block that only other site administrators or designers can edit, use [custom code](#) instead.

- Contributors can add content blocks to editable panels in site pages based on the template. If you make widgets available to contributors, they can also add them to editable panels.
- Site administrators and designers can edit any page element you make editable.

Default Content in Editable Page Elements

The content of all editable page elements on a child page or template is linked to the content of the editable elements on its parent page template. When you update the content of an editable page element on the parent template, the changes are pushed down to any child pages or page templates. However, if you modify the content of an editable page element at the child page or template level, you break the link between the elements, and any subsequent changes made to the page element on the parent template won't trickle down to its children. (To return control of the content to the parent template, select the editable page element on the page or in the Page Structure pane and click  > **Revert to Parent Content**. When you do this, any custom content in the editable page element is lost.)

Disabling the `Editable` property of a panel in a parent template overrides any changes made to that panel in child pages or templates. Changes to the panel at the child level disappear, and the panel reflects only the content from the parent template. However, the changes

at the child level aren't lost. Re-enabling the `Editable` property of the panel in the parent template restores the custom content previously added to its children. Any changes made to the element at the parent level will no longer show up.

Creating Site.com Pages

As a site administrator or designer, when you create a site page, you can choose to base it on a [page template](#). If you're creating several site pages that have common page elements, such as a navigation menu, you can save time and effort and achieve a consistent look and feel by [creating a page template](#) first and then basing your site pages on it. Alternatively, if none of your site pages have a similar structure or if you need to create a one-off site page that doesn't follow the overall site design, such as a home page, you can create a page based on a basic layout.

Creating Site Pages from a Layout

Start from scratch with a completely blank page or use a basic page layout.

1. Hover over **Site Pages** on the Overview tab and click **New**, or click **New > Site Page** when the Site Pages view is open.
2. Enter the site page name. Page names can't include spaces or special characters, such as #, ?, or @.
3. Click **Layouts** and select either a blank page or a predefined page layout, such as a page with a header and footer.

 **Note:** Predefined page layouts use [panels](#) to create columns, headers, and footers. These panels use inline CSS to set their position, so you can easily modify the layout after the page is created. However, if you're familiar with CSS and prefer using CSS rules, you can remove the inline style by selecting the panel, deleting the code from the Code tab in the Style pane (), and clicking **Apply**.

4. Choose a layout mode:
 - To expand the page to fill the width of the browser window, click **Full width**.
 - To set the page width, click **Fixed width** and enter the width.
5. Click **Create**. The site page opens.

Creating Site Pages from a Page Template

If you created a page template, you can base your site pages on it.

The quickest option is to:

1. Select the template in the Page Templates view and click  > **Create Page from Template**. Alternatively, click **Page Actions > Create Page from Template** if the template is open.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Identifying Which Template a Site.com Page Uses

When you edit a template-based page, you can't modify its non-editable page elements. You also can't reposition, resize, or delete editable page elements, or alter the events, properties, or style associated with them. To update these elements or properties, you must edit them in the template the page is based on.

To identify which page template a site page is based on:

- Hover over the site page in the Sites Pages view on the Overview tab. An information popup appears that displays the page template's name.

- Examine the Page Structure pane when the page is open. The template's name is displayed as a link that you can click to open the template.

Renaming, Duplicating, and Converting Pages

When working with pages and templates, you can perform common tasks, such as renaming, deleting, or duplicating pages.

To access more page options, select or hover over a page on the Site Pages view of the Overview tab and click .

To access more template options, select or hover over a template in the Page Templates view of the Overview tab and click .

Alternatively, if the page or template is open, click on the toolbar.

The available options vary for pages and templates:

Select	To...
Edit	Open the page or template for editing. Alternatively, double-click the page or template.
Rename	Change the page or template name.
Preview	View the page in a browser window.
Duplicate	Create a copy of the page or template. Duplicating a page template doesn't duplicate the pages or templates based on it.
Delete	Remove a page or template. You can't delete a template that has pages based on it.

Adding Features and Page Elements

Site.com Page Elements

Page elements are the building blocks of your site pages and page templates. Combined, they provide the page's structure and content.

When a site page or page template is open in Site.com Studio, these page elements are available to site administrators and designers.

Page Element	Description
Content Block	Contains the page text, and can also house images, media, and hyperlinks. Also available to contributors if the page has editable areas.
Custom Code	Lets you customize your site by adding markup, such as HTML and JavaScript for elements that aren't provided in Site.com Studio.
Image	Adds images directly to the page.
Breadcrumb	Adds a breadcrumb navigation element to the page.
Menu	Creates a menu that lets users navigate through the pages of your site.
Panel	Adds structure to the page and lets you group other page elements together.
Button	Adds a button to the page. You can use the actions in the Events pane to add functionality to the button.
Form	Lets you create web-to-lead forms or gather customer feedback, and submit the data to Salesforce objects.
Input Fields	Provides several field types to add to forms or pages. When added to a form, binds to fields in the form's object. See Input Field Types on page 4457.
Data Element	Must be contained in a data repeater. Binds to a field in the data repeater's object and acts as a placeholder that shows the content of a specified field for the current record.
Data Function	Connects to a standard or custom Salesforce object, performs calculations on the returned results, and displays the calculation on the page.
Data Repeater	Connects to a Salesforce object and returns a dataset based on filters that you specify.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Page Element	Description
	Combines with data elements or custom code page elements to display the results on the page.
Data Table	Connects to a standard or custom Salesforce object, retrieves a data set based on the filter criteria that you specify, and displays one or more record as rows in the table.

- [Editing and Working With Site.com Page Elements](#)

Adding Site.com Page Elements

[Page elements](#) are the building blocks of your site pages and page templates. [Panel elements](#) add structure to your pages. You can think of both pages and panels as “containers” for the page elements that you add to them.

If a site page or page template is based on another [page template](#), you can only add page elements to [editable panels](#), which are highlighted with a blue border on the page.

Pages, panels, data repeaters, and forms are “container” page elements, so you can add other page elements to them when the page is open.

- In the Page Elements pane (), either:
 - Drag the page element onto the page canvas or container page element.
 - Click the page element, select where to place it in the popup that appears, and click **Apply**.
- In the Page Structure pane (), hover over a container page element and click  > **Add Page Elements**. Click the item you want to add or drag it onto the container page element.
- Select a container page element on the page and click  > **Add Page Elements**. Click the item you want to add or drag it into the container page element.

When you drag a page element into an editable panel, the page element displays a permitted icon and a green border shows where you're placing the element.

If you try dragging a page element into a panel that isn't editable, the page element displays a not-permitted icon.

Editing and Working With Site.com Page Elements

The Page Structure pane () displays the hierarchy of all elements on the page and is a very useful way of selecting, moving, and reordering elements, particularly for more complicated page designs.

- To select a page element, either click it on the page, or select it in the Page Structure pane. This highlights the element on the page and displays the item's selector bar and **Actions** menu ().
- To edit a page element, such as a content block, image, or custom code, either:
 - Double-click the element on the page.
 - Select the element on the page and click  > **Edit** on its selector bar.
 - Select or hover over the element in the Page Structure pane and click  > **Edit**.
 - Click **Edit Content** on the toolbar (for content blocks only).
- To move a page element, either:
 - Select the element on the page and drag it to the correct position, or click  > **Move** on its selector bar.
 - Drag the item to your preferred location in the Page Structure pane, or select it and click  > **Move** > *Direction*. You can also drag all page elements other than panels to your preferred location in the Page Structure pane.
- To resize a page element, select it and drag the resize handles to the correct size. If the corner resize handles are grayed out, it means the item's Auto Height property is enabled, which adjusts the height depending on its contents. To resize it to a set height, disable the property by either deselecting **Auto Height** in the Properties pane (), or by clicking one of the bottom resize handles and clicking **Disable Auto Height** in the popup message that appears.
 -  **Tip:** If you disable the Auto Height property on an image, but you want it to retain its aspect ratio—the relationship of height to width—press and hold down the SHIFT key while you drag to resize it.

Alternatively, if you're using CSS to style the page element, adjust the style of the class or ID that styles it.
- To delete an element, select it and either:
 - Click  > **Delete** on the item's selector bar.
 - Press **DELETE**.

[Adding Content Blocks to Pages](#)

[Laying Out Site.com Pages Using Panels](#)

[About Editable Page Elements](#)

Working with Panels

Laying Out Site.com Pages Using Panels

A panel is a useful layout tool that defines the logical divisions of your page and lets you group page elements together for easy movement and positioning. Think of it as a container for other page elements, including other panels, or as a `div` that wraps around the content placed within it. Panels are ideal for adding editable areas to [page templates](#).

When you create a page template or site page, you can use predefined page layouts that include headers, footers, and columns, which are created using panels. Once created, you can then further modify the layout to match your site's design.

If you need to add more divisions to the page and you're not familiar with CSS, the easiest method is to use row and column panels. This feature adds panels with predefined CSS positioning to ensure they align correctly on the page.

 **Note:** Predefined page layouts, and row and column panels use inline CSS to set their position. If you're familiar with CSS and are using CSS rules to style your site, you can remove the inline CSS by deleting it from the Code tab in the Style pane () and clicking **Apply**.

To add row and column panels to a page:

1. Select the page (the top folder icon) in the Page Structure pane ().
2. Click  > **Add Rows and Column Panels**.
3. Select the number of row or column panels you require. If the page already contains content, it is placed in the first new panel.

To add a row panel:

- Above a panel, select the panel on the page or in the Page Structure pane and click  > **Add Rows and Column Panels > Insert Row Above**
- Below a panel, select the panel on the page or in the Page Structure pane and click  > **Add Rows and Column Panels > Insert Row Below**

To add row and column panels to another panel:

1. Select the panel on the page or in the Page Structure pane.
2. Click  > **Add Rows and Column Panels**.
3. Select the number of row or column panels you require. If the page already contains content, it is placed in the first new panel.

To add a single panel, drag a **Panel** from the Page Elements pane () onto the page.

By default, the height of a panel automatically adjusts when you add content to it because its Auto Height property is enabled. You can [disable the property to resize and reposition](#) panels. If you hover over a panel on the page, an information popup appears that displays the width and height of the panel.

Panel
Width: 50%
Height: Auto Height

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- Site.com Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

When you drag a page element onto a panel, the edges change color, indicating that the element is now grouped within it. To remove the element from the group, drag it outside the panel.

SEE ALSO:

[Adding Site.com Page Elements](#)

[Positioning Panels Using CSS](#)

[Changing a Page Element's HTML Tag](#)

Positioning Panels Using CSS

A panel is a useful layout tool that defines the logical divisions of your page. Using CSS, you can position panels and improve the layout of the page.

Adding Padding and Margins to Panels

Two CSS properties—[margins and padding](#)—can help with your page layout by creating space between the rows and columns, and the content within. The margin property controls the space outside the panel between its border and outer edge, while the padding property controls the space between the panel's content and border.

To add margins and padding:

1. Select the panel.
2. Open the Dimensions section of the Style pane.
3. In the Margins section, either:
 - Set the margin width for all four sides by entering a value in the `A11` text box and selecting the unit of measurement.
 - Set the margin widths for the top, right, bottom, or left sides independently by entering a value in the appropriate text box and selecting the unit of measurement.
4. Similarly, in the Padding section, set the padding widths as required. Adding padding increases the total width of the panel. For example, if you have a panel with a width of 500px and you add padding of 20px to all sides, the total width of the panel will be 540px.

 **Tip:** You can center a panel or block page element using the margin property. Enter `0` in the `A11` text box and select Auto in the drop-down list.

Creating Column Panels Using the Float Property

If you need to add more divisions to the page and you're not familiar with CSS, the easiest method is to use [row and column panels](#). Alternatively, using the CSS [float](#) property, you can position panels to the left or right to create columns. (When you add panels using the row and column panels feature, they're automatically positioned using the float property.) For example, you could add two single panels to a container panel and set both panel's float and width properties to create a two-column page layout.

To create a column panel:

1. Select the panel.
2. Open the Layout section of the Style pane.
3. Click  to float the panel to the left, or click  to float the panel to the right. If you're creating a two-column layout, for example, ensure you set the float property of both panels.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- `Site.com Publisher User` field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

- Adjust the width of the panel to ensure the panels align correctly by either setting the width in the Dimensions section or dragging the panel's border on the page. For example, if you're creating two columns of equal width, set the width of both panels to 50%.

Tip: When you use the float property, remember to set the overflow property of the container panel to "hidden." This allows the container panel to grow as the height of the column panels increase. Select the container panel and in the Layout section of the Style pane, select Hidden in the Overflow drop-down list.

Adding Images Directly to the Page

As a site administrator or designer, you can add images directly to your site pages and page templates or you can [add images to content blocks](#).

To add an image directly to the page:

- Open the site page or page template.
- Drag an **Image** from the Page Elements pane onto the page.
- In the Add an Image dialog box, either:
 - Find an existing image by typing its name in the `Search Image` text box and selecting it from the list.
 - Upload an image from your computer in the Upload tab by browsing to the image, clicking **Upload**, and selecting it from the list.
- Click **Apply**. The image is added to the page.
- Enter a brief description of the image in the `Alternative Text` field in the Properties pane. The description is used by screen reader users or as a substitute if the browser can't display the image. It can also help with search engine optimization (SEO).

Understanding the Content Editing Toolbar

Designers and site administrators can [edit content blocks](#) when in Design mode. Content blocks contain the site page's text, along with images, videos, and hyperlinks.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

When in Design Mode, you can use the content editing toolbar to:

- Undo and redo your edits, and remove the formatting of text copied and pasted from Microsoft® Office, which can often include hidden formatting (1).
 - Cut, copy, and paste text (2).
 - Apply direct formatting (3), such as:
 - Font family and size
 - Bold, italic, underline, subscript, superscript, and strikethrough
 - Font and highlight color
 - Control the text style and layout (4) by:
 - Applying paragraph and heading styles
 - Setting paragraph indentation
 - Left-aligning, centering, right-aligning, or justifying text
 - Inserting numbered or bulleted lists
 - Insert a table, and add rows, columns, and spacing (5).
 - Add [images](#), [videos](#), and special characters (6).
 - Add and remove [hyperlinks](#) and [anchors](#) (7).
-  **Tip:** Avoid applying formatting, such as different fonts or highlighting, directly to text whenever possible. Instead, it's best practice to use the paragraph and heading styles to quickly apply consistent formatting throughout the site. This also ensures that all page text is updated automatically if a site administrator or designer modifies the site's paragraph and heading styles.

Editing Content Blocks in Design Mode

Designers and site administrators can edit content blocks on the page. Content blocks contain the text for site pages, and can also house images, videos, and hyperlinks.

When the page is open in Design Mode:

1. Double-click the content block on the page.
2. Add or edit text and format it using the [content editing toolbar](#).

Tip:

- If you copy and paste text from Microsoft® Office, highlight the text and click  to remove any hidden formatting, which can adversely affect how the text appears on the page.
- Avoid applying formatting, such as different fonts or highlighting, directly to text whenever possible. Instead, it's best practice to use the paragraph and heading styles to quickly apply consistent formatting throughout the site. This also ensures that all page text is updated automatically if a site administrator or designer modifies the site's paragraph and heading styles.

3. Add [images](#), [videos](#), [hyperlinks](#), or [anchors](#) as required.
4. Click **Save**.

 **Note:** The content of all editable page elements on a child page or template is linked to the content of the editable elements on its parent page template. When you update the content of an editable page element on the parent template, the changes are pushed down to any child pages or page templates. However, if you modify the content of an editable page element at the child page or template level, you break the link between the elements, and any subsequent changes made to the page element on the parent template won't trickle down to its children.

Adding Images to Content Blocks in Design Mode

Designers and site administrators can add images to content blocks when viewing a page in Design Mode.

When the page is open:

1. Double-click the content block on the page.
2. Position your cursor where you want to insert the image and click .
3. In the Image Properties dialog box, either:
 - Enter a URL to an image in the `Image URL` field.
 - Select an image from your website by clicking **From Website** and selecting the image in the list that appears.
 - Upload an image from your computer by opening the Upload tab, browsing to the image, and clicking **Upload**.
4. Enter a brief description of the image in the `Alternative text` field. The description is used by screen reader users or as a substitute if the browser can't display the image. It can also help with search engine optimization (SEO).
5. Optionally, preview how the image appears in relation to the text on the page and set:
 - The width and height of the image
 - How much space surrounds the image (which is controlled by the `HSpace` and `VSpace` properties)
 - How it aligns with the text on the page
 - The image border (for example, to set a dotted green border that's 10 pixels wide, you enter `10px dotted green` in the `Border` field)
6. Click **Apply**.
7. Click **Save**.

Adding Video to Content Blocks in Design Mode

Designers and site administrators can add YouTube®, Google®, Adobe® Flash®, Windows Media®, and Apple QuickTime® videos to content blocks when viewing a page in Design Mode.

When the page is open:

1. Double-click the content block on the page.
2. Position your cursor where you want to insert the video and click .
3. In the Video Properties dialog box, select the video type and either:
 - Enter the URL to the video in the `video URL` text box—for example, `http://www.youtube.com/watch?v=123abc`.
 - Select a video from your website by clicking **From Website** and selecting the video in the list that appears.
 - Upload a video from your computer by opening the Upload tab, browsing to the image, and clicking **Upload**.
4. To specify how the video is displayed on the page, you can set:
 - The width and height of the video
 - How much space surrounds the video (which is controlled by the `HSpace` and `VSpace` properties)
 - How it aligns with the text on the page

You can also preview the video.
5. Click **Apply**. The video appears as an icon in the content block.
6. Click **Save**.

 **Note:** You can view all video types, other than Windows Media videos, when you [preview a page](#).

Attaching Hyperlinks to Text and Images in Design Mode

When viewing a page in Design Mode, designers and site administrators can create hyperlinks to:

- External Web pages or websites
- Pages and assets in the site
- Email messages
- Anchors on the page

When the page is open:

1. Double-click the content block on the page.
2. Select the text or image that you want to attach a hyperlink to and click .
3. Select the link type in the Link to drop-down list. To link to:
 - A Web page:
 - a. Select **A URL**.
 - b. Type the address in the URL field—for example, `http://www.externalsite.com`.
 - c. Go to step 4.
 - A page or item in your site:
 - a. Select **An item in your site**.
 - b. Select the item type, such as a page or image.
 - c. Select the item. (If you can't see the list of items, place your cursor in the URL field and press the DOWN key on your keyboard.)
 - d. Go to step 4.
 - [An anchor](#) that you previously added to the page:
 - a. Select **An anchor on the page**.
 - b. Select the anchor in the drop-down list. Alternatively, enter a new anchor name and create the anchor afterwards.
 - c. Go to step 5.
 - An email message:
 - a. Select **An email**.
 - b. Enter the recipient's email address and the message information.
 - c. Go to step 5.

 **Note:** For content blocks in a data repeater, you can use [expressions](#) to add a custom link, such as a URL query string, to an item in your site or to a Web page.
4. To select which window the item should open in, select an option in the Target drop-down list:
 - **Popup window** loads the item into a popup window. When you select this option, you can set the title for the popup and control its appearance and size with the options that appear.
 - **New window (_blank)** loads the item into a new, unnamed browser window.
 - **Same window (_self)** loads the item into the same frame or window as the link. This is the default setting.
 - **Topmost window (_top)** loads the item into the topmost parent frameset or window of the frame that contains the link.

EDITIONS

Available in: Salesforce Classic

Adding Anchors to Pages in Design Mode

An anchor is an invisible marker that identifies a particular location on a page. If you're a designer or site administrator, you can add an anchor to the page and then create a hyperlink that jumps to that specific location. This can be useful if a page is particularly long; for example, if your page has several sections, you could add links to each section at the top of the page to aid navigation.

When the page is open in Design Mode:

1. Double-click the content block on the page.
2. Place your cursor at the beginning of the line where you want to link to and click .
3. Enter a name for the anchor and click **Apply**. Ideally, use a name that helps identify the anchor's location on the page—for example, *top*.
4. Now [create a hyperlink](#) that links to the anchor.

Adding Custom Code to Pages

Custom code lets you customize your site using markup, such as HTML and JavaScript.

- [Add markup to a specific location on a page](#) using the Custom Code page element. JavaScript added using the Custom Code page element loads when that part of the page loads.
- [Add markup to the page head](#). JavaScript in the page `head` loads first.
- [Add JavaScript to the page body](#) on page 4398. JavaScript added to the page `body` is positioned at the end of the `body` tag and only loads when the DOM is ready.
- [Add a reference to a JavaScript file or library](#) on page 4398 in the page `head` or `body`.

Tip:

- Scripts can't execute while you're editing a page in Site.com Studio. To test your code, preview the page.
- If you are building a Site.com site from an existing HTML site, avoid using the Custom Code page element to paste large chunks HTML from the original site. Instead, use the available page elements, such as [panels](#), [content blocks](#), and [data tables](#). This will let you make future updates and design changes much more easily.

Adding Markup Directly to the Page

1. Drag a **Custom Code** page element from the Page Element pane onto the page.
2. Enter the code in the Edit Code dialog box.
3. Click **Save and Close** to add the code directly to the page.

Adding Markup to the Page `head`

1. In the Scripts section of the Properties pane, click **Configure** in the Edit Head Markup section.
2. Enter the markup in the Edit HTML Code dialog box.
3. Click **Save and Close** to insert the markup into the page `head`.

Adding JavaScript to the Page `body`

1. In the Scripts section of the Properties pane, click **Configure** in the Edit Body Scripts section.
2. Enter the code in the Edit JavaScript Code dialog box. Don't add `<script>` tags, as they're already included.
3. Click **Save and Close** to add the code to the bottom of the page `body`.

Using JavaScript Files or Libraries

Instead of adding JavaScript code directly to a page, you can include links to imported or external JavaScript files, or to an open-source library (via the Google Libraries API).

1. In the Scripts section of the Properties pane, click  in either the Body Scripts or the Head Scripts section.
2. To link to:
 - A JavaScript file that you've imported, select **An imported script** and select the file.
 - An open-source JavaScript library, select **A Google AJAX library** and select the library.
 - An external JavaScript file, select **A URL to an external script** and enter the address.

Adding Website Navigation

About the Site Map and Page Hierarchy

The Site Pages view on the Overview tab contains the pages and [site map links](#) of your website. The Site Map folder reflects the hierarchy or tree structure of your site by housing site pages and links that are included in the site map. When you create new pages or site map links, they're automatically added to this folder. The Landing Pages folder houses standalone pages that are excluded from the site map, making it ideal for temporary pages, such as promotional or competition pages.

 **Tip:** If you can't see the Site Map folder in the Site Pages view on the Overview tab, click .

When adding a navigation menu to your site, it's important to organize the hierarchy of your site pages and links accurately, because this structure is used to generate the menu. Pages and site map links are displayed in navigation menus in the order you arrange them.

In this representation of the site hierarchy, you can more clearly see the tree structure.

1. The Site Map folder, which contains four site pages.
2. A top-level page in the site hierarchy.
3. A top-level, parent page with two child pages. A child page is a page at a lower level in the site hierarchy than its parent page.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

4. Two child pages.
5. The Landing Pages folder, which contains a temporary page that's not part of the site map or navigation menu.

 **Tip:** If a page has child pages, the  icon appears beside it indicating that you can expand the branch.

By default, when you create a menu, it's generated from the pages and site map links in the Site Map folder in the Site Pages view. However, you can also create a menu that's generated from the pages in the Landing Pages folder or from the child or sibling pages of a site page.

You can hide a page in menus, breadcrumbs, and the site map by selecting the `Hide Page` checkbox found on the Properties pane for each page. This setting also prevents website visitors from accessing the page's direct URL. By default, all pages are visible.

SEE ALSO:

[Adding a Navigation Menu](#)

[Creating Site.com Pages](#)

Adding Links to a Site Map

Pages aren't the only things you can assign to your site map. Add internal or external URLs to your site map to customize your navigation menus and breadcrumbs, and achieve greater flexibility and control.

For example, let's say you have a top-level Products page that has a menu based on its child pages. You also want to include a page called Testimonials in the menu, but it's not a child page of the Products page. You can create a site map link that points to the Testimonials page and add the link under Products in the site map. Now when visitors view the Products page, they see a menu consisting of its child pages, along with a menu item that takes them directly to Testimonials.

1. On the Overview tab, click **New > Site Map Link**.
2. Enter a name for the link.
3. Enter a URL. URLs can be either relative or absolute, and are case sensitive.

 **Note:** You can't preview absolute site map links in Site.com Studio unless they include a prefix, such as `http://` or `https://`.

4. Click **Create**.
The link appears at the bottom of the site map.
5. Drag the link to the correct position in the site map.

 **Note:** Site map links are automatically included in navigation menus and breadcrumbs. However, you can't set a site map link as a custom root node in a breadcrumb.

Adding Breadcrumb Navigation to Pages

Add a Breadcrumb page element to your page to help users navigate through your site and show the page's location in the site hierarchy.

Breadcrumb navigation is based on the pages and links in the site map and usually supplements menu navigation. You can hide a page in menus, breadcrumbs, and the site map by selecting the `Hide Page` checkbox found on the Properties pane for each page. This setting also prevents website visitors from accessing the page's direct URL. By default, all pages are visible.

 **Tip:** To save time and effort, add a Breadcrumb page element to a page template to automatically include it on every template-based site page. The breadcrumb on each derived page dynamically updates based on its location in your site map.

1. Open the page or page template that you want to add the breadcrumb element to.
2. Drag a **Breadcrumb** from the Page Elements pane onto the page.
3. In the Properties pane, under `Root`, specify a custom root node for the breadcrumb. By default, the root value is set to `None`, which builds the breadcrumb structure based on the page's location in the site map.
 - Select `Home Page` to set the site's home page as the first item in the breadcrumb. To find out how to set a site's home page, see [Configuring Site Properties](#).
 - Select a specific site page to set it as the first item in the breadcrumb.

 **Note:** You can't set a site map link as a custom root node in a breadcrumb.

4. In the Properties pane, under `Separator`, you can customize the separator used between breadcrumb nodes.

By default, the separator is `>`. However, you can change it to another text symbol or insert HTML code for an image in your site, such as ``.

5. To style the breadcrumb:
 - a. Click the Style pane and ensure `Class` is selected.
 - b. Choose an option from the Style drop-down list.
 - c. Adjust the values in the [Visual tab](#) as desired.

Adding a Navigation Menu

By default, when you create a menu, it's generated from the pages and site map links in the Site Map folder in the Site Pages view. However, you can also create a menu that's generated from the pages in the Landing Pages folder or from the child or sibling pages of a site page.

1. Arrange site pages and [site map links](#) in the Site Map folder or the Landing Pages folder in the order you want them to appear in the menu by dragging them to the desired location. Drag a page or site map link onto another page or link to make it a child of that item. Drag pages or links into the Landing Pages folder to exclude them from the site map.

 **Tip:** If you can't see the Site Map folder in the Site Pages view on the Overview tab, click .

2. Open the page template or site page that you want to add the navigation menu to.
3. Drag a **Menu** from the Page Elements pane onto the page.
4. In the Properties pane, under Menu Source, select the pages that you want to use for the menu. By default, the Site Map folder is used to create the menu. Any site map link in the applicable hierarchy also shows up in your menu.
 - Select *Landing Pages* to create the menu from the pages in the Landing Pages folder.
 - Select *Child Pages* to create the menu from the current page's child pages.
 - Select *Sibling Pages* to create the menu from all of the pages that share the same parent as the current page.
 - Select a specific site page to create the menu from just its child pages.

 **Note:** If you add a menu element to a page template, the menu doesn't display correctly in the template if you select *Child Pages* or *Sibling Pages* as the menu source, because page templates aren't part of the site map hierarchy. However, the menu appears as expected on site pages based on the page template.

5. To alter the appearance of the menu, you can select a different theme from the Theme Name drop-down list. For example, to create a drop-down menu, select `Horizontal Drop-down`. You can [modify the style of any theme](#) to suit your needs.
6. To change the name of a page in the menu, open the associated page and update its `Navigation Name` field in the Properties pane. Navigation names can include spaces and special characters.

Alternatively, to change the name of a site map link in your menu, hover over the link in the Site Pages view on the Overview tab, click **Edit**, and update the name.

 **Tip:**

- When you add a new page or site map link, update a page's `Navigation Name` property, or rearrange pages or links, the menu updates automatically to reflect the changes.
- To automatically include a menu on every site page, add the menu to a [page template](#) and base the site pages on it.

[Styling Navigation Menus](#)

[About the Site Map and Page Hierarchy](#)

[Adding Site.com Page Elements](#)

Styling Navigation Menus

Navigation menus are styled using CSS themes that you can customize to match the design of your website. When you add a navigation menu to a page, it uses a default theme to control its appearance. Choose from other existing themes in the Theme Name drop-down list in the Properties pane.

Alternatively, to customize a theme to suit your needs:

- Select the navigation menu on the page.
- Select a theme to use as a base in the Theme Name drop-down list in the Properties pane. Use a theme that most closely matches your site design or select `Blank` to start with a completely blank theme.
- Open the Style pane and ensure `Class` is selected.
- In the Style drop-down list, select the part of the menu that you want to style. When you select an item, it's highlighted for a few seconds, so you can easily see which part you're styling.

Tip: If you're familiar with CSS, you can also modify the style of the menu in the site's style sheet.

- To style the selected menu item, use the [Style pane properties](#). Your changes are immediately reflected in the menu.
- Repeat as required for each part of the menu.

Adding Custom HTML Attributes

You can add custom HTML attributes to pages and page elements, which are rendered on the HTML tag of the page element. For example, this is useful when working with third-party frameworks that render page elements differently based on certain attributes.

When the page is open:

1. Select the relevant page or page element in the Page Structure pane.
2. In the HTML Attributes section of the Properties pane, click .
3. Enter a name and value for the HTML attribute.
4. Click **Save**.

To delete an HTML attribute, select it and click .

To change the order in which an HTML attribute is rendered, select it and click  or .

Changing a Page Element’s HTML Tag

By default, panels, data repeaters, data elements, custom code, and content blocks are each defined as a `div`, but you can change this to any other HTML tag using the `HTML Tag` property. This gives you greater flexibility and control over how the page element is displayed on the page.

 **Warning:** The `HTML Tag` property provides a powerful way to control how page elements are displayed. However, if you change a page element’s HTML tag, you may generate invalid HTML. Before publishing any changes, test the page thoroughly.

To redefine a panel, data repeater, data element, custom code, or content block:

1. Select the element on the page.
2. In the `HTML Tag` field in the Properties pane, start typing the tag name.
