[Track Field History](#)

### EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

Standard Objects are not available in **Database.com**

### USER PERMISSIONS

To set up which fields are tracked:

- "Customize Application"

## Track Field History for Custom Objects

1. From the management settings for the custom object, click **Edit**.
2. Select the `Track Field History` checkbox.
 

 **Tip:** When you enable tracking for an object, customize your page layouts to include the object's history related list.
3. Save your changes.
4. Click `Set History Tracking` in the Custom Fields & Relationships section. This section lets you set a custom object's history for both standard and custom fields.
5. Choose the fields you want tracked. You can select up to 20 standard and custom fields per object. You can't track:
  - Formula, roll-up summary, or auto-number fields
  - `Created By` and `Last Modified By`
6. Click **Save**. Salesforce tracks history from this date and time forward. Changes made prior to this date and time are not included.

### SEE ALSO:

[Track Field History](#)

[Find Object Management Settings](#)

## Disable Field History Tracking

-  **Note:** You can't disable field history tracking for an object if Apex references one of its a field on the object is referenced in Apex.
1. From the management settings for the object whose field history you want to stop tracking, go to Fields.
  2. Click `Set History Tracking`.
  3. Deselect **Enable History** for the object you are working with—for example, **Enable Account History**, **Enable Contact History**, **Enable Lead History**, or **Enable Opportunity History**. The History related list is automatically removed from the associated object's page layouts. If you disable field history tracking on a standard object, you can still report on its history data up to the date and time that you disabled tracking. If you disable field history tracking on a custom object, you cannot report on its field history.
  4. Save your changes.

## Field Audit Trail

Field Audit Trail lets you define a policy to retain archived field history data up to ten years, independent of field history tracking. This feature helps you comply with industry regulations related to audit capability and data retention.

Use Salesforce Metadata API to define a retention policy for your field history. Then use REST API, SOAP API, and Tooling API to work with your archived data. For information about enabling Field Audit Trail, contact your Salesforce representative.

Field history is copied from the History related list into the `FieldHistoryArchive` object and then deleted from the History related list. You define one `HistoryRetentionPolicy` object for your related history lists, such as Account History, to specify Field Audit Trail retention policies for the objects that you want to archive. You can then deploy the object by using the Metadata API (Workbench or Force Migration Tool). In production organizations that have Field Audit Trail enabled, data is archived by default after 18 months. In sandbox organizations, the default is one month. You can update the retention policies as often as you like.

You can set Field Audit Trail policies on the following objects.

- Accounts
- Cases
- Contacts
- Leads
- Opportunities
- Assets
- Entitlements
- Service Contracts
- Contract Line Items
- Solutions
- Products
- Price Books
- Custom objects with field history tracking enabled

You can include field history retention policies in managed and unmanaged packages.

The following fields can't be tracked.

- Formula, roll-up summary, or auto-number fields
- Created By and Last Modified By
- Expected Revenue field on opportunities
- Master Solution Title or the Master Solution Details fields on solutions
- Long text fields
- Multi-select fields

After you define and deploy a Field Audit Trail policy, production data is migrated from related history lists such as Account History into the `FieldHistoryArchive` object. The first copy writes the field history that's defined by your policy to archive storage and sometimes takes a long time. Subsequent copies transfer only the changes since the last copy and are much faster. A bounded set of SOQL is available to query your archived data.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To specify a field history retention policy:

- "Retain Field History"

-  **Note:** For some time after the initial GA release, data might not be automatically deleted from the History related list and may reside in both the `FieldHistoryArchive` object and in the History related list. Salesforce reserves the right to delete archived data from the History related list in accordance with the customer-defined policy in future releases.
-  **Note:** If your organization has Field Audit Trail enabled, previously archived data isn't encrypted if you subsequently turn on Platform Encryption. For example, your organization uses Field Audit Trail to define a data history retention policy for an account field, such as the phone number field. After enabling Platform Encryption, you turn on encryption for that field, and phone number data in the account is encrypted. New phone number records are encrypted as they are created, and previous updates to the phone number field that are stored in the Account History related list are also encrypted. However, phone number history data that is already archived in the `FieldHistoryArchive` object continues to be stored without encryption. If your organization needs to encrypt previously archived data, contact Salesforce. We will encrypt and rearchive the stored field history data, then delete the unencrypted archive.

[Force.com SOQL and SOSL Reference: SOQL with Archived Data](#)

## Examples

### Set a Data Retention Policy for Field History

This example demonstrates how to set a field history data retention policy by using Metadata API. You need to edit the metadata only if you want to override the default policy values (18 months of production storage and 0 years of archive storage). Setting data retention policy involves creating a metadata package and deploying it. The package consists of a `.zip` file that contains an `objects` folder with the XML that defines each object's retention policy, and a project manifest that lists the objects and the API version to use.

-  **Note:** The first copy writes the entire field history that's defined by your policy to archive storage and might take a long time. Subsequent copies transfer only the changes since the last copy, and will be much faster.
1. Define a field history data retention policy for each object. The policy specifies the number of months that you want to maintain field history in Salesforce, and the number of years that you want to retain field history in the archive. The following sample file defines a policy of archiving the object after six months, and keeping the archives for five years.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
 <historyRetentionPolicy>
 <archiveAfterMonths>6</archiveAfterMonths>
 <archiveRetentionYears>5</archiveRetentionYears>
 <description>My field history retention</description>
 </historyRetentionPolicy>
 <fields>
 <fullName>AccountSource</fullName>
 ...
 </CustomObject>
```

The file name determines the object to which the policy is applied. For example, to apply the above policy to the Account object, save the file as `Account.object`. For existing custom objects, this works the same way, with the file named after the custom object. For example: `myObject__c.object`.

2. Create the project manifest, which is an XML file that's called `package.xml`. The following sample file lists several objects for which data retention policy is to be applied. With this manifest file, you expect the objects folder to contain five files: `Account.object`, `Case.object`, and so on.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
 <types>
 <members>Account</members>
 <members>Case</members>
 <members>Contact</members>
 <members>Lead</members>
 <members>Opportunity</members>
 </types>
 <version>32.0</version>
</Package>
```

3. Create the `.zip` file and use the `deploy()` function to deploy your changes to your production environment. For more information, see the [Metadata API Guide](#).

**Note:** This pilot doesn't support deployment from sandbox to production environments.

That's it! Your field history retention policy will go into effect according to the time periods that you set.

## Create a Custom Object and Set Field History Retention Policy at the Same Time

You can use Metadata API to create a custom object and set retention policy at the same time. You must specify the minimum required fields when creating a new custom object. Here's sample XML that creates an object and sets field history retention policy:

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
 <deploymentStatus>Deployed</deploymentStatus>
 <enableHistory>true</enableHistory>
 <description>just a test object with one field for eclipse ide testing</description>
 <historyRetentionPolicy>
 <archiveAfterMonths>3</archiveAfterMonths>
 <archiveRetentionYears>10</archiveRetentionYears>
 <gracePeriodDays>1</gracePeriodDays>
 <description>Transaction Line History</description>
 </historyRetentionPolicy>
 <fields>
 <fullName>Comments__c</fullName>
 <description>add your comments about this object here</description>
 <inlineHelpText>This field contains comments made about this object</inlineHelpText>

 <label>Comments</label>
 <length>32000</length>
 <trackHistory>true</trackHistory>
 <type>LongTextArea</type>
 <visibleLines>30</visibleLines>
 </fields>
 <label>MyFirstObject</label>
 <nameField>
 <label>MyFirstObject Name</label>
 <type>Text</type>
```

```

</nameField>
<pluralLabel>MyFirstObjects</pluralLabel>
<sharingModel>ReadWrite</sharingModel>
</CustomObject>

```

Set `trackHistory` to `true` on the fields that you want to track and `false` on the other fields.

## Query Archived Data

You can retrieve archived data by making SOQL queries on the `FieldHistoryArchive` object. You can filter on the `FieldHistoryType`, `ParentId`, and `CreatedDate` fields, as long as you specify them in that order. For example:

```

SELECT ParentId, FieldHistoryType, Field, Id, NewValue, OldValue FROM FieldHistoryArchive
WHERE FieldHistoryType = 'Account' AND ParentId='906F000000

```

## Monitor Debug Logs

When you've set your trace flags, monitor logging for users, Apex classes, and Apex triggers in the Developer Console or in Setup.

You can retain and manage the debug logs for specific users, including yourself, and for classes and triggers.

To view saved debug logs, from Setup, enter *Debug Logs* in the `Quick Find` box, then select **Debug Logs**. When you've started retaining debug logs, you can view, download, or delete your logs from this page.

### SEE ALSO:

[Set Up Debug Logging](#)

[Viewing Debug Logs](#)

### EDITIONS

Available in: Salesforce Classic

Available in **Enterprise**, **Developer**, **Performance**, **Unlimited**, and **Database.com** Editions

The Salesforce user interface and Email Services are not available in **Database.com**.

### USER PERMISSIONS

To view, retain, and delete debug logs:

- "Manage Users"

## Set Up Debug Logging

To activate debug logs for users, Apex classes, and Apex triggers, configure trace flags and debug levels in the Developer Console or in Setup.

You can retain and manage the debug logs for specific users, including yourself, and for classes and triggers.

The following are the limits for debug logs.

- Each debug log must be 2 MB or smaller. Debug logs that are larger than 2 MB are reduced in size by removing older log lines, such as log lines for earlier `System.debug` statements. The log lines can be removed from any location, not just the start of the debug log.
- Each organization can retain up to 50 MB of debug logs. Once your organization has reached 50 MB of debug logs, the oldest debug logs start being overwritten.

### Configure Trace Flags in the Developer Console

To configure trace flags and debug levels from the Developer Console, click **Debug > Change Log Levels**. Then complete these actions.

- To create a trace flag, click **Add**.
- To edit an existing trace flag's duration, double-click its start or end time.
- To change a trace flag's debug level, click **Add/Change** in the Debug Level Action column. You can then edit your existing debug levels, create a debug level, and assign a debug level to your trace flag.

### Configure Trace Flags in Setup

To configure trace flags and debug levels from Setup, complete these actions.

1. Navigate to the appropriate Setup page.
  - For user-based trace flags and debug levels, enter *Debug Logs* in the *Quick Find* box, then click **Debug Logs**.
  - For class-based trace flags and debug levels, enter *Apex Classes* in the *Quick Find* box, click **Apex Classes**, click the name of a class, then click **Trace Flags**.
  - For trigger-based trace flags and debug levels, enter *Apex Triggers* in the *Quick Find* box, click **Apex Triggers**, click the name of a trigger, then click **Trace Flags**.
2. From the Setup page, complete these actions.
  - To add a trace flag, click **New**.
  - To change an existing trace flag, click an option in the Action column.
    - To delete a trace flag, click **Remove**.
    - To modify a trace flag, click **Edit**.
    - To modify a trace flag's debug level, click **Filters**.
    - To create a debug level, click **Edit**, click the magnifying glass icon next to the Debug Level field, and then click **New**.

[Monitor Debug Logs](#)

## Monitoring Scheduled Jobs

The All Scheduled Jobs page lists all reporting snapshots, scheduled Apex jobs, and dashboards scheduled to refresh.

To view this page, from Setup, enter *Scheduled Jobs* in the **Quick Find** box, then select **Scheduled Jobs**. Depending on your permissions, you can perform some or all of the following actions.

- Click **Del** to permanently delete all instances of a scheduled job.
- View the details of a scheduled job, such as the:
  - Name of the scheduled job
  - Name of the user who submitted the scheduled job
  - Date and time at which the scheduled job was originally submitted
  - Date and time at which the scheduled job started
  - Next date and time at which the scheduled job will run
  - Type of scheduled job

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Reporting Snapshots and Dashboards are not available in **Database.com**

### USER PERMISSIONS

To monitor scheduled jobs:

- “View Setup and Configuration”

## Monitoring Background Jobs

You can monitor background jobs if your organization has parallel sharing recalculation enabled. Parallel sharing recalculation helps larger organizations to speed up sharing recalculation of each object. In Winter '14, parallel recalculation is automatically available in new organizations. Existing organizations can contact Salesforce to determine if this feature is appropriate for your organization.

To view any background jobs in your organization, from Setup, enter *Background Jobs* in the **Quick Find** box, then select **Background Jobs**.

The All Background Jobs page shows the details of background jobs, including a percentage estimate of the recalculation progress. The **Job Type** column shows the background job that's running, such as *Organization-Wide Default Update*. The **Job Sub Type** column shows the affected object, such as *Account* or *Opportunity*.

 **Note:** You can only monitor background jobs on this page. Contact Salesforce to abort a background job.

## Configure Salesforce Mobile Apps

### Salesforce1

#### Salesforce1 Mobile App Setup Considerations

There are many options for customizing the Salesforce1 mobile app, to tailor it into an effective on-to-go tool for your users.

All Salesforce1 customization options are available from the Setup menu, which you access from the upper-right corner of any Salesforce page. For your convenience, you can access many Salesforce1 settings pages more quickly from the Salesforce1 Quick Start setup page. In Salesforce Classic, from Setup, click **Salesforce1 Quick Start**. In Lightning Experience, from Setup, enter *Salesforce1 Quick Start* in the **Quick Find** box, then select **Salesforce1 Quick Start**.

 **Note:** We recommend using Google Chrome for the Salesforce1 Quick Start setup page. Microsoft Internet Explorer 9 or later and Mozilla Firefox are also supported.

Here are the Salesforce1 customization options you can consider for your organization.

- Do some basic setup using the Salesforce1 Wizard. From the Salesforce1 Quick Start page, click **Launch Quick Start Wizard**.
- Define the users who can access Salesforce1.
  - For the downloadable apps, from the Salesforce1 Quick Start page, click **App Security Controls**.
  - For the mobile browser app, from the Salesforce1 Quick Start page, click **Mobile Browser Option**.
- Customize how data appears in Salesforce1. Unless otherwise specified, you can access these customizations from the management settings for the object whose data you want to customize.

#### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

#### USER PERMISSIONS

To monitor background jobs:

- "View Setup and Configuration"

#### EDITIONS

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

- Optimize your page layouts so they display well on mobile devices. You can modify existing page layouts or create new, mobile-friendly page layouts. From the appropriate object management settings, go to Page Layouts.
  - Add expanded lookups, components (including the Twitter component), or Visualforce pages to the Mobile Cards section of a page layout to have them display as mobile cards in Salesforce1. From the appropriate object management settings, go to Page Layouts.
  - Make sure that Visualforce pages are enabled for use in Salesforce1, so they'll display in the app. From Setup, enter *Visualforce Pages* in the Quick Find box, then select **Visualforce Pages**. Click **Edit** next to the name of a page, and select *Available for Salesforce mobile apps*.
  - Define the fields that show up in an object's record highlight area and in related list preview cards by creating custom compact layouts. From the appropriate object management settings, go to Compact Layouts.
  - Verify that your existing search layouts populate Salesforce1 search results with the desired fields. From the appropriate object management settings, go to Search Layouts.
- Make it easy and efficient to work in the field by creating actions that are tailored to your specific business activities and use cases.
    - Enable actions in the publisher for your organization. From Setup, enter *Chatter Settings* in the Quick Find box, then select **Chatter Settings**. Select the *Enable Actions in the Publisher* checkbox. (This option assumes that your organization has Chatter enabled and that you want the actions you create to display in the Chatter publisher. If your organization doesn't have Chatter enabled, you can still use actions but they only display in Salesforce1 and not in the full Salesforce site.)
      - 📌 **Note:** If actions in the publisher aren't enabled, only standard Chatter actions (Post, File, Link, Poll, and Thanks) appear in the Chatter publisher in the full Salesforce site. When Chatter is enabled but actions in the publisher aren't, standard Chatter actions and nonstandard actions appear in the Salesforce1 action bar and in third-party apps that use action lists. Nonstandard actions include Create, Update, Log a Call, custom actions, and Mobile Smart Actions.
    - Create global actions that allow users to add new object records with no automatic relationship to other records. From Setup, enter *Global Actions* in the Quick Find box, then select **Global Actions**. To customize the fields that are used by global actions, click **Layout** on the Global Actions page.
 

Then add the new actions to the Salesforce1 and Lightning Experience Actions section of the global publisher layout so that they appear in Salesforce1. From Setup, enter *Publisher Layouts* in the Quick Find box, then select **Publisher Layouts**.
    - Create object-specific actions that allow users to add new records or update data in existing records. From the management settings for the object that you want to add an action to, go to Buttons, Links, and Actions. To customize the fields used by an object-specific action, click **Layout** on the Buttons, Links, and Actions page.
 

Then add the new actions to the Salesforce1 and Lightning Experience Actions section on the appropriate object page layout.
  - Customize the options that are available in the Salesforce1 navigation menu, and the order in which items appear. From the Salesforce1 Quick Start page, click **Navigation Menu**.
  - Help keep Salesforce1 users aware of important Salesforce activities by enabling in-app and push notifications. From the Salesforce1 Quick Start page, click **Notification Options**.
  - Integrate third-party apps into the Salesforce1 navigation menu by adding Lightning Page tabs for the Lightning Pages deployed to your organization. From Setup, enter *Tabs* in the Quick Find box, select **Tabs**, and then click **New** on the Lightning Page Tabs related list.
  - Customize Salesforce1 to match the look and feel of your company's branding. From the Salesforce1 Quick Start page, click **Salesforce1 Branding**.

- Allow the Salesforce1 downloadable apps to automatically cache frequently accessed Salesforce data to secure, persistent storage, so users can view data when their devices are offline. (This option is turned on by default.) From the Salesforce1 Quick Start page, click **Offline Cache**.

You can also check out the [Salesforce1 Mobile App Admin Guide](#), which walks you through using the Salesforce1 declarative tools in Setup to get your organization ready for the Salesforce1 mobile experience.

## Set Up the Salesforce1 Mobile App with the Salesforce1 Wizard

The Salesforce1 Wizard provides an easy way to complete the essential setup tasks for Salesforce1. After you've set up Salesforce1 with this wizard, your sales reps can use Salesforce1 to run their business from their mobile devices.

 **Note:** We recommend using Google Chrome for the Salesforce1 Wizard and the Salesforce1 Setup page. Microsoft Internet Explorer 9 or later and Mozilla Firefox are also supported.

If you're using Lightning Experience:

1. From Setup, click **Launch Wizard** in the Set Up Salesforce1 tile in the quick access carousel.

If you're using Salesforce Classic:

1. From Setup, click **Salesforce1 Quick Start**.
2. On the Salesforce1 Setup page, click **Launch Quick Start Wizard**.

 **Note:** Although the Salesforce1 Wizard gets you up and running with basic setup tasks, it doesn't include all Salesforce1 setup tasks. For example, although you can rearrange global quick actions via the wizard, the Salesforce1 action bar and action menu can include other types of actions such as object-specific quick actions and standard Chatter actions, depending on the context.

After you've finished the wizard, you'll be directed to the Salesforce1 Quick Start setup page, which provides easy access to Salesforce1 setup pages and documentation. For settings that are configured on a single page, the Quick Start page includes direct links to those pages. In cases where the settings are available on multiple pages in Setup, we've provided links to relevant documentation about the setting.

## Control Access to the Salesforce1 Mobile App

You can control your organization's access to the Salesforce1 downloadable apps and the Salesforce1 mobile browser app.

Based on your organization's configuration, you can:

- Enable or disable access to the Salesforce1 mobile browser app. From Setup, enter *Salesforce1 Settings* in the **Quick Find** box, then select **Salesforce1 Settings**. See [Enable the Salesforce1 Mobile Browser App](#).
- Control who can access the Salesforce1 downloadable apps, and configure other security policies. From Setup, enter *Connected Apps* in the **Quick Find** box, then select the option for managing connected apps. See [User Access and Security Policies for the Salesforce1 Downloadable Apps](#).

### User Access and Security Policies for the Salesforce1 Downloadable Apps

The Salesforce1 downloadable apps are connected apps. As a result, you can control the users who have access to the apps, as well as other security policies. By default, all users in your organization can log in to the Salesforce1 downloadable apps.

You can control security and access policies for each of the Salesforce1 downloadable apps, using settings components that are installed from the managed Salesforce1 connected apps package. These components need to be installed in Salesforce:

- Salesforce1 for Android
- Salesforce1 for iOS

These components are automatically installed when one of your users installs a Salesforce1 downloadable app from the App Store or Google Play on a mobile device and authenticates with your organization by logging in to the mobile app.

Alternatively, you can manually install the [Salesforce1 and Chatter Apps connected apps package](#) so you can review and modify the default security and access settings before rolling out the Salesforce1 downloadable apps to your users.

When the Salesforce1 connected apps components are installed, they're added to the **Connected Apps** page. (From Setup, enter *Connected Apps* in the **Quick Find** box, then select the option for managing connected apps.) Here, you can view and edit the settings for each of the apps, including controlling user access with profiles, permissions, and IP range restrictions. An error message is displayed if a restricted user attempts to log in to a Salesforce1 downloadable app.

Push notifications for the Salesforce1 downloadable apps aren't managed from the **Connected Apps** page. To manage these settings, from Setup, enter *Notifications* in the **Quick Find** box, then select **Salesforce1 Notifications**.

#### EDITIONS

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

#### EDITIONS

## Enable the Salesforce1 Mobile Browser App

You can control whether users can access the Salesforce1 mobile browser app when they log in to Salesforce from a mobile browser. By default, the mobile browser app is turned on for your organization.

**Important:** Use of the Salesforce Classic full site in a mobile browser isn't supported. While you can disable the Salesforce1 mobile browser app for your organization, and individual users can turn off the mobile browser app for themselves, regular use of the full site in a mobile browser isn't recommended. Your users may experience problems that Salesforce Customer Support won't investigate.

It's not possible to access the Lightning Experience full site from any mobile browser.

1. From Setup, enter *Salesforce1 Settings* in the **Quick Find** box, then select **Salesforce1 Settings**.
2. Select **Enable the Salesforce1 mobile browser app** to allow all users in your organization to access the app. Deselect this option to turn off access to the app.
3. Click **Save**.

When this option is turned on, users who log in to Salesforce from a supported mobile browser are automatically directed to the Salesforce1 interface. Logging in from an unsupported mobile browser loads the Salesforce Classic full site, even when this option is selected.

## Salesforce1 Mobile App Navigation Menu

Learn about the items that can appear in the Salesforce1 navigation menu. You can customize most aspects of the navigation menu for your organization.

The  icon in the Salesforce1 header opens the navigation menu.

### EDITIONS

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

If the default navigation menu doesn't meet your users' needs, you can easily customize it. From Setup, enter *Mobile Navigation* in the **Quick Find** box, then select **Mobile Navigation**.

Depending on your organization's settings, the menu can contain:

Menu Item	Description
Approval Requests	Displays a list of the user's pending approvals. Users can tap an approval item and approve or reject it from within Salesforce1. Available in the Salesforce1 downloadable app for iOS and the Salesforce1 mobile browser app.
Canvas apps	Appears for organizations that have enabled a canvas app to appear in the Salesforce1 navigation menu.
Dashboards	Availability depends on edition and user permissions. If you don't include this item in the menu, a Dashboards item is automatically added to the set of Smart Search Items.
Events	Lists events that are owned by the user, that the user created for him- or herself, and that the user or a user's groups are invited to.
Feed	Appears for organizations that have Chatter enabled.
Lightning component tabs (Beta)	Only custom Lightning components that have a Lightning component tab associated with them can appear in the Salesforce1 navigation menu.

Menu Item	Description
Lightning Pages	Custom Salesforce1 app pages.
Groups	Appears for organizations that have Chatter enabled. If you don't include this item in the menu, a Groups item is automatically added to the set of Smart Search Items.
Paused Flow Interviews	Displays a list of flow interviews that the user paused. An interview is a running instance of a flow. Users can tap an interview and resume or delete it from within Salesforce1. Available in the Salesforce1 mobile browser app only.
People	Appears for organizations that have Chatter enabled. If you don't include this item in the menu, a People item is automatically added to the set of Smart Search Items.
Smart Search Items	<p>Adds Salesforce objects to the Recent section in the menu. This item also adds a set of recently-searched objects to the Recent section and adds the More item so users can access all the objects they have permission to use and that are supported in Salesforce1. If you don't include this item in the navigation menu, users can't access any objects in Salesforce1.</p> <p> <b>Note:</b> If your users don't yet have a history of recent objects, they initially see a set of default objects in the Recent section. It can take up to 15 days for the objects that users work with regularly in both Salesforce1 and the full Salesforce site to appear in the Recent section. To make objects appear under Recent sooner, users can pin them from the search results screen in the full site.</p>
Tasks	Lists of a user's open and closed tasks and tasks that have been delegated.
Today	An app that helps users plan for and manage their day by integrating mobile calendar events with associated Salesforce tasks, accounts, and contacts. The app also allows users to instantly join conference calls, quickly log notes about events, and more. Available in the Salesforce1 downloadable apps only.
Visualforce page tabs	Only Visualforce pages with the <code>Available for Salesforce mobile apps</code> checkbox selected will display in Salesforce1.

## Things to Keep in Mind

- You can't set different menu configurations for different types of users.
- Anything that is represented by a tab in Salesforce—such as standard and custom objects, Visualforce pages, the Feed, People, or Groups—is visible for a user in the Salesforce1 menu, based on the user's profile settings. For example, if a user is assigned to a profile that has the Groups tab set to Tab Hidden, the user won't see the Groups menu item in Salesforce1, even though an administrator has included it in the menu.
- The navigation menu in a community isn't controlled via the Navigation Menu settings page. Instead, the tabs that are specified in Tabs & Pages in the community's administration settings determine the contents of the community's navigation menu.

### SEE ALSO:

[Customize the Salesforce1 Navigation Menu](#)

[Notes About the Salesforce1 Navigation Menu](#)

[Enable Visualforce Pages for the Salesforce1 Mobile App](#)

## Customize the Salesforce1 Navigation Menu

Customize your users' mobile Salesforce experience by selecting the menu items, apps, Visualforce pages, or Lightning Pages to display in the Salesforce1 navigation menu.

**Note:** Before you can include Visualforce pages, Lightning Pages, or Lightning components in the Salesforce1 navigation menu, create tabs for them. From Setup, enter *Tabs* in the Quick Find box, then select **Tabs**.

[Walk Through It: Customize the Salesforce1 Navigation Menu](#)

1. From Setup, enter *Mobile Navigation* in the Quick Find box, then select **Mobile Navigation**
2. Select items in the Available list and click **Add**.

### EDITIONS

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

### USER PERMISSIONS

To customize the Salesforce1 navigation menu:

- "Customize Application"

3. Sort items by selecting them and clicking **Up** or **Down**.

The order you put items in the Selected list is the order that they display in the navigation menu.

**Note:** The first item in the Selected list becomes your users' Salesforce1 landing page.

4. Click **Save**.

Once saved, the navigation menu items and their order should be reflected in Salesforce1. You may need to refresh to see the changes.

**Tip:** When organizing the menu items, put the items that users will use most at the top. The Smart Search Items element can expand into a set of eight or more menu items and it might end up pushing other elements below the scroll point if you put it

near the top of the menu. Anything you put below the Smart Search Items element appears in the Apps section of the navigation menu.

#### SEE ALSO:

- [Salesforce1 Mobile App Navigation Menu](#)
- [Notes About the Salesforce1 Navigation Menu](#)
- [Enable Visualforce Pages for the Salesforce1 Mobile App](#)

## Notes About the Salesforce1 Navigation Menu

Some objects are excluded from the Recent section in the Salesforce1 navigation menu, even if you accessed them recently.

- Tasks and events
- People, groups, and dashboards, if these items were added directly to the navigation menu
- List views, which are shown only on object home pages, not in the navigation menu
- Objects that aren't available in Salesforce1, including any objects that don't have a tab in the full Salesforce site

### About the Dashboards, People, and Groups Menu Items

If you don't add the Dashboards, People, or Groups menu items to the Selected list for the navigation menu, then they're automatically included in the Smart Search Items set of objects and show up in the Recent section of the menu in Salesforce1. If you do add Dashboards, People, or Groups individually to the Selected list for the navigation menu, then they show up outside of the Recent section and their location in the Salesforce1 menu can be customized, just like Tasks, Today, and other individual menu items.

### Pin an Object into the Recent Section

Users can customize the objects that appear in the Recent section of the Salesforce1 navigation menu. If they search for an object in the full site, they can hover their mouse over the object name and click  to pin it to the top of the search results. The order of pinned objects in the full site determines the order of the objects that stick to the top of the Recent section of the navigation menu. However, pinning objects in this way causes the unpinned objects remaining in the Recent section to drop into the **More** element.

## Salesforce1 Mobile App Notifications

Notifications let your users know when certain events occur in Salesforce. For example, notifications let users know when they receive approval requests or when someone mentions them in Chatter.

Two types of notifications can appear to Salesforce1 users.

- *In-app notifications* keep users aware of relevant activity while they're using Salesforce1. By tapping , a user can view the 20 most recent notifications received within the last 90 days.

#### EDITIONS

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

#### EDITIONS

Salesforce1 available in: **All** editions except Database.com

If Salesforce Communities is enabled for your organization, users see notifications from all of the communities they're members of. To help users easily identify which community a notification came from, the community name is listed after the time stamp.

- *Push notifications* are alerts that appear on a mobile device when a user has installed the Salesforce1 downloadable app but isn't using it. These alerts can consist of text, icons, and sounds, depending on the device type. If an administrator enables push notifications for your organization, users can choose individually whether to receive push notifications on their devices.

 **Note:** Some notifications include text that your users enter in Salesforce. To ensure that sensitive information isn't distributed through a third-party service without proper authorization, push notifications include minimal content (such as a user's name) unless you enable full content in push notifications.

For example, suppose an in-app notification reads: "Allison Wheeler mentioned you: @John Smith, heads-up! New sales strategy for Acme account." By default, the equivalent push notification would be "Allison Wheeler mentioned you." However, if you enabled full content in push notifications, this push notification would include the same (full) content as the in-app notification.

## Terms and Conditions for Including Full Content in Push Notifications

If you go to the Notifications Settings page on the full site and select the option to include full content in push notifications, a pop-up window displays several terms and conditions. If you click **OK** in the pop-up window, you're agreeing to these terms and conditions on behalf of your company.

### Salesforce1 Mobile Push Notifications

The Salesforce1 full-content push notifications feature will provide your organization's Users (collectively, "you" or "your") with real-time updates — for example, whenever you receive an approval request or a mention in a post. The frequency of notifications sent to you will depend on the number of these actions occurring for you.

Enable or disable full-content push notifications at any time from Setup by entering *Notifications Settings* in the **Quick Find** box, selecting **Notifications Settings**, and then selecting or deselecting "Include full content in push notifications."

For Users within your organization whose mobile devices run the iOS platform, usage of the full-content push notifications feature will result in transmission of your data contained in those notifications (potentially including Customer Data and/or Confidential Information, as those terms are defined in the subscription agreement that governs your use of Salesforce products) to Apple Inc. and its affiliated entities (collectively, "Apple"). To the extent that any such data is transmitted to Apple, Salesforce is not responsible for the privacy, security, or integrity of that data.

If you are authorized by the company that has purchased the subscriptions associated with your use of the Salesforce Services to enable this functionality and agree to these terms and conditions, please confirm your acceptance by checking the box marked "OK" below. If you are not authorized by such company to accept these terms and enable this functionality, you must click "Cancel".

SEE ALSO:

[Enable Salesforce1 Mobile App Notifications](#)

## Enable Salesforce1 Mobile App Notifications

Allow all users in your organization to receive mobile notifications about events in Salesforce, for example when they receive approval requests or when someone mentions them in Chatter.

1. From Setup, enter *Salesforce1 Notifications* in the **Quick Find** box, then select **Salesforce1 Notifications**.
2. Select the notifications you want your Salesforce1 users to receive.
3. If you're authorized to do so for your company, select **Include full content in push notifications**.
4. Click **Save**. If you checked the box to include full content in push notifications, a pop-up appears displaying terms and conditions. Click **OK** or **Cancel**.

By enabling this option, you're agreeing to the terms and conditions on behalf of your company. For details, see [Salesforce1 Mobile App Notifications](#) on page 928.

A user can receive approval requests in Salesforce1 notifications only when the user receives approval requests as email notifications. You or your user can change the **Receive Approval Request Emails** user field to set this preference.

SEE ALSO:

[Salesforce1 Mobile App Notifications](#)

## Salesforce1 Mobile App Offline Access

Salesforce1 can cache recently accessed data so it's available when a user's device is offline or unable to connect to Salesforce. Offline access is currently read-only, and is available in the Salesforce1 downloadable apps for iOS and Android devices.

Offline access is enabled the first time a user in your organization installs one of the Salesforce1 downloadable apps. You can manage this setting on the Salesforce1 Offline page in Setup.

With offline access turned on, the app automatically caches a user's most recently accessed records for the objects listed in the Recent section of the Salesforce1 navigation menu, and a user's recent dashboards. Recently accessed records are determined by a user's activities in both the mobile app and the full Salesforce site. In addition, the app caches much of the data that a user accesses during a Salesforce1 session.

Cached data is encrypted and stored in a secure, persistent data store.

This table lists the data and Salesforce1 elements that are available offline.

Salesforce1 Element	Available for Offline Use
Navigation Menu	Yes
Global Search	Previous searches only
Notifications	Previously viewed only
Feeds, Groups, and People	Previously viewed only
Salesforce Today	Main page and mobile event records if previously view
Salesforce Events	Previously viewed only

### EDITIONS

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

### USER PERMISSIONS

To view notifications settings:

- "View Setup and Configuration"

To modify notifications settings:

- "Customize Application"

### EDITIONS

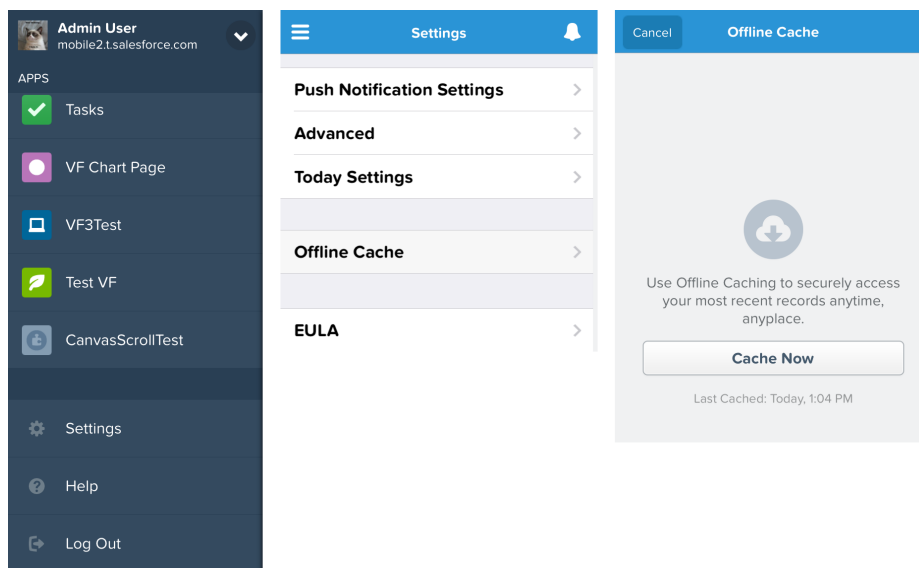

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

Salesforce1 Element	Available for Offline Use
Recent Objects	Yes (top five)
Other Objects	No
Record Details	Yes (30 most recent records)
Related Records	Previously viewed only
List Views	Previously viewed only
Tasks	Only tasks from the first page of the My Tasks list (up to 10 tasks), and only if the list was previously viewed or after the user manually updates the cache
Dashboards	Yes (top five)
Approvals (submit, approve, or reject)	No
Visualforce pages	No
Canvas Apps	No
Lightning Pages	No
Settings	Yes

Cached data is refreshed when a user switches to Salesforce1. If a user switches to another app, the user's cached data is automatically refreshed if the existing data store is over one hour old.

Users can manually cache their data at any time—for example, before switching into airplane mode or entering an area with no service. From the Salesforce1 navigation menu, select **Settings > Offline Cache > Cache Now**.

**Note:** The cache is saved for two weeks. Users can clear the cache by logging out of the Salesforce1 app.

## Enable Visualforce Pages for the Salesforce1 Mobile App

You can use Visualforce to extend the Salesforce1 app and give your mobile users the functionality that they need while on the go. Before adding a Visualforce page to Salesforce1, make sure the page is enabled for mobile use or it won't be available in the mobile apps.

 **Tip:** Before exposing existing Visualforce pages in Salesforce1, consider how they'll look and function on mobile phones and tablets. Most likely, you'll want to create a new page specifically for mobile form factors.

Visualforce pages must be enabled for mobile use before they can display in these areas of the Salesforce1 user interface:

- The navigation menu, via a Visualforce tab
- The action bar, via a custom action
- Mobile cards on a record's related information page
- Overridden standard buttons, or custom buttons and links
- Embedded in record detail page layouts
- Lightning pages

To enable a Visualforce page for Salesforce1:

1. From Setup, enter *Visualforce Pages* in the **Quick Find** box, then select **Visualforce Pages**.
2. Click **Edit** for the desired Visualforce page.
3. Select **Available for Salesforce mobile apps and Lightning Pages** then click **Save**.

Consider these notes about Visualforce support in Salesforce1.

- Standard tabs, custom object tabs, and list views that are overridden with a Visualforce page aren't supported in Salesforce1. The Visualforce page is shown for full site users, but Salesforce1 users will see the default Salesforce1 page for the object. This restriction exists to maintain the Salesforce1 experience for objects.
- You can also enable Visualforce pages for Salesforce1 through the metadata API by editing the `isAvailableInTouch` field on the `ApexPage` object.
- The **Salesforce Classic Mobile Ready** checkbox on Visualforce Tab setup pages is for Salesforce Classic Mobile only and has no effect on Visualforce pages in the Salesforce1 apps.

Available in Salesforce Classic in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

### USER PERMISSIONS

To enable the display of Visualforce in Salesforce1:

- "Customize Application"  
"Author Apex"

## Custom Branding for the Salesforce1 Mobile App

You can customize the Salesforce1 mobile app to match the look and feel of your company's branding, so the app is instantly recognizable to your mobile users. Custom branding is displayed in all of the Salesforce1 apps.

 **Note:** Images that you upload to customize the Salesforce1 app are stored in a Documents folder named Salesforce1 Branding Resources. For this reason, the Documents object must be enabled for your organization before administrators can view and modify the Salesforce1 Branding page. (The Documents tab doesn't need to be visible, however.)

For users of the Salesforce1 mobile browser app to see custom branding, Documents must be enabled for your organization. For the Salesforce1 downloadable apps, users must also have "Read" user permissions on Documents.

You can customize:

Element	Description
Brand Color	<p>The color for key user interface elements such as the header, buttons, and search bar.</p> <p>Based on the brand color you select, contrasting colors for user interface elements such as borders for the navigation menu, the notifications list, and button text are automatically defined.</p> <p>The headers on overlays, popups, and dialogs—such as edit and create windows or windows that open from actions in the action bar—aren't affected by this setting. These headers are always white, to provide a visual indicator that the user is performing an action as opposed to simply viewing information.</p>
Loading Page Color	The background color on the loading page that appears after a mobile user logs in.
Loading Page Logo	<p>The image on the loading page that appears after a mobile user logs in.</p> <p>We recommend using an image with the largest dimensions allowable for best results. Maximum image size is 460 pixels by 560 pixels.</p>

Consider the following tips when customizing the branding of the Salesforce1 app:

- When creating your logo image, be sure to compress it. In many image editing programs, this process is identified as "use compression," "optimize image," "save for web," or "shrink for the web."
- Verify that your logo appears correctly in Salesforce1, using the same devices as your user base, not just a desktop monitor. Your image can render at different scales or proportions depending on the screen size and pixel density of each device.
- Salesforce1 supports .png, .gif, and .jpg image formats for custom branding elements, but we recommend using .png for the best results.
- These interface elements can't be customized:
  - The Salesforce1 app icon that appears on the mobile device's home screen.
  - The initial loading screen when launching the Salesforce1 downloadable app for iOS. This loading screen appears before the user is prompted by the login page.
- Your mobile users must close the app and then log in again to see any custom branding changes.

### EDITIONS

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

You can also customize the branding for the Salesforce1 app login page. My Domain must be enabled to modify the login page. To customize your company's Salesforce1 login page, see [Customize Your Login Page Branding](#) on page 782.

## Change Salesforce1 Mobile App Branding for Your Organization

Change the Salesforce1 mobile app's appearance, including the loading page background color, loading page logo, and header background color, so the app matches your company's branding.

 **Note:** Images that you upload to customize the Salesforce1 app are stored in a Documents folder named Salesforce1 Branding Resources. For this reason, the Documents object must be enabled for your organization before administrators can view and modify the Salesforce1 Branding page. (The Documents tab doesn't need to be visible, however.)

For users of the Salesforce1 mobile browser app to see custom branding, Documents must be enabled for your organization. For the Salesforce1 downloadable apps, users must also have "Read" user permissions on Documents.

1. From Setup, enter *Branding* in the **Quick Find** box, then select **Salesforce1 Branding**, then click **Edit**.
2. To customize brand color for key user interface elements, including the header, click  or enter a valid hexadecimal color code.
3. To customize the background color of the loading page, click  or enter a valid hexadecimal color code.
4. To customize the loading page logo, click **Choose File** to upload an image. Images can be .jpg, .gif, or .png files up to 200 KB in size. The maximum image size is 460 pixels by 560 pixels.
5. Click **Save**.

## SalesforceA

Manage users and view information for Salesforce organizations from your mobile device.

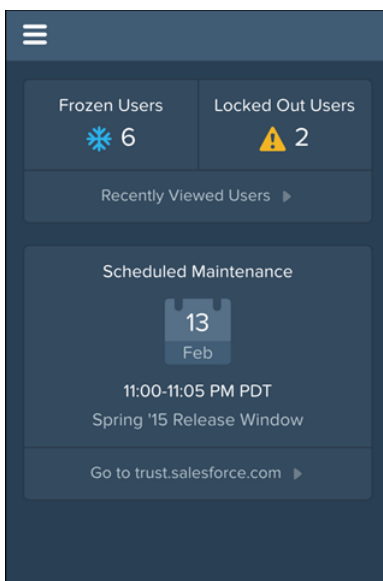

SalesforceA is a mobile app for Salesforce administrators. When you're away from your desk, you can use your phone or tablet to perform essential administration tasks like resetting passwords, freezing users, assigning permission sets, and viewing current system status.

SalesforceA is free. Download it from the Google Play Store for Android phones and tablets, and from the Apple App Store for Apple iPhone, iPod Touch, and iPad.

### Overview of Your Organization

The Overview screen shows:

- Number of frozen and locked out users
- Next scheduled maintenance

The navigation icon is in the top left. Tap it to go to the navigation menu.

### User Management

From the navigation menu, tap **Users** to see a list of users or search for a user. Tap a name to:

- View or edit user details
- Freeze, deactivate, or reactivate the user
- Reset a user password
- Assign permission sets

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To use SalesforceA:

- "Manage Users"

Swipe to the Related page to see:

- The user's current permission sets
- The user's login history

#### **Additional Information**

The navigation menu also gives you quick access to:

- Salesforce success community
- Salesforce release notes
- System status

#### IN THIS SECTION:

##### [Log In to SalesforceA](#)

Log in to the SalesforceA mobile app to perform essential administrative tasks for your Salesforce organization.

##### [Log In to Multiple Organizations with SalesforceA](#)

Use SalesforceA on your mobile device to log in to multiple Salesforce organizations that you administer. Once logged in, you can switch between organizations without going through the login process again.

#### SEE ALSO:

## Log In to SalesforceA

Log in to the SalesforceA mobile app to perform essential administrative tasks for your Salesforce organization.

As a Salesforce administrator, you can use SalesforceA to log in to your production organization (default), sandbox environment, or a custom host. Choose the environment or host with the host menu.

- For iOS users: open the host menu from the gear icon in the upper right corner of the login screen.
- For Android users: open the host menu from your device's menu button.

If prompted, enter a passcode as an extra layer of security for your mobile device. Manage this security setting in the Salesforce desktop browser application from **Setup** in the **Connected Apps** entry for **SalesforceA**.

Once you log in, you see the Overview screen. The navigation icon is in the top left.

# Salesforce Classic

## Salesforce Classic Mobile Overview for Administrators

Salesforce Classic Mobile helps your teams succeed by allowing users to access their latest Salesforce data, whenever and wherever they need it, directly from Android™, BlackBerry® and iPhone® devices. The Salesforce Classic Mobile app exchanges data with Salesforce over mobile or wireless networks, and stores a local copy of the user's data in its own database on the mobile device. Users can edit local copies of their Salesforce records when a data connection isn't available, and transmit those changes to Salesforce when a connection is available again. The app also promotes near real-time logging of critical information by prompting users to enter updates directly in Salesforce or Force.com AppExchange apps after important customer calls, emails, or appointments.

A Salesforce Classic Mobile license is required for each user to use the full version of Salesforce Classic Mobile. For organizations using Unlimited, Performance, and Developer Editions, Salesforce provides one mobile license for each Salesforce license. Organizations using Professional or Enterprise Editions must purchase mobile licenses separately.

Any Salesforce user who doesn't have a mobile license can download a free, restricted version of Salesforce Classic Mobile. The free version:

- Supports fewer standard objects
- Doesn't support custom objects
- Doesn't allow administrators to customize or create mobile configurations
- Isn't available for use by partner portal users

 **Note:** The Android, BlackBerry, and iPhone apps are available in English, Japanese, French, German, and Spanish. Contact Salesforce to turn on Salesforce Classic Mobile for your organization.

## About the Salesforce Classic Mobile Default Configuration

Mobile configurations for the Salesforce Classic Mobile app are sets of parameters that determine what data Salesforce transmits to users' mobile devices and which users receive the data on their mobile devices. A default mobile configuration is provided for Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations. Administrators can't view or edit the default mobile configuration.

Users are automatically assigned to the default mobile configuration when they activate their Salesforce account from a supported mobile device using the Salesforce Classic Mobile app.

The default mobile configuration:

- Allows users with an assigned mobile license to install and activate Salesforce Classic Mobile, even if you haven't yet assigned them to a mobile configuration.
- Allows users without an assigned mobile license to install and activate the free version of Salesforce Classic Mobile.

You can [disable Salesforce Classic Mobile](#) to prevent users from activating the Salesforce Classic Mobile app.

The default configuration can mobilize the following objects:

- Accounts
- Assets
- Cases
- Contacts
- Dashboards
- Events
- Leads
- Opportunities
- Reports
- Solutions
- Tasks

### Note:

- Not all objects available in the Salesforce Classic Mobile app are mobilized with the default configuration.
- Assets aren't available as a tab in the Salesforce Classic Mobile app but display as a related list for accounts, cases, and contacts.

The default configuration automatically synchronizes records the user recently accessed in Salesforce on the Salesforce Classic Mobile app. Users can search for records that aren't automatically synchronized; once the user downloads a record, the record becomes a permanent part of the data set. In addition to recently accessed records, the default configuration synchronizes activities closed in the past five days and open activities due in the next 30 days.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Free version available in: **All** editions except **Database.com**

Full version available in: **Performance, Unlimited, and Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

## Salesforce Classic Mobile Implementation Tips and Best Practices

Set up the Salesforce Classic Mobile app using these tips and best practices.

### Building Lean Data Sets

- Keep the data sets in your mobile configurations as small as possible. Not only do lean data sets greatly improve the Salesforce Classic Mobile app's performance, but they also make the app easier to use. Pushing massive amounts of data to the device might seem like a good idea, but the important records tend to get lost among the ones that aren't relevant to users' day-to-day activities. Small data sets are powerful because the Salesforce Classic Mobile app synchronizes with Salesforce every 20 minutes, so the data is constantly refreshed with new and updated records. Even if your mobile configurations don't account for every possible record your users might need, they can search for records that aren't automatically synchronized to their devices.

To build small data sets:

- Nest the objects in the data set tree. For example, add contacts as a child data set of the account object so that the data set includes contacts related to the mobilized accounts instead of all the user's contacts.
  - Avoid setting the record ownership filter to All Records unless your organization uses a private sharing model. It's unlikely that users need to see all of an object's records on their devices. Instead of mobilizing all opportunity records, for example, mobilize just the opportunities owned by the user or the user's opportunity team.
  - Use filters that synchronize the most relevant records. For example, even if you limit the opportunities on the device to records owned by the user, you could further prune the data set by mobilizing only opportunities closing this month.
  - Set a record limit to prevent the data set from getting too large. Generally, a single data set should generate no more than 2,500 records.
- Another way to build lean data sets is to [mobilize the Salesforce recent items list](#), add the data sets, and set the record ownership filters in your data sets to None (Search Only). The user's data set is populated with records recently accessed in Salesforce, and those records in turn synchronize additional data based on the data set hierarchy. For example, let's say you create a data set with the account object at the root level and add the contact, task, and event objects as child data sets. When the Salesforce Classic Mobile app synchronizes an account from the Salesforce recent items list, it also synchronizes the contacts, tasks, and events related to that account.
  - If you're not sure which fields to use as filters for your data sets or mobile views, consider using the Last Activity Date field. For example, set up a filter that synchronizes contacts with an activity logged this week or this month. The Last Activity Date field is a better indicator of a record's relevance than the Last Modified Date field—often the main detail of a record remains unchanged even though users frequently log related tasks and events.

### Mobilizing Records Users Need

- Before mobilizing a custom object, make sure the object's functionality is compatible with the Salesforce Classic Mobile app. Salesforce Classic Mobile doesn't support S-controls, mashups, merge fields, image fields, or custom links.
- To obtain a relevant set of activities, mobilize the task and event objects at the root level of the data set hierarchy and nest them under parent objects, like contacts, accounts, and opportunities. Adding tasks and events at multiple levels ensures that users will see their personal activities and activities related to the records on their devices. Avoid mobilizing too much activity history or too

#### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Free version available in: **All** editions except **Database.com**

Full version available in: **Performance, Unlimited, and Developer** Editions, and for an extra cost in: **Professional and Enterprise** Editions

#### USER PERMISSIONS

To view Salesforce Classic Mobile configurations:

- "View Setup and Configuration"

To create, change, or delete Salesforce Classic Mobile configurations:

- "Manage Mobile Configurations"

many tasks and events not owned by the user. Generally, there are more task and event records in an organization than any other type of record, so it's easy to bloat data sets with too many activities.

- If your sales representatives frequently take orders in the field and need a comprehensive inventory list, add the product object at the root level of the data set hierarchy. Nesting the opportunity product object below the opportunity object won't mobilize all products.
- If your users need to assign tasks to other users or change the record owner, mobilize the user object so that the names of other users will be available on the device. Avoid mobilizing all user records—instead, set up filters based on the role or profile.
- Be sure that users assigned to a mobile configuration have field-level access to all the fields used in the configuration's filter criteria. If a user doesn't have access to a field in a data set's filter criteria, the Salesforce Classic Mobile app won't synchronize the records for that data set or its child data sets.
- You can sometimes use cross-object formula fields to work around limitations of the Salesforce Classic Mobile app. For example, Salesforce Classic Mobile doesn't support campaigns, so you can't add the campaign object as a data set and add the opportunity object as its child data set to get the related records. However, you can create a text formula field on the opportunity object equal to the name of the parent campaign. The field needs to be visible, but it doesn't need to be included on your page layouts. Then add the opportunity object to the data set and use the new formula field to filter opportunities related to a specific campaign.
- Although a mobile configuration might include an object at multiple levels in the data set hierarchy, users won't see duplicate tabs in the Salesforce Classic Mobile app. Only one Task tab appears on the device even if you mobilize the task object at the root level and as a child data set of three objects.

## Customizing Mobile Configurations

- Clean up your mobile page layouts by excluding fields from the objects in the mobile configuration. Less data is sent to the device, and mobile users don't have to scroll through unnecessary fields.
- If you mobilize the Dashboards tab, be sure to select any other tabs that should appear in the Salesforce Classic Mobile app. Customizing the tabs for a mobile configuration overrides the default tab set—if you only mobilize the Dashboard tab, it will be the only tab sent to the device.
- Due to the small size of mobile device screens, you can only select two display columns for mobile views. If you need three columns of data, create a text formula field on the object that concatenates the three fields, then use the formula field in the mobile view criteria.
- When creating mobile views, you can filter based on the current user with the `$User.ID` global variable, but you can't enter a user's name as a value in the filter criteria. To build a view based on users, create a text formula field on the appropriate object, then use the formula field in the mobile view criteria. For example, to create a view that displays opportunities owned by an opportunity team, create a text formula field on the opportunity object that contains the opportunity owner's user ID or role, then create a view that filters on values in that field.

## Testing and Deploying the Mobile Product

- It's important to test mobile configurations to make sure they're synchronizing an acceptable amount of data. Test configurations against active users who own a very large number of records. Typically, most data sets generate between 500 KB and 4 MB of data. If the data sets are over 4 MB, refine the filter criteria to limit the amount of data sent to the device.
- You can use the Salesforce Classic Mobile app in the sandbox before deploying to your organization.
- Use of the Salesforce Classic Mobile app requires a data plan. The wireless data volume for the Salesforce Classic Mobile app varies greatly between customers and even users in the same organization. It's impossible to predict your organization's data usage, but we can offer some guidelines:
  - The initial data download consists of records that match the criteria specified in the user's mobile configuration and the metadata needed to support these records when disconnected. On average, the data sizes range from 500 KB–4 MB.

- After the initial download of data, incremental update requests are initiated by the client app every 20 minutes. Each of these requests and the corresponding server response are approximately 200 bytes.
- If any new data is downloaded to the client app as a result of the update request, only the new or changed values are sent. For example, the Salesforce Classic Mobile app only downloads the new phone number in a contact record, not the entire contact record. The amount of data transmitted differs for every organization and every user.

Generally, the volume of data transmitted by the Salesforce Classic Mobile app is low compared to moderate email usage.

- If you're deploying to BlackBerry users, evaluate your corporate network infrastructure before implementing the mobile solution.

## Best Practices

- Use the zero-administration deployment option to experiment with the Salesforce Classic Mobile app before you set up mobile configurations. You'll create better blueprints for your mobile configurations if you've tried using the Salesforce Classic Mobile app.
- Talk to users about their favorite reports, views, and dashboards to get ideas for what filter criteria to use in mobile configurations.
- After setting up mobile configurations, deploy the Salesforce Classic Mobile app on a limited basis with a select group of users. Adjust the mobile setup based on their feedback, then deploy to all of your users.

## Setting Up Salesforce Classic Mobile

To deploy the Salesforce Classic Mobile app to your organization:

1. [Review the mobile implementation tips and best practices](#)
2. [Enable mobile users](#)
3. [Create one or more mobile configurations](#)
4. [Define the data sets for your mobile configurations](#)
5. [Test the mobile configurations](#)
6. [Customize mobile page layouts and adjust mobile user permissions](#) (optional)
7. [Customize mobile tabs](#) (optional)
8. [Create custom mobile views](#) (optional)
9. [Set up dashboards](#) (optional)
10. [Set up mobile reports](#) (optional)
11. [Set up Salesforce CRM Content](#) (optional)
12. [Configure access for partner users](#) (optional)
13. [Create links to Web and Visualforce Mobile pages](#) (optional)
14. [Notify users that Salesforce Classic Mobile is available for download](#)

When users download the Salesforce Classic Mobile app and activate their accounts, you can [manage their devices](#) in the Salesforce Classic Mobile Administration Console.

- [Manage Salesforce Classic Mobile Devices](#)

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Free version available in: **All** editions except **Database.com**

Full version available in: **Performance, Unlimited,** and **Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

### USER PERMISSIONS

To view Salesforce Classic Mobile settings:

- “View Setup and Configuration”

To change Salesforce Classic Mobile settings:

- “Manage Mobile Configurations”

## Enabling Salesforce Classic Mobile Users

To enable users to access to the full version of Salesforce Classic Mobile:

1. Allocate mobile licenses to users by selecting the `Salesforce Classic Mobile User` checkbox on the user record.
2. Edit each custom profile to which Salesforce Classic Mobile users are assigned to include the "API Enabled" permission. Salesforce Classic Mobile users need access to the API so their mobile devices can communicate with Salesforce. The "API Enabled" permission is enabled by default on standard profiles.

 **Note:** The Android, BlackBerry, and iPhone apps are available in English, Japanese, French, German, and Spanish. Contact Salesforce to turn on Salesforce Classic Mobile for your organization.

To prevent users from activating the full version of Salesforce Classic Mobile on their mobile devices before you're ready to deploy the app, disable the `Salesforce Classic Mobile User` checkbox for all your users.

 **Note:** If you deselect this checkbox for a user who is already assigned to a mobile configuration, Salesforce removes that user from the mobile configuration and assigns the user to the default mobile configuration.

The free version of Salesforce Classic Mobile is enabled by default. If you want to block users without Salesforce Classic Mobile licenses from accessing their Salesforce data on mobile devices, disable the free version of Salesforce Classic Mobile.

1. From Setup, enter `Salesforce Classic Settings` in the `Quick Find` box, then select **Salesforce Classic Settings**.
2. Click **Edit**.
3. Deselect `Enable Mobile Lite`.

 **Note:** If you deselect this option while users are running the Salesforce Classic Mobile app, the Salesforce data on their devices is erased the next time the devices synchronize with Salesforce.

4. Click **Save**.

Full version available in: **Performance, Unlimited, and Developer** Editions, and for an extra cost in: **Professional and Enterprise** Editions

### USER PERMISSIONS

To view Salesforce Classic Mobile settings:

- "View Setup and Configuration"

To change Salesforce Classic Mobile settings:

- "Manage Mobile Configurations"

## Create Salesforce Classic Mobile Configurations

Mobile configurations are sets of parameters that determine the data Salesforce transmits to users' mobile devices, and which users receive that data on their mobile devices. Organizations can create multiple mobile configurations to simultaneously suit the needs of different types of mobile users. For example, one mobile configuration might send leads and opportunities to the sales division, while another mobile configuration sends cases to customer support representatives.

Before creating your mobile configurations, plan which profiles and users you want to assign to each configuration. Each mobile configuration only affects the mobile devices of users assigned to the configuration.

To create a mobile configuration:

1. [Enter Basic Information](#)
2. [Assign Users and Profiles](#)
3. [Set Total Data Size Limit](#)
4. [Complete Your Mobile Configuration](#)

 **Note:** A [default mobile configuration](#) is provided for Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations. You can't view or edit the default configuration. Any Salesforce user who doesn't have a mobile license can download a free, restricted version of Salesforce Classic Mobile. These users are assigned to the default mobile configuration when they activate their Salesforce account from a mobile device.

### Enter Basic Information

1. From Setup, enter *Salesforce Classic Configurations* in the **Quick Find** box, then select **Salesforce Classic Configurations** to access the mobile configurations list page.
2. Click **New Mobile Configuration**.
3. Enter a name for the mobile configuration.
4. Select the **Active** checkbox if you want to activate the mobile configuration immediately after creating it. The mobile configuration does not work until you select this checkbox.

If you deactivate an active mobile configuration, Salesforce saves all requests from devices of the users assigned to the mobile configuration for up to one week. If you reactivate the mobile configuration, Salesforce executes those requests in the order received.

5. Optionally, enter a description for the mobile configuration.
6. Optionally, select the **Mobilize Recent Items** checkbox to mark recently used records in Salesforce for device synchronization. Selecting this option ensures that mobile users assigned to the configuration will not have to search for and download items they recently accessed on Salesforce, even if those records do not meet the configuration's filter criteria. Only records belonging to mobilized objects can be marked for device synchronization; for example, if you do not mobilize the account object in a configuration, users assigned to that configuration cannot automatically receive recent accounts on their devices.
7. If you select the **Mobilize Recent Items** checkbox, select a value from the **Maximum Number of Recent Items** drop-down list. Set a low number if your users have minimal free space on their mobile devices.
8. Optionally, select the **Mobilize Followed Records** checkbox to automatically synchronize records users are following in Chatter to their mobile device. The device only synchronizes followed records for objects included in the mobile configuration's data set.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Free version available in: **All** editions except **Database.com**

Full version available in: **Performance, Unlimited,** and **Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

### USER PERMISSIONS

To view Salesforce Classic Mobile configurations:

- "View Setup and Configuration"

To create, change, or delete Salesforce Classic Mobile configurations:

- "Manage Mobile Configurations"

The `Mobilize Followed Records` checkbox is only available if Chatter is enabled for your organization.

## Assign Users and Profiles

You can assign individual users and profiles to each mobile configuration. If you assign a profile to a mobile configuration, the mobile configuration applies to all Salesforce Classic Mobile users with that profile unless a specific user is assigned to another mobile configuration.

 **Tip:** For ease of administration, we recommend that you assign mobile configurations to profiles; however, you may have situations in which you need to assign a configuration directly to individual users.

To assign users and profiles to a mobile configuration:

1. In the Search drop-down list, select the type of member to add: users or profiles. This drop-down list is not available if you have not enabled the `Mobile User` checkbox on any user records, or if all users are already assigned to a mobile configuration; in that case, you can only assign profiles to this mobile configuration.
2. If you do not immediately see the member you want to add, enter keywords in the search box and click **Find**.
3. Select users and profiles from the `Available Members` box, and click the **Add** arrow to add them to the mobile configuration. You can assign each user and profile to only one mobile configuration.

The `Available Members` box only displays users who have the `Mobile User` checkbox enabled.

4. If there are users or profiles in the `Assigned Members` box you do not want to assign to this mobile configuration, select those users and click the **Remove** arrow.

 **Warning:** Removing a user from an active mobile configuration deletes the Salesforce-related data on the user's mobile device but does not delete the client application.

## Set Total Data Size Limit

Different types of mobile devices offer different memory capacities, and some devices experience serious problems if all of the flash memory is used. To avoid overloading mobile devices, optionally specify a total data size limit for each mobile configuration. The total data size limit prevents Salesforce from sending too much data to the mobile devices of users assigned to the mobile configuration.

To set the total data size limit, use the `Don't sync if data size exceeds` drop-down list to specify the amount of memory that is consistently available on the mobile devices of users who are assigned to this mobile configuration. If the combined size of all the data sets exceeds this limit, users assigned to this profile receive an error message on their mobile devices, and Salesforce will not synchronize any data sets in this mobile configuration. [Test your mobile configuration](#) to make sure the data sets do not exceed the total data size limit.

 **Tip:** To reduce the size of your data, do one or more of the following:

- Delete a data set.
- Reduce the scope of your data sets.
- Refine the filter criteria of your data sets.

## Complete Your Mobile Configuration

Click **Save**. Note that your mobile configuration is not active until you select the `Active` checkbox.

SEE ALSO:

[Manage Salesforce Classic Mobile Configurations](#)

[Define Data Sets](#)

[Setting Up Salesforce Classic Mobile](#)

## Define Data Sets

Accessing Salesforce from a mobile device is very different than accessing it from your computer. This is because mobile devices generally have less memory and screen size than computers, and they do not maintain a constant network connection. To work with these limitations, each mobile configuration only transfers data sets, which are subsets of the records users access in the Salesforce online user interface. Mobile devices store data sets in on-board databases, allowing users to access their most important records and work offline when no network connection is available. Salesforce automatically synchronizes the on-board databases when the mobile device reestablishes a network connection.

Each data set can contain records related to a single object and is classified by the name of that object. For example, the Accounts data set only includes account records.

Data sets can have child data sets, which are data sets that contain records associated with a top-level (parent) data set. For example, if the first level of your hierarchy has an Accounts data set, you can add a Contacts child data set that includes all contact records related to the account records. Child data sets appear as related lists on mobile devices.

A single mobile configuration can have multiple data sets for the same object and at different levels. For example, you can have an Events parent data set and an Events child data set under Leads.

 **Tip:** Review the [sample data sets](#) to see how you might define data sets for common groups of Salesforce users.

After [creating a mobile configuration](#), you must define its data sets. To access the data sets for a mobile configuration:

1. From Setup, enter *Salesforce Classic Configurations* in the `Quick Find` box, then select **Salesforce Classic Configurations**. Then click the name of the mobile configuration that you want to modify.
2. In the Data Sets related list, click **Edit**.
3. From the Data Sets page, you can:
  - [Add a data set](#).
  - Remove a data set by selecting the data set you want to remove and clicking **Remove**.
  - Edit a data set by selecting the data set you want to edit in the hierarchy. The right pane displays the filters for that data set.
  - [Test your mobile configuration](#).

As you define and modify the data sets, Salesforce automatically saves your changes.
4. Click **Done** when you are finished.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Free version available in: **All** editions except **Database.com**

Full version available in: **Performance, Unlimited, and Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

### USER PERMISSIONS

To view mobile data sets:

- “View Setup and Configuration”

To create, change, or delete mobile data sets:

- “Manage Mobile Configurations”

## Adding Data Sets

To add a data set:

1. In the hierarchy, select **Data Sets** to create a parent data set, or select an existing data set to create a child data set.
2. Click **Add...**
3. In the popup window, select the object for the records you want the data set to include. Salesforce lets you create parent data sets for all custom objects and the following standard objects:
  - Accounts
  - Assets
  - Attachments
  - Cases
  - Contacts
  - Content
  - Events
  - Leads
  - Notes
  - Opportunities
  - Price Books
  - Products
  - Solutions
  - Tasks
  - Users

### Note:

- Although attachments are available as a data set, they're only supported in Salesforce Classic Mobile for Android. Salesforce Classic Mobile for iPhone and BlackBerry don't currently support attachments.
- Salesforce Classic Mobile supports default field values only for picklists and multiselect picklists. Default field values for other types of fields, such as checkboxes and numeric fields, do not appear in Salesforce Classic Mobile.

When adding to an existing data set, the popup window displays any object with a relationship to the selected object. This includes child objects, and also parent objects with a master-detail or lookup relationship to the selected object.

For example, assume you created an account field called Primary Contact with a lookup relationship to the contact object. If you add Account as a top-level data set in a mobile configuration, you see two sets of contacts when you add Contact below Account:

- **Contact:** Represents the standard relationship between the account and contact objects.
- **Contact (Referenced by Account):** Represents any object that is the parent in a lookup or master-detail relationship for the selected object. In this case, the contact object is referenced by the Primary Contact field on the account object.

Because Salesforce distinguishes between these two types of relationships, you could, for example, mobilize just the contacts referenced by a custom account field without sending any child contact records to the device.

4. Click **OK**. The data set you created appears in the hierarchy.
5. Optionally, use filters to restrict the records that a parent or child data set includes:
  - a. Use the Filter by Record Ownership options to configure Salesforce to automatically synchronize records based on the owner of the record. The possible options are:

- **All Records:** Salesforce automatically synchronizes all records the user can access. The **All Records** option is not available for tasks and events when they are parent data sets in a mobile configuration. This helps prevent failed data synchronization due to activity filter queries that take too long to run.
- **User's Records:** Salesforce automatically synchronizes all records the user owns.
- **User's Team's Records:** Salesforce automatically synchronizes all records owned by the user and the user's subordinates in the role hierarchy.
- **User's Account Team's Records:** Salesforce automatically synchronizes accounts for which the user is an account team member, but does not include accounts owned by the user.
- **User's Opportunity Team's Records:** Salesforce automatically synchronizes opportunities for which the user is an opportunity team member, but does not include opportunities owned by the user.
- **None (Search Only):** Salesforce does not automatically synchronize any records for this data set; however, users can use their mobile devices to search all of the records they can access.

Salesforce only displays options that relate to the selected data set. For example, selecting an account data set displays the **User's Account Team's Records** option, while selecting an opportunity data set displays the **User's Opportunity Team's Records** option.

If your mobile needs for an object require a combination of the available record ownership filters, you can add the same object data set up to four times on the same hierarchy level. For example, a sales manager might want to synchronize his opportunities, opportunities owned by his subordinates, and opportunities for which he is an opportunity team member. In this case, you would add an opportunity data set and select **User's Team's Records**, then add a second opportunity data set at the same level in the hierarchy and select **User's Opportunity Team's Records**. Note that objects with only one ownership filter option, such as Case Comment, cannot be added multiple times at the same level of the hierarchy.

- Set the filter criteria to automatically synchronize only records that meet specific criteria in addition to the **Filter by Record Ownership** option you selected. For example, you can set the filter to only include opportunity records with amounts greater than \$50,000, or contact records with the title "Buyer."
- To prevent a single data set from consuming all the memory on a mobile device, select the second radio button under **Set Max Record Limit** and enter the maximum number of records this data set can transfer to mobile devices. Use the **Order By** and **Sort** drop-down lists to specify which records are synchronized if the [data size limit](#) is exceeded.

If the limit is reached, Salesforce updates the records currently on the mobile device approximately every 20 minutes, and replaces the records approximately every 24 hours in accordance with the **Order By** and **Sort** settings. For example, if the settings are **Last Modified Date** and **Descending**, Salesforce transfers the most recently modified records to mobile devices and removes the same number of records that were least recently modified.

If you selected the **None (Search Only)** **Filter by Record Ownership** option, the limit you set does not apply because no records are automatically synchronized.

**Tip:** Do not use **Set Max Record Limit** in place of filters. Only use **Set Max Record Limit** as a safety mechanism, and use filters as the primary means of limiting the number of records on a mobile device. This ensures that your mobile users receive the correct records on their devices.

Because of the memory restrictions of mobile devices, Salesforce prevents a single query from returning more than 2,500 records.

- Be sure to [test your mobile configuration](#) to make sure the data does not exceed the total data size limit.

7. Click **Done**.

[Manage Salesforce Classic Mobile Configurations](#)

[Setting Up Salesforce Classic Mobile](#)

## Merge Fields for Mobile Filter Criteria

Some of the \$User merge fields are available when defining filters for mobile configurations and mobile custom views. In mobile configurations, you can use these merge fields to synchronize records where the user is linked to a record but is not the record owner. For example, you can send cases created by the current user to the mobile device, or you can send records to the device where the current user is referenced in a custom field. In mobile views, you can use the merge fields to define view based on the record owner; for example, you might create a view that displays the current user's accounts with a rating of "Hot".

The following table describes the available user merge fields:

Merge Field	Description
<code>\$User.ID</code>	References the ID of the current user. This merge field can be applied to fields that contain a user lookup. The valid operators for this merge field are Equals and Not Equal To. When creating mobile view filters that reference an owner field, you can only use the <code>\$User.ID</code> merge field.
<code>\$User.Username</code>	References the username of the current user. This merge field can be applied to any text or lookup field, except picklists. The valid operators for this merge field are Equals, Not Equal To, Greater Than or Equal, Less Than or Equal, Contains, Does Not Contain, and Starts With.
<code>\$User.Firstname</code>	References the first name of the current user. This merge field can be applied to any text or lookup field, except picklists. The valid operators for this merge field are Equals, Not Equal To, Greater Than or Equal, Less Than or Equal, Contains, Does Not Contain, and Starts With.
<code>\$User.Lastname</code>	References the last name of the current user. This merge field can be applied to any text or lookup field, except picklists. The valid operators for this merge field are Equals, Not Equal To, Greater Than or Equal, Less Than or Equal, Contains, Does Not Contain, and Starts With.
<code>\$User.Fullname</code>	References the first and last name of the current user. This merge field can be applied to any text

### EDITIONS

## SEE ALSO:

- [Manage Salesforce Classic Mobile Configurations](#)
- [Salesforce Classic Mobile Overview for Administrators](#)
- [Define Data Sets](#)

**Sample Data Sets**

Many administrators create mobile configurations based on the functional groups in their organization because users in the same group usually have similar mobile requirements for data. Below are sample data sets for common Salesforce groups. Your mobile users have unique needs, but you can use the examples as a reference to help you get started with mobile configurations.

**Sales Manager**

Sales managers usually need to see records they own and also the records of their subordinates. They also tend to closely monitor large deals in the pipeline.

This mobile configuration allows sales managers to see:

- The opportunities they own.
- The opportunities owned by users who report to them in the role hierarchy.
- All opportunities scheduled to close in the current quarter with an amount greater than \$100,000.
- All accounts related to the opportunities.
- A subset of their contact and activity records.

**Sample Mobile Configuration for Sales Managers**

Object	Ownership Filter	Field Filter	Max Records	Order By
Opportunity	User's Team's Records	(Close Date equals THIS QUARTER) AND (Amount greater than "100,000")	No Limit	
Account	All Records		No Limit	
Contact	User's Records		500	Last Activity (Decending)
Task	User's Records	Closed equals False	No Limit	
Event	All Records	Date equals TODAY OR Date equals NEXT 30 DAYS	No Limit	

**Sales Engineer**

The sales engineer mobile configuration retrieves opportunities owned by the other members of the user's opportunity team, but does not include the user's records. The configuration is opportunity-based because all accounts and contacts sent to the device are related to the opportunities. The sales engineers would see activity history related to the opportunities on the device and also their own activities.

### Sample Mobile Configuration for Sales Engineers

Object	Ownership Filter	Field Filter	Max Records	Order By
Opportunity	User's Sales Team's Records	Closed equals False	No Limit	
↳ Account	All Records		No Limit	
↳ Contact	All Records		No Limit	
↳ Task	All Records	Due Date equals LAST 30 DAYS OR Due Date equals NEXT 30 DAYS	No Limit	
↳ Event	All Records	Date equals LAST 30 DAYS OR Date equals NEXT 30 DAYS	No Limit	
Task	User's Records	Closed equals False	No Limit	
Event	User's Records	Date equals TODAY OR Date equals NEXT 30 DAYS	No Limit	

#### Account Executive

This account executive mobile configuration is account-based, which means the device pulls down the user's accounts and opportunities related to those accounts. The opportunities are filtered so that only open opportunities scheduled to close in the current quarter appear on the device. The Task and Event child data sets retrieve all activities related to those opportunities, not just the user's activities. Only open tasks and events from a two-month window are sent to the device. The Task and Event parent data sets pull down just the user's activities and restrict the activities to open tasks and events scheduled for the next 30 days. The Contact data set delivers the user's contact records, but limits the record count to the 500 most recently active contacts.

### Sample Mobile Configuration for Account Executives

Object	Ownership Filter	Field Filter	Max Records	Order By
Account	User's Records		No Limit	
↳ Opportunity	User's Records	(Closed equals False) AND (Close Date equals THIS QUARTER)	No Limit	
↳ Event	All Records	(Date equals LAST 30 DAYS) AND (Date equals NEXT 30 DAYS)	No Limit	
↳ Task	All Records	Due Date equals LAST 30 DAYS OR Due Date equals NEXT 30 DAYS	No Limit	
Contact	User's Records		500	Last Activity (Decending)
Task	User's Records	Closed equals False	No Limit	
Event	User's Records	Date equals TODAY OR Date equals NEXT 30 DAYS	No Limit	

#### Customer Support Representative

Customer support representatives are focused primarily on cases and solutions. This mobile configuration delivers all open cases to the user's device, along with related accounts, contacts, case comments, case history, tasks, and events. The Case Solution child data set sends all solutions related to the cases, and the Solution data set lets the user search for solutions from the Solutions tab on the device. The support representatives also have access to a subset of their activity records.

### Sample Mobile Configuration for Customer Support Representatives

Object	Ownership Filter	Field Filter	Max Records	Order By
Task	All Records	Closed equals False	No Limit	
Event	All Records	Date equals TODAY OR Date equals NEXT 30 DAYS	No Limit	
Case	User's Records	Closed equals False	No Limit	
Task	All Records	Due Date equals LAST 30 DAYS OR Due Date equals NEXT 30 DAYS	No Limit	
Case Comment	All Records		No Limit	
Event	All Records	Date equals LAST 30 DAYS OR Date equals NEXT 30 DAYS	No Limit	
Account	All Records		No Limit	
Contact	All Records		No Limit	
Case History	All Records		No Limit	
Case Solution	All Records		No Limit	
Solution	None (Search Only)		No Limit	

#### SEE ALSO:

[Salesforce Classic Mobile Overview for Administrators](#)

[Manage Salesforce Classic Mobile Configurations](#)

[Define Data Sets](#)

## Test Salesforce Classic Mobile Configurations

When you [create a Salesforce Classic Mobile configuration](#), you specify a total data size limit for the configuration. The total data size limit prevents Salesforce from sending too much data to the mobile devices of users assigned to the mobile configuration. After [defining the data sets](#), it's important to test the mobile configuration to make sure the total data size limit isn't exceeded.

To estimate the size of the data set that the mobile configuration will deliver to a user's device:

1. From Setup, enter *Salesforce Classic Configurations* in the Quick Find box, then select **Salesforce Classic Configurations**. Then click the name of the mobile configuration that you want to test.
2. In the Data Sets related list, click **Edit**.
3. In the Test Data Size section, click the lookup icon next to the `Select a user` field to choose the user you want to test. While users must be mobile-enabled in order to assign them to mobile configurations, you can test the configuration's data size against any user account.

The `Select a user` field defaults to the name of the user currently logged in; however, it is important to test a mobile configuration with the accounts of users who will actually be assigned to the configuration, particularly users who own a large number of records.

4. Select the **Include metadata** checkbox to include metadata in the estimate. Metadata consists of page layout and schema information, and the amount of metadata sent to a device can be very high depending on the size of your organization and the complexity of its setup.

**Warning:** It might take a while for Salesforce to calculate the metadata size in addition to the data size. Even if you choose to hide the metadata in your test results, the metadata is still factored into the total data size when the mobile device synchronizes with Salesforce.

5. Click **Estimate Data Size**.

The size of each data set is calculated. Results display in the hierarchy tree, which is the left pane of the data set region at the top of the page. Additional results appear in the Test Data Size section below the hierarchy.

- In the hierarchy tree, two numbers appear next to each data set. The first represents the number of records generated by the data set, and the second represents the total size of the data set in bytes or kilobytes. This breakdown is useful for identifying which data sets might require additional filtering criteria to reduce the size.
- The Test Data Size section provides an estimate of the data that the current mobile configuration would deliver to the selected user's device, including:
  - The size and number of records in each object's data set.
  - The total size and number of records, which includes records in the data set and marked records. A marked record is a record that is not part of a user's mobile configuration. There are two ways marked records can become part of the data set:
    - The user downloads records to his or her device through online searches, and the records are flagged so that they get sent to the user's device every time the device synchronizes with Salesforce.
    - Records in the user's data set contain lookup fields to records that do not match the mobile configuration's filter criteria. Salesforce synchronizes the records referenced in the lookup fields so that users do not encounter broken links in the mobile app.

**Tip:** For an accurate count of the marked records, synchronize the data in the mobile app before estimating the data size. To synchronize the data:

- On an Android device, tap **Application Info** > **Sync Now** > **Refresh All Data**.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Free version available in: **All** editions except **Database.com**

Full version available in: **Performance, Unlimited, and Developer** Editions, and for an extra cost in: **Professional and Enterprise** Editions

### USER PERMISSIONS

To view Salesforce Classic Mobile data sets:

- "View Setup and Configuration"

To test Salesforce Classic Mobile configurations:

- "Manage Mobile Configurations"

- On a BlackBerry device, open the menu and select **System Info**, then open the menu and select **Refresh All Data**.
  - On an iPhone device, tap **More**, then tap **App Info**. Tap **Sync Now**, then tap **Refresh All Data**.
- The size of the metadata that would be sent to the device for the user, if you selected the **Include metadata** checkbox.
  - The total mobilized data set, which is the sum of all the records.
- Reports are not included in the data size estimate.
6. Compare the test results to the total data size limit that was set for the configuration; the limit is located in the top of the Test Data Size section. Click the size limit to increase or decrease the value on the Edit Mobile Configuration page.
- If the total data size is below the limit, the selected user can safely be assigned to the mobile configuration. However, keep in mind that the test results are an estimate because different devices have different storage algorithms.
  - If the total data size exceeds the limit, reduce the size of the data by reducing the scope of your [data set](#), refining the filter criteria of your data sets, deleting a data set, or [removing fields from the mobile page layout](#). Repeat the testing process until the data is below the total limit.
-  **Note:** The data size estimate in the Test Data Size section does not automatically refresh if you edit the data sets. Click **Refresh Data Size** to update the test results.

## Edit Object Properties for Salesforce Classic Mobile

You can change the properties of standard and custom objects in the Salesforce Classic Mobile app. For example, you can restrict the permissions of Salesforce Classic Mobile users, or you can exclude unnecessary fields from the object's mobile page layout.

Salesforce Classic Mobile object properties are customized per mobile configuration. To edit mobile object properties:

1. From Setup, enter *Salesforce Classic Configurations* in the Quick Find box, then select **Salesforce Classic Configurations**.
2. Click the name of the mobile configuration you want to modify.
3. In the Mobile Object Properties related list, click **Edit** next to an object name.

Only objects you mobilized in the configuration's data set appear in the related list. You can't change the properties of the user object.

4. From the Edit Mobile Configuration page, you can:
  - [Remove Mobile Permissions](#)
  - [Customize Salesforce Classic Mobile Page Layouts](#)
5. Click **Save**.

### Remove Mobile Permissions

The Salesforce Classic Mobile app inherits the user's permissions from Salesforce. Some administrators want to further restrict the permissions of users when they access Salesforce data in Salesforce Classic Mobile, usually due to limitations of the app or the possibility of user error. For example, users can inadvertently delete a record because they don't realize that deleting a record in Salesforce Classic Mobile also deletes the record in Salesforce. If this is a concern, administrators can prevent users from deleting records in the mobile application, regardless of their standard and custom object permissions in Salesforce. Also, Salesforce Classic Mobile doesn't support all Salesforce features, such as S-controls and Apex. If your business process for an object is unsupported by Salesforce Classic Mobile, you might choose to prevent mobile users from updating those records in the app.

In the Permissions section, select which permissions to remove from mobile users for this object. Use the **Deny Create**, **Deny Edit**, or **Deny Delete** checkboxes to prevent users from creating, editing, or deleting records in Salesforce Classic Mobile.

 **Note:** Currently, you can't block mobile permissions for the content object.

### Customize Salesforce Classic Mobile Page Layouts

The Salesforce Classic Mobile app inherits the user's page layouts from Salesforce. Administrators may want to exclude some fields from each object's mobile page layout because unnecessary fields consume memory and make it harder for users to scroll through pages on the mobile device.

In the Excluded Fields section, select which fields to display on the mobile device for this object. To add or remove fields, select a field name, and click the **Add** or **Remove** arrow.

- Administrators can view all available fields per object, regardless of field-level security.
- Certain fields are required in order for Salesforce Classic Mobile to communicate with Salesforce. Those fields don't display in the Available Fields box because they are mandatory and can't be excluded from mobile page layouts.
- Fields used in custom mobile views can't be excluded from mobile page layouts.

#### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Free version available in: **All** editions except **Database.com**

Full version available in: **Performance, Unlimited, and Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

#### USER PERMISSIONS

To view Salesforce Classic Mobile configurations:

- "View Setup and Configuration"

To edit Salesforce Classic Mobile object properties:

- "Manage Mobile Configurations"

- If you mobilize the content object, all of the content object's fields display in the Available Fields box; however, the layout of the content detail page in the Salesforce Classic Mobile app is hard-coded to show only a few fields. Excluding fields for the content object doesn't affect the page layout in the app.

## SEE ALSO:

[Salesforce Classic Mobile Overview for Administrators](#)

[Manage Salesforce Classic Mobile Configurations](#)

[Manage Salesforce Classic Mobile Tabs](#)

[Create Links to Web and Visualforce Mobile Pages for Salesforce Classic Mobile](#)

[Setting Up Salesforce Classic Mobile](#)

## Assign Tabs to a Salesforce Classic Mobile Configuration

For each mobile configuration, you can select the tabs that appear in the Salesforce Classic Mobile app and define the order of the tabs. The available tabs for a mobile configuration include:

- Standard object tabs
- Custom object tabs
- Visualforce and web tabs that have been enabled for Salesforce Classic Mobile

**Warning:** Not all websites and Visualforce features are supported on mobile devices. Carefully review the [best practices](#) for creating mobile-friendly pages before enabling Visualforce or web tabs for the Salesforce Classic Mobile app.

By default, tabs work the same in the Salesforce Classic Mobile app as in the full Salesforce site—if an object's tab is hidden in Salesforce, it's hidden in Salesforce Classic Mobile as well.

**Note:** If you customize mobile tabs, the tabs you select for the mobile configuration are sent to users' mobile devices even if the tabs have not been added to a configuration. Although the tabs are sent to the device, they only display in the Salesforce Classic Mobile app if users have permission to view the tab.

There are several reasons you might want to hide an object's tab in Salesforce Classic Mobile even though the object records are sent to the device. The Salesforce Classic Mobile app has much less screen space to display a row of tabs, so occasionally you might choose to reduce the number of tabs on the device. Also, sometimes a custom object has a relationship to a standard object, and users access the custom object record from the parent object record. In that case, you could mobilize the custom object but hide the tab.

To assign tabs to a mobile configuration:

1. From Setup, enter *Salesforce Classic Configurations* in the **Quick Find** box, then select **Salesforce Classic Configurations**. Then click the name of a mobile configuration.
2. In the Mobile Tabs related list, click **Customize Tabs** to define mobile tabs for the first time. If you have already set up the mobile tabs, click **Edit**.
3. Select tabs from the **Available Tabs** list, and click the **Add** arrow to add them to the mobile configuration.
4. In the **Selected Tabs** list, choose tabs and click the **Up** and **Down** arrows to arrange the tabs in the order they should appear in the Salesforce Classic Mobile app.
5. Click **Save**.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Free version available in: **All** editions except **Database.com**

Full version available in: **Performance, Unlimited, and Developer** Editions, and for an extra cost in: **Professional and Enterprise** Editions

### USER PERMISSIONS

To view Salesforce Classic Mobile configurations:

- "View Setup and Configuration"

To customize Salesforce Classic Mobile tabs:

- "Manage Mobile Configurations"

-  **Note:** iPhone users can customize the order of their tabs in the Salesforce Classic Mobile app. If the user customizes their tab order, any administrator changes to the tab order in the mobile configuration are ignored by the app, and any newly mobilized tabs are added below the user's existing tabs.

## SEE ALSO:

- [Manage Salesforce Classic Mobile Tabs](#)
- [Enabling Web and Visualforce Tabs for Salesforce Classic Mobile](#)
- [Salesforce Classic Mobile Overview for Administrators](#)
- [Manage Salesforce Classic Mobile Configurations](#)

## Enabling Web and Visualforce Tabs for Salesforce Classic Mobile

You can make web and Visualforce tabs available in the Salesforce Classic Mobile app. When you build the web tab or Visualforce tab, edit the tab properties and select the `Salesforce Classic Mobile Ready` checkbox to ensure that the web page or Visualforce page displays and functions properly on a mobile device. Selecting the checkbox adds the tab to the list of available tabs for your Salesforce Classic Mobile mobile configurations.

It is important to note that most mobile browsers have technical limitations concerning display size, scripts, processor speed, and network latency. Review the following considerations before mobilizing your web and Visualforce pages to ensure that they are compatible with mobile browsers.

### Mobile Web Tab Considerations

Consider the following when defining a web tab that will be used in the Salesforce Classic Mobile app:

- The ability to mobilize web tabs is only available for BlackBerry and iPhone devices. If you mobilize a web tab, keep in mind that Android users can't view the tab in Salesforce Classic Mobile.
- The minimum BlackBerry operating system requirement for web tabs is 4.3.
- The tab type must be URL. The mobile application can't run S-controls.
- Some web pages contain JavaScript and Flash, but not all mobile browsers support them:
  - Apple's Safari browser supports JavaScript, but not Flash.
  - The BlackBerry browser has limited support for JavaScript and no support for Flash.
- Before mobilizing a web tab, navigate to the target URL on one of your organization's mobile devices to verify that it works as expected in a mobile browser. In the event that your organization's device inventory includes phones with different operating systems—for example, both iPhones and BlackBerry smartphones—be sure to test on each type of device. If users can't accomplish the necessary tasks on the web page from a mobile browser, do not mobilize the web tab.
- JavaScript must be enabled on BlackBerry devices in order to view JavaScript web pages. The BlackBerry administrator can globally enable JavaScript from the BlackBerry Enterprise Server. Users can also enable JavaScript on a BlackBerry smartphone by opening the BlackBerry browser, selecting **Options > Browser Configuration**, and then selecting the **Support JavaScript** checkbox.

### Visualforce Mobile Tab Considerations

Consider the following when defining a mobile Visualforce tab:

#### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Free version available in: **All** editions except **Database.com**

Full version available in: **Performance, Unlimited, and Developer** Editions, and for an extra cost in: **Professional and Enterprise** Editions

- Visualforce Mobile is only available for BlackBerry and iPhone. If you mobilize a Visualforce tab, keep in mind that Android users can't view the tab in Salesforce Classic Mobile.
- The Salesforce Classic Mobile app can run on BlackBerry operating system versions 4.3 through 7.0. For optimum performance, however, Salesforce recommends running Visualforce Mobile on BlackBerry smartphones installed with at least version 6.0.
- Because the display size is limited on mobile browsers, we recommend redesigning the Visualforce page to optimize it for mobile users:
  - Set the `sidebar` and `showHeader` attributes on the `<apex:page>` tag to `false`. Phones have small screens and limited processing power, so it is essential that the page suppresses the tab header and sidebar.
  - Set the `standardStylesheets` attribute on the `<apex:page>` tag to `false`. The standard Salesforce stylesheet causes pages to load slowly on the device. Additionally, most BlackBerry browsers older than the 6.0 OS can't properly interpret CSS. The best approach to adding a stylesheet to your page is to include a `<style>` section just below the `<apex:page>` component.
  - Set the `columns` attribute on the `<apex:pageBlockSection>` component to `1`. There is not enough room on a mobile device's screen to display two columns, so specifying a one-column layout prevents fields from wrapping awkwardly on the page.
- Splash pages don't display in the Salesforce Classic Mobile app.
- In the Salesforce Classic Mobile app, the Visualforce page is embedded in a tab, so you should avoid using tabs for navigation in mobile Visualforce pages.
- Even if you know that the mobile browser supports the JavaScript in your Visualforce page, keep your use of JavaScript to a minimum. Mobile devices generally have slow network connections, and too many scripts running on a page creates a poor user experience. To minimize the amount of JavaScript on your mobile Visualforce pages, try to build them using mostly HTML.
- All Visualforce pages contain JavaScript, even if you don't create pages that use JavaScript code. JavaScript must be enabled on BlackBerry devices in order to view Visualforce pages. The BlackBerry administrator can globally enable JavaScript from the BlackBerry Enterprise Server. Users can also enable JavaScript on a BlackBerry smartphone by opening the BlackBerry browser, selecting **Options > Browser Configuration**, and then selecting the **Support JavaScript** checkbox.
- The embedded browser in the BlackBerry client application doesn't have built-in navigation. If your Visualforce page is a wizard, you should provide navigation links that allow users to return to the previous page and advance to the next page.
- BlackBerry administrators should be aware that the download size setting on the BlackBerry Enterprise Server affects how much data can be pushed to the device. Check that the download size setting is appropriate, and be sure to test your Visualforce pages before deploying them to your Salesforce Classic Mobile users.
- User agent inspection can be executed in a custom controller to support multiple devices. You can do this by inspecting the appropriate result of the `getHeaders()` method on the current page reference.

[Assign Tabs to a Salesforce Classic Mobile Configuration](#)

## Create List Views for Salesforce Classic Mobile

You can create custom list views for Salesforce Classic Mobile users. Custom list views for Salesforce Classic Mobile, also called mobile views, are different from Salesforce custom views in these ways:

- Administrators set up mobile views for each mobile configuration. The views are available to all users assigned to the configuration, and administrators can't restrict visibility to certain groups of users within the configuration. Each mobilized object in a mobile configuration can have up to 10 custom views.
- Users can't filter mobile views by All Records or My Records. The views apply to all records stored locally on the device regardless of ownership; however, ownership filters can be applied using the additional fields in the search criteria.
- Mobile views don't support filter logic.
- Mobile views are limited to a two-column display.
- Users can sort mobile views in ascending or descending order by up to two fields.

For each mobile configuration, you can define up to 10 custom views per object. These views are then pushed to the devices of users assigned to the affected configurations. To create a custom view for Salesforce Classic Mobile:

1. From Setup, enter *Salesforce Classic Configurations* in the Quick Find box, then select **Salesforce Classic Configurations**. Then click the name of a mobile configuration. You might need to [create a mobile configuration](#) if you haven't already.
2. Scroll down to the Mobile Views related list.
3. Choose an object type from the Select an object drop-down list, and then click **New Mobile View**. Only objects included in the mobile configuration's data set appear in the drop-down list. You can't create mobile views for the user object.
4. Enter the view name.

Because display space on mobile devices is limited, the maximum length of a mobile view name is 30 characters.

5. In the Specify Filter Criteria section, enter conditions that the selected items must match; for example, *Amount is greater than \$100,000*.
  - a. Choose a field from the first drop-down list.

**Note:** You can't create views based on fields you [excluded from mobile page layouts](#) or fields that are [hidden for all profiles and permission sets](#).

- b. Choose a filter operator.
- c. In the third field, enter the value to match.

**Warning:** Note the following about filter criteria values for mobile views:

- You can use the `$User.ID` merge field as a value in your filter criteria to reference the current user. You can't enter user names in your filter criteria.
- You can only enter special date values in your filter criteria, not actual dates.
- You can't use FISCAL special date values in the filter criteria.

- d. Select **Match All** if items in the mobile view should match all the criteria you entered. Select **Match Any** if items in the mobile view should match any of the criteria you entered. Mobile custom views do not support advanced filtering options.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Free version available in: **All** editions except **Database.com**

Full version available in: **Performance, Unlimited, and Developer** Editions, and for an extra cost in: **Professional and Enterprise** Editions

### USER PERMISSIONS

To view Salesforce Classic Mobile devices and users:

- "View Setup and Configuration"

To manage Salesforce Classic Mobile custom views:

- "Manage Mobile Configurations"

6. In the Select Fields to Display section, select the fields to use as display columns.  
The default fields are automatically selected. You can choose up to two different columns of data fields to display in your mobile custom view.
7. In the Define Sort Order section, optionally set a primary and secondary sort order for the view.
  - a. Select a field in the Order By drop-down list. You can sort by fields that have been excluded from the object's mobile page layout.
  - b. Set the sort order to Ascending or Descending.
8. Click **Save**.

## Set Up The Mobile Dashboards for iPad App

 **Important:** As of Summer '15, the Mobile Dashboards for iPad app is no longer supported. You can continue to use the app, but Salesforce no longer provides support in the form of bug fixes or enhancements for any issues you may encounter. Talk to your Salesforce administrator about migrating to the Salesforce1 app, the new Salesforce mobile experience.

You can make the Dashboards tab available in Salesforce Classic Mobile by adding it to the tabs for a [mobile configuration](#). Mobile dashboards allow field users to keep up with corporate metrics and key performance indicators even when they are away from their desks.

Note the following about mobile dashboards:

- The Dashboards tab in the mobile application launches an embedded browser to display the dashboards.
- Due to screen size limitations, mobile dashboards display in a single column.
- Links to custom report details are disabled in mobile dashboards.
- The first time a user visits the Dashboards tab in Salesforce Classic Mobile, the mobile application requests the last dashboard the user viewed in Salesforce. Depending on the strength of the cellular or WiFi signal, it could take several minutes before the dashboard displays on the page.
- Dashboards do not automatically refresh in the mobile application. Users can request a dashboard refresh by clicking the **Refresh** button.
- Users are able to work offline in the mobile application. Without a wireless connection, users can see the last viewed dashboard, but they cannot refresh the dashboard or select a different one.
- The minimum BlackBerry operating system requirement for mobile dashboards is 4.5. Mobile dashboards are compatible with version 4.3, but tables in the dashboards might not display properly.
- BlackBerry administrators should be aware that the download size setting on the BlackBerry Enterprise Server affects how much dashboard data can be pushed to the device. Check that the download size setting is appropriate, and be sure to test your dashboards before deploying them to your mobile users.

 **Note:** Currently, dashboards are only available in the BlackBerry and iPhone mobile client applications.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To view mobile configurations:

- "View Setup and Configuration"

To mobilize dashboards:

- "Manage Mobile Configurations"

To enable mobile dashboards:

1. From Setup, enter *Mobile Dashboards* in the `Quick Find` box, then select **Mobile Dashboard Settings**. Then click the name of a mobile configuration.
2. In the Mobile Tabs related list, click **Customize Tabs** to define mobile tabs for the first time. If you have already set up the mobile tabs, click **Edit**.
3. Select **Dashboards** from the Available Tabs list, and click the **Add** arrow to add it to the mobile configuration. The Available Tabs list includes standard object tabs and custom object tabs. It can also include web and Visualforce tabs.

**Warning:** If you have not yet customized tabs in the mobile configuration, you must select all the tabs that should appear in the mobile application, not just the Dashboards tab.

4. In the Selected Tabs list, choose the Dashboards tab and click the **Up** and **Down** arrows to define where the Dashboards tab should appear in the mobile application.
5. Click **Save**.

SEE ALSO:

[Setting Up Salesforce Classic Mobile](#)

## Enable Reports in Salesforce Classic Mobile

To enable reports in the Salesforce Classic Mobile app:

1. Create a Mobile Reports folder in Salesforce. From the reports home page in the full site, click **Create New Folder**.
2. In the `Report Folder` field, enter: *Mobile Reports*.

The server won't load reports on mobile devices unless this folder is named `Mobile Reports`. Be sure to check for any typos in the name before saving the folder. Additionally, Salesforce doesn't require folder names to be unique. Salesforce Classic Mobile users can see any report stored in all folders named `Mobile Reports` unless you restrict access with the folder visibility option.

3. Choose a `Public Folder Access` option. This option doesn't affect the ability of mobile users to run reports.
4. Optionally, select any unfiled reports and click **Add** to store them in the `Mobile Reports` folder. You can also add reports to the folder after saving the folder.
5. Choose a folder visibility option.

- `This folder is accessible by all users` gives every user in your organization the ability to see the list of mobile reports from their devices.
- `This folder is accessible only by the following users` lets you grant access to a desired set of users.

Don't make the `Mobile Reports` folder private unless you want to hide mobile reports from all users, including yourself.

6. Click **Save**.
7. Add reports to the `Mobile Reports` folder. Click the report name on the reports home page, then click **Save As** and save the report in the `Mobile Reports` folder.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Free version available in: **All** editions except **Database.com**

Full version available in: **Performance, Unlimited, and Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

### USER PERMISSIONS

To create, edit, and delete public report folders:

- "Manage Public Reports"

To view Salesforce Classic Mobile configurations:

- "View Setup and Configuration"

After saving the report, you can edit the options to make the report easier to view on a mobile device. For example, you might reduce the number of columns or enter additional filtering criteria.

8. Add the Reports tab to your mobile configurations. From Setup, enter *Salesforce Classic Configurations* in the **Quick Find** box, then select **Salesforce Classic Configurations**. Then click the name of a mobile configuration.
9. In the Mobile Tabs related list, click **Customize Tabs** to define mobile tabs for the first time. If you've already set up the mobile tabs, click **Edit**.
10. Select **Reports** from the Available Tabs list, then click the **Add** arrow to add it to the mobile configuration. The Available Tabs list includes standard object tabs and custom object tabs. It can also include web and Visualforce tabs.

**Warning:** If you have not yet customized tabs in the mobile configuration, you must select all the tabs that should appear in the Salesforce Classic Mobile, not just the Reports tab.

11. In the Selected Tabs list, choose the Reports tab and click the **Up** and **Down** arrows to define where the Reports tab should appear in the Salesforce Classic Mobile app.
12. Click **Save**.

**Note:** Currently, reports in Salesforce Classic Mobile aren't available on Android or iPhone devices.

SEE ALSO:

[Setting Up Salesforce Classic Mobile](#)

## Setting Up Salesforce CRM Content for Salesforce Classic Mobile

Note the following about how Salesforce CRM Content is implemented in Salesforce Classic Mobile:

- Content record information is synchronized to the device; however, the files associated with the content records are not. This allows users to deliver content from the app even when a file is too large to be downloaded to a mobile device.
- Users can't search for a specific piece of content in the app. They can only share the content available on the Content tab, which is automatically synchronized to their device based on the filters in their assigned mobile configuration.
- Users can't view a list of their subscribed content in the app. They also can't filter the list of records on the Content tab based on a particular library.
- While users can preview and share content from the app, they can't update the file associated with a content record. If they have the required permissions, they can edit the fields on the content detail page.
- Users must have a data connection to preview and deliver content. Without a data connection, they can only view the content detail page.
- Content in Salesforce Classic Mobile is only supported on BlackBerry and iPhone devices.
- Content is not available in the free version of Salesforce Classic Mobile.
- You can't block mobile permissions for the content object. Currently, the content object in Salesforce Classic Mobile is read-only.
- You can't edit the mobile page layout for the content object. The content detail page in the app is hard-coded to display only a few fields.

To set up Content for a Salesforce Classic Mobile configuration:

1. From Setup, enter *Salesforce Classic Configurations* in the Quick Find box, then select **Salesforce Classic Configurations**, and then click the name of a mobile configuration.
2. In the Data Sets related list, click **Edit**.
3. Click **Add...**
4. In the popup window, select Content, then click **OK**.
5. Use field filters to specify which content records are synchronized.

Because users can't search for content in the Salesforce Classic Mobile app, it's essential to set up filters that make important content available on the device. You can't create filters based on libraries or subscriptions, but here are a few options for setting up useful filter conditions:

- **Date:** Filter on the `Last Modified Date`, `Content Modified Date`, or `Created Date` fields. Use special date values like `LAST 90 DAYS` or `LAST 180 DAYS` to ensure that recently updated content records are synchronized.
  - **Owner:** Filter on the author if certain people in your organization are responsible for publishing content.
  - **File Type:** Filter on certain types of documents. For example, your opportunity team might generally be interested in presentations or PDF documents.
  - **Custom Fields:** If you created custom content fields that help you categorize your content, filter on the custom fields. For example, if you built a `Functional Use` field with picklist values, you could set up a filter condition where `Functional Use` equals `Sales`.
6. Optionally, prevent content records from consuming all the memory on a mobile device by selecting the second radio button under Set Max Record Limit and entering the maximum number of content records this configuration can transfer to mobile devices. Use

## Configuring Salesforce Classic Mobile Access for Partner Users

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

You can allow partner users to access partner portal data on mobile devices using the Salesforce Classic Mobile app.

Tips for setting up Salesforce Classic Mobile access for partner users:

- Before setting up Salesforce Classic Mobile for partner users, you must configure partner user accounts and purchase mobile licenses for each partner portal user that will be using Salesforce Classic Mobile. Partner user profiles must be assigned to at least one active partner portal before partner users can use Salesforce Classic Mobile. If a user profile is assigned to multiple partner portals, only the first assigned partner portal will be accessible using Salesforce Classic Mobile.
- Custom mobile list views don't affect list views in the partner portal.
- If you make User data sets available in the Salesforce Classic Mobile app, partners can assign objects to their partner account users and all internal users. If you don't make User data sets available, partners can only assign objects to internal or partner account users who are associated with records that you've made available on the mobile device.

## Create Links to Web and Visualforce Mobile Pages for Salesforce Classic Mobile

To improve the integration between the Salesforce Classic Mobile app, Visualforce Mobile, and external websites, you can optionally create links from native Salesforce records to Visualforce Mobile pages or external websites. To create the links, build text formula fields on a standard or custom object. The field must be visible on the page layout to appear in the Salesforce Classic Mobile app. The best practice is to include all embedded links in a separate section labeled "Mobile Links" at the bottom of the page layout. There is currently no way to hide these links in Salesforce, but users can collapse the section to keep the links out of the way.

1. Navigate to the fields area of the appropriate object.
2. Click **New** in the fields section of the page.
3. Select **Formula**, and then click **Next**.
4. Enter the field label.

The field name is automatically populated based on the field label you enter.

5. Select **Text**, then click **Next**.
6. In the formula editor, create the link to the custom Visualforce page or external website:

- To create a Visualforce link, type `"visualforce:///apex/PageName"`, and replace *PageName* with the name of your Visualforce page. You can append parameters to the string, such as `?contactid=" & Id"`, in order to pass information from the record in the client application to the Visualforce page.
- To create a Web link, type `"weblink:"`, followed by the URL to which you want the link to point, such as `"weblink:http://www.salesforce.com"`. You can append parameters to the string in order to pass information from the record in the client application to the Web page. For example, the following Web link launches a social networking site from a contact record and performs a search for the contact:

```
"weblink:http://m.linkedin.com/members?search_term=" &FirstName& "+" &LastName&
"&filter=name&commit=Search"
```

 **Note:** The client application passes the Visualforce or Web link with all parameters to the embedded browser. It is up to the website or Visualforce Mobile page to interpret any parameters. Be sure to construct your Visualforce Mobile page to consume any parameters passed in the link.

7. Click **Next**.
8. Set the field-level security to determine whether the field should be visible or read only for specific profiles, and click **Next**.
9. Choose the page layouts that should display the field. In the next step, you will customize the layout to change the location of the field on the page.
10. Save your changes.
11. Edit the object's page layout. From the management settings for the object whose page layout you want to change, go to Page Layouts.
12. Drag a Section element from the palette to the page layout and drop it below the existing sections.
13. In the **Section Name** field, type *Mobile Links*.
14. Deselect the **Edit Page** option.
15. Select the 1-column layout, then click **OK**.
16. Drag the new text formula field from its current location into the new Mobile Links section.

## Notifying Users about Salesforce Classic Mobile Availability

When you're ready to deploy the Salesforce Classic Mobile app to your users, send them an email to notify them about the availability of the app and provide installation instructions. You can send the email using your corporate email application, like Outlook, or you can send mass email from Salesforce. Either way, include the URL that launches the download.

- For Android and BlackBerry users, the download URL is `mobile.salesforce.com`. The link is the same for the initial download and for subsequent upgrades.
- If you manage BlackBerry devices with a BlackBerry Enterprise Server, you can use Application Push to remotely deliver Salesforce Classic Mobile to users. For more information about BlackBerry Enterprise Application Push, see the [Salesforce Classic Mobile Implementation Guide](#).
- You can obtain the iPhone download URL from iTunes. Open iTunes, click **iTunes Store**, then search for Salesforce Classic Mobile. Click the app icon to view details about the app. At the top of the iTunes window is a bread crumb path representing the application's location in the App Store: **App Store > Business > Salesforce Classic Mobile**. Drag-and-drop the path into a text editor or word processing program to display the app's download URL.

To send mass email to Salesforce Classic Mobile users from Salesforce:

1. Create an email template that informs users about the availability of Salesforce Classic Mobile. From your personal settings, enter *Templates* in the *Quick Find* box, and select either **My Templates** or **Email Templates**—whichever one appears. Optionally, you can also create a separate email template for upgrade notifications. Include the download link in the templates.
2. Create a custom view on the Mass Email page that shows your Salesforce Classic Mobile users only.

 **Note:** The `Mobile User` checkbox on the user record assigns a mobile license to users, which enables use of the full version of Salesforce Classic Mobile. But other Salesforce users can access the free version of Salesforce Classic Mobile without an assigned mobile license, so you can't filter for all Salesforce Classic Mobile users by license. Create a view for users of the free version by filtering by roles or profiles instead.

3. Send mass email to your Salesforce Classic Mobile users, using the custom view that you created. From Setup, enter *Mass Email Users* in the *Quick Find* box, then select **Mass Email Users**.

## Salesforce Classic Mobile FAQ for Administrators

- [Is the Salesforce Classic Mobile mobile app secure?](#)
- [My Salesforce Classic Mobile users have Android, BlackBerry, and iPhone devices. Can we have multiple types of device in one organization?](#)
- [Is there an easy way to deploy Salesforce Classic Mobile to all of my BlackBerry users?](#)

### Is the Salesforce Classic Mobile mobile app secure?

All data transmitted between Salesforce and Salesforce Classic Mobile is fully encrypted and secured over the air.

The mobile application has multiple layers of security at the device level. Device vendors provide the ability to set password or passcode access restrictions. Users must be required to use the device protection in accordance with your organization's security policy. If the device is locked by password, it is difficult for unauthorized persons to obtain sensitive data.

Additionally, a user must have valid Salesforce credentials to activate the mobile application on the device. When a user registers a new wireless device, the Salesforce data on their old wireless device is automatically erased—users can only activate one mobile device at a time. Users are also warned when a new device is activated using their Salesforce account. If a logged in user exceeds the administrator-configured inactivity period on the mobile device, the mobile session is terminated and the password or passcode is required to reestablish the session.

Administrators can also remotely [delete data](#) from any lost or stolen devices.

### My Salesforce Classic Mobile users have Android, BlackBerry, and iPhone devices. Can we have multiple types of device in one organization?

Yes, one organization can have multiple types of devices. However, a Salesforce Classic Mobile user can only have one active device.

### Is there an easy way to deploy Salesforce Classic Mobile to all of my BlackBerry users?

If your organization manages BlackBerry smartphones using the BlackBerry Enterprise Server (BES), you can use Application Push. Application Push is an administrator-initiated delivery technology on the BlackBerry Enterprise Server that installs applications on BlackBerry smartphones remotely. This technology is not developed or supported by Salesforce, but BlackBerry Enterprise Server administrators can use it to install Salesforce Classic Mobile on their BlackBerry users' mobile devices.

For instructions on how to configure the BlackBerry Enterprise Server v4.1 to push Salesforce Classic Mobile to your BlackBerry users, see "BlackBerry Enterprise Server Application Push" in the [Salesforce Classic Mobile Implementation Guide](#).

You can find detailed information about Application Push in the official *BlackBerry Enterprise Server Administrator Guide* from Research in Motion in the sections "Making additional BlackBerry device software and applications available to users" and "Creating software configurations." If you have any technical issues with Application Push, contact [Research in Motion Support](#).

- “Manage Mobile Configurations”

## Managing Salesforce Classic Mobile Permissions

A mobile license is required for each user who will access the full version of the Salesforce Classic Mobile app. You allocate mobile licenses using the `Mobile User` checkbox on the user record. For organizations using Unlimited, Performance, and Developer Editions, Salesforce provides a mobile license for each Salesforce license and the `Mobile User` checkbox is enabled by default for all users. Organizations using Professional or Enterprise Editions must purchase mobile licenses separately and allocate them manually.

 **Note:** The `Mobile User` checkbox is disabled by default for new Performance Edition users.

To prevent users from activating the full version of Salesforce Classic Mobile on their mobile devices before you're ready to deploy the app, disable the `Mobile User` checkbox for all your users.

Any Salesforce user who doesn't have a mobile license can download a free, restricted version of Salesforce Classic Mobile. Starting with Summer '13, the free version of Salesforce Classic Mobile is disabled by default in all new organizations. You can enable it to give users access to Salesforce on their mobile devices.

To enable the free version of Salesforce Classic Mobile:

1. From Setup, enter *Salesforce Classic Settings* in the `Quick Find` box, then select **Salesforce Classic Settings**.
2. Click **Edit**.
3. Select `Enable Mobile Lite`.
4. Click **Save**.

## Salesforce Classic Mobile Usage Data in Custom Report Types

You can create custom report types with data that shows how your organization uses Salesforce Classic Mobile. For example, the reports can show how often users access Salesforce Classic Mobile, which mobile device models they use, and so forth.

To create a custom report type with Salesforce Classic Mobile usage data, select the Mobile Session `Primary Object` when defining a custom report type. When you select the fields for the custom report type, choose from the following Salesforce Classic Mobile-specific fields.

Mobile Usage Data Point	Definition
Brand	Wireless carrier
Data Size (Bytes)	Total size of records on device
Device Address	Unique physical address of device (PIN for BlackBerry or UDID for iOS)
Device Application Version	Installed version of Salesforce Classic Mobile
Device Model	Model of device
Device Operating System Version	Version of operating system installed on device
Duration	Duration of the mobile session in seconds
Last Registration Date	Date of last registration or activation
Last Status Date	Date of last communication received from device
Manufacturer	Manufacturer of device
Metadata Size (Bytes)	Size of metadata (page layouts, picklist values, and so forth) on the device
Owner: Full Name	Name of the device user
Session Start Date	Date the mobile session started
Status	Indicator that the user's data set exceeds the maximum allowed size by the mobile configuration

### Note:

- Mobile sessions are similar to Web-based sessions in login history reports; however, mobile sessions have a fixed timeout value of 20 minutes. Salesforce creates a new Mobile Session when a user logs into or launches Salesforce Classic Mobile after 20 minutes of inactivity in the app or on the device in general.
- Mobile session reports only have usage data for the Salesforce Classic Mobile app and not other Salesforce mobile apps, such as the Salesforce1 apps.
- Some devices do not provide every physical attribute. For example, Apple devices do not provide brand.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Free version available in: **All** editions except **Database.com**

Full version available in: **Performance, Unlimited,** and **Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

### USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To delete custom report types:

- "Modify All Data"

## Manage Salesforce Classic Mobile Devices

After a user installs the Salesforce Classic Mobile app on a mobile device and logs in for the first time, Salesforce collects information about the device and associates it with the user's record. The device information is read only.

Although the device entry is created automatically, you can still view and manage all the mobile users and devices in your organization from Setup by entering *Users and Devices* in the **Quick Find** box, then selecting **Users and Devices**.

From the All Mobile Users and Devices page, you can:

- View the list of users in your organization who have been enabled to use Salesforce Classic Mobile.
- Create custom list views to see different subsets of your mobile users. For example, create a view that shows the users who have never logged in to Salesforce from the Salesforce Classic Mobile app to evaluate the effectiveness of your organization's Salesforce Classic Mobile deployment efforts.
- [View details about a mobile device](#) by clicking the device address.
- View details about a specific user by clicking the username.
- View details about a mobile configuration by clicking the mobile configuration name.
- Perform these actions on multiple users at the same time:
  - [Adjust the mobile session timeout value](#)
  - [Erase the Salesforce data from a user's mobile device](#)
  - [Delete a mobile device from a user's record](#)
- Find out why a user's device isn't synchronizing by hovering your mouse over the red error icon in the Status column. Additional information about the synchronization errors appears on the device's detail page.

 **Note:** You can also manage mobile users from the Assigned Mobile Devices related list on the user detail page.

### IN THIS SECTION:

[Permanently Link Salesforce Classic Mobile Users to a Mobile Device](#)

You can prevent mobile users from registering any mobile device other than the one they used for their initial Salesforce Classic Mobile activation.

To manage Salesforce Classic Mobile devices:

- "Manage Mobile Configurations"

## Permanently Link Salesforce Classic Mobile Users to a Mobile Device

You can prevent mobile users from registering any mobile device other than the one they used for their initial Salesforce Classic Mobile activation.

By default, Salesforce automatically associates a device record with the mobile user who most recently activated the device, so administrators don't need to update the device record to assign the device to another user. While this behavior makes it easy to switch devices between users in your organization, some administrators prefer that users are permanently linked to the devices they were originally assigned. This helps administrators of organizations with highly sensitive data ensure that their users do not access corporate data from personal devices.

To permanently link a user to a mobile device:

1. From Setup, enter *Salesforce Classic Settings* in the Quick Find box, then select **Salesforce Classic Settings**.
2. Click **Edit**.
3. Select **Permanently Link User to Mobile Device**.
4. Click **Save**.

 **Warning:** Enabling the **Permanently Link User to Mobile Device** setting requires administrative action when users need to switch devices. You must manually [delete the existing device](#) from a user's record in order for the user to register a different device. If you don't delete the device, the user won't be able to access the Salesforce Classic Mobile app.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Free version available in: **All** editions except **Database.com**

Full version available in: **Performance, Unlimited,** and **Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

### USER PERMISSIONS

To view Salesforce Classic Mobile settings:

- "View Setup and Configuration"

To change Salesforce Classic Mobile settings:

- "Manage Mobile Configurations"

## Viewing Salesforce Classic Mobile Device Information

Salesforce collects information about a mobile user's device the first time the user logs in to the Salesforce Classic Mobile app. There are two ways to access the device details.

- From Setup, enter *Users and Devices* in the **Quick Find** box, then select **Users and Devices**. Then click a device address in the list view.
- From Setup, enter *Users* in the **Quick Find** box, then select **Users**. Click **Edit** next to a user's name, and then click the device address in the Assigned Mobile Devices related list.

From the Mobile Device page, you can:

- Review device information
- [Adjust the mobile session timeout value](#)
- [Erase the Salesforce data from a user's device](#)
- [Delete a device from a user's record](#)

Below is a description of the fields in alphabetical order that are stored for each mobile device in your organization.

Field	Description
Brand	The brand of the mobile device, if available.
Carrier	The name of the carrier providing service for the mobile device, if available.
Connected Since	The date and time the device established a connection to the mobile server. The device loses a connection when the battery dies or when the session is closed because the server has not received data from the device for a long period of time.
Connection Status	The state of the device connection. Possible values for this field are Connected, Not Connected, and Not Available.
Created By	The name of the first user who registered the mobile device and the time and date the registration occurred.
Data Size	The size of the Salesforce data currently stored on the user's mobile device. The mobile device periodically sends this information to Salesforce, which is helpful when troubleshooting synchronization errors resulting from an <a href="#">exceeded data limit</a> .
Device Address	The unique identifier of the user's mobile device.
Device Model	The model of the mobile device.
Is Simulator?	A flag indicating whether the device is a simulator or a mobile device. A simulator is a

### EDITIONS

### USER PERMISSIONS

To view Salesforce Classic Mobile devices and users:

- "View Setup and Configuration"

To manage Salesforce Classic Mobile devices:

- "Manage Mobile Configurations"

Field	Description
	software application that emulates the behavior of a mobile device.
Last Activated	The last time a full data set was downloaded to the mobile device. If a user's data set exceeds the limit defined in the assigned mobile configuration, the device can be registered but not activated.
Last Data Received	The last time data was received from the device. This information is helpful for troubleshooting connection issues.
Last Registration	The last time a user registered the mobile device. The registration process creates the device record in Salesforce and associates it with the user who registered it.
Last Status Date	The last time the mobile device notified Salesforce that the device is no longer synchronizing data due to an error. The Last Status Date field is only visible when an error is present.
Manufacturer	The manufacturer of the mobile device.
Metadata Size	The size of the Salesforce metadata currently stored on the user's mobile device. Metadata consists of page layout and schema information, and the amount of metadata sent to a device can be very high depending on the size of your organization and the complexity of its setup.
Modified By	The name of the last user who registered the mobile device and the time and date the registration occurred.
Number of Pending Outgoing Messages	The number of messages queued on the mobile server waiting to be sent to the device.
Operating System	The type of operating system installed on the mobile device: Android, BlackBerry, or iPhone.
Operating System Version	The version number of the operating system installed on the mobile device.
Phone Number	The phone number associated with the mobile device.
Salesforce Classic Mobile Version	The version number and build number of the mobile client application installed on the device.
Size of Pending Outgoing Messages (Bytes)	The total data size of the messages queued on the device waiting to be sent to the mobile server. Because the server processes messages almost instantaneously, this value is usually 0.
Size of Outgoing Messages (Bytes)	The total data size of the outbound message queue on the mobile server.
Status	Indicates whether any synchronization errors exist between the device and Salesforce. The Status field is only visible when an error is present. The two error statuses are Data Limit Exceeded and Unknown Error.

Field	Description
Username	The Salesforce username of the user who is associated with the mobile device.

 **Note:** If Salesforce detects the selected device was registered by a user in another organization, an error displays on the device detail page. This can happen when a device was registered to a user in your sandbox organization and then later activated by a user in your production organization. To remove the old device record from your organization, simply [delete the device](#).

## Set Salesforce Classic Mobile Session Timeout Values

For security reasons, the Salesforce Classic Mobile app is set to lock out users after 10 minutes of inactivity. Administrators can adjust or disable this setting on a device-by-device basis. For example, you might disable the Salesforce Classic Mobile timeout setting if a mobile device's operating system has its own locking mechanism.

To change the Salesforce Classic Mobile session timeout value:

- Navigate to one of these pages.
  - To deal with multiple devices at the same time, from Setup, enter *Users and Devices* in the **Quick Find** box, then select **Users and Devices**. In the list view on the Mobile Users and Devices page, select the desired devices.
  - To deal with a specific device, from Setup, enter *Users* in the **Quick Find** box, then select **Users**. Click a user's name, then click the device address in the Assigned Mobile Devices related list to see the Mobile Device page.
- Click **Set Mobile Session Timeout**.
- Choose the new timeout value in minutes. You can also choose **Never Expire** if users shouldn't be locked out of the app.
- Click **Save**.  
Salesforce attempts to send a message containing the new session timeout setting to the selected mobile devices.
- A confirmation page [summarizes the results](#) for each mobile device you selected.

## Mobile Session Timeout Results

After Salesforce sends the new session timeout session to the selected mobile devices, a results page provides information about the status of each message. The table below describes the three possible outcomes:

Result	Description
Message successfully queued	The Salesforce Classic Mobile server has sent the message to the device. Salesforce can't detect if the message was received by the device.
Unable to send message	A temporary communication problem between Salesforce and the Salesforce Classic Mobile server prevented the message from being sent. Try again later.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Free version available in: **All** editions except **Database.com**

Full version available in: **Performance, Unlimited,** and **Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

### USER PERMISSIONS

To set Salesforce Classic Mobile session timeout values:

- "Manage Mobile Configurations"

Result	Description
User has no mobile device	The selected mobile user never registered a device, so therefore the message could not be sent.

## Erasing Data in Salesforce Classic Mobile

When a user accesses the Salesforce Classic Mobile app, the user's mobile device contains both the mobile app and a set of the user's Salesforce data. An administrator can remove the data from a device without uninstalling the mobile app. This is an effective security tool when a user misplaces his or her device. You also must erase a device's data if you plan to give it to another user.

To erase the Salesforce data on one or more mobile devices:

- Navigate to one of these pages.
  - To deal with multiple devices at the same time, from Setup, enter *Users and Devices* in the **Quick Find** box, then select **Users and Devices**. In the list view on the Mobile Users and Devices page, select the desired devices.
  - To deal with a specific device, from Setup, enter *Users* in the **Quick Find** box, then select **Users**. Click a user's name, then click the device address in the Assigned Mobile Devices related list to see the Mobile Device page.
- Click **Erase Data**, then click **OK**.  
Salesforce attempts to send a message to the mobile devices to erase the data.

### Erase Data Results

After Salesforce sends the message to the mobile devices to erase data, a results page provides information about the status of each message. The table below describes the three possible outcomes:

Result	Description
Message successfully queued	The Salesforce Classic Mobile server has sent the message to the device. Salesforce can't detect if the message was received by the device.
Unable to send message	A temporary communication problem between Salesforce and the Salesforce Classic Mobile server prevented the message from being sent. Try again later.
User has no mobile device	The selected mobile user never registered a device, so therefore the message could not be sent.

#### USER PERMISSIONS

To delete the Salesforce data on a device running Salesforce Classic Mobile:

- "Manage Mobile Configurations"

## Deleting Mobile Devices

There are two instances when you would delete a mobile device from a user's record:

- Your organization's mobile settings permanently link mobile users to their devices, and you need to assign a device to a different user. If you did not enable this setting, Salesforce automatically associates a device record with the mobile user who most recently activated the device, so it is unnecessary to delete a device to assign it to another user.
- You want to move a device from your sandbox organization to your production organization.

To delete a mobile device:

1. Navigate to one of these pages.
  - To deal with multiple devices at the same time, from Setup, enter *Users and Devices* in the **Quick Find** box, then select **Users and Devices**. In the list view on the Mobile Users and Devices page, select the desired devices.
  - To deal with a specific device, from Setup, enter *Users* in the **Quick Find** box, then select **Users**. Click a user's name, then click the device address in the Assigned Mobile Devices related list to see the Mobile Device page.
2. On the Mobile Devices and Users page, select one or more devices, then click **Delete Device**. On the Mobile Device page, click **Delete**.
3. Click **OK**.  
Salesforce attempts to delete the selected device(s).
4. A confirmation page [summarizes the results](#) for each mobile device you selected.

### Delete Device Results

After Salesforce sends the message to the mobile server to delete the devices, a results page provides information about the status of each device. The table below describes the three possible outcomes:

Result	Description
Device deleted.	Salesforce removed the device record from your organization.
Device cannot be deleted at this time. Please try again later.	A temporary communication problem between Salesforce and the mobile server prevented the device from being deleted. Try again later.
User has no mobile device.	The selected mobile user never registered a device, so therefore the message could not be sent.

# Chatter Mobile for BlackBerry

## Configure Chatter Mobile for BlackBerry

**!** **Important:** As of Summer '14, the Chatter Mobile for BlackBerry app is no longer supported. You can continue to use the app, but Salesforce no longer provides support in the form of bug fixes or enhancements for any issues you may encounter. Talk to your Salesforce administrator about migrating to the Salesforce1 app, the new Salesforce mobile experience.

Chatter Mobile for BlackBerry is built as a connected app. A connected app is an application that integrates with Salesforce using APIs. Connected apps allow administrators to set various security policies and have explicit control over who may use the applications. Administrators can view and manage the Chatter Mobile for BlackBerry settings in the same way they view and manage other connected app settings.

Chatter Mobile for BlackBerry is automatically installed as part of a managed Salesforce connected apps package when one of these events occurs:

- A user in your organization downloads the Chatter Mobile for BlackBerry mobile app and authenticates with your organization by logging in to the mobile app.
- An existing Chatter Mobile user's session refreshes.

**📝 Note:** Sessions refresh automatically between every 15 minutes and 12 hours while a user is in the app based upon the session `Timeout` value set for your organization; this is often undetected by the user.

Alternatively, an administrator can manually install the Salesforce1 and Chatter Apps connected apps package to view and manage the settings before the package is automatically installed.

The connected apps package includes a separate connected app for the BlackBerry mobile device type.

**!** **Important:** Unless an administrator manually installs the package, you'll only see the Chatter Mobile for BlackBerry connected app after someone in your organization activates a mobile app or an existing user's session refreshes.

Administrators can use profiles, permission sets, and IP range restrictions to control which users can access the app. These settings are controlled on the Chatter Mobile for BlackBerry connected app detail page, which you can access from Setup by entering *Connected Apps* in the *Quick Find* box, then selecting the option for managing connected apps.

The app displays an error message if a restricted user tries to open it.

## Mobile Dashboards for iPad

### Let Users View Dashboards on the iPad

The Mobile Dashboards for iPad app is automatically enabled for your organization so your users can access the app without any configuration on your part.

**Important:** As of Summer '15, the Mobile Dashboards for iPad app is no longer supported. You can continue to use the app, but Salesforce no longer provides support in the form of bug fixes or enhancements for any issues you may encounter. Talk to your Salesforce administrator about migrating to the Salesforce1 app, the new Salesforce mobile experience.

You can disable the app if you don't want users accessing Salesforce data from mobile devices and you can easily re-enable it if you change your mind later.

To configure access to Mobile Dashboards for iPad:

1. From Setup, enter *Mobile Dashboards* in the *Quick Find* box, then select **Mobile Dashboard Settings**.
2. Select or deselect *Enable the Mobile Dashboards iPad app for all users*.
3. Click **Save**.

Users can download and install the Mobile Dashboards for iPad app from the [Apple App Store](#) or [AppExchange Mobile](#).

Aside from editions noted, the app is available to organizations enabled with REST API.

### View a Mobile User's Push Registration Information

With the Mobile Push Registrations Page, you can view any user's push registration information for general troubleshooting.

To view a user's device push registration information:

1. From Setup, enter *Users* in the *Quick Find* box, then select **Users**.
2. Select a user.
3. On the user detail page next to *Mobile Push Registrations*, click **View**.

# Install Packages and Manage Apps

## Installed Packages

You can install packages into your Salesforce organization, and then configure and manage them. To view the packages you've installed, from Setup, enter "Installed" in the Quick Find box, and then select **Installed Packages**.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

## Install a Package

Here are the steps for installing a package.

### Pre-Installation Steps

1. In a browser, go to the installation URL provided by the package developer, or, if you're installing a package from the AppExchange, click **Get It Now** from the application information page.

 **Note:** If you're installing into a sandbox, replace the `www.salesforce.com` portion of the installation link with `test.salesforce.com`. The package is removed from your sandbox organization whenever you create a new sandbox copy.

2. Enter your username and password for the Salesforce organization in which you want to install the package, and then click the login button.
3. If the package is password-protected, enter the password you received from the publisher.
4. Optionally, if you're installing an unmanaged package, select `Rename conflicting components in package`. When you select this option, Salesforce changes the name of a component in the package if its name conflicts with an existing component name.

### Default Installation

Click **Install**. You'll see a message that describes the progress and a confirmation message after the installation is complete.

### Custom Installation

Follow these steps if you need to modify the default settings as an administrator.

1. Choose one or more of these options, as appropriate.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To install packages:

- "Download AppExchange Packages"

- Click **View Components**. You'll see an overlay with a list of components in the package. For managed packages, the screen also contains a list of connected apps (trusted applications that are granted access to a user's Salesforce data after the user and the application are verified). Review the list to confirm that the components and any connected apps shown are acceptable, and then close the overlay.
  -  **Note:** Some package items, such as validation rules, record types, or custom settings might not appear in the Package Components list but are included in the package and installed with the other items. If there are no items in the Package Components list, the package might contain only minor changes.
- If the package contains a remote site setting, you must approve access to websites outside of Salesforce. The dialog box lists all the websites that the package communicates with. We recommend that a website uses SSL (secure sockets layer) for transmitting data. After you verify that the websites are safe, select **Yes, grant access to these third-party websites** and click **Continue**, or click **Cancel** to cancel the installation of the package.
  -  **Warning:** By installing remote site settings, you're allowing the package to transmit data to and from a third-party website. Before using the package, contact the publisher to understand what data is transmitted and how it's used. If you have an internal security contact, ask the contact to review the application so that you understand its impact before use.
- Click **API Access**. You'll see an overlay with a list of the API access settings that package components have been granted. Review the settings to verify they're acceptable, and then close the overlay to return to the installer screen.
- In Enterprise, Performance, Unlimited, and Developer Editions, choose one of the following security options.
  -  **Note:** Depending on the type of installation, you might not see this option. For example, in Group and Professional Editions, or if the package doesn't contain a custom object, Salesforce skips this option, which gives all users full access.

#### Install for Admins Only

Specifies the following settings on the installing administrator's profile and any profile with the "Customize Application" permission.

- Object permissions—"Read," "Create," "Edit," "Delete," "View All," and "Modify All" enabled
- Field-level security—set to visible and editable for all fields
- Apex classes—enabled
- Visualforce pages—enabled
- App settings—enabled
- Tab settings—determined by the package creator
- Page layout settings—determined by the package creator
- Record Type settings—determined by the package creator

After installation, if you have Enterprise, Performance, Unlimited, or Developer Edition, set the appropriate user and object permissions on custom profiles as needed.

#### Install for All Users

Specifies the following settings on all internal custom profiles.

- Object permissions—"Read," "Create," "Edit," "Delete," "View All," and "Modify All" enabled
- Field-level security—set to visible and editable for all fields
- Apex classes—enabled
- Visualforce pages—enabled
- App settings—enabled
- Tab settings—determined by the package creator
- Page layout settings—determined by the package creator

- Record Type settings—determined by the package creator

 **Note:** The Customer Portal User, Customer Portal Manager, High Volume Customer Portal, Authenticated Website, Partner User, and standard profiles receive no access.

### Install for Specific Profiles...

Enables you to choose the usage access for all custom profiles in your organization. You can set each profile to have full access or no access for the new package and all its components.

- Full Access—Specifies the following settings for each profile.
  - Object permissions—“Read,” “Create,” “Edit,” “Delete,” “View All,” and “Modify All” enabled
  - Field-level security—set to visible and editable for all fields
  - Apex classes—enabled
  - Visualforce pages—enabled
  - App settings—enabled
  - Tab settings—determined by the package creator
  - Page layout settings—determined by the package creator
  - Record Type settings—determined by the package creator
- No Access—Specifies the same settings as Full Access, *except* all object permissions are disabled.

You might see other options if the publisher has included settings for custom profiles. You can incorporate the settings of the publisher’s custom profiles into your profiles without affecting your settings. Choose the name of the profile settings in the drop-down list next to the profile that you need to apply them to. The current settings in that profile remain intact.

Alternatively, click **Set All** next to an access level to give this setting to all user profiles.

2. Click **Install**. You’ll see a message that describes the progress and a confirmation message after the installation is complete.
  - During installation, Salesforce checks and verifies dependencies. An installer’s organization must meet all dependency requirements listed on the Show Dependencies page or else the installation will fail. For example, the installer’s organization must have divisions enabled to install a package that references divisions.
  - When you install a component that contains Apex, all unit tests for your organization are run, including the unit tests contained in the new package. If a unit test relies on a component that is initially installed as inactive, such as a workflow rule, this unit test might fail. You can select to install regardless of unit test failures.
  - If your installation fails, see [Why did my installation or upgrade fail?](#) on page 1002.

## Post-Installation Steps

If the package includes post-installation instructions, they’re displayed after the installation is completed. Review and follow the instructions provided. In addition, before you deploy the package to your users, make any necessary changes for your implementation. Depending on the contents of the package, you might need to perform some of the following customization steps.

- If the package includes permission sets, assign the included permission sets to your users who need them. In managed packages, you can’t make changes to permission sets that are included in the package, but subsequent upgrades happen automatically. If you clone a permission set that comes with a managed package or create your own, you can make changes to the permission set, but subsequent upgrades won’t affect it.
- If you’re re-installing a package and need to re-import the package data by using the export file that you received after uninstalling, see [Importing Package Data](#) on page 995.
- If you installed a managed package, click **Manage Licenses** to assign licenses to users.

 **Note:** You can't assign licenses in Lightning Experience. If you need to assign a license, switch to Salesforce Classic.

- Configure components in the package as required. For more information, see [Configuring Installed Packages](#) on page 987.

[Installed Packages](#)

## Configuring Installed Packages

Many components have an **Is Deployed** attribute that controls whether they are available for end users. After installation, all components are immediately available if they were available in the developer's organization. Before making the package available to your users, make any necessary changes for your implementation. Depending on the contents of the package, you might need to customize the following items:

### Configure Option

If the publisher included a link to an external website with information about configuration, AppExchange Downloads page displays a **Configure** option next to the package in Setup when you click **Installed Packages**. Click **Configure** to view the publisher's suggested configurations.

### Custom Fields and Custom Links

Add any necessary custom fields or links to the new custom objects.

### Custom Object

Enable tracking on objects that aren't in this package, but that have fields that are tracked in Chatter. For example, if you want to track a custom field on Account, you must make sure the Account standard object is enabled for tracking.

### Custom Report Types

If the `Report Type Name` of a custom report type matches one used within your organization, change the `Report Type Name` after you install the package to avoid any confusion between the two report types.

### Dashboard Running User

The `Running User` for any dashboards are set to the user installing the package. You can edit the properties of the dashboard and change the `Running User` to a user that has the security settings you want applied to the dashboard.

### Folders

When apps contain documents, email templates, reports, or dashboards, Salesforce creates new folders in the installer's organization using the publisher's folder names. Make sure these folder names are unique in your organization.

All users can see new folders. Configure folder settings before you deploy if you want them to have limited visibility.

### Home Page Layouts

Custom home page layouts included in the package are not assigned to any users. To make them available to your users, assign them to the appropriate profiles.

### List Views

List views included in apps are visible to all users. Change the visibility of these list views if necessary.

#### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

#### USER PERMISSIONS

To install packages:

- "Download AppExchange Packages"

To configure installed packages:

- "Customize Application"

### Page Layouts

All users are assigned the default page layout for any custom objects included in the package. Administrators of Enterprise, Unlimited, Performance, and Developer Edition organizations can configure the page layout for the appropriate users.

If a custom object in the package includes any relationships to standard objects, add them as related lists on the appropriate page layouts.

If the package includes any custom links, add them to the appropriate page layouts.

If your organization has advanced currency management enabled, currency roll-up summary fields are invalid if they are on accounts and summarizing opportunity values, or on opportunities and summarizing custom object values. Remove these fields from any page layouts.

### Permission Sets

Assign permission sets included in a package to the users who need access to the package.

You can't edit permission sets that are included in a managed package. If you clone a permission set that comes with the package or create your own, you can make changes to the permission set, but subsequent upgrades won't affect it.

### Translation Workbench

Translated values for installed package components are also installed for any language that the developer has included. Any package components the developer has customized within setup, such as a custom field or record type, display in the installer's setup pages in the developer's language (the language used when defining these components). Users in the installer's organization automatically see translated values if their personal language is included in the package. Additionally, installers can activate additional languages as long as the Translation Workbench is enabled.

### Workflow Alerts

If the recipient of a workflow alert is a user, Salesforce replaces that user with the user installing the package. You can change the recipients of any installed workflow alerts.

### Workflow Field Updates

If a field update is designed to change a record owner field to a specific user, Salesforce replaces that user with the user installing the package. You can change the field value of any installed field updates.

### Workflow Outbound Messages

Salesforce replaces the user in the `User to send as` field of an outbound message with the user installing the package. You can change this value after installation.

### Workflow Rules

Workflow rules are installed without any time-based triggers that the developer might have created. Set up time-based triggers as necessary.

### Workflow Tasks

Salesforce replaces the user in the `Assigned To` field with the user installing the package. You can change this value after installation.

Make any more customizations that are necessary for your implementation.

 **Note:** Anything you add to a custom app after installation will be removed with the custom app if you ever uninstall it.

SEE ALSO:

[Installed Packages](#)

[Platform Encryption Considerations](#)

## Uninstalling a Package

You can remove any installed package, including all of its components and all data in the package. Additionally, any custom fields, links, or anything else you added to the custom app after installation are also removed.

To remove a package:

1. From Setup, enter *Installed* in the **Quick Find** box, then select **Installed Packages**.
2. Click **Uninstall** next to the package that you want to remove.
3. Select *Yes, I want to uninstall...* and click **Uninstall**.
4. After an uninstall, Salesforce automatically creates an export file containing the package data, as well as any associated notes and attachments. When the uninstall is complete, Salesforce sends an email containing a link to the export file to the user performing the uninstall. The export file and related notes and attachments are listed below the list of installed packages. We recommend storing the file elsewhere because it's only available for a limited period of time after the uninstall completes.

**Tip:** If you reinstall the package later and want to reimport the package data, see [Importing Package Data](#) on page 995.

### Notes on Uninstalling Packages

- If you're uninstalling a package that includes a custom object, all components on that custom object are also deleted. This includes custom fields, validation rules, s-controls, custom buttons and links, as well as workflow rules and approval processes.
- You can't uninstall a package whenever any component in the package is referenced by a component that will not get included in the uninstall. For example:
  - When an installed package includes any component on a standard object that another component references, Salesforce prevents you from uninstalling the package. This means that you can install a package that includes a custom user field and build a workflow rule that gets triggered when the value of that field is a specific value. Uninstalling the package would prevent your workflow from working.
  - When you have installed two unrelated packages that each include a custom object and one custom object component references a component in the other, Salesforce prevents you from uninstalling the package. This means that you can install an expense report app that includes a custom user field and create a validation rule on another installed custom object that references that custom user field. However, uninstalling the expense report app prevents the validation rule from working.
  - When an installed folder contains components you added after installation, Salesforce prevents you from uninstalling the package.
  - When an installed letterhead is used for an email template you added after installation, Salesforce prevents you from uninstalling the package.
- You can't uninstall a package if a field added by the package is being updated by a background job, such as an update to a roll-up summary field. Wait until the background job finishes, and try again.
- Uninstall export files contain custom app data for your package, excluding some components, such as documents and formula field values.

#### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group

- Enterprise
- Performance
- Unlimited
- Developer

#### USER PERMISSIONS

To uninstall packages:

- "Download AppExchange Packages"

## Managing Package Installations

View a list of the packages you installed from AppExchange and data export files from uninstalled packages by clicking **Installed Packages**. These packages can be either managed or unmanaged.

 **Note:** Salesforce only lists license information for managed packages. For unmanaged packages, the license-related fields, such as **Allowed Licenses**, **Used Licenses**, and **Expiration Date**, displays the value "N/A."

Using this list, you can:

- Click **Uninstall** to remove the package and all its components from your Salesforce organization.
- Click **Manage Licenses** to assign available licenses to users in your organization. You can't assign licenses in Lightning Experience. If you need to assign a license, switch to Salesforce Classic.

 **Note:** If you purchased a site license or if the managed package is not licensed, Salesforce assigns licenses to all your users and you can't manage licenses. Your users can use the package as long as they have the appropriate permissions.

- Click **Configure** if the publisher has included a link to an external website with information about configuring the package.
- Click the package name to view details about this package.
- View the publisher of the package.
- View the status of the licenses for this package. Available values include:
  - Trial
  - Active
  - Suspended
  - Expired
  - Free

This field is only displayed if the package is managed and licensed.

- Track the number of licenses available (**Allowed Licenses**) and the number of licenses that are assigned to users (**Used Licenses**).
- View the date your licenses for this package are scheduled to expire.
- View the date your licenses were installed.
- View the number of custom apps, tabs, and objects this package contains.
- See whether the custom apps, tabs, and objects count toward your organization's limits. If they do, the box in the **Limits** column is checked.

 **Note:** If you have not installed a licensed managed package, the **Publisher**, **Status**, **Allowed Licenses**, **Used Licenses**, and **Expiration Date** fields do not appear.

After an uninstall, Salesforce automatically creates an export file containing the package data, as well as any associated notes and attachments. When the uninstall is complete, Salesforce sends an email containing a link to the export file to the user performing the uninstall. The export file and related notes and attachments are listed below the list of installed packages. We recommend storing the file elsewhere because it's only available for a limited period of time after the uninstall completes. Using this list, you can:

- Click **Download** to open or store the export file.
- Click **Del** to delete the export file.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To uninstall packages:

- "Download AppExchange Packages"

To assign licenses for a managed package:

- "Manage Package Licenses"

To download or delete the export file for an uninstalled package:

- "Download AppExchange Packages"

### Expired Managed Packages and Sharing Rules

If a criteria-based sharing rule references a field from a licensed managed package whose license has expired, (`expired`) is appended to the label of the field. The field label is displayed in the field drop-down list on the rule's definition page in Setup. Criteria-based sharing rules that reference expired fields aren't recalculated, and new records aren't shared based on those rules. However, the sharing of existing records prior to the package's expiration is preserved.

[Displaying Installed Package Details](#)

[Importing Package Data](#)

## Displaying Installed Package Details

The package detail page displays essential details about the package you installed from AppExchange. To access the package detail page, from Setup, enter *Installed Packages* in the **Quick Find** box, select **Installed Packages**, and then click the name of the package that you want to view.

From this page, you can:

- Click **Uninstall** to remove the package and all its components from your Salesforce organization.
  - Click **Manage Licenses** to assign available licenses to users in your organization. You can't assign licenses in Lightning Experience. If you need to assign a license, switch to Salesforce Classic.
-  **Note:** If you purchased a site license or if the managed package is not licensed, Salesforce assigns licenses to all your users and you can't manage licenses. Your users can use the package as long as they have the appropriate permissions.
- Optionally, click **View Dependencies** and review a list of components that rely on other components, permissions, or preferences within the package.

## Viewing Installed Packages

The installed package page lists the following package attributes (in alphabetical order):

Attribute	Description
Action	Can be one of two options: <ul style="list-style-type: none"> <li>• <b>Uninstall</b></li> <li>• <b>Manage Licenses</b></li> </ul>
Allowed Licenses	The total number of licenses you purchased for this package. The value is "Unlimited" if you have a site license for this package. This field is only displayed if the package is managed and licensed.
Apps	The number of custom apps in the package.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To uninstall packages:

- "Download AppExchange Packages"

To manage user licenses for an AppExchange package:

- "Manage Package Licenses"

Attribute	Description
Connected Apps	A list of the connected apps that can have access to a user's Salesforce data after the user and the application have been verified.
Description	A detailed description of the package.
Expiration Date	The date that this license expires, based on your terms and conditions. The expiration date is "Does Not Expire" if the package never expires. This field is only displayed if the package is managed and licensed.
Installed Date	The date of the package installation.
Limits	If checked, the package's custom apps, tabs, and objects count toward your organization's limits.
Namespace	The 1- to 15-character alphanumeric identifier that distinguishes a package and its contents from packages of other developers on AppExchange.
Objects	The number of custom objects in the package.
Package Name	The name of the package, given by the publisher.
Publisher	The publisher of an AppExchange listing is the Salesforce user or organization that published the listing. This field is only displayed if the package is managed and licensed.
Status	<p>The state of a package. Available values include:</p> <ul style="list-style-type: none"> <li>• Trial</li> <li>• Active</li> <li>• Suspended</li> <li>• Expired</li> <li>• Free</li> </ul> <p>This field is only displayed if the package is managed and licensed.</p>
Tabs	The number of custom tabs in the package.
Used Licenses	The total number of licenses that are already assigned to users. This field is only displayed if the package is managed and licensed.
Version Name	The version name for this package version. The version name is the marketing name for a specific release of a package. It is more descriptive than the Version Number.

## Viewing Installed Package Details

The installed package detail page lists the following package attributes (in alphabetical order):

Attribute	Description
API Access	The type of access that the API and dynamic Apex code that package components have. The default setting is <b>Unrestricted</b> , which means that all package components that access the API have the same access as the user who is logged in. Click <b>Enable Restrictions</b> or <b>Disable Restrictions</b> to change the API and dynamic Apex access permissions for a package.
Apps	The number of custom apps in the package.
Description	A detailed description of the package.
First Installed Version Number	The first installed version of the package in your organization. This field is only displayed for managed packages. You can reference this version and any subsequent package versions that you have installed. If you ever report an issue with a managed package, include the version number in this field when communicating with the publisher.
Installed By	The name of the user that installed this package in your organization.
Limits	If checked, the package's custom apps, tabs, and objects count toward your organization's limits.
Modified By	The name of the last user to modify this package, including the date and time.
Namespace	The 1- to 15-character alphanumeric identifier that distinguishes a package and its contents from packages of other developers on AppExchange.
Objects	The number of custom objects in the package.
Package Name	The name of the package, given by the publisher.
Package Type	Indicates whether the package is managed or unmanaged.
Post Install Instructions	A link to information on configuring the package after it's installed. As a best practice, the link points to an external URL, so you can update the information independently of the package.
Publisher	The publisher of an AppExchange listing is the Salesforce user or organization that published the listing. This field is only displayed if the package is managed and licensed.
Release Notes	A link to release notes for the package. As a best practice, link to an external URL, so you can make the information available before the release and update it independently of the package.
Tabs	The number of custom tabs in the package.
Version Name	The version name for this package version. The version name is the marketing name for a specific release of a package. It is more descriptive than the <code>Version Number</code> .

Attribute	Description
Version Number	The version number for the latest installed package version. The format is <i>majorNumber.minorNumber.patchNumber</i> , such as 2.1.3. The version number represents a release of a package. The <code>Version Name</code> is a more descriptive name for the release. The <code>patchNumber</code> is generated only when you create a patch. If there is no <code>patchNumber</code> , it is assumed to be zero (0).

## Unused Components

You can see a list of components deleted by the developer in the current version of the package. If this field is part of a managed package, it's no longer in use and is safe to delete unless you've used it in custom integrations. Before deleting a custom field, you can keep a record of the data from Setup by entering *Data Export* in the *Quick Find* box, then selecting **Data Export**. After you've deleted an unused component, it appears in this list for 15 days. During that time, you can either undelete it to restore the field and all data stored in it, or delete the field permanently. When you undelete a field, some properties on the field are lost or changed. After 15 days, the field and its data are permanently deleted.

The following component information is displayed (in alphabetical order):

Attribute	Description
Action	Can be one of two options: <ul style="list-style-type: none"> <li>• <b>Undelete</b></li> <li>• <b>Delete</b></li> </ul>
Name	Displays the name of the component.
Parent Object	Displays the name of the parent object a component is associated with. For example, a custom object is the parent of a custom field.
Type	Displays the type of the component.

## Package Components

You can see a list of the components included in the installed package. The following component information is displayed (in alphabetical order):

Attribute	Description
Action	Can be one of two options: <ul style="list-style-type: none"> <li>• <b>Undelete</b></li> <li>• <b>Delete</b></li> </ul>
Name	Displays the name of the component.
Parent Object	Displays the name of the parent object a component is associated with. For example, a custom object is the parent of a custom field.

Attribute	Description
Type	Displays the type of the component.

[Managing Package Installations](#)

## Importing Package Data

When you uninstall an AppExchange package, Salesforce automatically creates an export file containing the package data as well as any associated notes and attachments. If you choose to install the package again, you can import this data.

To import your AppExchange package data, use one of the following tools that is available for your Edition:

- For Group Edition, use the appropriate import wizard.
- For Professional Edition, use the appropriate import wizard or any compatible Salesforce ISV Partner integration tool.
- For Enterprise, Developer, Performance, and Unlimited Edition, use the Data Loader.

### Notes on Importing AppExchange Package Data

- Salesforce converts date fields into date/time fields upon export. Convert the appropriate fields into date fields before you import.
- Salesforce exports all date/time fields in Greenwich Mean Time (GMT). Before importing these fields, convert them to the appropriate time zone.
- The value of auto number fields may be different when you import. To retain the old values, create a new custom auto number field on a custom object before importing the data.
- Salesforce updates system fields such as `Created Date` and `Last Modified Date` when you import. To retain the old values for these fields, contact Salesforce support.
- Relationships are not included in the export file. Recreate any master-detail or lookup relationships after importing your data.
- Record type IDs are exported but not the record type name.
- Field history is not exported.
- Recreate any customizations that you made to the package after installation.

#### USER PERMISSIONS

To import Force.com AppExchange package data:

- The permissions required to use the import tool you choose, such as the import wizard or Data Loader.

## Managing Licenses for Installed Packages

When you install a licensed managed package in your organization from AppExchange, you purchase a certain number of licenses from the package developer or publisher. You can assign each license to a user within your organization. If you assign all available licenses, but would like to grant licenses to additional users, you can reassign a license or purchase more. To get more licenses, contact the publisher of the managed package.

 **Note:** If you purchased a site license or if the managed package is not licensed, Salesforce assigns licenses to all your users and you can't manage licenses. Your users can use the package as long as they have the appropriate permissions.

1. From Setup, enter *Installed Packages* in the Quick Find box, then select **Installed Packages**.
2. Click **Manage Licenses** next to the package.

 **Note:** To assign licenses for a package, you must have access to the package and at least one available license.

- To assign licenses to more users, click **Add Users**.
- To remove a license from a user, click **Remove** next to the user's name. To remove licenses from multiple users, click **Remove Multiple Users**.
- Click any column heading to sort the users in ascending order using the data in that column. Click the heading again to sort in descending order.
- If available, select **fewer** or **more** to view a shorter or longer display list.

### USER PERMISSIONS

To manage licenses for a AppExchange package:

- "Manage Package Licenses"

## Assigning Licenses for Managed Packages

When you install a licensed managed package in your organization from AppExchange, you purchase a certain number of licenses from the package developer or publisher. You can assign each license to a user within your organization. If you assign all available licenses, but would like to grant licenses to additional users, you can reassign a license or purchase more. To get more licenses, contact the publisher of the managed package.

The Managed Packages related list on the user detail page lists all managed packages that user is assigned. Assigning a license for a managed package makes the package available to the user within Salesforce.

Unmanaged packages will not appear on this list, as you cannot assign licenses for them.

To assign a user to a license for one of the available managed packages:

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
2. Click **Assign Licenses** from the Managed Packages list.
3. Select the package you want to assign to the user. All available managed packages are listed in the Unassigned Packages list. After selecting a package, Salesforce automatically moves it to the Selected Packages list.

The Unassigned Packages list displays all packages that this user could access if assigned a license. Packages will not appear on this list if they are unmanaged, uninstalled, in use, or not available.

- Click a letter to view the packages that begin with that letter or click **All** to display all available managed packages.
  - Click **select shown** to select all packages displayed in the Unassigned Packages list on the current page, adding them to the Selected Packages list below.
  - Click **deselect shown** or **deselect all** to move packages from the Selected Packages area to the Unassigned Packages area.
4. Click **Add**.

To revoke a license from this user, click the **Remove** link next to the appropriate package name.

## Assigning Licenses for Installed Packages

To assign licenses to Force.com AppExchange users:

-  **Note:** If you purchased a site license or if the managed package is not licensed, Salesforce assigns licenses to all your users and you can't manage licenses. Your users can use the package as long as they have the appropriate permissions.
1. From Setup, enter *Installed Packages* in the **Quick Find** box, then select **Installed Packages** to find the installed package that has available licenses.
  2. Click the **Manage Licenses** link next to the package name.
  3. Click **Add Users**.
  4. Choose a view from the drop-down list, or click **Create New View** to build a new custom view.
  5. Click a letter to filter the users with a last name that corresponds with that letter or click **All** to display all users who match the criteria of the current view.
  6. Select users.
    - To select individual users, use the checkboxes. Selected users are listed in the Selected list. When the list includes all users to which you want to assign licenses, click **Add**.
    - To select all users for the current view, click **Add All Users** then click **OK**.

 **Note:** You can also add a single user from the user's detail page.

[Managing Licenses for Installed Packages](#)

## Removing Licenses for Installed Packages

To remove licenses for an AppExchange package from multiple users:

1. From Setup, enter *Installed Packages* in the **Quick Find** box, then select **Installed Packages**.
2. Click **Manage Licenses** next to the package name.
3. Click **Remove Multiple Users**.
4. To show a filtered list of items, select a predefined list from the **View** drop-down list, or click **Create New View** to define your own custom views.
5. Click a letter to filter the users with a last name that corresponds with that letter or click **All** to display all users who match the criteria of the current view.
6. Select users.
  - To select individual users, use the checkboxes. Selected users appear in the Selected for Removal list. When the list includes all users for which you want to remove licenses, click **Remove**.
  - To select all users in the current view, click **Remove All Users**, then click **OK**.

You can also remove licenses for an AppExchange package from a single user using the following options:

### EDITIONS

[Managing Licenses for Installed Packages](#)

## Responding to License Manager Requests

A license manager is a Salesforce organization that tracks all Salesforce subscribers installing a particular AppExchange package. Salesforce administrators can choose to designate another organization as the license manager for one of their packages. The license manager does not need to be the same organization as the one from which the package is managed. To choose another organization as the license manager, all you need is an email address (not a Salesforce username). If a Salesforce administrator selects to have a third-party license manager and enters your email address, you will receive a license management request in email.

To respond to a registration request:

1. Click the link in the license management request email. This displays the registration request in the requestor's Developer Edition organization.
2. Click **Accept** to complete the registration process. Alternatively, click **Reject** to decline the request and close the browser; this prevents you from using the link again.

 **Note:** If you accept this request, you authorize Salesforce to automatically create records in your Salesforce organization to track information about this package. Choosing a license manager organization is permanent and cannot be changed.

3. Enter the username and password for the Salesforce organization you want to use to manage licenses for this package. A license manager can be any Salesforce organization that has installed the free License Management Application (LMA) from Force.com AppExchange.
4. Click **Confirm**.

- "Customize Application"

## Assigning Licenses Using the API

Administrators can use the API to assign or revoke licenses for any managed package installed in their organization. License information for a package is stored in two objects, PackageLicense and UserPackageLicense, which were previously accessible only from the Manage Licenses page under Setup. These are now accessible as standard objects, so an administrator can assign licenses to specific users via API calls. This makes managing package licenses in a subscriber organization faster and easier, especially for large-scale deployments.

For example, suppose an administrator installs an app for use by all 200 salespeople in the company. Assigning a license to each salesperson from the UI is inefficient and time-consuming. Using the API, the administrator can assign licenses to all salespeople, based on their profile, in one step.

Here are some common licensing tasks that administrators can use the API to do.

- Determine the number of package licenses in use and available.
- Verify if a specific user has a license for the package.
- Get a list of all users who have a license for the package.
- Assign a package license to a user or group of users.
- Revoke a package license that was previously assigned to a user.

For details of the PackageLicense and UserPackageLicense objects and a code sample, see the [Object Reference for Salesforce and Force.com](#).

## Upgrading Packages

Salesforce supports upgrades for managed packages only. Publishers can publish an upgrade for a managed package and notify installers that the new version is available. Installers of a managed package can then install the upgrade as follows:

1. Before you install an upgrade, determine if the app you installed was from a managed package. Look for the  Managed - Installed icon on the detail pages for each component and on the list of packages installed.  
If the app you installed is not from a managed package, upgrades for it are not available.
2. Then, install the upgrade in the same way you would install any other package from the AppExchange. If the publisher provided a link to the new version, follow the link to the package posting and install it in your organization. The first page of the install wizard lists the current version you have installed, the version you're about to install, and a list of additional components included in the new version.

## Notes on Upgrading Managed Packages

Consider the following when upgrading a managed package:

- All existing custom objects that were previously deployed will still be deployed. Salesforce prompts you to deploy any new custom objects or previously undeployed custom objects.
- Profile settings for components in a package are editable by the customer but not upgradeable by the package developer. If the developer makes changes to any profile settings after releasing the package, those changes won't be included in an upgrade. Customers will need to manually update the profile settings after upgrading the package. In contrast, permission sets in a package

### EDITIONS

### USER PERMISSIONS

To upload packages:

- "Upload AppExchange Packages"

To install and uninstall packages:

- "Download AppExchange Packages"

are upgradeable by the developer, so any changes the developer makes will be reflected in the customer organization after upgrading the package.

- If the developer chooses to add universally required custom fields, the fields will have default values.
- Translation Workbench values for components that are “editable but not upgradeable” are excluded from upgrades.
- If an installed package has `Restricted` API access, upgrades will be successful only if the upgraded version does not contain any s-controls. If s-controls are present in the upgraded version, you must change the currently installed package to `Unrestricted` API access.
- When you upgrade a package, changes to the API access are ignored even if the developer specified them. This ensures that the administrator installing the upgrade has full control. Installers should carefully examine the changes in package access in each upgrade during installation and note all acceptable changes. Then, because those changes are ignored, the administrator should manually apply any acceptable changes after installing an upgrade.

## Can I uninstall packages that I installed from AppExchange?

Yes. All your installed packages are listed in the Installed Packages page. You can remove any package by clicking the **Uninstall** link next to the package name.

SEE ALSO:

[Uninstalling a Package](#)

[Importing Package Data](#)

## Why did my uninstall fail?

Salesforce prevents you from uninstalling a package if it causes any remaining components to malfunction.

SEE ALSO:

[Uninstalling a Package](#)

## Who can use AppExchange?

Anyone can browse and test drive AppExchange listings. Salesforce administrators and users with the “Download AppExchange packages” permission can install AppExchange apps. To publish an app on the AppExchange, a user must have both “Create AppExchange packages” and “Upload AppExchange packages” permissions.

## Why did my installation or upgrade fail?

An installation can fail for several reasons:

- The package includes custom objects that will cause your organization to exceed its limit of custom objects.
- The package includes custom tabs that will cause your organization to exceed its limit of custom tabs.
- The developer of the package has uploaded a more recent version of the package and has deprecated the version associated with this installation URL. Contact the publisher of the package to get the most recent installation URL.
- You’re trying to install an extension to a package, and you don’t have the base package installed.
- The package requires that certain components are enabled in your organization, or that required features are enabled in your edition.
- The package contains Apex code and you are not authorized to run Apex in your organization.
- The package you’re installing has a failing Apex test.

## Can I customize AppExchange packages?

Yes, all packages are customizable. However, to ensure compatibility with future versions, some aspects of managed packages can't be changed.

For a list of components that are editable in a managed package, see [ISVforce Guide](#).

## Who can use AppExchange packages?

If you use an Enterprise, Unlimited, Performance, or Developer Edition organization, you can choose which user profiles have access to the package as part of the installation process. Packages installed in Professional and Group Edition organizations are installed with “Full Access” to all user profiles. However, regardless of Edition, all custom objects are installed in “In Development” mode which hides them from all standard users. Users must have the “Customize Application” permission to view custom objects in “In Development” mode. When you are ready to roll out the package to other users, change the custom object status to “Deployed.”

## How can I upgrade an installed package?

Managed packages are completely upgradeable. Before installing a package, contact the publisher to determine if it’s managed.

## How secure are the components I install?

Salesforce performs periodic security reviews of all publicly listed applications on AppExchange. When installing third party applications with access to data, these applications may have access to other data within the organization where the package was installed. Private listings do not go through a security review and administrators should inspect the application carefully before determining whether it should be installed within their organization.

## What happens to my namespace prefix when I install a package?

A namespace prefix is a globally unique identifier that you can request if you plan to create a managed package. All the components from a managed package that you install from another developer contain the developer's namespace prefix in your organization. However, unmanaged packages can also have a namespace prefix if they originated from an organization that contained a managed package. When you install an unmanaged package that contains a namespace prefix, Salesforce replaces the developer's namespace prefix with yours.

## Can I reinstall an AppExchange package after uninstalling it?

Yes. You can reinstall a package in the same manner that you installed it.

SEE ALSO:

[Install a Package](#)

[Importing Package Data](#)

## When I install a package that's listed on the AppExchange, do custom objects, tabs, and apps in that package count against the limits of my Salesforce Edition?

No. If you install a package from the AppExchange, its custom objects, tabs, and apps don't count against the limits of your Salesforce edition. However, if the package uses other types of custom components, such as custom fields, they count against the relevant limits of your Salesforce edition.

**Note:** These rules apply only to managed packages that are listed on the AppExchange. If you install an unmanaged package or a managed package that's not publicly listed on the AppExchange, its custom objects, tabs, and apps count against the limits of your Salesforce edition.

## Printable Resources for Administrators

---

In addition to online help, Salesforce publishes printable documentation to help you successfully administer Salesforce.

These documents include tip sheets, user guides, implementation guides, and other resources that describe the features and capabilities of Salesforce. These documents are available as Adobe® PDF files. Adobe Reader® is required to open PDF files; to download the latest version of Reader, go to [www.adobe.com/products/acrobat/readstep2.html](http://www.adobe.com/products/acrobat/readstep2.html).

## Videos for Salesforce Administrators

---

In addition to online help, Salesforce creates video demos to help you learn about our features and successfully set up and manage Salesforce.

### Data Import

Video Title	For End Users	For Administrators
 <a href="#">Cleaning Up Your Import File</a> Learn how to clean up your import files and get Salesforce ready, as well as best practices for keeping data clean once it's been imported.		✓
 <a href="#">Cleaning and Preparing Your Data Using Excel</a> Excel offers many features and functions to make quick work of getting your data files ready for import. We'll show you some practical ways to use these features with your import data.		✓

Video Title	For End Users	For Administrators
 <a href="#">Choosing the Right Tool</a> Learn Data Loader in depth, so you can decide whether it's right for your needs. We compare it to the Import Wizards and also list some other tools you might consider.		✓
 <a href="#">Owner IDs and Parent IDs</a> Learn, step by step, which objects should be imported, and when. We'll cover how to make sure each child object, such as opportunities, has the correct owner and parent record, and we'll show you a demo in the user interface of how to do this using the Data Loader tool.		✓
 <a href="#">Best Practices for Importing Data</a> Learn the top pain points experienced by our customers, so you can avoid them entirely! This video could save you hours of frustration. We detail how to delete a bad import, how to back up data before import, and more.		✓
 <a href="#">Importing Your Accounts and Contacts—Part 1: Exporting Your Data</a> In this video, we'll walk you through how to import Account and Contact data using the Data Import Wizard. Once you have your data in a csv file, you can use the wizard to import it and map fields.		✓
 <a href="#">Importing Your Accounts and Contacts—Part 2: Importing Your Data</a>		✓

## Users' Access to Data

Video Title	For End Users	For Administrators
 <a href="#">Who Sees What: Overview</a> Learn how you can control who sees what data in your organization.		✓
 <a href="#">Who Sees What: Organization Access</a> Learn how to restrict login through IP ranges and login hours.		✓
 <a href="#">Who Sees What: Object Access</a> Learn how you can grant users access to objects by using profiles.		✓

Video Title	For End Users	For Administrators
 <a href="#">Who Sees What: Organization-Wide Defaults</a> Learn how you can restrict access to records owned by other users.		✓
 <a href="#">Who Sees What: Record Access via the Role Hierarchy</a> Learn how you can open up access to records using the role hierarchy.		✓
 <a href="#">Who Sees What: Record Access via Sharing Rules</a> Learn how you can grant access to records using sharing rules.		✓
 <a href="#">Who Sees What: Field-level Security</a> Learn how you can restrict access to specific fields on a profile by profile basis.		✓
 <a href="#">Creating a Criteria-Based Sharing Rule</a> Learn how to create a sharing rule based on a field value in a record.		✓
 <a href="#">Who Sees What: Permission Sets</a> Learn how to give users additional permissions and access settings without changing profiles.		✓

## Managing Users

Video Title	For End Users	For Administrators
 <a href="#">Removing Users' Access to Salesforce</a> Deactivating users in Salesforce removes access to their account data while preserving their historical activity and records. Once you understand why you deactivate users rather than deleting them, learn how to deactivate someone and see what happens to their data.		✓

# SELL TO YOUR CUSTOMERS

## Welcome, Sales Professionals

---

Use this documentation set to help you get up and running with Salesforce, so you can increase your successes when you sell to your customers. You'll find that this documentation contains concepts and tasks that are specific to your goals. If you also help administer Salesforce, you may find it necessary to refer to the documentation set for administrators, *Set Up and Maintain Sales Tools*, which includes tasks that are specific to Salesforce administrators.

We hope these two sets of documentation provide the complete content you need to increase your sales while using Salesforce. If you need further support, contact your Salesforce administrator or Salesforce Customer Support.

## Managing the People and Organizations You Sell To

---

### Establishing Your Customers, Competitors, and Partners

#### Accounts

Use Salesforce accounts to store information about your customers or the entities you are working with, such as companies, schools, government agencies, or individuals.

Think of an account as a file folder in which you store every bit of information you know about a customer. For example, if you're storing information about a company, you include its name, location, a contact person, past or current orders, and other related information. You could also keep a log of phone calls or service requests.

In Salesforce, information about the company itself—its name, location, website, and so on—is stored as an *account record*. Information related to the account, such as a contact person, notes, and orders, is stored in other types of records. Salesforce makes it easy to find all the records related to each account by listing them on the account record's home page. You can locate, create, delete, sort, and filter your accounts from the Accounts tab. Select an account to view its record home page, to edit the account, and access other records related to that account.

There are a few things to know about accounts.

#### Salesforce Offers Two Types of Accounts

Salesforce accounts are *business accounts* by default. Business accounts are used to store information about companies or other entities. Salesforce administrators can also choose to set up *person accounts*, which are used to store information about individual people. For example, person accounts fit your customers best if they are online shoppers, gym members, vacation travelers, or other individual consumers. Depending on who your company sells to, you might have just one type of account available, or both.

**Note:** In the Salesforce Help and other documentation, the word *account* by itself always refers to both business accounts and person accounts. We use the terms *business accounts* and *person accounts* when there are differences between the two types of accounts.

#### EDITIONS

Business accounts available in: Both Salesforce Classic and Lightning Experience

Business accounts available in: **All Editions** except **Database.com**

Person accounts available in: Salesforce Classic

Person accounts available in: **Enterprise, Performance, Unlimited, and Developer Editions**

### The Accounts Feature Can Be Renamed

Your Salesforce administrator can change the name of accounts to something that works better for your business, such as *Clients* or *Patients*. However, we will always refer to them as *accounts* in the Salesforce Help.

### Users Can Access Accounts on Mobile Devices

Your accounts are accessible to you from the full Salesforce site or the Salesforce1 mobile application, if your Salesforce administrator has turned on Salesforce1 access.

### Accounts Can Be Linked to Social Networks and News

Additional information and updates about your accounts are available if your company uses the Social Accounts, Contacts, and Leads; Account Insights; or Data.com Clean features.

## What Is a Person Account?

Person accounts store information about individual consumers.

Salesforce accounts are *business accounts* by default. Business accounts are used to store information about companies or other entities. Salesforce administrators can also choose to set up *person accounts*, which are used to store information about individual people. For example, person accounts fit your customers best if they are online shoppers, gym members, vacation travelers, or other individual consumers. Depending on who your company sells to, you might have just one type of account available, or both.

 **Tip:** To quickly verify whether person accounts are available in your Salesforce organization, try to create an account.

- If your organization uses both business accounts and person accounts, Salesforce asks you to select either a business account or person account record type. The default name of the person account record type is “Person Account” but an administrator can change the record type name, or add other record types.
- You aren’t asked to select a record type if your organization uses either business accounts or person accounts alone. To determine which type, check the fields on the account creation form. Person accounts have fields such as first name and last name. Business accounts have fields such as parent account and ticker symbol.

 **Warning:** Person accounts aren’t supported in Lightning Experience. For more information, review the Lightning Experience limitations for Sales features.

Person accounts work differently than business accounts. For example, person accounts can’t have contacts. Instead, the person account record stores the information you’d typically save for business contacts, such as first name and last name. You can usually treat a person account like a contact. For example, you can invite a person account to a meeting, associate it with a campaign, or send a Stay-in-Touch request. However, person accounts are accessible on the Accounts tab and appear in lists and reports as accounts, not as contacts. For other differences between person and business accounts, see [Person Account Behaviors](#) on page 1011.

#### EDITIONS

Business accounts available in: Both Salesforce Classic and Lightning Experience

Business accounts available in: **All Editions except Database.com**

Person accounts available in: Salesforce Classic

Person accounts available in **Enterprise, Performance, Unlimited, and Developer Editions**

 **Note:** In the Salesforce Help and other documentation, the word *account* by itself always refers to both business accounts and person accounts. We use the terms *business accounts* and *person accounts* when there are differences between the two types of accounts.

## Merge Fields for Person Accounts

 **Note:** Once person accounts have been enabled, they can't be turned off.

The list of available merge fields depends on the type of data that you're working with. This topic lists considerations for working with merge fields with person accounts.

- Both business account and person account fields are available as account merge fields. Account fields exclusive to person accounts, such as `Birthdate`, `Email`, and `Title` have `Account . Person` in their merge field names. For example, `{!Account.PersonBirthdate}`.
- If your organization uses person accounts, both business account and person account fields are available as account merge fields. Account fields exclusive to person accounts, such as `Birthdate`, `Email`, and `Title` have "Account.Person" in their merge field names. For example, `{!Account . PersonBirthdate}`.
- You can use the merge field `{!Account.IsPersonAccount}` to determine whether you are working with a person account or a business account.
- Account fields that previously had unique names and labels may no longer be unique because some contact fields are displayed as part of the account object. These fields on the accounts page are identified by the person account icon (  ). Ensure that all custom account fields have field names and labels unique to your organization so that the merge field references the correct field. For more information, see [What Is a Person Account?](#) on page 1008.

 **Important:** Ensure that all custom fields under account have unique field names and labels so that the merge field references the correct field.

SEE ALSO:

[Accounts](#)  
[Validation Rules for Person Accounts](#)

### EDITIONS

Business accounts available in: Both Salesforce Classic and Lightning Experience

Business accounts available in: **All** Editions except **Database.com**

Person accounts available in: Salesforce Classic

Person accounts available in: **Enterprise, Performance, Unlimited, and Developer** Editions

## Validation Rules for Person Accounts

 **Note:** Once person accounts have been enabled, they can't be turned off.

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record. The list of available merge fields depends on the type of data that you're working with. This topic lists considerations for working with merge fields in validation rules with person accounts.

### Tips

- To define a validation rule that applies only to person accounts, use the `IsPersonAccount` merge field. For example, `Account.City = "San Francisco"` verifies that a business or person account's city is San Francisco, while `IsPersonAccount ( Account.City = "San Francisco")` verifies that a person account's city is San Francisco.
- You must handle person account and business account names separately in account validation rules.
  - For business accounts, use the `Name` merge field.
  - For person accounts, use the `FirstName` and `LastName` merge fields.
- `Birthdate`, `Email`, and other fields that are only supported for person accounts are available as merge fields in account validation rules. When you use one of those merge fields, note that business account records will be processed as if those fields have blank values. For business account and person account fields, see [Account Fields](#) on page 1018.

### SEE ALSO:

[Accounts](#)

[Merge Fields for Person Accounts](#)

## What is a business account and how does it differ from a person account?

A business account is a company, corporation, firm, or other business entity to which you can associate multiple contacts. Business accounts are available in all Editions and have a folder icon (.

In Enterprise, Unlimited, Performance, and Developer Editions, your Salesforce organization can be enabled to use person accounts () , which are individual consumers who function simultaneously as accounts and contacts.

### SEE ALSO:

[Accounts](#)

### EDITIONS

Available in: Salesforce Classic

Business accounts available in: **All Editions** except **Database.com**

Person accounts available in **Enterprise, Performance, Unlimited,** and **Developer Editions**

## Person Account Behaviors

 **Note:** Person accounts are not enabled by default in Salesforce. To request person accounts, contact Salesforce.

Person accounts are accounts that can also be used as contacts in many situations. The following table summarizes the key areas in which person accounts differ from business accounts or have unique considerations:

Salesforce Functionality	Person Account Behavior
Account Merge	Person accounts can only be merged with other person accounts. See <a href="#">Merging Duplicate Accounts</a> on page 1032.
Account Quick Create	On the accounts home page, the fields in the Quick Create area are based on whether the default account record type set on your profile is a person account record type or a business account record type.
Accounts	Person accounts are accounts that support contact fields and capabilities.
Activities	<p>Person accounts can be associated with activities using either the <code>Name</code> or <code>Related To</code> fields.</p> <p>As with contacts, person accounts can be <a href="#">invited to events</a> and <a href="#">requested meetings</a>.</p> <p>For users to request a meeting with a person account, the <code>Email</code> field must be added to the Person Accounts page layout.</p>
Campaigns	As with contacts, person accounts can be added to campaigns and have a Campaign History related list.
Cases	On cases, person accounts can be entered in the <code>Account Name</code> field, the <code>Contact Name</code> field, or both.
Chatter Feed Tracking	When you follow person accounts, you follow the account fields, but not the contact fields.
Communities and Customer Portal	As with contacts, person accounts can be enabled as users for your Salesforce Communities and Customer Portals.
Contact Roles	As with contacts, you can add person accounts to the <a href="#">Contact Roles</a> related list on cases, contracts, and opportunities.
Contacts	<p>In most situations, you can use person accounts as if they were contacts. You can include them in all contact list views except on the contacts home page.</p> <p>Unlike business accounts, person accounts do not have a Contacts related list. However, you can use the Partners related list to track relationships between different person accounts.</p>
Custom Objects	Custom objects with relationships to either accounts or contacts can be added as related lists on person accounts.

### EDITIONS

Business accounts available in: Both Salesforce Classic and Lightning Experience

Business accounts available in: **All Editions** except **Database.com**

Person accounts available in: Salesforce Classic

Person accounts available in: **Enterprise, Performance, Unlimited, and Developer Editions**

Salesforce Functionality	Person Account Behavior
Data.com	Person accounts are not supported by Data.com Prospector or Data.com Clean.
Desktop Integration	Person accounts are currently supported in Connect Offline, Salesforce for Outlook, Salesforce Side Panel, and Connect for Outlook version 3.2 and later.
Email	As with contacts, you can send <a href="#">individual emails</a> and <a href="#">mass emails</a> to person accounts.
ExactTarget	Person accounts are supported, but additional configuration is required.
Field History	Account fields for person accounts can be tracked using the account field history settings, but contact fields for person accounts are configured on the contact field history settings page.
Fields	<p>A predetermined combination of standard account and contact fields is available on person account page layouts. In addition, all custom account and contact fields are available. See <a href="#">Person Account Fields</a> on page 1024.</p> <p>Note that some business account fields are not supported for person accounts, such as <code>Parent Account</code> and <code>View Hierarchy</code>. Also, the <code>Reports To</code> field on contacts is not supported for person accounts.</p> <p>You can rename field labels for a person account so alternate terms display in Salesforce.</p>
Icons	Person accounts have a person icon (👤), while business accounts have a folder icon (📁). The person account icon can be added to search results, list views, and lookup dialogs using the criteria <code>"Is Person Account equals True."</code>
Import Wizards	Person accounts can be imported using the Data Import Wizard. Alternately, person account data can be imported using the Import Wizard for Person Accounts.
Leads	Leads with an empty <code>Company</code> field convert to person accounts, assigned to the default person account record type for your profile. If you don't want to include a company name when creating person accounts, you must use the API. Leads that include a company name convert to business accounts, assigned to the default business account record type for your profile.
List Views	Person accounts appear in both account and contact list views. Add the <code>Is Person Account</code> icon to list views to visually differentiate person accounts from other records, and to include or exclude person accounts in a list.
Mobile Configurations	<p>Mobile configurations that include the account object automatically deliver person accounts and business accounts to users' mobile devices.</p> <p>Person accounts can be excluded from the configuration's data set using the criteria <code>"Is Person Account equals False."</code> To mobilize only person accounts, use the criteria <code>"Is Person Account equals True."</code> If a mobile configuration includes accounts but not contacts, users assigned to that configuration will see a <code>Contacts</code> tab in the mobile client application, and the tab will contain person accounts.</p>
Packaging	Person account components and attributes can be included in managed and unmanaged packages.
Page Layouts	Person accounts have unique page layouts that can have account fields, contact fields, account custom links, account related lists, and contact related lists. Person accounts page layouts do not support the <code>Reports To</code> and <code>Parent Account</code> fields.
Pardot	Person accounts are supported, but additional configuration is required.

Salesforce Functionality	Person Account Behavior
Partners	You can use the Partners related list to relate person accounts to each other. We recommend that you rename the Partners related list to "Related Accounts," "Relationships," or a similar term that reflects how your person accounts are connected.
Record Types	Administrators can configure multiple record types for person accounts. A person account can only be changed to another person account record type.
Renamed Tabs and Standard Fields	Administrators can customize the names of tabs and fields related to person accounts, such as: <ul style="list-style-type: none"> <li>• The Accounts tab name, the <code>business account</code> field label, and the <code>person account</code> field label.</li> <li>• The Contacts tab name and the <code>business contact</code> field label.</li> </ul>
Salesforce1	For organizations that have enabled person accounts and Salesforce1, person accounts can be created, accessed, and managed within Salesforce1 for most features.
Search	Person accounts only appear in account search results. Administrators can add the <code>Is Person Account</code> icon to account search layouts in order to differentiate person accounts from business accounts.
Self-Service Portal	As with contacts, person accounts can be enabled as users for your Self-Service portal. <p> <b>Note:</b> Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.</p>
Sharing Settings	Contact sharing is not available if you have enabled <a href="#">person accounts</a> . The organization-wide default for contacts is set to Controlled by Parent and is not editable. <p>If your organization has customized your contact sharing settings and you want to enable person accounts, change your organization-wide default for contacts to Controlled by Parent, which removes all your contact sharing rules and manually shared contacts.</p>
Social Accounts, Contacts, and Leads	As with contacts, you can link person accounts to social network profiles
Stay-in-Touch Requests	As with contacts, you can send individual and mass <a href="#">Stay-in-Touch requests</a> to person accounts.
Storage	Person accounts count against both account and contact storage because the API considers each person account to consist of one account as well as one contact.
Workflow Rules	Creating or editing a person account triggers account workflow rules.

## Viewing Account Lists

The accounts list page displays a list of accounts in your current view.

- Click an account name to [view the account details](#).
- Click **Edit** or **Del** next to an account name to [edit or delete the account](#).
- Click **New Account** or select **Account** from the Create New drop-down list in the sidebar to [create an account](#).
- If your organization uses person accounts and your current list view includes the field **Is Person Account**, the column heading for this field is the person account icon (  ) in Salesforce Classic. Click the person account icon in the header to sort person accounts at either the top or bottom of the list.

 **Note:** If your organization has [Salesforce for Wealth Management](#), accounts are called [clients](#).

Person accounts available in: Salesforce Classic

Person accounts available in **Enterprise, Performance, Unlimited, and Developer Editions**

Once you have located an account on the Accounts home or list pages, click the account name to view the Account's detail page.

- Use inline editing to edit fields directly on the detail page. If inline editing isn't enabled, contact your administrator. Inline editing is available in Salesforce Classic only.
- To display the page in edit mode, click **Edit**, make your changes, and click **Save**.
- To save the current account and create another one in Salesforce Classic, click **Save & New**.
- To open a printable display of the record details, in the top-right corner of the page, click **Printable View**. The printable display is available in Salesforce Classic only.
- To enable an account as a partner account, click **Manage External Account** and choose **Enable as Partner**. Available only in Salesforce Classic if your company enabled a partner portal.

- To [enable person accounts as Customer Portal users](#), click **Manage External User** and choose **Enable Customer User**. Available only in Salesforce Classic if your company has person accounts and a Customer Portal.

 **Note:** As the owner of an account, you can normally view all data related to that account.

However, your administrator can set an option on your role that determines whether you can view opportunities that you do not own that are associated with your accounts.

Also, if your accounts are assigned to [territories](#), your administrator can set options that determine whether users in that territory can view, edit, transfer, or delete your accounts.

## Guidelines for Creating Accounts

Keep these guidelines and tips in mind when creating accounts.

- To create business accounts, you need “Create” permission on accounts. To create person accounts, you need “Create” permission on both accounts and contacts.
- If your organization uses record types, you might be prompted to choose a `Record Type` when creating an account. Different record types can have different fields and different picklist values.
- To specify that a business account is a subsidiary of another business account, fill in the `Parent Account` field. You can then view a hierarchy of account relationships. The `Parent Account` field isn’t available for person accounts.
- Use the `Account Site` field to designate different locations of the same company. For example, Acme.com may have offices in Paris and London. Create two accounts, both called Acme.com, but with `Account Site` values of Paris and London, respectively.
- If your organization uses divisions, the division of a new account is automatically set to your default division, unless you manually select a different one.
- If your organization uses territory management, account assignment rules can automatically assign newly created accounts to territories. See [Territory Management Overview](#) on page 1238.

## Understanding What Happens when You Delete Accounts

Most accounts and their associated records can be deleted in one click—but some accounts can't be deleted until associations have been removed.

 **Important:** If you can delete an account, you will see **Delete** as an option on the account's detail page and on its row on the account list page in both Salesforce Classic and Lightning Experience. If you don't see the delete option, you don't have permission to delete the account. Ask your Salesforce administrator for help.

Deleted accounts are moved to the Recycle Bin, along with these associated items.

 **Note:** You can't access the recycle bin from Lightning Experience, but deleted items still go into it. Switch to Salesforce Classic temporarily to view or restore recycle bin items.

- Contacts
- Opportunities
- Contracts (if they're not activated)
- Activities
- Notes
- Attachments
- Portal roles and groups (if all portal users in the account are disabled.)
- Partner relationships
- Relationship group members

If you restore an account from the Recycle Bin, any related items are also restored except for:

- Relationship group members in some cases. See [Removing Members from Relationship Group Members](#) on page 1107.
- Portal roles and groups. See [Using Accounts](#) on page 1014.

You can't delete an account if:

- You don't have the "Delete" permission on accounts
- You aren't the account's owner, above the account's owner in the organization role hierarchy; or an administrator
- The account is enabled as a partner account; it has associated cases, activated contracts, or related opportunities that are owned by other users; or it has associated contacts that are enabled for the Self-Service portal.

In addition, if you attempt to delete an account that has closed/won opportunities owned by you, a message displays asking you whether you want to delete the closed/won opportunities along with the account or to cancel the account deletion.

 **Note:** You don't need the "Delete" permission on any associated records that are included in the deletion.

## Account Fields

### Business Account Fields

A business account has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

If the account record was added from Data.com, certain fields, as identified here, will be populated with the Data.com or Dun & Bradstreet (D&B) value, if a value is available. Some Data.com fields are available to only organizations that use a specific Data.com product. Those fields are identified in their descriptions.

Field	Description	Allows Value from Data.com or D&B
Account Currency	The default currency for all currency amount fields in the account. Amounts display in the account currency and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.	
Account Division	Division to which the account belongs. Records related to the account, such as contacts and opportunities, automatically inherit the account's division. Available only in organizations that use divisions to segment their data.	
Account Name	Name of company. Up to 255 characters are allowed in this field.	✔ (D&B)
Account Name (Local)	The name of the account translated into the local language.	
Account Number	Tracking or reference number for account. Up to 40 characters are allowed in this field.	
Account Owner	Assigned owner of account. Not available in Personal Edition.	
Account Record Type	Name of the field that determines what picklist values are available for the	

### EDITIONS

Available in: Salesforce Classic and Lightning Experience

The available business account fields vary according to which Salesforce Edition you have.

Person accounts available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

The available person account fields vary according to which Salesforce Edition you have.

Field	Description	Allows Value from Data.com or D&B
	record. Available in Enterprise, Unlimited, Performance, and Developer Editions.	
Account Site	Information about the account's location, such as <i>single location</i> , <i>Headquarters</i> , or <i>Branch</i> . Up to 80 characters are allowed in this field.	✔ (D&B)
Account Source	The source of the account record. For example, <i>Advertisement</i> , <i>Data.com</i> , or <i>Trade Show</i> . The source is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (Data.com)
Annual Revenue	Amount of annual reported revenue.   <b>Note:</b> If you clean your account records with Data.com Prospector or Data.com Clean, Data.com converts non-USD currencies to USD every month, which may cause the values in this field to change. For organizations that use non-USD currencies, we ignore the Annual Revenue field when determining a record's clean status (so the Clean Status field's value does not change). We also remove the value from the Annual Revenue field on account records and the clean comparison page.	✔ (D&B)
Billing City	City portion of billing address. Up to 40 characters are allowed in this field.	✔ (D&B)
Billing Country	Country portion of billing address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✔ (D&B)
Billing State/Province	State or province portion of billing address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✔ (D&B)
Billing Street	Street address used for billing. Up to 255 characters are allowed in this field.	✔ (D&B)

Field	Description	Allows Value from Data.com or D&B
Billing Zip/Postal Code	Zip or postal code portion of billing address. Up to 20 characters are allowed in this field.	✔ (D&B)
Clean Status	<p>Indicates the record's clean status as compared with Data.com. Values are: Not Compared, In Sync, Reviewed, Different, Not Found, or Inactive. This field is available to only organizations that use Data.com Prospector or Data.com Clean.</p> <p> <b>Note:</b> If you clean your account records with Data.com Prospector or Data.com Clean, Data.com converts non-USD currencies to USD every month, which may cause the values in the Annual Revenue field to change. For organizations that use non-USD currencies, we ignore the Annual Revenue field when determining a record's clean status (so the Clean Status field's value does not change).</p>	✔ (Data.com)
Created By	User who created the account, including creation date and time. (Read only)	
Data.com Key	The ID of the company in Data.com. When Salesforce records are compared with Data.com records (via either manual cleaning or automated clean jobs), if Data.com finds a match, the two records are linked by this field's numeric value.	✔ (Data.com)
D&B Company	A link to the corresponding D&B Company record, which displays Dun & Bradstreet (D&B) fields for the account. Use the lookup if you need to associate a different D&B Company record with the account. This field is only available to organizations that use Data.com Premium Prospector or Data.com Premium Clean.	✔ (D&B)
Description	Description of account. Up to 32 KB of data are allowed in this field. Only the first 255 characters display in reports.	✔ (D&B)

Field	Description	Allows Value from Data.com or D&B
D-U-N-S Number	<p>The Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the D&amp;B database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking. This field is available to only organizations that use Data.com Prospector or Data.com Clean.</p> <p> <b>Note:</b> To see the entire D-U-N-S number, either</p> <ul style="list-style-type: none"> <li>• Add the account to Salesforce if you haven't yet, or</li> <li>• Clean the account with Data.com if it already exists in Salesforce</li> </ul> <p>Until you add or clean the record, its first five digits will be masked with asterisks (*).</p>	✔ (D&B)
Employees	Number of people employed by the account.	✔ (D&B)
Evaluate this account against territory rules on save	When checked, causes account assignment rules to run when the account is edited and saved. When customizing the page layout for accounts, an administrator can control whether this checkbox displays and whether it is checked by default. See <a href="#">Territory Management Overview</a> on page 1238.	
Exclude from territory assignment rules	When checked, shields the account from being evaluated when account assignment rules are run, preventing it from being automatically assigned to territories. Also, if the account is already assigned to territories as a result of assignment rules, checking this box removes the account from those territories. This checkbox only affects rule-based account assignments and has no effect on manual account assignments. See <a href="#">Territory Management Overview</a> on page 1238.	

Field	Description	Allows Value from Data.com or D&B
Fax	Fax number. Up to 40 characters are allowed in this field.	✔ (D&B)
Industry	Primary business of account. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (Data.com)
Modified By	User who last changed the account fields, including modification date and time. This does not track changes made to any of the related list items on the account. (Read only)	
NAICS Code	The six-digit North American Industry Classification System (NAICS) code is the standard used by business and government to classify business establishments into 20 industries, according to their economic activity for the purpose of collecting, analyzing, and publishing statistical data related to the U.S. business economy. This field is available to only organizations that use Data.com Prospector or Data.com Clean.	✔ (D&B)
NAICS Description	A brief description of an organization's line of business, based on its NAICS code. This field is available to only organizations that use Data.com Prospector or Data.com Clean.	✔ (D&B)
Ownership	Ownership of company, for example, public or private. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (D&B)
Parent Account	Parent company for companies that are subsidiaries of a larger company or organization. The parent account must be an existing account in Salesforce. You can enter the account name, or select (or optionally, create) the account using the lookup icon.	
Partner Account	Read-only field that indicates whether an account is a partner account.	
Phone	Primary phone number of account. Up to 40 characters are allowed in this field.	✔ (D&B)

Field	Description	Allows Value from Data.com or D&B
Rating	Categorization of how you rate this account, for example, Hot, Cold. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Shipping City	City portion of primary mailing or shipping address. Up to 40 characters are allowed in this field.	✔ (D&B)
Shipping Country	Country portion of primary mailing or shipping address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✔ (D&B)
Shipping State/Province	State or province portion of primary mailing or shipping address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✔ (D&B)
Shipping Street	Primary mailing or shipping street address of account. Up to 255 characters are allowed in this field.	✔ (D&B)
Shipping Zip/Postal Code	Zip or postal code portion of primary mailing or shipping address. Up to 20 characters are allowed in this field.	✔ (D&B)
SIC Code	Standard Industrial Classification code of the account's main business categorization. Up to 10 characters are allowed in this field.	✔ (D&B)
SIC Description	A brief description of an organization's line of business, based on its SIC code.	✔ (D&B)
Territories	<p>The territories to which the account has been assigned. See <a href="#">Territory Management Overview</a> on page 1238.</p> <p>For organizations that use Enterprise Territory Management, this field is not available. Enterprise Territory Management offers a related list called Assigned Territories that you can add to account page layouts.</p>	
Ticker Symbol	The abbreviation used to identify publicly traded shares of a particular stock. Also	✔ (D&B)

Field	Description	Allows Value from Data.com or D&B
	known as the stock symbol. Up to 20 characters are allowed in this field.	
Tradestyle	A name, different from its legal name, that an organization may use for conducting business. Similar to "Doing business as" or "DBA". This field is available to only organizations that use Data.com Prospector or Data.com Clean.	✔ (D&B)
Type	Type of account, for example, Customer, Competitor, or Partner. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Custom Links	Listing of custom links for accounts as set up by your administrator.	
Website	URL of account's website, for example, www.acme.com. Up to 255 characters are allowed in this field; only the first 50 are displayed.	✔ (Data.com)
Year Started	The year the company was established or the year when current ownership or management assumed control of the company. If the company establishment or ownership year is unavailable, then the year the D&B record was created will be used. D&B does not supply this data for branch locations. This field is available to only organizations that use Data.com Prospector or Data.com Clean.	✔ (D&B)

## Person Account Fields

A person account has the following standard fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable. Fields with a checkmark in the Is Contact Field column are contact fields that are supported for person accounts but not business accounts.

Note that this list does not include any custom fields that your administrator may have created. Both account and contact custom fields are available for person accounts.

Field	Description	Is Contact Field
Account Currency	The default currency for all currency amount fields in the account. Amounts display in the account currency and are also converted to the user's personal currency. Available	

Field	Description	Is Contact Field
	only for organizations that use multiple currencies.	
Account Division	Division to which the account belongs. Records related to the account, such as contacts and opportunities, automatically inherit the account's division. Available only in organizations that use divisions to segment their data.	
Account Name	The name of the individual. In person accounts, the account name cannot be edited directly. Instead, Salesforce derives it by combining the <code>First Name</code> and <code>Last Name</code> fields in the appropriate order per the user's language setting. If <code>Middle Name</code> and <code>Suffix</code> fields have been enabled for the organization, those fields are also included in the account name.	
Account Name (Local)	The name of the account translated into the local language.	
Account Number	Tracking or reference number for account. Up to 40 characters are allowed in this field.	
Account Owner	Assigned owner of account. Not available in Personal Edition.	
Account Record Type	Name of the field that determines what picklist values are available for the record. Available in Enterprise, Unlimited, Performance, and Developer Editions.	
Account Site	Information about the account's location, such as <i>single location</i> , <i>Headquarters</i> , or <i>Branch</i> . Up to 80 characters are allowed in this field.	
Annual Revenue	Amount of annual reported revenue.	
Assistant	Name of assistant. Up to 40 characters are allowed in this field.	✓
Asst. Phone	Assistant's phone number. Up to 40 characters are allowed in this field.	✓
Billing City	City portion of billing address. Up to 40 characters are allowed in this field.	
Billing Country	Country portion of billing address. Entry is selected from a picklist of standard values,	

Field	Description	Is Contact Field
	or entered as text. Up to 80 characters are allowed if the field is a text field.	
Billing State/Province	State or province portion of billing address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	
Billing Street	Street address used for billing. Up to 255 characters are allowed in this field.	
Billing Zip/Postal Code	Zip or postal code portion of billing address. Up to 20 characters are allowed in this field.	
Birthdate	Birthday. You can enter a date, or choose a date from the calendar that displays when you put your cursor in the field.	✓
Created By	User who created the account, including creation date and time. (Read only)	
Custom Links	Listing of custom links for accounts as set up by your administrator.	
Department	Associated business or organizational unit. Up to 80 characters are allowed in this field.	✓
Description	Description of account. Up to 32 KB of data are allowed in this field. Only the first 255 characters display in reports.	
Do Not Call	Indicates that the contact does not want to be contacted by phone. If you use Data.com, the <code>Phone</code> field value will be masked out in search results and on the Contact Card, and it will be blank in <code>.csv</code> files created when you export records.	✓
Email	Email address. Must be a valid email address in the form: <code>jsmith@acme.com</code> . Up to 80 characters are allowed in this field.	✓
Email Opt Out	Indicates that the contact does not want to receive email. If you use Data.com, the <code>Email</code> field value will be masked out in search results and on the Contact Card, and it will be blank in <code>.csv</code> files created when you export records.	✓
Employees	Number of people employed by the account.	

Field	Description	Is Contact Field
Evaluate this account against territory rules on save	When checked, causes account assignment rules to run when the account is edited and saved. When customizing the page layout for accounts, an administrator can control whether this checkbox displays and whether it is checked by default. See <a href="#">Territory Management Overview</a> on page 1238.	
Exclude from territory assignment rules	When checked, shields the account from being evaluated when account assignment rules are run, preventing it from being automatically assigned to territories. Also, if the account is already assigned to territories as a result of assignment rules, checking this box removes the account from those territories. This checkbox only affects rule-based account assignments and has no effect on manual account assignments. See <a href="#">Territory Management Overview</a> on page 1238.	
Fax	Fax number. Up to 40 characters are allowed in this field.	
Fax Opt Out	Indicates if the person has requested not to be included in broadcast faxes.	✓
First Name	The first or given name of the individual. Up to 40 characters are allowed in this field.	✓
Home Phone	Person's home phone number. Up to 40 characters are allowed in this field.	✓
Industry	Primary business of account. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Last Name	The surname or family name of the individual. Up to 80 characters are allowed in this field.	✓
Last Stay-in-Touch Request Date	The date that the most recent Stay-in-Touch request was sent.	✓
Last Stay-in-Touch Save Date	The date that the most recent Stay-in-Touch request was returned and merged.	✓
Lead Source	Record source, for example, Advertisement, Partner, or Web. Entry is selected from a picklist of available values, which are set by	✓

Field	Description	Is Contact Field
	an administrator. Each picklist value can have up to 40 characters.	
Mailing City	City portion of mailing address. Up to 40 characters are allowed in this field.	✓
Mailing Country	The mailing country for the address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✓
Mailing State/Province	The mailing state or province for the address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✓
Mailing Street	Street mailing address. Up to 255 characters are allowed in this field.	✓
Mailing Zip/Postal Code	Zip or postal code portion of mailing address. Up to 20 characters are allowed in this field.	✓
Middle Name	Middle name of the individual. Up to 40 characters are allowed for this field.   <b>Note:</b> To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select <b>User Interface</b> . Then select <b>Enable Name Suffixes for Person Names</b> .	✓
Mobile	Cellular or mobile phone number. Up to 40 characters are allowed in this field.	✓
Modified By	User who last changed the account fields, including modification date and time. This does not track changes made to any of the related list items on the account. (Read only)	
Other City	City portion of additional address. Up to 40 characters are allowed in this field.	✓
Other Country	Another country for the address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✓

Field	Description	Is Contact Field
Other Phone	Additional phone number listing. Up to 40 characters are allowed in this field.	✓
Other State/Province	Another state or province for the address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✓
Other Street	Street address portion of additional address. Up to 255 characters are allowed in this field.	✓
Other Zip/Postal Code	Zip or postal code portion of additional address. Up to 20 characters are allowed in this field.	✓
Ownership	Ownership of company, for example, public or private. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Phone	Primary phone number of account. Up to 40 characters are allowed in this field.	
Rating	Categorization of how you rate this account, for example, Hot, Cold. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Salutation	Title for addressing the person, for example, Mr., Ms., Dr., or Prof. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✓
Shipping City	City portion of primary mailing or shipping address. Up to 40 characters are allowed in this field.	
Shipping Country	Country portion of primary mailing or shipping address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	
Shipping State/Province	State or province portion of primary mailing or shipping address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	

Field	Description	Is Contact Field
Shipping Street	Primary mailing or shipping street address of account. Up to 255 characters are allowed in this field.	
Shipping Zip/Postal Code	Zip or postal code portion of primary mailing or shipping address. Up to 20 characters are allowed in this field.	
SIC Code	Standard Industrial Classification code of the account's main business categorization. Up to 10 characters are allowed in this field.	
Suffix	<p>Name suffix of the individual. Up to 40 characters are allowed for this field.</p> <p> <b>Note:</b> To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select <b>User Interface</b>. Then select <b>Enable Name Suffixes for Person Names</b>.</p>	✔
Territories	The territories to which the account has been assigned. See <a href="#">Territory Management Overview</a> on page 1238.	
Ticker Symbol	The abbreviation used to identify publicly traded shares of a particular stock. Also known as the stock symbol. Up to 20 characters are allowed in this field.	
Title	Person's position within his or her organization. Up to 80 characters are allowed in this field.	✔
Type	Type of account, for example, Customer, Competitor, or Partner. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Website	URL of account's website, for example, www.acme.com. Up to 255 characters are allowed in this field; only the first 50 are displayed.

[Accounts](#)

## Account History

The Account History related list of an account detail page tracks the changes to the account. Any time a user modifies any of the standard or custom fields whose history is set to be tracked on the account, a new entry is added to the Account History related list. For person accounts, this includes any relevant contact fields that are set to be tracked. All entries include the date, time, nature of the change, and who made the change. Modifications to the related lists on the account are not tracked in the account history.

SEE ALSO:

[Accounts](#)

## Viewing Parent Accounts

The account hierarchy shows you the accounts that are associated through the `Parent Account` field, giving you a global view of a company and its subsidiaries. In the hierarchy, accounts are indented to show that they are subsidiaries of the parent account above them.

- To view the account hierarchy, click **View Hierarchy** next to the account name on the account detail page. The Account Hierarchy page displays up to 500 child accounts. If you don't have access to certain accounts that appear on the Account Hierarchy page, the columns for those accounts won't display details.
- To list an account as a subsidiary, edit the subsidiary account and type the name of an existing account in the `Parent Account` field. Alternatively, you can click the lookup icon to search for (or optionally, create) a parent account.

The parent account must be an existing account before it can be entered and saved in this field.

For companies with multiple office locations, you can also use the `Account Site` field to distinguish among the locations.

If your organization uses divisions, accounts that are associated via the `Parent Account` field do not need to be in the same division.

The `Parent Account` field and the **View Hierarchy** link are not supported for person accounts.

## Merging Duplicate Accounts

1. From the Accounts tab, click **Merge Accounts** in the Tools section.
2. Enter a search string to find the duplicate accounts.  
For example, you can enter *acme\** to find duplicate accounts listed as “Acmes” and “Acme, Inc.” Do not use the local name for the account. Then click **Find Accounts**.
3. Check the rows of up to three accounts you want to merge. Click **Next**.
4. Select one account as the “Master Record.” Any data in hidden or read-only fields will be taken from the Master Record. If you have “Edit Read Only Fields” permission, you can manually select which read-only fields to retain. Note that hidden fields are not displayed during the merge.
5. Select the fields that you want to retain from each record.  
When there is conflicting data, the fields in the left column are preselected and the row is marked in blue.
6. Click the **Merge** button to complete the merge.

### Guidelines for Merging Accounts

- You can merge accounts if you are an administrator, the account owner, or a user above the account owner in the role hierarchy and you have the appropriate user permissions.
- When merging two accounts that you do not own, you must have “Delete” permissions on accounts and “Edit” permissions on opportunities and cases. You need “Delete” permissions on accounts because you are deleting one of the accounts when you perform an account merge. You need “Edit” permissions on opportunities and cases because changing the account name field (`ACCOUNT ID`) edits any opportunities or cases that are associated with the accounts you are merging.
- Any related items from any of the duplicate accounts will be associated with the newly merged account.
- In Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, any sharing rules are applied to the newly merged account. Also, any manual sharing from the “Master Record” is applied to the merged account.
- When you merge accounts that are listed in the `Parent Account` field of other accounts, the newly merged account is linked only to the accounts of the selected Master Record.
- All discarded duplicate records are moved to the Recycle Bin.
- The newly merged account displays the `Created By` date from the oldest account you are merging, and shows the merge date as the `Modified By` date.
- In organizations that use divisions, the merged account is assigned to the division of the Master Record, unless you select otherwise.
- When you merge accounts that have territories and the `Exclude from account assignment rules` box was deselected on both of the original accounts, account assignment rules will run on the new account to determine its territories. Also, any manually added territories on the original accounts will be manually added to the new account.
- When you merge accounts that have territories and the `Exclude from account assignment rules` box was checked on one or both of the original accounts:
  - The newly merged account has all of the territories of the original accounts.
  - Account assignment rules will not run on the newly merged account.
  - If a territory was assigned to one of the original accounts based on account assignment rules, it will appear as having been assigned to the new account based on rules even if the new account does not match the rules.

#### EDITIONS

Available in: Salesforce Classic

Business accounts available in: **All Editions** except **Database.com**

Person accounts available in: **Enterprise, Performance, Unlimited, and Developer Editions**

#### USER PERMISSIONS

To view accounts:

- “Read” on accounts

To merge business accounts:

- “Delete” on accounts

To merge person accounts:

- “Delete” on accounts

AND

“Read” on contacts

- If a territory was manually assigned to one of the original accounts, it will be manually assigned to the new account.
- If a territory was added to one account manually and to the other account by rules, it will be manually added to the new account.
- When you merge accounts, you also merge the accounts' memberships in relationship groups.

### Guidelines for Merging Accounts with Team Members

- If both accounts have different account teams, the merged account will contain members from both account teams.
- If account team members have a greater access level, you must have the "Modify All Data" permission on accounts to merge those accounts. For example, if you're the account owner who's merging the accounts but an account team member has more access than you on any account child records, you'll need the "Modify All Data" permission to merge those accounts.

### Guidelines for Merging Person Accounts

- If your organization uses person accounts, both business accounts and person accounts are returned when you search for duplicates. However, you cannot merge a person account with a business account or vice versa. Person accounts are indicated by the person account icon (  ).
- You can't merge person accounts enabled to use a Customer Portal.

### Guidelines for Merging Accounts Associated with Portals

- You must have the "Manage Users" permission to merge accounts associated with portals.
- You can merge accounts that have contacts associated with the same type of portal. For example, you can merge accounts that have contacts associated with a [partner portal](#) or Customer Portal, but you cannot merge an account that has contacts associated with a partner portal with an account that has contacts associated with a Customer Portal.

When you merge accounts that have contacts associated with multiple portals of the same type, a contact's access to a specific portal does not change. This is because a portal user's profile determines the portal he or she can access.

- When merging a partner account with a non-partner account, the partner account must be the master.
- When merging partner accounts with a non-partner account, the owner cannot be changed.
- To ensure that merged accounts will include contacts associated with a portal, select the account with portal users as the master record during the merge process.

### Guidelines for Merging Accounts Assigned to Territories with Territory Management 2.0

When you merge accounts that have territories:

- Any manually assigned territories (for models in all states) on the original accounts will be manually added to the merged account if the merged account is not already associated with them.
- Account assignment rules will run on the merged account for the active territory model only if you select the *Select by default* checkbox for the *Evaluate this account against territory rules on save* checkbox on the applicable account page layout's layout properties.
- If the merged value of `Exclude from territory assignment rules = true`, then: 1) territory assignment rules are not evaluated even if the *Select by default* checkbox for the *Evaluate this account against territory rules on save* checkbox is selected on the applicable account page layout's layout properties; and 2) any existing rule based territory associations in the active model are removed from the merged account.

- For territory models in non-active states (Planning or Archived), rule-based associated territories will not change on the merged account even if the merged account field values do not match the rules.

SEE ALSO:

[Merging Accounts Associated with Relationship Groups](#)

## Merging Accounts Associated with Relationship Groups

When working with wealth management accounts (clients), you can merge up to three duplicate accounts at a time. For example, if the accounts “Joe Bannon” all represent the same client and need to be merged, you can use the Merge Accounts tool to consolidate those records into one. Note that merging results in a single account, and an account cannot exist more than once in the same relationship group. Review the following considerations before merging accounts that are members of relationship groups:

- The account you select as the master record retains its original relationship group memberships. For example, if the master record “Joseph Bannon” was a member of the “Bannon Family” and “Bannon Law Firm” relationship groups, it remains a member of those relationship groups.
- The master record replaces the non-master records in all other relationship groups involved in the merge. For example, if the non-master record “Joe Bannon” was a member of “Bannon Trust Beneficiaries,” the master record is transferred Joe Bannon’s membership in Bannon Trust Beneficiaries.
- If there is a relationship group to which the master record did not originally belong but the multiple non-master records belong, the master record is transferred the membership of the non-master account that had higher priority (primary versus secondary) or the account whose member record was most recently modified in the relationship group. For example, if the non-master records “JR Bannon” and “Joe Bannon” both were members of “Acme LLP” and JR Bannon was primary, then the master record is transferred JR Bannon’s membership in Acme LLP. Alternatively, if neither JR Bannon or Joe Bannon were primary or secondary but JR Bannon’s member record in the relationship group was modified more recently, then the master record would be transferred JR Bannon’s membership in Acme LLP.

### USER PERMISSIONS

To merge business accounts:

- “Delete” on accounts

To merge person accounts:

- “Delete” on accounts, “Read” on contacts

## Sharing Accounts

Your administrator defines your organization's sharing model as well as your organization's default account access levels for territories. However, you can extend sharing privileges for your own data on an account-by-account basis. You can use account sharing to increase access to your accounts; you cannot restrict access beyond your organization's default access levels.

To view and manage sharing details, click **Sharing** on the account detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the account. On this page, you can do any of the following:

- Click **Add** to grant access to the record for other users, groups, roles, or territories.
-  **Note:** When you share an account, Salesforce prompts you to share any related [contacts](#), [opportunities](#), or cases, up to and including your access level. Enterprise, Unlimited, Performance, and Developer Edition users can also share related records from the record detail pages. Ensure users have at least "Read" permission on shared records.

Alternatively, you can share account access by creating an [account team](#).

- Click **Expand List** to view all users that have access to the record.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level. For accounts, you can also edit the "Owner" sharing rule.

## Record Translated Names

Use local name fields to store translated names for accounts, contacts, or leads.

For example, you can store the name of an account in the default language of your organization as well as the account's or user's language. The following fields can have corresponding local names:

Standard Field	Local Name Field
Account Name	Account Name (Local)
Contact: First Name	Contact: First Name (Local)
Contact: Middle Name	Contact: Middle Name (Local)
Contact: Last Name	Contact: Last Name (Local)
Lead: Company	Lead: Company Name (Local)
Lead: First Name	Lead: First Name (Local)
Lead: Middle Name	Lead: Middle Name (Local)
Lead: Last Name	Lead: Last Name (Local)

## Changing the Territories of an Account

To modify an account's manually assigned territories:

1. From the account detail page, click **Change** next to the `Territories` field.
2. At the `Rule-based territory assignments` list, view the territories that contain the account due to active account assignment rules. You cannot use this page to remove the account from these territories; to do so you must modify the account assignment rules that evaluated the account.
3. If the account has existing manual assignments to one or more territories, the names of those territories will appear in the `Selected territories` list.
4. Click **Select** and **Deselect** to move territories between the Available territories list and the Selected territories list.
5. Optionally, click **Horizontal View** or **Vertical View** in the drop-down list to place the Selected territories list either alongside or below the Available territories list.
6. When the Selected territories list contains the territories to which the account should be manually assigned, click **Save** to finish and return to the account detail page.

### EDITIONS

Available in: Salesforce Classic

Business accounts available in: **All** Editions except **Database.com**

Person accounts available in **Enterprise, Performance, Unlimited, and Developer** Editions

### USER PERMISSIONS

To change the territories of an account:

- "Manage Territories"

OR

You are a forecast manager, Forecast managers can manage territories is selected, and you are working below your position in the territory hierarchy.

## Change a Record's Owner

You can give ownership of a record to another user as long as that user has at least "Read" permission for the type of record being transferred.

1. On the record detail page, click **Change** next to the `Owner` field.  
If you don't see the **Change** link, you don't have permissions to change record ownership.
2. Enter or select a new owner. In organizations where the Salesforce Customer Portal or partner portal is enabled, you can filter the results that appear on the user lookup dialog by selecting either a queue or group of users from the `Owner` or `Assigned To` drop-down list.

 **Note:** You can only enter or select users who have permission to own the record. Neither the User group nor the Roles and Internal Subordinates group contains Customer Portal or partner users.

3. Select the `Send Notification Email` checkbox to notify the new owner.  
The "From" email address displayed in the notification is your return email address set in your email settings.

For cases in Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, the email text is determined by the `Case Assigned Template` setting specified in the Support Settings. For other records, the email text is automatically generated and cannot be customized.

4. Depending on the type of object you are transferring and your user permissions, the following checkboxes may also appear:

Checkbox	Description	Appears For
<code>Change Division</code>	Transfers the record to the new owner's division. All records related to the account are transferred to the new division as well.	Accounts and leads in Salesforce Classic, if you can view or edit the <code>Division</code> field
<code>Transfer open opportunities not owned by the existing account owner or Transfer open opportunities not owned by you</code>	Transfers open opportunities owned by other users that are associated with the account.	Accounts in Lightning Experience Accounts in Salesforce Classic
<code>Transfer closed opportunities</code>	Transfers the closed opportunities associated with the account. This option applies only to closed opportunities owned by the account owner; closed opportunities owned by other users are not changed.	Accounts in Salesforce Classic
<code>Transfer open cases owned by the existing account owner</code>	Transfers any open cases associated with the account that are owned by the existing account owner.	Accounts in Salesforce Classic

### EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To transfer single records:

- "Transfer Record"

Checkbox	Description	Appears For
Transfer closed cases	Transfers the closed cases associated with the account. This option applies only to closed cases owned by the account owner; closed cases owned by other users are not changed.	Accounts in Salesforce Classic
Keep Account Team	Transfers all account team members on the account to the new owner.	Accounts in Salesforce Classic
Keep Opportunity Team	Preserves the opportunity team when the opportunity is transferred to the new owner. Any opportunity splits are preserved, and split percentages assigned to the previous owner transfer to the new one. If this box is unchecked, all opportunity team members and splits are deleted when the opportunity is transferred.	Accounts in Salesforce Classic Opportunities in Salesforce Classic

 **Note:** If you transfer closed opportunities, the opportunity team is maintained, regardless of this setting.

 **Note:** If you change an account owner with both `Transfer closed opportunities` and `Keep Opportunity Team` deselected, the opportunity team members' access for closed opportunities becomes Private (that is, the opportunity team members lose access to any closed opportunities).

5. Click **Save** to finish.

 **Example:** After you change a record's owner, the previous owner's visibility reverts to the default sharing setting unless that user is on an account or opportunity team. For example, if the previous owner of an account is on an account team, that user has Read Only or the access specified in your organization-wide default for accounts, whichever is greater. The previous owner's access to related records remain the same. This behavior is the same for opportunity owners that are members of an opportunity team as long as you change ownership using the API. When you change ownership of an opportunity within Salesforce, you can select the access level you want.

SEE ALSO:

[Transfer of Associated Items](#)

## Transfer of Associated Items

When you change a record's owner, some of its associated records may also be transferred to the new owner.

 **Important:** Workflow rules that update owners *do not* also transfer associated items. To ensure transfer, click **Change** next to the owner's name in a record and make your transfer selections.

Record Type	Associated items that are also transferred
Accounts	<p>Contacts, contracts with <i>Draft</i> status, attachments, notes, open activities, and orders with <i>Draft</i> status that are either associated with a transferring contract or no contract. Depending on your selections, this can also include open opportunities not owned by the current account owner, closed opportunities, open cases owned by the existing account owner, and closed cases.</p> <p>When a partner account is transferred, <a href="#">partner users</a> associated with that account are moved into the role hierarchy beneath the new owner.</p> <p>Contracts and orders with <i>Activated</i> status are not transferred to the new owner, however, the new owner has read-only access to these contracts and orders.</p>
Contacts	Notes, attachments, and open activities
Orders	Open tasks and future events (only applies if neither the old nor new owner is a queue)
Opportunities	Notes, attachments, and open activities
Leads	Notes, attachments, and open activities. Open activities are not transferred if you change lead ownership using the <code>Assign using active assignment rule</code> checkbox.
Cases	Notes, attachments, and open activities
Campaigns	Attachments and open activities
Contracts	Notes, attachments, open activities, and orders with <i>Draft</i> status
Custom objects	Notes, attachments, and open activities

 **Note:** You can't transfer events to which you have been invited and don't own.

## Finding Account-Related Information (Related Lists)

### USER PERMISSIONS

To view accounts:	"Read" on accounts
To edit business accounts:	"Edit" on accounts
To edit person accounts:	"Edit" on accounts and contacts
To enable partner accounts:	"Manage External Users"
To disable partner accounts:	"Edit" on accounts AND "Manage External Users"
To disable Customer Portal accounts:	"Edit" on accounts AND "Edit Self-Service Users"

### EDITIONS

Business accounts available in: Both Salesforce Classic and Lightning Experience

Business accounts available in: **All** Editions except **Database.com**

Person accounts available in: Salesforce Classic

Person accounts available in **Enterprise, Performance, Unlimited,** and **Developer** Editions

Related lists, such as opportunities, display information related to an account.

- Hover over the links at the top of a detail page to display the corresponding related list and its records. If Chatter is enabled, hover links display below the feed. An interactive overlay allows you to quickly view and manage the related list items. Click a hover link to jump to the content of the related list. If hover links are not enabled, contact your Salesforce administrator.
- If hover details are enabled, hover over any lookup field on the detail page to view key information about a record before clicking into that record's detail page.
- To directly add new items, click **New** (or the equivalent button) at the top of a related list. For example, to add a task to the Open Activities related list, click **New Task**.
- To change the number of records shown for related lists, click **View More** below a related list, or click **fewer** or **more** at the bottom of the page.
- If you are unable to see related records that belong to portal users, contact your Salesforce administrator.

## Viewing Related Lists

What related lists you see are determined by several things.

- The Salesforce edition you are using
- Whether you are using Salesforce Classic or Lightning Experience
- Whether you are viewing a business account or a person account
- Your personal customization
- Page layout customizations set by your Salesforce administrator
- Your permissions to view related data

[Accounts](#)

## Working Together on Accounts

### Account Teams Overview

An account team is a team of users that work together on an account. For example, your account team may include an executive sponsor, dedicated support representative, and project manager.

You can build an account team on each account that you own. When selecting an account team member, choose a role to indicate the role the person plays on the account. Also, depending on your sharing model, you can specify the level of access each account team member will have to the account and any contacts, opportunities, or cases associated with that account. So, you can give some team members read-only access and others read/write access.

You can also set up a default account team. Your default account team should include the users that you normally work with on your accounts. You have the option to automatically add your default account team to all of your accounts.

In a custom list view, you can filter account lists by the account teams in which you are a member. When creating or editing a custom list view for accounts, simply select the **My Account Teams** filter. In account reports, you can filter accounts by the account teams in which you are a member.

 **Note:** Account teams are not the same as opportunity teams, although they share the same set of available team member roles. Account teams work together on accounts, while opportunity teams work together on opportunities.

#### SEE ALSO:

[Set Up Account Teams](#)

[Setting Up Default Account Teams](#)

[Accounts](#)

### Set Up Account Teams

Your users can add account team members to accounts. Similar to opportunity teams on opportunities, account teams are teams of users who work together on accounts.

To access the Account Team Setup page, from Setup, enter *Account Teams* in the *Quick Find* box, then select **Account Teams**. On the Account Team Setup page, click the appropriate links to perform the following actions.

#### Defining Team Roles

Every member of an account team has a role that he or she plays for the account, for example, "Account Manager" or "Project Manager." You can customize the account team roles for your organization:

1. Click **Team Roles**.
2. Edit the existing entries or add new items.
3. Click **Save**.

#### EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

#### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

#### USER PERMISSIONS

To enable account teams:

- "Customize Application"

To set up team roles:

- "Customize Application"

## Replacing Team Roles

If you have changed your team roles and want to update all existing records, click **Replace Team Roles** to globally replace the picklist values in all existing records.

-  **Note:** Account teams share roles with the opportunity teams on opportunities. If you remove an account team role, that role will no longer be listed as an opportunity team role.

## Enabling or Disabling Account Teams

To enable or disable account teams:

1. Click **Enable Account Teams** or **Disable Account Teams**.
2. Select or deselect the `Account Teams Enabled` checkbox and click **Save**. Enabling account teams gives your users access to create and use account teams on accounts.
3. If you are enabling account teams, select the account page layouts that should include the new Account Team related list and click **Save**.

-  **Note:** Disabling account teams removes all account teams from all accounts and removes the Account Team related list from all page layouts.

In addition, you cannot disable account teams for your organization if team members are referenced in Apex. For example, if Apex code references the `Team Member` field (represented as `AccountTeamMember` in the code), account teams cannot be disabled.

SEE ALSO:

[Account Teams Overview](#)

[Setting Up Default Account Teams](#)

## Setting Up Default Account Teams

An account team is a team of users that work together on an account. For example, your account team may include an executive sponsor, dedicated support representative, and project manager.

### Adding Default Account Team Members

1. From your personal settings, enter *Advanced User Details* in the *Quick Find* box, then select **Advanced User Details**. No results? Enter *Personal Information* in the *Quick Find* box, then select **Personal Information**.
2. Click **Add** in the Default Account Team related list.
3. Select users to add as members of your default account team.
4. Select the access levels that each member should have on the accounts you own and the contacts, opportunities, and cases related to those accounts.

The access levels of the records can only grant the same or wider access than your organization's default access. However, at least one of the access levels must be set to a wider access than the organization's defaults. For example, if the organization-wide defaults for your contacts, opportunities, and cases are set to Private, then at least one of them must be set to a wider access for the account team members.

*Contact Access* is not available when the organization-wide default for contacts is set to Controlled by Parent.

5. Select an account team role for each member, for example, "Channel Manager."
6. Check the *Automatically add my default account team...* box to add your default account team to all accounts that you create and all accounts that are transferred to you.
7. Check the *Update account teams...* box to apply default account team changes to all of your existing accounts.
8. Click **Save**.

### Editing and Deleting Default Account Team Members

To change the access levels or role of a default team member, click **Edit** next to the user's name in the Default Account Team related list.

To delete a user from your default account team:

1. Click **Del** next to the user's name in the Default Account Team related list.
2. Select **Remove this user...** to remove the user from your existing account teams.
3. Click **Delete** to finish.

To change or remove a default team member for a specific account, go to the Account Team related list on that account.

#### USER PERMISSIONS

To set up default account teams:

- "Read" on opportunities

To add default account teams to accounts:

- "Read" on accounts

AND

Owner of account record, or above owner in your organization's role hierarchy

## Adding Account Team Members

An account record owner or users above the owner in the role hierarchy who have read access on the account can add team members but not edit them. If they have edit access on the account, they can also edit or delete team members.

A user who doesn't own the account record can add team members only if he or she has edit access on the record.

You can grant the team member a higher access to the record only if you are the owner of account record, or above the owner in your organization's role hierarchy.

 **Note:** The **Account Access**, **Contact Access**, **Opportunity Access**, and **Case Access** options depend on your sharing model. In a Public sharing model, you may only have one option. **Contact Access** is not available when the organization-wide default for contacts is set to Controlled by Parent. Regardless of sharing access, account team members must also have the "Read" permission on accounts to view accounts that list them as members.

To build an account team, select an account and add account team members to it. High-volume portal users can't be added to teams.

1. View the account.
2. Click **Add** in the Account Team related list.
3. Select users to add to the account team. To add your default account team to an account, click **Add Default Team** in the Account Team related list. To add all account team members to an opportunity, click **Add Account Team** from the Opportunity Team related list on the opportunity.
4. Select the type of access each member should have to the account's related records. The access level cannot be less restrictive than your organization's default account access level.
5. Select a team role for each member.
6. Click **Save**.

 **Tip:** In a custom list view, you can filter account lists by the account teams in which you are a member. When creating or editing a custom list view for accounts, simply select the **My Account Teams** filter. In account reports, you can filter accounts by the account teams in which you are a member.

### USER PERMISSIONS

To add team members to an account:

- "Read" on users
- AND

"Edit" on accounts

To view accounts as team members:

- "Read" on accounts

## Editing Account Team Members

For each account you own or have access to, you can change the access level and role of any member.

 **Note:** If a team member is on your default account team and you modify his or her properties for a specific account, those changes affect only that account. The setup of your default account team doesn't change.

You can grant the team member a higher access to the record only if you are the owner of account record, or above the owner in your organization's role hierarchy.

1. View the account.
2. To add team members, click **Add** or **Add Default Team** on the Account Team related list.
3. To edit a team member's access, click **Edit** next to the member's name and select a different access level for the account and its related contacts, opportunities, and cases.

The access levels of the records can only grant the same or wider access than your organization's default access. However, at least one of the access levels must be set to a wider access than the organization's defaults. For example, if the organization-wide defaults for your contacts, opportunities, and cases are set to Private, then at least one of them must be set to a wider access for the account team members.

4. To edit a team member's role, click **Edit** next to the member's name and select a different role.
5. Click **Save**.

 **Tip:** Click **Display Access** in the Account Teams related list to show the organization-wide sharing settings related to accounts. These settings may allow greater access than those specified when the user was added to the account team. For example, if your company's organization-wide sharing setting for accounts is Read/Write, that setting will override a Read Only setting for an individual member of an account team. Contact access is not available when the organization-wide default access for contacts is set to Controlled by Parent.

### USER PERMISSIONS

To view accounts as team members:

- "Read" on accounts

To edit team members:

- "Read" on users

AND

Edit" on accounts

AND

Owner of account record, or above owner in your organization's role hierarchy

## Removing Account Team Members

For each account you own, you can remove any team member from the account team.

1. View the account.
2. Click **Del** next to the member's name in the Account Team related list.  
Click **Delete All** if you want to remove all the account team members at once.
3. Select **Remove** if you also want to remove the user from the opportunity teams of open opportunities associated with the account.
4. Click **Delete** to finish.

 **Note:** Unless specified, removing a member of your account team does not remove that person from your opportunity teams.

If a team member is on your default account team and you remove him or her from a specific account, those changes only affect that account. The setup of your default account team does not change. To remove users from your default account team, see [Setting Up Default Account Teams](#) on page 1043.

If a user on an account team has Read/Write access (**Account Access**, **Contact Access**, **Opportunity Access**, and **Case Access**) and is deactivated, the access will default to Read Only if the user is reactivated.

## Account Team Fields

An account team member has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

Field	Description
Account Access	The level of access that a team member has to the account. The access level can be read/write or read only, but it cannot be less than your organization's default account sharing access.
Contact Access	The level of access that a team member has to the contact. The access level can be read/write or read only, but it cannot be less than your organization's default contact sharing access.  Contact Access is not available when the organization-wide default for contacts is set to Controlled by Parent.
Opportunity Access	The level of access that team member has to the opportunities associated with the account.

## Syncing Prospects, Contacts, and Leads with Pardot

### Getting Started with the Salesforce Connector

Sync newly created prospects, contacts, and leads, between Pardot and Salesforce. In addition, sync Pardot emails sent to prospects as Salesforce activities.

The Salesforce connector, an AppExchange-certified solution, helps you streamline disparate marketing channels from within Pardot.

Records sync between in Pardot and Salesforce at least every 10 minutes. The sync process handles as many as 800 records every 10 minutes, and up to 4,800 every hour.

## Prepare Salesforce for Connecting to Pardot

Install an AppExchange package to get Salesforce ready to connect and sync with Pardot.

The package you'll download from the AppExchange automatically updates Salesforce with a custom application, custom tab, and custom fields for leads and contacts. After you install the package, you'll see a custom tab for the Pardot LeadDeck application. Keep in mind that you may need to customize your view to display the custom fields for leads and contacts. This helps your sales teams share information between Pardot and Salesforce.

### If you're installing the Pardot AppExchange package for a

#### You need to

Production environment

1. Go to the [Pardot AppExchange package](#) for production environments.
2. Click **Continue** to install the package.
3. When prompted for your username and password, enter your production username and password.
4. Review the actions and click **Deploy** to complete the installation.
5. Confirm with your Salesforce administrator you have read permissions for ObjectChangeLogs.

Sandbox environment

1. Log out of Salesforce.
2. Go to the [Pardot AppExchange package](#) for sandbox environments.
3. When prompted for your username and password, enter your sandbox username and password.
4. Click **Continue** to install the package.
5. Review the actions and click **Deploy** to complete the installation.
6. Confirm with your Salesforce administrator you have read permissions for ObjectChangeLogs.

## Set Up the Connector to Sync with Either Production or Sandbox Environments

Get your Salesforce connector ready to sync between Pardot and Salesforce for either a product or a sandbox environment.

Complete this procedure only if this is the first time you're establishing your connector. You'll need administrative rights in Salesforce for this procedure.

1. From Salesforce Setup, enter *Network Access* in the *Quick Find* box, then select **Network Access**.
2. Create these trusted IP ranges.

Start IP Address	End IP Address
67.228.95.145	67.228.95.145

### EDITIONS

Start IP Address	End IP Address
67.228.168.139	67.228.168.141
67.228.223.106	67.228.223.107

Add the Connector to Pardot

Add and manage connector settings directly in Pardot.

Complete this procedure only if this is the first time you’re establishing your connector and you have administrative rights in Salesforce.

1. In Pardot, hover over **Admin**, then click **Connectors**.
2. Click **+ Add Connector**.
3. Select Salesforce.
4. Type a name for the connector.  
Use a name that makes it easy for you to identify your connector.  
*Example:* Salesforce Connector)
5. Type your Salesforce username and password.  
Keem in mind that when your Salesforce password changes, you’ll need to update the Salesforce password for your connector.

### Options for Customizing the Connector

Customize the connector based on your preferences.

Select any of these options to customize your connector.

The option	Which
Automatically create prospects in Pardot if they’re created in Salesforce	Enables a trigger to set any newly created leads or contacts in Salesforce to sync to Pardot. This won’t happen for historical leads or contacts—only for those created after installing the Pardot AppExchange package in Salesforce, and will work only for leads and contacts created with an email address.  If this feature is enabled later on, any leads and contacts with email addresses that were created after the Pardot package was installed in Salesforce will be pushed down to Pardot. Select a default campaign from the dropdown for any prospect created with this option.
Automatically change emails in Pardot to reflect changes in Salesforce	Automatically updates email addresses for Pardot prospects if an email address of a lead or contact is updated in Salesforce.  Learn more about keeping email address updates in sync in <a href="#">About Email Address Updates Between Salesforce and Pardot</a> .

#### EDITIONS

Available in: Salesforce Classic

The option	Which
Automatically match Salesforce users to Pardot users	Lets you send emails from any user fields, including, for example, support contacts and account managers.  Learn how to set up this functionality is <a href="#">Send Emails from Salesforce</a> .
Exclude Salesforce Partner and Customer Portal users from Prospect assignment	Prevents Salesforce Partner and Customer Portal users from displaying in the “CRM Username” dropdown when you edit a user in Pardot.
Allow editing of Prospect lists within the CRM	Lets users add and remove Pardot prospects from within Salesforce. If you check this box, you must add the Visualforce elements to your Leads and Contacts page layouts.
Connect to a Salesforce sandbox account	Let’s you connect to a sandbox environment.
Sync emails with the CRM	Automatically logs an activity for every email sent to a prospect (list, drip, autoresponder and 1-to-1 prospect emails).   <b>Note:</b> This can quickly fill up your activity views, especially on an account object. Disabling <b>Email Logging in Pardot</b> is not retroactive. If the email logging may interfere with your workflow in Salesforce, we recommended that you do not enable this option.
Sync plugin emails with the CRM	Logs an activity for emails you send through Pardot for Microsoft® Outlook®, our Thunderbird extension, our Apple Mail plug-in, or our add-in for Gmail.
Enable Salesforce emails for task creation	Lets you send a notification email to users when a task is created.
Enable Salesforce emails for assignment rules	Lets Salesforce send a notification email to users when assignment rules run.
Enable Salesforce emails for user and queue assignments	Lets Salesforce send a notification email to users when an assignment takes place for a user or queue.

### Set Up the Connector to Sync with Sandbox Environments

Get your Salesforce connector ready to sync between Pardot and your Salesforce sandbox.

Complete this procedure only if you already have a Salesforce connector set up for your production environment, but want the connector to point to your sandbox environment instead.

1. In Pardot, hover over **Admin**, then click **Connectors**.
2. In the row for your Salesforce connector, click , then **Edit**.
3. In the `Username` field, append `.NSPARDOT` to your username.  
(Example: christina.wills@pardot.com.NSPARDOT)
4. If your sandbox password differs from your password in production, enter your sandbox one in the `Password` field.
5. Select the option `Connect to a Salesforce sandbox account`.

Because your sandbox is a copy of your production Salesforce organization, you’ll see the connector for your sandbox, too.

## Whitelist Pardot IP Addresses in Salesforce

Set up Pardot IP addresses in Salesforce so that Pardot can communicate with Salesforce.

Complete this procedure only if this is the first time you're establishing your connector. You'll need administrative rights in Salesforce for this procedure.

1. From Salesforce Setup, enter *Network Access* in the *Quick Find* box, then select **Network Access**.
2. Create these trusted IP ranges.

Start IP Address	End IP Address
67.228.95.145	67.228.95.145
67.228.168.139	67.228.168.141
67.228.223.106	67.228.223.107

## Turn On the Connector

Complete a simple task to turn on the Salesforce connector so that you can begin syncing between Pardot and Salesforce.

1. In Pardot, hover over **Admin**, then click **Connectors**.
2. In the row for your Salesforce connector, click **verify now**.

If Pardot is able to send data to and receive data from Salesforce, the status will change to .

## Map Custom Leads Fields to Contacts Fields

Get the most out of contacts created from converted leads when you map custom fields between the two record types.

The connector creates leads in Salesforce from prospects in Pardot. But when you convert those Salesforce leads to contacts, only standard fields from the contacts appear for the newly converted contacts. Mapping custom fields between leads and contacts ensures you see all the information that helps you with your marketing and sales efforts.

1. From the object management settings for leads, go to the fields area, and then click **Map Lead Fields**.
2. For each custom lead field, choose a custom account, contact, or opportunity field into which you want the information inserted when you convert a lead.
3. Click **Save**.

## Setting Up Pardot Custom Fields in Salesforce

Get your custom Pardot fields to appear in Salesforce.

The AppExchange package you installed to get Salesforce ready to connect and sync with Pardot sets up the custom fields for you, but the fields do not appear in Salesforce automatically. You need to complete a procedure to have these custom fields appear in Salesforce.

### Add Sections to Leads and Contacts Page Layouts

Complete a procedure for getting Pardot fields to appear in leads and contacts page layouts.

1. In Salesforce, from the object management settings for leads, go to Page Layouts.  
A drag-and-drop box including your field options appears at the top of the page.
2. Drag a Section field to your Leads page layout.
3. In the pop-up window, enter section name *Pardot*.
4. For the number of columns, select **2 (Double)**.
5. Select the option for showing the section heading, and then click **OK**.
6. Return to the Fields section of the drag-and-drop editor and scroll right to locate the Pardot custom fields.
7. Drag all the Pardot fields into your new section.
8. Add another section using the drag-and-drop editor, but for the number of columns, select **1 (Single)**.
9. Select the option for showing the section heading, and then click **OK**.
10. Select **Visualforce Pages tab** and drag **Pardot Lead Activities** and **Pardot Lead List Membership** into your new section.

### Set Up Salesforce to Add Campaign Prospects to Pardot

Set up Salesforce to quickly get prospects from your Salesforce campaigns into Pardot.

1. From the object management settings for campaigns in Salesforce Setup, go to Page Layouts.
2. Edit the layout, and select **Buttons**.
3. Drag the **Add to Pardot List** button to your row of custom buttons at the top of the Campaign view.
4. Save the layout.

## Set Up Salesforce for Adding Leads and Campaigns to Pardot

Easily add buttons in Salesforce that make it easy to add leads and campaigns to Pardot, as well as send Pardot-tracked email from Salesforce.

If you want to add Salesforce leads and campaigns to Pardot, set up and use the **Send to Pardot** button. If email address associated with the Salesforce records:

- Don't yet exist in Pardot, the Send to Pardot feature creates new records for you in Pardot.
- Already exist in Pardot, no harm done—you won't get duplicate records in Pardot.

If you want to send Pardot-tracked email from Salesforce set up and use the **Send Pardot Email** button. You can send free-form tracked email, or use a marketing approved Pardot email template to send email to a lead or contact.

1. Log in to Salesforce as an administrator.
2. From the object management settings for leads, go to Page Layouts.  
A drag-and-drop box including your field options appears at the top of the page.
3. In the Lead Layout box, select **Buttons**.
4. Select the **Send to Pardot** button and drag it into the Lead Detail section.
5. Select the **Send Pardot Email** button and drag it into the Lead Detail section.
6. Save the layout.
7. Repeat Steps 2 through 6 for Contacts.

## Assign Your Salesforce Username to the Connector

Make sure that any actions you take with the connector are associated with you.

1. In Pardot, hover over **Admin**, then click **User Management > Users**.
2. In the row for your user profile, click , then **Edit**.
3. Scroll to the bottom of the Edit User box.
4. Select your Salesforce username from the drop-down menu.
5. Click **Save user**.
6. When you're in your Pardot user profile, you'll see your Salesforce username in the **CRM Username** field. Click **Verify**, and enter your Salesforce password.

## Set Up Single Sign-On for Salesforce and Pardot

Avoid having to sign on to your two separate Salesforce and Pardot systems.

1. Log in to Pardot.
2. Hover over your email address, and then click **My Settings**.
3. Verify that your Salesforce username is correct. If it's correct, click **Verify**. If you need to change or add it, click **Edit My User Information** to change or add it.
4. When prompted, enter your Salesforce password, and then click **Verify**.  
You'll receive a message letting you know whether the validation was successful.
5. If the validation was successful, log in to Salesforce and select the Pardot tab.  
You should be able to see the contents of the tab without having to log in to Pardot separately.

## Send Emails from Salesforce

Send emails from any user field, including support contacts, account managers, or anyone who is attached to a Pardot prospect.

Setting up your users and the necessary custom fields in Pardot lets you take advantage of this feature, and send emails to prospects that could appear to come from any user in Salesforce.

In	Do this
Salesforce	<ol style="list-style-type: none"> <li>1. Create the field you'd like to use to contain your CRM User Value, e.g. Relationship Manager, on the lead or contact record in Salesforce. This field should be the type "Lookup Field." If you already have the field created, make sure that it's a "Lookup Field" and that it's successfully populated.</li> <li>2. Populate the lookup field with the user.</li> </ol>
Pardot	<ol style="list-style-type: none"> <li>1. Create matching user seats for any Salesforce users.</li> <li>2. On the user record, map the Pardot user seat to the Salesforce user. This lets Pardot to infer information about the user for variable tags when sending the email.</li> <li>3. Create a custom field in Pardot with the designated type "CRM User" to hold the field values on the prospect record. This field is a read-only field in Pardot.</li> <li>4. Map the custom field to the corresponding salesforce.com field.</li> </ol>

## About Email Address Updates Between Salesforce and Pardot

Learn how email address updates for your Salesforce contacts and leads automatically sync to your corresponding prospects in Pardot.

When you update email addresses either manually or with Data.com for your Salesforce contacts and leads, the following sync cycle updates the email addresses for corresponding Pardot prospects. Also, if you merge Salesforce contacts or leads and the email addresses for your primary records differ from the corresponding Pardot prospects, the following sync cycle updates email addresses for your prospects.

### What Syncs when Email Addresses are Missing in Salesforce or Pardot

If you have Salesforce contacts or leads that don't include email addresses, but then subsequently add them, the sync cycle will not create new prospects in Pardot. If, however, prospects with matching email addresses already exists in Pardot, the sync cycle will update email addresses for the matching Salesforce leads or contacts.

## Understanding Sync Options for Salesforce Person Accounts

Easily sync leads between the two systems after you assign your Pardot prospects to users.

You have two options to consider if you plan to sync Pardot accounts and Salesforce person accounts.

### If you want Pardot to

Create leads in Salesforce and sync with person accounts

By default, the connector creates Salesforce records as leads. But when leads are converted to person accounts, Pardot is unable to recognize person accounts. Pardot can't sync with person accounts. Instead, Pardot recreates leads to sync with.

If you use person accounts in Salesforce, you'll want to change this default behavior. By enabling person account syncing with lead creation, Pardot still creates records in Salesforce as leads, but when the leads are converted into person accounts, Pardot syncs with the person account and no additional Salesforce leads will be created for that prospect.

With this syncing, a Salesforce person account will sync to a Pardot prospect record that is associated with an Account in Pardot, which will not merge the two records into one view as in Salesforce. The field mapping will remain the same—contact fields will map to prospect fields and salesforce.com account level fields will map to Pardot account fields. This means that the Account Owner of a person account will sync to the Assigned User field on the account level in Pardot.

Create and sync person accounts only

Assigned prospects that have updated default field values (including the assigned owner) in Salesforce sync roughly every ten minutes, pushing the updates back to the Pardot record (because Salesforce wins in the event of a conflict in data). Updates to custom fields also sync with Salesforce, pushing those back to the Pardot record unless the option to have the Pardot value override the Salesforce value is enabled for that custom field.

Unassigned prospects in Pardot that have activities or updated records also sync if records in Salesforce use the same email address. Keep in mind that assigned prospects take higher priority for syncing than those that are unassigned in Pardot. If there are no matching email addresses in Salesforce, the prospect in Pardot will not sync until it's assigned to a user. This means that the connector will not create new records in Salesforce until the prospect is assigned in Pardot.

## Sync Leads between Pardot and Salesforce

Easily sync leads between the two systems after you assign your Pardot prospects to users.

If you already have leads in Salesforce, the connector will sync those leads to Pardot, merging the Pardot prospects and Salesforce leads between the two systems. If data in common fields between Salesforce and Pardot conflicts, including lead owner, the data from the Salesforce fields always wins. You can take advantage of this functionality when you set up custom fields in Pardot. You can also set up Pardot to send emails to prospects that appear to come from any user in Salesforce.

Sync Method	Do this
Manual	In Pardot, when you click the link <b>Synchronize with CRM</b> , prospects in Pardot and leads in Salesforce sync instantly, merging the data from Pardot with that from Salesforce.
Automatic	<p>Assigned prospects that have updated default field values (including the assigned owner) in Salesforce sync roughly every ten minutes, pushing the updates back to the Pardot record (because Salesforce wins in the event of a conflict in data). Updates to custom fields also sync with Salesforce, pushing those back to the Pardot record unless the option to have the Pardot value override the Salesforce value is enabled for that custom field.</p> <p>Unassigned prospects in Pardot that have activities or updated records also sync if records in Salesforce use the same email address. Keep in mind that assigned prospects take higher priority for syncing than those that are unassigned in Pardot. If there are no matching email addresses in Salesforce, the prospect in Pardot will not sync until it's assigned to a user. This means that the connector will not create new records in Salesforce until the prospect is assigned in Pardot.</p>

## Tracking Prospects as Salesforce Contacts

Automatically create contacts in Salesforce from your Pardot prospects.

By default, the Salesforce connector creates Salesforce leads from your prospects in Pardot. If you don't want to track your prospects as leads in Salesforce, you can have a Pardot Services member adjust the default setting so that Pardot creates contacts in Salesforce instead of leads.

If this feature is enabled on your account, Pardot will look first at your Salesforce leads to see whether there's an existing lead record with the same email address with which Pardot can sync. If there's no existing lead record, Pardot looks for an existing contact record with the same email address. If no Salesforce lead or contact exists with the same email address, Pardot will create a new Salesforce contact record.

## Tracking the Products Your Customers Buy

### Assets Overview

While products represent the items that your company sells, assets represent the specific products your customers have purchased, including a serial number, date of purchase, or any other information related to an individual sale. Depending on how your organization uses assets, they can represent a competitor product that your customer has or versions of your products.

Use assets to store specific information about the products your customers have. You can view assets on the Assets tab. Depending on your page layouts, you also can view asset related lists on your account, contact, and product page layouts.

If set up by an administrator, your customers may be eligible for support based on an asset they've purchased.

SEE ALSO:

[Getting Started with Assets](#)

[Viewing Asset Lists](#)

### Getting Started with Assets

If your organization has enabled products, assets are automatically enabled for your organization. However, administrators still need to customize their organization before users can begin using assets.

To implement assets for your organization:

- Add the Assets tab to your home page.

**Note:** By default, the Assets tab is hidden in organizations created before Spring '15. You can make the Assets tab visible to your users by changing the user profiles.

- Add the Assets related list to account, contact, and product page layouts. Users can create new assets from these related lists.
- Add the Cases related list to the appropriate product and asset page layouts.
- Add the `Asset` field to your case page layouts. Consider changing the field-level security for the `Asset` field so that it displays or is required if necessary for your business.
- By default, your users have "Read," "Create," "Edit," and "Delete" permissions on assets. If necessary, revise these permissions for your users. Without the "Read" permission on assets, users will not see any assets or asset related lists in Salesforce.
- Optionally, customize asset fields and page layouts from Setup by entering `Assets` in the `Quick Find` box, then selecting **Assets**.

## Displaying the Assets Tab

The Assets tab is where you can view and work with assets. The Asset tab is visible in organizations created after Spring '15.

By default, the Asset tab is hidden for organizations created before Spring '15, so it doesn't appear in the All Tabs page. Update the user profile to change the tab visibility.

1. From Setup, click **Administer | Manage Users | Profiles**.
2. Click **Edit** next to the user profile that you want to update.
3. In the Tab Settings list, change the setting for Assets to *Default On*.
4. Click **Save**.

Now users with the updated profile can see the Asset tab in the All Tabs page and can add the Assets tab to their home pages.

## Viewing Asset Lists

You can display a list of assets by opening the Assets tab. You also can display a list of assets by going to the Products tab and clicking a view from the Asset Views section.

To show a filtered list of items, select a predefined list from the View drop-down list, or click **Create New View** to define your own Custom view. To edit or delete any view you created, select it from the View drop-down list and click **Edit**.

- Click an asset name to view the detail. Click **Edit** or **Del** to [edit or delete the asset](#). For information on deleting assets, see [Deleting Assets](#) on page 1061.
- If Chatter is enabled, click  or  to follow or stop following an asset in your Chatter feed.

## Displaying and Editing Assets

You can display an asset from the Products tab or a related account or contact.

### Displaying Assets

Once you have located an asset from a related list, or the products home or list pages, click the name to display detailed information. If hover details are enabled, hover over any lookup field on the detail page to view key information about a record before clicking into that record's detail page.

### Viewing Asset Updates and Comments (Chatter)

Display a Chatter feed of updates, comments, and posts about the asset.

### Editing Assets

- Use inline editing to edit fields directly on the detail page. If inline editing isn't enabled, contact your administrator.
- To display the page in edit mode, click **Edit**, make your changes, and click **Save**.

### Asset Related Lists

Below the asset detail are related lists that include information about associated cases, entitlements, activities, or notes and attachments. The related lists you see are determined by your personal customization and any customization your administrator has made to page layouts. Click on individual items to display additional information about them. Click **more** at the bottom of the page or **View More** below a related list to display more items.

 **Note:** Hover over the links at the top of a detail page to display the corresponding related list and its records. If Chatter is enabled, hover links display below the feed. An interactive overlay allows you to quickly view and manage the related list items. Click a hover link to jump to the content of the related list. If hover links are not enabled, contact your Salesforce administrator.

### Printing Assets

To open a printable display of the record details, in the top-right corner of the page, click **Printable View**.

To return to the last list page you viewed, click **Back to list** at the top of the asset detail page. If your organization has enabled collapsible page sections, use the arrow icons next to the section headings to expand or collapse each section on the detail page.

You can enter person accounts in either the `Account` or `Contact` fields of an asset. The Assets related list on a person account includes all assets related to the person account, including those where the person account is in the `Contact` field.

 **Note:** Users can view an asset if they can view the account or contact listed on the asset. However, sharing settings may prevent users from viewing the account associated with the contact on the asset.

To change assets:

- "Edit" on assets

## Creating Assets

1. Click **New** on the Assets home page or on the Assets related list of an account, contact, or product. This action automatically inserts the account name, contact name or product name, depending on the record you selected when you clicked **New**.
2. To associate the asset with a product, enter the exact product name. If the product name is unique, Salesforce automatically inserts this name in the `Asset Name` field.  
If you do not know the name of the product:
  - a. Click the `Product` lookup icon if the asset is based on a product.
  - b. Enter a search filter to find a current product, and click **Go!**
  - c. Select the appropriate product. Salesforce automatically inserts the selected product name in the `Asset Name` field.
3. Enter a name for the asset.
4. Choose the account or contact for the customer who has purchased the asset.  
If necessary, you can choose both an account and a contact that are not related. The asset will display on the contact selected on the asset as well as the account selected on the asset, however, it will not display on the account of the contact. If you only choose a contact, the asset will display on both the contact and the contact's account.
5. To create an asset for a competitor's product, check `Competitor Asset`.
6. Click **Save**.

You can enter person accounts in either the `Account` or `Contact` fields of an asset. The Assets related list on a person account includes all assets related to the person account, including those where the person account is in the `Contact` field.

## Cloning Assets

Use the **Clone** button on an asset to quickly create a new asset with the same information as the selected asset. To clone an asset for your organization:

1. Click **Clone** on an existing asset.
2. Enter or change any information for the new asset.
3. Click **Save**.

 **Note:** If you have read-only access to a field, the value of that field is not carried over to the cloned record.

SEE ALSO:

[Asset Fields](#)

## Deleting Assets

Since assets are related to account and contact records, you can delete them from those records or individually using the Products tab. Before you delete an asset, review the following scenarios:

- **Is the asset associated with a case?**

Assets associated with cases cannot be deleted. This includes deleting an account or contact record that is associated with an asset listed on a case.

- **Is the asset associated with a product?**

When an asset is based on a product, deleting the product does not delete the asset.

- **Is the asset associated with an account or contact?**

If you delete an account or contact, all associated assets are also deleted and moved to the Recycle Bin.

Note that if you delete an account with a related contact that is associated with an asset, all three records are deleted. To restore all three records, restore the account record.

 **Note:** You can delete an asset individually without deleting any related record. However, if you later delete the related record, you cannot recover the asset from the Recycle Bin.

To delete an asset:

1. Locate the asset on the Assets related list of an account or contact, or on an asset list view from the Products tab.
2. Click **Del** next to the asset you want to delete.

[Assets Overview](#)

## Asset Fields

An asset has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

Field	Description
Asset Division	Division to which the asset belongs. This value is automatically inherited from the related account if any. Otherwise the value is inherited from the related contact. Available only in organizations that use divisions to segment their data.
Asset Name	Identifying name for the asset. If you select a product from the product lookup, this name is automatically populated with the product name.
Account	Account associated with the asset. Each asset must be associated with an account or contact.
Contact	Contact associated with the asset. Each asset must be associated with an account or contact. If you choose both an account and contact, they do not need to be related to each other. Contacts that are not associated with an account cannot be linked to assets.
Competitor Asset	Checkbox to indicate if the asset represents a competitor's product. Use assets to track what customers have your competitor's products using this checkbox.
Description	Text that distinguishes this asset from others.
Install Date	Date the customer installed the asset.
Owner	Individual user to which the asset is assigned. By default, the asset owner is the user who created the asset record.
Price	Amount the customer paid for the asset.
Product	The product on which the asset is based.
Purchase Date	Date the customer bought the asset.
Quantity	The number of assets purchased.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Field	Description
Serial Number	The model number on the asset.
Status	State of the asset.
Usage End Date	The date the asset expires or the last date it is under warranty. Use this field to store whatever date is appropriate for your business.

SEE ALSO:

[Creating Assets](#)

[Cloning Assets](#)

## Set Field History Tracking on Assets

Track changes to asset records by enabling field history tracking.

Use field history tracking to see information about:

- The date and time when the field was changed
- What changed
- Who made the change

To enable tracking on asset fields, from the object management settings for assets, go to the fields section and click **Set History Tracking**. See also [Tracking Field History](#) on page 911.

## Setting the Asset Owner Field

Asset records have an `Asset Owner` field, which is used to set hierarchy and sharing-based access controls. By default, the asset owner is the user who created the asset record.

As of Spring '15, the `Asset Owner` field is used for access control when the Assets object's sharing setting is *Private*, *Public Read-Only*, or *Public Read/Write*. If the Assets object's sharing setting is *Controlled by Parent*, the asset owner field has no effect on access control, because the parent account's settings control access to the asset.

In organizations created before Spring '15, you can automatically update the asset owner field on asset records when you enable the Assets object sharing preference. The sharing preference sets the value of the asset owner field to equal either:

- The user who created the asset, or
- The user who is the owner of the parent account

By default, the `Asset Owner` field is not shown in the page layout. To add the `Asset Owner` field to the page layout, from the object management settings for assets, go to Page Layouts.

1. From Setup, enter *Asset Settings* in the Quick Find box, then select **Asset Settings**.
2. Select the checkbox next to **Enable Asset Sharing**.  
The options for setting the default `Asset Owner` field display.
3. Set the `Asset Owner` to be either:

### USER PERMISSIONS

To enable sharing:

- "Manage Sharing"

To create, edit, and delete page layouts:

- "Customize Application"

- Creator of the asset
- Owner of the parent account

#### 4. Click **Save**.

The system updates the `Asset Owner` field with your selection.

To change the asset owner of an asset record, click the Assets tab and select an asset record or open the asset record from the Assets Related List on the Accounts, Contacts, or Products tabs. In the Asset Detail section, click **Change** next to the `Asset Owner` field and select a different user from the lookup menu.

#### SEE ALSO:

[Find Object Management Settings](#)

## Searching for Assets

1. Enter your search terms in the sidebar or header search box.
2. Click **Search**.
3. From the search results, click an item to open it or click **Edit**, if available.

You can also create an asset list view from the Products tab to find assets that match specific criteria.

## Enabling Sharing Rules for Assets

Sharing rules allow you to make automatic exceptions to your organization-wide sharing settings for defined sets of users. If your organization was created before Spring '15, you must enable the sharing preference so you can create and apply sharing rules on assets in your organization.

Previously, the asset object was a child object of the Accounts object, so the asset object's visibility was based on the parent object's settings. In Spring '15, the asset object was redesigned to be an individual standard object, not a child object. As a result, you can create sharing rules and apply them to asset records.

 **Note:** Sharing is enabled by default in organizations created after Spring '15, so you can skip these steps. For organizations created before Spring '15, sharing is disabled by default. If you want to use sharing rules, then you must enable the sharing preference.

1. From Setup, enter `Asset Settings` in the Quick Find box, then select **Asset Settings**.
2. Select the checkbox next to `Enable Asset Sharing`.
3. Click **Save**.  
Now you can create and apply sharing rules on assets.

## Sharing Assets

To view and manage sharing details for assets, click **Sharing** on the asset detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the asset.

Your administrator defines the default sharing model for your entire organization. You can change this model to extend sharing to more users than the default set by your administrator. However, you cannot change the sharing model to make it more restrictive than the default.

On the Sharing Detail page, you can do any of the following:

- To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.
- Click **Add** to grant access to the record for other users, groups, roles, or territories.
  -  **Note:** To share an asset with another user, that user must have access to the account associated with the asset and the "Read" permission on assets.
- Click **Expand List** to view all users that have access to the record.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level.

## Creating Asset Sharing Rules

Asset sharing rules can be based on the record owner or on other criteria, including record type and certain field values.

You can define up to 300 asset sharing rules, including up to 50 criteria-based sharing rules.

1. If you plan to include public groups in your sharing rule, confirm that the appropriate groups have been created.
2. From Setup, enter *Sharing Settings* in the `Quick Find` box, then select **Sharing Settings**.
3. In the Asset Sharing Rules related list, click **New**.
4. Enter the **Label Name** and **Rule Name**. The Label is the sharing rule label as it appears on the user interface. The Rule Name is a unique name used by the API and managed packages.
5. Enter the **Description**. This field describes the sharing rule. It is optional and can contain up to 1000 characters.
6. Select a rule type.
7. Depending on the rule type you selected, do the following:
  - **Based on record owner**—In the `owned by members of` line, specify the users whose records will be shared: select a category from the first drop-down list and a set of users from the second drop-down list (or lookup field, if your organization has over 200 queues, groups, roles, or territories).
  - **Based on criteria**—Specify the Field, Operator, and Value criteria that records must match to be included in the sharing rule. The fields available depend on the object selected, and the value is always a literal number or string. Click **Add Filter Logic...** to change the default AND relationship between each filter.

### USER PERMISSIONS

To create sharing rules:

- "Manage Sharing"

 **Note:** To use a field that's not supported by criteria-based sharing rules, you can create a workflow rule or Apex trigger to copy the value of the field into a text or numeric field, and use that field as the criterion.

8. In the **Share with** line, specify the users who should have access to the data: select a category from the first drop-down list and a set of users from the second drop-down list or lookup field.
9. Select a setting for **Asset Access**.
10. In the remaining fields, select the access settings for the records associated with the shared assets.

Access Setting	Description
Controlled by Parent	Users can view, edit, or delete an asset based on whether he or she can perform that same action on the parent object associated with the Asset object. Controlled by Parent is the default access setting.
Private (available for associated contacts, opportunities, and cases only)	Users can't view or update records, unless access is granted outside of this sharing rule.
Read Only	Users can view, but not update, records.
Read/Write	Users can view and update records.

 **Note:** Asset Access is not available when the organization-wide default for assets is set to Controlled by Parent.

11. Click **Save**.

## Tracking People Associated with Business Accounts

### Contacts Overview

Contacts are the people associated with your business accounts that you need to track in Salesforce.

Contacts are the people associated with your business accounts that you need to track in Salesforce. For each contact, you can store various kinds of information, such as phone numbers, addresses, titles, and roles in a deal.

The Contacts tab lets you quickly create and locate contacts, as well as sort and filter contacts using standard and custom list views. And you can use this tab to view and edit detailed information for each contact you have access to.

You can also enhance your traditional contact data with your customers' social information. With the Social Accounts and Contacts feature, you can see your contacts' social network profiles and

#### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

other social data directly in Salesforce. Easy access to this information helps you know your customers better, so you can solve their problems and build stronger relationships.

#### SEE ALSO:

- [Social Accounts, Contacts, and Leads](#)
- [Resolving Your Synced Contacts](#)
- [Manage Work and View Past Activity in Lightning Experience](#)
- [Send Email and Manage Templates Directly from Salesforce Records](#)

## Contacts

A contact is a person associated with one of your accounts. Most commonly, contacts are the employees at businesses you sell to. Contact records store information about people, such as a first and last name, mobile phone number, and job title. An account can have more than one contact. Contacts can also be associated with other types of records, such as opportunities.

You can delete or deactivate contact records for people who are no longer associated with your accounts. We recommend marking contacts as inactive, unless it's necessary to delete them. Marking contacts as inactive allows you to maintain a more accurate historical record.

 **Tip:** Always associate contacts with an account, unless you have a specific reason not to. Contacts without accounts are hidden from all users except their owner and system administrators, which makes them hard to find and easy to forget.

There are a few things to know about contacts.

### The Contacts Feature Can Be Renamed

Your Salesforce administrator can change the name of contacts to something that works better for your business, such as *Clients* or *Students*. However, we always refer to them as *contacts* in the Salesforce Help.

### Users Can Access Contacts on Mobile Devices

If your Salesforce administrator has turned on Salesforce1 access, your contacts are accessible to you from the full Salesforce site or the Salesforce1 mobile application.

### Contacts Can Be Linked to Social Networks

Additional information and updates about your contacts are available if your company uses the Social Accounts, Contacts, and Leads or Data.com Clean features.

## View Contact Lists

The contacts list page displays a list of contacts in your current view.

To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.

- If Chatter is enabled, click **+** or **x** to follow or stop following a contact in your Chatter feed.
- Click **New Contact** or select **Contact** from the Create New drop-down list in the sidebar to [create a contact](#).
- To [add contacts to an existing campaign](#), select the box next to one or more contacts, and then click **Add to Campaign**. Alternatively, select the box in the column header to select all displayed records, then click **Add to Campaign**.

## Working with Person Accounts

Person accounts appear in contact list views but not the Recent Contacts list on the Contacts home page.

- When you select a person account name on a contact list view, the corresponding person account appears on the Accounts tab.
- To make person accounts easy to find, create a custom list view, adding the `Is Person Account` icon as a column. Person accounts do not have contacts.

 **Note:** In most situations, you can use person accounts as if they were contacts. You can include them in all contact list views except on the contacts home page..

 **Note:** Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations can grant access to contacts beyond what the sharing model allows. See [Sharing Contacts](#) on page 1082. Contacts that are not linked to an account are always private, regardless of your organization’s sharing model. Only the owner of the contact and administrators can view it. Sharing rules and workflow rules do not apply to private contacts. If your organization uses divisions, private contacts always belong to the global division.

Available in: **All Editions** except **Database.com**

To edit accounts on contacts enabled to use a partner portal: "Edit" on contacts

AND

"Manage External Users"

---

To view person accounts:

"Read" on accounts and contacts

---

To edit person accounts:

"Edit" on accounts and contacts

---

Once you have located a contact on the Contacts home or list pages, click the contact name to display detailed information.

- Use inline editing to edit fields directly on the detail page. If inline editing isn't enabled, contact your administrator.
- To display the page in edit mode, click **Edit**, make your changes, and click **Save**.
- To save the current contact and create another one, click **Save & New**.
- To open a printable display of the record details, in the top-right corner of the page, click **Printable View**.

 **Note:** If the contact has a parent account and the organization-wide default is Controlled by Parent, you must have "Edit" access on the account to edit the contact.

## Changing the Account for Contacts

If you change the `Account Name` field:

- Cases and opportunities associated with the contact remain associated with the previous account and do not roll up to the new account.
- New cases and opportunities created for the contact are associated with the new account.

There are additional considerations for [contacts enabled for portals](#).

To change the account associated with a contact, you must meet one of these requirements:

- You have access to the contact, and you're the owner of the target account or the boss of the owner in the role hierarchy.
- You are the owner of the contact or you have access to the contact, and you have access to the target account.
- You are an administrator.

If you don't meet any of these conditions, contact your administrator to change the account associated with the contact.

## Finding Contact-Related Information (Related Lists)

Related lists, such as opportunities, display information related to a contact.

- Hover over the links at the top of a detail page to display the corresponding related list and its records. If Chatter is enabled, hover links display below the feed. An interactive overlay allows you to quickly view and manage the related list items. Click a hover link to jump to the content of the related list. If hover links are not enabled, contact your Salesforce administrator.
- If hover details are enabled, hover over any lookup field on the detail page to view key information about a record before clicking into that record's detail page.
- To directly add new items, click **New** (or the equivalent button) at the top of a related list. For example, clicking **New Case** lets you add a new case.
- To change the number of records shown for related lists, click **View More** below a related list, or click **fewer** or **more** at the bottom of the page.

### Viewing Related Lists

What related lists you see are determined by several things.

- The Salesforce edition you are using
- Whether you are using Salesforce Classic or Lightning Experience
- Whether you are viewing a business account or a person account
- Your personal customization
- Page layout customizations set by your Salesforce administrator
- Your permissions to view related data

## Self-Service for Contacts and Person Accounts

To allow a customer to access your Self-Service portal, you must enable Self-Service for the customer's contact or person account record.

 **Note:** Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

To enable Self-Service for the customer's contact or person account record:

1. If the customer is a contact, click the **Enable Self-Service** button on the contact detail page. If the customer is a person account, click the **Enable Self-Service** button on the person account detail page.
2. Verify the general information and locale settings, and enter any missing information. Note that the customer's Self-Service `username` defaults to his or her `Email`.
3. Optionally, select the `Super User` checkbox to enable the customer as a Self-Service super user who can view case information, add comments, and upload attachments for all cases submitted by anyone in his or her company.
4. Select `Generate new password and notify user immediately` to email a Self-Service username and password to the customer.

### EDITIONS

## Guidelines for Creating Contacts

Keep these tips and guidelines in mind when creating contacts.

- To create a contact that's automatically associated with an account, view the account and click **New Contact** in the task bar or **Contact** in the publisher actions list. You can also select **New** in the Contacts related list of an account.
- If your organization uses record types, you might be prompted to choose a `Record Type` when creating a contact. Different record types can have different fields and different picklist values.
- If your organization uses divisions, the division of a new contact is automatically set to the division of the related account.

 **Note:** Contacts that are not linked to an account are always private, regardless of your organization's sharing model. Only the owner of the contact and administrators can view it. Sharing rules and workflow rules do not apply to private contacts. If your organization uses divisions, private contacts always belong to the global division.

## Import Contacts from Mobile Device Contact Lists into Salesforce

Sales reps can save time and eliminate typos by using the Salesforce1 app to import contacts from mobile device contact lists into Salesforce. This feature is available only in the Salesforce1 downloadable apps.

1. In Salesforce1, navigate to where you create contacts.
2. Tap **Import from Device** to open the device's contact list.
3. Select a contact.
4. To associate the contact with an account in Salesforce, go to the contact record in Salesforce and add an account.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

When importing contacts from a mobile device, these fields are mapped from your device’s contact to the Salesforce contact.

- Email
- Home Phone
- Mailing City
- Mailing Country
- Mailing Postal Code
- Mailing State
- Mailing Street
- Mobile
- Other Phone
- Phone

 **Note:** In some situations, mappings from the local device don’t map as expected to the Salesforce1 contact record.

## Changing the Account on Contacts Enabled for Portals

### USER PERMISSIONS

To view contacts:	“Read” on contacts
To edit contacts:	“Edit” on contacts
To edit accounts on contacts enabled to use a Customer Portal:	“Edit” on contacts AND “Edit Self-Service”
To edit accounts on contacts enabled to use a partner portal:	“Edit” on contacts AND “Manage External Users”
To view person accounts:	“Read” on accounts and contacts
To edit person accounts:	“Edit” on accounts and contacts

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Keep these things in mind when you change the account on contacts enabled for a Customer Portal or partner portal.

- Portal users can access their own cases and opportunities from their previous accounts. Contacts that are [Self-Service users](#) can view on the Self-Service portal only cases that are associated with their current account. Self-Service users cannot view opportunities.
- Contacts’ portal roles are automatically updated to match the name of the account to which they are transferred (unless they’re high-volume portal users, which don’t have roles). For example, the portal role “Account A Customer User” becomes “Account B

Customer User” (because a portal role’s name includes the name of the account with which it is associated). Portal roles are unique to each account and are located under the account owner’s role in your organization’s [role hierarchy](#).

- When you transfer a partner portal user to another account:
  - Opportunities on each account are automatically recalculated through your organization’s [forecast hierarchy](#).
  - Opportunities owned by the partner portal user remain in the previous account.

This is because portal users’ roles are updated when you transfer them between accounts.

- [Delegated partner user administrators](#) and [delegated Customer Portal user administrators](#) can update portal users on accounts to which they are transferred.
- You can only transfer contacts enabled for a partner portal to [accounts that are enabled for a partner portal](#).

SEE ALSO:

- [Enabling the Customer Portal for Contacts and Person Accounts](#)
- [Self-Service for Contacts and Person Accounts](#)

## Contact Fields

A contact has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

If the contact record was added from Data.com, certain fields, as identified here, will be populated with the Data.com or Dun & Bradstreet (D&B) value, if a value is available.

Field	Description	Allows Value from Data.com or D&B
Account Name	Name of account that contact is linked to. You can enter the account name, or select the account using the lookup icon. Private contacts are those that do not have an account.	✔ (D&B)
Allow Customer Portal Self-Registration	When selected, allows contacts to self-register for access to your Customer Portal.	
Assistant	Name of assistant. Up to 40 characters are allowed in this field.	
Asst. Phone	Assistant’s phone number. Up to 40 characters are allowed in this field.	
Birthdate	Birthday. You can enter a date, or choose a date from the calendar that displays when you put your cursor in the field.	

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Field	Description	Allows Value from Data.com or D&B
Clean Status	Indicates the record's clean status as compared with Data.com. Values are: Not Compared, In Sync, Reviewed, Different, Not Found, or Inactive. This field is available to only organizations that use Data.com Prospector or Data.com Clean.	✔ (Data.com)
Contact Currency	The default currency for all currency amount fields in the contact. Amounts are displayed in the contact currency, and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.	
Contact Division	Division to which the contact belongs. This value is automatically inherited from the related account.  Available only in organizations that use divisions to segment their data.	
Contact Owner	Assigned owner of contact. Not available in Personal Edition.	
Contact Record Type	Name of the field that determines what picklist values are available for the record. Available in Enterprise, Unlimited, Performance, and Developer Editions.	
Created By	User who created the contact including creation date and time. (Read only)	
Data.com Key	The ID of the company in Data.com. When Salesforce records are compared with Data.com records (via either manual cleaning or automated clean jobs), if Data.com finds a match, the two records are linked by this field's numeric value.	✔ (Data.com)
Department	Associated business or organizational unit. Up to 80 characters are allowed in this field.	
Description	Description of contact. Up to 32 KB of data are allowed in this field. Only the first 255 characters display in reports.	
Do Not Call	Indicates that the contact does not want to be contacted by phone. If you use Data.com, the Phone field value will be masked out in search results and on the Contact Card,	

Field	Description	Allows Value from Data.com or D&B
	and it will be blank in .csv files created when you export records.	
Email	<p>Email address. Must be a valid email address in the form: jsmith@acme.com. Up to 80 characters are allowed in this field.</p> <p>Click the email address in this field to send an email using your personal email application. This type of email is not logged as an activity on the contact record.</p> <p>If the Gmail Buttons and Links feature is enabled, you can click the Gmail link next to the field to send an email from your Gmail account.</p>	✔ (Data.com)
Email Opt Out	Indicates that the contact does not want to receive email. If you use Data.com, the Email field value will be masked out in search results and on the Contact Card, and it will be blank in .csv files created when you export records.	
Fax	Contact's fax number. Up to 40 characters are allowed in this field.	✔ (Data.com)
Fax Opt Out	Indicates if the person has requested not to be included in broadcast faxes.	
First Name	First name of the contact, as displayed on the contact edit page. Up to 40 characters are allowed in this field.	✔ (Data.com)
First Name (Local)	First name of the contact translated into the local language.	
Home Phone	Person's home phone number. Up to 40 characters are allowed in this field.	
Last Name	Last name of the contact, as displayed on the contact edit page. Up to 80 characters are allowed in this field.	✔ (Data.com)
Last Name (Local)	Last name of the contact translated into the local language.	
Last Stay-in-Touch Request Date	The date that the most recent Stay-in-Touch request was sent.	
Last Stay-in-Touch Save Date	The date that the most recent Stay-in-Touch request was returned and merged.	

Field	Description	Allows Value from Data.com or D&B
Lead Source	Record source, for example, Advertisement, Partner, or Web. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (Data.com)
Mailing City	City portion of mailing address. Up to 40 characters are allowed in this field.	✔ (Data.com)
Mailing Country	The mailing country for the address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✔ (Data.com)
Mailing State/Province	The mailing state or province for the address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✔ (Data.com)
Mailing Street	Street mailing address. Up to 255 characters are allowed in this field.	✔ (Data.com)
Mailing Zip/Postal Code	Zip or postal code portion of mailing address. Up to 20 characters are allowed in this field.	✔ (Data.com)
Middle Name	<p>Middle name of the contact, as displayed on the contact edit page. Up to 40 characters are allowed for this field.</p> <p> <b>Note:</b> To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select <b>User Interface</b>. Then select <b>Enable Middle Names for Person Names</b>.</p>	
Middle Name (Local)	<p>Middle name of the contact translated into the local language.</p> <p> <b>Note:</b> To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select <b>User Interface</b>. Then select <b>Enable Middle Names for Person Names</b>.</p>	

Field	Description	Allows Value from Data.com or D&B
Mobile	Cellular or mobile phone number. Up to 40 characters are allowed in this field.	
Modified By	User who last changed the contact fields, including modification date and time. This does not track changes made to any of the related list items on the contact. (Read only)	
Name	Combined first name, middle name (beta), last name, and suffix (beta) of contact, as displayed on the contact detail page.	✔ (Data.com)
Other City	City portion of additional address. Up to 40 characters are allowed in this field.	
Other Country	Another country for the address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	
Other State/Province	Another state or province for the address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	
Other Street	Street address portion of additional address. Up to 255 characters are allowed in this field.	
Other Zip/Postal Code	Zip or postal code portion of additional address. Up to 20 characters are allowed in this field.	
Other Phone	Additional phone number listing. Up to 40 characters are allowed in this field.	
Phone	Contact's primary phone number. Up to 40 characters are allowed in this field.	✔ (Data.com)
Reports To	Name of contact's manager. You can enter an existing contact name, or select the contact using the lookup icon.	
Salutation	Title for addressing the person, for example, Mr., Ms., Dr., or Prof. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	

Field	Description	Allows Value from Data.com or D&B
Suffix	<p>Name suffix of the contact, as displayed on the contact edit page. Up to 40 characters are allowed for this field.</p> <p> <b>Note:</b> To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select <b>User Interface</b>. Then select <b>Enable Middle Names for Person Names</b>.</p>	
Title	<p>Person's position within his or her organization. Up to 80 characters are allowed in this field.</p>	 (Data.com)
Custom Links	<p>Listing of custom links for contacts as set up by your administrator.</p>	
Username	<p>For Self-Service contacts only. The <code>Username</code> defaults to the <code>Email</code>. The contact must enter their username when logging in to the Self-Service portal.</p> <p> <b>Note:</b> Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.</p>

[Guidelines for Creating Contacts](#)

## Displaying Contact Hierarchy

To display an organization chart, enter the name of the contact's manager in the `Reports To` field for each contact in the account. Then, click the **[View Org Chart]** link on any contact in the account. Salesforce displays an organization chart showing the contact hierarchy with the direct reports for each contact you entered.

 **Note:** To maintain a complete organization chart, make sure every contact in an account contains another contact in the `Reports To` field. The only exception to this is the contact at the very top of the organization chart. If only one contact in an account reports to no one, that account will have a single organization chart for the entire account.

Because of its flexibility, this feature will not prevent you from selecting `Reports To` contacts from other accounts.

[Contacts](#)

### EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

### USER PERMISSIONS

To view org chart:

- "Read" on contacts

To change org chart:

- "Edit" on contacts

## Merging Duplicate Contacts

Duplicate contacts can be merged if they're associated with the same account.

To merge duplicate contacts:

1. From the Contacts related list of an account, click **Merge Contacts**.
2. Check the rows of up to three contacts you want to merge. You can search the list of associated contacts to shorten the list, or click **All Contacts** to view the full list of associated contacts. Click **Next** to continue.
3. Select one contact as the Master Record. Any data in hidden or read-only fields will be taken from the Master Record. However, administrators and users with the "Edit Read Only Fields" permission can manually select which read-only fields to retain. Note that hidden fields are not displayed.
4. Select the partner portal or Customer Portal user you want to retain.  
This option is available only if a [partner portal](#) or [Customer Portal](#) is enabled for your organization.  
You can select `Not a portal user` so that a merged contact does not include a portal user.
5. Select the fields that you want to retain from each record.  
When there is conflicting data, the fields in the left column are preselected and the row is marked in purple.
6. Click the **Merge** button to complete the merge.

### Tips for Merging Contacts

Consider the following when merging contacts:

- Any related items from any of the duplicate contacts, such as opportunity or case information, will be associated with the merged contact.
- If you are merging duplicate contacts that are members of different [campaigns](#), the `campaign Member Status Updated` date for each contact is retained and associated with the newly merged contact.
- Before merging contacts that both have active Self-Service usernames, deactivate one Self-Service username. The merged record will adopt the active Self-Service username. For more information on the Self-Service username field, see [Contact Fields](#) on page 1073.
- Any account sharing and manual sharing for the master contact are applied to the newly merged contact.
- When you merge contacts that have `Reports To` relationships, the newly merged contact retains the `Reports To` field from the selected Master Record.
- All discarded duplicate records are moved to the Recycle Bin.
- The newly merged contact displays the `Created By` date from the oldest contact you are merging, and shows the merge date as the `Modified By` date.
- In organizations that use divisions, the merged contact is assigned to the division of the related account.
- Merging contacts is not tracked in the setup audit trail.
- You can delete a contact if you are an administrator, the contact owner, or a user above the contact owner in the organization role hierarchy, and if you have the appropriate user permission.
- The newly merged contact is automatically included on any case teams in which the contacts were associated.

#### EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Customer Portal is available in: **Enterprise, Performance, Unlimited, and Developer Editions**

Partner Portal is available in: **Enterprise, Performance, and Unlimited Editions**

#### USER PERMISSIONS

To merge contacts:

- "Delete" on contacts

To merge Customer Portal enabled contacts:

- "Delete" on contacts

AND

"Edit Self-Service Users"

To merge partner portal enabled contacts:

- "Delete" on contacts

AND

"Manage Partners"

- The master contact replaces the duplicate contacts in all the requested meetings they were invited to. Also, all meeting messages written by the duplicate contacts are automatically associated with the master contact. (Meeting messages appear on the requested meeting's Web page and are visible to all invitees.)
- The master contact replaces the duplicate contacts in all the scheduled meetings they were invited to. However, make sure to edit the event detail page and click **Add to Invitees** to add the new master contact to the meeting invitee list.

## Merging Contacts Associated with Portal Users

You can merge contacts associated with portal users under some conditions.

When you merge contacts associated with portal users, see the information in [Merging Duplicate Contacts](#) on page 1080 and note these additional considerations:

- Review the information in [Tips for Merging Contacts](#), which also applies to merging contacts associated with portal users.
- You can merge a portal contact record with another portal contact. For example, you can merge contacts enabled to use:
  - A partner portal or Customer Portal.
  - A partner portal *with* contacts enabled to use a Customer Portal or vice-versa.
  - A partner portal or Customer Portal with contacts that are *not* enabled to use a portal.
- When you merge contacts that include partner portal *and* Customer Portal users, you must choose which type of portal user to retain. The portal user you do not retain is [disabled](#). However, after the contacts are merged, you can enable the contact for access to the portal from which you removed during the merge process.
- To merge contacts associated with various accounts:
  1. [Transfer the contacts you want to merge into one account.](#)
  2. [Merge the contacts associated with the common account.](#)
- Portal users who are disabled during the merge process retain ownership of any records in which they are the owner. For example, if a portal user owns a case, and the portal user is disabled, he or she remains the owner of the case until the case is updated with a new owner.

### EDITIONS

To merge Customer Portal enabled contacts:

- "Delete" on contacts

AND

"Edit Self-Service Users"

To merge partner portal enabled contacts:

- "Delete" on contacts

AND

"Manage Partners"

## Sharing Contacts

You can share your own contacts individually. Use manual contact sharing to *increase* access to your contacts. You cannot restrict access to contacts beyond your organization's default access levels.

To view and manage sharing details, click **Sharing** on the contact detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the contact. The **Sharing** button is not available when the organization-wide default for contacts is Controlled by Parent.

On this page, you can do any of the following:

- To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
- Click **Add** to grant access to the record for other users, groups, roles, or territories.
- Click **Expand List** to view all users that have access to the record.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

## Contact Sharing Considerations

- You cannot manually share a private contact (a contact without an account).
- Make sure you are sharing records with users who have the appropriate "Read" object permission for viewing the shared records.
- If you have permission to share an account, Salesforce automatically provides "Read" access to the associated account when granting sharing access to a contact if the recipient does not already have it. If a recipient does not have access to the account, you cannot share the contact unless you also have permission to share the account.
- If your organization-wide default for contacts is set to Controlled by Parent, the `Contact Access` options are not available when sharing related records like accounts; instead, all access to contacts is determined by the user's access to the contact's account.
- If your organization-wide default for contacts is Controlled by Parent and your organization-wide default for accounts is Private, you can't view contacts for accounts you don't own even if you have the View All permission on the account object. However, if you own a contact on an account, you can view other contacts on the same account since access to a parent account always gives you access to the associated child records.
- Contact sharing is not available for organizations that have territory management or person accounts.
  - If your organization already has person accounts enabled, the organization-wide default for contacts is set to Controlled by Parent and is not editable.
  - If your organization does not have person accounts yet you want to enable one of them, set your organization-wide default for contacts to Controlled by Parent, which removes all your contact sharing rules and manual shares to contacts.

[Contacts](#)

## Stay-in-Touch Requests

To quickly and easily request updated contact information from your contacts and person accounts, send a Stay-in-Touch request.

You can request updates from:

- Contacts you own
- Contacts associated with accounts you own
- Contacts you can edit due to a sharing rule or manual record sharing
- Person accounts you own

 **Note:** The record must have a valid email address.

### How it Works

1. On the detail page of a contact or person account, click **Request Update** either at the top of the page or in the Activity History related list.
2. An outgoing email is created according to your personal Stay-in-Touch settings. As needed, edit the details of the email. If Spell Checker is enabled for your organization, click **Check Spelling** to check the spelling of the message. Spell Checker does not support all the languages that Salesforce supports. For example, Spell Checker doesn't support Thai, Russian, and double-byte languages, such as Japanese, Korean, or Chinese. Click **Send** to send the email.
3. The recipient receives the email and clicks a link to either provide updates or confirm no changes are necessary.
4. You receive an email notification. Click the link in the email to update, review, and accept or reject the new information.

 **Note:** To send individual Stay-in-Touch requests, you must have the "Send Email" permission. You can send individual Stay-in-Touch requests regardless of the recipient's `Email Opt Out` setting.

SEE ALSO:

[Merging Updated Contact Information](#)

[Mass Stay-in-Touch Update](#)

### Merging Updated Contact Information

When someone responds to a Stay-in-Touch request, you will receive an email that contains a link.

To merge the new information into Salesforce:

1. Click **Update Now** from the email you receive.
2. Review the new and original values.
3. Click **Accept Changes** to save the new data. Click **Reject Changes** to ignore the updates and retain the original values.

 **Note:** These updates do not trigger workflow rules.

[Stay-in-Touch Requests](#)

[Edit Stay-in-Touch Settings](#)

#### EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

#### USER PERMISSIONS

To request updates:

- "Send Stay-in-Touch Requests"

## Mass Stay-in-Touch Update

Use the Mass Stay-in-Touch wizard to request updated contact information from multiple contacts and person accounts simultaneously.

To send a mass Stay-in-Touch email:

1. On the contacts home page, click **Mass Stay-in-Touch** from the Tools section.  
If your organization uses person accounts, the link also appears on the accounts home page.
2. Select a list view of contacts and person accounts from whom you are requesting updated information. You can also edit existing list views and create new list views.
3. Click **Go**.
4. Select the individuals to whom the request will be sent. Note that records which lack email addresses cannot be selected. Click **Next** to continue.
5. Review the email to be sent and click **Send**.

Recipients can reply to you via email with their latest information. You can merge these updates as you receive them.

 **Note:** Records in which the `Email Opt Out` box is checked do not appear in the list view, because you cannot send mass emails to them.

SEE ALSO:

[Stay-in-Touch Requests](#)

[Edit Stay-in-Touch Settings](#)

## Deleting Contacts

Most contacts can be deleted in one click if you have the right permissions.

 **Important:** If you can delete a contact, you will see **Delete** as an option on the contact's detail page and on its row on the contact list page in both Salesforce Classic and Lightning Experience. If you don't see the delete option, you don't have permission to delete the contact. Ask your Salesforce administrator for help.

When you delete a contact, all related assets, campaign history, events, tasks, notes, and attachments are also deleted. You do not need the "Delete" permission on any associated records that are included in the deletion. Associated opportunities, accounts, entitlements, and cases are not deleted with the contact. The deleted contact is moved to the Recycle Bin. If you undelete the contact, any related items are also restored including any inactive Self-Service username.

You cannot delete contacts that have associated:

- Cases
- Contracts
- Service contracts
- Partner user
- Assets with cases
- An active Self-Service user
- An active Customer Portal user

### EDITIONS

Available in: Salesforce Classic

Available in: **All** Editions except **Database.com**

### USER PERMISSIONS

To send mass Stay-in-Touch updates:

- "Send Email"
- AND
- "Send Stay-in-Touch Requests"

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** Editions except **Database.com**

### USER PERMISSIONS

To delete contacts:

- "Delete" on contacts

 **Note:** You can delete a contact if you are an administrator, the contact owner, or a user above the contact owner in the organization role hierarchy, and if you have the appropriate user permission. If you delete or remove an activity's primary contact, another contact becomes the primary contact in its place. You can edit the activity to manually select another primary contact.

[Merging Duplicate Contacts](#)

## Defining Roles that Your Contacts Play

### Contact Role Overview

A contact role defines the part that a contact or person account plays in a specific account, case, contract, or opportunity.

For example, Tom Jones might be the Decision Maker for the opportunity, and Mary Smith might be the Evaluator. You can assign a contact role to any contact or person account that affects your account, case, contract, or opportunity. Contacts and person accounts can have different contact roles on various accounts, cases, contracts, or opportunities.

The Contact Roles related list of an account, case, contract, or opportunity displays the roles that each contact or person account plays in that record. On person account detail pages, the Opportunity Contact Roles related list displays the opportunities on which the person account is listed in the `Account Name` field of the opportunity.

 **Note:** Users must have the appropriate user permissions and sharing access to view the contact information for any person listed in the appropriate contact roles related lists.

Available in: **All Editions** except **Database.com**

## Add Contact Roles in Salesforce Lightning Experience

Add contact roles to opportunities to indicate the part each contact plays in your sales process.

To assign a contact role on an opportunity:

1. Click **Add Contact Role** in the Contact Roles related list of an opportunity.
2. To select a contact, click the Contact field. Optionally, click **New** to create a new contact.  
When you add or edit contact roles on an opportunity that is associated with a business account, the page automatically displays the contacts for that business account.
3. Choose a role. If you don't select a role or the role is set to `None`, the contact is still added to the opportunity.
4. Optionally, select `Primary` to set the contact as primary for the opportunity. If the opportunity already has a primary contact, that contact will no longer be the primary.
5. Click **Save**.

When you create an opportunity from a contact detail page, you can assign the contact a role on the opportunity, and optionally assign the contact as the primary.

## Add Contact Roles in Salesforce Classic

Add contact roles to accounts, cases, contracts, or opportunities to indicate the part each contact plays in your sales or support process.

To assign a contact role to a contact or person account:

1. Click **New** in the Contact Roles related list of an account, case, contract, or opportunity.
2. Click the lookup icon to select a contact or person account. Optionally, click **New** to create a new contact.  
When you add or edit contact roles on an opportunity that is associated with a business account, the page automatically displays the contacts for that business account. If the business account has more than 50 contacts, the contacts are not automatically displayed, and you must use the lookup icon to select a contact.
3. Choose a role. If you don't select a role or the role is set to `None`, any changes you make to this record won't be saved.
4. Optionally, select `Primary` to set the contact or person account as primary for the account, contract, or opportunity.

 **Note:** On case contact roles, the `Primary` option is not available. The primary contact on a case is always the contact listed under `Contact Name` in the Case Detail section.

5. Click **Save**.

When you create an opportunity from a contact detail page, that contact automatically becomes the primary contact on the opportunity. However, a contact role is not automatically assigned.

 **Tip:** Adding person accounts in contact roles on accounts is available but not recommended. As a best practice, we recommend using the Partners related list to associate person accounts with other accounts.

### EDITIONS

## View and Edit Contact Roles in Salesforce Classic

View or make changes to the part that a contact or person account plays in a specific account, case, contract, or opportunity.

The Contact Roles related list of an account, case, contract, or opportunity displays the roles that each contact or person account plays in that record. On person account detail pages, the Opportunity Contact Roles related list displays the opportunities on which the person account is listed in the `Account Name` field of the opportunity.

- To add a contact role for the account, case, contract, or opportunity, click **New** in the Contact Roles related list. See [Add Contact Roles](#) on page 1085.
- To send an email to all contact roles on a case, click **Send an Email** in the Contact Roles related list. See [Sending Email](#) on page 1519. If a contact role does not have an email address specified on his or her contact record, the contact is not included in the email.
- To update a contact role, click **Edit** next to a contact role. Click **Save** when you have finished making changes.
- To mark a contact or person account as primary on the account, contract, or opportunity, click **Edit** next to the contact role entry, and select the `Primary` option.

**Note:** On case contact roles, the `Primary` option is not available. The primary contact on a case is always the contact listed under `Contact Name` in the Case Detail section.

- To delete a contact role, click **Del** next to the contact role you want to delete.
- To create an opportunity related to a person account, click **New** in the Opportunity Contact Roles related list on a person account.

## View and Edit Contact Roles in Salesforce Lightning Experience

View or change the part that a contact plays in an opportunity.

The Contact Roles related list of an opportunity displays the roles that each contact plays in that record.

- To add a contact role for an opportunity, click **Add Contact Role** in the Contact Roles related list. See [Add Contact Roles](#) on page 1085.
- To update a contact role, click **Edit** next to a contact role. Click **Save** when you have finished.
- To mark a contact as primary on the opportunity, click **Edit** next to the contact role entry, and select the `Primary` option. If the opportunity already has a primary contact, that contact will no longer be the primary.
- To delete a contact role, click **Delete** next to the contact role you want to delete.

## Contact Role Fields

A contact role defines the part that a contact or person account plays in a specific account, case, contract, or opportunity.

A contact role has the following fields, listed in alphabetical order.

Field	Description
Contact	Name of contact or person account. You can use the lookup icon to either select someone or create a contact.
Primary	Option that specifies the contact or person account as primary for the record.  Note that on case contact roles, the <code>Primary</code> option is not available. The primary contact on a case is always the contact listed under <code>Contact Name</code> in the Case Detail section.
Role	Participating role in the account, case, contract, or opportunity, for example, Buyer, Decision

## Cultivating High Net Worth Customers for Financial Services

### Salesforce for Wealth Management Overview

#### What Is Salesforce for Wealth Management?

Salesforce for Wealth Management is an industry solution that is designed and customized for the wealth management industry.

#### Who Should Use Salesforce for Wealth Management?

Salesforce for Wealth Management is intended for wealth management professionals who advise high net worth clients. It allows you to build deeper customer relationships, integrate key systems to drive user adoption, and effectively support compliance processes.

#### How Do I Obtain Salesforce for Wealth Management?

Salesforce for Wealth Management is available for free on AppExchange for Enterprise, Unlimited, and Performance Editions. It includes all generally available Enterprise, Unlimited, and Performance Edition features such as Outlook integration, workflow, and the Force.com API. As a prerequisite, it requires [person accounts](#), which are enhanced account records designed for business-to-consumer industries such as financial services.

#### What Does Salesforce for Wealth Management Include?

Salesforce for Wealth Management contains the following components that set it apart from standard Salesforce functionality:

- Easy-to-use tabs with client-oriented fields
- Comprehensive client information including financial accounts, investment preferences, addresses, and personal interests
- Comprehensive “Know Your Client” suitability forms with an automated approval process
- Reports and dashboards specific to the wealth management process
- Relationship groups (also known as households)

[Navigating the Salesforce for Wealth Management App](#)

## Get Started With Salesforce for Wealth Management

As an administrator, perform the following tasks to set up Salesforce for Wealth Management for your organization:

### Verify the Contents of the Salesforce for Wealth Management App

Verify that the Salesforce for Wealth Management custom app contains the correct tabs:

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. In the list, click *Salesforce for Wealth Management*.
3. Verify that the following tabs are present in the Included Tabs list:
  - Home
  - Accounts
  - Financial Accounts
  - Holdings
  - WM Assets
  - Client Interests
  - Know Your Clients
  - Reports
  - Dashboards
  - Documents
  - Console
4. If necessary, click **Edit** and choose the appropriate tabs to add or remove.

### Configure Users' App Choices

In addition to the main Salesforce for Wealth Management custom app, the following custom apps are also available in the Force.com app menu:

- Salesforce Financial Accounts & Holdings
- Salesforce Clients and Interests
- Salesforce Know Your Client

Optionally, you can hide these apps from users in the Force.com app menu, because all appropriate tabs are already consolidated in the main Salesforce for Wealth Management custom app. To hide these apps:

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. Click **Edit** next to the appropriate app name.
3. In the *Assign to Profiles* area, deselect the checkboxes in the *Visible* column that correspond to end users' profiles. Select only the checkboxes that correspond to administrator profiles.
4. Click **Save**.
5. Repeat this procedure as necessary for the remaining custom apps listed above.

#### USER PERMISSIONS

To view the setup options for custom apps:

- "View Setup and Configuration"

To manage custom apps:

- "Customize Application"

## Verify Record Types

From the object management settings for person accounts, go to Record Types to verify that the following record types are available for person accounts (clients).

### Individual

This record type is for clients and prospective clients. It should be assigned to the `Individual` page layout.

### Professional Relationship

This record type is for lawyers, accountants, and other professional relationships. It should be assigned to the `Professional Relationship` page layout.

## Configure Users' Page Layouts

Ensure that the following components are included in users' page layouts, which can be configured from the management settings for each object by going to Page Layouts.

### Home Tab Page Layouts

The home page layout for financial advisors, titled FA Home Page, should include the following components:

- Items To Approve
- Tasks
- Calendar
- Dashboard Snapshot
- Search
- Create New
- Recent Items
- Messages & Alerts
- Custom Links

### Person Accounts Page Layout

The page layouts for person accounts (clients) should include the following related lists:

- Financial Accounts
- Holdings
- Client Interests
- Know Your Client
- Open Activities
- Activity History
- Partners
- Account Team
- Notes & Attachments

## Verifying the Know Your Client Approval Process

Salesforce for Wealth Management includes an approval process that routes Know Your Client forms to the appropriate Salesforce users for approval.

## Managing the Know Your Client Approval Process

### About the Know Your Client Approval Process

An approval process is an automated process your organization can use to approve records in Salesforce. An approval process specifies the steps necessary for a record to be approved and who must approve it at each step. A step can apply to all records included in the process, or just records that meet certain administrator-defined criteria. An approval process also specifies the actions to take when a record is approved, rejected, recalled, or first submitted for approval.

The Know Your Client approval process is included in Salesforce for Wealth Management and has the following general definition:

1. A financial advisor creates a new Know Your Client record.

**Note:** Data from a saved Know Your Client record can be merged into a printable Microsoft Word document using the provided mail merge template.

2. A financial advisor submits the Know Your Client record for approval, which sets the following actions in motion:
  - The Know Your Client record is locked and cannot be edited
  - `KYC Approval Status` becomes "Pending Approval"
  - `Date Know Your Client Submitted` becomes today
  - Know Your Client record type becomes "KYC Submitted"
  - An approval request is routed to the appropriate Salesforce user for review, and he or she is also sent an email notification using the appropriate email template
3. The lead financial advisor approves or rejects the approval request, which causes the following actions:
  - The record continues to be locked and cannot be edited
  - `KYC Approval Status` becomes "Approved" or "Rejected"
  - `Date KYC Approved/Rejected` becomes today
  - If the record was approved, a follow-up task is scheduled for the financial advisor to review the Know Your Client form in six months

### USER PERMISSIONS

To create, edit, delete, or clone approval processes:

- "Customize Application"

To view approval processes:

- "View Setup and Configuration"

### Activating the Know Your Client Approval Process

To activate the Know Your client approval process:

1. From Setup, enter `Approval Processes` in the `Quick Find` box, then select **Approval Processes**.

- In the Manage Approval Processes For drop-down list, select “Know Your Client.”
- Click **Activate** next to the approval process name.

## Navigating the Salesforce for Wealth Management App

To access the Salesforce for Wealth Management app, go to the Force.com app menu in the top right corner of any Salesforce page and select Salesforce for Wealth Management. To get started on any task, just click the tab you want.

SEE ALSO:

- [Salesforce for Wealth Management Overview](#)
- [Managing Wealth Management Clients](#)

## Managing Wealth Management Clients

Clients are exclusively available in Salesforce for Wealth Management. A client is a person who you advise or do business with, a prospect who you potentially will do business with, or a professional relationship such as an accountant or lawyer. You can manage your clients on the Clients tab. In standard Salesforce terminology, clients are called “accounts.” However, Salesforce for Wealth Management uses the term “clients.”

Clients have all of the standard capabilities of account records.

In addition, the special capabilities of clients are as follows:

### Client Record Types

Record types are categories that allow you to organize your records. You can assign client records to the following record types:

- “Business” specifies a corporate entity or trust
- “Individual” specifies an existing or prospective client
- “Professional Relationship” specifies an accountant, lawyer, or other professional relationship

### Client List Views

On the Clients tab, you can use [list views](#) to conveniently access different sets of clients. For example, select “My A Clients” to view a list of your clients who have an “A” rating.

### Client Details

The client detail page includes groups of fields tailored to wealth management clients. For example, one section tracks a client's preferences in several categories — you can specify that a client is interested in vacation homes, mid-cap stocks, the retail and entertainment sectors, golf, and US politics.

### Financial Accounts Related List

The Financial Accounts related list provides an overview of the client's financial accounts, such as account names, account numbers, and current values. This information comes from the records on the Financial Accounts tab.

### USER PERMISSIONS

To view the Clients tab:

- “Read” on accounts

To view clients:

- “Read” on accounts

To create clients:

- “Create” on accounts and contacts

**Holdings Related List**

The Holdings related list provides an overview of the client's owned assets such as funds, stocks, and bonds. For each holding you can see values such as market value, last price, purchase price, and number of shares. This information comes from the records on the Holdings tab. Note that each holding is associated with a financial account record.

**Client Interests Related List**

The Client Interests related list provides an overview of the securities that the client is interested in buying or selling. This information comes from the records on the Client Interests tab.

**Know Your Clients Related List**

The Know Your Clients related list provides an overview of the Know Your Client forms that are associated with the client. This information comes from the records on the Know Your Clients tab.

**Relationships Related List**

A relationship refers to a client who has a role in the life of another client, such as a spouse, child, accountant, or attorney. Relationships are tracked in the Relationships related list on the client detail page, which is available as an option. In standard Salesforce terminology, relationships are called "[partners](#)." However, Salesforce for Wealth Management uses the term "relationships."

**Client Team Related List**

The Client Team related list tracks the financial advisors and other Salesforce users who are involved in the management of a particular client. In standard Salesforce terminology, client teams are called "[account teams](#)." However, Salesforce for Wealth Management uses the term "client teams."

**Relationship Group Members Related List**

The Relationship Group Members related list displays the relationship groups of which the client is a member. It is available as an option and is called "Household Members" in some organizations.

## SEE ALSO:

## Salesforce for Wealth Management Reports and Dashboards

### Salesforce for Wealth Management Reports

Salesforce for Wealth Management offers industry-specific reports, which are grouped in the following folders on the Reports tab:

- Client Reports
- Client Interest Reports
- Financial Account Reports
- Holdings and WM Asset Reports
- Know Your Client Reports

To access these reports, select the appropriate folder from the drop-down list on the Reports tab, then click the appropriate report name.

### Salesforce for Wealth Management Dashboards

Salesforce for Wealth Management offers industry-specific dashboards, such as a dashboard of financial accounts that allows you to analyze your book of business. To access these dashboards, go to the Dashboards tab and select the appropriate dashboard name from the drop-down list.

**USER PERMISSIONS**

To run reports:

- "Run Reports"

AND

"Read" on the records included in reports

To view dashboards:

- "Run Reports"

AND

Access to view dashboard folders

 **Note:** You can see a dashboard snapshot on the Home tab.

## Establishing Relationship Groups of Your Customers

### Relationship Groups Overview

#### What Are Relationship Groups?

Relationship groups are custom object records used to store collections of [accounts](#). For example, you can use relationship groups to manage the following:

- A household of people who reside at the same address
- An extended family consisting of multiple generations of relatives
- A professional group such as a medical practice or a law firm
- The trustees and beneficiaries of a trust

The accounts that you add to relationship groups are called *relationship group members*. For more information, see [About Relationship Group Members](#) on page 1097.

#### Who Can Use Relationship Groups?

 **Note:** Relationship groups are only available upon request to [Salesforce for Wealth Management](#) customers. Note that the Relationship Groups tab may be named “Households” in Salesforce for Wealth Management organizations. To enable relationship groups, contact your Salesforce representative.

Your organization must have implemented [person accounts](#) before you can use relationship groups.

Your administrator can enable relationship groups by installing the Relationship Groups custom app.

#### What Are the Benefits of Relationship Groups?

Relationship groups allow you to:

- Track the familial and professional roles of different relationship group members
- Assign primary and secondary designations to the two most important members of a relationship group
- View roll-up related lists of all [activities](#) for the members of a relationship group

#### EDITIONS

Available in: Salesforce Classic

Available in: Salesforce for Wealth Management

#### USER PERMISSIONS

To create or edit relationship groups and relationship group members via the wizard:

- “Create” and “Edit” on relationship groups
- AND
- “Create” and “Edit” on relationship group members
- AND
- “Read” on accounts

To delete relationship groups:

- “Delete” on relationship groups

To remove relationship group members:

- “Delete” on relationship group members

- View roll-up related lists of the custom objects that are related to the accounts in a relationship group

## SEE ALSO:

[Using Relationship Groups](#)

[Relationship Group Considerations](#)

## Relationship Group Fields

A relationship group custom object has the following default fields, listed in alphabetical order.

Name	Description
Description	A text description of the relationship group. Up to 255 characters are allowed.
Primary Name	The name of the primary <a href="#">relationship group member</a> .
Secondary Name	The name of the secondary <a href="#">relationship group member</a> .
Total Members	The total number of members in the relationship group.

## EDITIONS

Available in: Salesforce Classic

Available in: Salesforce for Wealth Management

To add custom fields to relationship groups, from the object management settings for relationship groups, go to the fields area, then click **New** in the Custom Fields & Relationships section.

## SEE ALSO:

[Using Relationship Groups](#)

## About Relationship Group Members

 **Note:** Relationship groups are only available upon request to [Salesforce for Wealth Management](#) customers. Note that the Relationship Groups tab may be named “Households” in Salesforce for Wealth Management organizations. To enable relationship groups, contact your Salesforce representative.

### What Are Relationship Group Members?

The accounts that you add to relationship groups are called *relationship group members*. Like relationship groups, relationship group members are custom objects. Each relationship group member record represents an association between an account and a relationship group. For example, if you add the account “Mary Smith” to the relationship group “Smith Family,” a relationship group member record is created that links Mary Smith to the Smith Family.

Relationship group members are unique because they have two master-detail relationships: one with accounts and another with relationship groups. When discussing these master-detail relationships, accounts and relationship groups are sometimes referred to as the “parents” of relationship group members.

### What Are the Limits on Relationship Group Members?

You can add a given account to up to 200 relationship groups. For example, an account “Joseph Brown” who is an attorney may be a member of several relationship groups—in some cases as an attorney, in other cases as a family member.

You can add up to 20 accounts to a particular relationship group. For example, a relationship group that represents a large extended family including grandparents, children, and grandchildren cannot have more than 20 relationship group members.

In a particular relationship group, you can specify only one relationship group member as primary, and only one relationship group member as secondary. In addition, you cannot add the same account more than once to a particular relationship group.

### Where Can I View Relationship Group Members?

The Relationship Group Members related list displays on both the relationship group detail page and the account detail page. On the relationship group detail page, the related list summarizes the accounts that are members of the given relationship group. On the account detail page, the related list summarizes the relationship groups of which the given account is a member.

### Relationship Group Member Fields

Relationship group members have the following fields.

Field Name	Description
Account	The name of the account.
Role	The familial, professional, or other role that an account has in a relationship group - for example, Client, Spouse, Child, Attorney, or Accountant. Your administrator defines the available values in this picklist.

### EDITIONS

Available in: Salesforce Classic

Available in: Salesforce for Wealth Management

### USER PERMISSIONS

To create or edit relationship groups and relationship group members via the wizard:

- “Create” and “Edit” on relationship groups
- AND
- “Create” and “Edit” on relationship group members
- AND
- “Read” on accounts

To delete relationship groups:

- “Delete” on relationship groups

To remove relationship group members:

- “Delete” on relationship group members

Field Name	Description
Primary	Designates an account as the most important member of the relationship group. Only one relationship group member can be specified as primary.
Secondary	Designates an account as the second-most important member of the relationship group. Only one relationship group member can be specified as secondary.
Include in Roll-up	Specifies whether the activities and custom objects of an account display in related lists on the relationship group detail page.
Priority	Does not display in the relationship group wizard, but is available as a column in the Relationship Group Members related list on account and relationship group detail pages. This column displays the primary (👤) or secondary (👥) icon as appropriate next to account names.
Unique Key	This is a system field that prevents duplicate records. It does not display to users in Salesforce but is visible in the Force.com API. This field should be treated as read only; attempts to modify it through the API will be ignored.

 **Note:** When you merge accounts, you also merge the accounts' memberships in relationship groups.

[Relationship Groups Overview](#)

[Relationship Group Considerations](#)

## Relationship Group Considerations

To make the most of relationship groups and relationship group members, review the notable behaviors and limitations below.

### Relationship Group Considerations

Relationship groups:

- Support roll-up related lists for activities and custom objects only.
- Are completely separate from the Partners related list on accounts.
- Do not have directly associated activities, notes, or attachments.
- Only support required custom fields that are configured with a default value. Such custom fields will display on relationship group detail and edit pages, but not in the relationship groups wizard.
- Only support validation rules on custom fields that were added after the Relationship Group managed package was installed.
- Cannot be renamed to a different name than "relationship group," because they are a custom object in a managed package.
- Can be created and edited through the relationship group wizard regardless of field-level security settings on the `Description` field.

### EDITIONS

Available in: Salesforce Classic

Available in: Salesforce for Wealth Management

### Relationship Group Member Considerations

Relationship group members:

- Are limited to a maximum of 20 per relationship group.
- Cannot be imported via the import wizard for custom objects.
- Do not support tagging.
- Have the division of the parent relationship group.
- Are owned by both the parent relationship group and the parent account.
- Do not support validation rules.
- Do not support universally required fields.
- Cannot be renamed to a different name than "relationship group member," because they are a custom object in a managed package.
- Can have the fields `Primary`, `Secondary`, and `Include in Roll-Up` edited through the relationship group wizard even when the field-level security on those fields is "read-only."
- Cannot be included in workflow rules or approval processes.
- Cannot be used in Salesforce to Salesforce.
- Are not supported in Connect Offline.
- Are only supported in API version 11.0 and later. In the API, using the `upsert` call on relationship group members is not supported.

- “Create” and “Edit” on relationship groups
- AND
- “Create” and “Edit” on relationship group members
- AND
- “Read” on accounts

To delete relationship groups:

- “Delete” on relationship groups

To remove relationship group members:

- “Delete” on relationship group members

## Creating Relationship Groups

Salesforce provides an easy wizard so you can quickly create and edit relationship groups. To create a new relationship group:

1. On the Relationship Groups home page, click **New** next to `Recent Relationship Groups`.
  2. Enter the name and description of the relationship group:
    - a. Enter a name for the relationship group.
    - b. Optionally, enter a description for the relationship group.
    - c. Click **Next** to continue.
  3. Define the members of the relationship group:
    - a. Use the lookup fields to select the appropriate records.
    - b. In the `Role` drop-down list, specify the appropriate role for each person in the relationship group.
    - c. Designate one of the records as primary.
    - d. Designate another record as secondary.
    - e. Optionally, click **Add Member** as needed to include additional members. You can add a maximum of 20 records to a relationship group.
    - f. Select `Include in Roll-up` for the accounts whose related activities and custom objects should display on the relationship group detail page.
    - g. Click **Save** to finish.
  4. After completing the wizard, the detail page of the new relationship group displays so you can review your work.
-  **Note:** You can also add an account to a new or existing relationship group. To add an account, go to the Relationship Group Members related list and click **New**.

## Adding Accounts to Relationship Groups

Salesforce provides an easy wizard so you can quickly create and edit relationship groups. On the Accounts tab, you can add an account to a new or existing relationship group:

1. Open the detail page for the account you want to add to a relationship group.
2. On the Relationship Group Members related list, click **New**.
3. Choose whether to add the account to an existing relationship group or a new relationship group:
  - If you are adding the account to an existing relationship group, click the lookup icon to find the appropriate relationship group.
  - If you are adding the account to a new relationship group, enter a name and optionally a description for the new relationship group.
4. Click **Next**.
5. Define the members of the relationship group:
  - a. Use the lookup fields to select the appropriate records.
  - b. In the **Role** drop-down list, specify the appropriate role for each person in the relationship group.
  - c. Designate one of the records as primary.
  - d. Designate another record as secondary.
  - e. Optionally, click **Add Member** as needed to include additional members. You can add a maximum of 20 records to a relationship group.
  - f. Select **Include in Roll-up** for the accounts whose related activities and custom objects should display on the relationship group detail page.
  - g. Click **Save** to finish.
6. After completing the wizard, the detail page of the new relationship group displays so you can review your work.

## Editing the Members of Relationship Groups

Salesforce provides an easy wizard so you can quickly create and edit relationship groups. To edit the members of a relationship group:

1. Click **New** or **Edit** on the Relationship Group Members related list of a relationship group detail page. Alternatively, click **Edit** next to a member listed on the Relationship Group Members list of an account detail page.
2. To remove an account from the relationship group, click **[remove]**.
3. To add an account to the relationship group, enter an account name in an empty Account lookup field.
4. In the **Role** drop-down list, choose a role for each member of the relationship group.
5. In the **Primary** column, select a primary relationship group member.
6. In the **Secondary** column, select a secondary relationship group member.
7. Select **Include in Roll-up** for the accounts whose related activities and custom objects should display on the relationship group detail page.
8. Optionally, click **Add Member** as needed to include additional members. You can add a maximum of 20 records to a relationship group.
9. Click **Save** to finish.

## Displaying and Editing Relationship Groups

 **Note:** Relationship groups are only available upon request to [Salesforce for Wealth Management](#) customers. Note that the Relationship Groups tab may be named “Households” in Salesforce for Wealth Management organizations. To enable relationship groups, contact your Salesforce representative.

The following sections describe how to display and edit relationship groups:

- [Accessing the Relationship Groups Tab](#)
- [Viewing Relationship Group Lists](#)
- [Displaying Relationship Group Records](#)
- [Editing Relationship Group Records](#)

### Accessing the Relationship Groups Tab

The Relationship Groups tab is available by default in the Relationship Groups app. To switch to the Relationship Groups app, select Relationship Groups from the Force.com app menu in the top right corner of every Salesforce page.

Note that your administrator may have customized your profile to also display the Relationship Groups tab in other apps.

### Viewing Relationship Group Lists

You can work with relationship group list views as you would any other custom object. .

### Displaying Relationship Group Records

To open an individual relationship group record, click a relationship group name on the relationship groups home page or a relationship groups list view.

Note the following when viewing related lists on the relationship group detail page:

- The Relationship Group Members related list summarizes the accounts that are members of the relationship group. In the `PRIORITY` column, the icons ( and ) show which accounts are defined as primary or secondary for the relationship group. For more information on relationship group members, see [About Relationship Group Members](#) on page 1097.
- The Activity History and Open Activities related lists on a relationship group are roll-ups of activities for the relationship group members; relationship groups themselves do not have their own tasks and events.
- If accounts have a relationship with a custom object, a related list for that custom object can display on the relationship group detail page. This requires that `Include in Roll-Up` is selected on an associated relationship group member record. For example, in the following theoretical scenario, the vehicles associated with members of the Stone family display in a Vehicles related list on both the account detail page and the relationship group detail page:
  - The account Sam Stone has a Toyota Prius car tracked in the Vehicles custom object related list on the account detail page
  - The account Chris Stone has a Ford Mustang car tracked in the same related list
  - Sam and Chris Stone are members of the Stone Family relationship group
  - Both associated relationship group member records have `Include in Roll-Up` selected

### EDITIONS

Available in: Salesforce Classic

Available in: Salesforce for Wealth Management

### USER PERMISSIONS

To create or edit relationship groups and relationship group members via the wizard:

- “Create” and “Edit” on relationship groups
- AND
- “Create” and “Edit” on relationship group members
- AND
- “Read” on accounts

To delete relationship groups:

- “Delete” on relationship groups

To remove relationship group members:

- “Delete” on relationship group members

### Editing Relationship Group Records

On the relationship group detail page, you can:

1. Click **Edit** to change the fields in the Relationship Group Detail section.
2. Click **Delete** to delete the relationship group. For more information, see [Deleting Relationship Groups](#) on page 1106.
3. Click **Clone** to create a copy of the relationship group.
4. On the Relationship Group Members related list, click **New** to add an account to the relationship group. For more information, see [Editing the Members of Relationship Groups](#) on page 1103.
5. On the Activity History and Open Activities related lists, click the buttons such as **New Task** and **Log a Call** to add activity records for a relationship group member. By default, the new activity records are associated with the primary account on the relationship group.

## Searching for Relationship Groups

1. Enter your search terms in the sidebar or header search box.
2. Click **Search**.
3. From the search results, click an item to open it or click **Edit**, if available.

Your administrator can customize the search layout for relationship groups to include the primary and secondary account fields, so you can view and access those account records directly from relationship group search results.

### SEE ALSO:

[Relationship Groups Overview](#)

## Deleting Relationship Groups

Relationship groups are custom object records that you can delete as you would any other record.

A relationship group is the master object in a master-detail relationship with relationship group members. Consequently, when you delete a relationship group, all relationship group members on that relationship group are also deleted. Restoring a relationship group from the Recycle Bin also restores the associated relationship group members that were deleted. However, if you delete a relationship group that contains the same relationship group member as a deleted account, the shared relationship group member cannot be restored from the Recycle Bin.

- "Delete" on relationship groups

## Removing Members from Relationship Group Members

To remove an individual relationship group member, go to the Relationship Group Members related list on an account or relationship group detail page and click **Del** next to the appropriate relationship group member record.

Relationship group members are unique because they have two master-detail relationships: one with accounts and another with relationship groups. Also, there are rules that govern the number of relationship group members a relationship group can have, as well as prevent more than one relationship group member from being specified as either primary or secondary on a given relationship group. The following considerations apply to deleting relationship group members:

### Deleting Accounts with Relationship Group Members

When you delete an account, its associated relationship group members are also deleted. However, you cannot restore an account from the Recycle Bin if restoring the account's deleted relationship group members would violate rules such as the maximum of 20 relationship group members per relationship group. Also, if you delete an account that shares a relationship group member with a deleted relationship group, the shared relationship group member is automatically purged from the Recycle Bin.

### Deleting Relationship Groups with Relationship Group Members

See [Deleting Relationship Groups](#) on page 1106.

### Restoring Individual Relationship Group Members

You cannot restore an individual relationship group member from the Recycle Bin in the following scenarios:

- Restoring the record would violate rules such as the maximum of 20 relationship group members per relationship group
- The deleted relationship group member was deleted during an account merge

Relationship group members are automatically and irrecoverably removed from the Recycle Bin in the following scenarios:

- If both parents (the relationship group and the account) of a relationship group member are deleted, the relationship group member is removed
- If a relationship group member is deleted individually and then one of its parents is deleted, the relationship group member is removed

# Finding New Accounts, Contacts, and Leads with Data.com

## Get Started with Data.com

Data.com is the Salesforce solution for delivering leading business data inside your CRM. Use Data.com to search valuable account information from D&B and millions of crowd-sourced contacts and find the records your business needs. With Data.com Prospector, you can add these records to Salesforce as new accounts, contacts, and leads, or export them to use in other apps. With Data.com Clean, you can keep your CRM records clean and up to date.

### IN THIS SECTION:

#### [Get Started with Data.com Prospector](#)

Check out some topics to help you get started with Data.com Prospector. In no time, you'll be searching valuable company information from D&B and millions of crowd-sourced contacts to get the accounts, contacts, and leads that your business needs.

#### [Get Started with Data.com Clean](#)

Check out some topics to help you get started with Data.com Clean. In no time, you'll be leveraging valuable company information from D&B and millions of crowd-sourced contacts to keep your Salesforce data clean and up to date. Spend less time updating data and more time growing your business!

## Get Started with Data.com Prospector

## Get New Salesforce Accounts, Contacts, and Leads from Data.com

Use Data.com Prospector to search valuable company information from D&B and millions of crowd-sourced contacts to find the records your business needs. Add accounts to Salesforce as new accounts, and add contacts as new Salesforce contacts or leads. Before getting started, you should review a number of important guidelines for adding Data.com records to Salesforce.

### IN THIS SECTION:

#### [Find and Add Accounts from Data.com](#)

Use the Data.com tab to search for accounts across industries and locations, and add them to Salesforce.

#### [Find and Add Data.com Accounts by Global Ultimate D-U-N-S Number](#)

If you use Data.com Premium Prospector, you can search D&B Company records by Global Ultimate D-U-N-S Number to see a list of accounts within an organization's corporate structure and then add those accounts to Salesforce.

#### [Find and Add Data.com Contacts from the Data.com Tab](#)

Use the Data.com tab to search millions of crowd-sourced contacts across industries and locations, and add them to Salesforce.

#### [Add Data.com Contacts as Leads](#)

Need leads? Use the Data.com tab to search account information from D&B and millions of crowd-sourced contacts across industries and locations. Then, add contact records to Salesforce as new leads.

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Clean license in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

Available with a Data.com Clean license in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

### [Get Data.com Contacts from an Account](#)

Need contacts for an account? Use the `Get Contacts` button on the account detail page to add related contacts from Data.com to Salesforce.

### [Data.com Company Hierarchy \(Beta\)](#)

Data.com Company Hierarchy uses Dun & Bradstreet company data in Data.com to display a hierarchical view of companies. It shows parent-child relationships and account information, such as the annual revenue, ownership, and number of employees.

### [Guidelines for Adding Data.com Records to Salesforce](#)

Search Data.com for accounts, contacts, and leads, and if you have a Data.com license, you can add the records you want to Salesforce. Here are some guidelines to follow when you add Data.com records to Salesforce.

### [Limitations for Data.com Prospector](#)

There are several important limitations to note for users who are searching and adding records from Data.com.

## Find and Add Accounts from Data.com

Use the Data.com tab to search for accounts across industries and locations, and add them to Salesforce.

Watch a Demo:  [Finding Data.com Accounts and Contacts and Adding Them to Salesforce](#)

1. Click the Data.com tab.
2. Click **Find Accounts**.
3. Enter or select your search criteria. When you click the selection box in the `Industry` field, for example, you'll see the [Industry Selector](#), where you can use industry classifications to select from extensive lists of industries and subindustries to build an industry query as part of your search criteria. When you click the selection box in the `Location` field, you'll see the [Location Selector](#), where you can build a location query as part of your search criteria.
4. Click **Search**. Results are sorted by number of active contacts. To show records that have been flagged as inactive, under Options, select `Show Inactive Records`. Inactive records are marked with .
5. If the results list is long, you can:
  - Sort the results by any table heading. The `Updated` heading, for example, sorts results by when they were last updated.
  - Jump to a page by entering a number in the `Page` field.
  - Click the arrows to move from page to page.
6. If you don't see what you're looking for, use filters to narrow your results. Expand filter categories as needed. Enter a range or select the checkbox next to each filter you want to apply.
7. Add all accounts or a selection to Salesforce.
  - To add all accounts, click **Add to Salesforce** and select `All`.
  - To add selected accounts, select the ones you want, then click **Add to Salesforce** and choose `Selected`.
8. Click **Continue**.
 

If your selection includes duplicates, we'll add them if duplicate account records are allowed in your Salesforce organization. Adding more than 200 records can take a few minutes. If you add that many, we'll send you an email when the process is complete.
9. From the confirmation message, click **Go to Accounts** to view the list of new records on the Accounts home page.

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

### USER PERMISSIONS

To add accounts from Data.com:

- "Create" on accounts

If you use Data.com Premium Prospector, when you add an account from Data.com, a corresponding D&B Company record (if one exists in Data.com) is automatically created in Salesforce and linked to the account record via its `D&B Company` field.

## SEE ALSO:

- [Guidelines for Adding Data.com Records to Salesforce](#)
- [Data.com Account Search Fields and Filters](#)
- [Explore Data.com Accounts from the Account Card](#)
- [Record Icons in Data.com Search Results](#)
- [Understand Data.com Searches](#)

## Find and Add Data.com Accounts by Global Ultimate D-U-N-S Number

If you use Data.com Premium Prospector, you can search D&B Company records by Global Ultimate D-U-N-S Number to see a list of accounts within an organization's corporate structure and then add those accounts to Salesforce.

The Global Ultimate is the highest entity within an organization and is identified by a nine-digit Global Ultimate D-U-N-S Number. All companies that are part of the same corporate structure as the Global Ultimate are identified by the same Global Ultimate D-U-N-S Number.

 **Note:** Before you can search by Global Ultimate D-U-N-S Number, the `Search Global Ultimate D-U-N-S` button must be [added to the D&B Company page layout](#).

1. Go to the detail page of the D&B Company record you want to find accounts with the same Global Ultimate D-U-N-S Number for.
2. Click **Search Global Ultimate D-U-N-S**.  
The Data.com tab opens and displays a list of accounts that match the Global Ultimate D-U-N-S Number of the D&B Company record.
3. If the results list is long, you can sort the results by any table heading. The **Location Type** heading, for example, sorts results by headquarters, single location, and branch.
4. If you don't see what you're looking for, use filters to narrow your results.
5. For more information about a particular account, such as its account site, click the account name to see its account card.
6. Add all accounts or a selection to Salesforce.
7. From the confirmation message, click **Go to Accounts** to view the list of new records on the Accounts home page.

Here are some things to keep in mind when searching by Global Ultimate D-U-N-S Number.

- Global Ultimate D-U-N-S Number search results *only* include accounts that are in Data.com, so you may not get *complete* Global Ultimate D-U-N-S results if some members of the corporate structure are not in Data.com.
- You can use [filters](#) to narrow down your Global Ultimate D-U-N-S Number search results.
- You can [export records](#) from your Global Ultimate D-U-N-S Number search results.
- You can't save the search.

Available with a Data.com Clean license in:  
**Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

## USER PERMISSIONS

To add accounts from Data.com

- "Create" on accounts

## Find and Add Data.com Contacts from the Data.com Tab

Use the Data.com tab to search millions of crowd-sourced contacts across industries and locations, and add them to Salesforce.

If you add records as contacts, you'll be prompted to associate them with a single account, so keep that in mind when you define your search.

1. Click the Data.com tab.
2. Click **Find Contacts**.
3. Enter or select your search criteria. When you click the selection box in the `Industry` field, for example, you'll see the [Industry Selector](#), where you can use industry classifications to select from extensive lists of industries and subindustries to build an industry query as part of your search criteria. When you click the selection box in the `Location` field, you'll see the [Location Selector](#), where you can build a location query as part of your search criteria.

4. Click **Search**.  
Results are sorted alphanumerically. To show records that have been flagged as inactive, under `Options`, select `Show Inactive Records`. Inactive records are marked with .

5. If the results list is long, you can:
  - Sort the results by any table heading. The `Updated` heading, for example, sorts results by when they were last updated.
  - Jump to a page by entering a number in the `Page` field.
  - Click the arrows to move from page to page.

Sorting and page navigation only work for lists of fewer than 100,000 records.

6. If you don't see what you're looking for, use filters to narrow your results. Expand filter categories as needed. Enter a range or select the checkbox next to each filter you want to apply.  
The list updates automatically.
7. Add all contacts or a selection to Salesforce.
  - To add all contacts, click **Add to Salesforce** and select **All**.
  - To add selected contacts, first select the ones you want, then click **Add to Salesforce** and choose *Selected*.

You'll get a confirmation message showing the number of records you're adding.

8. Select **Contacts**.  
Enter or select the account you want to associate the contacts with. You can associate only one account. If you need to create the account to associate, use the lookup.
9. Click **Continue**.  
If your selection includes duplicates, we'll add them if duplicate contact records are allowed in your Salesforce organization. Adding more than 200 records can take a few minutes. If you add that many, we'll send you an email when the process is complete.
10. Click **Go to Account** to return to the account record.

 **Tip:** You can also add Data.com contacts directly from an account. Just [start your search from that account's detail page](#).

## Get Data.com Contacts from an Account

Need contacts for an account? Use the `Get Contacts` button on the account detail page to add related contacts from Data.com to Salesforce.

Before you begin, make sure the `Get Contacts` button has been added to the Account page layout.

1. Go to the detail page of the account you want to add contacts for.
2. Click **Get Contacts**. From the drop-down, either:
  - Select a filter to narrow your results by level or department, or
  - Select **All...** to see all contacts for the account.

The Data.com tab opens and displays a list of contacts that match the account name and any filters you selected. For example, if you want to get manager contacts at Universal Telco, go to Universal Telco's account detail page. Click **Get Contacts** and under `By Level`, select the `Manager-Level` filter. The Data.com tab opens with a list of managers at Universal Telco.

3. Select more filters if you need a more targeted list. Expand filter categories as needed. Enter a range or select the checkbox next to each filter you want to apply.
4. Add all contacts or a selection to Salesforce.
  - To add all contacts, click **Add to Salesforce**.
  - To add selected contacts, first select the ones you want, then click **Add to Salesforce** and choose `Selected`.
5. Select **Contacts** to add the records as contacts associated with the account you started from. They'll be associated with the account you started from.
6. Click **Continue** to add the records.  
If your selection includes duplicates, we'll add them if duplicate contact records are allowed in your Salesforce organization. Adding more than 200 records can take a few minutes. If you add that many, we'll send you an email when the process is complete.
7. Click **Go to Account** to return to the account record.

### SEE ALSO:

## Get Data.com Prospecting Insights for Accounts

Need detailed information about account businesses? Click the **Prospecting Insights** button on the account detail page to get data about your prospects' businesses and financials, as well as competitive and industry details—directly from Data.com in real time.

Prospecting Insights is available with Data.com Corporate Prospector and Data.com Premium Prospector licenses. Insights data is available for accounts that were imported from, or cleaned by, Data.com.

Before you begin, make sure that your administrator has added the **Prospecting Insights** button to the Account page layout.

1. Open the account detail page for a prospect.
2. Click **Prospecting Insights**.

If you click **Prospecting Insights** for an account that hasn't been imported from or cleaned by Data.com, a message recommends that you first clean the account.

SEE ALSO:

### Data.com Company Hierarchy (Beta)

Data.com Company Hierarchy uses Dun & Bradstreet company data in Data.com to display a hierarchical view of companies. It shows parent-child relationships and account information, such as the annual revenue, ownership, and number of employees.

Data.com Company Hierarchy uses Dun & Bradstreet data to create a hierarchical view of an account displaying its relationship with related companies. To add an account to your Salesforce organization, click the **Add Account** button next to the account.

Company Hierarchy is available as a standard feature for Data.com Premium Prospector customers. Company Hierarchy is built using Dun & Bradstreet company data. In addition to showing the relationships between corporate entities, you can see the associated annual revenue and number of employees at different entities in the hierarchy. Information from your Salesforce organization is also included to provide more context, such as whether an entity exists as an account record, along with the listed account owner. Using this information, sales reps can identify relevant prospective customers, and then add them as accounts to your Salesforce organization with the click of a button directly from the hierarchy view.

This release contains a beta version of Data.com Company Hierarchy that is production quality. You can provide feedback and suggestions for Company Hierarchy on the [IdeaExchange](#). For information on enabling this feature for your organization, contact Salesforce.

The Data.com Company Hierarchy shows you different company types and how they are related.

Company Type	Description
Global Headquarters	The highest organizational entity in a corporate hierarchical structure that oversees domestic or international companies and subsidiaries.
Domestic Headquarters	The highest level member in a corporate hierarchy within a single country. A DHQ typically reports to a GHQ.
Headquarters	A company that owns branches, divisions, or subsidiaries and has financial responsibility for the companies that report to it.
Branch	A secondary location of a headquarters.
Single Location	A company with no branches or subsidiaries.
Unmarketable	This company is unmarketable, and record details are intentionally hidden. You can't add this record from the hierarchy, but you can view or add active, linked accounts.

#### IN THIS SECTION:

## Guidelines for Adding Data.com Company Hierarchy Records to Salesforce

Data.com Company Hierarchy searches Data.com for Dun & Bradstreet company records and displays company linkages in a hierarchical view. From the Company Hierarchy, you can add account records to Salesforce. Here are some guidelines to follow when you add Data.com records to Salesforce from Company Hierarchy.

- A green dot (●) appears in the search results next to records already in Salesforce. These records can't be added again unless they have first been deleted from Salesforce, or your organization allows duplicates.
  -  **Tip:** If a record is already in Salesforce, hover over the green dot and click the link to go directly to the record.
- You can add only one record at a time from Company Hierarchy.
- Records are considered duplicates when they have the same Data.com ID number in the `Data.com Key` field. When a duplicate record is added, it isn't counted against your record addition balance.
- If you can't add a record to Salesforce because of errors, we'll notify you and provide the error details in a .csv file.

## Guidelines for Adding Data.com Records to Salesforce

Search Data.com for accounts, contacts, and leads, and if you have a Data.com license, you can add the records you want to Salesforce. Here are some guidelines to follow when you add Data.com records to Salesforce.

- A green dot (●) appears in the search results next to records already in Salesforce. These records can't be added again unless they have first been deleted from Salesforce, or your organization allows duplicates.
  -  **Tip:** If a record is already in Salesforce, hover over the green dot and click the link to go directly to the record.
- A blue checkmark (✓) appears in search results next to records you've already purchased (added or exported) from Data.com. When you add Data.com contacts or accounts, each one counts against your record addition balance. If you add records you've already exported from Data.com, the added records don't count against your record addition balance.
- If the number of records you've selected to add *exceeds* your record addition balance, we'll let you know. You can proceed to add as many records as your balance and other settings allow.
- Regardless of your record addition limit or your record addition balance, you can't manually select more than 1,000 records at a time.
- Regardless of your record addition limit or your record addition balance, you can't add more than 100,000 records at a time.
- Records are considered duplicates when they have the same Data.com ID number in the `Data.com Key` field. This includes records that were added from Data.com as both contacts and leads. When a duplicate record is added, it will *not* be counted against your record addition balance.
- If you can't add one or more records to Salesforce because of errors, we'll notify you and provide the error details in a .csv file.

## Limitations for Data.com Prospector

There are several important limitations to note for users who are searching and adding records from Data.com.

- The subindustries under Government in the Data.com Industry Categories classification system are currently unavailable due to mapping limitations between the Data.com Industry Categories and the SIC system.
- By default, each user assigned a Data.com Prospector user license has a monthly record addition limit of 300. This number can be adjusted based on your agreement. Record additions expire at midnight on the last day of each month, as determined by your organization's default time zone.
- A single Data.com Prospector license is assigned every time you enable a user for Data.com Prospector.
- If your organization purchased only Data.com Prospector, only users with licenses can clean records.
- When adding records from Data.com, annual revenue is only available in US dollars. If U.S. Dollar is not an active currency for your organization, records added from Data.com do not include annual revenue information.

### [Export Data.com Contact Records](#)

Work with Data.com contact records in other apps by exporting the records from your Data.com search results.

### [Guidelines for Exporting and Importing Data.com Records](#)

If you want to include Data.com records in other apps, you can export records from your search results on the Data.com tab. Exporting records creates a comma-separated value (.csv) file that you can open in Microsoft® Excel® or other apps that support .csv format. Here are some things to consider when exporting records sourced from Data.com.

## Export Data.com Account Records

Work with Data.com account records in other apps by exporting the records from your Data.com search results.

Exporting records creates a comma-separated value (.csv) file that you can open in Microsoft® Excel® or other apps that support .csv format.

How we provide the export file depends on:

- The number of records. If you export fewer than 200 records, you'll see a message with a link to the export file on the Files tab. If you export 200 or more records, you'll receive an email with a link to the export file on the Files tab.
- Whether you have Chatter enabled. If you do not, you'll receive an email with the export file attached.

The account fields that we export include:

- Jigsaw (the account's Data.com Key)
- Name
- Website
- Phone
- BillingStreet
- BillingCity
- BillingStateCode
- BillingPostalCode
- BillingCountry
- Industry
- NumberOfEmployees
- AnnualRevenue
- Ownership
- TickerSymbol
- Fax
- FipsMsaCode (available with Data.com Premium Prospector only)
- Sic
- SicDesc
- NaicsCode
- NaicsDesc
- StockExchange (available with Data.com Premium Prospector only)
- SalesVolumeReliability (available with Data.com Premium Prospector only)

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

### USER PERMISSIONS

To export Data.com accounts records:

- "Read" on accounts

- `EmployeesTotalReliability` (available with Data.com Premium Prospector only)
- `Data.com Last Updated Date`
- `BillingState` (available with state and country picklists only)
- `BillingCountryCode` (available with state and country picklists only)

Here's how you can export Data.com account records.

1. Start from a list of Data.com account search results.
2. Export all accounts or a selection.
  - To export all accounts, click **Export Results** and choose *ALL*.
  - To export selected accounts, select the ones you want, then click **Export Results** and choose *Selected*.
3. If the number of records you've selected to export *is equal to or less than* your record balance, choose to either:
  - Export all records; or
  - Export all records except those already in Salesforce (●) or already purchased (added or exported) by any Data.com user in your organization (✓).

If the number of records you've selected to export *exceeds* your record balance, we'll let you know. You can then proceed to export as many records as your balance and other settings allow without having to adjust your selection. When exporting more than your balance, you can either:

- Include records already purchased (✓) along with new records; or
- Exclude all selected records that your organization already owns (● or ✓).

See the example that follows.

4. Click **Continue**.

A dialog box appears. It will either include a link to the export file on the Files tab or inform you that the export file will be sent in an email.

-  **Example:** For example: you have a record balance of 50, but select 150 account records to export. You opt to export both new and already purchased records. Thirty (30) of the selected records have already been purchased by your organization. We'll export all of the 30 previously purchased records, plus 50 of the remaining new records. After the export, your record balance will be 0.

## Export Data.com Contact Records

Work with Data.com contact records in other apps by exporting the records from your Data.com search results.

Exporting creates a comma separated value (.csv) file that you can open in Microsoft® Excel® or any other app that supports .csv format. If your organization respects Do-Not-Contact settings, contact records with `Do Not Call` or `Email Opt Out` selected have blank `Phone` or `Email` fields in .csv files.

How we provide the export file depends on:

- The number of records. If you export fewer than 200 records, you'll see a message with a link to the export file on the Files tab. If you export 200 or more records, you'll receive an email with a link to the export file on the Files tab.
- Whether you have Chatter enabled. If you do not, you'll receive an email with the export file attached.

The contact fields that are exported are:

- `Jigsaw` (the contact's `Data.com Key`)
- `FirstName`
- `LastName`
- `Title`
- `Phone`
- `Email`
- `MailingStreet`
- `MailingCity`
- `MailingStateCode`
- `MailingPostalCode`
- `MailingCountry`
- `AccountName`
- `NumberOfEmployees`
- `AnnualRevenue`
- `Department`
- `Industry`
- `Data.com Last Updated Date`
- `MailingState` (available with state and country picklists only)
- `MailingCountryCode` (available with state and country picklists only)

Here's how to export Data.com contact records.

1. Start from a list of Data.com contact search results.
2. Export all contacts or a selection.
  - To export all contacts, click **Export Results** and choose *All*.
  - To export selected contacts, select the ones you want, then click **Export Results** and choose *Selected*.
3. If the number of records you've selected to export is equal to or less than your record balance, choose to either:
  - Export all records; or

### EDITIONS

## Guidelines for Exporting and Importing Data.com Records

If you want to include Data.com records in other apps, you can export records from your search results on the Data.com tab. Exporting records creates a comma-separated value (.csv) file that you can open in Microsoft® Excel® or other apps that support .csv format. Here are some things to consider when exporting records sourced from Data.com.

- A green dot (●) appears in search results next to records *already in Salesforce*. A blue checkmark (✓) appears in the search results next to records that were *already purchased by any Data.com user in your organization*. Both of these types of records are considered to be records your organization *already owns*.
- If the number of records you've selected to export *exceeds* your record addition balance, we'll let you know. Then, from the export confirmation message, you can opt to either *include already purchased records (✓) along with new records* in your export; or *exclude all selected records that your organization already owns (● or ✓)*, and export *only new records*. Just select the option you want on the export confirmation message.
- If you export Data.com contacts or accounts *instead of* adding them to Salesforce, each exported record counts against your record addition balance. If you export records you've already added to Salesforce or re-export records you previously exported, the exported records don't count against your record addition balance.
- If you export a group of Data.com contacts, you can still add those contacts back into Salesforce as contacts or leads without affecting your record addition balance.
- Regardless of your addition limit or the number of records you have left to add, you can't export more than 100,000 records at a time. Records will be exported in batches of 50,000. If two batches are needed, the records will be sent in a .zip file.
- If your organization respects Do-Not-Contact settings, contact records with `Do Not Call` or `Email Opt Out` selected have blank `Phone` or `Email` fields in .csv files.

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in:  
**Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

- If numeric values, such as phone numbers, are cut off in the .csv file, change the format of the field's column in the .csv file to *General* or *Text*, or open the file in a text editor such as WordPad.

You can import a list of exported records back into Salesforce using Data Loader. Unless your Data.com preferences are set to allow duplicate records, the import process checks for duplicates using the Data.com ID number from the `Data.com Key` field.

These records won't be imported from Data Loader.

- Any record that has the same Data.com ID (from the `Data.com Key` field) as another record within the .csv file.
- Any record that has the same Data.com ID (from the `Data.com Key` field) as a record already in Salesforce.

## Get the Best Search Results with Data.com

The Data.com search feature contains fields and filters that make it easy to find the accounts and contacts your business needs. Use search modifiers and an industry selector to hone in on the best results. Then save any of your searches.

IN THIS SECTION:

[Save Data.com Searches](#)

Need to run a specific Data.com search on a regular basis—to find new contacts for your favorite accounts, or new leads for your target markets? You can. Just create a search and save it to run it again as often as you like.

[Understand Data.com Searches](#)

Learn how the Data.com search features work, what fields are searched, and how to refine your search results using filters and location criteria so you can easily find the records most valuable to your business.

[Understand Data.com Search Modifiers](#)

When searching for Data.com accounts and contacts, you can use modifiers to target and narrow your search results. Here's how modifiers work, field by field.

[How Is Industry Determined for Records in Data.com?](#)

We use the primary SIC (Standard Industry Classification) code to determine the value of the `Industry` field on account cards and account records in Data.com. By using only the primary SIC code for this industry mapping, we're able to provide a more consistent and accurate value in the `Industry` field, which leads to more relevant search results, regardless of the industry classification system you use in your search query.

[Data.com Industry Selector](#)

When searching for accounts and contacts in Data.com, use the industry selector to add industries and subindustries to your search criteria.

[Data.com Location Selector Fields](#)

When you search for accounts and contacts in Data.com, use the location selector to add location criteria to your search query.

[Data.com Contact Search Fields and Filters](#)

There are a number of Data.com search fields and filters to help you easily find the contacts and leads your business needs.

[Data.com Account Search Fields and Filters](#)

There are a number of Data.com search fields and filters to help you easily find the accounts your business needs.

## Save Data.com Searches

Need to run a specific Data.com search on a regular basis—to find new contacts for your favorite accounts, or new leads for your target markets? You can. Just create a search and save it to run it again as often as you like.

Saving a search *does not* save a static list of results. It saves the criteria and filters you define, so when you rerun the search, you can find the latest matching records. Saved searches are listed to the left of the search tabs, with the most recently run saved search at the top.

You can always modify the search criteria or filters after you run a saved search. If you save the search again, you'll get the option to rename it.

1. Start from the tab for the kind of records you want: contacts or accounts.
2. Enter your search criteria, and filter your results if you need to.
3. Click **Save Search**.  
The name of the save search appears in the Saved Search list.
4. To rerun your saved search, just select its name from the Saved Searches list.
5. If you need to delete a saved search, click Delete (✕) next to its name.

 **Note:** You can have up to 25 saved searches at a time.

SEE ALSO:

[Understand Data.com Searches](#)

## Understand Data.com Searches

Learn how the Data.com search features work, what fields are searched, and how to refine your search results using filters and location criteria so you can easily find the records most valuable to your business.

Searching Data.com for CRM records is simple. Start your search by entering search criteria in the fields on the Data.com tab. You can also [use search modifiers to target and narrow your search results](#). Depending on your entries and selections, you may end up with a large list of accounts or contacts. To find out how many, check the results list's header or footer. Click the **Reset Search** link if you need to clear all your entries and selections. You'll see your search results until you start a new search or refresh your browser page.

For account searches, the Data.com search results you get are based on the company name, the website of the parent company, and the websites of the parent company's subsidiaries and branch locations, if any, so your results may include companies that you didn't actually search for. For example, if you want to find Sun Microsystems and you enter either *Sun Microsystems* or *sun.com* in the `Company` or `website` field, the results will also include Oracle Corporation because Oracle is the parent company of Sun Microsystems.

Also, account searches are based on both the `Account Name` field and the `Tradestyle` field. So, for example, if you are looking for United Parcel Services, you can search on its tradestyle, *UPS*, and still see *United Parcel Services, Inc.* in your search results.

Once you have a set of records, you can narrow your list by using filters if you need to. Just look for the filter categories at the left of the page, and select the checkboxes for the filters you need. Some searches generate filter options that are specific to your results. For example, if you want leads in `Healthcare, Pharmaceuticals & Biotech` industry—specifically `Doctors & Health Care Practitioners`—the list of filters in the `Title` category might include `Doctor, Chiropractor, Dentist`, and

### EDITIONS

### USER PERMISSIONS

To save a Data.com search:

- No permissions required

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in:  
**Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

**Office Manager.** For searches that generate a large list of results for **Title**, **Company Name**, and **Website Domain Type** filters, we show the 25 filters with the most search results. To see a shorter list of filters, narrow your initial search.

Some filter categories are expanded automatically when you run a search, but you can click the links at the top of the Filters panel to expand or collapse them all. As you select filters, the search results list is updated automatically.

For example, if you search for contacts from your IBM account detail page, the Data.com tab will open and automatically enter IBM's URL, *www.ibm.com*, in the **Company** or **Website** field on the Find Contacts subtab. The search will generate a list of thousands of IBM contacts all over the world. That's probably more than you need, so you can either:

- Refine your initial search by selecting location criteria (such as *Australia* or *United States*) or industry options (like *Computers & Electronics* or *Financial Services*)
- Narrow your search results list by selecting filters such as *Human Resources*, *C-Level*, or *Program Manager* or
- Select *IBM* in the **Company Name** filter category.

By refining your search criteria and filtering your results, you can narrow your list from more than 30,000 contacts to the 25 or so you want to call or email.

#### SEE ALSO:

[Data.com Contact Search Fields and Filters](#)

[Understand Data.com Search Modifiers](#)

## Understand Data.com Search Modifiers

When searching for Data.com accounts and contacts, you can use modifiers to target and narrow your search results. Here's how modifiers work, field by field.

### Company or Website

- To search for or exclude multiple companies, separate them with commas: *.* For example, *salesforce.com,Apple* returns results for both *salesforce.com* and *Apple* (for example, *Apple Computer, Inc.* and *Apple Inc.*), or either one, depending on Data.com data.
- To search for the exact name of a company, type the name within quotation marks: *" "*. For example, *"Apple, Inc."* returns only results with the exact company name *Apple, Inc.*
- To exclude a company from your results, before the company name, type a minus sign: *-*. For example, *-Oracle* returns a list of results that excludes *Oracle*. For company names with more than one word, after the minus sign, type the first part of the name. For example, *-Adobe* returns a list of results that excludes *Adobe Systems*.
- You can also use mixed search modifiers. For example, *salesforce, -Microsoft, "GE Healthcare"* returns all results including *salesforce* (for example, *salesforce* and *salesforce.com, inc.*); it excludes all results containing *Microsoft*; and it finds *GE Healthcare* but not *GE Health Care*.

### Title

- To exclude a title, before the title, type a minus sign: *-*. For example: *-buyer*.
- To search for exact titles, type them within quotation marks: *" "*. For example: *"Managing Director"*.
- To search for multiple titles, separate them with commas: *.* For example: *CEO,-Dr,"managing director"*.

#### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

#### USER PERMISSIONS

To search Data.com for accounts:

- No permissions required

To search Data.com for contacts:

- No permissions required

## Name or Email

- To search for results for an individual element in this field—just Name or just Email—type that element followed by a colon (:), and a space, then type the name, or email you're looking for. For example, *Name: Marc Benioff* returns results with only the name Marc Benioff. *Email: marcbenioff@salesforce.com* returns results with only the email address marcbenioff@salesforce.com.
- Modifiers will not work if you don't include "name:" or "email:", and you can't mix and match these modifiers (for example, using "name:" and "email:" in the same search).
- To search for multiple names or emails, separate them with commas: ,.
- To search for exact titles, names, or emails, type them within quotation marks: "".
- To exclude a title, name, or email from your results, before the element, type a minus sign: -.

## Location | City

- To search for multiple cities, separate them with commas: ,. For example, *San Francisco, San Jose* returns results for both San Francisco and San Jose, or either one, depending on Data.com data.
- To search for exact cities, type them within quotation marks: "". For example, "San Francisco", won't return results for South San Francisco. Similarly, "South San Francisco" won't return any results for San Francisco.

## Location | Postal/ZIP Code

- To search for multiple postal or ZIP codes, separate them with commas: ,. For example, *94105, 94122* returns results for both 94105 and 94122, or either one, depending on Data.com data.
- To exclude a postal or ZIP code from your results, before the code, type a minus sign: -. For example, *-94122* returns a list of results that excludes 94122.

## Location | Area Code

- To search for multiple area codes, separate them with commas: ,. For example, *312, 708* returns results for both 312 and 708, or either one, depending on Data.com data.
- To exclude an area code from your results, before the area code, type a minus sign: -. For example, *-708* returns a list of results that excludes 708.
- To find area codes outside the United States and Canada, add the country calling code as a prefix. For example, the United Kingdom's country calling code is *44*, and London's area code is *20*, so to find accounts or contacts in London by area code, enter *4420* in the **Area Code** field.

[Understand Data.com Searches](#)

[Data.com Contact Search Fields and Filters](#)

[Data.com Location Selector Fields](#)

## How Is **Industry** Determined for Records in Data.com?

We use the primary SIC (Standard Industry Classification) code to determine the value of the **Industry** field on account cards and account records in Data.com. By using only the primary SIC code for this industry mapping, we're able to provide a more consistent and accurate value in the **Industry** field, which leads to more relevant search results, regardless of the industry classification system you use in your search query.

A limited number of Data.com accounts show `Data.com - Jigsaw` as the value of the **Source** field on their account card. These accounts do not have a value for the SIC code, and so their **Industry** value is determined using a different system. Contact Salesforce Customer Support for details.

 **Example:** You're searching Data.com for accounts with a SIC industry value of *Computer Peripheral Equipment*, which maps to **Electronics** in Data.com. Your Data.com search results will include all accounts with a value of **Electronics** in the **Industry** field. If you use the Data.com Industry Categories classification system and select the *Computers and Electronic* industry, which also maps to **Electronics**, your results will again include all accounts with a value of **Electronics** in the **Industry** field.

[Default Data.com-to-Salesforce Field Mappings](#)

## Data.com Industry Selector

When searching for accounts and contacts in Data.com, use the industry selector to add industries and subindustries to your search criteria.

Here's how it works.

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in:  
**Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in:  
**Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

1. Select the industry classification system your organization uses.
  - *NAICS* (North American Industry Classification System): Used by business and government to classify North American business establishments according to the type of economic activity. This system includes 20 industry sectors, each with multiple levels of subindustries. Industries and subindustries are identified by numeric code, up to six digits.
  - *SIC* (Standard Industry Classification): Used by the United States government to classify business establishments according to the type of economic activity. This system includes 10 industry sectors, each with multiple levels of subindustries. Industries and subindustries are identified by numeric code, up to four digits.
  - *Data.com Industry Categories*: The Data.com system of classifying business establishments by industry and subindustry.

You can select a different industry classification system at any time, but doing so will clear your selections.

2. Use the selection panels to explore industries and their subindustries and add them to your search. If an industry has a numeric classification code, you'll see it here. When you hover over an industry name, you'll get two options.
  - Click the industry name to view its subindustries, if any, in the right panel. If an industry has any available subindustries, you'll see an arrow → to the right of the industry name.
  - Click **Add** to add the industry (including all its subindustries) to the **Categories to search by** (Categories) box.

When you click an industry name in the right panel, it moves to the left panel and its subindustries appear in the right panel. You can continue moving through the industry levels in this manner, adding any industries and subindustries you want to search on as you go. A circle ● to the right of a subindustry name means you have reached the final level of subindustries. When you add an industry to your search criteria, it appears in the Categories box and all of its subindustries are automatically included. You'll also see a solid green checkmark ✓ next to its name. Only the industry, however, appears in the Categories box.

To remove industries from the Categories box, hover over the industry name and click the ✕. If you remove any subindustries from the selection panel, the industry is removed from the Categories box, and its remaining subindustries appear instead. (This

partial selection is denoted by an outlined green checkmark  next to the industry name.) Keep in mind that if you select some but not all subindustries within an industry, the number of selections in the Categories box increases.

3. Use the navigation links at the top of the page to keep track of where you are within the industry levels. Click any link to return to that industry level in the selection panels.
4. Click the **Back** arrow to move up one industry level.
5. All industries and subindustries that you add to your search appear in the **Categories to search by** box. You can remove individual selections by clicking the  next to the industry or subindustry name. Clicking **Clear all** removes *all* your selections.
6. There's a limit on how many industries and subindustries you can add to one search. If you exceed the limit, you'll need to remove selections in order to continue your search.
7. If the **Categories to search by** box includes a long list of industries, you may need to click the arrow to expand the box to view them all.

Here's an example of how the industry selector works. John is looking for companies that manufacture computers. He decides to use the North American Industry Classification System (NAICS) and begins by clicking the **Manufacturing** industry to reveal its subindustries, which include **Food Manufacturing**, **Machinery Manufacturing**, and lots more. He finds **Computer and Electronic Product Manufacturing**, and clicks it, moving it to the left panel to reveal its subindustries in the right panel. He continues to navigate deeper in to the industry levels in this manner, clicking through subindustries until he ultimately finds what he's looking for: **Computer and Peripheral Equipment Manufacturing**. John clicks **Add** to add two subindustries, **Electronic Computer Manufacturing** and **Computer Storage Device Manufacturing**, to the **Categories to search by** box. Those selections remain in the Categories box even if he navigates to other levels in the selection panel and adds other industries. When he is finished adding industries to the Categories box, he does a last review of his selections, then happily clicks **Done** to return to the Data.com tab to complete his search.

### Data.com Location Selector Fields

When you search for accounts and contacts in Data.com, use the location selector to add location criteria to your search query.

Here are the fields available with the location selector.

Field	Definition
Country	The country or countries where you want to find accounts or contacts. There are over 200 countries available for account searches. There is a limited number of countries available for contact searches. To jump to a country in the list, type the first few letters of the country you're looking for.
State	The state or states where you want to find accounts or contacts. This field also includes counties, provinces, and other distinct geographical regions. You must select a single country first. Not all countries have states. To

Field	Definition
City	<p data-bbox="820 258 1446 321">jump to a state in the list, type the first few letters of the state you're looking for.</p> <p data-bbox="820 346 1446 510">The city or cities, where you want to find accounts or contacts. You must select a single country first. If the country you selected has states available, you can narrow the city search to include all available states or one specific state. You can use <a href="#">search modifiers</a> in this field to target and narrow your results.</p>
Metro Area	<p data-bbox="820 539 1446 737">The metro area or areas where you want to find accounts or contacts. Also known as metropolitan and micropolitan statistical areas, metro areas are available for the United States only. You can't use a metro area in a search with a city or a state. To jump to a metro area in the list, type the first few letters of the metro area you're looking for.</p>
Postal/ZIP Code	<p data-bbox="820 766 1435 858">The postal or ZIP code(s) where you want to find accounts or contacts. You can use <a href="#">search modifiers</a> in this field to target and narrow your results.</p>
Area Code	<p data-bbox="820 888 1446 980">The area code(s) where you want to find accounts or contacts. You can use <a href="#">search modifiers</a> in this field to target and narrow your results.</p> <p data-bbox="820 1003 1446 1167">To find area codes outside the United States and Canada, add the country calling code as a prefix. For example, the United Kingdom's country calling code is <i>44</i>, and London's area code is <i>20</i>, so to find accounts or contacts in London by area code, enter <i>4420</i> in the <b>Area Code</b> field.</p> <p data-bbox="820 1190 1414 1291"> <b>Tip:</b> When using country calling codes, you should also select a country. This will ensure you're getting only the results you want.</p>

## Data.com Contact Search Fields and Filters

There are a number of Data.com search fields and filters to help you easily find the contacts and leads your business needs.

### Data.com Contact Search Fields

Field	Definition
Company or Website	The name of the company you want to find contacts for or the URL of its website.  For URLs, use the format <i>companyname.domaintype</i> ; for example, <i>universaltelco.com</i> . Don't enter protocols, such as <i>http:</i> or <i>https:</i> . You can use <a href="#">search modifiers</a> in this field to target and narrow your results.
Title	The title of a contact or contacts. You can use <a href="#">search modifiers</a> in this field to target and narrow your results.
Location	A drop-down that lets you select location criteria, such as country, state, and city. Use the <a href="#">location selector</a> to add location criteria to your search query.
Industry	The industry or industries and any related sub-industries for which you want to find contacts. Use the <a href="#">industry selector</a> to add industry categories to your search query.
Name or Email	The name, or email address of a specific contact. You can use <a href="#">search modifiers</a> in this field to target and narrow your results.

### Data.com Contact Filter Categories

Filter Category	Definition
Options	The <code>Show Inactive Records</code> checkbox lets you show or hide inactive records. Inactive contact records are those flagged in Data.com as containing out-of-date or inaccurate information. Inactive records are hidden by default.
Company Name	A list of companies found in your initial search results. For example, if you search for a contact named <i>William Chen</i> , all companies that have contacts named William Chen are listed. For searches that generate a large list of results, we show the 25 filters with the most results. To see a shorter list, narrow your initial search.

<b>Filter Category</b>	<b>Definition</b>
Department	A list of typical departments within organizations.
Level	A list of typical levels within organizations.
Title	A set of titles found in your initial search results. For example, if you search for contacts in the <b>Healthcare, Pharmaceuticals &amp; Biotech</b> industry and <b>Doctors &amp; Health Care Practitioners</b> sub-industry, the list of title filters might include <b>Chiropractor, Dentist,</b> and <b>Office Manager</b> . For searches that generate a large list of results, we show the 25 filters with the most results. To see a shorter list, narrow your initial search.
Employees	A manually entered range for the number of employees within an organization. Results are based on the <b>Number of Employees—Total</b> field. You can use abbreviations for multiples of thousands ( <b>K</b> for thousand, <b>M</b> for million, and <b>B</b> for billion). For example, 10K converts to 10,000. Leave the <b>Min</b> or the <b>Max</b> field blank to increase your search results. For example, a blank <b>Min</b> field will return all zero (0) or blank values.
Revenue	A manually entered range for an organization's yearly revenue. You can use abbreviations for multiples of thousands ( <b>K</b> for thousand, <b>M</b> for million, and <b>B</b> for billion). For example, 10K converts to 10,000. Leave the <b>Min</b> or the <b>Max</b> field blank to increase your search results. For example, a blank <b>Min</b> field will return all zero (0) or blank values.
Location Type	A list of organizational types, such as <b>Single Location, Headquarters,</b> and <b>Branch</b>
Ownership	A list of organization ownership types, such as <b>Public, Private,</b> and <b>Government</b> .
Website Domain Type	A list of website domain types, such as <b>.com, .org,</b> and so on. For searches that generate a large list of results, we show the 25 filters with the most results. To see a shorter list, narrow your initial search.

**USER PERMISSIONS**

To search Data.com for accounts:

- No permissions required

Here are your options.

1. Get address and phone information plus a link to the account’s website.
2. View the account’s demographic and financial data. The Account Site field identifies whether the company is a headquarters, a branch, or a single location.
3. Identify the source of the account information (D&B or Jigsaw), and find out when the source’s information was last updated.
4. Click an icon to research the account by searching Google, LinkedIn, or Yahoo Finance. If the account’s data comes from Jigsaw, you’ll see an icon for Data.com and can search there.
5. Click the Data.com Contacts tab to see the account’s Data.com contact breakdown by level and department. Click a number to find the account’s contacts at that level on the Salesforce Data.com tab.
6. Click the Overview tab to get a detailed company description from D&B (if available).
7. Click the Additional D&B Data tab to view the additional D&B fields available, including D-U-N-S Number and NAICS Code.

 **Note:** You can’t see the entire D-U-N-S Number value for an account (on the comparison page or the account card) until the account has been added to Salesforce from Data.com or (for existing records) cleaned with Data.com. Until you add or clean the record, the number’s first five digits are masked with asterisks (\*).

## Explore Data.com Contacts from the Contact Card

The contact card lets you preview a contact record before deciding whether to add it to Salesforce as a contact or lead or export it to use in other programs. Just click the name of any contact in your Data.com contact search results, and its contact card appears.

-  **Note:** If your search produces a large number of results, contact cards will not be available past page 10. If this happens, have your system administrator contact Salesforce Customer Support to enable unlimited view.
-  **Tip:** You can view the contact card for any of your Salesforce contacts that exist in Data.com. Just do a quick search for the contact on the Data.com tab.

Here are your options.

1. Get the contact's title, address, phone, and email.
2. Get the name and address of the company the contact works for.
3. Search for the contact on Google, LinkedIn, or Data.com.

## Resolve Data.com Record Addition Errors

If errors prevent you from adding one or more Data.com records to Salesforce, we'll provide a .csv error log file to help you fix any record addition errors.

How we provide the error log depends on what you were trying to do. If you were trying to add:

- Fewer than 200 records, you'll see a message with a link to the error log on the Files tab.
  - Two hundred records or more, you'll receive an email with a link to the error log on the Files tab.
  - Any number of records and you *do not* have Chatter enabled, you'll receive an email with the error log attached.
1. Open the record addition error log and review the errors, then take one of these actions.
    - If you see errors regarding duplicate records, you don't need to do anything. *Duplicate* errors mean that the records are already in Salesforce, so you don't need to add them again. If your Data.com preferences are set to allow duplicates, the error log will not include any *duplicate* errors. If your Data.com preferences are set to allow duplicates but your organization also uses duplicate rules to prevent the creation of duplicate records, the duplicate rule will determine if the duplicate record is allowed or blocked. Records that are blocked by the duplicate rule will appear in the error log.
    - If you see errors regarding your organization's custom configurations, such as triggers, validation rules, or workflow, let your administrator know because they may need to correct these configurations.
    - If your organization uses state and country picklists and you see errors regarding available states or countries, notify your administrator, who will need to add the particular state or country to the picklist.
    - For all other errors, contact your administrator, who may need to contact Salesforce Customer Support.
  2. After your administrator resolves the errors, try again to add the Data.com records to Salesforce.

## Understand D&B Company Records

If your organization has Data.com Premium Prospector or Data.com Premium Clean, account and lead records include the `D&B Company` field, which links to an associated D&B Company record with over 70 additional fields from Dun & Bradstreet (D&B). This gives your organization integrated access to D&B's trusted global database of company information directly in Salesforce.

Dun & Bradstreet (D&B) is the world's leading source of commercial information and insight on businesses, enabling companies to Decide with Confidence<sup>®</sup> for over 170 years. D&B's global database contains the world's largest source of business records, and is backed by D&B's proprietary DUNSRight<sup>®</sup> quality assurance process, ensuring you that company information is complete and accurate.

When an account or lead is added to Salesforce from Data.com, a D&B Company record is automatically created and linked to that account or lead via the `D&B Company` field. Cleaning an account or lead, either manually or via automated jobs, also creates a D&B Company record if you don't yet have one in Salesforce. Just click the link in the `D&B Company` field to open the corresponding D&B Company record and view the rich set of D&B data, including a `Company Description` field, plus sections like Primary Data and Firmographic Data. If the D&B Company record is linked to an account, the Accounts related list on the page links back to the account record.

For example, if you add an account record for Starbucks from Data.com, when you open its record, the `D&B Company` field value is Starbucks Corporation. The value is underlined to identify it as a link. Just click the link to open the Starbucks Corporation D&B Company record.

For accounts or leads not added from Data.com (those created manually, for example), if a corresponding D&B Company record exists, it is added to Salesforce and linked to the account or lead record the first time that record is cleaned.

If your company also uses Data.com Premium Clean, you can use automated jobs to update your D&B Company records.

D&B Company records linked to account records are not cleaned along with linked account records, but users can manually refresh them to get the latest data from D&B.

## D&B Company Fields

Organizations with Data.com Premium Prospector or Data.com Premium Clean have access to our complete set of Dun & Bradstreet (D&B) data—over 70 fields, including NAICS and SIC codes and descriptions. This information is available in fields on D&B Company records.

When an account or lead is added to Salesforce from Data.com, a D&B Company record is automatically created and linked to that account or lead via the `D&B Company` field. Cleaning an account or lead, either manually or via automated jobs, also creates a D&B Company record if you don't yet have one in Salesforce. Just click the link in the `D&B Company` field to open the corresponding D&B Company record and view the rich set of D&B data, including a `Company Description` field, plus sections like Primary Data and Firmographic Data. If the D&B Company record is linked to an account, the Accounts related list on the page links back to the account record.

This topic defines the fields you'll see on D&B Company records.

 **Note:** Some D&B field labels are different from the object field labels they are mapped to. For example, the `Account Site` field on account records maps to the `Location Type` field on the linked D&B Company record. For a list of default mappings, see [Default Data.com-to-Salesforce Field Mappings](#), on page 1644

Field	Description
<code>Annual Sales Volume</code>	The total annual sales revenue in the headquarters' local currency. D&B tracks revenue data for publicly traded companies, Global Ultimates, Domestic Ultimates, and some headquarters. D&B does not supply this data for branch locations.
<code>Annual Sales Volume Indicator</code>	The reliability of the <a href="#">Annual Sales Volume</a> figure. Available values are <i>Actual number</i> , <i>Low</i> , <i>Estimated (for all records)</i> , <i>Modeled (for non-US records)</i> . A blank value indicates this data is unavailable.
<code>Company Description</code>	A brief description of the company, which may include information about its history, its products and services, and its influence on a particular industry. This data is supplied by Hoover's.
<code>Delinquency Risk</code>	The probability that a company will pay with a significant delay compared to the agreed terms. The risk level is based on the standard Commercial Credit Score, and ranges from low risk to high risk. Also known as marketing prescreen. Available values are <i>High risk of delinquency</i> , <i>Low risk of delinquency</i> , and <i>Moderate risk of delinquency</i> . D&B supplies this data for US and Canadian organizations only.

Field	Description
	 <b>Important:</b> Use this information for marketing pre-screening purposes only.
Domestic Ultimate Business Name	The primary name of the Domestic Ultimate, which is the highest ranking subsidiary, specified by country, within an organization's corporate structure.
Domestic Ultimate D-U-N-S Number	The <a href="#">D-U-N-S Number</a> for the Domestic Ultimate, which is the highest ranking subsidiary, specified by country, within an organization's corporate structure.
D-U-N-S Number	The Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the D&B database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking.
Facsimile Number	The company's facsimile number.
Fifth NAICS Code	An additional NAICS code used to further classify an organization by industry. See <a href="#">Primary NAICS Code</a> .
Fifth NAICS Description	A brief description of an organization's line of business, based on the corresponding NAICS code. See <a href="#">Primary NAICS Description</a> .
Fifth SIC8 Code*	An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
Fifth SIC8 Description	A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
Fifth SIC Code	An additional SIC code used to further classify an organization by industry. See <a href="#">Primary SIC Code</a> .
Fifth SIC Description	A brief description of an organization's line of business, based on the corresponding SIC code. See <a href="#">Primary SIC Description</a> .
Fifth Tradestyle	An additional tradestyle used by the organization. See <a href="#">Primary Tradestyle</a> .
FIPS MSA Code	The Federal Information Processing Standards (FIPS) and the Metropolitan Statistical Area (MSA) codes identify the organization's location. The MSA codes are defined by the US Office of Management and Budget. D&B supplies this data for US organizations only.
FIPS MSA Code Description	A brief description of an organization's <a href="#">FIPS MSA code</a> . D&B supplies this data for US organizations only.
Fourth NAICS Code	An additional NAICS code used to further classify an organization by industry. See <a href="#">Primary NAICS Code</a> .

Field	Description
Fourth NAICS Description	A brief description of an organization's line of business, based on the corresponding NAICS code. See <a href="#">Primary NAICS Description</a> .
Fourth SIC8 Code*	An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
Fourth SIC8 Description	A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
Fourth SIC Code	An additional SIC code used to further classify an organization by industry. See <a href="#">Primary SIC Code</a> .
Fourth SIC Description	A brief description of an organization's line of business, based on the corresponding SIC code. See <a href="#">Primary SIC Description</a> .
Fourth Tradestyle	An additional tradestyle used by the organization. See <a href="#">Primary Tradestyle</a> .
Fortune 1000 Rank	The numeric value of the company's Fortune 1000 ranking. A null or blank value means that the company isn't ranked as a Fortune 1000 company.
Geocode Accuracy	The level of accuracy of a location's geographical coordinates compared with its physical address. Available values include <i>Rooftop level, Street level, Block level, Census tract level, Mailing address level, ZIP code level, Geocode could not be assigned, Places the address in the correct city, Not matched, Not matched, Street intersection, PO BOX location, and Non-US rooftop accuracy</i> .
Global Ultimate Business Name	The primary name of the Global Ultimate, which is the highest entity within an organization's corporate structure and may oversee branches and subsidiaries.
Global Ultimate D-U-N-S Number	<a href="#">The D-U-N-S Number</a> of the Global Ultimate, which is the highest entity within an organization's corporate structure and may oversee branches and subsidiaries.
Import/Export	Identifies whether a business imports goods or services, exports goods or services, and/or is an agent for goods.
International Dialing Code	The required code for international calls.
Latitude	The geographical coordinates that specify the north-south position of a point on the Earth's surface. Used with <a href="#">longitude</a> to specify a precise location, which is then used to assess the <a href="#">Geocode Accuracy</a> .
Legal Structure	Identifies the legal structure of an organization. Available values include <i>Cooperative, Nonprofit organization,</i>

Field	Description
	<i>Local government body, Partnership of unknown type, and Foreign company.</i>
Local Currency Code	The currency in which the company's sales volume is expressed. The full list of values can be found at the <a href="#">Optimizer Resources</a> page maintained by D&B.
Local Currency ISO Code	The code used to represent a company's local currency. This data is provided by the International Organization for Standardization (ISO) and is based on their three-letter currency codes. For example, USD is the ISO code for United States Dollar.
Location Ownership Indicator	Indicates whether a company owns or rents the building it occupies.
Location Type	Identifies the organizational status of a company. Available values are <i>Single location, Headquarters/Parent, and Branch.</i>
Longitude	The geographical coordinates that specify the east-west position of a point on the Earth's surface. Used with <a href="#">latitude</a> to specify a precise location, which is then used to assess the company's <a href="#">Geocode Accuracy</a> .
Mailing Address	The address where a company has its mail delivered. If the mailing address is the same as the primary address, this field will be blank.
Marketing Segmentation Cluster	Twenty-two distinct, mutually exclusive profiles, created as a result of cluster analysis of D&B data for US organizations. Available values include <i>High-Tension Branches of Insurance/Utility Industries, Rapid-Growth Large Businesses, Labor-Intensive Giants, Spartans, Main Street USA.</i> D&B supplies this data for US organizations only.
Minority-Owned Indicator	Indicates whether an organization is owned or controlled by a member of a minority group. D&B supplies this data for US organizations only.
National Identification Number	The identification number used in some countries for business registration and tax collection. This field does not apply to US organizations.
National Identification System	Identifies the type of <a href="#">national identification number</a> used. The full list of values can be found at the <a href="#">Optimizer Resources</a> page maintained by D&B.
Number of Business Family Members	The total number of family members, worldwide, within an organization, including the Global Ultimate, its subsidiaries (if any), and its branches (if any).

Field	Description
Number of Employees—Global	The total number of employees at the Global Ultimate, which is the highest entity within an organization's corporate structure and may oversee branches and subsidiaries.
Number of Employees—Location	The number of employees at a specified location, such as a branch location.
Number of Employees—Location Indicator	The reliability of the <a href="#">Number of Employees—Location</a> figure. Available values are <i>Actual number</i> , <i>Low</i> , <i>Estimated (for all records)</i> , <i>Modeled (for non-US records)</i> . A blank value indicates this data is unavailable.
Number of Employees—Total	The total number of employees in the company, including all subsidiary and branch locations. This data is only available on records that have a value of <i>Headquarter/Parent</i> in the <a href="#">Location Type</a> field.
Number of Employees—Total Indicator	The reliability of the <a href="#">Number of Employees—Total</a> figure. Available values are <i>Actual number</i> , <i>Low</i> , <i>Estimated (for all records)</i> , <i>Modeled (for non-US records)</i> . A blank value indicates this data is unavailable.
Out of Business Indicator	Indicates whether the company at the specified address has discontinued operations.
Ownership Type Indicator	Indicates whether ownership of the company is public or private. The subsidiaries of a publicly traded parent company will show a value of <i>Private</i> unless the subsidiaries are independently traded.
Parent Company Business Name	The primary name of the parent or headquarters company.
Parent Company D-U-N-S Number	The <a href="#">D-U-N-S Number</a> for the parent or headquarters.
Primary Address	The address where a company is physically located. This field is <a href="#">Billing Address</a> on account records.
Primary Business Name	The primary or registered name of a company.
Primary NAICS Code	The six-digit North American Industry Classification System (NAICS) code is the standard used by business and government to classify business establishments according to their economic activity for the purpose of collecting, analyzing, and publishing statistical data related to the US business economy. The full list of values can be found at the <a href="#">Optimizer Resources</a> page maintained by D&B.
Primary NAICS Description	A brief description of an organization's line of business, based on its NAICS code.
Primary SIC Code	The four-digit Standard Industrial Classification (SIC) code is used to categorize business establishments by industry. The full list of values can be found at the <a href="#">Optimizer Resources</a> page maintained by D&B.

Field	Description
Primary SIC Description	A brief description of an organization's line of business, based on its SIC code.
Primary Tradestyle	A name, different from its legal name, that an organization may use for conducting business. Similar to "Doing business as" or "DBA".
Prior Year Employees	The total number of employees for the prior year.
Prior Year Revenue	The annual revenue for the prior year.
Second SIC8 Code*	An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
Second SIC8 Code Description	A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
Second NAICS Code	An additional NAICS code used to further classify an organization by industry. See <a href="#">Primary NAICS Code</a> .
Second NAICS Description	A brief description of an organization's line of business, based on the corresponding NAICS code. See <a href="#">Primary NAICS Description</a> .
Second SIC Code	An additional SIC code used to further classify an organization by industry. See <a href="#">Primary SIC Code</a> .
Second SIC Description	A brief description of an organization's line of business, based on the corresponding SIC code. See <a href="#">Primary SIC Description</a> .
Second Tradestyle	An additional tradestyle used by the organization. See <a href="#">Primary Tradestyle</a> .
Sixth NAICS Code	An additional NAICS code used to further classify an organization by industry. See <a href="#">Primary NAICS Code</a> .
Sixth NAICS Description	A brief description of an organization's line of business, based on the corresponding NAICS code. See <a href="#">Primary NAICS Description</a> .
Sixth SIC8 Code*	An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
Sixth SIC8 Description	A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
Sixth SIC Code	An additional SIC code used to further classify an organization by industry. See <a href="#">Primary SIC Code</a> .
Sixth SIC Description	A brief description of an organization's line of business, based on the corresponding SIC code. See <a href="#">Primary SIC Description</a> .
Small Business Indicator	Indicates whether the company is designated a small business as defined by the Small Business Administration of the US government. D&B supplies this data for US organizations only.
Stock Exchange	The corresponding exchange for a company's <a href="#">ticker symbol</a> . For example: NASDAQ or NYSE.

Field	Description
Subsidiary Indicator	Indicates whether a company is more than 50 percent owned by another organization.
S&P 500	A true or false value. If <code>true</code> , the company is listed in the S&P 500 Index. If <code>false</code> , the company isn't listed in the S&P 500 Index.
Telephone Number	A company's primary telephone number.
Third NAICS Code	An additional NAICS code used to further classify an organization by industry. See <a href="#">Primary NAICS Code</a> .
Third NAICS Description	A brief description of an organization's line of business, based on the corresponding NAICS code. See <a href="#">Primary NAICS Description</a> .
Third SIC8 Code*	An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
Third SIC8 Description	A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
Third SIC Code	An additional SIC code used to further classify an organization by industry. See <a href="#">Primary SIC Code</a> .
Third SIC Description	A brief description of an organization's line of business, based on the corresponding SIC code. See <a href="#">Primary SIC Description</a> .
Third Tradestyle	An additional tradestyle used by the organization. See <a href="#">Primary Tradestyle</a> .
Ticker Symbol	The abbreviation used to identify publicly traded shares of a particular stock. Also known as the stock symbol.
URL	An organization's primary website address.
US Tax ID Number	The identification number for the company used by the Internal Revenue Service (IRS) in the administration of tax laws. Also referred to as Federal Taxpayer Identification Number. D&B supplies this data for US organizations only.
Woman-Owned Indicator	Indicates whether a company is more than 50 percent owned or controlled by a woman. D&B supplies this data for US organizations only.
Year Started	The year the company was established or the year when current ownership or management assumed control of the company. If the company establishment or ownership year is unavailable, then the year the D&B record was created will be used. D&B does not supply this data for branch locations.

\* Available with Data.com Premium Prospector license only.

## Default Data.com-to-Salesforce Field Mappings

This topic shows which Salesforce fields get values from Data.com when you add records with Data.com Prospector or update records with Data.com Clean. Salesforce admins can customize these field mappings.

### Accounts

Data.com Field	Account Field
Annual Revenue (in US dollars)*	Annual Revenue
Company Description	Description
D-U-N-S Number	D-U-N-S Number
Facsimile Number	Fax
Location Type	Account Site
Mailing Address**	Shipping Address
Number of Employees-Total	Employees
Ownership Type Indicator	Ownership
Primary Address	Billing Address
Primary Business Name	Account Name
Primary NAICS Code	NAICS Code
Primary NAICS Description	NAICS Description
Primary SIC Code	SIC Code
Primary SIC Description	SIC Description
Primary Tradestyle	Tradestyle
Telephone Number	Phone
Ticker Symbol	Ticker Symbol
URL	Website
Year Started	Year Started

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

Available with a Data.com Clean license in: **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

 **Tip:** Not all Data.com fields are mapped by default to the Account page. To map more Data.com fields to Account fields, see [Customize Data.com-to-Salesforce Field Mappings](#) on page 1646, and check out the latest release notes to find new mappable fields.

## Contacts

D&B Field	Contact Field
Primary Address	Mailing Address
Primary Business Name	Account Name

## Leads

D&B Field	Lead Field
Annual Revenue* (in US dollars)	Annual Revenue
Company Description	Description
D-U-N-S Number	Company D-U-N-S Number
Number of Employees-Total	No. of Employees
Primary Address	Address
Primary Business Name	Company

\* The Data.com Annual Revenue field is not directly accessible. It's only used to populate the Annual Revenue field in Salesforce.

\*\*Data.com Clean does not use the Mailing Address mapping for accounts. It only uses the Primary Address value to update accounts.

### SEE ALSO:

[Understand Data.com Searches](#)

## How can I see complete, relevant information for Data.com search results?

We've limited the number of details available for search results that exceed ten pages, to ensure data security.

To see complete, relevant account information in search results:

- Narrow your search using the search filters on the left of the page. Filtering out results that aren't the focus of your search gives fewer, more targeted results. For example, selecting Director-level accounts in a company's Sales department reduces the results from 50 pages to 4, listing only the accounts you're looking for.
- Sort your search results so that the target of your search appears in the first few pages. For example, sorting the Updated column lists the most recently updated accounts first.

Once you've identified the accounts you're looking for, purchase the accounts by adding or exporting them to Salesforce from Data.com. You see full details of the accounts and contacts you purchase and add to your organization.

## Which Data.com user type am I?

It's easy to find out. From your personal settings, enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**. The **Data.com User Type** field identifies you as either a Data.com User or a Data.com List User. If the field is blank, you do not have a Data.com user license.

For a quick definition of your Data.com user type, just click the info icon () next to the field.

### SEE ALSO:

[How Do Data.com User Types, Licenses, and Record Addition Limits Work?](#)

[Using Data.com FAQ](#)

[Find Your Personal Settings](#)

## How can I improve my Data.com search results?

It's easy. Just use [search modifiers](#). To see examples, just click the info icon () above each Data.com search field. It's also helpful to [save searches you use frequently](#).

### SEE ALSO:

[Understand Data.com Searches](#)

## Why do I see companies I didn't search for in my Data.com search results?

For account searches, the Data.com search results you get are based on the company name, the website of the parent company, and the websites of the parent company's subsidiaries and branch locations, if any, so your results may include companies that you didn't actually search for. For example, if you want to find Sun Microsystems and you enter either *Sun Microsystems* or *sun.com* in the **Company** or **Website** field, the results will also include Oracle Corporation because Oracle is the parent company of Sun Microsystems..

### SEE ALSO:

[Understand Data.com Searches](#)

[Using Data.com FAQ](#)

## What's the limit of Data.com records I can add to Salesforce?

From Setup, enter *Users* in the **Quick Find** box, then select **Prospector Users**. In the Data.com Users section, find your name and see what your monthly limit is and how many records you've already added or exported during the month. Your administrator sets the monthly allowance, which expires at the end of each month, regardless of whether you've met your limit.

If you're a Data.com List User, your name also appears in the Data.com List User section of the page. After you've used your monthly record additions, you'll share record additions from a pool with all other List Users in your organization. Your organization's pool has a limit, so if one Data.com List User reaches the limit, other Data.com List Users can't add records. List pools expire one year after purchase.

If adding a set of records causes you to exceed your addition limit, you'll see a message that tells you how many additions you have remaining. If you still need to add more records, contact your administrator.

[Using Data.com FAQ](#)

## When I add CRM records from Data.com, how do I know which field values have Data.com data?

Just check the help topics that define the fields on those records. All fields that are enabled for Data.com data are identified.

- [Account Fields](#)
- [Contact Fields](#)
- [Lead Fields](#)

SEE ALSO:

[Using Data.com FAQ](#)

## What does the **Account site** field value on an Account record mean?

**Headquarters/Parent** indicates that a company is a legal entity with other locations.

**Single location** indicates that a company is a headquarters with no other locations, and that it may or may not be a distinct legal entity.

**Branch** indicates that a company is not a distinct entity. Rather, a branch is a location of a headquarters or parent company.

SEE ALSO:

[What is the difference between the Account Site and Location Type fields?](#)

[Using Data.com FAQ](#)

## Why does the **ownership** field have a value of **Private** for companies I know are public?

Dun & Bradstreet (D&B), who provides this data, only tracks ownership information for headquarters or parent companies. If a publicly traded headquarters or parent company has any subsidiaries, such as branch locations, those subsidiaries show a value of **Private** unless they are traded independently. The value will also be **Private** if the ownership type is unknown.

SEE ALSO:

[What does the Account Site field value on an Account record mean?](#)

[Using Data.com FAQ](#)

## I'm seeing a discrepancy between the numbers in the **Employees** and **Contacts** fields on an Account record. Why?

There are a number of possible reasons.

- The number of employees is only available on records that have a value of **Headquarters/Parent** in the **Account Site** field. This means that a branch location may show a value of zero in the **Employees** field but still have a number of contacts.
- The **Employees** field on Account records shows the total number of employees within a company, including all subsidiary and branch locations. The number of contacts, however, reflects only the contacts at that specific location. So a headquarters location that has 5,000 employees throughout its various locations may only have 3,000 contacts at the headquarters location.
- *Employee* totals come from Dun & Bradstreet (D&B) and usually *do not* include contract employees. *Contact* totals and related data come from the Data.com community and often *do* include contract employees as long as they have a valid company email address.

SEE ALSO:

[Using Data.com FAQ](#)

### I use Data.com and I'm seeing a blank or zero (0) value in the Employee and Revenue fields. Why?

Dun & Bradstreet (D&B) collects revenue data for headquarters and single locations only, so records associated with branch locations won't have a value for the `Annual Revenue` field on account and leads records or the `Annual Sales Volume` field on D&B Company records.

Similarly, D&B doesn't always have confirmed employee counts for branches and single locations, so there might not be a value for the `Number of Employees` field on lead records, the `Employee` field on account records, or the `Number of Employee-Total` field on D&B Company records.

SEE ALSO:

[Using Data.com FAQ](#)

### Why do some leads have a blank or zero (0) value in the `Annual Revenue` and `Number of Employees` fields after I use the Data.com Clean auto-fill feature?

Data.com Clean has improved its location-based matching and, as a result, contacts are now associated with their actual location, rather than the organization's headquarters location. Because Dun & Bradstreet (D&B) only collects revenue data for headquarters locations, leads associated with a branch location or single location won't have a value for the `Annual Revenue` field. Similarly, D&B doesn't always have confirmed employee counts for branch and single locations, so there might not be a value for the `Number of Employees` field on lead records.

If you want to map the revenue and employee data from the headquarters location to the branch or single location records, contact your Salesforce administrator.

SEE ALSO:

[Using Data.com FAQ](#)

### When I use the Employees or Revenue filter to refine my account or contact search results, I get far fewer results than I expect. Why?

Dun & Bradstreet (D&B) doesn't collect revenue data for branch locations and doesn't always have confirmed employee counts for branches or single locations. Therefore, if you enter `1` as your minimum range in the Revenue filter, your search results will exclude all records that have a zero (0) Revenue value. Similarly, if you enter `0` as your minimum range in the Revenue filter, your search results will exclude all records that have a blank Revenue value. The Employee filter works the same way.

If you want all records with a zero (0) or blank Revenue or Employee value included in your filtered search results, be sure to leave the `Min` field blank.

SEE ALSO:

[What does the Account Site field value on an Account record mean?](#)

[Data.com Contact Search Fields and Filters](#)

[Using Data.com FAQ](#)

### Why do some account and D&B Company records have identical D-U-N-S Numbers?

If a company operates within a single country, its Global Ultimate (highest entity within an organization) and Domestic Ultimate (highest entity within an organization in a country) are the same entity, and therefore the values in their `D-U-N-S Number` fields are the same. For definitions of all the D&B fields, see [D&B Company Fields](#).

SEE ALSO:

[Using Data.com FAQ](#)

### What is the difference between the `Account Site` and `Location Type` fields?

`Account Site` is the field found on account records and the Data.com account card. `Location Type` is the field found on D&B Company records. (D&B Company records are available to organizations that have purchased Data.com Premium Prospector.) Both fields contain the same values: `Single location`, `Headquarters/Parent`, and `Branch`.

SEE ALSO:

[Using Data.com FAQ](#)

[Understand D&B Company Records](#)

### Why did I receive a message that says, **You have limited access to data, so you can't completely clean this record?**

If you can't edit one or more fields on an account, contact, or lead record, you'll see this message when you use Data.com Clean to manually clean the record. You'll still be able to clean the fields that you can edit.

Ask your administrator to make sure you can edit the [Salesforce fields affected when cleaning records](#), including D&B fields. How your administrator does this depends on which edition of Salesforce your company uses.

- For Contact Manager, Group, and Professional editions, make sure the fields are on the appropriate page layout.
- For Enterprise, Performance, and Unlimited editions, make sure field-level security is set to `visible` for the fields.

SEE ALSO:

[What Salesforce Fields Are Affected by Data.com Clean?](#)

[Using Data.com FAQ](#)

### Why did I receive a message that says, **You can't clean this record because you have limited data access, as set by your administrator?**

If you don't have appropriate access to the `D&B Company` object, you'll see this message when you use Data.com Clean to manually clean an account.

Ask your administrator to make sure you have read access to the `D&B Company` object.

## Keep Your Salesforce CRM Records Up to Date with Data.com Clean

Leverage valuable company information from D&B and millions of crowd-sourced contacts to ensure your Salesforce records are up to date and complete. You can manually clean your records from the record detail page or from a list view, or use Data.com Clean to run automated jobs that review and update all of your accounts, contacts, and leads.

### IN THIS SECTION:

#### [Clean Records Manually with Data.com Clean](#)

Use Data.com Clean to manually update your account, contact, and lead records. Manual clean lets users compare a single Salesforce record side by side with its matched Data.com record and update the Salesforce record field by field.

#### [Clean a List of Salesforce Records with Data.com Clean](#)

With Data.com Clean, you can select account, contact, and lead records from a list, and clean them all at one time. A Data.com Clean license is required to clean records from a list.

#### [Refresh D&B Company Records](#)

If your organization doesn't use Data.com Clean jobs for updating D&B Company records, you can manually refresh records to get the latest D&B data. D&B Company records are available in organizations that use either Data.com Premium Prospector or Data.com Premium Clean.

#### [What Salesforce Fields Are Affected by Data.com Clean?](#)

#### [Data.com Clean Statuses](#)

If you use Data.com Prospector or Data.com Clean, your Salesforce account, contact, and lead records have a `Clean Status` field, which indicates the record's clean status as compared with Data.com.

#### [What Does the Data.com Clean Status Tell Me About a Record?](#)

The `Clean Status` field on account, contact, and lead records indicates how the record's data compares with data from Data.com. If you click the icon next to the status, you'll get more status details, plus options for refreshing the status. Depending on the status, you can also clean some records right from the `Clean Status` field.

#### [Learn More about Cleaning Records with Data.com Clean](#)

When you clean a record, you're comparing your Salesforce data with information in Data.com. There are a number of important concepts to understand about this process, including how to select matching records and how to mark Data.com records as wrong.

#### [Manually Add Information to an Individual Account, Contact, or Lead](#)

If you need to test whether Data.com clean rules are working, you can manually add information to an individual Salesforce record.

## Clean Records Manually with Data.com Clean

Use Data.com Clean to manually update your account, contact, and lead records. Manual clean lets users compare a single Salesforce record side by side with its matched Data.com record and update the Salesforce record field by field.

Data.com Clean offers a number of ways to clean records. Users can clean individual records manually or clean groups of records from a list view. Your organization can also clean batches of records using automated Clean jobs. Manual clean works for *all* the account, contact, and lead records you have access to in Salesforce—not just those you previously added from Data.com. Manual clean is available to organizations that have purchased Data.com Clean, and to any Salesforce user with a Data.com Prospector license.

 **Note:** If you clean your account records with Data.com Prospector or Data.com Clean, Data.com converts non-USD currencies to USD every month, which may cause the values in the `Annual Revenue` field to change. For organizations that use non-USD currencies, we ignore the `Annual Revenue` field when determining a record's clean status (so the `Clean Status` field's value does not change). We also remove the value from the `Annual Revenue` field on account records and the clean comparison page.

1. Open the record and check its `Clean Status` field. Even if its status is `In Sync`, you can manually clean the record. And if your organization uses D&B's DUNSRight matching service, you may be able to match your record to a different one from Data.com.

 **Tip:** From the `Clean Status` field, you can also get additional status information (such as which fields have different data in Data.com) and then clean the record. Just click the status icon () and the popup will guide you.

2. Click **Clean** to open the comparison page and compare the Salesforce record with Data.com's.

3. Compare the two records side by side. You'll see a check mark next to any Data.com field value that matches the corresponding value in your Salesforce record.

4. Select the checkbox next to any Data.com value you want to accept.

5. If you use DUNSRight Matching and want to look for a different match from Data.com, click **Wrong Match?**

6. Click **Save** when you're satisfied that the record is accurate, even if you don't accept any data from Data.com. The `Clean Status` field reflects the record's current status and its time stamp is updated to reflect your activity.

 **Note:** If you click **Cancel**, your Salesforce record's data won't be updated, but if Data.com finds a better match for the record, the values in its `Clean Status` and `Data.com Key` fields may change. These two fields always reflect the best match from Data.com as of the most recent clean process, regardless of the method used to clean the record.

If your organization uses Data.com Premium Clean or Data.com Premium Prospector and you've manually cleaned an account or lead record that doesn't yet have a D&B Company record linked to it, Salesforce will create a D&B Company record (if available) and link it to the account or lead record when you click **Save**. The next time you open the comparison page, the linked record will be identified by its D-U-N-S Number in the `D&B Company Record Linked` field.

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Clean license in:  
**Professional, Enterprise, Performance,** and  
**Unlimited** Editions

With Data.com Clean, you can select account, contact, and lead records from a list, and clean them all at one time. A Data.com Clean license is required to clean records from a list.

Data.com Clean offers a number of ways to clean records. Users can clean individual records manually or clean groups of records from a list view. Your organization can also clean batches of records using automated Clean jobs.

Cleaning from a list works for all the account, contact, and lead records you have access to in Salesforce—not just those you previously added from Data.com. When you click the Accounts, Contacts, or Leads tab, you can select a view to see a list of the records you’re allowed to view. The results you see are called a *list view*. From the list view, simply select the records you want to clean and Data.com Clean does the rest.

 **Note:** If you’re cleaning records from a standard list view, make sure your system administrator has added the `Clean Status` field to the view. If you’re cleaning records from a custom list view you’ve created, you’ll need to add the `Clean Status` field yourself. If you use Data.com Social Key together with Social Accounts and Contacts, you or your administrator can also add the fields for the applicable social networks (LinkedIn, Twitter, or Facebook) to your contact list views.

1. Click the tab (Accounts, Contacts, or Leads) for the object whose records you want to clean from your list.
2. Select a view from the drop-down and click **Edit**.
3. From the list, select the records you want to clean, and click **Clean**.
4. Select one of these Clean options.
  - `Update Clean Status` will update each record’s `Clean Status` field. If you use Social Key, social handles will be added to the record, if available.
  - `Update Clean Status and Fill Blank Fields` will update each record’s `Clean Status` field and fill blank fields with Data.com data. If you use Social Key, social handles will be added to the record, if available.
5. Click **Update**.  
We’ll provide a confirmation message telling you how many records were matched, updated, and whether any errors occurred. If your organization uses Social Key with contacts and leads, we’ll also let you know if we were able to supply social handles.
6. Review the changes to your records.

If you selected the option to update only the `Clean Status` field and now find records with a clean status of `Different`, you can manually clean each record from its detail page.

## Refresh D&B Company Records

If your organization doesn't use Data.com Clean jobs for updating D&B Company records, you can manually refresh records to get the latest D&B data. D&B Company records are available in organizations that use either Data.com Premium Prospector or Data.com Premium Clean.

1. Open the D&B Company record you want to refresh. You can do that from the link in the `D&B Company` field on the account record, or from the D&B Companies list view.
2. Click **Refresh**.

### USER PERMISSIONS

To refresh D&B Company records:

- "Edit" on accounts

## What Salesforce Fields Are Affected by Data.com Clean?

 **Note:**

- These fields may be different if your organization uses customized Data.com-to-Salesforce field mappings.
- If you can't edit one or more fields on an account, contact, or lead record, you may receive a message that says, *You have limited access to data, so you can not completely clean this record* or *You have limited access to account fields, so you can not update all the fields shown here*. If this happens, ask your administrator for help.

When you use Data.com Clean to clean a Salesforce record, either manually or with automated jobs, the record's fields are updated with Data.com data. Here's a list of the fields that are updated.

### Account Fields

Account Name	Industry
Account Site	NAICS Code
Annual Revenue	NAICS Description
Billing Address	Ownership
Clean Status	Phone
D&B Company (Premium Prospector and Clean only)	SIC Code
Data.com Key	SIC Description
D-U-N-S Number	Ticker Symbol
Description	Tradestyle
Employees	Website
Fax	Year Started

### Contact Fields

Clean Status	Mailing Address
Data.com Key	Phone
Email	Title
Name	

#### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

Available with a Data.com Clean license in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

## Lead Fields

Address	Email
Annual Revenue	Industry
Clean Status	Name
Company	No. of Employees
Company D-U-N-S Number	Phone
D&B Company (Premium Prospector and Clean only)	Title
Data.com Key

## Data.com Clean Statuses

If you use Data.com Prospector or Data.com Clean, your Salesforce account, contact, and lead records have a `Clean Status` field, which indicates the record's clean status as compared with Data.com.

Clean Status	Definition	API Value	Notes
 Not Compared	The current version of the Salesforce record has not been compared with Data.com. This status may occur because: <ul style="list-style-type: none"> <li>The record was <i>created manually</i> in Salesforce (not <i>added from Data.com</i>) and has not yet been compared with Data.com.</li> <li>The Salesforce record was previously compared with Data.com but later edited by a user and not compared again.</li> <li>The Salesforce record was previously compared with Data.com but later updated by a workflow or other automated process (such as lead conversion)</li> </ul>	Pending	Records you add from Data.com are always <code>In Sync</code> until the data changes in one or both of the records.  After you clean the record and a match is found in Data.com, the record's <code>Clean Status</code> changes to <code>Reviewed</code> until one of these conditions is met. <ul style="list-style-type: none"> <li>The two records are identical (<code>In Sync</code> status).</li> <li>The record is updated in Salesforce or Data.com</li> </ul>

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

Available with a Data.com Clean license in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

Clean Status	Definition	API Value	Notes
	<p>and not compared with Data.com again.</p> <ul style="list-style-type: none"> <li>You map Data.com fields to Salesforce fields and one or more newly mapped Data.com fields has no value.</li> </ul>		<p>(<code>Different</code> status).</p> <ul style="list-style-type: none"> <li>The record becomes inactive in Data.com (<code>Inactive</code> status).</li> </ul>
 <code>In Sync</code>	<p>When your Salesforce record was last compared with the Data.com record, the two were identical. Records with <code>In Sync</code> status are considered to be clean.</p>	<code>Matched</code>	<p>Records in <code>In Sync</code> status are considered to be clean, but you can repeat the clean process.</p> <p>Click the icon in the <code>Clean Status</code> field and check the time stamp to see when the record was last compared.</p>
 <code>Reviewed</code>	<p>When your Salesforce record was last compared with the Data.com record, the user who compared them:</p> <ul style="list-style-type: none"> <li>Kept one or more values from the Salesforce record.</li> <li>May have also flagged a field value as <i>wrong</i> to Data.com.</li> <li>Marked a record as <i>Inactive</i>.</li> </ul> <p>or</p> <ul style="list-style-type: none"> <li>Your Clean jobs are set to overwrite values for one or more fields, and one or more values were overwritten during the most recent job.</li> </ul>	<code>Acknowledged</code>	<p>Records in <code>Reviewed</code> status are considered to be clean, but you can repeat the clean process.</p> <p>After you clean the record and a match is found in Data.com, the record's <code>Clean Status</code> remains in <code>Reviewed</code> status until one of these conditions is met.</p> <ul style="list-style-type: none"> <li>The two records are identical (<code>In Sync</code> status).</li> <li>The record is updated in Salesforce or Data.com (<code>Different</code> status).</li> <li>The record becomes inactive in Data.com (<code>Inactive</code> status).</li> <li>Any fields previously flagged as <i>wrong</i> to Data.com have been reflagged as <i>right</i>.</li> </ul>
 <code>Different</code>	<p>The Salesforce record has different data from the corresponding Data.com record.</p> <p> <b>Note:</b> It's important to remember that a record's clean status can change from <code>In Sync</code> or <code>Reviewed</code> to <code>Different</code> when values change in the matched Data.com record. This may happen regularly as updated information</p>	<code>Different</code>	<p>After you clean the record and a match is found in Data.com, the record's <code>Clean Status</code> remains in <code>Different</code> status until one of these conditions is met.</p> <ul style="list-style-type: none"> <li>The two records are identical (<code>In Sync</code> status).</li> </ul>

Clean Status	Definition	API Value	Notes
	from Data.com and D&B is made available.		<ul style="list-style-type: none"> <li>A user reviews the two records and keeps one or more values from the Salesforce record (<code>Reviewed</code> status).</li> <li>The record becomes inactive in Data.com (<code>Inactive</code> status).</li> </ul>
 Select Match	Data.com does not have a record qualified for an <i>automatic</i> match but does have one or more potential matches. You can select one from up to five (5) match candidates.	<code>SelectMatch</code>	This status is available with the Data.com Clean product and D&B DUNSRight matching service only.
 Not Found	The Salesforce record has no similar records in Data.com record.	<code>NotFound</code>	The record can't be cleaned in Salesforce because Data.com could not find a record to match it with.
 Inactive	The Data.com record corresponding to the Salesforce record has been reported as inactive by either Data.com or a user in your organization. A contact record may be inactive if it contains out-of-date or inaccurate information. An account record is inactive if D&B has marked it as out of business.	<code>Inactive</code>	<p><code>Inactive</code> records are hidden from Data.com Prospector search results by default, but you can use filters to show them.</p> <p>If clean the record and report it as <code>Active</code> to Data.com, the record's clean status changes to <code>Reviewed</code>.</p>
 Skipped	<p>Either:</p> <ul style="list-style-type: none"> <li>The Salesforce record encountered an error related to a validation rule or trigger when it was last saved, causing the next incremental sync Clean job to set the record's status to <code>Skipped</code>.</li> </ul> <p>or</p> <ul style="list-style-type: none"> <li>The record's clean status was set to <code>Skipped</code> via the API.</li> </ul> <p><i>Incremental sync</i> Clean jobs <i>do not</i> process records with <code>Skipped</code> clean status.</p> <p><i>Full sync</i> Clean jobs process records with <i>any</i> clean status that encountered errors related to validation rules, triggers, or other customizations when last saved, but those</p>	<code>Skipped</code>	<p>Work with your administrator to either:</p> <ul style="list-style-type: none"> <li>Modify the trigger, validation rule, or API customization that caused the error and the <code>Skipped</code> status, and then clean the record again manually or with Clean jobs.</li> </ul> <p>or</p> <ul style="list-style-type: none"> <li>Ask your administrator to consider selecting the <code>Skipped Records Clean Job Bypass</code> preference, which causes <i>both incremental and full sync jobs</i> to skip processing</li> </ul>

Clean Status	Definition	API Value	Notes
	records' Clean Status field values do not change until the errors are resolved.		for records in Skipped clean status.

### What Does the Data.com Clean Status Tell Me About a Record?

The Clean Status field on account, contact, and lead records indicates how the record's data compares with data from Data.com. If you click the icon next to the status, you'll get more status details, plus options for refreshing the status. Depending on the status, you can also clean some records right from the Clean Status field.

Here's an example that shows some of your options.

1. This record's status is **Different** because when it was last compared, one week before, the records in Salesforce and Data.com had different values for some or all of their fields. The user who compared the records previously may have:
  - Decided not to accept any of the Data.com values.
  - Accepted some values from Data.com and kept some Salesforce values.
  - Clicked **Cancel** on the comparison page.

Click the icon to view the popup, which provides additional information and Clean options.

2. This line tells you about the Salesforce record's most recent comparison activity. In this case, a user compared the Salesforce account record with Data.com's version one week ago.
3. This section provides more details about the comparison. In this case, Data.com had *different* Email, Phone, and Mailing Address values for the contact.
4. You can click the **Clean...** link to compare the Salesforce and Data.com records yourself.

If you click **Cancel**, the record's clean status will remain **Different**. If you click **Save**, even if you haven't accepted any Data.com values, the record's clean status will be **Reviewed**.

## Learn More about Cleaning Records with Data.com Clean

When you clean a record, you're comparing your Salesforce data with information in Data.com. There are a number of important concepts to understand about this process, including how to select matching records and how to mark Data.com records as wrong.

### IN THIS SECTION:

#### [Flag an Account, Contact, or Lead Field Value as Wrong or Right to Data.com](#)

When you use Data.com Clean to clean a Salesforce record, if you know that one of its fields has an incorrect, or "*wrong*" value, you can report that information to Data.com. If a field value has been reported as wrong, we'll let you know. If you believe the field value is correct, or "*right*," you can tell us that, too.

#### [Report an Account, Contact, or Lead as Inactive or Active to Data.com](#)

When you use Data.com Clean to clean a Salesforce record, if you know the related account, contact, or lead is either out of business or not active at a company, you can report that information to Data.com. If an account, contact, or lead has been reported as `Inactive` to Data.com, we'll let you know. If you believe the account, contact, or lead is `Active`, you can tell us that, too.

#### [Select a Matching Data.com Record for a Salesforce Account](#)

If your organization uses D&B's DUNSRight™ matching service to match and clean your account records, we automatically match records according to a preset D&B confidence code, which your administrator selects. If we don't have a record qualified for an *automatic* match, but we have identified one or more *potential* matches, we'll set your record's clean status to `Select Match`. This clean status lets you know you need to *manually* review match candidates and select one. After you select a match, you manually clean your Salesforce record in the usual way.

#### [Select a Different Data.com Match for a Salesforce Account Record](#)

If your organization uses D&B's DUNSRight Matching service, and you believe an account record has been matched incorrectly to a Data.com record, you may be able to match to a different Data.com record. After you select a new match, you manually clean your record in the usual way.

#### [How Are Salesforce and Data.com Records Matched?](#)

If you clean your Salesforce account, contact, and lead data with Data.com, it's important to understand how your Salesforce records are compared and matched with records from Data.com.

#### [Guidelines for Selecting an Account Matching Service](#)

If you use Data.com Prospector or Data.com Clean, you can select the matching service your organization uses to clean account records. It's important to understand each service, its clean behaviors, and related considerations before selecting your service.

#### [D&B Match Grades](#)

If your organization uses D&B DUNSRight™ matching service to clean records, the D&B match grade helps you decide which record is the right one when selecting a match.

#### [Compare Salesforce and Data.com Data at a Glance](#)

When you manually clean a Salesforce account, contact, or lead record, you compare the data in your Salesforce record with data from Data.com. When you click the **Clean** button or `Clean Status` field value from a record, the comparison page appears. There you'll see the Salesforce record's fields and values side by side with the Data.com record's fields and values.

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

Available with a Data.com Clean license in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

## Flag an Account, Contact, or Lead Field Value as Wrong or Right to Data.com

When you use Data.com Clean to clean a Salesforce record, if you know that one of its fields has an incorrect, or “*wrong*” value, you can report that information to Data.com. If a field value has been reported as wrong, we’ll let you know. If you believe the field value is correct, or “*right*,” you can tell us that, too.

When you clean an account, contact, or lead record, if you know that a particular field value is incorrect, you can flag that value as *wrong* to Data.com. If the value has been flagged as *wrong*, but you know the value is correct, you can flag it as *right*. On the comparison page, most fields offer the flagging option.

### Note:

- If your account, contact, or lead record’s `Clean Status` value is `In Sync`, and you flag a field value as *wrong* on the comparison page, the record’s `Clean Status` value changes to `Reviewed`.

1. From the record, click **Clean** to open the comparison page.
2. If you want to flag a field value as *wrong*, click the down arrow next to the field and select **Flag as wrong to Data.com**.  
A red flag (  ) appears next to the field.
3. Click **Save**.
4. If a field value has been flagged as *wrong*, but you know it’s right, click the down arrow next to the field and select **Flag as right to Data.com**.  
The red flag disappears.
5. Click **Save**.

When an `email` field value is flagged as wrong, that information is immediately submitted to Data.com’s automated fact processing system. If enough Data.com users flag the same email, the record may ultimately be marked as `Inactive` by Data.com. When other fields are flagged as wrong, the information is reviewed by data stewards at Data.com or D&B.

## Report an Account, Contact, or Lead as Inactive or Active to Data.com

When you use Data.com Clean to clean a Salesforce record, if you know the related account, contact, or lead is either out of business or not active at a company, you can report that information to Data.com. If an account, contact, or lead has been reported as *Inactive* to Data.com, we'll let you know. If you believe the account, contact, or lead is *Active*, you can tell us that, too.

An account, contact, or lead may be designated as *Active* or *Inactive* by either Data.com or a Data.com Clean user. For accounts, *Inactive* means out of business, and for contacts or leads, it means the associated person no longer works at the company.

If a record is *Inactive*, we'll let you know the source of that status, and if the source is Data.com, we'll tell you why. For example, we'll tell you if an account is out of business, a contact is no longer employed at the company, or a contact or lead's phone or email is invalid.

1. From the account, contact, or lead record, click **Clean** to open the comparison page.
2. If the account, contact, or lead is inactive, click **Report as Inactive**.
3. Click **Save**.  
The record's `Clean Status` field now shows that it's *Inactive*.
4. If an account has been reported as inactive, but the company remains in business, or a contact or lead has been reported as inactive, but the person still works at the company, you can clean its record again. On the comparison page, you'll see a message telling you the record's current reported status—*out of business* for accounts or *Inactive* for contacts and leads—and who reported it: Data.com or a user.
5. Click **Report as Active**.  
The record's `Clean Status` field reverts to the value it had before the record was reported as *Inactive*. For example, if a contact's `Clean Status` is *Reviewed*, and then the contact is reported as *Inactive*, its clean status will change to *Inactive*. If the contact is later reported as *Active*, its clean status reverts to *Reviewed*.

## Select a Matching Data.com Record for a Salesforce Account

If your organization uses D&B’s DUNSRight™ matching service to match and clean your account records, we automatically match records according to a preset D&B confidence code, which your administrator selects. If we don’t have a record qualified for an *automatic* match, but we have identified one or more *potential* matches, we’ll set your record’s clean status to `Select Match`. This clean status lets you know you need to *manually* review match candidates and select one. After you select a match, you manually clean your Salesforce record in the usual way.

### Select a Data.com Match for your Salesforce Account Record

1. If you need to select an initial match, from the record, click the `Select Match` clean status value, then click **Select Account from Data.com**.  
On the select match page, you’ll see up to five match candidates, with the most similar record at the top.
2. Review the candidates. Hover over any candidate’s gray match grade bar to view the record’s D&B DUNSRight match information, including its confidence code and match grade details (if available). The blue match grade legend shows D&B code letters that correspond to these fields in your account record, in this order left to right:  
`Account Name or Tradestyle | Street Number | Street Name | City | State / Province | Mailing Address / PO Box | Phone`
3. Click any code letter to see the field name and an explanation.

Letter	Definition
A	Values either match exactly or are similar enough that they should be considered to match.
B	Values are similar.  In some cases, when Data.com and D&B data are updated at different times, if a field on the D&B record is blank, the match grade letter will indicate that the field values are similar (B) instead of blank (Z).
F	Values do not match.
Z	Value is blank in one or both of the records.  When the <code>State</code> value is blank within a D&B record, the <code>Street</code> field value is normalized to be blank. In these cases, both fields are colored gray in the match grade legend and the match grade for each is <code>Z</code> .

4. Highlight the match you want, then click **Select and Proceed to Clean**. If you don’t find a match you want, click **Cancel**; your record’s status will remain `Select Match`.
5. Clean the record.

## EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in:  
**Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

Available with a Data.com Clean license in:  
**Professional, Enterprise, Performance,** and **Unlimited** Editions

## USER PERMISSIONS

- To clean account records:
- “Edit” on accounts
- To clean contact records:
- “Edit” on contacts
- To clean lead records:
- “Edit” on leads

The record's `Clean Status` field is updated.

 **Example:** For example: your organization's D&B Confidence Code setting is `9`. You open your United Technologies account record to find that its `Clean Status` field value is `Select Match`. You click the status value to open the select match page. There you see four match candidates from Data.com. You hover over the match grade bar for the top candidate: United Technologies Corporation. In the popup, you see that the United Technology record's confidence code is `8`. The match grade legend shows these letters: **B A B A A Z**. You know that `A` means the values should be considered to match, so you check out the values that do not.

You click the first **B** and see that the `Account Name` field values are similar, but not a clear-cut match: your record's `Account Name` value does not include `Corporation` while the Data.com record's `Account Name` value does. You click the second **B** and find that your record's `City` value is `Francisco` while the Data.com record's `City` value is `San Francisco`. So... similar, but not an exact match. You click **Z** and see that your record's `Phone` value is blank. The Data.com record's `Phone` value is `+1.415.901.7000`.

The Data.com United Technologies Corporation record looks like the one that matches your United Technologies record, so you select it, then click **Select and Proceed to Clean**. On the comparison page, you click **Select All** to accept all of the Data.com record's values, including the `Account Name`, `City`, and `Phone` values that were different or blank in your record. You click **Save** and your record's clean status changes to `In Sync`. Awesome.

## How Are Salesforce and Data.com Records Matched?

If you clean your Salesforce account, contact, and lead data with Data.com, it's important to understand how your Salesforce records are compared and matched with records from Data.com.

 **Tip:** For complete details about how the Data.com matching service works, including a graphic overview and extensive examples, please see our white paper, [Data.com Record Matching in Salesforce](#).

Watch a Demo:  [Understanding Matching Rules](#)

Salesforce and Data.com records can be compared and matched in two ways.

- Manually, when a user clicks **Clean** on an individual account, contact, or lead record.
- Via Clean jobs, which automatically attempt to match all your account, contact, or lead records.

*Automated* clean jobs are only available to organizations that purchase Data.com Clean. *Manual* clean is available to all licensed Data.com Prospector users.

The first time a Salesforce record is cleaned—either manually or via automated job—the matching service searches Data.com for similar records. It examines the field values in each record and looks for enough identical or similar information to indicate that the two records represent the same entity (that is—the same account, contact, or lead). If Data.com finds a match, the two records are linked by a numeric value in the `Data.com Key` field. For contact and lead records, every time the Salesforce record is cleaned, the matching service is used to match the record. For account records, every time the Salesforce record is cleaned, the `D-U-N-S Number` field is used to match (or look up) the record. If the `D-U-N-S Number` field is blank, the matching service will be used to find a match. If the Salesforce record changes substantially, the next time it is cleaned, the matching service may look for a better match from other Data.com records.

 **Note:**

- If you prefer to rematch account records with the matching service, regardless of whether a D-U-N-S Number is present, please contact Salesforce Customer Support. Doing so, however, may cause some account records to have the `Data.com Clean Not Found` status.
- If you've remapped or skipped mapping for the `D-U-N-S Number` field, or if your organization purchased Data.com prior to December 16, 2011, the matching service will automatically be used to rematch account records.

For contacts and leads, the important fields are:

- Name
- Email

Ideally, use a direct email address rather than a group address like `info@org.com`. (Identical Email values will almost always trigger a match unless other values in the record conflict.) **Note:** Data.com does not store emails that may be personal contact information, such as those from Gmail or Yahoo.

- Account Name for contacts; Company for leads.
- Title
- Phone

For accounts, the important fields are:

- Account Name
  - Make sure the account name doesn't contain any unrelated artifacts, such as numbers (1002), special characters (!#@#), or unrelated words. (These symbols are acceptable if they are part of the company's name.)
  - Try to avoid country and state names as values unless they are part of the company's name.

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

Available with a Data.com Clean license in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

- If the account name contains more than one word, like *DSGI Business (PC World Business)* try both of them.
- If an account name is also a Website (like *salesforce.com*), try leaving off the subdomain (.com and the like).
- **Billing Address**
  - Use a full address, if possible.
  - Try to specify a value for the `Country` field. This will optimize your match rates.
  - Try to specify a value for the `State` or `ZIP code` field.
  - If you know the account's street name but not its street number, use the street name only. A street name without a street number is better than no value.
- **Website**
- **Phone**

### Guidelines for Selecting an Account Matching Service

If you use Data.com Prospector or Data.com Clean, you can select the matching service your organization uses to clean account records. It's important to understand each service, its clean behaviors, and related considerations before selecting your service.

The available matching services are:

#### Data.com matching

Data.com's own matching technology, which matches on the `Account Name`, `Billing Address`, `Website`, and `Phone` fields.

The Data.com matching service is always used when cleaning accounts that have a valid `D-U-N-S Number`, even if the DUNSRight matching service is selected.

#### D&B DUNSRight™ matching

D&B's proprietary data-quality technology, which uses a rigorous process to normalize data and match D&B company records to your account records. The process also employs the D&B Confidence Code, which ranks Data.com match candidates based on how similar they are to your record, from 1 (not similar) to 10 (identical or highly similar). D&B also provides letter-coded match grades for individual fields. For details about how D&B DUNSRight matching works, see [D&B Entity Matching](#).

#### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, **Performance**, and **Unlimited Editions**

Available with a Data.com Clean license in: **Professional**, **Enterprise**, **Performance**, and **Unlimited Editions**

Attribute	Data.com matching	DUNSRight™ matching
Default matching service	✓	
Includes D&B's Confidence Code		✓
Supports broad international matching <sup>1</sup>		✓
Supports non-English speaking countries		✓
Requires default mapping for <code>D-U-N-S Number</code>		✓

<sup>1</sup>D&B DUNSRight matching provides matching records for over 200 more countries than Data.com matching. DUNSRight matching *does not* support these countries and regions: Admiralty Islands; Åland Islands; Antarctica; Ascension Island; Bonaire; Bouvet Island; British Indian Ocean Territory; Caroline Islands; Cocos (Keeling) Islands; Cuba; Curaçao; French Southern Territories; Guernsey; Heard Island and

McDonald Islands; Isle of Man; Jersey; Korea, Democratic People's Republic of; Mayotte; Micronesia, Federated States of; Midway Islands; Mongolia; Niue; Palau; Palestinian Territory Occupied; Pitcairn; Saint Barthélemy; Saint Eustatius and Saba; Saint Martin (French part); Sint Maarten (Dutch part); South Georgia; South Sandwich Islands; Svalbard and Jan Mayen; Timor Leste; Turkish Cyprus; United States Minor Outlying Islands; Wake Island; Wallis and Futuna; Western Sahara.

D&B Match Grades

If your organization uses D&B DUNSRight™ matching service to clean records, the D&B match grade helps you decide which record is the right one when selecting a match.

Hover over any candidate’s gray match grade bar to view the record’s D&B DUNSRight match information, including its confidence code and match grade details (if available). The blue match grade legend shows D&B code letters that correspond to these fields in your account record, in this order left to right: `Account Name or Tradestyle | Street Number | Street Name | City | State / Province | Mailing address / PO Box | Phone`

Letter	Definition
A	Values either match exactly or are similar enough that they should be considered to match.
B	Values are similar.  In some cases, when Data.com and D&B data are updated at different times, if a field on the D&B record is blank, the match grade letter will indicate that the field values are similar (B) instead of blank (Z).
F	Values do not match.
Z	Value is blank in one or both of the records.  When the <code>state</code> value is blank within a D&B record, the <code>street</code> field value is normalized to be blank. In these cases, both fields are colored gray in the match grade legend and the match grade for each is <code>Z</code> .

## Compare Salesforce and Data.com Data at a Glance

When you manually clean a Salesforce account, contact, or lead record, you compare the data in your Salesforce record with data from Data.com. When you click the **Clean** button or **Clean Status** field value from a record, the comparison page appears. There you'll see the Salesforce record's fields and values side by side with the Data.com record's fields and values.

Cleaning records is easier if you understand how to read and use the comparison page. Here's what you'll find there.

1. The columns present Salesforce and Data.com records side by side, so you can easily compare the data from each source.
2. Field names appear on the left.
3. If your Salesforce data matches Data.com's you'll see a green check mark (✓) for that field in the Data.com column.
4. If Data.com has data for a field that's blank or different in Salesforce, you'll see a checkbox. Select it to accept Data.com's data.
5. When you clean an account, contact, or lead record, if you know that a particular field value is incorrect, you can flag that value as *wrong* to Data.com. If the value has been flagged as wrong, but you know the value is correct, you can flag it as *right*. On the comparison page, most fields offer the flagging option.
6. If you use Data.com Premium Prospector or Data.com Premium Clean, when you clean an account or lead record, we create a D&B Company record (if one is available from Data.com and doesn't yet exist in Salesforce) and link it to the account or lead. The D&B Company record is identified on the comparison page.
7. If your Salesforce record is currently matched to a Data.com record and you think the match is wrong, click **Wrong Match?** and select a different Data.com record. This feature is available for D&B DUNSRight matching only.
8. By default, fields that have identical data are hidden. Click **Show Identical Fields** to see them all, along with the fields that have different data (as in this example). If there are a lot of fields, a scroll bar may appear. To hide identical fields, click **Hide Identical Fields**.
9. When you clean a Salesforce record, if you know the related account, contact, or lead is either out of business or not active at a company, click **Report as Inactive** to report that information to Data.com. If you believe the account, contact, or lead is active, you can tell us that, too.

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in:  
**Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited Editions**

Available with a Data.com Clean license in:  
**Professional, Enterprise, Performance,** and **Unlimited Editions**

10. Click **Save** when you're satisfied that you have the data you want, even if you don't make any changes. The Salesforce record's clean status will be updated as appropriate. If you click **Cancel**, your Salesforce record's data won't be updated, but if Data.com finds a better match for the record, the values in its `Clean Status` and `Data.com Key` fields may change. These two fields always reflect the best match from Data.com as of the most recent clean process, whether the record was cleaned manually (by you) or automatically (via Clean jobs).

 **Note:** You can't see the entire `D-U-N-S Number` value for an account (on the comparison page or the account card) until the account has been added to Salesforce from Data.com or (for existing records) cleaned with Data.com. Until you add or clean the record, the number's first five digits are masked with asterisks (\*).

## Run Data.com Data Assessments

To run a data assessment, your organization must have the Data.com Data Assessments AppExchange app installed. Contact your salesforce.com sales rep if you need Data Assessments.

Data.com Data Assessments is a Salesforce AppExchange package that tells you how many of your organization's records Data.com can enrich with more and better data. It can also tell you how many of your records have been marked as `Inactive` in Data.com, and if you request, how many records in your Salesforce organization appear to be duplicates. Data assessments also list the fields on accounts, contacts, and leads, and tell you how many are blank within your records and how many have different values from Data.com's. Your organization can request one assessment every 30 days.

1. From the Force.com app menu, select Data.com Assessment to open the Data Assessment app.
2. Click the Data.com Assessment tab and define your assessment preferences.
3. Click **Start My Assessment**. We'll tell you how long we expect it to take. The completion calculation is based on 15 records per second, and we round up to the nearest hour. So if you have 200,000 accounts, for example, your assessment will take about 3 hours and 45 minutes to complete. We'll estimate it at 4 hours.

## Analyze Data Quality with Data.com Data Assessments

How many of your organization's records can Data.com enrich with more and better data? Data.com Assessments can tell you. It can also identify how many of your records have been marked as `Inactive` in Data.com or appear to be duplicates.

Data assessments also lists the fields on accounts, contacts, and leads, and tell you how many are blank within your records and how many have different values from Data.com's. (For example, you may have 10 account records in which the `Phone` field value is blank, or five contacts in which the `Account Name` field is blank.) You can use it to help you decide whether to purchase Data.com Clean, which will update fields with blanks or out-of-date values. If you already use Clean, it can help show you the value you're getting.

Data.com Data Assessments is a free AppExchange package.

Available with a Data.com Clean license in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

#### USER PERMISSIONS

- To install packages:
- "Download AppExchange Packages"

1. Go to the Data.com reports package you want to download.
2. Click **Get it Now**.
3. Install the Data.com reports packages you want to use.
4. If your organization uses Professional Edition, add these fields to your page layouts. If you don't, these fields won't be included on your reports.

Page Layout	Fields
Account	Sourced from Data.com
Contact	Sourced from Data.com
Lead	Sourced from Data.com
Opportunity	Sourced from Data.com

5. Let your users know which Data.com reports and dashboards are available.

### View and Understand Data.com Data Assessments

When your Data.com data assessment is complete, you can take a look, and learn how Data.com can enhance your CRM records. You can also view previous assessments run by you or other users in your organization.

 **Tip:**

- For more information about clean status values, including those provided in data assessments (*In Sync*, *Different*, and *Inactive*) see [Data.com Clean Statuses](#) on page 1162.
- To learn more about how Data.com matching works, check out our white paper: [Data.com Record Matching in Salesforce](#).

1. If you need to, from the Force.com app menu, select `Data.com Assessments`.
2. Click the Data.com Assessment tab, then click the Assessments tab.
3. Click **View Assessments** next to the assessment you want.
4. Click through the assessment tabs. Here's what you'll find.

Tab	What it Tells You
Summary	Breaks down the set of records we analyzed for the assessment. It tells you how many we can enrich with better data, how many records are likely to be inactive in Data.com and if you requested it when you ran the assessment, how many of your records are likely to be duplicates. We also tell you how many of your records were matched to Data.com records and how many were not.
Accounts	Breaks down the account records we matched, showing the number and percentage of records by status and identifying the match percentage. Data assessments also list Account fields and for a given field, tell you how many records have blank values for that field and how many have values that are different from Data.com's. (For example, you may have 10 account records in which the <code>PHONE</code> field value is blank.)
Contacts	Breaks down the contact records we matched, showing the number and percentage of records by status and identifying the match percentage. Data assessments also list Contact fields and for a given field, tell you how many records have blank values for that field and how many have values that are different from Data.com's. (For example, you may have five contact records in which the <code>ACCOUNT</code> field value is blank.)
Leads	Breaks down the lead records we matched, showing the number and percentage of records by status and identifying the match percentage. Data assessments also list Lead fields and for a given field, tell you how many records have blank values for that field and how many have values

Tab	What it Tells You
	that are different from Data.com's. (For example, you may have 12 lead records in which the <code>Title</code> field value is different from Data.com's.)
Unmatched	Data.com's matching algorithm uses key fields to identify matching records. This tab lists those fields, and shows you the number and percentage of blank field values within your unmatched records. Adding valid data to these fields will most likely improve your organization's match results.
DUNSRight	Shows the expected account match rate using D&B DUNSRight Matching. The confidence code is a number from 1 to 10. A match confidence code of 10 is the most precise and the most exact match. You can set a confidence level threshold that identifies records as Matched or Select Match. Matched records are automatically added to your automated clean process. You can manually add Select Match records to your automated clean process.

## Find Your Nearby Accounts, Contacts, and Leads

Visiting New York and wanting to check in on your most valuable customers and highest-quality leads? If your Salesforce records have accurate geocode information, it's a cinch to find your nearby accounts, contacts, and leads.

1. Using the Salesforce API, query records within a specified radius of a latitude and a longitude.

**Example: Salesforce Object Query Language (SOQL) query for the first 20 contacts within a 50-mile radius of San Francisco**

```
SELECT Name, Email, MailingAddress, MailingCity, MailingState, MailingCountry,
MailingLatitude, MailingLongitude
FROM Contact
WHERE distance(MailingAddress, geolocation(37.775, -122.418), 'mi') < 50
ORDER BY distance(MailingAddress, geolocation(37.775, -122.418), 'mi')
LIMIT 20;
```

SEE ALSO:

[Manually Add Geocode Information for an Individual Address](#)

## Data.com Prospector

Use Data.com Prospector to search valuable company information from Dun & Bradstreet and millions of crowd-sourced contacts to find the records your business needs. Add these records to Salesforce as new accounts, contacts, and leads, or export them to use in other apps. It's a great way to get the data you need to plan your sales territories, segment campaigns, find new accounts to engage, and expand your sales network.

All Salesforce users can search Data.com for accounts and contacts. Users with a Data.com Prospector license can:

- Add accounts and contacts to Salesforce, and add contacts as leads.
- Add contacts for an account directly from the account record.
- Export accounts and contacts from Data.com.
- Manually clean Salesforce account, contact, and lead records, regardless of whether they were added from Data.com.
- Get prospecting insights into accounts' business, financial, competitive, and industry details.
- Get company hierarchical views of parent-child relationships and account information, such as the annual revenue, ownership, and number of employees. (Available to Data.com Premium Prospector users as a beta feature.)

Available with a Data.com Prospector license in:

**Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

There are two versions of Data.com Prospector: Corporate Prospector and Premium Prospector. They differ based on the Dun & Bradstreet fields that are included when you add or manually clean account or lead records. Premium Prospector users also have access to the Company Hierarchy page.

Data.com Prospector Version	Dun & Bradstreet (D&B) Fields
Data.com Corporate Prospector	Basic set of Dun & Bradstreet fields.
Data.com Premium Prospector	Basic set of Dun & Bradstreet fields, plus the <code>D&amp;B Company</code> field. This field links to an associated Dun & Bradstreet Company record with over 70 additional Dun & Bradstreet fields that are accessible on the <code>D&amp;B Companies</code> tab. The Company Hierarchy page provides a hierarchical view of Dun & Bradstreet company relationships.

Organizations that purchased Data.com prior to December 16, 2011 may still be using an earlier version of the product with a limited set of fields. We're retiring this version in Summer '14. For information about upgrading to Data.com Prospector, contact your Salesforce account manager. The Salesforce Help refers to the Data.com Prospector product unless otherwise noted.

## Data.com Clean

Data.com Clean provides a number of ways to keep your Salesforce CRM records up to date by leveraging company information from D&B and millions of crowd-sourced contacts. There are two versions of the Data.com Clean product: Corporate Clean and Premium Clean. They differ based on the D&B fields that are available when you clean account or lead records.

Clean compares your Salesforce account, contact, and lead records with records from Data.com and creates a link between your Salesforce record and its matching Data.com record. Clean also provides [clean status information for Salesforce accounts, contacts, and leads](#) on page 1162.

Users with a Clean license can:

- Manually compare individual Salesforce records side by side with matched Data.com records, and update Salesforce records field by field.
- Select account, contact, and lead records from a list, and clean them all at once.
- Manually refresh D&B Company records linked to accounts (Premium Clean only).

Your organization can also:

- Configure and run automated Clean jobs to flag field value differences on Salesforce records, fill blank fields, overwrite field values.
- Use the [Data.com Match API](#) to create a custom solution for specific business purposes like cleaning leads as they are created and cleaning custom objects.

Data.com Clean does not support person accounts.

There are two versions of Data.com Clean: Corporate Clean and Premium Clean. They differ based on the D&B fields that are available when you clean account or lead records, either manually or via automated jobs.

Data.com Clean Version	D&B Fields
Data.com Corporate Clean	Basic set of D&B fields.
Data.com Premium Clean	Basic set of D&B fields, plus the <code>D&amp;B Company</code> field. This field links to an associated D&B Company record with over 70 more

[Confirm that Data.com Clean Is Enabled](#)

[Analyze Data Quality with Data.com Data Assessments](#)

[Data.com Social Key](#)

## Data.com Social Key

Data.com Social Key works with Social Accounts and Contacts and Data.com Clean to make it easier to learn more about your contacts and leads in Salesforce or on social network sites. Your organization must have Data.com Clean enabled to use Social Key.

 **Important:** As of Spring '16, Data.com Social Key and the Data.com Social Profile Match API are no longer available. At that time, social profile handles, such as those from LinkedIn®, aren't added to records that are cleaned with Data.com. And, you can't use the Data.com Social Profile Match API to search for social profile handles.

When Clean jobs are run or records are cleaned from a list, Social Key finds and associates social handles for your contacts and leads. Social Key currently provides social handles for LinkedIn®, Twitter®, and Facebook® for contacts and leads in the United States only. Your administrator selects the social networks you want.

Users log in to a social network from a contact or lead's detail page and view the associated profile from within the Social Accounts and Contacts viewer or on the social network site. There's no manual search required.

 **Note:** Depending on contacts' and leads' privacy settings, as well as the permissions set by their friends or connections and the site's terms of use, users might not see as much information as they would if logged in to their social network accounts directly.

**EDITIONS**

Available in: Salesforce Classic

Available with a Data.com Clean license in:

**Professional, Enterprise, Performance, and Unlimited Editions**

Data.com Clean must be enabled to use Social Key.

## Stay Up to Date with Social Networks and News

### Account Insights

Give your users instant access to relevant, timely news articles about customers, partners, and competitors with Account Insights.

Account Insights provides up to 20 relevant, timely news articles selected to help you stay up-to-date with your accounts, industries you work with, and more. Salesforce pre-processes all news articles to ensure relevance and to filter out spam and inappropriate content. It's not possible to add or change news sources.

Account Insights is available in English only, and only in the Salesforce1 mobile app and Salesforce Lightning Experience.

Accounts Insights provides different articles depending on where you access it.

- On account record detail pages, articles are selected based on the account, its executives, and its industry.
- In Salesforce Today, articles are selected based on recently viewed accounts and opportunities, and on tasks and events for those accounts. In Salesforce1, articles might also be related to the accounts that are associated with attendees on your upcoming mobile calendar events.

Articles are divided into four categories.

#### Account News

Articles related to an account, based on the Account Name entered in Salesforce.

#### Industry News

Articles based on the selected value in the Industry field for each account.

#### Executive News

Articles about individuals who hold executive roles at an account. You don't have to list executives as contacts on the account to get executive news.

#### Trending at My Company

Articles that other users in your Salesforce organization are reading.

Account Insights is curated using technology provided by Data.com and third parties. You don't have to be a Data.com customer to use Account Insights.

-  **Note:** When enabled, Account Insights uses third parties and other Salesforce technologies, which offer different levels of privacy and security protection. These services can save or process some of your organization's data, such as Account Name and Website. Salesforce is not responsible for the privacy and security of data that is shared with third parties when you use this feature.

## Social Accounts, Contacts, and Leads

Increase your users' access to social intelligence and serve current and potential customers better with easy access to social networking within Salesforce

[Watch a demo](#) (3:29 minutes)

Once an account, contact, or lead is linked to a social network profile, you and everyone else in your organization can access current social data without having to log in to other sites.

Organizations using Data.com Clean also get Data.com Social Key, which makes finding social information for contacts and leads even easier. When Data.com Clean jobs are run or you clean records from a list, your contact and lead records are updated with social handles from Twitter, and Facebook, when available.

Social Network	What You See in Salesforce	Supported Objects in Salesforce Classic	Supported Objects in Lightning Experience Salesforce1	Objects Updatable with Data.com Social Key
Twitter	Twitter is a great way to see the public personas of your existing and potential customers and learn what's on their minds. You can see bios, recent tweets, and the people who are following and being followed by your accounts, contacts, and leads.	Accounts Contacts Leads	Accounts Contacts Leads	Contacts Leads
Facebook	Facebook gives you a more personal view of your existing and potential customers and helps you find common interests. For contacts, leads, and person accounts, you can	Accounts Contacts Leads		Contacts Leads

### EDITIONS

Available in: Salesforce Classic and Lightning Experience

Business accounts available in: **All Editions** except **Database.com**

Leads available in: **Groups, Professional, Enterprise, Unlimited, and Developer Editions**

Data.com Clean and Data.com Social Key available in: **Professional, Enterprise, Performance, and Unlimited Editions**

see profiles, status updates, and the number of mutual friends you share. For business accounts, you can view your customers' corporate social media presence, including their company profile and wall posts.

Klout	Klout is a third-party service that analyzes people's influence across social networks, including Twitter, Facebook, and LinkedIn. Use Klout to see the influence of your accounts, contacts, and leads on social media, who they influence, who influences them, and the topics they talk about.	Accounts Contacts Leads
YouTube videos	YouTube helps you find and view videos related to your accounts, contacts, and leads.	Accounts Contacts Leads

After you or another user in your organization associate a social network profile with an account, a contact, or a lead, Salesforce always displays current information about it. Which details each Salesforce user can see depend on how they're connected with the account, contact, or lead on the social network, as well as the privacy settings for the profile. If you aren't signed in to the social network through Salesforce, you see only information the social network user has made publically available.

**⚠ Important:** The Social Accounts, Contacts, and Leads feature uses Facebook, Klout, Twitter, and YouTube public APIs to display social information in Salesforce. Because these social networks have the option of modifying or terminating access to their APIs at any time, salesforce.com can't guarantee the future availability of this feature or any of its functionality, including access to the data that is currently provided or to any particular social network as a whole. As of the Winter '16 release, LinkedIn is no longer available through this feature.

### Get Started in Salesforce1 or the Full Salesforce Site

To get started, simply go to any account, contact, or lead detail page and sign in to your social network accounts. Signing in creates private connections between Salesforce and your social network accounts, allowing you to see external social profiles in Salesforce.

SEE ALSO:

- [Enable Social Accounts, Contacts, and Leads](#)
- [Configure Social Accounts, Contacts, and Leads](#)

## Security and Privacy When Using Social Accounts, Contacts, and Leads

The Social Accounts, Contacts, and Leads feature is built to provide security and privacy for you and your data.

- Salesforce uses the trusted OAuth protocol when you sign in to your Facebook, Twitter, or Klout accounts. Your login credentials aren't exposed to Salesforce, and we never store your passwords.
- Salesforce doesn't import or store social information. Each time you select a social profile or a YouTube video, Salesforce retrieves the information that you want to see directly from the social network. You'll always see current social information for your accounts, contacts, and leads.
- Associating a Salesforce record with a social network account doesn't cause any activity on the social network. For example, when you associate a contact with a Twitter account, you don't become a Follower of that account on Twitter.
- Salesforce never posts anything about you or your activities to your social network accounts.
- Your accounts, contacts, and leads aren't notified when you use Salesforce to view their social network profiles. And your interaction with social networks through Salesforce is read-only as long as you're using the Social Viewer.

 **Note:** If you leave the Social Viewer, for example by clicking a link that opens a new Web browser tab, you're leaving Salesforce and interacting directly with the social network. Actions you perform outside of the Salesforce Social Accounts, Contacts, and Leads viewer may be recorded on the social network.

- Your view of a Facebook or Twitter profile is unique to you and depends on how you're connected with each account, contact, or lead on each social network, as well as on the privacy settings currently in use by the account, contact, or lead. Other Salesforce users must sign in to their own social network accounts, and they'll only see what's permitted to them based on their own connection level. For example, if your Twitter profile is connected to your lead's Twitter profile, you could see that lead's other connections, but another user at your organization whose Twitter profile isn't directly connected with the lead won't.

## Configure Social Accounts, Contacts, and Leads

You can disable the Social Accounts, Contacts, and Leads feature or turn some social networks on or off.

If you disable the Social Accounts, Contacts, and Leads feature for your login, you won't see any social networks for your accounts, contacts, or leads. Or, if you turn off access to an individual social network, you won't be able to view or access data for that social network.

 **Note:** In Salesforce Lightning Experience and the Salesforce1 mobile app, users can access Twitter only, even if other networks are enabled.

1. From your personal settings, enter *Social* in the *Quick Find* box, then select **My Social Accounts and Contacts Settings**, **My Social Accounts and Contacts**, or **Settings**—whichever one appears.
2. Set up Social Accounts and Contacts so that it works the way you want it to.
3. Click **Save**.

To view social network profiles associated with leads:	"Read" on leads

View current information about your accounts, contacts, and leads gathered from their social network profiles and activity by associating each record to a social network profiles on Twitter and FaceBook.

Once you've linked an account, contact, or lead with a social network profile, you can view profile details and the profile's latest activity on the social network from the account's, contact's, or lead's detail page. If your organization uses Data.com Social Key, we provide the links automatically (if available) for Twitter, and Facebook.

 **Note:** What information and activities you can see for each social network profile varies depending on that profile's privacy settings, the permissions set by their friends or connections, and the social network's terms of use. For more information about security and privacy, see [Security and Privacy When Using Social Accounts, Contacts, and Leads](#).

You can link accounts, contacts, and leads with Twitter or Facebook profiles in Salesforce Classic. In Lightning Experience or Salesforce1 can view and link Twitter profiles only.

1. From an account, contact, or lead detail page, sign in to the social network
2. If a social network profile isn't linked with the record yet, Salesforce automatically searches for profiles that match the record's name. Select a profile to link it with the record, or search again using different search parameters if none of the profiles are a good match.
3. View the social information that the social network is sharing with you.
4. In Salesforce Classic you can also:
  - a. Click **Show Photo in Salesforce** to display the social network's profile image as the record profile image in Salesforce.
  - b. Click **View Full Profile** to see the complete social network profile directly in the social network.
  - c. Click **Find Different Profile** to change the social network profile that is linked to the account record.

## Select and Change Profile Images for Accounts, Contacts, and Leads

When you or another user have associated records for accounts, contacts, and leads to social networks profiles, the records display images from Twitter or Facebook profiles. For some networks, profile images appear in Salesforce even when you aren't logged in to the network.

By default, the profile image for an account, a contact, or a lead is the profile image from the first social network linked to the record.

 **Note:** Profile images from Facebook are visible in Salesforce Classic only.

1. On an account, contact, or lead detail page, click any social network icon (     ).
2. In the Social Viewer, select the tab for the social network that has the image you want to use.
3. Click **Show Photo in Salesforce**.

## Troubleshoot Social Accounts, Contacts, and Leads

Increase your users' access to social intelligence and serve current and potential customers better with easy access to social networking within Salesforce

 **Note:** Different social networks are available in different Salesforce products. Review the [social network availability information](#) on page 1187 to ensure the network you're trying to access is available in the product you're using.

### Salesforce Classic

1. Click the social network icons in the header on account, contact, and lead detail pages to display the Social Viewer.
2. If no icons are visible, the Social Accounts, Contacts, and Leads feature may be disabled for your organization. Ask an administrator to [enable the feature](#).
3. If a social network icon is missing, that social network may be turned off.
  - Ask an administrator to [turn on the social network for your organization](#).
  - Review your personal settings and [turn on the network for your login](#).

### Salesforce Lightning Experience

1. Open any account, contact, or lead record detail page.
2. If the Twitter card doesn't appear, the Social Account, Contacts, and Leads feature may be disabled for your organization. Ask an administrator to [enable the feature and turn on Twitter access](#) for your organization.
3. If the feature is enabled but the Twitter card doesn't appear, [review your personal settings](#).

### Salesforce1

1. Open any account, contact, or lead record detail page.
2. If the Twitter card doesn't appear, try the following.
  - Ask an administrator to [enable the Social Accounts, Contacts, and Leads feature](#).
  - Ask an administrator to [turn on Twitter access for the organization](#).
  - Ask an administrator to [add the Twitter card to the mobile page layout](#) for accounts, contacts, and leads.
  - [Review your personal settings](#) to make sure Twitter is turned on for your login.

## Planning, Managing, and Tracking Campaigns

### Campaigns Overview

A campaign is an outbound marketing project that you want to plan, manage, and track within Salesforce. It can be a direct mail program, seminar, print advertisement, email, or other type of marketing initiative. You can organize campaigns into hierarchies for easy analysis of related marketing tactics.

The Campaigns tab displays a home page that lets you quickly locate and report on campaigns. You can also sort and filter campaigns using standard and custom list views. In addition, this tab lets you view and edit detailed information on campaigns.

 **Note:** To manage campaigns, users must have the Marketing User checkbox selected on their personal information page, the appropriate user permissions, and sharing access to the campaign. Other users can only view campaigns and run campaign reports. See [Who has access to campaigns?](#) on page 1236.

In addition, campaigns cannot be disabled for your organization if campaigns are referenced in Apex.

## Campaigns Home

Clicking on the Campaigns tab displays the campaigns home page. Any user can access the campaigns home page.

- To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
- In the **Recent Campaigns** section, select an item from the drop-down list to display a brief list of the top campaigns matching that criteria. From the list, you can click any campaign name to go directly to the campaign detail. Toggle the **Show 25 items** and **Show 10 items** links to change the number of items that display. The fields you see are determined by the “Campaigns Tab” search layout defined by your administrator and by your field-level security settings (available in Enterprise, Unlimited, Performance, and Developer Editions only). The Recent Campaigns choices are:

Recent Campaigns Choice	Description
Recently Viewed	The last ten or twenty-five campaigns you viewed, with the most recently viewed campaign listed first. This list is derived from your recent items and includes records owned by you and other users.
My Active Campaigns	The most recent ten or twenty-five campaigns marked as Active, with the most recently created campaign listed first. This list only includes records owned by you.

- In the **Recent Campaigns** section, click **New** to create a new campaign.
- Under **Reports**, click any report name to jump to that report.

Managing campaigns in Salesforce involves the five major steps listed below. We recommend you follow these steps to make your marketing programs and post-campaign analysis more effective.

See the [Campaign Management Implementation Guide](#) for additional information.

### 1. Create the campaign

After determining your marketing strategy, create a campaign to track your efforts. See [Create Campaigns](#) on page 1223.

### 2. Create your target list

Next define who you want to target with your campaign. The method used to create a target list depends on who you are targeting:

- **Rented or Purchased Lists** - Simply use the list of names as your target list. We recommend that you do not import the names into the system yet.
- **Existing Contacts, Leads, or Person Account** - Run a contact, lead, or person account report in Salesforce and use the **Add to Campaign** button to associate those records with your campaign. Alternatively, go to a list view of contacts or leads and use the **Add to Campaign** button to associate those records with your campaign. Note that person accounts are included in contact list views and can be added to campaigns from them. See [Managing Campaign Members](#) on page 1207.

### 3. Execute the campaign

All campaign execution occurs outside of Salesforce. It can be online or offline, for example:

- **Online** - Send email using an email execution vendor.
- **Offline** - Plan and host a conference; run print or radio advertisements; send direct mail pieces; or host a Web seminar.

### 4. Track responses

The possible types of campaign responses can be divided into the following groups based on the response tracking mechanism:

- **Website Response** - Prospects respond by filling in a form on your website. Use Web-to-Lead to set up a jump page or microsite for the campaign. All responses are created as leads, and if the Web form includes the `Campaign` field value, the leads are directly associated to the campaign. You can also include the `Member Status` field in the form to automatically mark all submissions with a particular member status.
- **Manual Update** - Customers and prospects respond via phone or mail. A sales or marketing team member can manually update the Campaign History for the lead, contact, or person account. See [Adding, Editing, or Cloning Individual Campaign Members](#) on page 1218.
- **Mass Update/Offline Response** - The third type of response is any response that you track in an offline list, for example, trade show attendance or email responses from your email vendor. In Salesforce, use the Manage Members page to update the member status of leads, contacts, or person accounts that have been associated with your campaign. See [Editing Multiple Campaign Members](#) on page 1209. Alternatively, import the offline list into Salesforce via the Campaign Import Wizards. See [Importing Campaign Members](#) on page 1220.

## 5. Analyze campaign effectiveness

The final step is to analyze the effectiveness of the campaign using reports and campaign statistics. See [Displaying and Editing Campaigns](#) on page 1200 for information on calculating statistics.

SEE ALSO:

[Campaigns FAQ](#)

## Viewing Campaign Lists

The campaigns list page displays a list of campaigns in your current view. To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.

- Click a campaign name to view the detail. Click **Edit** or **Del** to [edit or delete the campaign](#).
- Click **New Campaign** or select **Campaign** from the Create New drop-down list in the sidebar to [create a campaign](#).

## Viewing Campaign Hierarchies

A campaign hierarchy allows you to group campaigns together within a specific marketing program or initiative, which enables you to analyze related marketing efforts more efficiently.

To view the hierarchy for a campaign, click **View Hierarchy** next to the `Campaign Name` field on the campaign detail page. If a campaign is not part of a hierarchy, its corresponding Campaign Hierarchy page shows only the campaign you selected.

A campaign hierarchy shows campaigns that are associated with one another via the `Parent Campaign` field. A hierarchy illustrates a relationship between campaigns, such as a grouping of campaigns within a specific marketing tactic. Each campaign can have only one parent campaign but an unlimited number of sibling campaigns, and a campaign hierarchy can contain a maximum of five levels or generations. In other words, a campaign hierarchy has a maximum depth of five levels but an unlimited breadth on each level. Campaign members, such as contacts and leads, can be included on any level.

On the Campaign Hierarchy page, campaigns are indented to show that they are related to the campaigns above them. Campaigns are listed in descending order based on their hierarchy level. Click any campaign name to open the detail page for that campaign.

Statistics for an individual campaign are in the Campaign Statistics section of the campaign detail page. Aggregate statistics for parent and child campaigns are in the Campaign Hierarchy related list.

**Note:** To ensure accurate reporting, all campaigns in a hierarchy must use the same currency.

SEE ALSO:

[Setting Up Campaign Hierarchies](#)

[Viewing Campaign Hierarchy Statistics](#)

## Viewing Campaign Hierarchy Statistics

Campaign detail pages include a Campaign Hierarchy related list, which displays a parent campaign and all the campaigns directly below the parent campaign in the campaign hierarchy. You can create a campaign hierarchy by associating campaigns with one another using the `Parent Campaign` lookup field on the campaign detail page. Click any campaign in the related list to open the detail page for that campaign.

The Campaign Hierarchy related list provides statistics fields for each campaign in the list as well as the total value for the parent campaign and all the campaigns below it in the campaign hierarchy. Statistics fields are not visible in the related list until campaign hierarchies are enabled for your organization. For more information and a list of fields, see [Setting Up Campaign Hierarchies](#) on page 1203.

The Campaign Hierarchy related list shows a maximum of two hierarchy levels: the parent campaign and its child campaigns. If a child campaign has children, those children do not appear in the related list but their data is included in the campaign hierarchy statistic field values. The campaign hierarchy statistic fields provide aggregate data regardless of whether you have sharing rights to view individual campaigns within the hierarchy. However, if you do not have access to a campaign that appears

in the related list, you cannot view its detail page from the link on the related list. To view all the levels in a campaign hierarchy, click the **View Hierarchy** link next to the `Campaign Name` on the campaign detail page.

SEE ALSO:

[Displaying and Editing Campaigns](#)  
[Campaign Fields](#)

## Displaying and Editing Campaigns

### Displaying Campaigns

Once you have located a campaign on the campaigns home or list pages, click the campaign name to display detailed information. You can also select a campaign name from the Campaign History related list of an associated lead, contact, or person account. If hover details are enabled, hover over any lookup field on the detail page to view key information about a record before clicking into that record's detail page.

### Editing Campaigns

To update a campaign, click **Edit**, and then change the fields you want to update. When you have finished, click **Save**. You can also click **Save & New** to save the current campaign and create another.

Use inline editing to edit fields directly on the detail page. If inline editing isn't enabled, contact your administrator.

 **Note:** To edit a campaign that is a child of another campaign, you must have at least "Read" access on the parent.

### Creating Campaign Hierarchies

When creating or editing a campaign you can use the `Parent Campaign` lookup field to assign a parent to your campaign. In the lookup dialog you can search for an existing campaign or create a new parent campaign. For more information on configuring campaign hierarchies for your organization, see [Setting Up Campaign Hierarchies](#) on page 1203.

### Calculating Campaign Statistics

The campaign detail includes campaign statistic fields, which are updated automatically and include values from all associated records regardless of whether you have read access to those records. If you have campaign hierarchies enabled, the Campaign Hierarchy related list contains aggregate statistics for a parent campaign and all the campaigns below it in the campaign hierarchy.

 **Note:** The campaign statistics calculation process runs every two minutes and processes one campaign's statistics at a time. If there are a large number of campaigns or campaigns with large numbers of campaign members pending, there may be a delay of 10 minutes or more.

### Linking Contacts, Leads, or Person Account to Campaigns

Select one of the following options from the **Manage Members** drop-down button on the campaign detail page:

- **Add Members - Search** to [add campaign members](#) from a search.
- **Add Members - Import File** to add campaign members by [importing leads](#) from a comma-delimited text file (.csv).
- **Edit Members - Search** to [view, update, or delete](#) existing campaign members.
- **Update & Add Members - Import File** to [edit campaign member status](#) using an import file.

#### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional

- Performance
- Unlimited
- Developer

#### USER PERMISSIONS

To view campaign lists:

- "Read" on campaigns

To change campaigns:

- "Edit" on campaigns

AND

Marketing User checked in your user information

### Advanced Setup

Click **Advanced Setup** to customize the `Member Status` values for a campaign. The `Member Status` values are the possible responses that a member can have to the campaign, for example, "Sent," "Responded," "Attended." See [Customizing Campaign Setup](#) on page 1202.

### Campaign Related Lists

- Hover over the links at the top of a detail page to display the corresponding related list and its records. If Chatter is enabled, hover links display below the feed. An interactive overlay allows you to quickly view and manage the related list items. Click a hover link to jump to the content of the related list. If hover links are not enabled, contact your Salesforce administrator.
- The lower portion of the display provides information related to the campaign including activities, attachments, campaign members, campaign hierarchies, and the opportunities that resulted from the campaign. The related lists you see are determined by your personal customization, and by any customization your administrator has made to page layouts or your permissions to view related data. You can click individual items to display additional detail. Click **More** at the bottom of the page or **View More** below a related list to display more items.

### Printing Campaigns

To view a printable display of all information for the campaign, click **Printable View** on the campaign detail page. Use your browser's Print function to print the display.

### Sharing

To share a campaign with other users, groups, or roles, click **Sharing**. See [Sharing Campaigns](#) on page 1230.

To return to the last list page you viewed, click **Back to list** at the top of the campaign detail page. If your organization has enabled collapsible page sections, use the arrow icons next to the section headings to expand or collapse each section on the detail page.

### SEE ALSO:

[Searching for Campaigns](#)

[Managing Campaigns](#)

## Customizing Campaign Setup

For each campaign, Marketing Users must define campaign `Member Status` values. These are the statuses that a lead, contact, or person account may have for a campaign. For example, you might define values of “Planned,” “Sent Invitation,” “RSVP,” and “Attended” for a conference. If you want to copy the `Member Status` values from an existing campaign, you can begin by [cloning that campaign](#).

### User Privileges for Customizing Campaign Setup

- Anyone can view a campaign's advanced setup. You can *edit* advanced setup if:
  - The `Marketing User` checkbox is selected in your user information
  - You have the “Edit” permission on campaigns
  - You have at least read/write sharing access on the campaign record
- If you [replace member status values](#), all campaign records are updated regardless of your sharing access to the related contacts or leads.

### Defining Member Status Values

New campaigns have two default member status values: “Sent” and “Responded”. You can edit them or create new ones.

1. Click **Advanced Setup** on a campaign detail page.
2. Click **Edit**.
3. Update the existing entries or add new values.
4. Click **Add More** as needed to add additional entries. You can add up to 50 entries.
5. Select one entry as the “Default” value.
6. Choose which values will be counted as “Responded.” Members with “Responded” values are tallied in the `Total Responses` field on the campaign.

 **Note:** Modifying the Responded checkbox has broad effects. When you select or deselect the Responded checkbox, [campaign statistics](#) and campaign member details change accordingly. Specifically, the fields `Responded`, `Last Responded Date`, and `Last Modified` change on the campaign member record. For example, if you're working with a status called “Attended” and you select the `Responded` checkbox for it, existing campaign members whose status is “Attended” will then be counted as responses in campaign statistics and the aforementioned date fields will update.

### Replacing Member Status Values

You can globally replace the `Member Status` values for each campaign member. For example, you may decide that “Attended” is a more appropriate value than “Showed Up.”

1. Click **Advanced Setup** on a campaign detail page.
2. Click **Replace** in the Member Status Values related list.
3. Enter the value you want to change, and select the new value.
4. Click **Save**.

#### EDITIONS

[Managing Campaign Members](#)

## Setting Up Campaign Hierarchies

Campaign hierarchies provide a powerful categorization tool that enables you to analyze and report on the health of your related campaigns. By associating campaigns with one another using a lookup relationship, you can group campaigns within a specific marketing program or initiative. A hierarchy can contain a maximum of five levels. Each campaign can have only one parent campaign but an unlimited number of sibling campaigns. By default, the Campaign Hierarchy related list appears on the campaign detail page but does not contain records until campaign hierarchies are configured for your organization.

To set up campaign hierarchies, add the `Parent Campaign` field to your campaign page layout and enable the campaign hierarchy statistics fields.

 **Note:** Depending on your user profile, the campaign hierarchy statistics fields may already be visible.

The campaign hierarchy fields include:

- `Total Num Sent in Hierarchy`
- `Total Expected Revenue in Hierarchy`
- `Total Budgeted Cost in Hierarchy`
- `Total Actual Cost in Hierarchy`
- `Total Leads in Hierarchy`
- `Total Converted Leads in Hierarchy`
- `Total Contacts in Hierarchy`
- `Total Opportunities in Hierarchy`
- `Total Won Opportunities in Hierarchy`
- `Total Value Won Opportunities in Hierarchy`
- `Total Value Opportunities in Hierarchy`
- `Total Responses in Hierarchy`

See [Campaign Fields](#) on page 1224 for a description of each field.

The process for making the fields visible depends on your Salesforce edition. For Enterprise, Unlimited, Performance, and Developer editions, use field-level security. As you make each field visible, Salesforce displays the field's value in the **Hierarchy Total** section of the Campaign Hierarchy related list. For Professional Edition, add the campaign hierarchy statistic fields to the campaign page layout; the fields will appear on the page layout and in the **Hierarchy Total** section of the Campaign Hierarchy related list.

 **Note:** The campaign hierarchy fields provide aggregate data for a parent campaign and all the campaigns below it in the campaign hierarchy, regardless of whether a user has sharing rights to a particular campaign within the campaign hierarchy. Therefore, consider your organization's campaign sharing settings when enabling campaign hierarchy fields. If you do not want users to see aggregate hierarchy data that includes campaigns to which the users do not have access, you can choose to remove any or all of the campaign hierarchy fields from the Campaign Hierarchy related list. If you do not add the campaign hierarchy fields to the related list or page layout, you can still access these fields on reports.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To create a campaign hierarchy:

- "Create" on campaigns
- AND

Marketing User enabled in your user detail page

To set up campaign hierarchies:

- "Customize Application"

Once campaign hierarchies are set up, users can create and assign parent campaigns using `Parent Campaign` and then view details about the hierarchy on the Campaign Hierarchy page or the Campaign Hierarchy related list.

 **Note:** All campaigns within a hierarchy must use the same currency.

The Campaign Hierarchy page, accessible from the **[view hierarchy]** link next to the **Campaign Name** on the campaign record, shows all the levels in a hierarchy and the campaigns included in each level. For more information, see [Viewing Campaign Hierarchies](#) on page 1199. The Campaign Hierarchy related list provides aggregate data for the parent campaign and all the campaigns below it in the hierarchy. For more information see [Viewing Campaign Hierarchy Statistics](#) on page 1199.

[Customizing Campaign Setup](#)

[Campaign Fields](#)

## Associating Influential Campaigns to Opportunities

### Campaign Influence

Associate multiple influential campaigns to a single opportunity.

View influential campaigns from the Campaign Influence related list on the opportunity detail page. The `Primary Campaign Source` field on an opportunity detail page allows you to designate the most influential campaign for that opportunity.

If enabled, automatic association will add influential campaigns to opportunities when the campaign is related to a contact that is assigned a contact role on the opportunity prior to the opportunity close date. You can specify additional automatic association criteria, including a campaign influence time frame that limits the amount of time a campaign can influence a new opportunity after the campaign first associated date and before the opportunity created date. Influential campaigns can also be added to opportunities manually by clicking the **Add Campaign** button in the Campaign Influence related list.

Use the Campaigns with Influenced Opportunities campaign report to view opportunities that have been influenced by multiple campaigns.

Before using the campaign influence feature, you must complete the following.

1. From the object management settings for Opportunities, go to Page Layouts.
2. Add the [Campaign Influence related list](#) to the opportunities page layout.
3. [Set up campaign influence](#).

SEE ALSO:

[Campaign Fields](#)

[Find Object Management Settings](#)

#### EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

#### USER PERMISSIONS

To set up campaign influence:

- "Customize application"

To view the campaign influence related list:

- "Read" on campaigns

AND

"Read" on opportunities

To manually add influential campaigns:

- "Read" on campaigns

AND

"Edit" on opportunities

## Configure Campaign Influence

### Setting up Campaign Influence

You can configure influential campaigns to be automatically added to opportunities. When automatic association is enabled, influential campaigns are added to opportunities when a campaign is related to a contact that is assigned a contact role on an opportunity prior to the close date of the opportunity. For example, if you have an email campaign with a member who is assigned a contact role on an open opportunity, the email campaign will be added to the Campaign Influence related list for that opportunity.

You can set a Campaign Influence Time Frame that specifies the maximum number of days between the campaign first associated date and the opportunity created date, during which a campaign is considered influential. For example, if you specify a Campaign Influence Time Frame of 15 days and one of your contacts becomes a member of a campaign on June 1, the campaign is considered influential to any opportunity that is created and associated with the contact by June 15. Use the association rules to configure additional criteria that campaigns must meet to be automatically associated to an opportunity.

When automatic association is disabled, users must manually add influential campaigns to opportunities using the [Campaign Influence related list](#).

To set up automatic association for campaign influence:

1. From Setup, enter *Campaign Influence* in the **Quick Find** box, then select **Campaign Influence**.
2. Select **Enabled**.
3. In the **Campaign Influence Time Frame** field, optionally specify the maximum number of days between the campaign first associated date and the opportunity created date.

 **Note:** Campaigns associated to a contact prior to this time frame will not be considered influential. The maximum campaign influence time frame is 9,999 days. If you do not want to specify a campaign influence time frame, leave the **Campaign Influence Time Frame** field blank.

4. Optionally, define additional filter criteria that must be met in order for a campaign to be automatically associated.
5. Click **Save**.

Campaigns will be automatically added to the Campaign Influence related list on opportunities when they meet the criteria you specified.

To disable automatic association for campaign influence:

1. From Setup, enter *Campaign Influence* in the **Quick Find** box, then select **Campaign Influence**.
2. Select **Disabled**.
3. Click **Save**.

## Adding Influential Campaigns to Opportunities

Manage lists of campaigns that influence your opportunities directly on opportunity detail pages.

Consider these details before adding influential campaigns to your opportunities.

- Though multiple campaigns can be influential, you can designate only one campaign as the primary campaign source on the opportunity.
- The campaign you designate as the primary campaign source will always appear in the Campaign Influence related list.
- The opportunities fields of the campaign statistics section on a campaign detail page will populate for only the campaign you designate as the primary campaign source. For example, you have an email campaign and a telemarketing campaign that both influence the same opportunity, and you designate the email campaign as the primary campaign source. The campaign statistics opportunities fields will populate for only the email campaign.
- When you select `Primary Campaign Source`, the `Primary Campaign Source` field on the opportunity detail page updates with the name of the primary campaign. It's possible that workflow and Apex rules on opportunities can be triggered by this change.
- When you add campaigns using **Add Campaign** in the Campaign Influence related list, campaign member details don't appear in the related list.

Let's now add influential campaigns from the Campaign Influence related list.

1. View the detail page of an opportunity.
2. Click **Add Campaign** in the Campaign Influence related list.
3. Enter a campaign name in the `Campaign name` field or click  to search for a campaign.
4. If you want to designate the campaign as the primary campaign, select `Primary Campaign Source`.
5. Click **Save**.

You can also [configure filter criteria](#) that, when met, will automatically add influential campaigns to opportunities. For example, you can configure a filter to add only email and telemarketing campaigns.

## Managing Campaign Members

### Managing Campaign Members

Campaign members are created from lead, contact, or person account records. Salesforce provides a variety of ways in which you can manage your campaign members. You can add and update up to 50,000 campaign members at a time through lead, contact, and person account reports; you can search for and add or edit multiple leads and contacts from the Manage Members page; you can add an unlimited number of leads and contacts using a CSV import file; or you can add members to a campaign one at a time from contact or lead detail pages.

#### Adding Campaign Members

You can [add new members to a campaign](#):

- Individually from the [Campaign History related list](#) on a contact, lead, or person account detail page
- By searching for contacts and leads from the [Manage Members page](#)
- [From a campaign, contact, person account, or lead report](#)
- [From a list view of existing contacts or leads](#)
- [From a CSV import file of new leads](#)
- [From a CSV import file of existing members](#)

 **Note:** If a campaign has a campaign member type, you must have access to that campaign member type in order to add members to the campaign. Otherwise, you can only update existing campaign members.

#### Editing Campaign Members

You can edit the details of existing campaign members:

- [Campaign History related list](#) on a contact, lead, or person account detail page
- [From the Campaign Members related list](#) on a campaign detail page
- [From the Manage Members page](#)

#### Updating the Status of Existing Campaign Members

You can update the status of existing campaign members:

- [From the Campaign History related list](#) on a contact, lead, or person account detail page
- [From the Manage Members page](#)
- [From a campaign, contact, person account, or lead report](#)
- [From a CSV import file of existing members](#)

#### Removing Campaign Members

You can remove members of a campaign:

- [From the Campaign History related list](#) on a contact, lead, or person account detail page
- [From the Campaign Members related list](#) on a campaign detail page
- [From the Manage Members page](#)

#### EDITIONS

Available in: **Salesforce Classic**

Available in:

- Professional
- Enterprise
- Performance

- Developer

## Example Uses

- **Create follow-up campaigns**—Search for a custom list view of contacts or leads that is restricted to an earlier campaign and a certain member status, such as “Attended”. Then add items from the generated list to a follow-up campaign. See [Adding Contacts or Leads from a List View to a Campaign](#) on page 1214.
- **Leverage reporting functionality**—Customize a standard report or build a new custom report that returns a list of contacts, person account, or leads that you want to target. With the click of a button, you can add the entire list to a campaign. See [Add Campaign Members from Reports](#) on page 1212.

## Editing Multiple Campaign Members

Editing Campaign Members from the Manage Members Page

 **Note:** Before using the Manage Members page, verify that you are using a supported browser.

To update the campaign member status, edit campaign member details, or remove campaign members from the Manage Members page:

1. Click **Manage Members** and choose **Edit Members - Search** from the drop-down button on a campaign detail page or the Campaign Members related list on a campaign detail page.
2. On the Existing Members subtab, optionally enter filter criteria to find existing members and click **Go!**.

 **Note:** For campaigns with campaign members created from both leads and contacts, you must have “Read” permission on leads and contacts to see all members. If you only have “Read” on leads, you will only see campaign members created from leads; if you only have “Read” on contacts, you will only see campaign members created from contacts.

3. Select the checkboxes next to the records you want to edit. To select all records on the current page, select the checkbox in the header row.
4. Optionally perform the following actions:
  - To change the campaign member status, select a status from the **Update Status** drop-down list.
  - To remove a member from a campaign, click **Remove**.
  - To edit the details of a campaign member, click **Edit**. Fields derived from the lead or contact record can only be edited on the lead or contact detail page. The `Campaign Member Type` field can only be edited on the campaign detail page.
  - To [view, edit, delete, clone, a campaign member](#), click the campaign member’s name in the Name column.

The latest Manage Members page is not available in accessibility mode. In accessibility mode, you can still [add contacts or leads to a campaign](#), [update campaign members](#), and [remove campaign members](#) using the campaign member wizards.

## Using the Campaign Members Related List

With the Campaign Members related list, you can view, add, edit, or remove campaign members directly from a campaign detail page.

The Campaign Members related list displays five campaign members by default. To display more members, click the **Show more** link.

 **Note:** For campaigns with campaign members created from both leads and contacts, you must have “Read” permission on leads and contacts to see all members. If you only have “Read” on leads, you will only see campaign members created from leads; if you only have “Read” on contacts, you will only see campaign members created from contacts.

The **Manage Members** drop-down button in the Campaign Members related list and in the campaign detail section lets you search for leads and contacts and add them as campaign members, update or remove existing members, and add and update campaign members using an import file.

From the Campaign Members related list:

- Click the campaign member’s name in the Name, First Name, or Last name column to [view the campaign member details](#).
- Click **Remove** to remove a campaign member from the campaign.
- Click **Edit** to [edit the campaign member details](#).
- Select one of the following from the **Manage Members** drop-down button:
  - **Add Members - Search** to [add campaign members](#) from a search.
  - **Add Members - Import File** to add campaign members by [importing leads](#) from a comma-delimited text file (.csv).
  - **Edit Members - Search** to [view, update, or delete](#) existing campaign members.
  - **Update & Add Members - Import File** to [edit campaign member status](#) using an import file.

## Adding Multiple Campaign Members

Adding Campaign Members from the Manage Members Page

You can add leads and contacts as members of a campaign from the Manage Members page. To add contacts to a campaign, the [Add to Campaign checkbox must be enabled](#). If a campaign has a campaign member type, you must have access to that campaign member type in order to add members to the campaign. Otherwise, you can only update existing campaign members.

 **Note:** Before using the Manage Members page, verify that you are using a supported browser.

To add campaign members from the Manage Members page:

1. Click **Manage Members** and choose **Add Members - Search** from the drop-down button on a campaign detail page or the Campaign Members related list.
2. On the Add Members subtab, select the **Leads** or **Contacts** radio button to add leads or contacts, respectively.
3. Search for leads or contacts:
  - You can specify search filters and click **Go!**
  - Alternatively, you can select an existing view, such as all open leads, from the Use Existing View drop-down list. Your results will display automatically. If you select an existing view, you can modify its criteria by adding or changing filters, and clicking **Go!**
4. Select the checkboxes next to the records you want to add. To select all records on the current page, select the checkbox in the header row.
5. Select a status from the **Add with Status** drop-down list.

A confirmation message will display and you will see the members you added on the Existing Members subtab.

 **Note:** If you are unable to add contacts, enable the [Add to Campaign](#) checkbox:

1. From the object management settings for contacts, go to Search Layouts.
2. Click **Edit** next to Contacts List View.
3. Select [Add to Campaign](#).
4. Click **Save**.

The latest Manage Members page is not available in accessibility mode. In accessibility mode, you can still [add contacts or leads to a campaign](#), [update campaign members](#), and [remove campaign members](#) using the campaign member wizards.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

To add leads, contacts, or person accounts from a report to a campaign:

1. Click **Add to Campaign** from a campaign, contact, lead, or person account report that returns lead, contact, or person account records.

 **Tip:** You must have sharing access to view the lead or contact you are adding.

If your report returns more than 50,000 records, the button will be disabled. You can modify your report to return fewer records.

2. Use the lookup icon to choose a campaign to which the report results will be added.
3. Choose a member status for the contacts, leads, or person accounts you are adding to the campaign.
4. Choose whether or not to override the member status of members who already exist in the campaign.

If you choose to override the status of existing campaign members, you will be updating their member statuses to whatever value you selected in the previous step.

5. Click **Add to Campaign**.
6. Review the confirmation screen.
7. Click **Done** to return to the report.

 **Note:** You can add campaign members directly from a tabular, summary, or matrix report, but not from a joined report.

Consider the following additional tips when adding campaign members from a report:

- Campaign members are added in batches, so in the event that the process is interrupted, for example, by clicking **Cancel**, some members will still be added.
- If lead or contact records are edited after you click **Add to Campaign** but before they are actually added, they will not be added to the campaign.
- You cannot add converted leads to campaigns. If any converted leads are included in a report, they will be ignored during the add to campaign process.
- If a campaign has a campaign member type, you must have access to that campaign member type in order to add members to the campaign. Otherwise, you can only update existing campaign members.

SEE ALSO:

[Managing Campaign Members](#)

## Adding Contacts or Leads from a List View to a Campaign

To add existing contacts, leads, or person accounts to a campaign from a list view:

1. Navigate to a list view of contacts or leads, such as the “My Contacts” list view. You can create custom list views that restrict results according to campaign name and optionally also by campaign member status.

 **Tip:** You must have sharing access to view the lead or contact you are adding.

Note that person accounts are included in contact list views and can be added to campaigns from them.

2. Check the boxes next to the records you want to select. Optionally, check the box in the column header to select all currently displayed items. Up to 250 records can display on the page at a time.
3. Click **Add to Campaign**. If a campaign has a campaign member type, you must have access to that campaign member type in order to add members to the campaign. Otherwise, you can only update existing campaign members.
4. In the first step of the wizard, enter the name of the campaign you want to update, or click the lookup icon to search for and select an existing campaign.
5. Choose whether or not to override the member status of members who already exist in the campaign.  
If you choose to override the status of existing campaign members, you will be updating their member statuses to whatever value you selected in the previous step.
6. Click **Add to Campaign**.
7. In the second step of the wizard, review confirmation messages about the members you selected. If a selected member already existed in the campaign, then its member status value will have been updated.
8. Click **Done** to exit the wizard and return to the list view.

## Displaying and Editing a Campaign Member

From the campaign member detail page, you can edit, delete, or clone a campaign member record. Additionally, if the campaign member is based on a lead, you can convert the lead; if the campaign member is based on a contact, you can create an opportunity.

To view the campaign member detail page, click the campaign member's name in the Name, First Name, or Last Name columns on the Campaign Members related list on a campaign detail page or on the Existing Members tab.

 **Note:** To view a campaign member, you must have permissions on the campaign and the lead or contact. For example, to view a campaign member created from a lead, you must be able to view both the campaign and the lead.

To edit the campaign member detail page layout, from the object management settings for campaign members, go to Page Layouts, and then click **Edit** next to the page layout name.

### Editing a Campaign Member

To edit a campaign member, click **Edit** on the campaign member detail page, change the fields you want to update, then click **Save**. Fields derived from the contact or lead can only be edited from the lead or contact detail pages.

 **Note:** If your administrator has enabled inline editing for your organization, you cannot use inline editing on the `STATUS` drop-down list on the campaign member detail page. Instead, click **Edit** on the campaign detail page to edit the `STATUS` drop-down list.

### Cloning a Campaign Member

To clone a campaign member, click **Clone** on the campaign member detail page, then select a campaign and a contact or lead. Change the fields you want to clone for the new campaign member, then click **Save**.

### Deleting a Campaign Member

To delete a campaign member, click **Delete** on the campaign member detail page.

 **Note:** Deleting a campaign member record is permanent; the record is not recoverable from the recycle bin. However, the original lead or contact record is not deleted.

### Converting a Lead

If the campaign member was created from a lead, you can click **Convert Lead** on the campaign member detail page to convert the lead. When you convert a lead, the campaign member is still a part of the campaign, but its type changes from lead to contact.

### Creating an Opportunity

If the campaign member was created from a contact, you can click **Create Opportunity** on the campaign member detail page to create an opportunity. When you create an opportunity, the campaign member is still a part of the campaign.

## Campaign Member Fields

These are the fields (in alphabetical order) that make up a campaign member. Most campaign member fields are derived from the lead or contact record from which the campaign member was created and must be edited from the corresponding lead or contact record. Some of these fields may not be visible or editable depending on your page layout and field-level security settings.

Field	Description
Campaign	The campaign to which the lead or contact belongs.
Campaign Member Currency	The default currency for currency amount fields on the campaign member. Amounts display in the campaign member currency and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.
Campaign Member Type	The record type of the campaign member, which determines the page layout available for the campaign member. (Read only)
City	City portion of the lead or contact's address.
Company (Account)	The company, if the campaign member is based on a lead, or the account, if the campaign member is based on a contact.
Contact	The name of the contact, if the campaign member is based on a contact.
Country	Country portion of user's address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Created By	User who created the campaign member. (Read only)
Created Date	Date the campaign member was created. (Read only)
Description	Description of the lead or contact.
Do Not Call	Indicates that the contact does not want to be contacted by phone. If you use Data.com, the <code>Phone</code> field value will be masked out in search results and on the Contact Card, and it will be blank in <code>.csv</code> files created when you export records.
Email	Email address of the lead or contact.
Email Opt Out	Indicates that the contact does not want to receive email. If you use Data.com, the <code>Email</code> field value will be masked out in search results and on the Contact Card, and it will be blank in <code>.csv</code> files created when you export records.
Fax	Fax number of the lead or contact.
Fax Opt Out	Indicates if the person has requested not to be included in broadcast faxes.
First Name	First name of the lead or contact.

### EDITIONS

Available in: Salesforce Classic

The available fields vary according to which Salesforce Edition you have.

<b>Field</b>	<b>Description</b>
First Responded Date	Date the campaign member first responded. (Read only)
Last Modified By	User who last changed the campaign member record. (Read only)
Last Modified Date	Date the campaign member record was last modified. (Read only)
Last Name	Last name of the lead or contact.
Lead	The name of the lead, if the campaign member is based on a lead.
Lead Source	Source of lead, for example, Advertisement, Partner, or Web. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.
Mobile	Mobile phone number for the lead or contact.
Phone	Phone number for the lead or contact.
Responded	Indicates if the campaign member has responded.
Salutation	The salutation for addressing the person, for example, Mr., Ms., Dr., or Prof.
State/Province	State or province portion of user's address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Status	The status of the campaign member, for example, sent or responded.
Street	Street portion of the lead or contact's address.
Title	The title of the lead or contact, for example, President.
Zip/Postal Code	Zip or postal code portion of the lead or contact's address.

## Adding, Editing, or Cloning Individual Campaign Members

For campaigns that elicit responses one-by-one, for example, via a phone call to a sales rep, you can manually link a contact, lead, or person account to a campaign and update that individual's campaign status. Any user can do this from the Campaign History related list on a contact, lead, or person account.

You can also [add multiple campaign members](#) and [edit multiple campaign members](#).

 **Note:** If a campaign has a campaign member type, you must have access to that campaign member type in order to add members to the campaign. Otherwise, you can only update existing campaign members.

### Adding Individual Campaign Members

To add a campaign member:

1. Click **Add to Campaign** in the Campaign History related list on the detail page of the contact, lead, or person account you want to add to the campaign.
2. In the popup window, specify the campaign.
3. On the Campaign Member Edit page, specify the campaign member status.
4. Enter or change any additional information.

Fields derived from the lead or contact record can only be edited on the lead or contact detail page. The `Campaign Member Type` field can only be edited on the campaign detail page.

5. Click **Save**.

### Editing Individual Campaign Members

To edit a campaign member:

1. Find an existing campaign member:
  - Click **Edit** next to the campaign name in the Campaign History related list on the detail page of a contact, lead, or person account
  - Click **Edit** next to the campaign member's name in the Campaign Members related list on the detail page of a campaign
2. Enter or change any additional information.

Fields derived from the lead or contact record can only be edited on the lead or contact detail page. The `Campaign Member Type` field can only be edited on the campaign detail page.

3. Click **Save**.

### Cloning Individual Campaign Members

To clone a campaign member:

1. Click a campaign member's name in the Name, First Name, or Last Name columns in the Campaign Members related list of the detail page of a campaign.
2. Click **Clone**.

#### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

#### USER PERMISSIONS

To add or clone a campaign member:

- "Read" on campaigns
- AND
- "Edit" on leads and contacts

To edit a lead or contact campaign member:

- "Read" on campaigns
- AND
- "Read" or "Edit" on leads or contacts

To edit person account campaign member:

- "Read" on campaigns
- AND
- "Read" or "Edit" on accounts and contacts

3. In the popup window, specify a campaign.
4. On the Campaign Member Edit page, specify either a lead or a contact; do not specify both.
5. Enter or change any additional information.

Fields derived from the lead or contact record can only be edited on the lead or contact detail page. The `Campaign Member Type` field can only be edited on the campaign detail page.

6. Click **Save**.

**Note:** If you have read-only access to a field, the value of that field is not carried over to the cloned record.

## Importing Campaign Members

With the two campaign import wizards, designated Marketing Users can use CSV (comma-separated values) files to import new leads and track the responses of leads and contacts at each stage of a campaign.

For example, you can mark each contact or lead as “Planned” at the beginning of the campaign and then mark them as “Responded” after they respond. These different “responses” are referred to as the Member Status of each lead or contact associated with the campaign.

 **Note:** If commas are not appropriate for your locale, use a tab or other delimiter.

To use one of the import wizards, click the **Manage Members** drop-down button on a campaign detail page and select one of the following:

- **Add Members - Import File** then click **Leads**: With the Data Import Wizard, you can import a list of new names. Salesforce creates leads in the system, and associates those leads with your campaign to create new campaign members.
- **Update & Add Members - Import File** then click **Update & Add Campaign Members**: With the Campaign Update Wizard, you can import a list of existing Salesforce contacts and leads. Salesforce associates the records with your existing campaign member records, and updates their response history. In addition, any new leads or contacts added using the Campaign Update Wizard will be added as members of the campaign.

 **Note:** If a campaign has a campaign member type, you must have access to that campaign member type in order to add members to the campaign. Otherwise, you can only update existing campaign members.

## Using the Data Import Wizard with Campaigns

With the Data Import Wizard, you can import a list of up to 50,000 new leads and associate them with a campaign. Use this wizard for campaigns that generate new leads.

### Example Uses

- If you buy a list of names for a direct mailing, you can import the list to create new leads and associate them with your direct mail campaign.
- If you have a list of individuals who visited your booth at a trade show, you can import the list to create new leads and mark them as “Attended”.

### Tips for Using the Data Import Wizard

- If names in your import file match existing leads, duplicate leads are created.
- If duplicate names exist in the import file, duplicate leads are created.
- If a campaign has a campaign member type, you must have access to that campaign member type in order to add members to the campaign. Otherwise, you can only update existing campaign members.

### Using the Data Import Wizard

1. Prepare your list of names according to the specifications for mapping fields in your lead import file.
2. Click the **Manage Members** drop-down button and select **Add Members - Import File** on the detail page of the campaign you want to update.
3. Click **Leads**.
4. Click **Update existing records**.
5. Select a lead source.
6. Select an assignment rule to assign the leads.
7. Optionally choose to use assignment rule settings to notify the new record owners.
8. Select the default member status for leads with blank or invalid statuses.
9. Select the character encoding of your import file. Most users do not need to change the default setting.
10. Optionally choose to trigger workflow rules for new and updated records.
11. Optionally choose to trigger workflow rules for new campaign members.
12. Choose your import file
13. Click **Next**.
14. Map the Salesforce fields to the fields in your import file, then click **Next**.
15. Map the Salesforce campaign member status field and any campaign member custom fields to your import file, then click **Next**. This is only available if you have campaign member custom fields.
16. Click **Import Now!**.

#### EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

The **Group** Edition can access the Data Import Wizard, but does not have access to campaigns.

#### EDITIONS

## Campaign Update Wizard

With the Campaign Update Wizard, you can import up to 50,000 existing contacts and leads to update the statuses for campaign members. Use this wizard for campaigns that target existing leads or contacts.

### Example Uses

- For a Web seminar targeted at existing leads, you can import a list of those leads with their member statuses for the campaign, for example, “Attended,” “Registered,” and “No Show.”
- For a conference targeted at existing contacts, you can import a list of contacts to track your customers' attendance.

### Tips for Using the Campaign Update Wizard

- Campaign members based on contacts created from converted leads are not updated.
- If the import file includes leads or contacts that are not campaign members, they are added as campaign members.
- The campaign update wizard only changes records to which you have sharing access. Additionally, the campaign update wizard only updates child campaigns if you have at least “Read” access on the parent.
- If a campaign has a campaign member type, you must have access to that campaign member type in order to add members to the campaign. Otherwise, you can only update existing campaign members.

### Using the Campaign Update Wizard

1. Run a contact or lead report in Salesforce, include the `Contact ID` or `Lead ID` field, and export it to Excel.

If you are targeting both leads and contacts, combine the exported lead and contact reports into one CSV (comma-separated values) file in Excel. Make sure the `Lead ID` and `Contact ID` values are in the same Excel column.

 **Note:** If commas are not appropriate for your locale, use a tab or other delimiter.

2. Rename the `Lead ID/Contact ID` column to `Record Id`.
3. Optionally add a column called `Status`, and enter the member status for each record. Records with blank or invalid statuses are assigned the default member status you select in the wizard.
4. Click the **Manage Members** drop-down button and select **Update & Add Members - Import File** on the campaign you want to update.
5. Click **Update & Add Campaign Members**.

### EDITIONS

Available in: Salesforce Classic

Available in:

## Create Campaigns

To create a campaign:

1. Select **Campaign** from the Create New drop-down list in the sidebar or click **New** next to **Recent Campaigns** on the campaigns home page.
  2. Choose the following, then click **Continue**:
    - A campaign record type, which determines the page layout and picklist values for the campaign
    - A campaign member type, which determines the page layout for members of the campaign

 **Note:** These options are only available if your organization has two or more campaign record types or campaign member record types, respectively. To skip this step, set up default record types.
  3. Enter information for the campaign.
  4. Click **Save**, or click **Save & New** to save the campaign and add another.
-  **Note:** New campaigns have two default member status values: "Sent" and "Responded". You can [edit them](#) or [create new ones](#) as needed.

## Cloning Campaigns

The **Clone** button on a campaign creates a new campaign with the same information and member status values as an existing campaign.

1. Click **Clone** on a campaign.

 **Note:** If your organization uses record types, and the campaign you're cloning doesn't have a campaign member type, or has an invalid campaign member type, select campaign member type and click **Continue**.

2. Enter or change any information for the new campaign.

3. Click **Save**.

 **Note:** If you have read-only access to a field, the value of that field is not carried over to the cloned record.

SEE ALSO:

[Campaign Fields](#)

## Campaign Fields

A campaign has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

Field	Description
Active	Checkbox to mark whether the campaign is active or not.
Actual Cost	Amount of money spent to run the campaign.
Budgeted Cost	Amount of money budgeted for the campaign.
Campaign Currency	The default currency for currency amount fields in the campaign. Amounts display in the campaign currency and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.
Campaign Member Type	Record type for campaign members; determines the page layout of the members of the campaign. Available in Enterprise, Unlimited, Performance, and Developer Editions.
Campaign Name	Identifying name for the campaign.
Campaign Owner	Assigned owner of the campaign.

Field	Description
Campaign Record Type	Record type for the campaign; determines the picklist values available for the campaign. Available in Enterprise, Unlimited, Performance, and Developer Editions.
Converted Leads	Number of leads that were converted to accounts due to the marketing efforts in the campaign. Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. For more information on converting leads, see <a href="#">Convert Qualified Leads</a> on page 1256. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
Created By	User who created the campaign including creation date and time. (Read only)
Custom Links	Listing of custom links for campaigns as set up by your administrator.
Description	Description of the campaign. Up to 32KB of data are allowed in this field. Only the first 255 characters display in reports.
End Date	Ending date for the campaign. Responses received after this date are still counted.
Expected Response (%)	Percentage of responses you expect to receive for the campaign.
Expected Revenue	Amount of money you expect to generate from the campaign.
Last Modified By	User who last changed the campaign fields, including modification date and time. This does not track changes made to any of the related list items on the campaign. (Read only)
Num Total Opportunities	Calculated field for number of opportunities associated with the campaign. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
Num Sent	Number of individuals targeted by the campaign. For example, the number of emails sent.
Num Won Opportunities	Calculated field for number of closed/won opportunities associated with the campaign. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.

Field	Description
Parent Campaign	The campaign above the selected campaign in the campaign hierarchy.
Start Date	Starting date for the campaign.
Status	Status of the campaign, for example, Planned, In Progress. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.
Total Actual Cost in Hierarchy	Calculated field for the total amount of money spent to run a campaign hierarchy. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
Total Budgeted Cost in Hierarchy	Calculated field for the total amount of money budgeted for a campaign hierarchy. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
Total Contacts	Number of individuals on accounts that are associated with the campaign. Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
Total Contacts in Hierarchy	Calculated field for number of contacts associated with the campaign hierarchy. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
Total Converted Leads in Hierarchy	Calculated field for the total number of leads associated with the campaign hierarchy that were converted into accounts, contacts, and opportunities. Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.

Field	Description
Total Expected Revenue in Hierarchy	Calculated field for the total amount of money you expect to generate from a campaign hierarchy. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
Total Leads	Number of potential opportunities (leads) associated with the campaign. Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
Total Leads in Hierarchy	Calculated field for the total number of leads associated with the campaign hierarchy. This number also includes converted leads. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
Total Num Sent in Hierarchy	Calculated field for the total number of individuals targeted by a campaign hierarchy, for example, the number of emails sent. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
Total Opportunities in Hierarchy	Calculated field for the total number of opportunities associated with the campaign hierarchy. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
Total Responses	Calculated field for the total number of contacts and unconverted leads that have a <code>Member Status</code> equivalent to "Responded" for the campaign. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or

## Sharing Campaigns

Your administrator defines your organization's sharing model for campaign access. However, you can extend sharing privileges for your own campaigns individually. Use campaign sharing to *increase* access to your campaigns; you cannot restrict access beyond your organization's default access levels.

To view and manage sharing details, click **Sharing** on the campaign detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the campaign. On this page, you can do any of the following:

- To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
- Click **Add** to grant access to the record for other users, groups, roles, or territories.
- Click **Expand List** to view all users that have access to the record.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level.

## Special Considerations

- To share a campaign, you must have Public Full Access to the campaign and have the `Marketing User` checkbox selected in your personal information.
- The **Sharing** button is available depending on your organization-wide default for campaigns.
- Make sure you are sharing records with users who have the appropriate "Read" object permission for viewing the shared records.
- Sharing a campaign does not automatically grant read access to all the campaign members. Make sure that the user you are sharing a campaign with has visibility to the associated leads or contacts.
- The campaign hierarchy statistic fields provide aggregate data for a parent campaign and all the campaigns below it in the hierarchy, regardless of whether a user has sharing rights to a particular campaign within the hierarchy. Therefore, consider your organization's campaign sharing settings when enabling campaign hierarchy statistics. If you do not want users to see aggregate hierarchy data,

## Deleting Campaigns

To delete a campaign, click **Del** next to the campaign on the campaigns list page. You can also delete a campaign by clicking **Delete** on the campaign detail page.

When you delete a campaign, all related events, tasks, and attachments are also deleted. Associated contacts, leads, person accounts, and opportunities are not deleted with the campaign. The deleted campaign is moved to the Recycle Bin. If you undelete the campaign, any related items are also restored.

## Mass Adding Contacts or Leads to a Campaign

To add existing contacts, leads, or person account to a campaign from a campaign detail page:

1. View the campaign you want to update.
2. Click **Manage Members**.
3. Click either **Add Members - Existing Contacts** or **Add Members - Existing Leads**.
4. In the first step of the wizard, choose a campaign member status value to assign to the new members.  
Note that the name of the campaign from which you navigated is automatically populated.

5. Click **Next**.
6. In the second step of the wizard, you see a list of potential members who are not associated with your campaign.

Note that person accounts are included in contact list views and can be added to campaigns from them.

- a. Check the boxes for the records you want to select. Optionally, check the box in the column header to select all currently displayed items. Note that up to 250 records can display on the page at a time.
- b. Click **Add to Campaign**. This immediately saves those individuals as campaign members with the chosen status.
- c. Click the letter links or the **Next Page** and **Previous Page** links to view other list pages, and continue adding members in the same manner.

 **Note:** A confirmation message keeps a running tally of the total number of members added during this session of the wizard. Any members already added during this wizard session are shown with a read-only check mark next to them.

- d. Optionally, modify the display by choosing a different list view or creating a new list view. Note that you can define custom list views that restrict results according to campaign name and optionally also by member status.

7. When you have added all desired members to your campaign, click **Done** to exit the wizard.

## Mass Removing Contacts or Leads from a Campaign

To remove existing contacts, leads, or person accounts from a campaign:

1. View the campaign detail page for the campaign you want to update.
2. Click **Manage Members**.
3. Click either **Remove Members - Existing Contacts** or **Remove Members - Existing Leads**.
4. Choose the campaign members that you want to remove from the campaign:
  - a. Check the boxes for the records you want to select. Optionally, check the box in the column header to select all currently displayed items. Note that up to 250 records can display on the page at a time.
  - b. Click **Remove from Campaign**.
  - c. Click the letter links or the **Next Page** and **Previous Page** links to view other list pages, and continue removing members in the same manner.
 

 **Note:** A confirmation message keeps a running tally of the total number of members removed during this session of the wizard. Any members already removed during this wizard session are shown with a read-only check mark next to them.
  - d. Optionally, modify the display by choosing a different list view or creating a new list view. Note that you can define custom list views that restrict results according to campaign name and optionally also by member status.
5. When you are finished removing members from your campaign, click **Done** to exit the wizard.

### Can I use mass email for my email campaigns?

Mass email is designed for small-scale sales and support mailings, not for marketing purposes. We recommend that you use a third-party email-execution vendor to send emails for marketing campaigns.

SEE ALSO:

[Campaigns FAQ](#)

### How can I add contacts and leads to my campaigns?

Your company's campaigns typically will target existing customers (contacts) and/or prospective customers (leads). Both contacts and leads can be associated with your campaigns as campaign members. You can easily add members from a campaign member detail page by clicking the Manage Members drop-down button in the campaign detail section or in the Campaign Members related list, then selecting one of the following options:

- **Add Members - Search** to [add campaign members](#) from a search.
- **Add Members - Import File** to add campaign members by [importing leads](#) from a comma-delimited text file (.csv).
- **Edit Members - Search** to [view, update, or delete](#) existing campaign members.
- **Update & Add Members - Import File** to [edit campaign member status](#) using an import file.

The following tables describe additional methods to add [campaign members](#).

#### Adding Contacts to Campaigns

Contact Source	Recommended Campaign Member Tool	Maximum Number of Records
A report of existing contacts	<a href="#">Add Campaign Members from Reports</a>	50,000 per report
A .csv file of existing contacts	<a href="#">Campaign Update Wizard</a>	50,000 per import file
A list view of existing contacts	<a href="#">Adding Contacts or Leads from a List View to a Campaign</a>	250 per list page

### Adding Contacts to Campaigns

Contact Source	Recommended Campaign Member Tool	Maximum Number of Records
An individual contact detail page	<a href="#">Adding, Editing, or Cloning Individual Campaign Members</a>	1

### Adding Leads to Campaigns

Lead Source	Recommended Campaign Member Tool	Maximum Number of Records
A report of existing leads	<a href="#">Add Campaign Members from Reports</a>	50,000 per report
A .csv file of new leads	<a href="#">Using the Data Import Wizard with Campaigns</a>	50,000 per import file
A list view of existing leads	<a href="#">Adding Contacts or Leads from a List View to a Campaign</a>	250 per list page
An individual lead detail page	<a href="#">Adding, Editing, or Cloning Individual Campaign Members</a>	1

[Campaigns FAQ](#)

## How can I calculate the ROI for my campaigns?

The Campaign ROI Analysis Report is located on the Reports tab in the Campaign Reports folder. It calculates your campaigns' performance by return on investment (ROI) and average cost. For each campaign in the report:

- ROI, which is expressed as a percentage, is calculated as the net gain (Total Value Won Opportunities - Actual Cost) divided by the Actual Cost.
- Total Value Won Opportunities is the calculated amount of all closed or won opportunities where the campaign is the Primary Campaign Source on the opportunity.

SEE ALSO:

[Campaigns FAQ](#)

## How can I track which opportunities resulted from campaigns?

One key benefit of campaigns is the ability to track how much business has been generated from each campaign. When you create an opportunity, you can fill in the `Primary Campaign Source` field to indicate that the opportunity resulted from a specific campaign.

In addition, when you convert a lead that is linked to a campaign, that campaign is automatically inserted into the opportunity `Primary Campaign Source` field.

If a lead or contact is linked to multiple campaigns, the campaign with which he or she is most recently associated is inserted into the opportunity `Primary Campaign Source` field.

The Opportunities related list on a campaign shows every opportunity that is linked to that campaign. You can also run the Campaign Revenue Report to track which opportunities are linked to your campaigns.

SEE ALSO:

[Campaigns FAQ](#)

### How does Primary Campaign Source work?

Primary Campaign Source is the campaign associated with a lead prior to lead conversion. This value can be manually changed in the lead detail. Additionally, it provides 100% of the amount revenue credit to the specified campaign.

SEE ALSO:

[Campaigns FAQ](#)

### How is Campaign influence different from ROI reports?

Campaign influence tracks pipeline and revenue for multiple campaigns, and ties all campaigns of a contact role to that opportunity for pipeline and ROI reporting. This is especially helpful for longer deal cycles when more than one campaign contributes to a closed deal or a converted lead.

SEE ALSO:

[Campaigns FAQ](#)

### Who has access to campaigns?

Depending on your sharing settings, users in your organization can view campaigns, view the advanced campaign setup, or run campaign reports. However, only designated Marketing Users with the appropriate user permissions can create, edit, and delete campaigns and configure advanced campaign setup. An administrator must select the `Marketing User` checkbox on a user's personal information to designate that user as a Marketing User.

In addition, Marketing Users can import leads and use the campaign import wizards if they also have the Marketing User profile (or the "Import Leads" permission and "Edit" on campaigns).

[Campaigns FAQ](#)

## Explore Your Organization's Territory Model

A territory model includes a hierarchy and a list view of parent and child territories. If you manage, administer, or belong to a sales territory, you should explore your territory model to understand how Sales efforts are organized. Drill down to get important details on individual territories, including assigned accounts.

 **Note:** This information applies to Enterprise Territory Management only, not to previous versions of Territory Management.

1. From Setup, enter *Territory Models* in the **Quick Find** box, then select **Territory Models**. The list view displays your organization's active territory model. Click the model's label if you want to view its detail page. Along with other details, this page tells you the last time account assignment rules were run to realign the territory.
2. From the list view, click the model's **View Hierarchy** link.
3. Click **Tree View** to expand and explore the hierarchy tree.
4. Within the hierarchy, click a territory label to view its detail page, where you can identify its territory type, assigned users and their access levels, assignment rules, and more.
5. From the top of the page, navigate back to the model's territory hierarchy and check out its other territories.

## Managing Accounts by Territory

### Territory Management Overview

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

 **Note:** Territory Management is available only with [Customizable Forecasts](#) and not supported with the [Winter '12 release of Forecasts](#). If Territory Management is enabled, you can no longer use the [Winter '12 release of Forecasts](#).

Territory management is an account sharing system that grants access to accounts based on the characteristics of the accounts. It enables your company to structure your Salesforce data and users the same way you structure your sales territories. Particularly if your organization has a private sharing model, you may need to grant users access to accounts based on criteria such as postal code, industry, revenue, or a custom field that is relevant to your business. You may also need to generate forecasts for these diverse categories of accounts. Territory management solves these business needs and provides a powerful solution for structuring your users, accounts, and their associated contacts, opportunities, and cases.

 **Note:** Account ownership and its effect on record sharing remains valid and unchanged when territory management is in use.

Key benefits of territory management include:

- The ability to use account criteria to expand a private sharing model.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

- Support for complex and frequently changed sales organization structures.
- Support for transferring users between territories, with the option to retain opportunities.
- Multiple forecasts per user, based on territory membership.
- Territory-based sales reports.

 **Note:** Territory management only affects accounts and the standard objects that have a master-detail relationship to accounts. For example, opportunities are included in territory management but leads are not.

## What is a Territory?

A territory is a flexible collection of accounts and users where the users have at least read access to the accounts, regardless of who owns the account. By configuring territory settings, users in a territory can be granted read, read/write, or owner-like access (that is, the ability to view, edit, transfer, and delete records) to the accounts in that territory. Both accounts and users can exist in multiple territories. You can manually add accounts to territories, or you can define account assignment rules that assign accounts to territories for you.

Not only can you control access to accounts for users in each territory, you can also control users' access to the opportunities and cases associated with the accounts in the territory, regardless of who owns the records.

## What is a Territory Hierarchy?

Territories exist in a hierarchy which you can set up with as many nested levels as you wish. For example, you could create a top-level territory named "Worldwide Sales" that has the child territories "North America," "Europe/Middle East," "Latin America," "Africa," and "Asia/Australia." "North America" might have the child territories "Canada" and "United States." "United States" might have the child territories "Western," "Central," "Southern," and "Eastern." Finally, "Western" might have the child territories "California," "Oregon," "Washington," "Nevada," "Arizona," and "Utah."

Note that territory hierarchies do not have to be focused on geography; they can be defined however you like.

## How Do Territories Affect Forecasting?

When you enable territory management for your organization, the territory hierarchy also becomes the forecast hierarchy. Your forecast data is derived from the opportunities that are associated with the accounts in your territories. Users will have a different forecast for each territory to which they are assigned. For example, if you are assigned to both "California" and "Arizona," you will have one forecast for the opportunities you have in "California," and another forecast for the opportunities you have in "Arizona." See [Viewing Customizable Forecasts](#) on page 1465.

## Managing Territories

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Managing your organization's territories involves the following tasks:

- Organize territories into hierarchies that represent your organization's forecasting requirements and how users work in your organization.
- Configure organization-wide settings for territory management.
- Create new territories and edit existing territories.
- Assign users to territories.
- Define account assignment rules that evaluate accounts and assign them to territories.
- Select accounts from lists and manually assign them to territories.

[Territory Management FAQ](#)

## Assigning Opportunities to Territories

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

An opportunity can be assigned to a territory when the opportunity is created—either manually or during lead conversion—or when account assignment rules run that affect existing opportunities. This topic includes the following sections:

- [Territory Assignment for Manually Created Opportunities](#)
- [Territory Assignment for Converted Leads](#)
- [Notes About Territory Assignment for Opportunities](#)

### Territory Assignment for Manually Created Opportunities

When an opportunity is created from the Opportunities tab or from the Quick Create area on the sidebar, Salesforce compares the territories associated with the opportunity's account to the territories that the opportunity owner is a member of:

- If there is a single territory that both the account and the opportunity owner belong to, the opportunity is assigned to that territory if "Evaluate this account against territory rules on save" is selected.

#### EDITIONS

#### USER PERMISSIONS

To manage territories:

- "Manage Territories"
- OR

You are a forecast manager, Forecast managers can manage territories is selected, and you are working below your position in the territory hierarchy.

#### EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

#### USER PERMISSIONS

To create opportunities:

- "Create" on Opportunities

- If more than one territory is common to both the account and the opportunity owner, the opportunity is not automatically assigned to any territory. The opportunity owner must manually assign a territory to the opportunity.
- If no territory is common to both the account and the opportunity owner, the opportunity owner cannot assign the opportunity to a territory.

### Territory Assignment for Converted Leads

When a lead is converted to an opportunity, that opportunity's territory assignment depends on several factors, including:

- Whether the account associated with the opportunity is assigned to one or more territories
- Whether the lead owner is a member of the same territory as the account
- The number of users assigned to a territory
- Whether a forecast manager is assigned to the territory

If the account associated with the opportunity is assigned to only one territory, use the following table to determine how the opportunity's territory is assigned:

<b>Lead Owner Belongs to Same Territory as Account</b>	<b>Number of Users Assigned to Territory</b>	<b>A Forecast Manager is Assigned to the Territory</b>	<b>Results</b>
Yes	1	N/A	The opportunity is assigned to the same territory as the account and the lead owner becomes the opportunity owner.
No	1	N/A	The opportunity is assigned to the same territory as the account and the opportunity owner is the sole member of the territory.
No	0	N/A	The opportunity is assigned to the same territory as the account and the lead owner becomes the opportunity owner. The lead owner is added as an inactive member of the territory.
Yes	>1	Yes	The opportunity is assigned to the same territory as the account and the forecast manager becomes the opportunity owner.
Yes	>1	No	The opportunity is assigned to the same territory as the account and the lead owner becomes the opportunity owner.
No	>1	Yes	The opportunity is assigned to the forecast manager of the territory.
No	>1	No	The opportunity is assigned to the same territory as the account and the lead owner becomes the opportunity owner. The lead owner is added as an inactive member of the territory.

If the account associated with the opportunity is assigned to more than one territory, use the following table to determine how the opportunity's territory is assigned:

Lead Owner's Territory Membership	Results
Lead owner has one territory in common with the account	The opportunity is not assigned to any territories and the lead owner becomes the opportunity owner. The opportunity owner can assign the opportunity to the account's territory.
Lead owner has more than one territory in common with the account	The opportunity is not assigned to any territories and the lead owner becomes the opportunity owner. The opportunity owner can assign the opportunity to any territory that he or she has in common with the account.
Lead owner has no territories in common with the account	The opportunity is not assigned to any territories and the lead owner becomes the opportunity owner. The opportunity owner cannot assign the opportunity to any territories.

## Notes About Territory Assignment for Opportunities

- The following actions do not change an opportunity's territory:
  - Manually assigning the opportunity's account to a territory
  - Changing which account is associated with the opportunity
  - Changing the account's territory as a result of account assignment rules if the opportunity and its account are in different territories
  - Transferring the opportunity to a new owner
- Territory assignment rules do not update an opportunity if the opportunity's `Close Date` is before the current date and the opportunity's `Stage` is `Closed Won` or `Closed Lost`.
- When an opportunity is not automatically assigned to a territory, we recommend that users be notified if the opportunity is not assigned to a territory manually within one day. You can set up time-based workflow to notify users about unassigned opportunities.
- Restoring an account or opportunity from the Recycle Bin restores the territory assignment, but it does not trigger the evaluation of account assignment rules. If account assignment rules changed while the record was in the Recycle Bin, the restored record may have territories that are inconsistent with the new rules.
- When opportunities are transferred from one user to another, whether individually or as a group, the territory assignment on the opportunities is unaffected. However, if the opportunities are assigned to a user who is not already a member of the opportunity's territory, that user is added as an inactive member of the territory.
- When users are removed from a territory, you can specify who should receive their open opportunities. Also, when users are transferred from one territory to another, you can specify which opportunities the users should continue to own and select a recipient for any remaining opportunities. If you do not specify a recipient:
  - If the parent territory has a forecast manager, the forecast manager takes ownership of the user's open opportunities. The forecast manager is assigned to the territory and `Active in Territory` is unchecked.

- If the parent territory does not have a forecast manager, the user remains in the territory and `Active in Territory` is unchecked.

SEE ALSO:

[Territory Management Overview](#)

### How does Salesforce handle territory management?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

In Enterprise, Unlimited, Performance, and Developer Edition organizations, you can enable territory management to organize your users into territories and provide access to accounts and their related opportunities and cases.

In Professional Edition organizations, Salesforce's role hierarchy allows you to manage the roll-up of information among your company's territories. The hierarchy structure is not based on traditional titles, but rather on a hierarchy of roles. Multiple people with different titles can be assigned to the same role. Users always have access to the data that is owned by or shared with users assigned to roles below them in the hierarchy. A user's role also determines which data is accessible to him or her in forecasts.

A typical organization may have three levels of roles, for example:

- The top role may include your VPs of sales, marketing, and client services, and your CFO. These users will be able to view all information at lower levels and perform roll-ups on that information.
- The middle level may include various vice president or regional managers. These roles can access the data owned by or shared with all users below them in the hierarchy. For example, the Western VP role can view and perform roll-ups of the information owned by users in the Western Reps role.
- Since no roles are below the various Reps roles, the users in those roles cannot perform any roll-ups or view anyone's information except their own.

 **Note:** Your role hierarchy interacts with your organization's sharing model to determine exactly what information a user can see, given the sharing setting is selected to use hierarchies. For forecasts, a user's role always determines which information he or she can view, regardless of the sharing model. Likewise, in a Private sharing model, a user's role determines his or her access to other users' data. However, in a Public Read/Write or Public Read Only organization, users can view (and edit, for Public Read/Write) information of all other users, in addition to having access to the data of users below them in the hierarchy.

SEE ALSO:

[Territory Management FAQ](#)

[Territory Management Overview](#)

## Are opportunities transferred to different users when account assignment rules are run?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

When account assignment rules cause an opportunity to be reassigned to a territory to which you already belong, you automatically become the owner of that opportunity when you meet any of the following criteria:

- You are the only member of the territory.
- You are the only forecast manager in the territory.
- You are the only territory member enabled for forecasting.

If none of these criteria are met, the original opportunity owner is added to the territory as an inactive member.

SEE ALSO:

[Territory Management FAQ](#)

## Are the territory hierarchy and the role hierarchy different?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Yes. The territory hierarchy and the role hierarchy are independent. See the following comparison:

<b>Territory Hierarchy</b>	<b>Role Hierarchy</b>
Is available by contacting Salesforce	Is available by default
Determines forecasts	Has no impact on forecasting when territory management is enabled
Supports assigning a user to multiple territories	Supports assigning a user to only one role
Affects account and opportunity reports	Affects all other reports
Grants access to records regardless of ownership. Users receive whatever access is most permissive across both hierarchies.	Grants access to records based on ownership. Users receive whatever access is most permissive across both hierarchies.

SEE ALSO:

[Territory Management FAQ](#)

## How are opportunities assigned to territories?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Opportunities are automatically assigned to territories based on the following actions.

- Creating a new opportunity
- Running account assignment rules

When account assignment rules are run, opportunities are automatically assigned to the same territory as the account when:

- An opportunity does not have a territory and its account is added to a territory.
- An account moves from one territory to another. However, if an account assignment rule prohibits opportunities from moving outside a given part of the territory hierarchy, the opportunities do not move and no longer belong to any territories.

Opportunities are not automatically assigned to the same territory as the account when:

- An account is removed from a territory and not reassigned to a new territory in the same operation. The account's opportunities from the original territory no longer belong to any territories.
- An account is reassigned to multiple territories in one operation. The account's opportunities from the original territory no longer belong to any territories, unless the `Confine Opportunity Assignment` checkbox is checked.

 **Note:** If the opportunity owner is not part of the new territory, he or she is added as an inactive member of the territory.

The following actions do not change an opportunity's territory.

- Manually assigning the opportunity's account to a territory
- Changing which account is associated with the opportunity
- Changing the account's territory as a result of account assignment rules if the opportunity and its account are in different territories
- Transferring the opportunity to a new owner.

SEE ALSO:

[Territory Management FAQ](#)

## How do manually assigned accounts differ from those assigned by account assignment rules?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Manually assigned accounts are not evaluated when running account assignment rules. After they have been manually assigned to a territory, they remain there until they are manually removed from the territory.

SEE ALSO:

[Territory Management FAQ](#)

## How does opportunity confinement work?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

If the `Confine Opportunity Assignment` checkbox is selected for a territory, the territory's opportunities remain in the territory or its child territories when you run account assignment rules. The following exceptions apply:

- If an opportunity's account moves to only one of the territory's children, then the opportunity follows the account and is reassigned to the account's new territory. This includes when an account moves to multiple territories and only one of the new territories is a child of the original territory.
- If an opportunity's account moves to more than one of the territory's children, then the opportunity's territory field is set to blank.
- If an opportunity's account moves completely out of the territory and its children, then the opportunity's territory field is set to blank.

SEE ALSO:

[Territory Management FAQ](#)

## Must I be assigned to the same territories as the opportunities I own?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

When an open opportunity is assigned to you and you do not belong to that opportunity's territory, you are assigned to the territory with `Active in Territory` unchecked in the Assigned Users related list of the territory.

SEE ALSO:

[Territory Management FAQ](#)

## What happens when I undelete an account or opportunity that was assigned to a territory?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Undeleting an account or opportunity restores the territory assignment, but does not trigger the evaluation of account assignment rules. If account assignment rules changed while the record was in the Recycle Bin, the restored record may have territories that are not consistent with the new rules.

SEE ALSO:

[Territory Management FAQ](#)

## What kinds of records have territories?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Accounts, opportunities, and users have territory fields. Accounts and users can be associated with multiple territories. An opportunity can be associated with only one territory.

SEE ALSO:

[Territory Management FAQ](#)

## When do account assignment rules evaluate accounts?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Active account assignment rules automatically evaluate accounts and assign them to territories when:

- An account is created using the Salesforce user interface, the Force.com API, or a client such as Connect Offline.

- An account is imported using an import wizard.
- An account is created by the conversion of a lead.
- An account is edited and saved if the `Select by default` checkbox is selected for the “Evaluate this account against territory rules on save” checkbox option under **Layout Properties**. If the account assignment rule initiates an opportunity ownership change, you must have transfer access on the opportunity.
- An account is edited and saved via the Force.com API.
- **Run Rules** is clicked on a territory detail page, provided the `Exclude from territory assignment rules` checkbox on the account is deselected.
- **Save & Run Rules** is clicked on the manage account assignment rules page for a territory, provided the `Exclude from territory assignment rules` checkbox on the account is deselected.
- Duplicate accounts are merged.

[Territory Management FAQ](#)

## Tracking Potential Opportunities as Leads

### Leads

Track prospects apart from your contacts and opportunities with Salesforce lead records. After you've qualified your lead records, convert them to contacts and create accounts for them (if you don't already have the accounts in Salesforce). And hopefully, create opportunities to bolster your pipeline.

Regardless of whether you're working in Lightning Experience or Salesforce Classic, you work with a list of leads. From the list, you quickly create, locate, and work with the leads you're focusing on at the moment.

Associate relevant events and tasks with those leads. And convert your qualified leads to contacts that have opportunities associated to them. For any lead records that you mark Unqualified, plan to revisit them later to see whether those prospects' needs for your products and services changed.

## Guidelines for Creating Leads

Get some guidance when you manually create leads to track your prospects.

- From the Leads tab in Salesforce Classic, you can automatically assign the lead using the active lead assignment rule. To do so, select **Assign using active assignment rules**. Otherwise, the lead belongs to you.

If you automatically assign the new lead, the record type of the lead can change, depending on the behavior your administrator specified for assignment rules.

- If your sales team uses divisions, the division of a new lead is automatically set to your default division, unless you manually select a different one.
- Your administrator determines the default lead status for new leads.
- The lead is marked as “Read”, and doesn’t appear in the My Unread Leads list view. But in Salesforce Classic, if you save the lead by clicking **Save & New**, the lead is marked as “Unread.”

## Leads Home

Clicking on the Leads tab displays the leads home page.

- In the **Lead Views** section, select a list view from the drop-down list to go directly to that list page, or click **Create New View** to define your own custom view.

To view the leads in a queue, choose that queue list from the drop-down list. For every queue your administrator creates, Salesforce adds a corresponding queue list view.

-  **Note:** The organization-wide sharing model for an object determines the access users have to that object's records in queues:

### Public Read/Write/Transfer

Users can view and take ownership of records from any queue.

### Public Read/Write or Public Read Only

Users can view any queue but only take ownership of records from queues of which they are a member or, depending on sharing settings, if they are higher in the role or territory hierarchy than a queue member.

### Private

Users can only view and accept records from queues of which they are a member or, depending on sharing settings, if they are higher in the role or territory hierarchy than a queue member.

Regardless of the sharing model, users must have the “Edit” permission to take ownership of records in queues of which they are a member. Administrators, users with the “Modify All” object-level permission for Cases, and users with the “Modify All Data” permission, can view and take records from any queue regardless of the sharing model or their membership in the queue.

- In the **Recent Leads** section, select an item from the drop-down list to display a brief list of the top leads matching that criteria. From the list, you can click any lead name to go directly to the lead detail. Toggle the **Show 25 items** and **Show 10 items** links to change the number of items that display. The fields you see are determined by the “Leads Tab” search layout defined by your administrator and by your field-level security settings (available in Enterprise, Unlimited, Performance, and Developer Editions only). - “Create” on leads

Recent Leads Choice	Description
<b>My Unread Leads</b>	The last ten or twenty-five leads assigned to you which you have not yet viewed or edited. This list only includes records owned by you.
<b>Recently Viewed</b>	The last ten or twenty-five leads you viewed, with the most recently viewed lead listed first. This list is derived from your recent items and includes records owned by you and other users.
<b>Recently Created</b>	The last ten or twenty-five leads you created, with the most recently created lead listed first. This list only includes records owned by you.

- If Quick Create has been enabled by your administrator, you can add a new lead from the **Quick Create** area in the sidebar on the leads homepage. Alternatively, click **New** next to the **Recent Leads** section to create a new lead.
- Under **Reports**, click any report name to jump to that report.
- In the **Summary** section, choose values and click **Run Report** to view a summary list of your leads.
- Select any of the links under **Tools** to manage your leads.
- If leads are shared with external contacts via Salesforce to Salesforce, choose one of the list views under **Leads from Connections** to view leads that your business partners have shared with you.

[Leads](#)

## Lead Fields

A lead has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

If the lead record was added from Data.com, certain fields, as identified here, will be populated with the Data.com or Dun & Bradstreet (D&B) value, if a value is available. Some Data.com lead fields are available only to organizations that use a specific Data.com product.

Field	Description	Accepts Data.com or D&B Value
Address	Street address for the lead, for example, 475 Boardwalk Ave. Up to 255 characters are allowed in this field.	✔ (Data.com)
Annual Revenue	Amount of annual revenue at lead's company.	✔ (D&B)
Campaign	Name of the campaign responsible for generating the lead. Displays only when creating a new lead. Data entered in this field is stored in the Campaign History related list on the lead.

Field	Description	Accepts Data.com or D&B Value
City	City portion of the lead's address, for example, San Francisco. Up to 40 characters are allowed in this field.	✔ (Data.com)
Clean Status	Indicates the record's clean status as compared with Data.com. Values are: <i>Not Compared</i> , <i>In Sync</i> , <i>Reviewed</i> , <i>Different</i> , <i>Not Found</i> , or <i>Inactive</i> . This field is available to only organizations that use Data.com Prospector or Data.com Clean.	✔ (Data.com)
Company	Name of company with which lead is affiliated. Up to 255 characters are allowed in this field.	✔ (D&B)
Company D-U-N-S Number	Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the D&B database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking. This field is available to only organizations that use Data.com Prospector or Data.com Clean.   <b>Note:</b> To see the entire D-U-N-S number, either <ul style="list-style-type: none"> <li>• Add the lead to Salesforce if you haven't yet, or</li> <li>• Clean the lead with Data.com if it already exists in Salesforce</li> </ul> Until you add or clean the record, its first five digits will be masked with asterisks (*).	✔ (D&B)
Company Name (Local)	Name of the company in the local language.	
Country	Country portion of user's address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	
Created By	User who created the lead, including creation date and time. (Read only)	
D&B Company	A link to the corresponding D&B Company record, which displays Dun & Bradstreet (D&B) fields for the lead. Use the lookup if you need to associate a different D&B Company record with the lead. This field is only available to organizations that use Data.com Premium Prospector or Data.com Premium Clean.	✔ (D&B)
Data.com Key	The ID of the company in Data.com. When Salesforce records are compared with Data.com records (via either manual cleaning or automated clean jobs), if Data.com finds a match, the two records are linked by this field's numeric value.	✔ (Data.com)
Description	Description of the lead. Up to 32KB of data are allowed in this field. Only the first 255 characters appear in reports.	
Do Not Call	Indicates that the lead does not want to be contacted by phone. If you use Data.com, the <i>Phone</i> field value will be masked out in search	

Field	Description	Accepts Data.com or D&B Value
	results and on the Contact Card, and it will be blank in .csv files created when you export records.	
Email	Email address of lead. Must be a valid email address in the form: jsmith@acme.com. Up to 80 characters are allowed in this field.  Click the email address in this field to send an email using your personal email application. If the Gmail Buttons and Links feature is enabled, you can click the Gmail link next to the field to send an email from your Gmail account. See <a href="#">Using Gmail in Salesforce</a> on page 3201 for more information.	✔ (Data.com)
Email Opt Out	Indicates that the lead does not want to receive email. If you use Data.com, the Email field value will be masked out in search results and on the Contact Card, and it will be blank in .csv files created when you export records.	
Fax	Lead's fax number. Up to 40 characters are allowed in this field.	
Fax Opt Out	Lead has not requested to be included in broadcast faxes.	
First Name	First name of the lead, as displayed on the lead edit page. Up to 40 characters are allowed in this field.	✔ (Data.com)
First Name (Local)	First name of the lead translated into the local language.	
Industry	Primary business of lead's company. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (Data.com)
Last Name	Last name of the lead, as displayed on the lead edit page. Up to 80 characters are allowed in this field.	✔ (Data.com)
Last Name (Local)	Last name of the lead translated into the local language.	
Last Transfer Date	The date the lead owner was last changed.	
Lead Currency	The default currency for all currency amount fields in the lead. Amounts display in the lead currency and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.	
Lead Division	Division to which the lead belongs. Available only in organizations that use divisions to segment their data.	
Lead Owner	Assigned owner of the lead.	
Lead Record Type	Name of the field that determines what picklist values are available for the record. The record type may be associated with a lead process. Available in Enterprise, Unlimited, Performance, and Developer Editions.	

Field	Description	Accepts Data.com or D&B Value
Lead Source	Source of lead, for example, Advertisement, Partner, or Web. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (Data.com)
Lead Status	Status of the lead, for example, Open, Contacted, Qualified. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Middle Name	Middle name of the lead, as displayed on the lead edit page. Up to 40 characters are allowed for this field.   <b>Note:</b> To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select <b>User Interface</b> . Then select <b>Enable Name Suffixes for Person Names</b> .	
Middle Name (Local)	Middle name of the lead translated into the local language.   <b>Note:</b> To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select <b>User Interface</b> . Then select <b>Enable Name Suffixes for Person Names</b> .	
Mobile	Cellular or mobile phone number. Up to 40 characters are allowed in this field.	
Modified By	User who last changed the lead fields, including modification date and time. This does not track changes made to any of the related list items on the lead. (Read only)	
Name	Combined first name, middle name (beta), last name, and suffix (beta) of lead, as displayed on lead detail page.	✔ (Data.com)
No. of Employees	Number of employees at the lead's company.	✔ (D&B)
Phone	Lead's primary phone number. Up to 40 characters are allowed in this field.	✔ (Data.com)
Partner Account	Read-only field that indicates the lead is owned by a partner user.	
Rating	Indicates value or prospect of the lead, for example, Hot, Warm, Cold. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Read	Flag indicating that the lead has been viewed or edited by the lead owner. Flag is not displayed on lead edit or detail pages. Leads marked as "Read" do not contain a check mark in the Unread column on leads list views.	
Salutation	Title for addressing the lead, for example, Mr., Ms., Dr., or Prof. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	

Field	Description	Accepts Data.com or D&B Value
State/Province	State or province portion of user's address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	
Suffix	Name suffix of the lead, as displayed on the lead edit page. Up to 40 characters are allowed for this field.   <b>Note:</b> To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select <b>User Interface</b> . Then select <i>Enable Name Suffixes for Person Names</i> .	
Title	Position of lead within his or her company. Up to 80 characters are allowed in this field.	✔ (Data.com)
Unread	Flag indicating that the lead has not been viewed or edited by the lead owner. Flag is not displayed on lead edit or detail pages. Leads marked as "Unread" contain a check mark in the Unread column on leads list views.	
Custom Links	Listing of custom links for leads as set up by your administrator.	
Website	URL of company's website, for example, www.acme.com. Up to 255 characters are allowed in this field; only the first 50 are displayed.	
ZIP	ZIP code or postal code portion of the lead's address. Up to 20 characters are allowed in this field.	✔ (Data.com)

## Convert Qualified Leads

Keep the sales process moving when you qualify a lead and then convert it to a contact. Relate that contact to either an existing account in Salesforce, or an account that you create. And if the lead you're converting results in a deal that looks promising, create an opportunity record at the same time.

Keep in mind that you can't reverse lead conversion. When you convert leads to contacts, the process sometimes creates duplicate records. If so, we tell you. How these duplicate records are handled depends on how your administrator has set up Apex Lead Convert and Duplicate Management. For example, your administrator can require that you resolve the duplicates before you finish converting.

1. After you choose to convert the lead record, select an existing account or enter an account name for the one you're creating.
2. *Salesforce Classic only:* If you update a person account, select the option to overwrite the lead source in the person account with the value from the lead.
3. If you want to create an opportunity record, give it name.
4. Convert the lead.

[Considerations for Converting Leads](#)

[Lead Conversion Mapping](#)

## Considerations for Converting Leads

Learn what happens to qualified leads when you convert them to accounts, contacts, and opportunities.

When you convert qualified leads, Salesforce moves any campaign members to the new contacts, and the leads become read-only records. If existing accounts and contacts share the same names as those specified on the leads, you can choose to update the existing accounts and contacts.

Salesforce adds information from the lead into empty fields; Salesforce does not overwrite existing account and contact data.

All open and closed activities from the leads are attached to the accounts, contacts, and opportunities. You can assign the owner of the records, and schedule follow-up tasks. When you assign new owners, only the open activities are assigned to the new owner. If you have custom lead fields, that information can be inserted into custom account, contact, or opportunity fields. You can't view converted leads, but they appear in lead reports. Salesforce updates the `Last`

- Developer

`Modified Date` and `Last Modified By` system fields on converted leads when picklist values included on converted leads are changed.

Campaigns	<p>If the lead matches an existing contact and both records are linked to the same campaign, the campaign member status is determined by whichever is further along in the lifecycle of the campaign. For example, if the lead member status is "sent" and the contact member status is "responded," the responded value is applied to the contact.</p> <p>Related campaign information is always associated with the new contact record, regardless of the user's sharing access to the campaign.</p> <p>When more than one campaign is associated with a lead, the most recently associated campaign is applied to the <code>Primary Campaign Source</code> field on the opportunity, regardless of the user's sharing access to the campaign.</p>
Chatter	<p>When you convert a lead to an existing account, you don't automatically follow that account. However, when you convert the lead to a new account, you automatically follow the new account, unless you disabled feed tracking for accounts in your Chatter settings.</p>
Data.com / D&B Company	<p>If you use Data.com Premium, when you add a lead from Data.com, a corresponding D&amp;B Company record (if one exists in Data.com) is automatically created in Salesforce and linked to the lead record via its <code>D&amp;B Company</code> field. If you later convert that lead:</p> <ul style="list-style-type: none"> <li>• And if the account is created from the conversion, the lead's <code>Company D-U-N-S Number</code> field value transfers to the account's <code>D-U-N-S Number</code> field, and the lead's <code>D&amp;B Company</code> field value transfers to the account's <code>D&amp;B Company</code> field.</li> <li>• Its <code>Data.com Key</code> field value transfers to the contact's <code>Data.com Key</code> field.</li> </ul> <p>If you use Data.com Corporate, no D&amp;B Company record is created, but the lead's <code>Data.com Key</code> field value transfers to the contact's <code>Data.com Key</code> field.</p>
Divisions	<p>The new account, contact, and opportunity are assigned to the same division as the lead. If you update an existing account during lead conversion, the account's division is not changed, and the new contact and opportunity inherit the account's division.</p>
Duplicate Management	<p>When you convert leads to contacts, the process sometimes creates duplicate records. If so, we tell you. How these duplicate records are handled depends on how your administrator has set up Apex Lead Convert and Duplicate Management. For example, your administrator can require that you resolve the duplicates before you finish converting.</p>
Enterprise Territory Management	<p>Filter-based opportunity territory assignment is not triggered when an opportunity is created through lead conversion.</p>
Existing Contact	<p>When you update an existing contact with a lead that you are converting, lead information in multi-select picklist fields carries over to the existing contact only if the matching fields for the contact are blank.</p>
Local Lead Names	<p><code>Company Name (Local)</code> on the lead automatically maps to <code>Account Name (Local)</code>, along with their associated standard name fields.</p>
Person Accounts	<p>With person accounts enabled, you can convert leads to either person accounts or business accounts. Leads with an empty <code>Company</code> field convert to person accounts, assigned to the default person account record type for your profile. If you don't want to include a company name when creating person accounts, you must use the API. Leads that include a company name convert to business accounts, assigned to the default business account record type for your profile.</p>

We recommend you use different lead record types and page layouts to differentiate leads that will convert to person accounts from those that will convert to business accounts. Specifically, remove the `Company` field from the page layouts for leads that will convert to person accounts. Then, make the `Company` field required on the page layouts for leads that will convert to business accounts.

If you convert a lead and attach it to a person account that someone else owns, that person account owner becomes the contact owner.

If you convert a lead that someone else owns and attach it to a person account that you own, the lead owner becomes the contact owner.

Record Types	<p>If the lead has a record type, the default record type of the user converting the lead is assigned to records created during lead conversion.</p> <p>The default record type of the user converting the lead determines the lead source values available during conversion. If the desired lead source values are not available, add the values to the default record type of the user converting the lead.</p>
Salesforce to Salesforce	<p>When you convert a lead, Salesforce to Salesforce inactivates the shared record and updates the External Sharing related list in your connection's lead record with an Inactive (converted) status. Due to inactivation of the shared record, changes to the Lead Status during conversion aren't reflected in your connection's lead record.</p>
Standard and Custom Lead Fields	<p>The system automatically maps standard lead fields to standard account, contact, and opportunity fields. For custom lead fields, your administrator can specify how they map to custom account, contact, and opportunity fields.</p> <p>The system assigns the default picklist values for the account, contact, and opportunity when mapping standard lead picklist fields that are blank. If your organization uses record types, blank values are replaced with the default picklist values of the new record owner.</p>
Territory Management	<p>If your organization uses territory management, the new account is evaluated by account assignment rules and may be assigned to one or more territories. If the rules assign the account to exactly one territory, then the opportunity will also be assigned to that territory. If the rules assign the account to multiple territories, then the opportunity is not assigned to any territory.</p>
Triggers	<p>During lead conversion, Apex triggers are fired, and universally required custom fields and validation rules are enforced, only if validation and triggers for lead convert are enabled in your organization.</p> <p>Salesforce ignores lookup filters when converting leads if the <code>Enforce Validation and Triggers from Lead Convert</code> checkbox on the Lead Settings page is deselected.</p>
Workflow	<p>You can't convert a lead that's associated with an active approval process or has pending workflow actions. Converting a lead to a person account won't trigger workflow rules.</p> <p>When a lead is converted by someone who isn't the lead owner, all workflow tasks associated with the lead that are assigned to that user, except email alerts, are reassigned to the lead owner. Workflow tasks assigned to users other than the lead owner and lead converter aren't changed.</p> <p>If validation and triggers for lead convert are enabled, then converting a lead can trigger a workflow action on a lead. For example, if there's an active workflow rule that either updates a lead field or transfers the owner of a lead, that rule can trigger when the lead is converted, even if the lead isn't visible on the Leads tab as a</p>

result of the conversion. If a workflow rule creates a new task as a result of a lead conversion, the task is assigned to the newly created contact and related to the associated account or opportunity.

## Lead Conversion Mapping

Learn which fields from the lead records you convert map to fields in your newly created contact, account, and opportunity records.

When you convert lead records, standard lead fields automatically map to contact, account, and opportunity fields. If you have custom fields, your administrator specifies the fields to which they map in your newly created contact, account, and opportunity records.

Lead Field	Maps to
Address	Account: Billing Address Contact: Mailing Address
Annual Revenue	Account: Annual Revenue
Campaign	Opportunity: Primary Campaign Source For leads associated with multiple campaigns, Salesforce adds the most recently associated campaign to the opportunity, even if the sales rep can't access that campaign.
Company	Account: Account Name Contact: Account Opportunity: Account Name Opportunity: Opportunity Name
Company Name (Local)	Account: Account Name (Local)
Description	Contact: Description
Do Not Call	Contact: Do Not Call This field is not updated for leads converted to existing contacts.
Email	Contact: Email
Email Opt Out	Contact: Email Opt Out This field is not updated for leads converted to existing contacts.

### Opportunity Close Dates

During the lead conversion process, Salesforce automatically assigns close dates for the opportunities you create depending on the fiscal year settings in Salesforce.

If the fiscal year in Salesforce is	Salesforce assigns close dates for opportunities to
Standard	The last day of the current fiscal quarter.

If the fiscal year in Salesforce is	Salesforce assigns close dates for opportunities to
Custom	The last day of the current fiscal period. If a fiscal year has not been defined for the current date, the close date is the end of the current calendar quarter.

[Considerations for Converting Leads](#)

## Lead Sharing in Salesforce Classic

Extend sharing privileges beyond the basic sharing model for your own data on a lead-by-lead basis.

Your administrator defines the sharing model for your company. And if that sharing model for leads is Private or Public Read Only, you can use lead sharing to increase access to your leads. You cannot, however, restrict access beyond your company's default access levels.

You can see sharing details when you click **Sharing** on the lead detail page.

## SEE ALSO:

[Leads](#)

## Merging Duplicate Leads

To merge duplicate leads:

1. Select a lead record.
2. Click **Find Duplicates**.
3. Select up to three leads in the matching leads list that you want to merge.

Optionally, enter a new lead name or company and click **Search** to find another lead to merge. Salesforce performs a phrase search for matches in the `NAME` and `COMPANY` fields. It also considers an implied wildcard after any entry. Search results include matches for any fields you enter, so if you enter *Bob Jones* who works at *Acme*, search results include anyone named *Bob Jones* at any company and any lead with *Acme* as a company.

4. Click **Merge Leads**.

**Tip:** Click **Convert Lead** to quickly [convert the selected lead](#) into an existing account, opportunity, and contact.

5. Select one lead as the "Master Record." Any data in hidden or read-only fields will be taken from the Master Record. However, administrators and users with the "Edit Read Only Fields" permission can manually select which read-only fields to retain. Note that hidden fields are not displayed during the merge.
6. Select the fields that you want to retain from each record.

When there is conflicting data, the fields in the left column are preselected and the row is marked.

### USER PERMISSIONS

To view leads:

- "Read" on leads

To merge leads:

- "Delete" on leads

7. Click the **Merge** button to complete the merge.
8. Click **OK** to confirm.

## Notes About Merging Leads

- Any related items from the duplicate leads, such as campaign or activity information, will be associated with the newly merged lead.
- If you are merging duplicate leads that are members of different [campaigns](#), the campaign `Member Status Updated` date for each lead is retained and associated with the newly merged lead.
- In Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, any sharing rules are applied to the newly merged lead.
- All discarded duplicate records are moved to the Recycle Bin.
- The newly merged lead displays the `Created By` date from the oldest lead you are merging, and shows the merge date as the `Modified By` date.
- In organizations that use divisions, the merged lead is assigned to the division of the Master Record, unless you select otherwise.
- The fields visible in the search results for duplicate leads and matching accounts, contacts, and opportunities are controlled by the search layouts for those types of records.
- The master lead replaces the duplicate leads in all the requested meetings they were invited to. Also, all meeting messages written by the duplicate leads are automatically associated with the master lead. (Meeting messages appear on the requested meeting's Web page and are visible to all invitees.)
- The master lead replaces the duplicate leads in all the scheduled meetings they were invited to. However, make sure to edit the event detail page and click **Add to Invitees** to add the new master lead to the meeting invitee list.

### What is a Lead?

Leads are people who are interested in your product and service. Converting leads to loyal customers will provide success within a business. By managing your leads in a systematic and structured way, you can increase both the numbers of leads you generate and how many leads you convert.

SEE ALSO:

[Leads FAQ](#)

## What are the advantages of using leads?

Using leads allows your company to maintain two separate lists - one for prospective customers and one for existing customers. You can store your prospects as leads, and then once a lead becomes qualified, you can convert it to an account, contact, and, optionally, an opportunity.

Leads are especially useful if your company has two separate teams - one that handles lead generation and mass marketing and one that handles sales. The lead generation team can concentrate their work on the Leads tab, and the opportunity team can use the Account, Contact, and Opportunity tabs.

SEE ALSO:

[Leads FAQ](#)

## Can I convert existing accounts or contacts into leads?

No. As an alternative, create an opportunity for the account or contact. If you prefer to use a lead, create a report containing the accounts or contacts you want to convert into leads, export them, and then import them as leads.

SEE ALSO:

[Leads FAQ](#)

## How many leads can we capture from our website?

In Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, you can capture up to 500 leads in a 24-hour period. If your organization exceeds its daily Web-to-Lead limit, the Default Lead Creator (specified in the Web-to-Lead setup page) receives an email containing the additional lead information. If your company regularly exceeds the Web-to-Lead limit, click **Help & Training** at the top of any page and select the My Cases tab to submit a request for a higher limit directly to Salesforce.

When your organization reaches the 24-hour limit, Salesforce stores additional requests in a pending request queue that contains both Web-to-Case and Web-to-Lead requests. The requests are submitted when the limit refreshes. The pending request queue has a limit of 50,000 combined requests. If your organization reaches the pending request limit, additional requests are rejected and not queued. Your administrator receives email notifications for the first five rejected submissions. Contact Salesforce Customer Support to change your organization's pending request limit.

SEE ALSO:

[Leads FAQ](#)

## What if my company reaches the limit for web-generated leads?

The daily limit for Web-to-Lead requests is 500. If your company generates more leads than the maximum allowed, the Default Lead Creator (specified in the Web-to-Lead setup page) will receive an email containing the captured information. Contact Customer Support if your company would like to generate over 500 Web-to-Lead requests per day.

SEE ALSO:

[Leads FAQ](#)

## How do I specify which information to capture online?

When you generate the HTML for your company's website, you can choose which standard or custom lead fields for which you want to gather information. You must create the custom lead fields prior to generating the HTML code. From Setup, enter *Web-to-Lead* in the **Quick Find** box, then select **Web-to-Lead** to set up this feature and generate the necessary HTML.

SEE ALSO:

[Leads FAQ](#)

## Can I capture leads from multiple web pages?

Yes. Insert the generated HTML code into the web pages from which you want to capture leads. Whenever someone submits information on any of those web pages, a lead will be created.

SEE ALSO:

[Leads FAQ](#)

## How can our webmaster test the Web-to-Lead page?

Add the following line to your Web-to-Lead page code if you want to see a debugging page when you submit the form. Don't forget to remove this line before releasing the Web-to-Lead page on your website.

```
<input type="hidden" name="debug" value="1">
```

SEE ALSO:

[Leads FAQ](#)

## Who owns new web-generated leads?

Your administrator can create a lead assignment rule to determine how web leads will be automatically assigned to different users or queues. In addition, your administrator must customize the Lead Settings to specify a Default Lead Owner to whom all web leads will be assigned if the assignment rule fails to locate an owner. If you do not use assignment rules, all web leads will be assigned to the Default Lead Creator (specified in the Web-to-Lead setup).

SEE ALSO:

[Leads FAQ](#)

## What status is assigned to web-generated leads?

All new web leads are marked with a status equal to the "default status" that your administrator selects when editing the **Lead Status** picklist values. In addition, web-generated leads are marked with the "Unread" flag; they have a check mark in the Unread column on the lead list views. When a user views or edits a new web lead, the lead is automatically set to "Read." This way you can easily locate all new leads using the My Unread Leads list view.

SEE ALSO:

[Leads FAQ](#)

## How can I be sure that leads won't be lost?

The daily limit for Web-to-Lead requests is 500. If your organization exceeds its daily Web-to-Lead limit, the Default Lead Creator (specified in the Web-to-Lead setup page) receives an email containing the additional lead information.

If a new lead cannot be generated due to errors in your Web-to-Lead setup, Customer Support is notified so that we can assist you in correcting it.

Salesforce ensures that your leads won't be lost if they are submitted during a scheduled Salesforce downtime.

SEE ALSO:

[Leads FAQ](#)

## How can I tell which of my leads are new?

When a lead is assigned to you, either manually transferred, imported, or generated from the web, the lead is marked as "Unread," that is, it has a check mark in the Unread column on leads list views. To view your new leads, select the My Unread Leads list view on the Leads tab. When you view or edit an "Unread" lead, it is automatically marked as "Read."

SEE ALSO:

[Leads FAQ](#)

## What happens when I convert leads?

When you convert leads, Salesforce creates new accounts, contacts, and opportunities using information from the leads you're converting. Salesforce moves any campaign members to the new contacts, and the leads become read-only records. If existing accounts and contacts share the same names as those specified on the leads, you can choose to update the existing accounts and contacts. Salesforce adds information from the lead into empty fields; Salesforce does not overwrite existing account and contact data.

All open and closed activities from the leads are attached to the accounts, contacts, and opportunities. You can assign the owner of the records, and schedule follow-up tasks. When you assign new owners, only the open activities are assigned to the new owner. If you have custom lead fields, that information can be inserted into custom account, contact, or opportunity fields. You can't view converted leads, but they appear in lead reports. Salesforce updates the `Last Modified Date` and `Last Modified By` system fields on converted leads when picklist values included on converted leads are changed.

SEE ALSO:

[Leads FAQ](#)

## How are lead fields mapped to other fields during conversion?

When you convert a lead, data in standard lead fields is transferred into standard account, contact, and opportunity fields. For custom lead fields, the data is mapped to custom account, contact, and opportunity fields as specified by your administrator.

Any standard lead picklist fields that are blank automatically inherit the default picklist value for accounts, contacts, and opportunities. If your organization uses record types, all records created during lead conversion adopt the default record type for the owner of the newly-created account, contact, and opportunity.

SEE ALSO:

[Leads FAQ](#)

## Can I automatically email leads that come from my website?

Yes. You can create auto-response rules that will email these prospects using templates that vary based on criteria you set up.

SEE ALSO:

[Leads FAQ](#)

## Why can't I see the **Sharing** button on a record?

The **Sharing** button lets users grant other users access to a record beyond the organization-wide defaults or sharing rules. You can easily remove this access after it's no longer needed.

You have access to the **Sharing** button when your sharing model is either Private or Public Read Only for a type of record or related record. For example, the **Sharing** button may appear on an account even though your organization-wide default for accounts is Public Read/Write, if your organization-wide default for related opportunities is Public Read Only.

When the button is available on the page layout, administrators see the button on all records. Non-administrators see this button on records that only they own.

# Managing Activities, Opportunities, and Products

---

## Plan and Track Meetings and Tasks

### Activities

Events and tasks are the engine of sales productivity. With Salesforce, you can be prepared for any meeting and know which task is your highest priority right now. Track meetings and tasks together in lists and reports to keep your finger on the pulse of all your leads, contacts, opportunities, accounts, and campaigns. Events and tasks also serve historical reporting purposes in Salesforce. Whether you're a manager delegating tasks, part of a sales team, or a sales rep who closes 50 deals a month, activities in Salesforce help you power through your day.

IN THIS SECTION:

[Track Events and Tasks Together](#)

Activities in Salesforce are your events, your tasks, calls you've made, and emails you've sent. Salesforce gives you multiple ways to track your activities together, for a more accurate picture of your progress on deals and accounts.

[Next Steps and Past Activity](#)

See at a glance what just happened and what to do next on the deals and accounts that you're working on.

[Considerations for Using Activities](#)

Keep in mind these considerations for using activities, including the use of Shared Activities to represent activity relationships more accurately, choosing a primary contact, roll-up of activities to parent records, and what the `Last Activity` date represents.

### [Activities Reporting](#)

You can run various reports to get insight into the progress and history of accounts and deals. If your administrator has enabled Shared Activities, you can run certain standard or custom reports that display details specific to tasks or events and their related contacts, accounts, opportunities, and other associated records.

### [Access to Activities](#)

Know who can view, create, and delete events and tasks, and when they have access. Calendar sharing and access are controlled separately from access to individual activities.

### [Activity Reminders in Salesforce Classic](#)

Salesforce displays event and task reminders in a small browser window. When you log in to Salesforce in Salesforce Classic, if any reminders have been triggered since the last time you logged in, a sound plays and the reminder window opens. The reminder window also opens whenever a reminder is triggered while you're logged in and using Salesforce Classic. Salesforce displays reminders according to certain default settings; you can customize reminders in your personal settings.

### [Archived Activities](#)

Salesforce archives certain events and tasks every Saturday at approximately 5:00 AM Greenwich Mean Time (GMT). You can view archived activities in certain locations in Salesforce.

#### SEE ALSO:

[Events and Calendars](#)

[Tasks](#)

## Track Events and Tasks Together

Activities in Salesforce are your events, your tasks, calls you've made, and emails you've sent. Salesforce gives you multiple ways to track your activities together, for a more accurate picture of your progress on deals and accounts.

#### IN THIS SECTION:

##### [Track Events and Tasks Together in Lightning Experience](#)

You can track events and tasks in the activity timeline and in reports.

##### [Track Events and Tasks Together in Salesforce Classic](#)

You can track events and tasks—collectively, activities—in lists, calendars, and reports. For example, track all the activities on an account to get a complete picture of the preparation, follow-up, past and future meetings, and other planned and completed work associated with the account. Events and tasks share many standard fields, such as subject, contact name, and related record.

## Track Events and Tasks Together in Lightning Experience

You can track events and tasks in the activity timeline and in reports.

- Use the activity timeline.  
The activity timeline shows you your open tasks, upcoming meetings, and past activity on an opportunity, a lead, an account, or a contact. Always know what to do next on each deal that you're working on, and see at a glance what's already happened.
- Use the Opportunity Board or Lead Board.  
The Board displays a yellow triangle on opportunities and leads for which you have no scheduled meetings or tasks. Get the deal moving by clicking the triangle to create an activity.
- Use activities reports.  
You can run various reports to get insight into the progress and history of accounts and deals. If your administrator has enabled Shared Activities, you can run certain standard or custom reports that display details specific to tasks or events and their related contacts, accounts, opportunities, and other associated records.

## Track Events and Tasks Together in Salesforce Classic

You can track events and tasks—collectively, activities—in lists, calendars, and reports. For example, track all the activities on an account to get a complete picture of the preparation, follow-up, past and future meetings, and other planned and completed work associated with the account. Events and tasks share many standard fields, such as subject, contact name, and related record.

### Activities List Views

Salesforce provides several list views of activities. You can also define your own.

#### All Activities

Shows events and tasks that you can view. In Personal Edition, the All Activities list view shows all of your activities.

#### My Activities

Shows events and tasks that you own.

#### My Delegated Activities

Shows activities that you created but that are owned by someone else.

 **Note:** Assigning multiple Salesforce users to an event or task is like delegating that activity to those users. The My Delegated Activities list view also shows activities for all assignees, even if you still own that activity. In the list view, the invited user appears as the person assigned to the activity, but the activity's detail page shows you as the assignee.

#### My Team's Activities

Shows activities owned by users who report to you in the role hierarchy. For your convenience, your team's activities are converted to your time zone.

## Other Lists of Activities

### Open Activities Related List

The Open Activities related list on a record displays all future events and open tasks related to a record.

### Activity History Related List

The Activity History related list of a record displays all completed tasks, logged phone calls, saved interaction logs, expired events, outbound email, mass email, email added from Microsoft® Outlook®, and merged documents for the record and its associated records.

### Console Tab

The Console tab lets you find, view, and edit activities and their related records on one screen.

## Activities Reports

### Standard and Custom Activities Reports

You can run various reports to get insight into the progress and history of accounts and deals. If your administrator has enabled Shared Activities, you can run certain standard or custom reports that display details specific to tasks or events and their related contacts, accounts, opportunities, and other associated records.

## Next Steps and Past Activity

See at a glance what just happened and what to do next on the deals and accounts that you're working on.

### IN THIS SECTION:

#### [Manage Work and View Past Activity in Lightning Experience](#)

The activity timeline shows you your open tasks, upcoming meetings, and past activity on an opportunity, a lead, an account, or a contact. Always know what to do next on each deal that you're working on, and see at a glance what's already happened.

#### [Work on Open Activities and View Activity History in Salesforce Classic](#)

Open Activities and Activity History tell you at a glance what just happened and what to do next on the deals and accounts that you're working on. Use the buttons and links next to these related lists to keep them current: create a task, request a meeting or an update from a contact, log a call, or send the contact an email. If you use person accounts, you can enter them in either the `Name` or the `Related To` field of an event or a task.

## Manage Work and View Past Activity in Lightning Experience

The activity timeline shows you your open tasks, upcoming meetings, and past activity on an opportunity, a lead, an account, or a contact. Always know what to do next on each deal that you're working on, and see at a glance what's already happened.

- Take the next steps on a deal or account.

Use Next Steps to manage open tasks and preview upcoming meetings. Add tasks and meetings using the composer above the activity timeline. Activities that you add to the timeline appear automatically on the opportunity, lead, or other record you're working with. Your activities also appear under Next Steps for other related records. Suppose that you add a task on an opportunity: The task also appears on the contact related to the opportunity. Update tasks under Next Steps, or mark them done.

**Note:** You can eliminate a contact or a record on a task without deleting the entire task. For example, suppose that a task is related to Contact A and Contact B, and you want to relate it only to Contact A. Rather than deleting the task, just remove Contact B from the `Name` field.

- View past activity.

Past Activity shows you your past meetings, calls that you've logged, and emails that you've sent using the composer. Like the items under Next Steps, items under Past Activity appear on other related records.

## Work on Open Activities and View Activity History in Salesforce Classic

Open Activities and Activity History tell you at a glance what just happened and what to do next on the deals and accounts that you're working on. Use the buttons and links next to these related lists to keep them current: create a task, request a meeting or an update from a contact, log a call, or send the contact an email. If you use person accounts, you can enter them in either the `Name` or the `Related To` field of an event or a task.

### Open Activities

The Open Activities related list shows you open tasks, future events, and requested meetings related to other records. For example, if an upcoming meeting on your calendar is related to a contact, that event is displayed in the Open Activities related list of the contact and the account that the contact is related to.

Use Open Activities to do the following:

- Create events and tasks that are automatically related to the record
- Request a meeting with a contact (📅 denotes a meeting request that's emailed to a contact)
- Ask a contact for an update
- Edit, close, or delete activities on the list

You can send meeting requests and requests for updates to a contact, a lead, or a person account.

### Activity History

The Activity History related list shows you all completed tasks, logged phone calls, saved interaction logs, expired events, outbound email, mass email, email that's added from Microsoft® Outlook®, and merged documents for the record and its associated records. For

example, suppose you've just completed a task related to a contact. That task is displayed in the Activity History related list of the contact and the account that the contact is related to.

Use Activity History to do the following:

### Log a Call

Note the results of an unplanned phone call, and schedule a follow-up task. The call appears as a completed task under Activity History, and the task appears under Open Activities.

### Mail Merge

Generate personalized documents by using data and Microsoft Word templates that your administrator provides. You can choose whether to show the merged document under Activity History. This button isn't available on all types of records.

### Send an Email

Send an email to a contact, and relate the email to the contact and the corresponding account, opportunity, case, or custom object. If the subject is longer than 100 characters, it is truncated with ellipses (...). This button isn't available on all types of records.

### Send Gmail

Send an email to a contact from your Gmail account. If you don't see this link, ask your Salesforce admin to enable Gmail Buttons and Links. If the Gmail to Salesforce feature is also enabled, the email that you send appears under Activity History on the contact or lead record.

### Request Update

Send an email to a contact to request updated contact information. You can update your contact record when you receive the response. This email and mass Stay-in-Touch emails appear under Activity History.

### View All

Display a printable view of the activity history for the record, if the record has activity history.

### Choose Whether to Display Activity in Self-Service Portal

If your organization has added the Case Activities related list to the View Cases page layout in the Self-Service portal, and you've set the field-level security to visible for the `Visible in Self-Service` checkbox on activities, you have the following options for each activity.

- **Make Public:** Display a completed activity under Activity History on the case in the Self-Service portal.
- **Make Private:** Hide a completed activity under Activity History on the case in the Self-Service portal.

## Considerations for Using Activities

Keep in mind these considerations for using activities, including the use of Shared Activities to represent activity relationships more accurately, choosing a primary contact, roll-up of activities to parent records, and what the `Last Activity` date represents.

### Activity Relationships Give You a More Accurate Picture of Activity on Your Contacts, Accounts, Leads, and Opportunities

By letting you relate different objects to one another, Salesforce helps you understand and use your data. For example, when you create a task, you can relate it to both a company and one or more people at the company. Then Salesforce displays the task together with the company and your contacts there in related lists and reports.

On the detail page for each contact, you see related events and tasks in the Open Activities and Activity History related lists alongside other contact details. Conversely, on the detail page for an event or a task, you see the names of all contacts related to that activity, alongside other details. If you don't see the names of all the contacts that you've related to a task, ask your Salesforce admin to add the `Name` related list to the activity detail page layouts.

### EDITIONS

Available in Lightning Experience in: **Contact Manager, Personal, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Available in Salesforce Classic in: **All Editions Except Database.com**

### You Choose a Primary Contact on an Activity

If your Salesforce admin enables Shared Activities, you can relate each event or task to up to 50 contacts. You designate one contact as the primary contact on the activity. Without Shared Activities, you can relate each event or task to one contact.

If you delete the primary contact, the next contact on the activity's related list becomes the new primary contact. If that's not the primary contact you want, you can edit the activity to select another. Lists and reports display primary and secondary contacts differently.

### Activities Roll Up to Parent Records

Suppose that you create an activity and relate it to an account and a contact. If that contact is related to a different account, the activity rolls up to the contact's parent account. For example:

- The "Sales Rep Call" task is related directly to the Global Media account and also to the contact Ron Dean.
- Ron Dean's parent account is HiTech Solutions.
- The "Sales Rep Call" task appears in the Global Media account details and also in the HiTech Solutions account details.

### Last Activity Date Shows Recent Meetings and Tasks

The `Last Activity` date in activities related lists and reports represents the last time someone in your organization took action on an account or a contact. It's either the date and time of the most recent event or the due date of the most recently closed task related to the account or contact.

Because activities roll up through related records, the `Last Activity` date on an account or a contact can represent an activity that's related to a different record and not to the account or contact directly. For example, suppose that you have an opportunity related to an account: The `Last Activity` date shown for the account can represent a meeting related to the opportunity rather than the account.

If your Salesforce admin has enabled Shared Activities, the contact's `Last Activity` date is based on the latest activity in which the contact is a primary contact. For example:

- Jane is a contact who is related to two tasks.
- Jane is *not* the primary contact for the first task, which has a due date of November 30.
- Jane *is* the primary contact for the other task, which has a due date of November 15.
- The `Last Activity` date is November 15, because that's the most recent task due date for which Jane is the primary contact.

## Activities Reporting

You can run various reports to get insight into the progress and history of accounts and deals. If your administrator has enabled Shared Activities, you can run certain standard or custom reports that display details specific to tasks or events and their related contacts, accounts, opportunities, and other associated records.

### IN THIS SECTION:

#### [Reports That You Can Run on Activities](#)

Run standard or custom reports that display details specific to tasks or events and their related contacts, accounts, opportunities, and other associated records.

#### [Report on Sales Reps' Meetings with Customers](#)

Let's say that, as a sales manager, you want more insight into how your sales teams are prioritizing their time. Create a custom report that shows which customers sales reps are spending their time with.

## Report on Sales Reps' Meetings with Customers

Let's say that, as a sales manager, you want more insight into how your sales teams are prioritizing their time. Create a custom report that shows which customers sales reps are spending their time with.

1. Create a custom report type.
  - a. For Primary Object, choose **Users**.
  - b. Complete the remaining required fields: label, description, and category.
  - c. Click **Next**.
2. Define a relationship between activities and users.
  - a. Relate the Activity Relationships object to the Users object.
  - b. Click **Save**.
3. Define default fields to appear in reports of this type.
  - a. In the Fields Available for Reports section, click **Edit Layout**.
  - b. Add the following Activity Relationships fields to the layout for reports of this type: `Date`, `Subject`, `Name`, `Related To`, `Relation Count`. Change the label for the `Name` field to `Contact` and for the `Related To` field to `Opportunity`.
  - c. For each field, check the option to display the field by default.
  - d. Click **Save**.
4. Create a report.
  - a. In the Reports tab, find and select the report type that you created in steps 1-3.
  - b. Choose **Summary Format**. Create a grouping by `Full Name`.
  - c. Run and save the report.

You now have a report that you can use to help your sales teams optimize the time that they spend with customers.

 **Note:** If you haven't enabled Shared Activities, then custom reports based on activity relationships don't include event organizers along with invitees, and they don't show events to which no one has been invited.

### EDITIONS

Available in Lightning Experience in: **Contact Manager, Personal, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All Editions Except Database.com**

### USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"
- AND
- "Report Builder"

To view activities owned by you and users below you in the role hierarchy:

- No permissions needed

To view all activities:

- "View All Data"

## Access to Activities

Know who can view, create, and delete events and tasks, and when they have access. Calendar sharing and access are controlled separately from access to individual activities.

Watch a Demo:  [Who Sees What: Organization-Wide Defaults](#)

Several kinds of settings affect your access to events and tasks owned by others in your Salesforce org.

### Role

You have access to view and edit your own activities plus activities assigned to people below you in the role hierarchy of your Salesforce org.

### Permissions

People with the “View All Data” permission can view all activities.

### Sharing Model

When the activity sharing model is “Controlled By Parent,” people with “View All” permission for the type of object on the related record can view the activity.

### Important:

- Suppose you relate one or more contacts to an activity that other people can view. Those people can view the activity along with the name, account name, and title of each contact you relate to the activity—regardless of whether they can otherwise view that information.
- An event with the `Private` checkbox selected is accessible only by the person assigned to the event.

 **Example:** You can view an activity when one of the following applies:

- You’re assigned to the activity
- You’re above the user assigned to the activity in the role hierarchy
- You have at least read access to the record to which the activity is related
- You have the “View All Data” permission
- You have the “View All” object-level permission for at least one contact and the related opportunity, account or case, and Shared Activities is enabled
- You have the “View All” object-level permission for the related opportunity or account, where the sharing model applied to the record is “Controlled By Parent”, and Shared Activities isn’t enabled

You can edit or delete an activity (in Salesforce Classic only) when the following applies:

- You have the “Edit Tasks” and “Edit Events” permissions
- AND
- You’re assigned to the activity, or
  - You’re above the user assigned to the activity in the role hierarchy, or
  - You have the “Modify All” object-level permission in the related record, where the record’s sharing model is “Controlled By Parent.” (with Shared Activities enabled, you need the “Modify All” object-level permission for at least one contact and the related record), or

## EDITIONS

Available in Lightning Experience in: **Contact Manager, Personal, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All Editions Except Database.com**

- You have the “Modify All Data” permission

[Share Your Calendar in Salesforce Classic](#)

## Activity Reminders in Salesforce Classic

Salesforce displays event and task reminders in a small browser window. When you log in to Salesforce in Salesforce Classic, if any reminders have been triggered since the last time you logged in, a sound plays and the reminder window opens. The reminder window also opens whenever a reminder is triggered while you’re logged in and using Salesforce Classic. Salesforce displays reminders according to certain default settings; you can customize reminders in your personal settings.

### EDITIONS

Available in Salesforce Classic in: **All Editions Except Database.com**

### Information in Reminder Windows

- Up to 100 of the oldest reminders that you haven’t dismissed
- The type of activity—event or task
- The activity subject (click to see activity details)
- When the event is scheduled to start or the task is due
- When the reminder is due or that the reminder is overdue

### Order of Reminders

Event reminders are sorted by start date and time, and task reminders are sorted by due date. If the option `Sort reminder window by due date` is *not* set, the window displays reminders in the following order:

1. The task and event reminder date and time.
2. The task due date *or* the event start date and time.
3. Ascending alphabetical order by subject.

If `Sort reminder window by due date` is set, the reminders are displayed in the following order:

1. The task due date *or* the event start date and time; if the task has no due date, then the reminder window displays it first
2. The task and event reminder date and time
3. Ascending alphabetical order by subject

### Display of Dates and Times

The table shows how reminders display the event start time or task due date.

Activity Type	Due Date or Time That You Specified	Due Date or Start Time Shown in the Reminder
Event	An event time	The date and time that you selected when you created or edited the event
	An all-day event	The date that you selected and the time set for <code>Start of day</code> in your <a href="#">Personal Information Settings page</a>

Activity Type	Due Date or Time That You Specified	Due Date or Start Time Shown in the Reminder
Task	A due date	The date that you selected when you created or edited the task
	No due date	The value <code>None</code>

## Customizable Reminder Settings

Follow these steps to customize your reminder settings.

1. From your personal settings, enter *Reminders* in the `Quick Find` box, then select **Reminders & Alerts**.
2. Change the settings as desired.

**Table 3: Reminder Settings**

Setting	Result When Setting Is Enabled
Trigger alert when reminder comes due	The reminder window opens when a reminder is due.
Play a reminder sound	Salesforce plays a reminder sound when a reminder is due.
By default, set reminder on Events to:	Salesforce sets a reminder on all new events. You choose the amount of time before the event start time when you want a reminder; the default is 15 minutes. You can disable the reminder or change the reminder time when you edit an event.
By default, set reminder on Tasks to:	Salesforce sets a reminder on all new tasks. You choose the date and time when you want task reminders; the default is 8:00 AM the day that a task is due. You can disable the reminder or change the reminder time when you edit a task.
Sort reminder window by due date	Salesforce sorts reminders by due date first and then by the reminder date and time.

To test your settings, click **Preview Reminder Alert**.

## Snoozing Reminders

You can snooze one or more reminders at a time. The default snooze option is to remind you again in five minutes.

When `Sort reminder window by due date` is not selected, if you click **Snooze**, the time overdue will be based on the snooze time when the reminder opens again. If you close the reminder window, it will open again when you're notified of the next reminder.

## Dismissing Reminders

You can dismiss one or more reminders at a time. To dismiss all reminders in the window, click **Dismiss All**. If the number of reminders exceeded 100 before you clicked **Dismiss All**, then after you click **Dismiss All**, the window displays the additional reminders.

 **Note:** If Salesforce doesn't display reminders that you've set, ensure that your browser isn't blocking popups.

[Find Your Personal Settings](#)

## Archived Activities

Salesforce archives certain events and tasks every Saturday at approximately 5:00 AM Greenwich Mean Time (GMT). You can view archived activities in certain locations in Salesforce.

### Activities Archived by Salesforce

- Events due more than 365 days ago
- Closed tasks due more than 365 days ago
- Closed tasks created more than 365 days ago, if they have no due date

### Where to View Archived Activities

- In weekly data export files
- By clicking **View All** in the Activity History related list
- In the printable view of the `Name or Related To` record
- By using the URL for the activity, if you know it

Archived activities aren't included in activity list views or reports.

### Other Considerations for Activity Archiving

#### Sandboxes

When you create or refresh a sandbox, archived activities aren't copied.

#### Deletion

Archived activities can be deleted manually, but Salesforce doesn't automatically delete them.

## Events and Calendars

Use Salesforce to schedule meetings and presentations with colleagues, customers, and prospects. With your calendar in Salesforce, everyone stays informed—your sales team, your sales manager—and meeting prep is easy: Just drill down from a calendar to related records, Chatter feeds, files, contracts, and more for any lead, contact, opportunity, or account.

IN THIS SECTION:

[Manage Events](#)

Manage Salesforce events on your calendar, with records such as opportunities, and in reports. Salesforce lets you relate events to opportunities, leads, accounts, and contacts—a powerful tool for keeping on top of customer relationships and closing deals.

[Calendar Sharing in Salesforce Classic](#)

Grant others access to view or edit your calendar in Salesforce Classic, or view a calendar that a coworker shares with you.

[Calendar Views](#)

Calendar views display your events in Salesforce.

### EDITIONS

Available in Lightning Experience in: **Contact Manager, Personal, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All Editions Except Database.com**

### [Considerations for Using Events and Calendars](#)

Salesforce always displays an event's start date in the time zone you've chosen in My Settings. Working with meetings and scheduling is different in Lightning Experience and Salesforce Classic.

### [Invitations and Scheduling in Salesforce Classic](#)

In Salesforce Classic, you can invite people to meetings, accept meeting invites, and use Cloud Scheduler to propose meeting times. You can also create a Microsoft® Outlook® appointment for an event in Salesforce.

## Manage Events

Manage Salesforce events on your calendar, with records such as opportunities, and in reports. Salesforce lets you relate events to opportunities, leads, accounts, and contacts—a powerful tool for keeping on top of customer relationships and closing deals.

#### IN THIS SECTION:

##### [Manage Events in Lightning Experience](#)

Create, update, and track events using your calendar or the activity timeline. You can also track events in reports.

##### [Manage Events in Salesforce Classic](#)

You can track, create, and update your own and others' meetings and invitation responses in different locations in Salesforce, depending on how you work and what meetings are relevant to you at a given moment. Salesforce displays events in activities list views and calendar views; Chatter feeds; and records that events are related to, such as contacts and accounts. You can also track events in reports.

## Manage Events in Lightning Experience

Create, update, and track events using your calendar or the activity timeline. You can also track events in reports.

- Use the calendar to work with all your events and to create events. In the navigation menu, choose **Calendar**.  
You can't share your calendar with others or invite others to an event.
- Use the activity timeline to monitor and update upcoming and past events on an opportunity, a lead, an account, or a contact.
- Use activities reports to view events owned by people below you in the role hierarchy of your Salesforce org.

 **Note:** You can eliminate a contact or a record on an event without deleting the entire event. For example, suppose that an event is related to Contact A and Contact B, and you want to relate it only to Contact A. Instead of deleting the event altogether, remove Contact B from the `Name` field.

#### EDITIONS

Available in Lightning Experience in: **Developer, Enterprise, Group, Performance, Professional,** and **Unlimited** Editions

#### USER PERMISSIONS

To create events

- "Edit Events"

## Manage Events in Salesforce Classic

You can track, create, and update your own and others' meetings and invitation responses in different locations in Salesforce, depending on how you work and what meetings are relevant to you at a given moment. Salesforce displays events in activities list views and calendar views; Chatter feeds; and records that events are related to, such as contacts and accounts. You can also track events in reports.

### Track Events

View a Demo: [How to Track Calls, Emails, and Meetings](#)

You can track events belonging to you and to others in the following locations. To see activities list views, click  on the Home tab or any calendar view, or go to the calendar day or week view.

#### Events That You Own

- The Home tab, in the Calendar section
- An activities list view: Choose an existing list view or customize one
- Your Chatter feed: Follow an event to track posts, comments, and updates about it

#### Events Owned by People Who Have Shared Their Calendars with You

The multi-user calendar view

#### Events That You've Assigned to Others

- The **My Delegated Activities** list view
- Activities reports

#### Events Owned by People Below You in Your Organization's Hierarchy

- The **My Team's Activities** list view
- Activities reports

#### Upcoming Events

- A calendar view
- The **Upcoming Events** list view
- The Open Activities related list for a record related to an event

#### Past Events

- A calendar view
- The **My Activities** list view
- The Activity History related list for a record related to an event

#### Events Related to Another Record, Such as a Contact or an Account

- The other record's detail page, in the Open Activities and Activity History related lists
- Your Chatter feed and in the Chatter feed for the other record
- Activities reports

### View Event Details

In a calendar view, in an activities list view, in a related list, or on the Home tab, there are two ways to see event details:

- Hover your mouse over an event's subject.

#### EDITIONS

Available in Salesforce Classic in: **All Editions Except Database.com**

Events with invitees not available in: **Personal Edition**

#### USER PERMISSIONS

To create events

- "Edit Events"

- Click the subject.

On an event detail page, to view the details of a single event in a recurring series () , select the View Event subtab. To view the details for the series, select the View Series subtab.

 identifies events with invitees.

## Create Events

### On the Home Tab

On the Home tab, under Calendar, click **New Event** or **New Meeting Request**.

### In a Chatter Feed

If you create an event in the feed for a record such as a contact, Salesforce automatically relates the event to the record.

### In the Sidebar

In the sidebar in Salesforce, in the Create New drop-down list, select **Event**.

### On the Detail Page of Another Record

On the Open Activities related list, click **New Event** or **New Meeting Request**. Salesforce automatically relates the event or meeting request to the record.

### On the Detail Page of an Event with Invitees

On the detail page of an event that you've invited one or more people to, click **Clone**. You can clone an event that has at least one invitee and isn't a recurring event.

### In a Calendar View

- Click **New Event**.
- In a day view, click a time, such as 9:00 AM.
- In a day or week view, double-click a time slot. You can't double-click to create a recurring event or an event that you invite people to. If double-clicking doesn't open a new event, ask your administrator to enable Click-and-Create Events.
- In a week or month view, click  .

### In an Activity List View ()

In a list view, click **New Event**.

### In a List View of Contacts, Leads, or Other Records

In a list view of contacts, leads, or other records, click  at the bottom of the page to add a weekly calendar view to the page. Create an event related to a record by dragging the record from the list view down to a time slot on the calendar. If you don't see , ask your Salesforce admin to enable Drag-and-Drop Scheduling.

**Note:** If you schedule meetings with people in a different time zone, your calendar shows their available and busy times in your time zone. An individual person's **Time Zone** setting (as specified on the personal information page) overrides the **Default Time Zone** set for the Salesforce org.

## Update Events

Anywhere (except reports) that you can view event details, you can edit any event that you have permission to edit.

You can edit an event in several ways:

- To reschedule an event, in a calendar view, drag the event to a different time slot. For best results, place your mouse over the subject line of the event before dragging it. If the event is a recurring event () , only the single occurrence that you drag is changed, not the entire series.
- Click **Edit** next to the event in an activities list view, an Open Activities related list, or an Activity History related list. The event detail page opens.

- Go to a calendar view, an activities list view, a related list, or the Home tab. Hover your mouse over the subject of an event. A small window with editing options appears.
- Use Cloud Scheduler to collaborate with others in choosing a meeting date and time. When you confirm the meeting date and time, you convert the meeting into a Salesforce event, which you can edit or delete like any other event.

## Calendar Sharing in Salesforce Classic

Grant others access to view or edit your calendar in Salesforce Classic, or view a calendar that a coworker shares with you.

Watch a Demo:  [Who Sees What: Organization-Wide Defaults](#)

### IN THIS SECTION:

#### [Share Your Calendar in Salesforce Classic](#)

You can grant coworkers, personal and public groups, roles, or roles and subordinates access to view or edit your calendar in Salesforce Classic.

#### [View a Coworker's Calendar in Salesforce Classic](#)

When coworkers share their calendars with you, you can view the calendars in Salesforce Classic.

### SEE ALSO:

[Activity Reminders in Salesforce Classic](#)

[Access to Activities](#)

## Share Your Calendar in Salesforce Classic

You can grant coworkers, personal and public groups, roles, or roles and subordinates access to view or edit your calendar in Salesforce Classic.

Watch a Demo:  [Who Sees What: Organization-Wide Defaults](#)

Options vary for sharing your calendar with others, depending on the organization-wide calendar sharing level that your Salesforce admin sets. The options can make your calendar more available to others, but not less. Calendar sharing settings affect the visibility of items on a calendar, but they don't give coworkers access to event detail pages.

Events associated with a record that you own are visible to anyone above you in the role hierarchy.

1. From your personal settings, enter *Calendar Sharing* in the Quick Find box, then select **Calendar Sharing**.
2. To share your calendar with others, click **Add**. Select the users, roles, or groups whose activities you want to display in your calendar.
3. Specify how you want to share your calendar. Select one of the following:

#### **Hide Details**

Coworkers can see whether given times are available but can't see any other information about the nature of events in your calendar.

### EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

### EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

### USER PERMISSIONS

To create events

- "Edit Events"

**Hide Details and Add Events**

Coworkers can see whether given times are available but can't see details of events. They can insert events in your calendar.

**Show Details**

Coworkers can see detailed information about events in your calendar.

**Show Details and Add Events**

Coworkers can see detailed information about events in your calendar, and they can insert events in your calendar.

**Full Access**

Coworkers can see detailed information about events in your calendar, insert events, and edit existing events.

## SEE ALSO:

[Access to Activities](#)

**View a Coworker's Calendar in Salesforce Classic**

When coworkers share their calendars with you, you can view the calendars in Salesforce Classic.

Your access to view event details, edit events, or create events varies by calendar. Your access to a given calendar depends on how your Salesforce admin sets up your org and the calendar sharing options that your coworker has chosen.

You can view all events owned by people below you in the role hierarchy.

- In day, week, or month view, click **Change** next to the name at the top of the calendar, then select the calendar that you want to view.

**EDITIONS**

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

**Calendar Views**

Calendar views display your events in Salesforce.

## IN THIS SECTION:

[Calendar Views in Lightning Experience](#)

View, create, and edit your events in a day or a week view. Click an event to see details. The calendar displays all events that you own in Salesforce, including events outside your business hours. Be aware of limitations on event reminders and on inviting people to events (multiuser events).

[Calendar Views in Salesforce Classic](#)

Calendar views display your own calendar and coworkers' calendars along with list views of open tasks. On the Home tab, the Calendar section shows upcoming events, a date picker for the month, and links to other calendar and activity views. Share your calendar with coworkers and print calendars and task lists.

**Calendar Views in Lightning Experience**

View, create, and edit your events in a day or a week view. Click an event to see details. The calendar displays all events that you own in Salesforce, including events outside your business hours. Be aware of limitations on event reminders and on inviting people to events (multiuser events).

You can't set or view event reminders; create or edit recurring events; or create, edit, accept, or decline meeting invites. However, suppose that a Salesforce Classic user creates a series of recurring events. Lightning Experience users see the individual events on their calendars. Similarly, Lightning Experience users can see individual events that they've been invited to by Salesforce Classic users.

**EDITIONS**

Available in Lightning Experience in: **Developer, Enterprise, Group, Performance, Professional, and Unlimited Editions**

## Calendar Views in Salesforce Classic

Calendar views display your own calendar and coworkers' calendars along with list views of open tasks. On the Home tab, the Calendar section shows upcoming events, a date picker for the month, and links to other calendar and activity views. Share your calendar with coworkers and print calendars and task lists.

### EDITIONS

Available in Salesforce Classic in: **All Editions Except Database.com**

### Where to Select or Switch Views

You access calendar views in the following locations:

- The Calendar section at the bottom of the Home tab (if your Home tab doesn't display the Calendar section, ask your administrator to customize your home page layout)
- The Calendar shortcut in the sidebar that opens your last used calendar view (if your Salesforce administrator has enabled the shortcut)
- The detail page for an event or a task
- An activities list view

In any view, when you hover your mouse over an event that you have permission to see and edit, an overlay displays key event details, links to related records, and buttons for editing and deleting the event. Your administrator configures the content of the overlays.

### Day, Week, Month, and Activity Views

Calendar views display events as follows:

- A day at a time:  or **Today**
- On a date that you choose using 
- A week at a time:  or **This Week**
- In a week view, with or without weekends
- A month at a time:  or **This Month**
- On a day that you choose: Click in the week or month view
- In a list of activities (events and tasks): 

Inside any calendar view, you can switch views by clicking the icon for a different view. In a week or month view, click a date to see that day's view.

### Single-User View and Views of Other Calendars

The single-user view () displays up to 1,000 events in one month in any of the following:

- Your own calendar
- The calendar of another user (not available in Personal Edition)
- A public calendar
- A resource calendar

Click **Change** to switch users or calendars. Click **Share My Calendar** to allow other users to view your calendar. To reset your view to your own calendar, click **Back to My Calendar**.

 **Note:** Activities related to another record are visible to users above the activity owner in the role hierarchy regardless of whether your organization's sharing settings specify the use of hierarchies.

All single-user day and week views of a user's calendar display a list of the user's open tasks alongside the calendar. A drop-down list lets you choose other views, for example overdue tasks or tasks due today.

By default, your daily and weekly calendar views display the range of hours specified as `Start of Day` and `End of Day` on your Personal Information page.

If you sync events from Outlook using Salesforce for Outlook, you may see a banner at the top of your calendar that is linked to a list of your unresolved events: synced Outlook events that haven't been assigned to Salesforce records.

### Multi-User View

The multi-user view () displays several users' calendars and activities together. Choose an existing list view of users from the **View** drop-down list or click **Create New View**.

The view shows each person's availability. A legend in the view shows busy and out-of-office time. If an event is set to show the time as free, then multi-user views don't display it.

Consider these limitations of the multi-user view:

- Drag-and-drop editing isn't available in the multi-user view.
- The multi-user calendar works differently in the partner portal. For example, partners can view events only on the calendars of people in their own company and their channel manager.

### Printable View

After you select a view and click **Printable View**, adjust the view before printing it.

- To send the printable view to a printer, click **Print This Page**.
- To change the dates before printing, click , , **Today**, **This Week**, or **This Month**.
- In a day or week view, select a different task list view if you like.
- In multi-user views, in the **Sort by** drop-down list, select `Time` to include all users' events on a single calendar, or select `User` to display a separate calendar for each user.

## Considerations for Using Events and Calendars

Salesforce always displays an event's start date in the time zone you've chosen in My Settings. Working with meetings and scheduling is different in Lightning Experience and Salesforce Classic.

### IN THIS SECTION:

[Considerations for Using Events and Calendars in Lightning Experience](#)

Be aware of these considerations for owning, viewing, creating, and updating meetings, and for using calendars.

[Considerations for Using Events and Calendars in Salesforce Classic](#)

In using events, take into account these considerations for editing and deleting events; working with recurring events, events related to multiple contacts (Shared Activities), meetings with other people, and events in Chatter; assigning event owners; and spell checking.

## Considerations for Using Events and Calendars in Lightning Experience

Be aware of these considerations for owning, viewing, creating, and updating meetings, and for using calendars.

### Relating Multiple Contacts to an Event on an Opportunity or Other Record (Shared Activities)

Using the `Name` field, you can relate up to 50 contacts (but only one lead) to a meeting on an opportunity or other record. You choose one primary contact. Any meeting related to an opportunity, a lead, an account, or a contact appears in the activity timeline for that record.

### No Calendar Sharing

You can't share your calendar with coworkers or your manager.

### Managers Can't Edit Their Reports' Events

Managers in the role hierarchy can use reports to view events owned by people below them in the role hierarchy. However, they can't edit events owned by others.

### Events Can Have One Owner at a Time

A meeting can be owned by one person. If you reassign it to someone else, it no longer appears on your calendar.

### Your Calendar Doesn't Indicate Your Business Hours

Your calendar doesn't indicate the business hours you've set in your personal settings.

### No Meeting Invites

You can't invite people to meetings. However, if someone creates a meeting in Salesforce Classic and invites you to it, your calendar displays it.

### No Recurring Events

You can't create recurring meetings. However, your calendar displays single meetings that have been created as part of a series in Salesforce Classic, and you can edit them.

SEE ALSO:

[Calendar Views in Lightning Experience](#)

#### EDITIONS

Available in Lightning Experience in: **Developer, Enterprise, Group, Performance, Professional, and Unlimited** Editions

## Considerations for Using Events and Calendars in Salesforce Classic

In using events, take into account these considerations for editing and deleting events; working with recurring events, events related to multiple contacts (Shared Activities), meetings with other people, and events in Chatter; assigning event owners; and spell checking.

Event Editing

### Permission to Edit Other People's Events

Permission to edit other people's events is controlled by your organization's calendar sharing model and your personal calendar sharing. However, regardless of these settings, managers in the role hierarchy can always edit events owned by people who report to them.

### Permission to Edit Public Calendars and Resource Calendars

Permission to edit events in public and resource calendars is controlled by the calendar sharing model.

### Changes to Fields in Single Events and Their Series

If you change a field in a single event, and then you change the same field in the series, the change in the series overrides the change to the single event.

#### EDITIONS

Available in Salesforce Classic in: **All** Editions Except **Database.com**

Events with invitees not available in: **Personal** Edition

## Event Deletion

**Declining Event Invitations**

If you decline an event that you've been invited to, Salesforce removes the event from your calendar. Only the event owner can delete an event with invitees.

**Notification for Deleted Event Series**

If an event owner deletes a series of recurring events, every invitee receives an email notification that the series of events has been canceled.

**Handling of Past and Future Events in Deleted Series**

If you delete a series of events, you delete only future events. Events that have already happened aren't affected.

If a series is deleted and it contains events that occurred in the past, the series isn't moved to the Recycle Bin. As a result, the series can't be restored from the Recycle Bin.

If a series is deleted and it doesn't contain past events, Salesforce moves the series to the Recycle Bin. Individual events that were part of the series aren't moved to the Recycle Bin.

**Handling of Series Restored from Recycle Bin**

If you restore a series from the Recycle Bin, single events are created. Those single events contain both the details defined by the series and any changes or additions made to them individually before the series was deleted.

**Deleted Public Calendars**

If you delete a public calendar, Salesforce doesn't put it in the Recycle Bin.

Recurring Events **Effects of Changes to an Event Series and Single Events in a Series**

**Warning:** Changes to any fields in an event series override changes previously made to single events.

In addition, if you change any of the following settings, the status of invitees for all future events is reset to Not Responded; you lose messages sent with invitees' responses and other changes to single future events; triggers and workflows are reset; and links to future events break:

- All-day event checkbox
- Start or end time
- Location
- Recurrence frequency
- Recurrence start or end date, if you send updates to invitees

If you don't send updates, and you only extend the recurrence end date, then future events aren't affected.

**Display of Original and New Start or End Time for a Changed Series**

If the organizer changes the start or end time of a single event in a recurring series, the calendar views and the Calendar section of the Home tab show the updated time. However, the detail page of the single event continues to show you the original time until you accept or decline the series.

**Maximum Number of Invitees****Duration of Events**

If your Salesforce admin has enabled multiday events, then you can create events up to 14 days long, except recurring events. When you create a recurring event, the maximum duration of the single events in the series is 24 hours. After you create the series, you can change the duration to up to 14 days if your Salesforce admin has enabled multiday events.

### Event Reminders

If you create a recurring event and you leave the reminder checkbox selected, you receive a reminder for each single event in the series.

### Attachments to Events

You can attach files to a series of recurring events. After you create a series, you can add or delete attachments to each single event in the series.

Attachments are displayed on the event detail page only, not on the detail page for other records that the event is related to. If you don't see the Attachments related list on the event detail page, ask your Salesforce admin to add it to the event page layout.

## Inviting People and Scheduling Resources

### Access Requirements for Inviting People and Resources

You must have at least read access to the contacts and leads you invite to an event. You must have at least "Add Events" on a resource to invite it to an event.

### Permission to Edit Events with Invitees

 identifies an event with one or more invitees. You can edit an event that you've invited people to only if you own the event. If the event isn't a recurring event, you can assign it to a different person.

If you want to send an email update, you can send it to all invitees or only to the people you added or deleted during editing.

### Event Attendance

Declining an event removes it from your calendar. The event owner doesn't receive an email notification when an invitee accepts or declines an invitation.

## Relating Events to Multiple Contacts (Shared Activities)

### Maximum Number of Related Contacts

You can relate an event to up to 50 contacts (but only one lead) in the `Name` field, including one primary contact. If you don't see

 next to the `Name` field, ask your administrator to enable Shared Activities.

### No Support for Recurring Events or Multiple Event Owners

You can't relate multiple contacts to a recurring event series or an event owned by multiple people.

## Assigning Events to Coworkers

### Default Event Owner

By default, an event is assigned to the user who creates it. To assign independent copies of a new event to multiple people, click

 next to **Assigned To**. In the window that opens, click the Multiple Users tab. The `Assigned To` field isn't available in Personal Edition.

## Spell Checking

### Not All Languages Supported

If you don't see Spell Checker on the `Description` field, ask your Salesforce admin to enable it. However, Spell Checker does not support all the languages that Salesforce supports. For example, Spell Checker doesn't support Thai, Russian, and double-byte languages, such as Japanese, Korean, or Chinese.

## Events in Chatter

### New Events in Chatter Feeds

If a new event is related to a record such as a lead, an account, or a custom object, the event appears in the feed for that record. On any record you follow, you see feed items for all events, regardless of who created them.

### Creating Events in Feeds

Your Salesforce admin specifies whether you can use Chatter to create events for different types of records. For example, some people can view but not create events in the feeds for accounts that they have access to.

### No Recurring Events in Chatter

Your Chatter feed doesn't display recurring events, either in series or singly, and you can't follow recurring events in Chatter.

## SEE ALSO:

[Calendar Views in Salesforce Classic](#)

## Invitations and Scheduling in Salesforce Classic

In Salesforce Classic, you can invite people to meetings, accept meeting invites, and use Cloud Scheduler to propose meeting times. You can also create a Microsoft® Outlook® appointment for an event in Salesforce.

## IN THIS SECTION:

[Invite People to an Event and Schedule Resources in Salesforce Classic](#)

Invite users, contacts, and leads to a meeting, and schedule meeting resources.

[Quickly Schedule a Meeting About an Account, a Contact, or a Lead in Salesforce Classic](#)

Drag-and-drop scheduling lets you schedule events related to accounts, contacts, and leads without leaving the list view page. You drag records from list views onto weekly calendar views and enter the details of the event in an overlay.

[Create an Outlook Appointment for an Event in Salesforce Classic](#)

Create an appointment in Microsoft® Outlook® from the details of an event.

[Create an Event in a Public Calendar in Salesforce Classic](#)

A public calendar contains a schedule of events that is available to a group of users; for example, a sales events calendar for a sales department. If your administrator has set up a public calendar and you're assigned to that group, you can view the public calendar in the same way that you would switch to viewing another user's calendar, and you can add an event to it in the same way you would add to your own.

[Use Cloud Scheduler to Request Meetings in Salesforce Classic](#)

Cloud Scheduler lets you request a meeting with a contact, a lead, a person account, or a coworker.

[Respond to Event Invitations in Salesforce Classic](#)

Accept or decline an invitation to an event. After you've accepted an invitation, you can add the event to Outlook.

## EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

## Invite People to an Event and Schedule Resources in Salesforce Classic

Invite users, contacts, and leads to a meeting, and schedule meeting resources.

1. On the Event detail page, in the Select Invitees section, click **Select**.
2. In the Select Invitees dialog box, search for the type of invitee: users, leads, contacts, or resources.
3. Enter a name or part of a name or leave the field blank to expand the search. Click Find.
4. Use  and  to select and deselect people or resources. To invite more people or resources, search again and select the invitees you want.
5. Click **Done**.
6. Review the calendar of each invitee and adjust the date and time of the event if necessary. The availability of invitees is indicated in color on their calendars: busy time is blue and out-of-office time is red. If an invitee has more than one event scheduled for a particular time, all the events are shown on the calendar. Hover your mouse over any event on the calendar to see the event details.

7. To remove an invitee from an event, click **Remove** next to the invitee's name.

8. Click **Save & Send Update**.

Invited leads, contacts, and person accounts receive an email containing a link to a web page where they can accept or decline the invitation for the event or event series. You also receive an email summary of the event. If an invited resource is available at the given time, the resource automatically accepts the invitation.

### EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

### USER PERMISSIONS

To invite people to an event:

- "Edit Events"

## Quickly Schedule a Meeting About an Account, a Contact, or a Lead in Salesforce Classic

Drag-and-drop scheduling lets you schedule events related to accounts, contacts, and leads without leaving the list view page. You drag records from list views onto weekly calendar views and enter the details of the event in an overlay.

If you don't see the  **Open Calendar** link, ask your administrator to enable drag-and-drop scheduling.

1. Click the  **Open Calendar** link at the bottom of a list view. A weekly view of a calendar appears below view.
  2. Drag a record from the list to a time slot on the calendar. A popup window for creating an event appears. The event is already related to the record that you dragged from the list view.
- The  **Open Calendar** link appears only at the bottom of list views for accounts, contacts, and leads.
  - Drag-and-drop scheduling isn't available for the Console tab, events that people have been invited to, recurring events, accessibility mode, or Connect Offline.
  - List views that include drag-and-drop scheduling can take slightly longer than usual to be displayed.
  - When you drag the bar in between the list and calendar to resize either one, the size is automatically saved for all views in which you use drag-and-drop scheduling. You can resize the list and calendar at any time.

### EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

### USER PERMISSIONS

To enable drag-and-drop scheduling:

- "Customize Application"

To create events:

- "Edit Events"

### USER PERMISSIONS

To create events:

- "Edit Events"

## Create an Outlook Appointment for an Event in Salesforce Classic

Create an appointment in Microsoft® Outlook® from the details of an event.

1. On the detail page for an event, click **Add to Outlook**.
2. Click **Open** to immediately add the event to Outlook, or save it to your computer as a `.vcs` file. If you save it as a `.vcs` file, import the file into Outlook.

The Outlook appointment is added to the “salesforce.com” folder and tagged with the “salesforce.com” category so that duplicates aren’t created during synchronization.

Consider the following when you add an event to Outlook.

- When you view the event in Outlook, the description doesn’t display line breaks that you entered in the event’s `Description` field. Any line breaks are replaced by two spaces in the `.vcs` file.
- You can also sync your Salesforce events to Outlook using Exchange Sync or Salesforce for Outlook.

 **Note:** You can also use the Salesforce App for Outlook and Salesforce for Outlook to add Microsoft® Outlook® emails to Salesforce. These email integration applications let you log an outbound or sent email as a task in Salesforce. Then you can associate this task with a contact, a lead, or another record.

## Create an Event in a Public Calendar in Salesforce Classic

A public calendar contains a schedule of events that is available to a group of users; for example, a sales events calendar for a sales department. If your administrator has set up a public calendar and you’re assigned to that group, you can view the public calendar in the same way that you would switch to viewing another user’s calendar, and you can add an event to it in the same way you would add to your own.

1. On a calendar view, click **[Change]** to switch to a public calendar.
2. Choose the time and date of the event:
  - On the day view, click a time such as **9:00 AM** to add an event at that time.
  - On the week or month view, click **+** to add an event on a particular date.
3. Enter the details of your event.
4. Click **Save**. Alternatively, click **Save & New Task** to save the event and immediately begin creating a new task or **Save & New Event** to save and begin creating an additional event.

## Use Cloud Scheduler to Request Meetings in Salesforce Classic

Cloud Scheduler lets you request a meeting with a contact, a lead, a person account, or a coworker.

### IN THIS SECTION:

#### [How Cloud Scheduler Works in Salesforce Classic](#)

When you use Cloud Scheduler to request a meeting with a contact, a lead, a person account, or a coworker, Salesforce creates a unique Web page for your meeting that displays the proposed meeting times. When invitees visit the page, they select the times that work for them and send you a reply. Salesforce tracks all the responses so that you can pick the best time to meet when you confirm the meeting.

#### [Request a Meeting in Salesforce Classic](#)

Use Cloud Scheduler to request a meeting with a contact, a lead, a person account, or a coworker.

### [Tips for Proposing Meeting Times in Salesforce Classic](#)

When you request a meeting using Cloud Scheduler, you can either propose meeting times or let Salesforce propose times for you. One of the benefits of letting Salesforce propose meeting times happens when there's a long delay between the time you send the meeting request and when the first invitee views it. For example, if you request a meeting with a contact on a Monday and that contact doesn't view your request until Thursday, Salesforce proposes times from Thursday forward instead of when the meeting request was sent.

### [Change the Invitees to a Requested Meeting in Salesforce Classic](#)

When you use Cloud Scheduler to request a meeting, you can add and remove invitees at any time.

### [Reschedule a Requested Meeting in Salesforce Classic](#)

If you used Cloud Scheduler to request a meeting that hasn't been confirmed, you can reschedule it and propose new times. However, when you confirm a meeting, it's converted to an event, so you can't propose new times. To reschedule an event, edit the event to change its date and send an update to the invitees.

### [Confirm a Requested Meeting in Salesforce Classic](#)

After you use Cloud Scheduler to request a meeting, wait for the invitees to reply with the times they can meet. When this happens, you receive an email notification, and the meeting in Salesforce is automatically updated with the times the invitees selected. You can then choose the best time to meet and confirm the meeting.

### [Cancel a Requested Meeting in Salesforce Classic](#)

If you used Cloud Scheduler to request a meeting and the meeting hasn't been confirmed, you can cancel the meeting, and Salesforce automatically sends a cancellation notice to the invitees. When you confirm a meeting, then it's converted to an event, which you can delete like any other event.

## How Cloud Scheduler Works in Salesforce Classic

When you use Cloud Scheduler to request a meeting with a contact, a lead, a person account, or a coworker, Salesforce creates a unique Web page for your meeting that displays the proposed meeting times. When invitees visit the page, they select the times that work for them and send you a reply. Salesforce tracks all the responses so that you can pick the best time to meet when you confirm the meeting.

### **Step 1: You Request a Meeting and Propose Meeting Times**

Go to either the Calendar section on the Home tab or the Open Activities related list on the detail page of the contact, lead, or person account you want to request a meeting with. Click **New Meeting Request** to open the Meeting Request page.

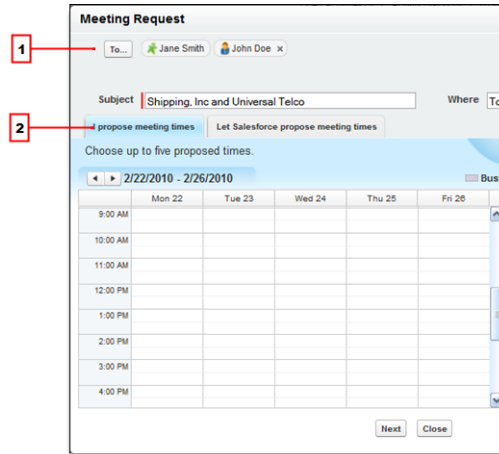

#### EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

#### USER PERMISSIONS

To request a meeting:

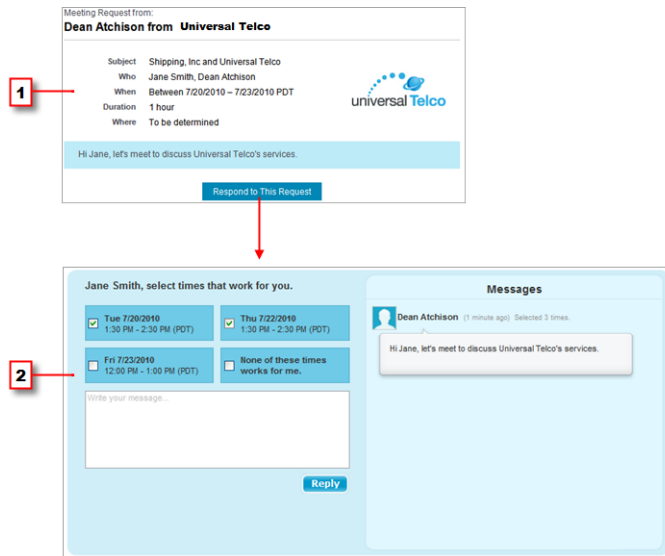

- "Edit Events"
- AND
- "Send Email"

1. Click **To** to invite coworkers, leads, contacts, or person accounts to the meeting.
2. Click in the calendar to propose up to five meeting times, or let Salesforce propose times for you.

**Step 2: Invitees Pick the Times They Can Meet**

Salesforce emails a meeting request to the invitees so they can pick the times they are available.

1. In the meeting request, invitees click **Respond to This Request** to open your meeting's Web page.
2. On the meeting Web page, invitees pick the proposed times that work for them and send you a reply.

**Step 3: You Confirm the Meeting**

Salesforce keeps track of all the responses so you can see when each invitee is available. You then select the best time to meet and confirm the meeting.

Attendee Availability

### Request a Meeting in Salesforce Classic

Use Cloud Scheduler to request a meeting with a contact, a lead, a person account, or a coworker.

Before you use Cloud Scheduler, consider these tips:

- You must have at least read access to the contacts, leads, and person accounts that you request a meeting with.
- Each invitee must have an email address specified in their record so Salesforce can send them a meeting request.
- You can invite up to 50 people to a meeting. Invitees can consist of only contacts, leads, or person accounts, only coworkers who use Salesforce, or a combination.
- We recommend you install [Salesforce for Outlook](#) so you can sync your calendar events between Salesforce and Microsoft® Outlook®.

When proposing meeting times, it's helpful to have your Salesforce calendar up-to-date so you can see your free and busy times.

To request a meeting:

1. Go to either the Calendar section on the Home tab or the Open Activities related list on the detail page of the contact, lead, or person account you want to invite to a meeting.
2. Click **New Meeting Request**.  
If this button doesn't display in the Calendar on the Home tab or on the Open Activities related list, ask your Salesforce administrator to add it.
3. Click **To** to invite coworkers, leads, contacts, or person accounts to the meeting.
  - a. Select the type of invitee from the drop-down list. person accounts are returned in contact searches and can be added as invitees.
  - b. Enter a name or part of a name in the text field, or leave the field blank to expand the search.
  - c. Click **Go!**
  - d. In the Search Results area, select the boxes next to the people you want to invite and click **Insert Selected**. To add more invitees, perform a new search and select more people as needed. If there's a warning icon (⚠️) next to a person's name, you can't invite them to the meeting because they don't have an email address specified in their record. After you add an email address to their record, you can invite them to meetings.
  - e. Click **Done**.

### EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

### USER PERMISSIONS

To request a meeting:

- "Edit Events"
- AND
- "Send Email"

- f. To remove someone you just invited, click “x” next to the person’s name in the **To** field. You can remove all invitees unless you requested the meeting from an Open Activities related list. In that case, the first contact, lead, or person account in the **To** field can’t be removed.
4. Enter a subject and location.  
If you requested the meeting from an Open Activities related list, the default subject is a combination of the account name for the lead or contact and the company name specified in your personal information. For example, if you’re meeting with a contact from the Sterling company and you work for ACME, the default subject is `Sterling and ACME`. The default location is always `To be determined`.
  5. Select one of these tabs:
    - **I propose meeting times**—Propose up to five meeting times by picking times in the calendar.
    - **Let Salesforce propose meeting times**—Choose the duration and time frame of the meeting and let Salesforce propose up to five meeting times for you.
  6. Click **Next**.
  7. Write a message to the invitees, and click **Send**.

Note the following:

- Your email signature is automatically added to your message.
- After you click **Send**, Salesforce emails a meeting request to the invitees.
- Your meeting’s Web page displays all messages between you and the invitees. This includes messages that invitees write when responding to your request.
- If you requested the meeting from an Open Activities related list, the meeting appears on the detail page for that contact or lead only. It doesn’t appear on the Open Activities related list for any other invitee. For example, if you requested a meeting with Jane Smith from her contact detail page and then clicked the **To** field to invite John Doe, the requested meeting only appears on the Open Activities related list for Jane Smith and not John Doe. If you requested the meeting from the Calendar section on the Home tab, the meeting doesn’t appear on the Open Activities related list for either Jane Smith or John Doe.

After you send your meeting request, wait for the invitees to reply with the times they can meet. Then confirm the meeting by selecting a final meeting time.

### Tips for Proposing Meeting Times in Salesforce Classic

When you request a meeting using Cloud Scheduler, you can either propose meeting times or let Salesforce propose times for you. One of the benefits of letting Salesforce propose meeting times happens when there’s a long delay between the time you send the meeting request and when the first invitee views it. For example, if you request a meeting with a contact on a Monday and that contact doesn’t view your request until Thursday, Salesforce proposes times from Thursday forward instead of when the meeting request was sent.

### Proposing Meeting Times

When you propose meeting times:

- Proposed times aren’t saved to your Salesforce calendar. The meeting only appears in your calendar after you [confirm the meeting](#).
- When the invitees view your meeting request, the proposed times are shown in your time zone. Proposed times aren’t shown in the invitees’ time zones.

#### EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

#### USER PERMISSIONS

To request a meeting:

- “Edit Events”
- AND
- “Send Email”

- You can't propose a time that occurs in the past (before the black line in the calendar).
- The calendar's shaded areas show when you and the other invited coworkers are busy based on your Salesforce calendars. Darker shades show when multiple coworkers are busy at the same time.
- Use the `Duration` field to change the length of your meeting.
- To remove a time you proposed, hover over the proposed time and click "x".

### Letting Salesforce Propose Meeting Times

When Salesforce proposes meeting times:

- You won't know which times are proposed until after you send the meeting request. Once the first invitee views your request, Salesforce checks the calendars of all coworkers invited to the meeting and proposes meeting times based on their availability. Salesforce tries not to propose the same times that invitees have already selected for other unconfirmed meetings. For example, if you request a meeting for the next five business days and your invitees respond that they can meet on Tuesday and Wednesday from 2:00 to 3:00 p.m., and then you request another meeting for the same time frame, Salesforce won't propose times for Tuesday and Wednesday from 2:00 to 3:00 p.m. unless your calendar is completely booked with confirmed meetings and other events.
- By default, Salesforce proposes meeting times between 9:00 a.m. and 5:00 p.m. in your time zone. However, if you have changed the `Start of day` and `End of day` fields in your Personal Information Settings page, Salesforce uses those settings instead.

 **Note:** If you don't want to meet at a specific time of day (like your lunch hour), schedule a recurring event in your Salesforce calendar to block out that time.

The following table describes the settings that control how Salesforce proposes meeting times.

Field	Description
<code>Duration</code>	The length of your meeting.
<code>Time Frame</code>	<p>How far in advance Salesforce proposes meeting times:</p> <ul style="list-style-type: none"> <li>• <b>Next 5 Business Days/Next 10 Business Days</b>—Salesforce tries to spread out the proposed times over the specified time frame. For example, if your time frame is Next 5 Business Days and the first invitee views the request on a Monday, Salesforce tries to propose a time for each day of that week. If some of your days are booked, Salesforce condenses the proposed times into fewer days. Business days exclude Saturdays and Sundays.</li> <li>• <b>Whenever</b>—Salesforce tries to propose five meeting times over the next five business days, and if it can't propose enough times, it extends the range over the next 10 business days. If Salesforce still can't find five times to propose, it looks for available times over the next four weeks. When you select this option, some of the times Salesforce proposes could be seven weeks away (5 business days + 10 business days + 20 business days = 7 weeks).</li> </ul>

## Change the Invitees to a Requested Meeting in Salesforce Classic

When you use Cloud Scheduler to request a meeting, you can add and remove invitees at any time.

1. Open your meeting using one of these methods:
  - From the Calendar section on the Home tab, click the **Requested Meetings** subtab and then click the subject of your meeting. If the **Requested Meetings** subtab doesn't display on the Calendar section, ask your administrator to add it.
  - If you requested the meeting from the Open Activities related list for that contact, lead, or person account, click the subject of your meeting in the related list.
  - From the email notification that you received when an invitee responded to your meeting request, click **View Response and Schedule Meeting**.
2. Do either of the following:
  - Click **To** to invite coworkers, leads, contacts, or person accounts to the meeting.
  - Click "x" next to an invitee's name to remove them from the meeting.

You can remove all invitees unless you requested the meeting from an Open Activities related list. In that case, the first contact, lead, or person account in the  $\text{T}\circ$  field can't be removed.

The calendar automatically updates based on the people you added or removed from the meeting.

 **Note:** If **Close** is the only button on the page, you don't have permission to modify the requested meeting. Either ask the organizer to change the meeting details for you, or contact your Salesforce administrator to grant you the required permissions.

3. Click **Send Update**.
4. Enter a message. For example, you might want to inform your invitees who you're adding or removing from the meeting.
5. Click one of the following:
  - **Send to All Invitees**—Sends an update to all existing and added invitees and a cancellation notice to removed invitees.
  - **Send Only to Changed Invitees**—Sends an update to added invitees and a cancellation notice to removed invitees.

## Reschedule a Requested Meeting in Salesforce Classic

If you used Cloud Scheduler to request a meeting that hasn't been confirmed, you can reschedule it and propose new times. However, when you confirm a meeting, it's converted to an event, so you can't propose new times. To reschedule an event, edit the event to change its date and send an update to the invitees.

If **Close** is the only button on the page, you don't have permission to modify the requested meeting. Either ask the organizer to change the meeting details for you, or contact your Salesforce administrator to grant you the required permissions.

1. Open your meeting using one of these methods:
  - From the Calendar section on the Home tab, click the **Requested Meetings** subtab and then click the subject of your meeting. If the **Requested Meetings** subtab doesn't display on the Calendar section, ask your administrator to add it.
  - If you requested the meeting from the Open Activities related list for that contact, lead, or person account, click the subject of your meeting in the related list.

### EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

### USER PERMISSIONS

To add and remove invitees from a requested meeting:

- "Edit Events"
- AND
- "Send Email"

### EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

### USER PERMISSIONS

To reschedule a meeting:

- "Edit Events"
- AND
- "Send Email"

- From the email notification that you received when an invitee responded to your meeting request, click **View Response and Schedule Meeting**.

2. Click **Reschedule** and propose new times.

Once the invitees reply to your updated request, you can confirm the meeting.

### Confirm a Requested Meeting in Salesforce Classic

After you use Cloud Scheduler to request a meeting, wait for the invitees to reply with the times they can meet. When this happens, you receive an email notification, and the meeting in Salesforce is automatically updated with the times the invitees selected. You can then choose the best time to meet and confirm the meeting.

The meeting confirmation page displays as read-only to coworkers without the “Edit Events” permission and coworkers without the “Edit” permission on the contact or lead record associated with a proposed meeting.

If your administrator added required fields to events, you're prompted to update those fields before the meeting is converted to an event.

1. Open your meeting using one of these methods:

- From the Calendar section on the Home tab, click the **Requested Meetings** subtab and then click the subject of your meeting. If the **Requested Meetings** subtab doesn't display on the Calendar section, ask your administrator to add it.
- If you requested the meeting from the Open Activities related list for that contact, lead, or person account, click the subject of your meeting in the related list.
- From the email notification that you received when an invitee responded to your meeting request, click **View Response and Schedule Meeting**.

2. Select a time, and click **Confirm**.

The **Confirm** button displays after you select a meeting time. If you don't select a time, the **Send Update** button displays instead so you can send the invitees a message without confirming a meeting time.

Use the following tools to help you pick a time:

- Green check marks show when each invitee can meet.
- **Free** shows when you are available based on your Salesforce calendar.
- If none of the times work for the invitees, propose new times and reschedule the meeting.

3. Optionally, enter a message to the invitee.

4. Click **Send** to confirm the meeting.

Salesforce then:

- Emails the invitees with the final date and time of the meeting.
- Converts the requested meeting to a new multi-person event. The last message you sent to the invitees appears in the event's **Description** field, but all other messages between you and the invitees aren't saved.

This event appears in the Calendar section on the Home tab. If you requested the meeting from an Open Activities related list, the event also appears in the Open Activities related list for that contact, lead, or person account.

#### EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

#### USER PERMISSIONS

To confirm a meeting:

- “Edit Events”
- AND
- “Send Email”

## Cancel a Requested Meeting in Salesforce Classic

If you used Cloud Scheduler to request a meeting and the meeting hasn't been confirmed, you can cancel the meeting, and Salesforce automatically sends a cancellation notice to the invitees. When you confirm a meeting, then it's converted to an event, which you can delete like any other event.

1. Open your meeting using one of these methods:
  - From the Calendar section on the Home tab, click the **Requested Meetings** subtab and then click the subject of your meeting. If the **Requested Meetings** subtab doesn't display on the Calendar section, ask your administrator to add it.
  - If you requested the meeting from the Open Activities related list for that contact, lead, or person account, click the subject of your meeting in the related list.
  - From the email notification that you received when an invitee responded to your meeting request, click **View Response and Schedule Meeting**.

2. Click **Cancel Meeting**.

You can also click **Del** next to the meeting from the Open Activities related list.

 **Note:** If **Close** is the only button on the page, you don't have permission to modify the requested meeting. Either ask the organizer to change the meeting details for you, or contact your Salesforce administrator to grant you the required permissions.

3. Click **OK** to confirm the cancellation.

Salesforce emails a meeting cancellation to all invitees. Canceled meetings are permanently removed and aren't stored in the Recycle Bin.

## Respond to Event Invitations in Salesforce Classic

Accept or decline an invitation to an event. After you've accepted an invitation, you can add the event to Outlook.

When another user invites you to an event, you receive an email containing a link to the event. The event also displays on your Home tab if your home page layout includes your calendar. To accept or decline the event:

1. Click the event description.
2. Optionally, enter a response.
3. If the event is a single event, click **Accept Meeting** or **Decline Meeting**. If you have been invited to a series of events, click **Accept Series** or **Decline Series**.

 **Note:** If you want to attend some of the events in a series of events, but want to decline other events in the series, accept the series and then decline the specific events you will not attend.

## Tasks

Keep your to-do list in Salesforce and stay right on top of your deals and accounts. Easily relate every task to records for leads, contacts, campaigns, contracts, and other information that you need. Salesforce gives you different ways to maximize productivity—quick ways to create and update tasks, prefiltered task lists, and task notification options.

### IN THIS SECTION:

#### [Manage Tasks](#)

Manage tasks alongside your calendar, with records such as opportunities, and in reports. Salesforce lets you relate tasks to opportunities, leads, accounts, and contacts—a powerful tool to help you track your work and close deals.

#### [Considerations for Using Tasks](#)

Salesforce always displays a task's due date in the time zone you've chosen in My Settings. If your Salesforce admin has created conditions for closing a task (for example, requiring you to enter a comment), you must edit the task details before you can close the task. If your Salesforce admin has set up more than one Closed or Open status for tasks, you must choose a status when you reopen or close a task. Working with tasks is different in Lightning Experience and Salesforce Classic.

#### [Repeat a Task](#)

Easily adjust the due date of a recurring task, or cut the clutter of recurring tasks in your future task list. Use repeating tasks to make a task recur a specified number of days after a trigger that you choose: The next task in the series is created only when the current task is due or marked completed. Repeating tasks are a streamlined alternative to regularly recurring tasks when you don't have to get a task done on a specific day.

#### [Assign Tasks to Multiple People in Salesforce Classic](#)

Assign up to 100 coworkers an independent copy of the same task. For example, you can create a task "Submit your expense reports" with the appropriate due date and assign it to a team of account executives.

#### [Task Notifications](#)

Set or receive an email notification when someone assigns you a task.

### SEE ALSO:

#### [Activities](#)

#### [Events and Calendars](#)

## Manage Tasks

Manage tasks alongside your calendar, with records such as opportunities, and in reports. Salesforce lets you relate tasks to opportunities, leads, accounts, and contacts—a powerful tool to help you track your work and close deals.

### IN THIS SECTION:

#### [Manage Tasks in Lightning Experience](#)

Create, update, and monitor your own tasks, tasks delegated to others, and tasks on an opportunity, a lead, an account, or a contact. You can also track tasks in reports.

#### [Manage Tasks in Salesforce Classic](#)

You can track, create, and update your own and others' tasks in different locations in Salesforce, depending on how you work and what tasks are relevant to you at a given moment. Salesforce displays tasks in activities list views and calendar views; Chatter feeds; and records that tasks are related to, such as contacts and accounts. You can also track tasks in reports.

## Manage Tasks in Lightning Experience

Create, update, and monitor your own tasks, tasks delegated to others, and tasks on an opportunity, a lead, an account, or a contact. You can also track tasks in reports.

- In the Board view, opportunities and leads alert you when a task is overdue or when no open activities exist. Move your deals ahead: Click a yellow triangle to create or update a task.
- On an individual opportunity, lead, account, or contact, use the composer and the activity timeline to create and work with tasks, meetings, calls, and emails.
- Use the task list to work with all your open tasks, tasks due today, and tasks completed in the last seven days. In the navigation menu, go to **Tasks** and choose a view.

The list keeps overdue tasks out of the way by collapsing them when overdue tasks total 10 or more. The **Delegated** view displays tasks that you've created and assigned to people below you in the role hierarchy of your Salesforce org.

You can also use activities reports to view tasks assigned to people below you in the role hierarchy of your Salesforce org.

Completed tasks include logged calls and sent emails.

-  **Note:** You can eliminate a contact or a record on a task without deleting the entire task. For example, suppose that a task is related to Contact A and Contact B, and you want to relate it only to Contact A. Instead of deleting the task altogether, remove Contact B from the Name field.

### EDITIONS

Available in Salesforce Classic in: **All Editions Except Database.com**

### USER PERMISSIONS

To create tasks

- "Edit Tasks"

### Tasks Related to Another Record, Such as a Contact or an Account

- The other record's detail page, in the Open Activities and Activity History related lists
- Your Chatter feed and in the Chatter feed for the other record
- Activities reports

**Note:** You can eliminate a contact or a record on a task without deleting the entire task. For example, suppose that a task is related to Contact A and Contact B, and you want to relate it only to Contact A. Rather than deleting the task, remove Contact B from the `Name` field.

### Delegated Tasks (Assigned to People below You in Your Organization's Hierarchy)

- The **My Delegated Activities** list view
- Activities reports
- The Salesforce1 **Delegated Tasks** list

### Overdue Tasks

- The **Overdue** activities list view
- The Salesforce1 **Overdue Tasks** list

### Completed Tasks

- The **My Activities** list view
- The Salesforce1 **Completed Tasks** list

### Tasks That You've Assigned to Others

- The **My Delegated Activities** list view
- Activities reports

### Tasks Assigned to People below You in Your Organization's Hierarchy

- The **My Team's Activities** list view
- Activities reports

### View Task Details

In a calendar, in an activities list view, in a related list, or on the Home tab, there are two ways to see task details:

- Hover your mouse over a task's subject.
- Click the subject.

On a task detail page, to view the details of a single task in a recurring series () , select the View Task subtab. To view the details for the series, select the View Series subtab.

### Create Tasks

#### On the Home Tab

On the Home tab, under My Tasks, click **New**.

#### In a Chatter Feed

If you create a task in the feed for a record such as a contact, Salesforce automatically relates the task to the record.

#### In the Sidebar

In the sidebar in Salesforce, in the Create New drop-down list, select **Task**.

### On the Detail Page of Another Record

- On the Open Activities related list, click **New Task**.
- On the Activity History related list, click **Log a Call** to add a task record with a status of Completed.

Salesforce automatically relates the task to the record.

### In a Calendar Day or Week View

Under My Tasks, click **New**.

### In an Activity List View ( )

In a list view, click **New Task**.

## Update Tasks

Anywhere (except reports) that you can view task details, you can edit any task that you have permission to edit.

## Considerations for Using Tasks

Salesforce always displays a task's due date in the time zone you've chosen in My Settings. If your Salesforce admin has created conditions for closing a task (for example, requiring you to enter a comment), you must edit the task details before you can close the task. If your Salesforce admin has set up more than one Closed or Open status for tasks, you must choose a status when you reopen or close a task. Working with tasks is different in Lightning Experience and Salesforce Classic.

### IN THIS SECTION:

#### [Considerations for Using Tasks in Lightning Experience](#)

Be aware of these considerations for owning, viewing, creating, and updating tasks.

#### [Considerations for Using Tasks in Salesforce Classic](#)

In using tasks, take into account these considerations for working with recurring tasks and tasks related to multiple contacts (Shared Activities); assigning tasks; task notifications; spell checking; and tasks in Chatter, with Email-to-Case, and in Salesforce for Outlook.

### SEE ALSO:

[Activity Reminders in Salesforce Classic](#)

[Find Your Personal Settings](#)

## Considerations for Using Tasks in Lightning Experience

Be aware of these considerations for owning, viewing, creating, and updating tasks.

### Relating Multiple Contacts to a Task on an Opportunity or Other Record (Shared Activities)

Using the **Name** field, you can relate up to 50 contacts (but only one lead) to a task on an opportunity or other record. You choose one primary contact. Any task related to an opportunity, a lead, an account, or a contact appears in the activity timeline for that record.

### One Task Owner at a Time

A task can be owned by one person. If you reassign it to someone else, it no longer appears in your task list unless the person is below you in the role hierarchy. In that case, you see the task in the Delegated view in your task list.

### EDITIONS

Available in Lightning Experience in: **Developer, Enterprise, Group, Performance, Professional, and Unlimited** Editions

### Viewing and Editing Others' Tasks

Anyone can reassign a task to a coworker. Managers in the role hierarchy can view tasks that they've assigned to people below them in the role hierarchy. They can also use reports to view tasks of people below them in the role hierarchy. However, they can't edit tasks owned by people who report to them.

### No Recurring Tasks

You can't create recurring tasks. However, your task list and the activity timeline display single tasks that have been created as part of a series in Salesforce Classic, and you can edit them if they're assigned to you.

### Notifications

Lightning Experience displays no option to send an email when you assign a task, and it displays no personal setting to receive an email when someone assigns you a task. However, if you switch from Lightning Experience to Salesforce Classic, one of these options can be available, depending on how your admin sets up your Salesforce org. If one of these options is available, you can receive emails for tasks that you assign to yourself or tasks created with a status of Completed, depending on how your admin sets up your Salesforce org.

### No Task Reminders

You can't set reminders for tasks.

## Considerations for Using Tasks in Salesforce Classic

In using tasks, take into account these considerations for working with recurring tasks and tasks related to multiple contacts (Shared Activities); assigning tasks; task notifications; spell checking; and tasks in Chatter, with Email-to-Case, and in Salesforce for Outlook.

### EDITIONS

Available in Salesforce Classic in: **All Editions Except Database.com**

### Recurring Tasks

#### Only the Default Record Type Is Allowed

If you apply a record type other than the default, Salesforce still applies the default record type to your recurring task, and it won't display picklist fields associated with the default record type.

#### No Due Date in Recurring Tasks

The **Due Date** field is disabled in recurring tasks because tasks in the series have different due dates.

#### Effects of Changes to a Task Series and Single Tasks in a Series

**Warning:** Changes to a series of recurring tasks override changes to single tasks that are due in the future. (Changes to a series don't affect tasks due before the current date.) In addition, if you change either of the following settings in a series, links to tasks due in the future break, and triggers and workflows are reset:

- Frequency
- Recurrence start or end date

#### Task Status

You can't change the status of a task series. You can only change the status of single tasks in a series.

#### Task Reminders

If you create a recurring task and you leave the reminder checkbox selected, you receive a reminder for each single task in the series.

#### Attachments to Tasks

You can attach files to a series of recurring tasks. After you create a series, you can add or delete attachments to each single task in the series.

Attachments are displayed on the task detail page only, not on the detail page for other records that the task is related to. If you don't see the Attachments related list on the task detail page, ask your Salesforce admin to add it to the task page layout.

## Relating Tasks to Multiple Contacts (Shared Activities)

### Maximum Number of Related Contacts

You can relate a task to up to 50 contacts (but only one lead) in the `Name` field, including one primary contact. If you don't see

next to the `Name` field, ask your Salesforce admin to enable Shared Activities.

### No Support for Recurring Tasks or Multiple Task Assignees

You can't relate multiple contacts to a recurring task series or a task assigned to multiple users.

## Assigning Tasks

### Task Is Assigned to User Who Created It

By default, a task is assigned to the person who creates it. To assign independent copies of a new task to multiple people, click  next to **Assigned To**; in the window that opens, click the Multiple Users tab. The `Assigned To` field isn't available in Personal Edition.

## Task Notifications

### Email Notifications

Depending on the way that your Salesforce admin has configured your Salesforce org, one of the following can happen:

- You automatically receive an email notification for every task assigned to you. You can turn off these notifications by going to the Reminders & Alerts page in your personal settings and deselecting the **Email me when someone assigns me a task** checkbox.
- You don't automatically receive an email notification for every task assigned to you. If you want an email sent to anyone you assign a task to, including yourself, select **Send Email Notification** when you create a task. (Depending on how your Salesforce admin has configured your Salesforce org, this checkbox may be unavailable.)

### Mobile Task Notifications

Salesforce1 has separate settings for the task assignment notifications that you receive via your mobile device.

## Spell Checking

### Not All Languages Supported

If you don't see Spell Checker on the `Comments` field, ask your Salesforce admin to enable it. However, Spell Checker does not support all the languages that Salesforce supports. For example, Spell Checker doesn't support Thai, Russian, and double-byte languages, such as Japanese, Korean, or Chinese.

## Tasks in Chatter

### New Tasks Appear in Chatter Feeds

If a new task is related to a record such as a lead, an account, or a custom object, the task appears in the feed for that record. On any record that you follow, you see feed items for all tasks, regardless of who created them.

### Creating Tasks in Feeds

Your Salesforce admin can specify whether you can use Chatter to create tasks for different types of records. For example, some people can view but not create tasks in the feeds for accounts that they have access to.

### No Recurring Tasks in Chatter

Your Chatter feed doesn't display recurring tasks, either in series or singly, and you can't follow recurring tasks in Chatter.

### No Email or Call Logging in Case Feeds

On cases, feeds don't include email tasks or call logging tasks.

## Email-to-Case

**Viewing Associated Emails**

If your organization has enabled Email-to-Case or On-Demand Email-to-Case, some tasks are associated with Email-to-Case or On-Demand Email-to-Case emails. Click the link at the top of the task to view the associated email. See [Working with Case Emails](#) on page 2092 for more information.

## Salesforce for Outlook

**Unresolved Items**

If the task is an email that was sent to Salesforce using Email to Salesforce or Salesforce for Outlook, sometimes the email detail page displays a banner with a link to the My Unresolved Items page. Use this page to assign any unassociated emails to related Salesforce records.

**Repeat a Task**

Easily adjust the due date of a recurring task, or cut the clutter of recurring tasks in your future task list. Use repeating tasks to make a task recur a specified number of days after a trigger that you choose: The next task in the series is created only when the current task is due or marked completed. Repeating tasks are a streamlined alternative to regularly recurring tasks when you don't have to get a task done on a specific day.

If you don't see the repeating tasks option when you create a task, ask your Salesforce admin to add repeating tasks to a page layout.

The screenshot shows two settings for a repeating task:

- 1 Repeat This Task:** A dropdown menu with the selected option being "After date completed".
- 2 Recurrence Interval:** A text input field containing the number "14".

1. For **Repeat This Task**, select **After due date** or **After date completed**.
2. For **Recurrence Interval**, enter the number of days after the task's due date or completed date when you want the next task to be due.

If **Repeat This Task** on an existing task is set to **(Task closed)**, it indicates that the task was closed as part of a repeating series. You can use this information to distinguish repeating tasks from other tasks for reporting purposes.

If you use Salesforce for Outlook to sync tasks, individual tasks in a repeating series are synced as they're created.

**Note:** When tasks in a series are set to repeat after their due date, Salesforce doesn't create recurrences that would have been due in the past. Instead, Salesforce keeps adding the interval until a repeated task has a due date in the future. For example, suppose someone sets a task to repeat three days after it's due but doesn't complete the task until five days after it's due. Instead of creating a task that's already overdue, Salesforce gives the new task a due date of tomorrow.

**EDITIONS**

Available in Lightning Experience in: **Contact Manager, Personal, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Available in Salesforce Classic in: **All Editions Except Database.com**

**USER PERMISSIONS**

To create tasks:

- "Edit Tasks"

## Assign Tasks to Multiple People in Salesforce Classic

Assign up to 100 coworkers an independent copy of the same task. For example, you can create a task "Submit your expense reports" with the appropriate due date and assign it to a team of account executives.

1. On the New Task page, click the lookup icon () next to the Assigned To field.
2. In the lookup window, select the **Multiple Users** tab.
3. Add up to 100 people (including members of groups) to Selected Members.

 **Tip:** Personal groups are a convenient way to organize users into groups that are meaningful to you. For details, see [Creating and Editing Groups](#).

4. Click **Done**.  
The New Task page displays your selections and the total number of tasks next to the Assigned To field.
5. Save the task.

You've now assigned copies of the task to the coworkers you selected. Coworkers can edit, reassign, or delete their individual tasks.

## Task Notifications

Set or receive an email notification when someone assigns you a task.

### IN THIS SECTION:

#### [Task Notifications in Lightning Experience](#)

Lightning Experience displays no option to send an email when you assign a task, and it displays no personal setting to receive an email when someone assigns you a task. However, if you switch from Lightning Experience to Salesforce Classic, one of these options can be available, depending on how your admin sets up your Salesforce org. If one of these options is available, you can receive emails for tasks that you assign to yourself or tasks created with a status of Completed, depending on how your admin sets up your Salesforce org. Ask your Salesforce admin for details.

#### [Task Notifications in Salesforce Classic](#)

Whether and how you receive an email notification when someone assigns you a task depends on how your Salesforce admin has set up your org.

## Task Notifications in Lightning Experience

Lightning Experience displays no option to send an email when you assign a task, and it displays no personal setting to receive an email when someone assigns you a task. However, if you switch from Lightning Experience to Salesforce Classic, one of these options can be available, depending on how your admin sets up your Salesforce org. If one of these options is available, you can receive emails for tasks that you assign to yourself or tasks created with a status of Completed, depending on how your admin sets up your Salesforce org. Ask your Salesforce admin for details.

### USER PERMISSIONS

To create tasks:

- "Edit Tasks"

### EDITIONS

Available in Lightning Experience in: **Developer, Enterprise, Group, Performance, Professional, and Unlimited Editions**

## Task Notifications in Salesforce Classic

Whether and how you receive an email notification when someone assigns you a task depends on how your Salesforce admin has set up your org.

Ask your Salesforce admin which way task notifications work in your org:

- You can set your own preference for email notifications when someone assigns you a task.
- Someone who assigns you a task can determine whether to send you an email notification of the task.
- You can't receive email notifications when someone assigns you a task.

If you can set your own preference for email notifications when someone assigns you a task, then you receive email notifications by default. If you don't want to receive the email, change the setting:

- In your personal settings, go to **Reminders & Alerts > Events and Tasks** and deselect **Email me when someone assigns me a task**.

## Tracking Products, and Their Prices and Schedules

### Products, Price Books, and Schedules Overview

Together, products and price books let you keep track of the products and services your company offers, and the different prices at which you sell them. When necessary, use schedules to define the payment and delivery cycles of your products.

#### Products

*Products* are the individual items or services that you sell to customers through your opportunities and quotes.

When you view the detail page of an opportunity or a quote, the Products related list or the Quote Line Items related list shows the products for that record. Use these related lists to choose a price book for the opportunity or quote, to add or edit products, and for opportunities, establish or edit product schedules.

#### Price Books

A *price book* is a list of products and their prices. Each product can exist in multiple price books with different prices. Each product and its price is called a *price book entry*. Use price books to track different prices for different groups of customers.

There are two types of price books—the standard pricebook and custom price books.

- The standard price book is the master list of all your products and their default, or *standard prices*. Salesforce creates the standard price book as soon as you or your administrator start creating product records. It automatically includes all of your products and their standard prices regardless of any custom price books that may also include those products.
- A custom price book is a separate list of products with custom prices, called *list prices*. Custom price books are ideal for offering products at different prices to different market segments, regions, or other subsets of your customers. Create a separate price book for each set of customers you want to address. Custom price books can contain list prices that are higher or lower than the standard price defined in the standard price book.

### EDITIONS

Products and Price Books available in: both Salesforce Classic and Lightning Experience	Quotes, Orders, and Schedules available in Salesforce Classic.
-----------------------------------------------------------------------------------------	----------------------------------------------------------------

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

For example, let's say you want one set of prices for domestic customers and another for international customers. In this case, you can create two custom price books—a domestic price book and an international one—to suit the different markets.

## Price Book Entries

A *price book entry* is a product with its price as listed in a price book. Each price book entry also specifies a currency for the price. Standard price book entries are the default, or standard prices for the products and services in the standard price book. When you or your administrator create a new product record, Salesforce creates a standard price book entry automatically. You can mark the standard price book entry as active or inactive, depending for example, on whether you intend to start selling the product right away.

Custom price book entries are the custom, or list prices for the products and services included in your custom price books. Custom price book entries can only be created for products with active standard price book entries.

In Salesforce Lightning Experience, Product detail pages display the Standard Price and Price Books related lists as a single Price Books related list.

 **Note:** If you or your administrator choose to customize the Price Book Entry detail page layout, keep in mind that there are no field dependencies for price book entry fields in the user interface. If the `Use Standard Price` checkbox is removed from the page layout and this checkbox is selected for a price book entry, users won't be able to edit the list price because the `List Price` field will be disabled and can't be enabled on this page.

## Schedules

Use *schedules* to determine the payment or delivery cycles for products that are paid for or delivered over a period of time. After you've established pricing for your products, you can create default schedules for products, as well as schedules for individual product line items on opportunities. Quantity schedules determine when products are delivered. Revenue schedules determine when products are paid for.

Default schedules are suitable if all of your customers make product payments on the same timetable or you deliver products on a regular schedule. However, if your users typically customize schedules, there's no advantage to creating default schedules.

Your administrator determines which types of schedules your organization can use: *quantity* schedules, *revenue* schedules, or both. Your administrator also specifies which types of schedules can be established for each individual product.

- **Quantity Schedule**—Suitable if your customers pay all at once, but receive the product in increments—for example an annual magazine subscription for a monthly-issued magazine. A quantity schedule defines the dates, number of units, and number of installments for payments, shipping, or other use as determined by your organization.
- **Revenue Schedule**—Suitable if your customers make regular payments but receive the product all at once—for example, if you sell customized products that are charged in installments, but delivered at one time. A revenue schedule defines the dates, revenue amounts, and number of installments for payments, recognizing revenue, or other use.
- **Revenue and Quantity Schedule**—Suitable if your customers receive their order on a delivery schedule and also pay for the products using a payment schedule—for example, a monthly product subscription that's paid for on a monthly basis.
- **Default Schedule**—A schedule associated with a specific product in a specific price book. Every time the product is added to an opportunity, the default schedule is used. Administrators can establish a default quantity schedule, revenue schedule, or both. On any particular opportunity, users can override the default schedules.

Schedules can't be created or edited in Salesforce Lightning Experience. To add or modify schedules, switch to Salesforce Classic.

Clicking the Products tab displays the products home page.

- In the **Find Products** section, enter product search terms and click **Find Product** to search for products that match your search terms. We recommend entering a search term of at least two characters, but you can leave this field empty to display a list of all products.
- In the **Price Books** section, select a price book to view a list of products within that price book or click **Create New View** to define your own custom price book view.
- In the **Product Views** section, choose a list view from the drop-down list to go directly to that product list page, or click **Create New View** to define your own product custom view.
- In the **Asset Views** section, choose an asset list view from the drop-down list to go directly to that list page, or click **Create New View** to define your own custom view to list assets.
- In the **Recent Products** section, select an item from the drop-down list to display a brief list of the top products matching that criteria. From the list, you can click any product to go directly to the product detail. Toggle the **Show 25 items** and **Show 10 items** links to change the number of items that display. The fields you see are determined by the "Products Tab" search layout defined by your administrator and by your field-level security settings (available in Enterprise, Unlimited, Performance, and Developer Editions only). The Recent Products choices are:

#### Recent Products Choice

#### Description

##### Recently Created

The last ten or twenty-five products created, with the most recently created product listed first. This list only includes records owned by you.

Recent Products Choice	Description
<b>Recently Modified</b>	The last ten or twenty-five products updated, with the most recently updated product listed first. This list only includes records owned by you.

- In the **Recent Products** section, click **New** to create a product.
- In Reports, click **Go to Reports** to create customized reports that include your product and price book information.
- Administrators and users with the appropriate permissions can click **Manage Price Books** to open the Price Books tab to create, clone, activate, or deactivate price books.
- If products are shared with external contacts via Salesforce to Salesforce, choose one of the list views under **Products from Connections** to view products that your business partners have shared with you.

## Create Products in Salesforce Lightning Experience

When your business is ready to sell a new product or service, create a product in Salesforce so your sales reps can add it to their opportunities.

 **Note:** These steps work in Lightning Experience. If you see a navigation bar on the left side of your screen, you're in Lightning Experience. If you see a row of tabs across the top of the screen, you're in Salesforce Classic.

1. On the Products home page, click **New**.
2. Enter a name for the product.
3. Enter any additional information for the product. See [Product, Price Book, Price Book Entry, and Schedule Fields](#) on page 1321 for a description of each field.
4. Click **Save** when you are finished.
5. (Optional) To add a standard price for the product, click **Related** on the product detail page and then click **Add Standard Price**. Enter a List Price for the product. This is the price that appears in your organization's standard price book. Save your changes.
6. (Optional) To add the product to a custom price book, click **Add to Price Book** on the product detail page. You cannot add a product to a custom price book until you have added a standard price for the product and marked that price active. See [Set Product Prices](#) on page 1317.

 **Note:** To ensure fast system performance with price books, keep the number of products below two million.

## Create Products in Salesforce Classic

When your business is ready to sell a new product or service, create a product in Salesforce so your sales reps can add it to their quotes, opportunities and orders.

 **Note:** These steps work in Salesforce Classic. If you see a row of tabs across the top of your screen, you're in Salesforce Classic. If you see a navigation bar on the left, you're in Lightning Experience.

1. Select **Product** from the Create New drop-down list in the sidebar, or click **New** next to **Recent Products** on the products home page.
2. Enter a name for the product.
3. Enter any additional information for the product. See [Product, Price Book, Price Book Entry, and Schedule Fields](#) on page 1321 for a description of each field.
4. Click **Save** when you are finished or click **Save & Add Price** to save the current product and enter a standard price.

 **Note:** To ensure fast system performance with price books, keep the number of products below two million.

Optionally, you also can:

- Click **Add** in the Standard Price related list to add an associated price and currency to the new product.
- Click **Add to Price Book** from the Price Books related list to include the new product in a price book. Products must have a standard price that is marked active before you can add them to a price book. See [Set Product Prices](#) on page 1317.
- Click **Edit** above the product detail to create a default schedule for the product. See [Creating and Editing Default Schedules](#) on page 1334.

## Create Price Books

Create custom price books for each market segment you sell to. Then add products to each price book with the prices you set for each market segment.

When you create a custom price book from scratch, you can leave it empty, populate it with price book entries copied from another price book, or add new entries.

1. Open the Price Books page and click **New**.
2. Enter a name for your price book.
3. If your organization uses descriptions, enter one for your price book.
4. Select **Active** to allow users to begin adding the price book or its entries to opportunities or quotes.

## Set Product Prices in Salesforce Lightning Experience

You can have up to three different types of prices for each of your products to fit the way you sell to different market segments and customers.

The different types of prices are:

- **Standard Price**—The default price you associate with a product, which is automatically included in your Standard Price Book.
- **List Price**—The custom price associated with a product in a custom price book. For example, let's say you need one set of prices for domestic orders and another for international orders. List prices can be lower or higher than standard price.
- **Sales Prices**—The actual prices sales reps specify for the products they add to opportunities and quotes. Sales prices can be the same as the list prices from the price book used for the opportunity or quote, or they can include discounts or other modifications.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To create or clone price books:

- "Create" on price books

To view price books:

- "Read" on products

AND

"Read" in price books

 **Note:** You can expand the format of your price fields to up to eight decimal places to the right of the decimal point. Contact Salesforce to expand your decimal place settings.

### Set Standard Prices in the Standard Price Book

Before you can add a product to an opportunity, quote, or custom price book, add a standard price to the product and mark it as active. This price is the default for the product.

To create a standard price for a product:

1. Select the product.
2. From the product detail page, click **Add Standard Price** from the Price Books related list. If you have already added a standard price, click **Edit** from the Show More menu to change it.
3. Enter the new standard price in the `List Price` field.
4. To make this price available to products on opportunities, quotes, or other custom price books, select `Active`.
5. Click **Save**. The standard price is automatically associated with the product in your standard price book.

### Set List Prices in Custom Price Books

If you have created custom price books, you can assign list prices for products in your custom price books. List prices are available to use when you add products to an opportunity or quote from a custom price book.

A product must have a standard price before you can set list prices. To add a list price:

1. Select the product.
2. On the product detail page, click **Add to Price Book** from the Price Books related list.
3. Choose the price book and currency for the new list price. Click **Next**.
4. Enter the list price. Alternatively, select `Use Standard Price` if you want the price in the chosen price book to match the standard price.
5. To make this price available to be used when adding the product to opportunities or quotes, select `Active`.
6. Click **Save**.

### Edit Price Book Entries in the Standard or a Custom Price Book

To edit a price book entry, click **Edit** next to a price book entry record in one of these locations.

- From the price book detail page, in the Products related list
- From the product detail page, in the Price Books related list
- From the price book list view

If the price book entry contains required custom fields, you can't create price book entries in the user interface. You can create these price book entries only by using Data Loader or the API.

### Set Product Prices in Salesforce Classic

You can have up to three different types of prices for each of your products to fit the way you sell to different market segments and customers.

The different types of prices are:

- **Standard Price**—The default price you associate with a product, which is automatically included in your Standard Price Book.

- **List Price**—The custom price associated with a product in a custom price book. For example, let's say you need one set of prices for domestic orders and another for international orders. List prices can be lower or higher than standard price.
- **Sales Prices**—The actual prices sales reps specify for the products they add to opportunities and quotes. Sales prices can be the same as the list prices from the price book used for the opportunity or quote, or they can include discounts or other modifications.

 **Note:** You can expand the format of your price fields to up to eight decimal places to the right of the decimal point. Contact Salesforce to expand your decimal place settings.

### Set Standard Prices

Before you can add a new product to an opportunity, quote, or custom price book, you must add a standard price to the product and mark it as active. This is the default pricing of the product.

To create a standard price for a product:

1. Select the product.
2. From the product detail page, click **Add** from the Standard Price related list. If you have already added a standard price, click **Edit** to change it or **Edit All** to edit all standard prices in other currencies.
3. Enter the standard price.
4. Select **Active** to make this price available to products on opportunities, quotes, or other custom price books.
5. Click **Save**. The standard price is automatically associated with the product in your standard price book.

### Set List Prices

If you have created custom price books, you can assign list prices for products in your custom price books. List prices are available to use when you add products to an opportunity or quote from a custom price book.

Before you begin, the product must have a standard price. To add a list price:

1. Select the product.
2. From the product detail page, click **Edit** from the Price Books related list next to the custom price book that should contain the list price.  
Click **Add to Price Book** from the Price Books related list if you have not already added the product to a custom price book.
3. Enter the list price. Alternatively, select **Use Standard Price** if both prices are the same.
4. Select **Active** to make this price available to products on opportunities or quotes.
5. Click **Save**.

### Considerations for Custom Fields in Price Book Entries

The following considerations apply only to price book entries that were created or edited by using the Salesforce user interface. There is no impact to price book entries that were created or edited by using Data Loader or the API.

#### Adding Standard or List Prices

You can add standard or list prices only through the multiline add pages (the Add Standard Price page and the Add List Price page). These pages do not support custom fields. To add standard or list prices and populate custom fields, follow this two-step process.

1. Add the price book entry via the multiline add pages.
2. Navigate to the Price Book Entry Edit page for the added record, and then update the custom fields.

### Editing Standard or List Prices

You can edit standard or list prices in either of the following ways: through the multiline edit pages (the Edit Standard Price page and the Edit List Price page) or the Price Book Entry Edit page. Similar to the multiline add pages, the multiline edit pages do not support custom fields. Edit custom fields that are associated to your standard or list prices in the Price Book Entry Edit page by editing price book entries individually.

To edit a price book entry individually on the Price Book Entry Edit page, click **Edit** next to a price book entry record in one of these locations.

- From the price book detail page, in the Products related list
- From the product detail page, in the Standard Price related list
- From the product detail page, in the Price Books related list
- From the price book list view

If the price book entry contains required custom fields, you can't create price book entries in the user interface. You can create these price book entries only by using Data Loader or the API.

### Clone Price Book Entries

Create a price book entry by cloning an existing price book entry.

Available in: **Professional, Enterprise, Performance, Unlimited**, and **Developer** Editions

#### User Permissions Needed

To clone price book entries:	"Create" on price books
To view price book entries:	"Read" on price books AND "Read" on products

1. On a price book detail page or product detail page, click **View** next to the price book entry that you want to clone.
2. Click **Clone**.
3. Update any of the following fields: `Product`, `Price Book`, or `Currency`.

 **Note:** You can update the `Currency` field only if multiple currencies are enabled in your organization.

4. Optionally, update the `List Price` field.
5. Select **Active** so that users can add the price book entry to opportunities, quotes, orders, or service contracts.
6. Click **Save**.

 **Note:** If you clone a custom price book entry that is using a standard price (`Use Standard Price` is checked), `Use Standard Price` and `Standard Price` won't be visible on the edit page before saving the cloned record. Also, `Use Standard Price` will be unchecked (set to `false`). After you save the cloned record, these fields will be visible again on the record's detail and edit pages.

## Associate Price Books and Products

Associating price books and products to other objects, such as an opportunity, adds product information to those objects for easy reference.

You can associate products and price books with either each other, or with opportunities, quotes, orders, or service contracts. For example:

- On a product detail page, click **Add to Price Book** on the Price Books related list to select a price book to contain the product. This option is available only if the product has a standard price.
- On a price book detail page, click **Add** or **Add Product** on the Products related list to select a product to include in the price book.
- On an opportunity detail page, click **Add Product** on the Products related list to select a product to list on the opportunity. The currency for the opportunity must match the currency used in the product and price book.
- On a quote detail page, click **Add Line Item** on the Quote Line Items related list to select a product to list on the quote.
- On an order detail page, click **Add Product** on the Order Products related list to select a product to list on the order.
- On a service contract detail page, click **Add Line Item** on the Contract Line Items related list to select a product to list on the service contract.

## Product, Price Book, Price Book Entry, and Schedule Fields

A product has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

### Product Fields

Field	Description
Active	Indicates whether the product is ready for use in a price book, opportunity, or quote and whether you can find the product in searches and see the product in views.
Created By	Name of the user who created the product.
Last Modified By	Name of the user who last saved the product record.
Product Code	Internal code or product number used to identify the product.

### EDITIONS

Products and Price Books available in: both Salesforce Classic and Lightning Experience	Quotes, Orders, and Schedules available in Salesforce Classic.
-----------------------------------------------------------------------------------------	----------------------------------------------------------------

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

### EDITIONS

Products and Price Books available in: both Salesforce Classic and Lightning Experience	Quotes, Orders, and Schedules available in Salesforce Classic.
-----------------------------------------------------------------------------------------	----------------------------------------------------------------

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Field	Description
Product Currency	In multicurrency organizations, the currency you want to use for the product. If the product currency is different from the user currency, currency-related fields for opportunities, quotes, and quote line items appear in both currencies. The product's currency is converted to the user's currency and the converted amount appears in parentheses.
Product Description	Text to distinguish this product from other products.
Product Family	Category of the product.
Product Name	Title for the product.
Quantity Scheduling Enabled	Indicates whether the product can have a quantity schedule.
Revenue Scheduling Enabled	Indicates whether the product can have a revenue schedule.
Custom Links	Listing of custom links for products from Salesforce.

## Price Book Fields

Field	Description
Active	Indicates whether you can add the price book to an opportunity or quote.
Created By	Name of the user who created the price book.
Description	Text to distinguish this price book from others.
Is Standard Price Book	Read-only checkbox that indicates whether the item is the standard price book.
Last Modified By	Date of the most recent save to the record.
Price Book Name	Title for the price book.

## Price Book Entry Fields

Field	Description
Active	Indicates whether the price book entry (product and list price) is active and can be added to an opportunity or quote.
Created By	The name of the user who created the price book entry.
Currency	This field is available only for organizations with multiple currencies enabled and represents the currency to use for the price book entry (product and list price).
Last Modified By	The name of the user who last saved the price book entry record.

Field	Description
List Price	The price of the product within the price book including currency.
Price Book	The price book that contains the price for this entry.
Product	The title for the product.
Product Code	The internal code or product number used to identify the product.
Standard Price	The standard price for the product. This field is derived and doesn't exist on the underlying PricebookEntry standard object.
Use Standard Price	Indicates whether the standard price is used.

## Schedule Fields

Field	Description
Schedule Type	Defines whether the product revenue or quantity will be divided into multiple installments or repeated for multiple installments.
Installment Period	Sets the interval for installments; for example, Weekly, Monthly.
Number of Installments	Number of installments in the schedule.

## View Product Lists in Salesforce Lightning Experience

The Products page lets you view, edit, add, or delete products your business sells.

 **Note:** These steps work in Lightning Experience. If you see a navigation bar on the left side of your screen, you're in Lightning Experience. If you see a row of tabs across the top of the screen, you're in Salesforce Classic.

The Products home page displays a list of your products in the view you select. To show a filtered list of items, select a predefined list from the view drop-down list. To define your own custom view,

choose **New** from the **List View Controls** menu . To edit or delete any view you created, select it from the view drop-down list and then choose **Edit List Filters** from the **List View Controls**

 menu.

- To view detailed product information, click a product name.
- If Chatter is enabled, click **Follow** or **Unfollow** to follow or stop following a product in your Chatter feed.
- To change product details, choose **Edit** from the **View More** menu .
- To create a new product, click **New** on the Products home page.

## View Product Lists in Salesforce Classic

The Products page lets you view, edit, add, or delete products your business sells.

 **Note:** These steps work in Salesforce Classic. If you see a row of tabs across the top of your screen, you're in Salesforce Classic. If you see a navigation bar on the left, you're in Lightning Experience.

The Products home page displays a list of your products in the view you select. To show a filtered list of items, select a predefined list from the **View** drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the **View** drop-down list and click **Edit**.

- To view detailed product information, click a product name.
- If Chatter is enabled, click  or  to follow or stop following a product in your Chatter feed.
- To create a new product, click **Add**, or select **Product** from the Create New drop-down list in the sidebar.
- To change product details, click **Edit**.

## View and Edit Products

View your product list and change product details so your sales reps can effectively sell them.

### Viewing Products

Once you have located a product on the products home or list pages, click the name to display detailed information.

### Viewing Product Updates and Comments (Chatter)

Display a Chatter feed of updates, comments, and posts about the product.

### Editing Products

Users can update a product by clicking **Edit** next to the product, and changing selected fields. When you have finished, click **Save**.

### Viewing and Editing Product Related Lists

The product detail page shows product fields and the product's related lists, such as price books, assets, and entitlement templates. The related lists you see result from your personal customizations and any customizations your administrator has made to page layouts or your permissions to view related data. You can click individual items to display additional information about them.

- To [select a price book](#) to contain the product, click **Add to Price Book** in the Price Books related list.
- In the Price Books related list, click **Edit** next to a custom price book entry to change it.
- In the Price Books related list, click **Delete** next to a custom price book entry to delete it.
- To view details of the price book, click the price book name or click **Edit** next to the price book to change the list price of the product.
- Click **New** in the Assets related list to create a new asset based on the current product. Assets only display in this list if you have sharing access to the account on the asset or the account related to the contact on the asset.

## Price Book List Views and Detail Pages

The price book list view and price book detail pages offer access to different features for managing price books or price book entries.

Your price books can be accessed from multiple locations within Salesforce. Each location provides access to different features.

- The *price book list view* is accessible on the Price Books page. From the list view, you can manage entries in your price books. You can also create custom list views for your price books, or filter or sort existing list views.
- The *price book detail page* is also accessible on the Price Books page. From the details page, you can edit the price book's properties, including its name, description, or state; create or duplicate entire price books; or edit price book entries.

## Add Products to Price Books in Salesforce Lightning Experience

Your standard price book automatically contains all active products that have standard prices assigned. You add, edit, or delete products in your custom price books manually.

New products aren't automatically added to your custom price books. You can manually add products as long as the products have a standard price and are marked as active.

1. Open the price book.
2. From the Products related list, click **Add Product**.
3. Select the product you want to add.
4. Choose a currency and click **Next**.
5. Add a list price for the item and click **Save**.

Items without list prices don't appear in the price books even if you have added them. To use the product's standard price as its list price in this price book, select **Use Standard Price**.

-  **Note:** You cannot edit custom fields via the **Add** button when adding price book entries. You can edit custom fields via the Price Book Entry Edit page, Data Loader, or the API.

## Add Products to Price Books in Salesforce Classic

Your standard price book automatically contains all active products that have standard prices assigned. You add, edit, or delete products in your custom price books manually.

New products aren't automatically added to your custom price books. You can manually add products as long as the products have a standard price and are marked as active.

1. Open the price book.
2. Click **Add**.
3. Select one or more products you want to add and click **Select**.
4. Add a list price for the item and click **Save**.

Items without list prices don't appear in the price books even if you have added them.

-  **Note:** You cannot edit custom fields via the **Add** button when adding price book entries. You can edit custom fields via the Price Book Entry Edit page, Data Loader, or the API.

## Edit the Products in a Price Book

Change product listings and prices entered in your price book.

1. Open the price book.
2. To edit a single entry, click **Edit** for that entry under the *Products* related list.
3. Edit the fields and settings.
4. If needed, add new price book entries by clicking **Add**.

## Sharing Price Books

Your administrator defines the default access your entire organization has to price books. Administrators and users with the “Edit” permission on price books can extend sharing of a price book manually to more users. However, you cannot change the sharing model to make it more restrictive than the default.

To view and manage sharing details, click **Sharing** on the price book detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the price book. On this page, you can do any of the following:

- To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
- Click **Add** to grant access to the record for other users, groups, roles, or territories.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level.

 **Tip:** If your organization-wide default for price books is “No Access,” give your entire organization “View Only” access to your Standard Price Book so that users can see prices on the product detail page.

## Cloning Products

The **Clone** button on a product quickly creates a new product with the same information as the existing product. Cloning products also creates any price book entries in price books that you can view. Price book entries in price books that you do not have sharing access to will not be created.

1. Click **Clone** on an existing product.
2. Enter or change any information for the new product.
3. Click **Save**.

 **Note:** If you have read-only access to a field, the value of that field is not carried over to the cloned record.

## Deleting Products and Pricebooks

### Deleting Products and Price Books Overview

Deleting products or price books is unique because both can have related price book entries. When you delete either a product or a price book, all related price book entries are also deleted.

However, if you have several price books that contain the same product, deleting the product from one price book doesn't affect the other price books. Similarly, if you delete a price book, the products it contained are not deleted or removed from any other price book.

#### Note:

- You can't delete a product if opportunities, quotes, service contracts, or contract line items are associated with it.
- You can't delete a product or price book that's associated with an approval process or has a pending workflow action.

Before you begin, review your options for deleting products and price books with related records:

#### • Does it have a related price book entry?

You can delete a product or price book that has associated price book entries. Salesforce moves it to the Recycle Bin temporarily, from where you can restore it. All price book entries are deleted or restored along with their related product or price book.

#### • Is it on an opportunity or quote?

If your product or price book is used on an opportunity or quote, you have three options:

- Deactivate it by editing it and deselecting the `Active` field. We recommend deactivating a product or price book that is on an opportunity or quote because it will no longer be available to users but you can activate it again if necessary. Deactivation doesn't affect the history of an opportunity line item.
- Remove the related product or price book from all opportunities and quotes. When you try to delete a product or price book that is used on an opportunity or quote, Salesforce displays a list of the opportunities or quotes using it. If you are deleting a price book, go to each opportunity or quote listed and remove the price book from them. If you are deleting a product, remove the product from every opportunity and quote that uses it. Then, delete the price book or product and it will be stored in the Recycle Bin temporarily, during which time, you can recover it and all its related price book entries.
- Archive the product or price book and each related price book entry. Archived products and price books can't be recovered because they are not stored in the Recycle Bin, so use this option with caution. Additionally, archived products and price books still appear on any opportunities or quotes that contained them before they were archived.

 **Note:** If you choose to archive a price book instead of deleting the associated records and then deleting the price book, it will still be visible in the associated records but won't be accessible. After you archive a price book, you can't retrieve it.

#### EDITIONS

Products and Price Books available in: both Salesforce Classic and Lightning Experience	Quotes, Orders, and Schedules available in Salesforce Classic.

- "Delete" on products

To delete price books:

- "Delete" on price books

To delete opportunity products:

- "Edit" on opportunities

To delete quote line items:

- "Edit" on quotes

## Deleting Products

To delete a product, click **Delete** from the product detail page to move it to the Recycle Bin. When you delete a product, all related price book entries are also deleted. If you restore the product from the Recycle Bin, any related price book entries are restored with it.

### Note:

- You can't delete a product if opportunities, quotes, service contracts, or contract line items are associated with it.
- You can't delete a product that's used on an opportunity or quote. If you try to delete it, Salesforce displays a list of the opportunities and quotes so you can remove the product from those opportunities and quotes and try again. If you don't want to remove the product from all opportunities and quotes, you can deactivate (which is the recommended approach) or archive the product instead. See [Deleting Products and Price Books Overview](#) on page 1330.

## Deleting Price Book Entries

You can delete products from custom price books without affecting the original product listing or its entries in other price books.

You can have the same product listed in many price books. If you delete entries from one custom price book, it doesn't affect other price books. When you delete an entry from the standard price book, the product is still available and active, but its standard price is deleted and it is removed from all custom price books.

1. Open the price book.
2. Click **Del** next to the price book entry you want to delete.
3. Click **OK**.
4. If you are deleting the product from the standard price book and it is still associated with any custom price books, click **OK** to remove it from all custom price books.

## Guidelines for Removing Price Books

When you want to remove price books from your related lists, you can either archive, deactivate, or delete the price books.

Each removal option has a different result. Before you remove a price book from your related lists, determine which of the options best fits your business needs.

### Note:

- Deleting, deactivating, or archiving a custom price book doesn't affect other price books or your product lists. However, it could affect your opportunities and quotes, or you may have to change associations with opportunities or quotes before you can remove an associated price book.
- You can deactivate the standard price book, but you can't delete or archive it. If you'd like to remove your standard price book by deleting or archiving, designate a new standard price book first.

## Tips for Deleting Price Books

- You can't delete a price book while it is in use on opportunities or quotes. If you attempt to delete a price book while it's in use, the system creates a list of the opportunities or quotes on which the price book is used..
- When you delete a price book, you automatically delete all entries in the price book. The deleted price book and its entries are moved to the recycle bin.
- You can restore deleted price books with all entries from the Recycle Bin for 15 days.
- Deleted price books can't be recovered after 15 days.

## Tips for Deactivating Price Books

- You can activate, deactivate, or reactivate price books at any time by changing the price book's properties.
- You can deactivate a price book even if it is used on an opportunity or quote.
- Deactivated price books are no longer available to users.
- You can continue to manage entries in your price book while it is deactivated.

## Tips for Archiving Price Books

- You can archive a price book even if it is in use on an opportunity or quote.
- An archived price book is visible in all associated records, but not accessible.
- Entries in archived price books don't appear in search results.
- Archived price books can't be recovered or deleted.

[Deleting Price Book Entries](#)

## Deleting Price Books

Deleted price books are permanently removed after a short time.

If your organization stops using a price book, you can delete it. Deleted price books are moved to the Recycle Bin and are recoverable for 15 days after deletion.

1. On the Price Books tab, open the price book.
2. Click **Delete**.
3. Click **OK**.

[Restoring Price Books](#)

## Restoring Price Books

Deleted price books can be recovered for a short time.

If you've deleted a price book and need to recover it, you have 15 days to restore it from the recycle bin. After that, deleted price books are permanently removed and can't be recovered.

1. On the sidebar, click **Recycle Bin**.
2. Select the price book you want to restore.
3. Click **Undelete**.

## Creating and Editing Default Schedules

Before creating default schedules, make sure the appropriate [schedule types are enabled](#).

To create and edit default schedules:

1. Select the product from the products home page.
2. Click **Edit** above the product detail.
3. Set the schedule details.

Field	Description
Schedule Type	Defines whether the product revenue or quantity will be divided into multiple installments or repeated for multiple installments.
Installment Period	Sets the interval for installments; for example, Weekly, Monthly.
Number of Installments	Number of installments in the schedule.

 **Note:** For example, if the product unit price is \$100 and you specify a revenue schedule with ten monthly installments, a `Schedule Type` of "Divide" will create ten installments of \$10 each, and "Repeat" as the `Schedule Type` will create ten installments of \$100 each for a total of \$1000.

4. Click **Save**.

If you add or change a default schedule for a product, opportunities with that product are not updated. If a product has both a default quantity schedule and a default revenue schedule, the quantity schedule is calculated first to determine the total product revenue, and then the revenue schedule is applied to that amount.

If you have a quote line item with a discount, you can't edit the `Discount` field if the corresponding product record has a default schedule.

## Examples

The following examples illustrate some common uses of default schedules.

**Default Revenue Schedule Only**—Your ASP company sells yearly contracts of product licenses at \$1200 per license per year. When a customer buys licenses, the licenses are all "delivered" at one time, but you recognize the revenue on a monthly basis. In this case, you would set a revenue schedule of `Schedule Type=Divide`, `Installment Period=Monthly`, and `Number of Installments=12`.

With this default revenue schedule, a salesperson sells 200 licenses at a unit price of \$1200 per license per year on an opportunity on March 15. The 200 licenses are all "delivered" on March 15. The total revenue for this product is the quantity of 200 multiplied by the unit price of \$1200 per year, for a total yearly revenue of \$240,000. The revenue schedule automatically divides the total revenue into monthly installments of \$20,000 on the 15th of every month for the next year.

**Default Quantity Schedule Only**—Your medical supplies company sells a box of tongue depressors for \$10 per box. You normally have yearly contracts with hospitals to deliver boxes every month. In this case, you would set a quantity schedule of `Schedule Type=Repeat`, `Installment Period=Monthly`, and `Number of Installments=12`.

### USER PERMISSIONS

To create schedules:

- "Edit" on products

To edit schedules:

- "Edit" on products

With this default quantity schedule, a salesperson sells 1000 boxes on an opportunity on January 1. The quantity schedule automatically creates 12 monthly installments of 1000 boxes each, for a total quantity of 12,000 boxes. The total revenue from this opportunity is calculated using the unit price and the total quantity, so \$120,000 is booked on January 1.

**Default Quantity and Revenue Schedules**—Your manufacturing company sells widgets for \$10 each. You normally have yearly contracts to deliver widgets on a weekly basis, but your customers pay quarterly. In this case, you would set a quantity schedule of Schedule Type=Repeat, Installment Period=Weekly, and Number of Installments=52. You would also set a revenue schedule of Schedule Type=Divide, Installment Period=Quarterly, and Number of Installments=4.

With these default schedules, a salesperson sells 2000 widgets on an opportunity on January 1. The quantity schedule is applied first, and it schedules 2000 widgets to be delivered every week for a year, for a total quantity of 104,000. The total revenue is calculated using the unit price and the total quantity. The total revenue of \$1,040,000 is then divided into quarterly installments of \$260,000 each.

## Editing Schedules

To edit an existing schedule for a product on an opportunity:

1. Click the product name in the Products related list.
2. Click **Edit** on the Schedule related list of the product detail.
3. In the list of installments, add comments or change the dates, quantities, and revenue amounts.
4. Click **Recalculate** to preview the new total revenue and/or quantity of the product.

The product totals are the sum of the installments. Any changes you make will override the product totals currently stored for the product.

5. Click **Save** to finish.

 **Note:** If you cannot easily obtain the results you want by manually editing the schedule installments, you can return to the product detail and click **Re-Establish** to delete the old schedule and create a new one.

## Working with Products and Opportunities

### Choose a Price Book for an Opportunity, Quote, or Order

To include products on an opportunity, quote, or order, you must first choose a price book that contains the products you want to add.

You can add products, quote line items, or order products only from a single price book.

1. Click **Choose Price Book** in the Products related list on an opportunity or the Quote Line Items related list on a quote to select a price book.

**Choose Price Book** appears when you have access to more than one price book. If you have access to more than one price book and the option isn't visible, ask your administrator to add it to your page layout.

2. Select the price book you want to use for the opportunity.
3. Save your changes.

**Note:** The last price book you used on an opportunity or quote is selected by default.

If you change the price book for an opportunity that has products, all products are deleted from the Products related list, but the value in the opportunity's `Amount` field remains.

#### SEE ALSO:

## Add Products to Opportunities

You can add specific products to your opportunities, helping you see what's selling and in what quantity.

To add products to an opportunity:

1. Navigate to the opportunity you want to edit.
2. From the Products related list, choose **Add Product**. If you are adding the first product, you are asked to choose a price book for the opportunity.
3. Select one or more products from the list, or search for a product and then click the product name.
4. Enter the attributes for each product. Your administrator may have customized this page to include fields specific to your business.
5. Enter the `Sales Price` for the product. The Sales Price defaults to the List Price specified in the price book assigned to the opportunity. Depending on your user permissions, you may be able to override this value. You might want to give a discount, for example.
6. Enter the number of products at this price in the `Quantity` box.
7. Click **Save**.

 **Note:** If the product has default schedules, Salesforce creates the schedules automatically when you add the product to the opportunity in Salesforce Classic, but not when you add the product in Salesforce Lightning Experience. The opportunity `Amount` is the sum of the products you add to the opportunity. You cannot directly edit the `Amount` unless you first delete all the products from the opportunity. For multicurrency organizations, the opportunity `Currency` is tied to the currency of the associated price book entry. You cannot directly edit the `Currency` unless you first delete all the products from the opportunity.

## Edit Products on Opportunities

Maintain an accurate record of the products you are selling and your revenue by updating the quantity and price of products on your opportunities.

1. Click **Edit** next to the product name on the Products related list of the opportunity.
2. Enter the values for each product, including the `Sales Price` and `Quantity`. Your administrator may have customized this page to include additional fields specific to your business.
3. If the product has a discount, type it as a number with or without the percent sign (%) in the `Discount` field. You can use up to two decimal places.
4. Save your changes.

### Note:

- If the opportunity product has a revenue or quantity schedule, you can't edit the `Discount` field.
- In addition, field-level security is disabled by default for the `Discount` field. If you want to add the field to the page layout, you can enable field-level security.
- If an opportunity is syncing with a quote, and the quote record is locked by an approval process, you can't edit the opportunity products.

## Sorting Products on Opportunities and Quotes

Products appear in alphanumeric order by default on the Products and Quote Line Items related lists, but you can sort them into any order you like. For example, you might want to group related line items together on a quote you're sending to a customer. Syncing a quote with an opportunity also syncs product sort order.

1. Click **Sort** in the Products related list on an opportunity or the Quote Line Items related list on a quote.
2. Select a product, and use the arrows to move it up or down the list.
3. Click **Save**.

## Establish Schedules on Opportunity Products

You can use schedules to set up installments for the quantity of product sales and realized revenue.

To create a new schedule for a product on an opportunity:

1. Click the product name in the Products related list.
2. Click **Establish** to create a new schedule, or click **Re-Establish** to delete the old schedule and create a new one. (See [Editing Schedules](#) to edit an existing schedule.)
3. Select the type of schedule to create: quantity, revenue, or both. Your choices are limited by your organization's schedule settings, and by the schedule types your administrator has enabled for the product.
4. Set the schedule details. See [Schedule Fields](#) on page 1323 for a description of scheduling fields.  
For example, if the product unit price is \$100 and you specify a revenue schedule with ten monthly installments, a Schedule Type of "Divide" will create ten installments of \$10 each, and "Repeat" as the Schedule Type will create ten installments of \$100 each for a total of \$1000.
5. Click **Save** to display the schedule installments.
6. If necessary, edit the installments as described in [Editing Schedules](#) on page 1335.

If you have a quote line item with a discount, you can't edit the `Discount` field if the corresponding opportunity product has an individual schedule.

### Products with Default Schedules

If a product has default schedules established on the product record, the schedules are automatically created when you add the product to the opportunity. The dates of the installments begin with the date you specified when adding the product. If you left the product date blank, the installment dates begin with the opportunity `Close Date`.

If you add or change a default schedule for a product, opportunities with that product are not updated. If a product has both a default quantity schedule and a default revenue schedule, the quantity schedule is calculated first to determine the total product revenue, and then the revenue schedule is applied to that amount.

If you have a quote line item with a discount, you can't edit the `Discount` field if the corresponding product record has a default schedule.

## Searching for Products

You can add products to price books, opportunities, quotes, and service contracts.

1. Enter your search keywords to return matches in standard or custom text fields.
2. To narrow your search results, click **More filters** and select the filters you want.
  -  **Tip:** Search by keyword or filter criteria either alone or together. When used together, Salesforce finds records that match both your keyword and filter criteria.
3. Click **Search**.
4. Click the alphabetical index links to filter your search results by initial letter.
5. Select the checkboxes next to the records you want. Optionally, select the checkbox in the column header to select all currently displayed items. You can also use the **Selected** drop-down list to select or clear all records on the page. You can select a maximum of 50 records. If more than 50 records appear on the page, you can't select them all using the column header or the **Selected** drop-down list.
6. If your search finds many records, use the number of records drop-down list to specify the maximum number of records to display on each page.
7. Click the **Previous** and **Next** links or enter a page number in the `Page` box to display another page of products. Your selections persist when you move to a different page. These navigation tools work only if your search results contain fewer than 2,000 records.
8. Click **Select**.

 **Note:** To display newly added products, click **Refresh** (  ). This ensures that your search results are current.

## Optimizing Search Results for Products

When searching for products, use the following guidelines to optimize your results.

- Find products easily. You can use global search—but not sidebar search or advanced search.
- Type your keywords in the same format as you would for an advanced or global search. For example, type a keyword to find records that contain that keyword in standard or custom text fields. Type more than one keyword to find records that contain any or all keywords. To find exact phrases, enclose keywords in quotes.
- Use an asterisk (\*) wildcard character in the same way as you would for an advanced or global search.
- Use field filters, operators, and values to improve your search results. For example, *List Price greater than 1,000*.
- When filtering search results, limit the search to records that contain neither blank nor `null` values for a particular field, by choosing the field and the *not equal to* operator, and leaving the third field blank.
- Click column headings to sort the results in ascending or descending order. Sorting applies across all search results for a particular object, including those on subsequent pages. You can't click on column headings for multi-select picklist fields because you can't sort the multi-select picklist field type.
- Work with your administrator to select the columns you want to appear in your search results.
- Change the order of displayed columns by dragging them to a new position in the table. Salesforce doesn't save these changes.
- If you're searching for products to add to a price book and the standard price book is not activated, ensure that the Price Book Name and Active (Price Book) columns aren't displayed. These columns search for products that are included in the standard price book when it's activated. So, if the standard price book is deactivated, your search results will be empty. Alternatively, you can display these columns and activate the standard price book to return a list of all products that match your search criteria.

## Using the Entitlement Templates Related List

Available in: **Enterprise, Performance, Unlimited**, and **Developer** Editions with the Service Cloud

The Entitlement Templates related list displays a product's applicable entitlement templates. Entitlement templates are predefined terms of customer support that you can quickly add to products. For example, you can create entitlement templates for Web or phone support so that users can easily add entitlements to products offered to customers.

Administrators determine an Entitlement Template related list's availability and content. The following options and information appear by default:

### Add Entitlement Template

Click this button to add entitlement template(s) to the product.

To search for entitlement templates, enter a name, or part of a name, in the text entry field and click **Go!**. Check the boxes next to the templates you want to add to the product and click **Insert Selected**. Click **Done** to add the selected templates.

### Action

The actions you can perform on the entitlement template. For example, Click **Remove** to remove an entitlement template from the product.

### Entitlement Template

The name of the template. Click to view the template's details.

## Building Your Pipeline with Opportunities

### Opportunities

Track and manage your potential deals with Salesforce opportunities.

See key details about the deals, including which accounts you're working with, who the players are, and the amounts of the potential sales. As your deals progress toward the Proposal stage:

- Add products and attach files, such as contracts or data sheets.
- Log the calls you make.
- Use Notes to jot down things during customer meetings.
- Create tasks for key activities and calendar events for client meetings.
- Send email to the opportunity contact or other key decision-makers.

During negotiation, share sales strategies with colleagues or to ask your manager for targeted guidance using Chatter. As you drive your deal from one stage to the next, update the opportunity record with the current stage. You'll be closing deals in no time.

## Opportunities Home

Clicking on the Opportunities tab displays the opportunities home page. From this page you can:

- Show a filtered list of opportunities using a predefined list from View or by creating a custom view.
- See a list of your most recently viewed, created, or modified opportunities in Recent Opportunities. Depending on the number of opportunities, toggle **Show 25 items** and **Show 10 items** to change the number of displayed items. The displayed fields are determined by the Opportunities Search Layout defined by your administrator and by your field-level security settings (available in Enterprise, Unlimited, Performance, and Developer Editions only).

Recent Opportunities Choice	Description
<i>Recently Viewed</i>	The last 10 or 25 opportunities you viewed, with the most recently viewed opportunity listed first. This list is derived from your recent items and includes records owned by you and other users.
<i>Recently Created</i>	The last 10 or 25 opportunities you created, with the most recently created opportunity listed first. This list only includes records owned by you.
<i>Recently Modified</i>	The last 10 or 25 opportunities you updated, with the most recently updated opportunity listed first. This list only includes records owned by you.

- Click an opportunity name in Recent Opportunities to open the opportunity detail page.
- Create a new opportunity. Click **New** in Recent Opportunities or enter information in Quick Create on the sidebar.
- Click a report name in Reports to jump to that report or click **Go to Reports** to jump to the Reports tab. In opportunity reports, you can filter opportunities by the opportunity teams in which you are a member.
- Click **Run Report** in Quarterly Summary to view a quarterly opportunity summary.
- If opportunities are shared with external contacts via Salesforce to Salesforce, choose a list view from Opportunities from Connections to view opportunities that your business partners have shared with you.
- Use opportunity tools.
  - Choose to add, remove, or reassign a team member.
  - Leverage Salesforce AppExchange Sales Methodology partners to use their sales methodology, sales process, and sales procedures with Salesforce data.

## Move an Opportunity to the Next Stage

Update your deal as it moves closer to closing. Accurate stage information is important for forecasting, reporting, and ultimately meeting your quota.

### IN THIS SECTION:

#### [Move an Opportunity to the Next Stage in Salesforce Lightning Experience](#)

Update your opportunity stage directly from its record or from the Board view.

#### [Move an Opportunity to the Next Stage in Salesforce Classic](#)

Track opportunity progress as you get closer to closing your deal.

### EDITIONS

All editions

## Move an Opportunity to the Next Stage in Salesforce Lightning Experience

Update your opportunity stage directly from its record or from the Board view.

 **Note:** These steps work in Lightning Experience. If you see a navigation bar on the left side of your screen, you're in Lightning Experience. If you see a row of tabs across the top of the screen, you're in Salesforce Classic.

- From an open opportunity, select the new stage on the Sales Path and then click **Mark as Current**.
- From an open opportunity, click **Mark Stage as Complete**.
- From the Board view, find the opportunity whose stage you want to update and drag its card to the next stage column.

## Opportunity Board

The Board is a visual summary of all the opportunities for a particular sales path. By seeing all opportunities at once, sales managers can effectively monitor the pipeline and sales reps can keep deals moving forward.

### EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

The screenshot shows the Salesforce Opportunity Board interface. At the top, there's a header 'OPPORTUNITIES My Opportunities' with a settings gear icon and a 'New' button. Below the header, it says '8 items - Sorted by Amount'. The main area is a pipeline with five stages: Qualification (2), Needs Analysis (1), Proposal (1), Negotiation (2), and Closed/Won (2). Each stage has a total value and a list of opportunity cards. A red box labeled '1' highlights the top navigation bar. A red box labeled '2' highlights a group of cards in the Qualification stage. A red box labeled '3' highlights a card being dragged from the Needs Analysis stage to the Proposal stage. A red box labeled '4' highlights a 'No open activities' popup menu with options 'New Task' and 'New Event'. A red box labeled '5' highlights the view toggle buttons (grid and list). A red box labeled '6' highlights the filter dropdown menu.

The Board displays opportunities from a particular sales path (1). The opportunities are sorted by stage and include the sum of the all opportunities for that stage. The fields shown on the card are the first four fields on the corresponding list view (2). Easily move an opportunity by dragging the card to the next stage (3). Alerts tell you what needs to be done to keep a deal on track; for example, create a new task or event on an opportunity that doesn't have any open activities (4). You can then create a new activity without navigating away from this view. Easily toggle between board view and grid view (5) and quickly filter the view (6) to see a specific set of opportunities.

There are a few things to consider when using the Board. For more information, see the [Lightning Experience guide](#).

## View Opportunity Lists

Filter, create, edit, or delete an opportunities list view, or edit an opportunity directly from the list.

To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.

- Click an opportunity name to view the detail.
- Click **Edit** or **Del** to edit or delete an opportunity.
- If Chatter is enabled, click  or  to follow or stop following an opportunity in your Chatter feed.
- To create an opportunity, either click **New Opportunity** at the top of the list, or select **Opportunity** from the Create New drop-down list in the sidebar.
- In a custom list view, you can filter opportunity lists by the Opportunity Teams to which you belong. When creating or editing a custom list view for opportunities, select the `My Opportunity Teams` filter.

## Sorting List Views

Click any column heading to sort in ascending or descending order using that column's information.

At the top of the list, click a letter to display the contents of the sorted column that begin with that character.

The alphabetic navigator won't appear if the list view doesn't support column sorting. If your language or the sorted column doesn't support alphabetic sorting, the navigator is disabled. For example, you can't click letters to sort on date fields.

-  **Note:** In Enterprise, Unlimited, Performance, and Developer Edition organizations, you can grant additional access to your opportunities beyond what the sharing model allows. In Professional Edition organizations, to allow additional access to your opportunities, you can share the account associated with the opportunity. See [Sharing Accounts](#).

## Opportunity Field History

The Opportunity Field History related list tracks the changes users make to an opportunity, quickly letting you see who made modifications and when.

Any time a user modifies any of the standard or custom fields whose history is set to be tracked on the opportunity, a new entry is added to the Opportunity Field History related list. All entries include the date, time, nature of the change, and who made the change. Modifications to the related lists on the opportunity are not tracked in the opportunity field history. You cannot customize which opportunity fields are tracked in the opportunities' Stage History related list; however, you can choose which opportunity fields are tracked in the Opportunity Field History related list.

### Note:

- Changes to the `Amount` and `Quantity` fields on opportunities are tracked even when the field is updated as the result of a change to an opportunity's products or schedules.
- For information on tracking changes in opportunity status, see [Stage History](#).

SEE ALSO:

[Opportunities](#)

## Stage History

The Stage History related list of an opportunity detail page tracks the changes in status for that opportunity.

The Stage History related list of an opportunity detail page tracks the changes in status for that opportunity. Any time you change the `Amount`, `Probability`, `Stage`, or `Close Date` for the opportunity, a new entry is added to the list with the name of the person that made the change and a date stamp.

For information on tracking changes to any standard or custom field on an opportunity, see [Opportunity Field History](#).

## Guidelines for Creating Opportunities in Salesforce Classic

Many of your organization's opportunities may be generated when you convert qualified leads, but you can also create opportunities manually in both Salesforce Classic Lightning Experience. These guidelines apply to creating opportunities in Salesforce Classic.

### Contacts and Contact Roles

To associate an opportunity with an account or contact, must have at least read access to the account or contact. When you create an opportunity from a contact record, that contact is automatically listed as the primary contact in the Contact Roles related list of the opportunity.

### Divisions

If your organization uses Divisions, the division of a new opportunity is automatically set to the division of the related account.

### Forecasts

- In Professional, Enterprise, Unlimited, Performance, and Developer Editions, opportunities you create are automatically given the forecast category that corresponds to the opportunity stage you assign. Your administrator correlates opportunity stages and forecast categories when editing the `Stage` picklist values.
- If the opportunity is set to close in a given month, as determined by the `Close Date`, the opportunity is automatically added to the forecast for that particular month, unless the forecast category on the opportunity is set to `Omitted`.

### Multicurrency

If your organization uses multiple currencies, your opportunity amounts are initially shown in your personal currency. Change the `Opportunity Currency` picklist to track the sales revenue in another currency.

### Opportunity Splits

When team selling and splits that total 100% are enabled, you're automatically added to the opportunity team and initially assigned 100% of the split.

### Territory Management

If your organization uses [territory management](#), opportunities that you create are automatically assigned a territory when both of the following conditions are met.

- You belong to or have edit privileges on the same territory as the account on the opportunity.
- You have no other territories in common with that account. (Note that if you have the "Manage Territories" permission, you have access to all territories, including the parent territories of the account. In this case, you *do* have other territories in common with the account, unless the account is only assigned to a single top-level territory. No territory is assigned to the opportunity.) For example, if you are in the territories Berkeley and San Francisco and the account is in the territories Portland, San Francisco, and Seattle, the opportunity is assigned to the San Francisco territory.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** Editions for organizations activated before Summer '09

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions for organizations activated after Summer '09

## Considerations for Deleting Opportunities

Before you delete Salesforce opportunities, make sure you're familiar with these considerations.

- You can delete an opportunity if you're an administrator, the opportunity owner, or a user above the opportunity owner in the organization role hierarchy, and you have the "Delete" permission on opportunities.
- When you delete an opportunity, all related notes, attachments, quotes, quote line items, quote PDF files, events and tasks, partner relationships, competitor strengths/weaknesses, contact roles, and stage history are deleted.
- If you restore the opportunity, any related items are also restored.
- Associated contacts and accounts are not deleted with the opportunity.
- The deleted opportunity is moved to the Recycle Bin.

SEE ALSO:

[Deleting Records](#)

## Opportunity Forecasts

The Opportunity Forecasts related list is available on the opportunity detail page if your organization uses customizable forecasting. It lists the forecast overrides for the selected opportunity. A forecast override is an amount that more accurately represents your forecasted sales.

1. In the Opportunity Forecasts related list, view a snapshot of the overrides made on that opportunity.
2. Click **Edit** to change the overrides. See [Overriding Customizable Forecasts](#) for instructions on overriding opportunity forecast amounts.
3. If your organization uses territory management, the territory to which the opportunity is assigned displays in the `Territory` drop-down list.

If you are a forecast manager for multiple territories, the drop-down list shows the territories from which you can override the opportunity. Choose a value and click **Edit** to override the opportunity from the desired territory.

## Changing the Territory of an Opportunity

If you have edit access to an opportunity, you can change the territory that is associated with the opportunity:

1. On the opportunity detail page, click **Change** next to the `Territory` field.
2. Choose a territory from the `Opportunity Territory` drop-down list.

The drop-down list shows:

- Territories where both the opportunity owner and the account on the opportunity are assigned to the territory.
- Territories to which you have administrative access that are also associated with the account on the opportunity.
- Territories to which you have administrative access that are above the account on the opportunity in the territory hierarchy.

3. Click **Save** to finish and return to the opportunity detail page.

SEE ALSO:

[Territory Management Overview](#)

## Cloning Opportunities

The **Clone** button on an opportunity quickly creates a new opportunity with the same information as the existing opportunity, for example, when you need to add multiple opportunities for the same account.

If the opportunity has an associated opportunity team, the team is not carried to the cloned opportunity. You must add an opportunity team to the cloned opportunity if required.

Cloning an opportunity varies if products are involved:

- If the opportunity does not have any associated products, click **Clone** on the opportunity to clone it.
- If the opportunity has associated products and your organization requires products on opportunities, click **Clone** to clone the opportunity and the associated products.
- If the opportunity has associated products and your organization does not require products on opportunities, select **Clone with products** from the **Clone** drop-down button to clone the opportunity and the associated products. Alternatively, select **Clone without products** to clone the opportunity without including the associated products.

Enter or change any information for the new opportunity, and click **Save**.

 **Note:** If you have read-only access to a field, the value of that field is not carried over to the cloned record.

## Considerations for Sharing Opportunities

Let others provide important updates to your opportunities, and give visibility into your pipeline.

Before you share your opportunities, keep in mind that:

- Your administrator determines your organization’s sharing model, including the default opportunity access levels for territories.
- While you can increase access to your opportunities, you can’t restrict it below your organization’s default access levels.
- To share an opportunity with another user, that user must have the “Read” permission on opportunities.
- The sharing detail page lists the users, groups, roles, and territories that have sharing access to the opportunity.

SEE ALSO:

[Record Access Levels](#)

## Opportunity Fields

The fields for opportunities contain a wide variety of information to help you track your pending and potential sales.

Opportunities include these fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

Field	Description
Account Name	<p>Name of account that opportunity is linked to. You can enter the account name, or select the account using the lookup icon.</p> <p>If you change the account for an opportunity that has partners, all partners are deleted from the Partners related list.</p>
Amount	<p>Estimated total sale amount. For organizations using multiple currencies, the amount is shown in your personal currency by default. Change the <code>Opportunity Currency</code> picklist to track the amount in another currency.</p> <p>For opportunities with products, the amount is the sum of the related products. You cannot directly edit the amount unless the opportunity has no products. To change the amount for an opportunity that contains products, edit the sales price or quantity of the related products.</p> <p>If you change the price book for an opportunity that has products, all products are deleted from</p>

### EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

### EDITIONS

Available in: Salesforce Classic and Lightning Experience

The available fields vary according to which Salesforce Edition you have.

Field	Description
Close Date	the Products related list, but the value in the opportunity's <code>Amount</code> field remains.  Date when you plan to close the opportunity. You can enter a date, or choose a date from the calendar that displays when you put your cursor in the field.  Opportunities with a <code>Close Date</code> in a given month will tally in the forecast for that month, unless you assign them to the Omitted category while editing the forecast.  When you set an open opportunity's <code>Stage</code> to a type of "Closed/Won," the <code>Close Date</code> is set to the current date in Coordinated Universal Time (UTC). At certain times of day, UTC will differ by one day from your time zone.
Contract	Contract that the opportunity is linked to.
Created By	User who created the opportunity including creation date and time. (Read only)
Custom Links	Listing of custom links for opportunities as set up by your administrator.
Description	Description of the opportunity. Up to 32KB of data are allowed. Only the first 255 characters display in reports.
Expected Revenue	Calculated revenue based on the <code>Amount</code> and <code>Probability</code> fields.
Forecast Category	Forecast category name that is displayed in reports, opportunity detail and edit pages, opportunity searches, and opportunity list views. The setting for an opportunity is tied to its <code>Stage</code> . For more information on forecast categories, see <a href="#">Working with Forecast Categories</a> on page 1463.
Last Modified By	User who last changed the opportunity fields, including modification date and time. This does not track changes that are made to any of the related list items on the opportunity. (Read only)
Lead Source	Source of the opportunity, for example, Advertisement, Partner, or Web. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.
Next Step	Description of next task in closing opportunity. Up to 255 characters are allowed in this field.
Opportunity Currency	The default currency for all currency amount fields in the opportunity. Amounts are displayed in the opportunity currency, and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.

Field	Description
Opportunity Division	<p>For opportunities with products, the currency is tied to the currency of the associated price book. You cannot directly edit this field unless you first delete the products.</p> <p>Division to which the opportunity belongs. This value is automatically inherited from the related account.</p> <p>Available only in organizations that use divisions to segment their data.</p>
Opportunity Name	Name of the opportunity, for example, Acme.com - Office Equipment Order. Up to 120 characters are allowed in this field.
Opportunity Owner	Assigned owner of opportunity. Not available in Personal Edition.
Opportunity Record Type	Name of the field that determines what picklist values are available for the record. The record type may be associated with a sales process. Available in Enterprise, Unlimited, Performance, and Developer Editions.
Partner Account	Read-only field that indicates the opportunity is owned by a partner user.
Primary Campaign Source	<p>Name of the campaign responsible for generating the opportunity.</p> <p>For opportunities created during lead conversion, this field is automatically filled in with the campaign name from the lead. If the lead has multiple associated campaigns, the campaign with the most recently updated member status is inserted into the opportunity.</p> <p>For opportunities with multiple influential campaigns, click <b>Edit</b> next the primary campaign in the Campaign Influence related list on the opportunity detail page and select the <code>Primary Campaign Source</code> checkbox. The campaign will display in the <code>Primary Campaign Source</code> field on the opportunity.</p>
Private	<p>Indicates that the opportunity is private. Only the record owner, users above that role in the hierarchy, and administrators can view, edit, and report on private opportunities. Not available in Group or Personal Editions. Private opportunities do not trigger <a href="#">Big Deal Alerts</a> or workflow rules. Private opportunities count towards your forecasts only if you have Customizable Forecasting or Collaborative Forecasts enabled. Users with the "View All Forecasts" permission can see private opportunities within the Forecasts tab.</p> <p> <b>Note:</b> When you mark opportunities <code>Private</code>, any opportunity teams, opportunity splits, and sharing are removed. (The owner of a private opportunity receives 100% of split types that total that amount.)</p>

Field	Description
Probability	Likelihood that opportunity will close, stated as a percentage.  The <code>Probability</code> value is always updated by a change in the <code>Stage</code> value, even if <code>Probability</code> is marked as read only on your page layout. Users with access to edit this field can override the value.
Quantity	Total of all <code>Quantity</code> field values for all products in the Products related list if the opportunity has products. General use field if the opportunity does not have products.
Stage	Current stage of opportunity based on selections you make from a predefined list, for example, Prospect or Proposal. Entry is selected from a picklist of up to 100 available values, which are set by an administrator. Each picklist value can have up to 40 characters.  Your administrator correlates the values in this picklist with Forecast Category values that determine how the opportunity contributes to your forecast.  When you set an open opportunity's <code>Stage</code> to a type of "Closed/Won," the <code>Close Date</code> is set to the current date in Coordinated Universal Time (UTC). At certain times of day, UTC will differ by one day from your time zone.
Synced Quote	Quote that's synced to the opportunity. Only one quote can sync to the opportunity at a time.
Territory	Territory with which the opportunity is associated. Only available if your organization has territory management. See <a href="#">Changing the Territory of an Opportunity</a> .
Type	Type of opportunity, for example, Existing Business or New Business. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.

## Opportunity Product Fields

Field	Description
Active	Indicates whether the price book entry (product and list price) is active and can be added to an opportunity or quote.
Created By	Name of the user who created the product.
Date	Close date of a particular opportunity product.
Discount	Discount for the product as a percentage.
Last Modified By	User who last changed the opportunity product fields. (Read only)

Field	Description
Line Description	Text to distinguish this opportunity product from another.
List Price	The price of the product within the price book including currency.
Opportunity	Name of the opportunity for this opportunity product.
Product	Item listed in the Products related list on an opportunity.
Product	The title for the product.
Quantity	Number of units for the opportunity product.
Sales Price	Price for the products in the opportunity product.
Subtotal	Difference between standard and discounted pricing. Converted currency amounts when the opportunity's currency is different from the user's currency.
Total Price	Sum of all the product amounts for this opportunity product.

## Finding Similar Opportunities

You can create bookmarks for Closed/Won opportunities that are similar to your current deal so you can quickly access useful information, such as previous notes, contacts, or salespeople. The records that you bookmark are saved to the Similar Opportunities related list.

When you search for similar opportunities, Salesforce looks for records in the Closed/Won stage that share one or more fields or related lists with the current opportunity. The search criteria for your organization is pre-determined by your administrator. The search finds a maximum of 10,000 opportunities with close dates in a three-month period and displays up to 300 of the records that best match the search criteria. The results are ranked by the number of matching fields.

1. On the opportunity's detail page, click **Find** in the Similar Opportunities related list. You see a list of similar opportunities that closed in the past three months.
2. Filter the search results to see different records.
  - Select a different range from the **Close Date Within** dropdown to view records that closed in a different three-month period.
  - Select one or more fields in the Match Criteria sidebar to filter the results. For example, select the account name to only see opportunities associated with that account or select the site city and country to only see opportunities from the specified region. Deselect the match criteria to return to the original search results.
3. Look for similar opportunities that will be helpful to you.
  - Hover over an opportunity name to see how the record is similar to your current deal. The matching attributes are highlighted in the Match Criteria sidebar.
  - Click an opportunity name to see more information about the record. You can only view these details if you have access to the opportunity.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To find and bookmark similar opportunities:

- "Read" on opportunities

4. Select the checkboxes next to the opportunities that you'd like to add to the Similar Opportunities related list and click **Bookmark**. To choose all opportunities on the page, select the checkbox in the header row.

[Enabling and Configuring Similar Opportunities](#)

## Schedule Reminders to Update Opportunities

Once [opportunity update reminders are enabled](#) for your organization, any user who has direct reports can schedule them.

1. From your personal settings, enter *Reminder* in the **Quick Find** box, then select **My Update Reminder**.
2. Check **Active** if you want reminders to start after you save the settings.
3. Enter a name and address for the sender of the reminders.
4. Choose a recipients option.
5. Enter any other recipients in the **CC** field. Separate additional email addresses with a commas, semi-colons, spaces, or new lines.
6. Enter a subject and message to be included in the email reminders.
7. Select a schedule frequency.
8. Select **Include Past Due Opportunities** to include all open opportunities that have a closing date within 90 days before the specified **Close Date**. For example, suppose your organization uses a normal fiscal year and the current quarter started on 4/1/2012. You configure update reminders for opportunities closing in the current quarter and then select **Include Past Due Opportunities**. When the update reminder is sent on 6/15, it includes all opportunities from 4/1 to 6/15. It also includes open opportunities with a closing date between 1/2 and 4/1 (there are 91 days in Q1).
9. Choose a **Close Date** to include opportunities with dates within that range.
10. Select the fields to include in the email reminders.

### EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Field	Description
Last Login Date	Most recent login date of the opportunity owner
# of Open Opportunities	Total number of opportunities in the report
# Not Updated in Last 30 Days	Total number of opportunities that have not been updated in 30 days
Open Opportunity Amount	Total of all opportunity amounts in report
Total Closed Amount	Total closed amount for all opportunities in report.  If your organization uses multiple currencies, this amount is converted to the user's currency. If your organization uses advanced currency management, the conversion is done using dated exchange rates.

Field	Description
Last Update Date	Most recent date the opportunity owner submitted a forecast.  If your organization uses multiple currencies, this amount is converted to the user's currency. If your organization uses advanced currency management, the conversion is done using dated exchange rates.

### 11. Click **Save**.

When there are no records in an opportunity update reminder, Salesforce does not send an email. If no email is sent for three consecutive opportunity update reminders, the scheduled reminder is deactivated.

## Teaming Up for Sales Opportunities

### Opportunity Teams

Avoid duplicate opportunity records created by each member of a sales team. Instead, create an Opportunity Team so that all the members of a team can access the same record. Enabling Opportunity Splits also lets you use opportunity splitting to share credit among team members.

An Opportunity Team is a set of Salesforce users who work together on sales opportunities. A typical opportunity team might include an account manager, a sales representative, and a presales consultant.

Set up an Opportunity Team for any opportunity owned by you or a team member below you in the role hierarchy. Add team members and select each person's role on the opportunity (for example, "Executive Sponsor"). Most important, specify each team member's level of access to the opportunity: read/write access or read-only access. Adding, editing, or deleting Opportunity Team members requires read/write access on the associated opportunity. You can't use Opportunity Teams for private opportunities, and you can't add high-volume portal users to teams.

You can set up a default Opportunity Team. Include the users you normally work with on your opportunities. You have the option to add your default Opportunity Team to all of your opportunities automatically.

Changes made to the Opportunity Team for an individual opportunity don't affect your default Opportunity Team or the Opportunity Teams on your other opportunities.

In a custom list view, you can filter opportunity lists by the Opportunity Teams to which you belong. When creating or editing a custom list view for opportunities, select the `My Opportunity Teams` filter. In opportunity reports, you can filter opportunities by the opportunity teams in which you are a member.

#### EDITIONS

Available in: **Salesforce Classic**

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

 **Note:** Opportunity Teams aren't the same as Account Teams, although they share the same set of available team member roles. Opportunity Teams work together on opportunities, while Account Teams work together on accounts.

- Unlimited
- Developer

## Add Members to an Opportunity Team

You can add team members to an opportunity you own, giving them access to the information they need to help you close the sale.

1. Open the opportunity and navigate to the Opportunity Team related list, then click **Add**.
2. Enter the member's name in the `USER` column. If the partner portal is enabled, choose whether the member is a Partner User or User, and then enter the member's name.

When you add an opportunity team member, the member is automatically granted read access to the associated account.

3. Select the member's opportunity team role.
4. Select the member's opportunity access level. The access level can't be less than your organization's default opportunity sharing access.
5. Specify values for any custom fields that your administrator has created for opportunity teams.
6. Click **Save**.

 **Tip:** Run the Opportunities with Opportunity Teams report to list the opportunity team members for the opportunities owned by you or users below you in the role hierarchy. The report also shows information about opportunities you own and opportunity teams to which you belong, including any opportunity splits.

### SEE ALSO:

### USER PERMISSIONS

To add team members to an opportunity:

- "Read" on users  
AND  
"Read" on opportunities  
AND  
Owner of opportunity record, or above owner in your organization's role hierarchy

To view an opportunity for which you're a team member:

- "Read" on the opportunity

## Editing Members of an Opportunity Team

1. Open the opportunity and navigate to the Opportunity Team related list. Or open any other page to which you administrator has added this list.
2. To update access or role information for a team member, click **Edit** next to the member's name. (If there are more than five members, click **Go to list** to list the entire team.)

 **Note:** Inactive users with assigned split percentages appear on the opportunity team, but you can edit only split-related fields for these users. All other fields are read only.

3. Select a different access level or role. The access level can't be less than your organization's default opportunity sharing access.
4. Edit values for any custom fields that your administrator has created for opportunity teams.

 **Important:** See [Working with Custom Fields for Opportunity Teams](#) on page 1363.

5. Click **Save**.
6. To view the organization-wide sharing settings for opportunities, click **Display Access**. These settings may allow greater access than those specified for an opportunity team member. For example, if the organization sharing setting for opportunities is Read/Write, it overrides a Read Only setting assigned to an individual opportunity team member.

 **Tip:** Run the Opportunities with Opportunity Teams report to list the opportunity team members for the opportunities owned by you or users below you in the role hierarchy. The report also shows information about opportunities you own and opportunity teams to which you belong, including any opportunity splits.

### USER PERMISSIONS

To edit team members:

- "Edit" on opportunities

AND

Owner of opportunity record, or above owner in your organization's role hierarchy

To view an opportunity for which you're a team member:

- "Read" on the opportunity

## Deleting Members from an Opportunity Team

1. View the opportunity and navigate to the Opportunity Team related list. Or open any other page to which you administrator has added this list.
2. Delete members no longer on the team. (If there are more than five members, click **Go to list** to list the entire team.)

If Opportunity Splits is enabled, keep these guidelines in mind.

- If the team member you want to delete is assigned a split percentage greater than zero, you must reassign the split before you can delete the team member.
- You can't delete the opportunity owner from the opportunity team. If you want to remove this member from splits calculations, either assign them a split percentage of zero, or transfer ownership of the opportunity.

SEE ALSO:

[Delete Members from Your Default Opportunity Team](#)

## Working with Custom Fields for Opportunity Teams

You can see custom fields for your opportunity teams if your administrator has defined them and added them to the relevant page layouts.

If your administrator has defined custom fields but not added them to the Add Opportunity Team Members page, you can't see them when you add a new team member. However, you might see them when you edit an existing opportunity team member by clicking **Edit** beside the member's name on the Opportunity Team related list.

It's important to remember that when you edit a member's details, the member's original details are overwritten. Let's say you add a member to the team and then edit that member's details to specify values for all associated custom fields. Later, you mistakenly think that the member hasn't been added to the team, perhaps because you don't look at the Opportunity Teams list view, and add the member again. Because the custom fields aren't displayed on the Add Opportunity Team Members page, when you add the member for a second time, you can't specify the values for these fields. In this case, the original values that you specified for the custom fields are overwritten with a blank value.

## Setting Your Default Opportunity Team

An opportunity team is a group of users that typically work together on opportunities. For example, the opportunity team may include the account manager, the sales engineer, and the sales representative. Your default opportunity team should include the users that you normally work with on the opportunities that you own. You can specify the role that each user plays on your team and the specific access that each user should have to your opportunities.

- [Add Members to Your Default Opportunity Team](#)

## Adding Your Default Opportunity Team

There are two ways to include your default opportunity team on the opportunities you own.

- When adding members to your default opportunity team, you can choose to automatically add the team to all of your open opportunities. See [Add Members to Your Default Opportunity Team](#).
- You can add your default opportunity team to each of your opportunities individually.
  1. View the opportunity and navigate to the Opportunity Team related list.
  2. Click **Add Default Team**.

 **Note:** Administrators and users above you in the role hierarchy can add your default opportunity team to opportunities you own. Clicking **Add Default Team** adds the default team of the opportunity owner, not of the user who clicks the button.

## Opportunity Splits Overview

Opportunity splitting lets team members share sales credit for an opportunity. Multiple team members working on an opportunity can roll their individual sales credits into quota and pipeline reports for the entire team.

[Watch a Demo](#) (1:44 minutes)

**Note:** To view and edit splits, you must be the opportunity owner or above in the organization hierarchy and have access to the split fields.

There are two types of opportunity splits.

- To credit team members who are directly responsible for opportunity revenue, use splits that total 100% of the opportunity amount. (These splits are called *Revenue* splits by default.)
- To credit supporting team members, use splits that can total any percentage of the opportunity amount, including percentages over 100%. (These splits are called *Overlay* splits by default.)

By default, your organization's `Opportunity-Amount` field comes with one revenue split and one overlay split. If custom split types are enabled for your organization, your administrator can create up to three more split types, for a total of five split types. Your administrator decides whether each split must total 100%.

For example, split credit for an opportunity on the standard `Estimated Revenue` field. Or add a currency field for profit and create a split type based on profit from an opportunity. Split types can be based on most opportunity currency fields, including custom fields and roll-up summary fields, but not formula currency fields.

To have custom split types enabled for your organization, contact Salesforce.

Your administrator can also create custom fields for opportunity splits, allowing you to better track and store information about splits you create for team members.

**Note:** You can't create dependent picklists for opportunity splits.

**Tip:** To include splits in your forecasts, see [Changing Between Revenue and Quantity Forecasts](#). (Splits can't be rolled up to sales territories.)

## Create Opportunity Splits

Add and adjust splits for opportunity team members.

If team selling and opportunity splits are enabled for your organization, you can edit splits for opportunity team members.

1. Open an existing opportunity or create a new one. The opportunity owner is automatically included in the opportunity team and initially assigned 100% of the split types that must total that amount.

2. In the Opportunity Split related list, click **Edit Opportunity Splits**.

 **Note:** If you don't see splits on a specific field, ask your administrator if field-level security limits your access.

3. Add appropriate opportunity team members and adjust their split percentages. To determine whether a split type must add up to 100%, look for for "must total 100%" in the description of the split.

To remove a team member from the split, click  next to the team member's name.

 **Note:** If you can't add a team member, go back to the main opportunity page and add the person in the Opportunity Team related list. (To add members while editing splits, contact your administrator.)

4. Click **Save**.

 **Note:** Split percentages are limited to two decimal places. If you enter a monetary amount that requires a split percentage with three decimal places or more, the amount is automatically rounded.

## Knowing Your Competitors

### Competitors Overview

You can track competitors in a pending sale by listing the competitors' names in the opportunity. You can enter the names of new competitors, or choose from a list of competitors defined by your administrator. To access this information, go to the Competitors related list of the opportunity.

SEE ALSO:

[Defining Competitors](#)

### Defining Competitors

Create a picklist of competitors that your users can attach to opportunities. To add competitors to the picklist:

1. From Setup, enter *Competitors* in the **Quick Find** box, then select **Competitors**.
2. Click **New** to add competitor names to the list.
3. Enter the name of the competitor.
4. Optionally, check the default option to select this value on any new record when another value is not selected.
5. Click **Save**.

# Improve Your Performance With Work.com

## Feedback Overview

Work.com Feedback allows you to request and offer unsolicited feedback on a person or topic, and also respond to feedback related to performance summaries.

Feedback offers, feedback requests, and feedback related to performance summaries are all managed from the Feedback tab. The Feedback tab displays the recent feedback you've viewed by default, and you can filter to see different types of feedback records. For example, select **New Feedback Requests** to see feedback records that require their input. You can also create custom list views with different filter options.

The default feedback filters include:

- All Feedback—All feedback, including one-time feedback and performance summary feedback
- Declined Feedback Requests—All the feedback you've requested that others have declined
- Feedback About Me—All the completed feedback about you
- Feedback About My Team—All the completed feedback about your team
- Feedback About Others—Completed feedback about others
- Feedback About Topics—Completed feedback about topics
- New Feedback Replies—New replies to the feedback you've requested
- New Feedback Requests—New feedback requests for one-time feedback and performance summaries

### EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Feedback requires a license to **Work.com**, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition, or Developer Edition**, and is included in **Performance Edition**.

### USER PERMISSIONS

To view feedback:

- "Read" on Feedback, Feedback Questions, Feedback Question Sets, and Feedback Requests

To create feedback:

- "Create" on Feedback, Feedback Questions, Feedback Question Sets, and Feedback Requests

To edit or submit feedback:

- "Edit" on Feedback, Feedback Questions, Feedback Question Sets, and Feedback Requests

To delete feedback (only for admin users with MAD/VAD permissions):

- "Delete" on Feedback, Feedback Questions, Feedback Question Sets, and Feedback Requests

On the feedback page, you can:

- View and filter your feedback list for new requests, replies, and other feedback
- Click a feedback record to view and edit details about the feedback
- Offer or request feedback

SEE ALSO:

- [Feedback Visibility](#)
- [Performance Summary Overview](#)
- [Enable or Disable Work.com Settings](#)

## Feedback Visibility

Visibility options are based on the type of feedback you choose.

### Feedback Requested

Only people to whom you sent the feedback request and an administrator with “Modify All Data” or “View All Data” access can view your request.

Feedback Requested About	Person Receiving the Request	Person’s Manager	Administrator with MAD/VAD Access
Topic	✓		✓
Myself	✓		✓
Another User	✓		✓

### Feedback Offered

You can only view feedback that is shared with you. For example, you won’t be able to view feedback about yourself that was shared only with your manager.

### EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Feedback requires a license to **Work.com**, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition, or Developer Edition**, and is included in **Performance Edition**.

Feedback Offered	Person	Person's Manager	Administrator with MAD/VAD Access
Person Only	✓		✓
Person and Manager	✓	✓	✓
Manager Only		✓	✓

## Goals Overview

Work.com Goals allow you to define, track, and measure your work. Access goals via the Goals tab or Chatter profile pages.

The Goals tab on a user’s profile displays the goals for that person. The top-level Goals tab is a general list view that can be configured to display different lists of goals (such as My Goals, My Team’s Goals, or Key Company Goals). The tabs and list views that appear may vary depending on how your administrator configured Work.com.

### EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions**

Goals requires a **Work.com** license, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition,** or **Developer Edition,** and is included in **Performance Edition.**

### USER PERMISSIONS

To view goals:

- “Read” on Goals and Goal Links

To create goals:

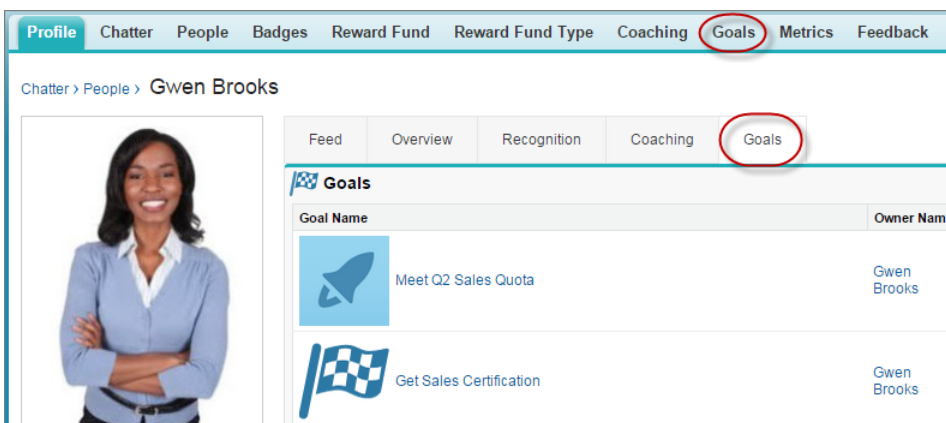

- “Create” on Goals and Goal Links

To edit goals:

- “Edit” on Goals and Goal Links

To delete goals:

- “Delete” on Goals and Goal Links

Click a goal in your list view to access the detail page.

Goals support Chatter feeds on goal records, so different users can collaborate in the feed and keep up-to-date on a goal's progress.

The goal detail page lists the metrics, tasks, events, notes, attachments, and other information related to a particular goal. Align goals with others by linking your goals with parent goals or subgoals.

Modify sharing settings to better control who can see and update your goals. For example, if goals in your organization are set to private by default, goal owners and administrators can share goals with select users or groups to increase collaboration and visibility. Choose between read-only and read/write access for more granular control over goal access.

On the Open Activities related list, click **New Task** or **New Event** to create a task or event tied to a specific goal. You can also create tasks or events for individual metrics, if desired.

Action	Metric Name	Progress	Status	Due Date	Current Value	Initial Value	Target Value	Owner Name	Comment	Weight
<a href="#">Edit</a>   <a href="#">Del</a>	<a href="#">Get 5000 in Sales</a>	66	On Track	9/1/2015	3,300.00	0.00	5,000.00	<a href="#">Dan Perkins</a>		60.00
<a href="#">Edit</a>   <a href="#">Del</a>	<a href="#">Get Sales Certification</a>	0	Postponed	9/1/2015				<a href="#">Dan Perkins</a>		10.00

Action	Metric Name	Progress	Status	Due Date	Current Value	Initial Value	Target Value	Owner Name	Comment	Weight
<a href="#">Edit</a>   <a href="#">Del</a>	<a href="#">Finish Sales Training</a>	100	Completed	8/1/2015				<a href="#">Dan Perkins</a>		30.00

Add metrics to your goals to calculate your progress. You can also link metrics to data in your favorite reports to keep track of your work in Salesforce. Assign weights to different metrics to precisely track the completion of the goal.

## Create a Goal

Define, track, and measure your work with Work.com Goals.

1. Click the top-level Goals tab.
 

If the Goals tab isn't displayed, select Work.com from the Force.com app drop-down menu at the top-right or click  to the right of your current tabs and select it from the All Tabs page.
2. Click **New**.
3. Enter a name for the goal, and specify additional details.
 

You can adjust a goal's sharing settings after it's created. Note that all goal images are externally available.

 **Tip:** To create a key company goal, select the **Key Company Goal** field. After the goal is created, share it with the All Internal Users group with the Access Level set to Read Only.
4. Set the goal's status:
  - Draft—The goal details are in draft state and haven't been finalized yet.
  - Published—The goal details have been finalized and the goal is in progress.
  - Completed—The goal is completed.
  - Canceled—The goal is canceled and no longer applies.
  - Not Completed—The goal is not completed.

5. Click **Save**.

You can reassign goals to other users by clicking **Change** next to Owner Name on a goal's detail page. Metrics can be owned by different users, so be sure to reassign metrics to the appropriate owner as well.

## Metrics

Use metrics to track and surface your data.

Create new metrics from the Metrics tab or from a goal detail page. Users can create standalone metrics or tie them to specific goals.

The screenshot shows the 'Metrics Home' interface. At the top, there's a 'View: All' dropdown and a 'Go!' button, along with a 'Create New View' link. Below this is a 'Recent Metrics' section with a 'New' button and a 'Recently Viewed' dropdown. The main content is a table with the following data:

Metric Name	Owner Name	Progress	Status	Due Date
 <a href="#">Get 50000 in Sales</a>	<a href="#">Gwen Brooks</a>	70	On Track	7/31/2015
 <a href="#">Pass Certification Test</a>	<a href="#">Gwen Brooks</a>	100	Completed	
 <a href="#">Finish Sales Training Course</a>	<a href="#">Gwen Brooks</a>	100	Completed	

### EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Metrics requires a **Work.com** license, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition, or Developer Edition**, and is included in **Performance Edition**.

Use Progress or Completion metrics to track the status of different goals that you set for yourself or others. Anyone with read/write access can refresh metric values, and metrics can also appear in relevant coaching spaces and performance summaries.

Anyone with read/write access can refresh metric values, and metrics can also appear in relevant coaching spaces and performance summaries.

#### IN THIS SECTION:

[Create a Metric](#)

Track and surface your work with Work.com Metrics.

## Create a Metric

Track and surface your work with Work.com Metrics.

1. Click the Metrics tab.

Alternatively, you can click **New Metric** on a goal's detail page.

2. Click **New**.
3. Select a Progress or Completion record type and click **Continue**.

- Progress metrics measure achievement based on how much is finished compared to a targeted value. They're ideal for tracking hard numbers and percentages. For example, create progress metrics to *Convert 50 Leads* or *Achieve 100% Customer Satisfaction*.
- Completion metrics measure whether the metric was completed or not. They're ideal for tracking milestones or when you don't have metrics based on hard numbers. For example, create a completion metric to *Become Salesforce Certified*.

4. Enter a name for the metric and specify additional details.

5. For Progress metrics, enter a target value.

You can update the current value manually or link it to a Salesforce report. To link a metric value to a report:

- a. In the Current Value field, click **From a Salesforce report**.
- b. Select the Report Name.
- c. Select the Summary Field.

6. Set the metric's status.

7. Click **Save**.

# Recognition Overview

Recognize and thank your coworkers by posting custom messages, badges, and rewards to their Chatter feed.

Work.com Recognition includes Thanks with unlimited custom badges and the ability to tie badges to tangible rewards such as gift cards. Managers can create reports and dashboards to view data on Recognition leaders. In addition to the required user permissions, your administrator must enable Thanks and Rewards for your organization. Depending on how your administrator configured Work.com, the Recognition tab and Badges tab may appear as top-level tabs. Additionally, the Recognition tab may appear as a subtab on your Chatter profile.

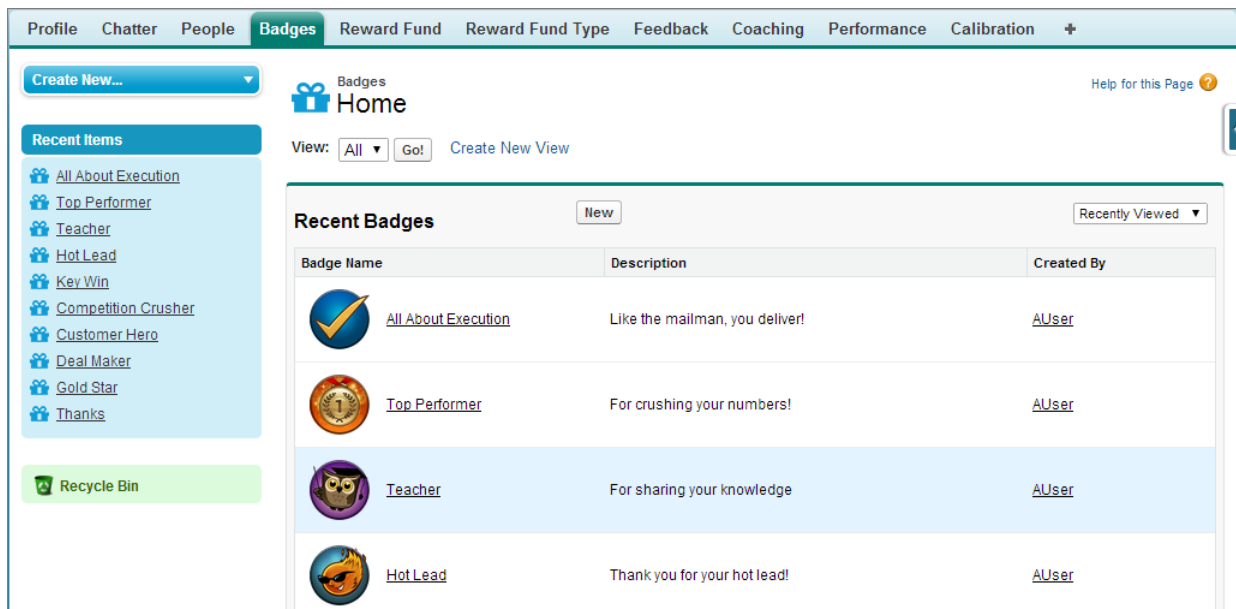

**Note:** Users can create, edit, share, and give thanks badges without a Work.com license. However, users will still need a Work.com license to use badges tied to rewards. For more information about obtaining Work.com, contact Salesforce.

## EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Rewards features require a license to **Work.com**, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition, or Developer Edition**, and is included in **Performance Edition**.

Access the library of available badges from the Badges tab. Click **New** to create a badge, or click a badge to see or edit badge details. You can only view the badges you have permission to give, and your ability to create or edit badges may be limited depending on how your feature is configured.

Give thanks badges from the Chatter publisher. Users are currently limited to giving badges to one user at a time. For more information, see [Give Thanks to Your Coworkers](#).

View the badges a user has received on the Recognition tab of their Chatter profile.

## Create a Badge

Create custom badges to uniquely recognize and thank your coworkers.

[Walk Through It: Create a Thanks Badge](#)

1. Click the Badges tab.  
If the Badges tab isn't displayed, click  to the right of your current tabs and select it from the All Tabs page.
2. Click **New**.
3. Enter a name and description for the badge, add a badge image, and optionally assign rewards and badge limits.

### Note:

- Only users with Rewards enabled can create a Rewards badge.
- Badges can't be transferred from a sandbox organization to a production organization.
- You can limit access to badge records with the Access related list, but badge images are externally available.

Badge Field	Description
Badge Name	The name of the badge.
Active	Indicates that the badge is active and available to give. This setting is enabled by default.
Reward Fund	Select a reward fund for this badge, if applicable.
Owner Name	The name of the badge owner.
Company Badge	Select to make this badge a company badge. Only users with the Chatter moderator permission can create and edit company badges. Company badges enable all users to give the badge.
Description	A description that explains the significance of the badge.
Image URL	A visual representation of the badge. Click the image field to select a picture from a directory on your computer. Badge images are stored at 128 x 128 pixels and are externally available.
Limit Number	The number of badges that are available. This can be per user or across all users. The default value is unlimited badges.
Limit Start Date	Indicates when the system begins to count the number of badges used. The default value is the date the badge is created.

### EDITIONS

Rewards features require a license to **Work.com**, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition, or Developer Edition**, and is included in **Performance Edition**.

## Reward Funds

Work.com Rewards allow you to tie tangible rewards to your badges. You can attach badges to tangible rewards from most digital gift codes globally.

Your administrator must enable Thanks and Rewards in your organization.

Work.com Rewards supports your choice of rewards programs or brands in addition to the default Amazon.com™ reward fund type. Reward information is stored in two objects, Reward Fund Type and Reward Fund. Here's a quick introduction to the differences between the two.

### Reward Fund Type

This object holds the fixed information about a reward such as the currency type, redemption information, and CSV file upload details. Examples include Amazon.com™, iTunes™, or Starbucks™.

### Reward Fund

This object holds the gifts codes and can only be tied to a single reward fund type. Each reward fund has a set value that you determine by purchasing gift codes for the specific denomination.

For example, a reward fund called Q1 US Rewards may contain codes linked to Amazon.com gift cards worth \$100 each. Another reward fund called Q1 Customer Service Rewards may contain codes linked to Amazon.com gift cards worth \$20 each. These reward funds would be related to the same reward fund type. However, a reward fund linked to Starbucks gift cards would be related to a different reward fund type.

You can create reward badges in three steps.

1. Create a reward fund type or use the default Amazon.com reward fund type.
2. Create a reward fund and upload reward codes.
3. Tie a thanks badge to a reward fund.

#### EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Rewards features require a license to **Work.com**, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition, or Developer Edition**, and is included in **Performance Edition**.

#### USER PERMISSIONS

To view Reward Funds:

- "Read" on Reward Funds

To create Reward Funds:

- "Create" on Rewards
- "Create" on Reward Funds

## Create Reward Fund Types

Use reward fund types to specify general reward information, such as currency codes, redemption information, and CSV file upload details.

1. Click the Reward Fund Type tab.  
If the Reward Fund Type tab isn't available, click  to the right of your current tabs and select it from the All Tabs page.
2. Click **New**.
3. Enter the Reward Fund Type details.

### Information

Field	Description
Reward Fund Type Name	The name of the reward fund type. Try to pick something descriptive, like Amazon.CA (Canada) or Starbucks (US).
Credit System	Select Gift Codes to tie your rewards to a cash reward. Select Points if the reward is not tied to cash. Reward Fund Types that use Points ignore the Currency Code field.
Active	Whether the reward fund type is active or not.
Owner Name	The owner of the reward fund type.
Currency Code	The type of currency.
Predefined	Read-only setting that indicates if a reward fund type is predefined, like the default Amazon.com type. You can't change the name, credit system, or currency code on predefined reward fund types. Predefined fund types are system-generated and can't be edited.

### Redemption

Field	Description
Redemption Url	The URL where the reward is redeemed. This field is optional based on the type of reward code. For reward codes that are links, do not enter a redemption URL.
Redemption Information	The instructions for redeeming the reward, including any extra steps the user may need to take to redeem the reward.
Terms and Disclaimer	Extra legal information about the reward fund type.

### Upload Configuration

Field	Description
Reward Code Column	The column in a CSV file that specifies the reward codes. The upload uses the second column by default. Enter a number to specify a different column.

### EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Rewards features require a license to **Work.com**, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition, or Developer Edition**, and is included in **Performance Edition**.

### USER PERMISSIONS

To view Reward Fund Types:

- "Read" on Reward Fund Types

To create Reward Fund Types:

- "Create" on Reward Fund Types
- "Read" and "Create" on Reward Funds
- "Read" and "Create" on Rewards

### Upload Configuration

Field	Description
Reward Value Column	The column in a CSV file that specifies the reward values. The upload uses the third column by default. Enter a number to specify a different column.

4. Click **Save**.

SEE ALSO:

- [Reward Funds](#)
- [Create Reward Funds](#)
- [Create a Badge](#)
- [Recognition Overview](#)

## Create Reward Funds

Use reward funds to hold the gift codes related to a reward fund type.

Users can build reward badges from the reward funds they created. Reward funds can include Amazon.com™ gift cards purchased from one of our third-party vendors, such as TangoCard™, or different rewards programs beyond Amazon.com.

1. Click the Reward Fund tab.  
If the Reward Fund tab isn't available, click **+** to the right of your current tabs and select it from the All Tabs page.
2. Click **New**.
3. Name your fund, select the Reward Fund Type, and enter the reward value.
4. Click **Save**.
5. Upload or enter your gift codes.
  - To upload gift codes through a CSV file, select **Upload CSV**, then select **Choose File**. Select a CSV file and click **Upload**.

By default, the upload uses the second column for reward codes and the third column for reward values. However, you can set these to different values on the related reward fund type. Here's an example of how you might format your CSV file:

	A	B	C
1	Sequence Number	Reward Code	Reward Value
2	1	1111-222222-3333	10
3	2	1111-222222-4444	10
4	3	1111-222222-5555	10
5	4	1111-222222-6666	10
6	5	1111-222222-7777	10

### EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Rewards features require a license to **Work.com**, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition, or Developer Edition**, and is included in **Performance Edition**.

### USER PERMISSIONS

- To view Reward Funds:
- "Read" on Reward Funds
- To create Reward Funds:
- "Create" on Reward Funds
  - "Create" on Rewards

 **Note:** Make sure the reward code data begins on the second row of the CSV file. The first row is seen as the header row and is not uploaded.

- To manually enter gift codes, select **New Reward**. Enter the gift code and click **Save**.

## Skills Overview

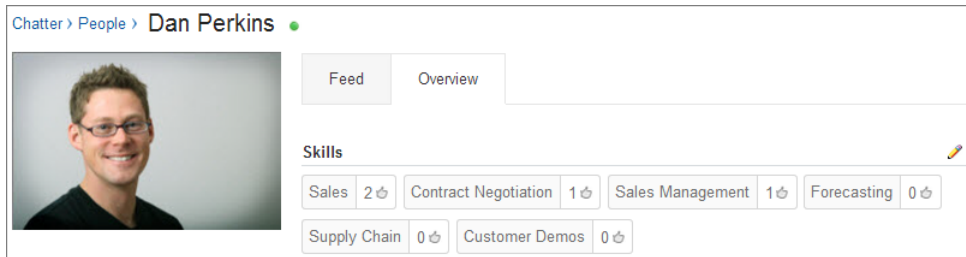

Skills allow users to share information about their professional expertise. With skills, users can discover, collaborate with, and endorse others based on their knowledge.

The Skills feature makes it easier to identify experts in different areas. Users can add or remove skills on their Chatter profile page or on record detail pages, and other users can endorse those skills. Use the global search bar to search for experts with specific skills.

### EDITIONS

Available in: **Salesforce Classic**

- Available in:
- Professional
  - Enterprise
  - Performance
  - Unlimited
  - Developer

IN THIS SECTION:

[Add a Skill Via Record Detail Pages](#)

Add skills to share your professional expertise.

[Remove a Skill Via Record Detail Pages](#)

Remove a skill if it no longer applies.

### [Endorse a Skill Via Record Detail Pages](#)

Endorse a user's skill to promote their expertise in a specific area.

[Add a Skill Via Record Detail Pages](#)

## Add a Skill Via Record Detail Pages

Add skills to share your professional expertise.

If the skill already exists, use the global search bar to find the skill, and click **Add to My Profile** on the skill record.

1. From your personal settings, enter *Advanced User Details* in the `Quick Find` box, then select **Advanced User Details**. No results? Enter *Personal Information* in the `Quick Find` box, then select **Personal Information**.
2. In the User Skills related list, click **New Skill**.
3. Enter the name of your skill and an optional description.
4. Click **Save**.  
The skill is created.
5. Click **Add To My Profile**.
6. Click **Save**.  
The skill is associated with you.

You can also add skills on Chatter profile pages.

#### SEE ALSO:

#### USER PERMISSIONS

To add skills:

- "Create" on Skills and Skill Users

## Remove a Skill Via Record Detail Pages

Remove a skill if it no longer applies.

1. From your personal settings, enter *Advanced User Details* in the *Quick Find* box, then select **Advanced User Details**. No results? Enter *Personal Information* in the *Quick Find* box, then select **Personal Information**.
2. In the User Skills section, click **Del** next to the skill you want to remove.
3. Click **OK**.

The skill is no longer associated with you, but it's not deleted. Only skill owners with the proper permissions and users with "Modify All Data" can delete skills.

You can also remove skills on Chatter profile pages.

SEE ALSO:

# Coaching Overview

With Work.com Coaching, you can privately coach or be coached by anyone in your company. You can also share coaching spaces to include additional observers and participants. Access Coaching via the Coaching tab or your profile page.

On the coaching page you can:

- View a list of your coaching spaces.  
You should create your own filters (such as My Coaches, People I Coach, and Inactive Relationships) that are suitable for your organization.
- Click **New** to create a coaching space. You can have as many coaching spaces as you want.

Click a coaching space in your list view to access the detail page.

From this page you can:

- Click **Show Feed** to see the feed related to a coaching space.  
Your administrator must enable Chatter feed tracking to display the feed.
- Access the goals, metrics, activities, notes, and attachments related to a particular coaching space.

## EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Coaching requires a **Work.com** license, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition,** or **Developer Edition,** and is included in **Performance Edition.**

## USER PERMISSIONS

To view coaching spaces:

- "Read" on Coaching

To create coaching spaces:

- "Create" on Coaching

- Set coaching spaces to inactive when they're no longer useful. This retains the record history, and the coaching space can also be reactivated anytime.
- Delete coaching spaces if you have the right access level.

## Configure Work.com Email Settings

Enable Work.com email to receive notifications related to your Work.com feedback and rewards.

1. From your personal settings, enter *work.com* in the **Quick Find** box, then select **Email Settings** under Work.com.
2. In the General section, select **Receive emails**.  
You can deselect this option at any time, if you no longer want to receive any Work.com emails.
3. In the Personal section, select which type of emails you want to receive.

Email Setting	Description
Someone gives me a reward	Select this option, if you want to receive an email when someone gives you a reward.
I am asked for a feedback, or receive feedback to a question I've asked	Select this option, if you want to receive an email when someone asks for your feedback or someone answers a question you asked.

4. Click **Save**.

### USER PERMISSIONS

To configure email settings:

- No additional permissions required

# Creating Quotes and Documenting Contracts

## Quoting Your Products and Services

### Quotes Overview

A quote is a record showing proposed prices for products and services. You create a quote from an opportunity and its products.

Each opportunity can have multiple associated quotes, and any one of them can be synced with the opportunity. When a quote and an opportunity are synced, any change to line items in the quote will sync with products on the opportunity, and vice versa.

When your quote is complete, you can generate a PDF and email it to your customer. Quote PDFs are based on templates. We offer a standard template, and you can also create your own.

 **Note:** Quote PDFs do not support right-to-left languages. The text aligns to the left side of the page instead of the right.

SEE ALSO:

- [Opportunities](#)
- [Creating Quotes](#)
- [Quotes Syncing Overview](#)

### Creating Quotes

 **Tip:** You can create a set of quotes to show different combinations of products, discounts, and quantities so customers can compare prices.

1. Click **New Quote** on the Quotes related list on an opportunity. The `Subtotal`, `Discount`, `Total Price`, and `Grand Total` fields show values from the opportunity.

 **Note:** The [price book](#), [products](#), and [list prices](#) must be active in the opportunity.

2. Enter a quote name.
3. In the `Expiration Date` field, enter the date when the quote will no longer be valid.
4. Enter taxes and shipping amounts as needed. The currency for these values comes from the opportunity.

For multicurrency organizations, the line item's currency is the same as the currency of the associated opportunity, which is inherited from the product record. If the product currency is different from the user currency, currency-related fields display both currencies: the product's currency is converted to the user's currency, and the converted amount appears in parentheses.

5. Enter a contact name or click the lookup icon () to select a contact. The quote shipping and billing addresses come from the associated account.
6. Click **Save** when you're done. When you save a quote:

#### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

#### USER PERMISSIONS

To view quotes:

- "Read" on quotes.

To create quotes:

- "Create" on quotes

#### EDITIONS

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

#### USER PERMISSIONS

To view quotes:

- "Read" on quotes.

To create quotes:

- "Create" on quotes

- A unique quote number is added.
- Any products on the opportunity are copied to the quote as line items.
- The grand total is recalculated based on any taxes or shipping information you entered.

Enterprise, Unlimited, Performance, and Developer Edition organizations can activate record types and ask you to choose a **Record Type** when creating a record. Record types determine the picklist values and business processes available when you create or edit a record.

SEE ALSO:

- [Displaying and Editing Quotes](#)
- [Create Quote PDFs](#)

## Displaying and Editing Quotes

### Displaying Quotes

From the Quotes related list on an opportunity, click the quote number to display the quote. All quotes associated with the opportunity appear in this list. If hover details are enabled, hover over any lookup field on the detail page to view key information about a record before clicking into that record's detail page.

### Editing Quotes

To update a quote, click **Edit** in any of these areas.

- On the quote detail page.
- Next to the quote in the Quotes related list of an opportunity.
- In the hover details for the quote in the Recent Items list.

Make changes as needed. Note that you can't change which opportunity is associated with the quote. Click **Save** when you're done. Use inline editing to edit fields directly on the detail page. If inline editing isn't enabled, contact your administrator.

### Related Lists

The related lists on a quote show key information related to the quote, including quote line items and the quote PDFs that have been created and emailed.

- Hover over the links at the top of a detail page to display the corresponding related list and its records. If Chatter is enabled, hover links display below the feed. An interactive overlay allows you to quickly view and manage the related list items. Click a hover link to jump to the content of the related list. If hover links are not enabled, contact your Salesforce administrator.
- To directly add new items, click **New** (or the equivalent button) at the top of a related list.
- To change the number of records shown for related lists, click **View More** below a related list, or click **fewer** or **more** at the bottom of the page.

What related lists you see are determined by several things.

- The Salesforce edition you are using
- Whether you are using Salesforce Classic or Lightning Experience
- Whether you are viewing a business account or a person account
- Your personal customization
- Page layout customizations set by your Salesforce administrator
- Your permissions to view related data

### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To change quotes:

- "Edit" on quotes  
AND  
"Read" on Quotes

## Printing Quotes

To open a printable display of the record details, in the top-right corner of the page, click **Printable View**.

SEE ALSO:

[Editing Quote Line Items](#)

[Quotes Fields](#)

## Adding Line Items to Quotes

To add line items to a quote:

1. Click **Add Line Item** in the Quote Line Items related list.
2. If no price book was selected on the opportunity, select a price book for the quote. Otherwise, the quote uses the opportunity's price book.
3. [Enter search criteria](#) in the lookup to locate a line item.
4. Select the products you want to add and click **Select**.
5. Enter the correct values in the fields. The sales price defaults to the product's list price as recorded in the price book. The sales price may be editable depending on your permissions. For multicurrency organizations, the line item's currency is the same as the currency of the associated opportunity, which is inherited from the product record. If the product currency is different from the user currency, currency-related fields display both currencies: the product's currency is converted to the user's currency, and the converted amount appears in parentheses.
6. Click **Save** to save and exit, or **Save & More** to add more line items. The line items are added to the Quote Line Items related list. The grand total in the detail section is the sum of the related line items, and the discount is the average discount for the line items.

If the product has default schedules, the schedules are not created when you add the line item. If the line item is copied from the opportunity, you can view the schedule from the opportunity. To change a schedule, edit the product record directly.

 **Note:** If this quote is synced with an opportunity, the new line item is copied to the opportunity as a product in the Products related list.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To add quote line items:

- "Edit" on quotes

AND

"Read" on products and price books

## View a Quote's Line Items Right in an Opportunity

Sync a quote with its related opportunity to show the quote's updated line items directly in the opportunity. When you sync, any changes or additions to a quote's line items are updated in the opportunity's Products related list, and vice versa. Line item page layouts are customizable.

Ask your administrator to customize the quote line item edit and detail pages you see when you select a line item on a quote.

### SEE ALSO:

[Find Object Management Settings](#)

## Editing Quote Line Items

To edit a quote line item:

1. Click **Edit** next to the line item in the Quote Line Items related list. You can also click **Edit All** to edit all line items at once.
2. Enter the correct values in the fields. The sales price defaults to the product's list price as recorded in the price book. The sales price may be editable depending on your user permissions.

For multicurrency organizations, the line item's currency is the same as the currency of the associated opportunity, which is inherited from the product record. If the product currency is different from the user currency, currency-related fields display both currencies: the product's currency is converted to the user's currency, and the converted amount appears in parentheses.

If you have a quote line item that has a discount, you can't edit the `Discount` field if the product has either a default schedule established on the product record or an individual schedule established on the opportunity product record.

3. Click **Save**. If the quote is synced with an opportunity, the opportunity product that corresponds to the quote line item is updated with your changes.

 **Note:** If an opportunity is syncing with a quote, and the quote record is locked by an approval process, you can't edit the opportunity products.

## Deleting Quote Line Items

If the quote is synced with an opportunity, deleting the quote line item also deletes the corresponding product from the opportunity's Products related list.

To delete a line item:

### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To customize page layouts:

- "Customize Application"

To view page layouts (enhanced page layout editor only):

- "View Setup"

### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To edit or delete quote line items:

- "Edit" on quotes

AND

"Read" on products and price books

- Click **Del** next to the line item in the quote's Quote Line Items related list.
- Click **Delete** on the quote line item's detail page.

## Deleting Quotes

You can delete a quote if you're an administrator, the quote owner, or a user above the quote owner in the organization role hierarchy and you have the appropriate permissions.

You can delete a quote from:

- An opportunity—Open an opportunity, and in the Quotes related list, click **Del** next to the quote.
- The quote detail page—Open the quote and click **Delete**.

When you delete a quote, all related PDFs, notes, and attachments are deleted. If the quote is synced with an opportunity, the record is removed from the opportunity's Quotes related list. The deleted quote is moved to the Recycle Bin. If you undelete a previously synced quote, it will no longer be synced with the opportunity.

## Create Quote PDFs

Use templates, either standard or your own custom design, to create quote PDFs to send to your customers.

You can generate quote PDFs to print or email to customers. You can generate a quote PDF from either the standard template, which comes built in, or a custom template you design. Quote PDFs use the language and locale of the running user.

-  **Note:** In some cases, a field may not appear on the quote templates palette or on a PDF created from a template.
- Text fields can't be used on quote templates if the default value for the field exceeds 255 characters.
  - If a user is unable to view or update a field because of field-level security settings, that field won't appear on PDFs created from a template, even if the template includes that field. Read-only fields will appear on PDFs.
  - A field that appears on a quote page layout but does not have a value for a given quote will appear on the quote templates palette, but won't appear on PDFs created from that quote.
  - Quote line item fields that don't contain data won't appear as columns in a list when a PDF is created, even if the template includes that field. For example, if no quote line items offer a discount, the `Discount` column won't appear, even if the list includes the `Discount` field.
  - If a related list is not included on a quote page layout, it won't appear on the template palette or any PDFs for quotes that use that page layout.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To view quote lists:

- "Read" on quotes

To delete quotes:

- "Delete" on quotes

### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To create quote PDFs:

- "Edit" on quotes

The PDF text has other limitations you should be aware of:

- Quote templates can't include text areas if the default value for the field exceeds 255 characters
- Text fields displayed in a related list in a quote PDF are truncated to less than 256 characters. This limitation occurs on rich text area fields, other types of text fields, standard fields, and custom fields.
- Quote PDFs do not support right-to-left languages. The text aligns to the left side of the page instead of the right.

### Creating Quote PDFs from the Standard Template

If you haven't created any custom templates or generated any PDFs, you start from the standard template.

1. On the quote detail page, click **Create PDF** to generate a preview.
2. Click **Save to Quote** to save the PDF to the Quote PDFs related list. The PDF name is the quote name plus a version number, such as *AcmeQuote\_v1*.

You can also save and email your quote directly from the preview page.

### Creating Quote PDFs by Selecting a Template

If you've already created a PDF, you can select a template from a list of those you've recently used. If you haven't created a PDF, or you want to use a template that's not listed, you can search for the one you want. The standard template is always available.

1. On the quote detail page, click the **Create PDF** drop-down list.
2. Either select your template from the Recent Templates list (if available), or click *Choose Template* and search for the one you want.

**Tip:** To bypass the list of recent templates and select a different one, click the **Create PDF** button on the quote detail page.

3. Click **Create PDF** to generate a preview.
4. Click **Save to Quote** to save the PDF to the Quote PDFs related list. The PDF name is the quote name plus a version number, such as *AcmeQuote\_v1*.

You can also save and email your quote directly from the preview page.

SEE ALSO:

[Emailing Quote PDFs](#)

## Emailing Quote PDFs

When you create a quote PDF, you can email it to your customer for approval. The quote must have a status that allows emailing.

1. Start by generating the email. You can:
  - Click **Save and Email Quote** on the PDF preview.
  - Click **Email Quote** on the quote detail page.
  - Click **Email** next to the PDF in the Quote PDFs related list.

An email task opens with the current quote PDF attached.

 **Tip:** To email a previous version, click **Email** next to that version in the Quote PDFs related list.

2. Enter the customer's email address, a subject, and body text, and then click **Send**.

SEE ALSO:

[Create Quote PDFs](#)

## Quotes Fields

This table lists the fields that make up a quote. Some of these fields may not be visible or editable depending on your page layout, field-level security settings, or Salesforce edition. (Field-level security is available in Enterprise, Unlimited, Performance, and Developer Editions only.)

 **Note:** If an opportunity product's currency is different from the user's currency in a multicurrency organization, currency fields for quotes and quote line items appear in both currencies. The product's currency is converted to the user's currency, and the converted amount appears in parentheses. Fields in quote custom reports appear in the report's currency. Currency fields include `Subtotal`, `Tax`, and `Grand Total`.

Field	Description
Account Name	Name of account the quote's opportunity is linked to. (Read only)
Additional To	Additional address field for use if needed. Not displayed on the page layout by default.
Additional To Name	Name of the person or company associated with the additional address.
Bill To	Billing address for the account associated with the quote.
Bill To Name	Name of the person or company the quote is billed to.
Contact Name	Name of the contact associated with the quote. By default, this is the primary contact on the opportunity.
Contract	Contract that's associated with the quote.
Created By	User who created the quote and creation date and time. (Read only)

### EDITIONS

Field	Description
Description	Description of the quote or notes to help you differentiate between quote versions.
Discount	Weighted average of all line item discounts on the quote. Can be any positive number up to 100. (Read only)
Email	Email address of the contact associated with the quote. If available, automatically filled in when you add a contact.
Expiration Date	Date this quote is no longer valid.
Fax	Fax number for the contact associated with the quote. If available, automatically filled in when you add a contact.
Grand Total	Total price of the quote plus shipping and taxes. (Read only)
Last Modified By	User who most recently changed the quote and modified date and time. (Read only)
Line Items	Number of line items on the quote.
Opportunity Name	Name of the opportunity associated with the quote. (Read only)
Phone	Phone number of the contact associated with the quote. If available, automatically filled in when you add a contact.
Quote Name	Name of the quote.
Quote Number	Automatically-generated number identifying the quote. (Read only)
Quote To	Address to send the quote to for approval, such as the address of a third-party agency representing a buyer. Not displayed on the page layout by default.
Quote To Name	Name of the entity (such as a person or business) the quote is sent to for approval.
Record Type	Name of the field that determines what picklist values are available for the record. The record type may be associated with a sales process. Available in Enterprise, Unlimited, Performance, and Developer Editions.
Shipping and Handling	Total shipping and handling costs for the quote.
Ship To	Shipping address for the account associated with the quote.
Ship To Name	Name of the entity (such as a person or company) the quote line items are shipped to.
Status	<p>Current status of the quote. The standard options are:</p> <ul style="list-style-type: none"> <li>• —None—</li> <li>• Draft</li> <li>• Needs Review</li> <li>• In Review</li> <li>• Approved</li> <li>• Rejected</li> <li>• Presented</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Accepted</li> <li>Denied</li> </ul> <p>Your administrator determines which status is the default for new quotes and which statuses allow you to email a quote PDF.</p>
Subtotal	Total of the quote line items before discounts, taxes, and shipping are applied. (Read only)
Syncing	Indicates whether the quote syncs with its associated opportunity. (Read only.)
Tax	Total taxes for the quote.
Total Price	Total of the quote line items after discounts and before taxes and shipping. (Read only)

## Quote Line Item Fields

This table lists the fields (in alphabetical order) that make up a quote line item.

Field	Description
Created By	User who created the line item and creation date and time. (Read only)
Date	Service, effective, or other date for the product.
Discount	Discount you apply to the line item. You can enter a number with or without the percent symbol and you can use up to two decimal places.
Last Modified By	User who most recently changed the line item and modify date and time. (Read only)
Line Description	Description of the product in the line item.
Line Item Number	Automatically system-generated number that identifies the line item. (Read only)
List Price	The price of the product within the price book including currency. (Read only)
Product	Name of the line item product as listed in the price book. (Read only)
Product Code	The internal code or product number used to identify the product.
Quantity	Number of units of this line item's product included in the quote. Value must be one or greater. If a quote is synced with an opportunity, this field is updated from the quote line item to the opportunity product. This field also appears in the Products list on the Opportunity Forecast Edit page, if you use forecasting for your opportunities ( <a href="#">depending on which forecasting version you use</a> ).
Quote Name	Name of the quote the line item is for.
Sales Price	Price you currently want to use for the product. Initially, the sale price for a product added to an opportunity or quote is the product's list price from the price book, but you can change it here. If a quote is synced with an opportunity, this field is updated from the quote line item to the opportunity product. If a quote is synced

Field	Description
	with an opportunity, this field is updated from the quote line item to the opportunity product. This field also appears in the Products list on the Opportunity Forecast Edit page, if you use forecasting for your opportunities ( <a href="#">depending on which forecasting version you use</a> ).
Schedule	Indicates whether the line item uses schedules in the opportunity. Note that default schedules are not carried over from the opportunity when opportunity products are copied to a quote.
Subtotal	Line item's sales price multiplied by the quantity.
Total Price	Line item's sales price multiplied by the quantity minus the discount.

## Quotes Syncing Overview

Quotes syncing lets you link a quote to the opportunity it was created from and synchronize all updates between the two records. An opportunity can have multiple quotes, but it can only sync with one quote at a time.

While a quote and an opportunity are synced, any addition or change to the list of products in one record syncs with the list of products in the other one. So adding or removing a line item from a quote updates the synced opportunity's Products related list, and adding or removing a product from the opportunity updates the synced quote's Quote Line Items related list. Product sorting also syncs between the two records. The quote and opportunity continue to sync each way until you stop syncing or delete one of the records.

You can sync quotes and opportunities that don't have any products. When you add a product to either record, it's automatically added to the record it's synced to.

If an opportunity and a quote are synced, the opportunity identifies the synced quote in two places:

- The `Synced Quote` field on the Opportunity detail page.
- The `Syncing` checkbox in the Quotes related list.

If you stop the sync between a quote and an opportunity, the link is broken and the records are no longer automatically updated with each other's changes.

SEE ALSO:

[Syncing Quotes and Opportunities](#)

## Syncing Quotes and Opportunities

To sync a quote with an opportunity:

1. Open the quote you want to sync and click **Start Sync**.
2. In the dialog boxes, click **Continue**, **Sync**, then **Done**.

The quote and the opportunity are now linked for syncing, which takes place any time you add or update a quote line item or opportunity product. The opportunity's `Synced Quote` field and Quotes related list identify the quote that's currently synced.

To stop sync between a quote and an opportunity, open the synced quote and click **Stop Sync**. Updates are no longer synced between the records.

To sync a different quote with an opportunity, follow the steps for syncing a quote. The previously synced quote stops syncing and the new quote starts.

## Troubleshooting Quotes Syncing

You may get error messages if you try to sync quotes under certain conditions. If so, find your error below and learn how to solve the problem.

### This quote can't be synced because it has inactive or archived products.

- If the product isn't active, edit the product and select the `Active` check box.
- If the product has been archived, delete the product if the opportunity is not closed.

### This quote can't be synced because it has an inactive or archived price book.

- If the price book is inactive, edit the price book and select the `Active` check box.
- If the price book has been archived, delete the price book if the opportunity is not closed.

### This quote can't be synced because it has inactive or archived list prices.

- If the list price isn't active, edit the list price and select the `Active` check box for the list price.
- If the list price has been archived, delete the list price if the opportunity is not closed.

### This quote can't be synced because it has an inactive currency.

Activate the currency from Setup by entering *Manage Currencies* in the `Quick Find` box, then selecting **Manage Currencies**.

### This quote can't be synced because one or more of the schedules for the opportunity products have changed since the quote was created.

Either create a new quote and sync that one, or open the product and delete the schedule, then recreate the schedule.

### This quote can't be synced because another quote that's being synced for this opportunity is locked due to a workflow approval process. Opportunities can only sync with one quote at a time.

To unlock the other quote, either finish the approval process or recall the request for approval.

### The SyncedQuote field is read only within a trigger.

Your organization may be using an Apex trigger that is attempting to modify the `SyncedQuote` field. The `SyncedQuote` field is read only and can't be modified with a trigger. Contact your system administrator to modify the trigger.

## Documenting Contracts for Your Accounts

### Contracts Overview

A contract is a written agreement between two or more parties. Many companies use contracts to define the terms for doing business with other companies.

Use Salesforce to establish and document the contracts you have with your accounts. Then, track the contract through your organization's approval process and use workflow alerts to notify yourself when to initiate contract renewals.

SEE ALSO:

[Contracts Home](#)

## Contracts Home

Click the Contracts tab to display the contracts home page.

- To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.
- In the **Recent Contracts** section, select an option from the drop-down list to display a brief list of the top contracts matching that criteria. From the list, you can select any contract to go directly to the contract detail. `Contract Name` displays in this list if you have added it to your contract page layout. Toggle the **Show 25 items** and **Show 10 items** links to change the number of items that display. The fields you see are determined by the “Contracts Tab” search layout defined by your administrator and by your field-level security settings (available in Enterprise, Unlimited, Performance, and Developer Editions only). The Recent Contracts options are:

### USER PERMISSIONS

To view the Contracts tab:

## Displaying and Editing Contracts

### Displaying Contracts

Once you have located a contract on the contracts home or list pages, click the contract number to display detailed information. From an account, click the contract number in the Contracts related list to display the contract. All contracts associated with the account are listed in the Contracts related list. If hover details are enabled, hover over any lookup field on the detail page to view key information about a record before clicking into that record's detail page.

### Viewing Contract Updates and Comments (Chatter)

Display a Chatter feed of updates, comments, and posts about the contract.

### Editing Contracts

To update a contract, click **Edit**, and then change the fields that you want to update. When you have finished, click **Save**. You can also select **Save & New** to save the current contract and create another. Users with the "Edit" permission on contracts can edit contracts until they are activated. Use inline editing to edit fields directly on the detail page. If inline editing isn't enabled, contact your administrator.

### Contract Related Lists

The lower portion of the display provides a snapshot of key information relating to the contract. The related lists you see are determined by your personal customization and by any customization your administrator has made to page layouts or your permissions to view related data. You can click on individual items to display additional detail. Click **more** at the bottom of the page or **View More** below a related list to display more items. Click **New** to directly add new items.

**Note:** Hover over the links at the top of a detail page to display the corresponding related list and its records. If Chatter is enabled, hover links display below the feed. An interactive overlay allows you to quickly view and manage the related list items. Click a hover link to jump to the content of the related list. If hover links are not enabled, contact your Salesforce administrator.

### Printing Contracts

To open a printable display of the record details, in the top-right corner of the page, click **Printable View**.

To return to the last list page you viewed, click **Back to list** at the top of the contracts detail page. If your organization has enabled collapsible page sections, use the arrow icons next to the section headings to expand or collapse each section on the detail page.

## Guidelines for Creating Contracts

Consider entering the following optional information to maximize the quality of your data.

- The start date
- How long the contract will be in effect
- The end date

 **Note:** Your administrator may have configured Salesforce to calculate `Contract End Date` based on `Contract Start Date` and `Contract Term`. If `Contract End Date` is auto-calculated, it won't display on the contract's edit page.

If your organization uses divisions, the division of a new contract is automatically set to the division of the related account.

[Cloning Contracts](#)

[Contracts Home](#)

[Contract Fields](#)

## Cloning Contracts

The **Clone** button on a contract quickly creates a new contract with the same information as the existing contract. For example, you can add multiple contracts for the same account.

Click **Clone** on an existing contract. Enter or change any information for the new contract and click **Save**.

 **Note:** If you have read-only access to a field, the value of that field is not carried over to the cloned record.

## Contract Fields

A contract has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

Field	Description
Account Name	Name of account associated with the contract.
Activated By	Name of the person that activated the contract.
Activated Date	Activation date of the contract.
Billing City	City portion of billing address. Up to 40 characters are allowed in this field.
Billing Country	Country portion of billing address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Billing State/Province	State or province portion of billing address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Billing Street	Street address used for billing. Up to 255 characters are allowed in this field.
Billing Zip/Postal Code	Zip or postal code portion of billing address. Up to 20 characters are allowed in this field.
Company Signed By	User at your organization who authorized the contract.
Company Signed Date	Date that the contract was authorized.
Contract Division	Division to which the contract belongs. This value is automatically inherited from the related account. Available only in organizations that use divisions to segment their data.
Contract End Date	Last day the contract is in effect. Your administrator can configure Salesforce to calculate <code>Contract End Date</code> based on <code>Contract Start Date</code> and <code>Contract Term</code> . If this field is auto-calculated, it will not display on the contracts edit page.
Contract Name	Title for the contract that distinguishes it from other contracts.
Contract Number	Unique number automatically assigned to the contract. Numbering for contracts starts at "100." (Read only) Administrators can modify the

### EDITIONS

Contracts are available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

<b>Field</b>	<b>Description</b>
	format and numbering for this auto-number field.
Contract Owner	User who owns the contract record.
Contract Start Date	First day that the contract is in effect.
Contract Term (months)	Number of months that the contract is in effect.
Created By	User who created the contract record.
Customer Signed By	Contact on the account that authorized the contract.
Customer Signed Date	Date the contact signed the contract.
Customer Signed Title	Title of the contact who signed the contract.
Description	Statement describing the contract.
Last Modified By	User who most recently changed the contract record.
Owner Expiration Notice	Number of days before the contract end date you want to send the notification, if the contract owner and account owner wants to be notified of an upcoming contract expiration.
Shipping City	City portion of primary mailing or shipping address. Up to 40 characters are allowed in this field.
Shipping Country	Country portion of primary mailing or shipping address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Shipping State/Province	State or province portion of primary mailing or shipping address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Shipping Street	Primary mailing or shipping street address of account. Up to 255 characters are allowed in this field.
Shipping Zip/Postal Code	Zip or postal code portion of primary mailing or shipping address. Up to 20 characters are allowed in this field.
Special Terms	Any terms that you have specifically agreed to and want to track in the contract.
Status	Indicates the stage that the contract has reached in the contract business process. Your organization can add values to this picklist within three system-defined contract status categories: <code>Draft</code> , <code>In Approval Process</code> , and <code>Activated</code> . You can use these status categories to track contracts within your business process using reports and views.

Field	Description
Custom Links	Listing of custom links for contracts set up by your administrator.

SEE ALSO:

[Displaying and Editing Contracts](#)

## Contract History

The Contract History related list of a contract detail page tracks changes to a contract. The default is to track changes for contracts with a status of either **In Approval Process** or **Activated**. To track changes for contracts with any status, see [Customizing Contract Settings](#) on page 1874.

Any time a user modifies any of the standard or custom fields whose history is set to be tracked on the contract, a new entry is added to the Contract History related list. All entries include the date, time, nature of the change, and who made the change. Modifications to the related lists on the contract are not tracked in the contract history.

You can report on activated contracts whose fields are tracked by clicking **New Report...** on the Reports tab, selecting **Contract Reports** as the Report type, and then selecting **Contract History**.

## Activating Contracts

Activating a contract changes the contract status to `Activated` and makes the contract read-only. Activated contracts cannot be edited, and only users with the “Delete Activated Contracts” permission can delete an activated contract.

To activate a contract:

1. Open the contract you want to activate.
2. Click **Activate**. The status of an activated contract is `Activated`.

- "Read" on accounts

## Managing and Tracking Your Customers' Orders

### Orders Overview

Use orders to track your customers' requests for products or services.

An *order* is an agreement between a company and a customer to provision services or deliver products with a known quantity, price, and date. Depending on your company's needs, your administrator might require orders to be added to a contract or allow them to be added directly to an account.

 **Example:** For example, an Internet service provider may require customers to commit to a year of service. That company would require contracts as a reference for every order. On the other hand, a company that sells clothing might sell products in a single transaction. That company would associate each order directly with an account.

## Guidelines for Creating Orders

Each order must be associated with an account or a contract, depending on your administrator's settings.

You can create an order directly on an account or contract, through its Orders related list, to automatically associate the order with that record. You can also create an order from the Orders tab and manually add the associated account and contract, if necessary.

If you want to create an order with the same details as another order, you can clone it. If you clone with products, you can't change the new order's currency or price book.

## Order Fields

Understand the fields in orders and reduction orders.

Orders and reduction orders have the following fields. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

Field	Description
Account Name	Name of the account associated with the order. (Read-only for reduction orders.)
Account Number	Unique number automatically assigned to the account associated with the order. (Read-only for reduction orders.)
Activated By	Name of the user who activated the order. (Read-only)
Activated Date	Date on which the order was activated.
Billing City	City portion of billing address. Up to 40 characters are allowed in this field.
Billing Country	Country portion of billing address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Billing State/Province	State or province portion of billing address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Billing Street	Street address used for billing. Up to 255 characters are allowed in this field.
Billing Zip/Postal Code	Zip or postal code portion of billing address. Up to 20 characters are allowed in this field.
Bill To Contact	Contact to whom the order is billed.
Company Authorized By	User at your organization who authorized the order.
Company Authorized Date	Date on which the order was authorized.
Contract End Date	Last day the contract is in effect. (Read-only)
Contract Name	Title for the parent contract that distinguishes it from other contracts. (Read-only)
Contract Number	Unique number automatically assigned to the contract. Numbering for contracts starts at "100". (Read-only for reduction orders)
Created By	User who created the order record. (Read-only)

### EDITIONS

Available in: Salesforce Classic

Orders are available in: **Professional, Enterprise, Unlimited, Performance,** and **Developer** Editions

Reduction orders are available in: **Enterprise, Unlimited, Performance,** and **Developer** Editions

Field	Description
Currency	The default currency for all currency amount fields in the order. (Read-only for reduction orders.)
Customer Authorized By	Contact on the order's account who authorized the order.
Customer Authorized Date	Date on which the contact authorized the order.
Description	Description of the order.
Last Modified By	User who most recently changed the order record
Opportunity	Opportunity that's associated with the order.
Order Amount	Total amount of the order.
Order End Date	Date on which the order ends.
Order Name	Title for the order that distinguishes it from other orders.
Order Number	Unique number automatically assigned to the order. Numbering for orders starts at "100." (Read-only)
Order Record Type	Record Type assigned to this order.
Order Reference Number	Reference number assigned to this order.
Order Start Date	Date on which the order becomes effective.
Order Type	Type of order. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.
Original Order	For reduction orders only. Pre-populated with the ID of the parent order when you create a reduction order by clicking <b>Reduce Order</b> .
Owner	Owner of the order. Can be either a user or a queue. Order owners have full access to their orders regardless of their account access.
PO Date	Date on which a purchase order was entered.
PO Number	Number of the purchase order.
Quote	Quote that's associated with the order.
Reduction Order	If selected, the order record represents a reduction order. Automatically selected when you create a reduction order by clicking <b>Reduce Order</b> . Read-only.
Shipping City	City portion of primary mailing or shipping address. Up to 40 characters are allowed in this field.
Shipping Country	Country portion of primary mailing or shipping address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.

Field	Description
Shipping State/Province	State or province portion of primary mailing or shipping address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Shipping Street	Primary mailing or shipping street address of account. Up to 255 characters are allowed in this field.
Shipping Zip/Postal Code	Zip or postal code portion of primary mailing or shipping address. Up to 20 characters are allowed in this field.
Ship To Contact	Contact to whom the order is shipped.
Status	<p>Indicates the stage that the order has reached in the order business process.</p> <p>Your organization can add values to this picklist within two system-defined order status categories: Draft and Activated. You can use these status categories to track orders within your business process using reports and views. Some user permissions apply specifically to draft statuses, and others apply specifically to activated statuses.</p>

## Editing and Deletion Limitations for Orders and Reduction Orders

Some fields aren't editable once an order is created. Others aren't editable once an order has been reduced.

- You can't edit the status category of an order or reduction order from *Draft* to *Activated* or vice versa. The status field is updated based on other processes.

For example, when you click **Activate**, the status category is changed from *Draft* to *Activated*. The status labels might differ, depending on your administrator's settings.

- Once an order is created, you can only change its `Account` field when the following conditions are true.
  - The order is in *Draft* status.
  - If the order has an associated contract, that contract is also associated with the new account.
- Once an order is created, you can only change its `Contract` field when the following conditions are true.
  - The order is in *Draft* status.
  - The account associated with the order is the same as the account associated with the new contract.
  - The currency associated with the order is the same as the currency associated with the new contract.
  - If the order has an associated price book, that price book is also associated with the new contract.
- Once a price book is assigned to an order, you can't change or remove the price book assignment.
- If an order has an associated reduction order, you can't edit the order's end date.
- To delete an activated order or reduction order, you must first deactivate it. To deactivate an order, you must first deactivate and delete any associated reduction orders.
- Only the order owners, account owners, contract owners, and system administrators can delete related orders.

-  **Note:** When you delete a contract, all related orders, notes, attachments, events and tasks, history, and approval requests are deleted. Associated accounts are not deleted with the contract. The deleted contract is moved to the Recycle Bin. If you undelete the contract, any related items are also restored.

Reduction orders are available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

### USER PERMISSIONS

To deactivate orders and reduction orders:

- "Edit Activated Orders"

## Order History

Track changes to an order—such as when the status is modified—on its detail page using the Order History related list.

Any time a user modifies a standard or custom field, a new entry is added to the Order History related list, regardless of the order's status. All entries include the date, time, and nature of the change, as well as who made the change. Modifications to the related lists on the order are not tracked in the order history.

## Order Products Overview

An *order product* is a product or service provided to a customer according to an associated order.

All order products in an order are associated with a price book. The Order Products related list on an order indicates in parentheses which price book the order is associated with. For example, if the Government price book is associated with your order products, the related list will be titled Order Products (Government).

A *reduction order product* is a product or service to be returned, reduced, de-provisioned, or disabled according to an associated reduction order. Each reduction order product is directly associated with an order product.

Field	Description
Available Quantity	Number of units available to be reduced. When a reduction order is activated, an order product's Available Quantity is updated to reflect the quantity of relevant reduction order products. Value must always be greater than or equal to 0. (Read-only)
Created By	User who created the order product record. (Read-only)
End Date	End date for the order product.
Last Modified By	User who most recently changed the order record
Line Description	Description for this order product record.
List Price	Default price set by the price book on the parent order. (Read-only)
Order	Parent order for this order product.
Order Product Number	Automatically generated number that identifies the order product record. (Read-only)
Original Order Product	Number that identifies the order product being reduced. Required if the order product is reducing another order product. (Read-only)
Product	Name of the product used in this order product record. (Read-only)
Product Code	Internal code or product number used to identify the product. (Read-only)
Quantity	Quantity of units of the product.
Quote Line Item	Quote line item that's associated with the order product. The quote line item's quote must match the quote that's associated with the order product's parent order.
Start Date	Start date for the order product.
Total Price	Quantity of the order product multiplied by the unit price.
Unit Price	Unit price for the order product.

## Adding Products to an Order

Keep track of what you're selling to a customer by adding products to their order records.

You can add order products to draft orders.

1. Open the order you want to add products to.
2. In the Order Products related list, click **Add Products**.
3. If there isn't already a price book selected for this order, select the price book you want to use for this order and click **Save**.

 **Note:** You can only use one price book per order.

4. Select the products you want to add to your order, and then click **Select**.
5. Enter the quantity for each order product.
6. Change the unit price, if necessary.
7. Consider adding line descriptions.
8. To select more products to add, click **Save & More**.
9. To add the selected products, click **Save**.

## Reduction Orders Overview

Use reduction orders to track requests to reduce, return, deactivate, or disable products or services for a given customer.

A *reduction order* is an agreement between a company and a customer to process product returns, de-provision services, or reduce services that have been provisioned. For example, if a customer has purchased 30 items through an order and later requests to cancel that order, you can create a reduction order to track the request.

You can create multiple reduction orders for a single order; however, you can't create a single reduction order for multiple orders. For example, if you need to reduce order products that were

### EDITIONS

Available in: Salesforce Classic

Orders are available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Reduction orders are available in: **Enterprise, Unlimited, Performance,** and **Developer** Editions

### USER PERMISSIONS

To edit an order product on a draft order or reduction order:

- "Edit" on order products

To delete an order product on a draft order or reduction order:

- "Delete" on order products

To edit order products on an activated order or reduction order:

- "Edit Activated Orders"

### EDITIONS

Available in: Salesforce Classic

Available in:

## Reducing Orders

If your company accepts returns or reductions on activated orders, you can reduce the relevant orders to reflect those exchanges of goods or services.

You can only reduce orders that have been activated.

You can apply a reduction order towards only one order. If you need to reduce order products across multiple orders, create a reduction order for each original order.

1. Go to the detail page of the order you're reducing.
2. Click **Reduce Order** to create a reduction order.
3. Enter the appropriate details for the reduction order, and click **Save**.
4. [Add products](#) to indicate which order products on the original order need to be reduced.

- "Create Reduction Orders"

## Adding Products to a Reduction Order

After creating a reduction order, indicate which products need to be reduced—as well as the quantities to reduce those products.

### Note:

- An order product is reducible only if its Available Quantity is greater than zero. You can partially reduce a product, but you can't reduce it to be less than zero.
- You can reduce up to 200 order products in one reduction order.

1. Open the reduction order you want to add products to, or [reduce an existing order](#) to create a new reduction order.
2. In the Order Products related list, click **Select Products to Reduce**.
3. In the Quantity to Reduce column, enter the number of units to reduce each order product's quantity.
  - If you want to fully reduce an order product, enter the same number in Quantity to Reduce as appears in Available Quantity.
  - If you don't want to reduce an item, leave the Quantity to Reduce blank.

For example, if the original order included 3000 coffee sleeves, and your customer only needs 2000, enter *1000* in the Quantity to Reduce column.

4. Click **Save**.

## Sharing Orders

Your administrator defines the default sharing model for your entire organization. You can change this model to extend sharing to more users than the default set by your administrator. However, you cannot change the sharing model to make it more restrictive than the default.

To view and manage sharing details, click **Sharing** on the order detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the order. The Sharing button isn't available when the organization-wide default for orders is controlled by the parent. On this page, you can take any of the following actions.

- To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
- Click **Add** to grant access to the record for other users, groups, roles, or territories.

 **Note:** To share an order with another user, that user must have "Read" permission on orders.

- Click **Expand List** to view all users that have access to the record.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level.

# Forecasting Sales

## Predicting and Planning Sales Cycles with Collaborative Forecasts

### Collaborative Forecasts Overview

Predict sales revenue and quantities from your opportunity pipeline, and incorporate product families, opportunity splits, and custom opportunity currency fields if needed.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Predict and plan the sales cycle from pipeline to closed sales, and manage sales expectations throughout the organization with Collaborative Forecasts. A forecast is an expression of expected sales revenue based on the gross rollup of a set of opportunities. The forecast amounts shown on the Forecasts tab are totals and subtotals of the opportunities in the four forecast categories—Pipeline, Best Case, Commit, and Closed. Depending on how an administrator sets up your organization, those amounts may reflect opportunities from either one or multiple forecast categories. On the Forecasts tab, users can roll over the  next to the column names to see which forecast categories roll up to the totals in each column. In the rollup table on the forecasts page, forecast amounts are organized by forecast rollup, time period, and optionally by product family. Forecasts can include adjustments made by forecast managers to their immediate subordinates' forecasts as well as adjustments made by forecast users to their own forecast amounts.

Your administrator can enable up to 4 different types of forecasts for your organization simultaneously. For example, you might want to forecast on revenue from opportunities as well as quantities by product family. You can switch between forecast types by clicking the forecast name and choosing another forecast from the pop-up menu. Each type of forecast stores its own separate quota and adjustment data.

Users can view forecast amounts and their related opportunities by forecast rollup for an individual or for everyone below them in the forecast hierarchy. For example, they can see the July Best Case forecast for all the sales managers who report to them, all the sales reps who report to any one of their managers, or just one individual. Users can also adjust their own forecasts and the forecasts of subordinates one level beneath them. The user interface makes it simple to conduct status calls with an opportunity team because users can move around it with ease.

Use the flexibility of Collaborative Forecasts to perform many tasks.

- Select and view forecasts using an interactive, expandable table.
- See forecast summary information for single months or quarters, and a multi-month or quarter range, for each forecast rollup.
- If your organization uses product families, see forecast summaries for each product family.
- If your organization uses opportunity splits, see the split percentages and the split amounts that contribute to each forecast.
- View and use the list of opportunities related to each forecast amount you select. Access opportunity details directly from this list.
- Hover and click on a column boundary and adjust the width to view data more easily.
- Make adjustments, and view adjustment details, such as the original forecast amount and who made the adjustment. If your organization has more than one type of forecast enabled, each forecast type maintains its own separate adjustments.
- If you're a forecast manager, move up and down through the forecasts hierarchy easily.
- View revenue- or quantity-based forecasts.
- View forecasts in multiple currencies.

#### EDITIONS

Available in: Salesforce Classic

Available in: **Professional** (no Opportunity Splits or Custom Field forecasts), **Enterprise, Performance, Unlimited, and Developer** Editions

- View quota information on each user's forecast page. If your organization has more than one type of forecast enabled, each forecast type maintains its own separate quota information.
- Use Collaborative Forecasts reports.
- Include the opportunities of your partner portal users in your forecasts.

## Planning Your Migration from Customizable Forecasting to Collaborative Forecasts

### USER PERMISSIONS

To view Forecast Setup:	"View Setup and Configuration"
To edit Forecast Settings:	"Customize Application"
To enable Forecasts users:	"Manage Internal Users" AND "Customize Application"
To manage quotas:	"Customize Application" AND "Manage Quotas"
To upload quota data to Salesforce:	"Manage Quotas" AND "View All Forecasts"

 **Note:** This information applies to organizations that want to migrate from [Customizable Forecasts](#) to [Collaborative Forecasts](#).

[Collaborative Forecasts](#) includes much of the same functionality as [Customizable Forecasts](#). When migrating from Customizable Forecasts to Collaborative Forecasts, keep the following in mind:

- To enable Collaborative Forecasts, Customizable Forecasts must be disabled first. Contact Salesforce for assistance with disabling Customizable Forecasts.
- When you turn off Customizable Forecasts, the Quotas related list no longer appears on User records and the Edit Personal Quota permission (API name: `PermissionsEditOwnQuota`) no longer appears in the Profile object.
- Organizations using custom fiscal years can't migrate to Collaborative Forecasts at this time.
- Organizations using Territory Management must disable Customizable Forecasting and Territory Management before migrating to Collaborative Forecasts. To disable these features, contact Salesforce.
- The forecast history, overrides, reports, and sharing data from Customizable Forecasts are purged.
- Prior to migrating to Collaborative Forecasts, consider exporting forecasting report data.
- Monthly forecasts is the default Collaborative Forecasts period, however you can change your settings to quarterly.

- The forecast hierarchy is retained. However, to reduce the chance of potential data loss, consider migrating to Collaborative Forecasts immediately after disabling Customizable Forecasts. Since the hierarchy is retained, do not enable Forecasts users again after migrating. Instead, after migration validate all hierarchies for accuracy.

Before migrating, make sure to review [What's the difference between the Forecasting versions?](#) to determine if you can benefit from the latest improvements offered in Collaborative Forecasts.

## Understanding the Elements of a Forecast

Learn about the items that contribute to and affect your forecasts.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

The Collaborative Forecasts feature is designed to help you easily find and communicate opportunity and forecast information. This table explains what a forecast is and defines the elements that comprise a forecast.

Concept	Definition
<b>Adjustment</b>	<p>A layer of detail you can add to a forecast amount.</p> <p>An adjustment shows a forecasts manager or sales rep’s judgment about the final amount they expect the forecast’s opportunities to bring in at the close of the forecast period. Forecast managers may want to adjust their own or a subordinate’s forecast. For example, if they know that some employees tend to be too optimistic or too conservative when assigning amounts to opportunities. Sales reps can also adjust their own forecasts if they think opportunity amounts are under or over stated. Forecast managers can adjust both forecasts that include only gross opportunity amounts or forecasts that already have adjustments made by someone else in their opportunity team. An adjustment doesn’t change the underlying gross rollup amount—it just adds a layer of detail. If your organization has more than one type of forecast enabled, each forecast type maintains its own separate adjustments.</p> <p>Forecast managers can adjust their own Commit and Best Case forecasts, and those of subordinates one level beneath them in the forecast hierarchy. They can view adjustments subordinates make at every level below them</p>

### EDITIONS

Concept	Definition
<b>Amount Without Adjustments</b>	in the forecast hierarchy. Adjustments made to their subordinates' forecasts roll up into their own forecasts. When you make an adjustment, you can choose to include a note to let others know why you made the adjustment. Adjustment notes do not appear in reports.
<b>Amount Without Manager Adjustments</b>	The sum of all of a person's owned revenue opportunities and also his or her subordinates' opportunities, without adjustments. Subordinates include everyone reporting up to a person in the forecast hierarchy.
<b>Corporate Currency</b>	The currency in which your organization's corporate headquarters reports revenue. Serves as the basis for all currency conversions.
<b>Forecast</b>	<p>An expression of expected sales revenue based on the gross rollup of a set of opportunities. The forecast amounts shown on the Forecasts tab are totals and subtotals of the opportunities in the four forecast categories—Pipeline, Best Case, Commit, and Closed. Depending on how an administrator sets up your organization, those amounts may reflect opportunities from either one or multiple forecast categories. On the Forecasts tab, users can roll over the  next to the column names to see which forecast categories roll up to the totals in each column.</p> <p>In the rollup table on the forecasts page, forecast amounts are organized by forecast rollup, time period, and optionally by product family. Forecasts can include adjustments made by forecast managers to their immediate subordinates' forecasts as well as adjustments made by forecast users to their own forecast amounts.</p> <p>Here, users can view forecasts and related opportunities by forecast category for everyone below them in the forecast hierarchy or just one person. For example, you can see the July Best Case forecast for all the sales managers who report to you, all the sales reps who report to any one of your managers, or just one individual.</p>
<b>Forecast Amount</b>	The revenue forecast from the forecast manager's perspective and the sum of the owner's and subordinates' opportunities, including all forecast adjustments.
<b>Forecast Category</b>	The category within the sales cycle that an opportunity is assigned to based on its opportunity stage. The standard forecast categories

Concept	Definition
Forecast Currency	are Pipeline, Best Case, Commit, Omitted, and Closed. You can customize forecast category names for your organization.
Forecast Display Currency	The currency that a user selects in which to display forecasts. The selection must be one of the currencies enabled for use in the organization and is made directly from the forecast page.
Forecast Hierarchy	A nested, expandable list of forecasts users. It determines how forecasts roll up within the organization, and who can view and adjust them. The forecast hierarchy is based entirely on the role hierarchy, but also specifies which users are forecast managers. When the Collaborative Forecasts feature is enabled for your organization, a forecast hierarchy is automatically generated based on your role hierarchy, but you may need to add or remove managers, sales reps, or other users.
Forecast Owner	A forecasts-enabled user who owns opportunities or is a forecast manager in the forecast hierarchy. Forecasts managers can have their own opportunities.
Forecast Quantity	The quantity forecast from the forecast manager's perspective and the sum of the owner's and subordinates' opportunities, including all forecast adjustments.
Forecast Range	The date range you want displayed in your forecast. Depending on the organization settings, the range can include months or quarters.
Forecast Type	<p>A forecast configured to use a specific type of data. The opportunity <code>Amount</code> field, opportunity splits, overlay splits, custom opportunity fields, or product families can be used. Each forecast type also has its own measurement, revenue or quantity. To use both, enable a separate forecast type for each. Administrators can enable up to four forecast types in an organization. Quantity forecasts can't be used with opportunity splits or custom opportunity field forecasts.</p> <p>An opportunity-quantity forecast rolls up based on the opportunity's <code>Quantity</code> field, while opportunity-revenue forecasts roll up based on the opportunity's <code>Amount</code> field. For opportunity splits-revenue forecasts, the rollup is based on the opportunity's <code>Amount</code> field and the split % assigned to the sales rep. For custom opportunity field forecasts, the rollup is based on the custom field amount. For product families-revenue forecasts, the rollup is based on the sum of the <code>Total Price</code> field for all opportunity line items in that product family, while product family-quantity forecasts roll up based on the <code>Quantity</code> field for all opportunity line items in that product family. For</p>

Concept	Definition
<b>Gross Rollup</b>	opportunities without opportunity line items or with line items that don't have a product family specified, the totals roll up into the Products Not Categorized row on the Forecasts page.
<b>Opportunity</b>	Opportunities are the sales and pending deals that you want to track.
<b>Opportunity Split</b>	<a href="#">Opportunity splits</a> let users share credit across an opportunity team. If your forecast data source is opportunity splits, you can see the split information on the forecast page.
<b>Opportunity Stage</b>	The current stage of an opportunity, such as Prospect or Proposal. Opportunity stage values correlate with forecast category values to determine how the opportunity contributes to a forecast.
<b>Owner Only Amount</b>	The sum of all of a person's revenue opportunities, without adjustments.
<b>Owner Only Quantity</b>	The sum of all of a person's quantity opportunities, without adjustments.
<b>Personal Currency</b>	A user's default currency for quotas, certain forecasting versions, and reports. This must be one of the active currencies for your organization. Your quota amounts display in your display currency.
<b>Product Family</b>	Product Families allow you to categorize your products. For example, if your company sells both hardware and software, you can create two product families: Hardware and Software.
<b>Quantity Without Adjustments</b>	The sum of a person's owned quantity opportunities and also his or her subordinates' opportunities, without adjustments. Subordinates include everyone reporting up to a person in the forecast hierarchy.
<b>Quantity Without Manager Adjustments</b>	The forecast number as seen by the forecast owner. This is the sum of the owner's quantity opportunities and his or her subordinates' opportunities, including adjustments made on the subordinates' forecasts. <i>It doesn't include adjustments made by forecast managers above the owner in the forecast hierarchy.</i>
<b>Quota</b>	The sales goal assigned to a user on a monthly or quarterly basis. A manager's quota equals the amount the manager and team are expected to generate together. The quota rollup is done manually by users and managers, and either revenue or quantity data can be used. If your organization has more than one type of forecast enabled, each forecast type maintains its own separate quota information.

Concept	Definition
<b>Revenue</b>	The total expected revenue amount from the opportunities that fit in a given category.
<b>Rollup Table</b>	The table at the top of a forecasts page. The Opportunities list at the bottom of the forecasts page corresponds dynamically with selections on the rollup table.
<b>Subordinate</b>	A Collaborative Forecasts user one or more levels beneath you in the forecast hierarchy. You can view all of your subordinates' forecasts. If your organization enables adjustments, you can view all of your subordinates' adjustment information and you can adjust the forecasts of subordinates one level beneath you in the hierarchy. Forecast amounts and adjustments roll up into the forecasts on your forecasts page.

## Understanding Monthly and Quarterly Forecasts

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Depending on your organization's Collaborative Forecasts period settings, you can forecast in either monthly or quarterly ranges. You can forecast up to 12 months or eight quarters in the future or past. In the forecasts page, the period selected by default in the rollup table is the current month or quarter if the forecast range includes the current month or quarter. If not, then the first month or quarter is selected by default in the rollup table instead. Whether your organization uses monthly

### EDITIONS

Available in: Salesforce Classic

Available in: **Professional** (no Opportunity Splits or Custom Field forecasts), **Enterprise, Performance, Unlimited, and Developer** Editions

or quarterly forecasts, forecast managers can still use quotas and make adjustments to their subordinates' forecasts. Quota and adjustment periods are based on the period settings.

SEE ALSO:

[Changing Your Forecast Date Range Display](#)

[Collaborative Forecasts Overview](#)

[Forecasts Tab Overview](#)

## Changing Your Forecast Date Range Display

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

The Collaborative Forecasts rollup table displays forecast amounts for individual months or quarters and a range of months or quarters, depending on the organization's Collaborative Forecasts settings. When your administrator sets up Collaborative Forecasts for your organization, a default forecast date range display is selected. For example, your organization's default might be three months into the future. You can use this default or can change the date range displayed for your own forecast. To change your forecast date range display:

1. Click the Forecasts tab.
2. Click **Change** in the rollup table.
3. In Forecast Range, use the drop-down lists to select a beginning and ending period.
4. Click **Save**.

 **Example:** The range you select is relative to the current month or quarter. For example, in January you might select January as your beginning month and April as the ending month. In February, the date range displayed becomes February to May, and so forth. Your date range selection remains until you choose another one.

SEE ALSO:

[Understanding Monthly and Quarterly Forecasts](#)

[Collaborative Forecasts Overview](#)

[Forecasts Tab Overview](#)

## Understanding Revenue and Quantity Forecast Measurements

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Forecasts can be calculated based on revenue or quantity. An opportunity-quantity forecast rolls up based on the opportunity's `Quantity` field, while opportunity-revenue forecasts roll up based on the opportunity's `Amount` field. For opportunity splits-revenue forecasts, the rollup is based on the opportunity's `Amount` field and the split % assigned to the sales rep. For custom opportunity field forecasts, the rollup is based on the custom field amount. For product families-revenue forecasts, the rollup is based on the sum of the `Total Price` field for all opportunity line items in that product family, while product family-quantity forecasts roll up based on the `Quantity` field for all opportunity line items in that product family. For opportunities without opportunity line items

### EDITIONS

Available in: **Professional** (No Opportunity Splits or Custom Field forecasts), **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

### USER PERMISSIONS

To use Forecasts:

- "Allow Forecasting"

### EDITIONS

Available in: Salesforce Classic

Available in: **Professional** (No Opportunity Splits or Custom Field forecasts), **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

or with line items that don't have a product family specified, the totals roll up into the Products Not Categorized row on the Forecasts page.

For example:

- A sales manager may need to forecast using revenue because the sales vice president sets quota amounts based on the US Dollar.
- A sales representative may need to forecast using quantity because of a sales incentive to sell 10,000 units of a promotional product.

If you want to forecast Revenue & Quantity for the same data source, such as Opportunities or Product Families, Your administrator can create a forecast type for each and you can toggle between them in the Forecasts tab.

You can adjust forecast amounts in each of those forecasts. However, adjustments made in the opportunity-revenue-based forecast don't display as adjustments in any other forecast type. So, if you adjust an amount in the opportunity-revenue forecast from \$100,000 to \$90,000 and then switch your forecast view, you won't see an equivalent adjustment value in the opportunity-quantity forecast. If you change the forecast view back to the opportunity-revenue-forecast, you'll again see your adjustment of \$90,000.

## Changing Between Revenue and Quantity Forecasts

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Forecasts can be calculated based on revenue or quantity. An opportunity-quantity forecast rolls up based on the opportunity's `Quantity` field, while opportunity-revenue forecasts roll up based on the opportunity's `Amount` field. For opportunity splits-revenue forecasts, the rollup is based on the opportunity's `Amount` field and the split % assigned to the sales rep. For custom opportunity field forecasts, the rollup is based on the custom field amount. For product families-revenue forecasts, the rollup is based on the sum of the `Total Price` field for all opportunity line items in that product family, while product family-quantity forecasts roll up based on the `Quantity` field for all opportunity line items in that product family. For opportunities without opportunity line items or with line items that don't have a product family specified, the totals roll up into the Products Not Categorized row on the Forecasts page.

If your organization has both kinds of forecasts enabled, you can select the type you want to use in your forecasts. To change between revenue and quantity:

1. Click  next to *Forecast Name* in *Currency Type* or Units.
2. Select `Revenue` or `Quantity (Units)`.
3. If you select Revenue and your organization has multiple currencies enabled, you can also select your display currency. Under *Currency*, click **Change currency**. A currency selection box opens for selecting a forecast display currency.

 **Note:** You can adjust forecast amounts in each of those forecasts. However, adjustments made in the opportunity-revenue-based forecast don't display as adjustments in any other forecast type. So, if you adjust an amount in the opportunity-revenue forecast from \$100,000 to \$90,000 and then switch your forecast view, you won't see an equivalent adjustment value in the

## Custom Opportunity Field Forecasts Overview

Track and predict revenue beyond the standard opportunity Amount field.

 **Note:** This information applies to Collaborative Forecasts and not to Customizable Forecasts.

You and your sales teams can forecast on custom currency fields on opportunities. For example, your sales teams might use a custom field such as Margin, Monthly Recurring Revenue, Annual Contract Value, or any other currency field that your organization requires. Your administrator can easily set up forecasts based on any of those custom fields, which sales managers can then view in the Forecasts tab like any other forecast.

If you use opportunity splits with your custom field, your forecast incorporates those splits. You can use a custom field forecast by itself or with other forecasts, such as an opportunity-revenue forecast based on the opportunity Amount field. In addition to custom currency fields, your administrator can also set up a forecast for the standard Expected Revenue field.

 **Note:** If the forecast manager or sales rep viewing the forecast does not have access to the custom opportunity field, they can see forecast amounts but they won't be able to see any of the custom field values in the opportunity list.

## Forecasting on Annual Contract Value—a Simple Custom Field Forecast

Here we see an opportunity owned by sales rep Anna Bressan. Anna's organization has a lot of multi-year deals, so they use a custom Annual Contract Value field to track the revenue received from the deal each year.

The screenshot shows the 'Opportunity Detail' page for 'Acme - Premium Support'. The page includes navigation links, a breadcrumb trail, and a table of opportunity details. Two red boxes with numbers 1 and 2 highlight specific fields: box 1 highlights the 'Opportunity Owner' field (Anna Bressan) and box 2 highlights the 'Annual Contract Value' field (USD 125,000.00).

Opportunity Detail		Edit   Delete   Clone   Sharing	
Opportunity Owner	Anna Bressan <a href="#">[Change]</a>	Close Date	4/15/2014
Opportunity Name	Acme - Premium Support	Stage	Negotiation/Review
Account Name	Acme Inc.	Probability (%)	90%
Type	Existing Business	Amount	USD 250,000.00
Primary Campaign Source			
Discount Percentage			
Commission	USD 0.00		
Region/Zone	/		
Discounted Amount	USD 250,000.00		
Annual Contract Value	USD 125,000.00		

1. Anna owns this opportunity.

2. This is the custom Annual Contract Value field.

The Annual Contract Value field in all of Anna’s opportunities rolls up into her Annual Contract Value forecast, which appears in the Forecasts tab along with any other forecasts that are set up in your organization.

1-11 of 11 | Page 1 of 1 | Chat

1. This is the Annual Contract Value forecast for Anna.
2. This forecast has the same name as the custom field.
3. The Forecasted Amount is the value of the Annual Contract Value field that rolls up into Anna’s forecast.
4. This is the Forecasted Amount from the Annual Contract Value field on Anna’s Acme – Premium Support opportunity.

**Note:** To enable a custom field forecast, your administrator also has to enable opportunity splits for the custom field. However, the opportunity owner automatically receives a 100% split for the field, so if your organization doesn’t plan to use splits with the field, the rollup is the same as if there were no splits.

### A Custom Field Forecast with Opportunity Splits

If you use opportunity splits on your custom field, your custom field forecast rolls up those splits. For example, here we can see that sales representative Anna owns an opportunity, which includes a custom split on the Annual Contract Value field for Kevin, a sales engineer responsible for increasing overall Annual Contract Value for the company. In this case, Kevin’s 25% split will roll up into his Annual Contract Value forecast.

**Opportunity Detail**

---

**Opportunity Splits**

Action	Team Member	Opportunity Split Type	Percent (%)	Amount	Note
<a href="#">Del</a>	<a href="#">Anna Bressan</a> <span style="border: 1px solid red; padding: 2px;">3</span>	Annual Contract Value	75.00	USD 93,750.00	
<a href="#">Del</a>	<a href="#">Kevin Bailey</a>	Annual Contract Value	25.00	USD 31,250.00	

1. Anna owns this opportunity.
2. The opportunity contains a custom currency field called Annual Contract Value.
3. Kevin receives a 25% split on the Annual Contract Value field.

Kevin’s manager can view the Annual Contract Value forecast where he can see the deal to which Kevin is contributing, along with all of the other opportunities his sales engineer team is working on. Kevin’s manager can see that Kevin is receiving a 25% credit for all of his opportunities, which contribute to a total of \$1,026,000 revenue in his Best Case forecast. If Kevin’s manager thinks the deal will ultimately close for a higher amount, his manager can adjust the Best Case forecast amount upward. Anna’s manager can see Anna’s 75% split in her forecast.

1. This is Kevin’s Annual Contract Value split forecast.
2. This is Kevin’s 25% split on Anna’s Acme – Premium Support opportunity.

### Forecasts from the Standard Expected Revenue Field

The standard Expected Revenue field is useful for opportunities that are likely to produce more or less revenue than indicated in the Amount field. If your organization uses the Expected Revenue field, your administrator can set up a forecast for it as well. The Expected Revenue forecast then appears in the Forecast Type menu in the same way as a custom field forecast.

### Overlay Splits Forecasts Overview

Track revenue from sales team members who help close opportunities, but are not directly responsible for them.

**Note:** This information applies to Collaborative Forecasts and not to Customizable Forecasts.

As a sales manager, you may already be using revenue splits for crediting team members who are directly responsible for opportunities. To provide more flexibility with how you assign credit for opportunities, you can use overlay splits, which help you and other team members allocate credit to overlay sales roles for working on opportunities. Overlay splits can add up to any percentage of the opportunity amount, sometimes exceeding 100%. For example, your sales team may include sales engineers, product specialists, or partners who help close deals, but are not directly responsible for them.

Overlay Forecasts let you predict revenue from overlay splits. Forecast amounts roll up through the role hierarchy based on the opportunity’s Amount field and the overlay team member’s split percentage.

Here we can see that sales representative Scott owns an opportunity, which includes an overlay split for sales engineer Owen, who’s working with Scott to close the deal. For Scott, the opportunity Amount field will roll into his opportunity revenue forecast.

## Forecasts Quotas Overview

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

A forecast quota is the sales goal assigned to a user on a monthly or quarterly basis. A manager's quota equals the amount the manager and team are expected to generate together. The quota rollup is done manually by users and managers, and either revenue or quantity data can be used. If your organization has more than one type of forecast enabled, each forecast type maintains its own separate quota information.

 **Note:** In Product Family forecasts, sales managers can't see their own quotas and quota attainment for individual product families. Only their total quota appears in the rollup table.

For example, three sales representatives might have combined quota amounts of \$75,000 and their forecasts manager might have an individual quota of \$30,000. The manager's quota in this case is \$105,000. You can only edit direct subordinates' quotas, and not your own; additionally, you must have the "Manage Quotas" permission.

If forecast quotas are enabled for your organization, quota data displays in two locations on the Forecasts tab.

- A column that contains quota amounts for a specific period. If your forecast includes product families, this column includes quotas for each product family.
- A row that contains the percentage amounts attained for a specific period in a specific forecast rollup.

If you're unsure about how to enter quota data or make updates to quotas, speak to your administrator.

 **Tip:** Hover and click on a column boundary and adjust the width to view data more easily.

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Available in: **Professional** Edition with the "API Enabled" permission

## Showing or Hiding Quota Information

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

You can show or hide quota data on your forecast page. To show quota data:

1. Click **Display Options**.
2. Select **Show quotas column** to show your quota amount for each period.
3. Select **Show Quota % Attainment** to show your quota attainment for a specific rollup in a selected period. The percentage shown below each forecast amount indicates the proportion of the user's quota that the amount represents.

The quota information displayed can be either revenue or quantity amounts, depending on the type of forecast you are using. If your organization has more than one type of forecast enabled, each forecast type maintains its own separate quota information. To hide quota information, return to **Display Options** and deselect these options.

 **Tip:** Hover and click on a column boundary and adjust the width to view data more easily.

SEE ALSO:

[Forecasts Quotas Overview](#)

[Enable Quotas in Forecasts](#)

## Forecasts Hierarchy Overview

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

The forecast hierarchy is a nested, expandable list of forecasts users. It determines how forecasts roll up within the organization, and who can view and adjust them. The forecast hierarchy is based entirely on the role hierarchy, but also specifies which users are forecast managers.

Based on your role, you can be added to or removed from the forecast hierarchy, or, your position within the hierarchy can change. For example, you might be a sales representative with no direct reports, so you can only view your own forecast. However, if your role changes and you become a sales manager, you could be added to the forecast hierarchy as a forecast manager.

Users designated as forecast managers can view the forecasts and opportunities of users, including partner portal users, below them in the forecast hierarchy. Forecast managers can also adjust the forecasts of direct reports. Only managers who made an adjustment and those above them in the hierarchy can view the adjustment.

## Finding Subordinates' Forecasts with Jump to...

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

You must be a forecasts manager and have forecasts users reporting to you in the forecasts hierarchy to see **Jump to...**

You might have several people whose forecasts you'd like to view or adjust, and you might need to traverse through several layers of the forecasts hierarchy if your organization is large. Finding forecasts is easy when you use **Jump to...** When you view a subordinate's forecast, you see the forecast just as they themselves would see it.

1. Click **Jump to...**
2. Begin typing up to 20 characters in the text box that appears.
3. Select a name to go to that person's forecast.
4. After you're on a forecasts page, you can expand rows by clicking them as you do in your own forecast. Hover over names to display the **Details >>** link. Navigation links with the names of forecast managers display at the top of the page as you drill down through the forecast hierarchy. Click on these links to move quickly back up the hierarchy.

SEE ALSO:

[Forecasts Hierarchy Overview](#)

## Forecasts Adjustments Overview

Forecast users who anticipate differences between the current forecast and actual future results can change forecast rollup amounts. Users can add adjustments to the Best Case and Commit forecast amounts, and these adjustments can be changed or removed at any time.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

To adjust forecasts, adjustments must be enabled for your organization. Your administrator can enable managers to adjust subordinates' forecasts, all forecast users to adjust their own forecasts, or both.

An adjustment shows a forecasts manager or sales rep's judgment about the final amount they expect the forecast's opportunities to bring in at the close of the forecast period. Forecast managers may want to adjust their own or a subordinate's forecast. For example, if they know that some employees tend to be too optimistic or too conservative when assigning amounts to opportunities.

Sales reps can also adjust their own forecasts if they think opportunity amounts are under or over stated. Forecast managers can adjust both forecasts that include only gross opportunity amounts or forecasts that already have adjustments made by someone else in their opportunity team. An adjustment doesn't change the underlying gross rollup amount—it just adds a layer of detail. If your organization has more than one type of forecast enabled, each forecast type maintains its own separate adjustments.

Forecast managers can adjust their own Commit and Best Case forecasts, and those of subordinates one level beneath them in the forecast hierarchy. They can view adjustments subordinates make at every level below them in the forecast hierarchy. Adjustments made to their subordinates' forecasts roll up into their own forecasts. When you make an adjustment, you can choose to include a note to let others know why you made the adjustment. Adjustment notes do not appear in reports.

For example, let's say you're a sales manager who's adjusted the forecast of one of your sales representatives down from \$2000 to \$1500.

Your vice president, who's your forecast manager, sees \$1500 when they view your forecast, along with an  icon indicating the amount contains an adjustment. However, they might decide to adjust it to \$2000 again.

A forecasts manager's own forecasts page shows all their forecast amounts and their related opportunity details. When managers view a subordinate's forecasts page, they see the totals that the subordinate would see. Any adjustments the manager makes to subordinates' amounts from their own forecast page don't appear on the subordinate's forecasts page. Instead, they see that subordinate user's forecasts and any adjustments the subordinate has made to their own amounts or those of their own subordinates. For example, let's say you're a vice president of sales. On your own forecasts page, you see a July Best Case forecast of \$1250 (including a \$50 adjustment you made) for one of your first-level subordinates, a sales manager. However, when you view the sales manager's forecasts page by using the Jump to field, the July Best Case forecast is \$1200, because it doesn't include your adjustment. If both a manager and a subordinate adjust the same forecast amount, only the manager's adjustment rolls up the forecast hierarchy.

If your organization uses more than one type of forecast, adjustments you make are specific to each forecast type. For example, if you use both opportunity revenue and opportunity quantity forecasts, you can adjust forecast amounts in each of those forecasts. However, adjustments made in the opportunity-revenue-based forecast don't display as adjustments in any other forecast type. So, if you adjust an amount in the opportunity-revenue forecast from \$100,000 to \$90,000 and then switch your forecast view, you won't see an equivalent adjustment value in the opportunity-quantity forecast. If you change the forecast view back to the opportunity-revenue-forecast, you'll again see your adjustment of \$90,000. If your organization uses product family forecasts, you can't adjust your own product family forecast amounts.

When an opportunity moves from one forecast category to another, such as from Pipeline to Best Case, the unadjusted raw amounts change for each of those rollups. However, forecast amounts with adjustments don't change in the rollup table on the Forecasts page. We recommend updating or removing your adjustments to each forecast rollup to account for changes in the stage of opportunities.

 **Note:** While you're viewing a forecasts page, your subordinates may be adjusting forecast amounts or editing related opportunities. Or you may adjust one of your subordinates' forecasts from your own page. All these events change forecast amounts. Click **Refresh** to view the most recent forecast amounts.

This table outlines who can view and adjust your forecasts.

User	Can view your forecasts?	Can adjust your forecasts?
Your manager's manager	Yes	No
Your manager	Yes	Yes. The manager adjusts amounts from their own forecasts page.
You	Yes	Yes, if enabled by your administrator. You can only adjust forecast totals, not the subtotal for My Opportunities.
Your direct report	No	No
Your non-direct report subordinate	No	No

This table defines whose forecasts you can view and adjust.

User	Can you view forecasts?	Can you adjust forecasts?
Your manager's manager	No	No
Your manager	No	No

User	Can you view forecasts?	Can you adjust forecasts?
You	Yes	Yes, if enabled by your administrator.
Your direct report	Yes. However, if you select a direct subordinate's forecast, you see the same view as that subordinate, so your adjustments are not visible.	Yes. You adjust these amounts from your own forecasts page.
Your non-direct report subordinate	Yes. You see the same view that the subordinate sees.	No. Your direct reports can adjust their own direct reports' forecasts.

If a forecast contains adjustments, you see one or more icons next to the amount. Here's what they mean.

Icon	Definition
	You adjusted the forecast amount. You see this indicator only on your own forecasts page..
	One of your subordinates adjusted the forecast. You see this indicator on both your own and your subordinates' forecasts pages.
	Both you and one or more subordinates adjusted the forecast. You see this indicator only on your own forecasts page because when you drill down to a subordinate's page, you see the page as that user sees it.
	Save your adjustment.
	Undo your adjustment and restore the previous value of the forecast. Hover over the button to see a tool tip that tells you if the previous value includes an adjustment.
	The adjustment includes a note.
<b>remove</b>	Remove your adjustment and restore the previous value, which may include someone else's adjustment.

## Adjusting Forecasts

To add an adjustment to a Best Case or Commit forecast amount, click its cell in the forecast table and enter the new amount.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

To adjust forecasts, adjustments must be enabled for your organization. Your administrator can enable managers to adjust subordinates' forecasts, all forecast users to adjust their own forecasts, or both.

An adjustment shows a forecasts manager or sales rep's judgment about the final amount they expect the forecast's opportunities to bring in at the close of the forecast period. Forecast managers may want to adjust their own or a subordinate's forecast. For example, if they know that some employees tend to be too optimistic or too conservative when assigning amounts to opportunities. Sales reps can also adjust their own forecasts if they think opportunity amounts are under or over stated. Forecast managers can adjust both forecasts that include only gross opportunity amounts or forecasts that already have adjustments made by someone else in their opportunity team. An adjustment doesn't change the underlying gross rollup amount—it just adds a layer of detail. If your organization has more than one type of forecast enabled, each forecast type maintains its own separate adjustments.

When an opportunity moves from one forecast category to another, such as from Pipeline to Best Case, the unadjusted raw amounts change for each of those rollups. However, forecast amounts with adjustments don't change in the rollup table on the Forecasts page. We recommend updating or removing your adjustments to each forecast rollup to account for changes in the stage of opportunities.

If your organization uses product family forecasts, make adjustments to a subordinate's individual product family totals, rather than to their total for all product families.

 **Tip:** To quickly find a forecast, click [Jump to...](#)

To adjust a forecast:

1. When you find a forecast you want to adjust, hover over its cell and click .
2. Enter your adjustment in the field.
3. (Optional) Add a note of up to 140 characters if you want to include information about why you made the adjustment.
4. Click . A white dot (•) appears next to the amount to show that you have adjusted the forecast, and the adjustment rolls up to the period range total rows on the page. A blue triangle (▾) appears next to the amount if you included a note with your adjustment.

 **Note:** If your organization has more than one type of forecast enabled, each forecast type maintains its own separate adjustments. For example, if your organization has both opportunity-revenue and opportunity-quantity forecasts enabled, you can adjust forecast amounts in each of those forecasts. However, adjustments made in the opportunity-revenue-based forecast don't display as adjustments in any other forecast type. So, if you adjust an amount in the opportunity-revenue forecast from \$100,000 to \$90,000 and then switch your forecast view, you won't see an equivalent adjustment value in the opportunity-quantity forecast. If you change the forecast view back to the opportunity-revenue-forecast, you'll again see your adjustment of \$90,000.

## Viewing and Editing Forecast Adjustments

You can view details about forecast adjustments that you or your subordinates have made, including who made the adjustments, the adjusted amounts, and the original gross rollup (the forecast amount before adjustments). You can also edit adjustments that you've made.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

To adjust forecasts, adjustments must be enabled for your organization. Your administrator can enable managers to adjust subordinates' forecasts, all forecast users to adjust their own forecasts, or both.

When an opportunity moves from one forecast category to another, such as from Pipeline to Best Case, the unadjusted raw amounts change for each of those rollups. However, forecast amounts with adjustments don't change in the rollup table on the Forecasts page. We recommend updating or removing your adjustments to each forecast rollup to account for changes in the stage of opportunities.

If both a manager and a subordinate adjust the same forecast amount, only the manager's adjustment rolls up the forecast hierarchy.

 **Tip:** To quickly find a forecast, click [Jump to...](#)

To edit an adjustment:

1. Expand the forecast table to find the adjusted forecast that you want to view. An indicator displays next to adjusted forecast amounts.
2. Hover over the cell to view adjustment detail information.
3. Double-click the cell or click  to edit or remove any adjustments that you made.

If your organization has more than one type of forecast enabled, each forecast type maintains its own separate adjustments. For example, if your organization has both opportunity-revenue and opportunity-quantity forecasts enabled, you can adjust forecast amounts in each of those forecasts. However, adjustments made in the opportunity-revenue-based forecast don't display as adjustments in any other forecast type. So, if you adjust an amount in the opportunity-revenue forecast from \$100,000 to \$90,000 and then switch your forecast view, you won't see an equivalent adjustment value in the opportunity-quantity forecast. If you change the forecast view back to the opportunity-revenue-forecast, you'll again see your adjustment of \$90,000.

## Understanding Adjustments Purges

Each forecast type enabled in your organization maintains its own separate adjustment data. Adjustments can be purged when you change some forecast settings.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

An adjustment shows a forecasts manager or sales rep's judgment about the final amount they expect the forecast's opportunities to bring in at the close of the forecast period. Forecast managers may want to adjust their own or a subordinate's forecast. For example, if they know that some employees tend to be too optimistic or too conservative when assigning amounts to opportunities. Sales reps can also adjust their own forecasts if they think opportunity amounts are under or over stated. Forecast managers can adjust both forecasts that include only gross opportunity amounts or forecasts that already have adjustments made by someone else in their opportunity team. An adjustment doesn't change the underlying gross rollup amount—it just adds a layer of detail. If your organization has more than one type of forecast enabled, each forecast type maintains its own separate adjustments. Adjustments can be purged from forecasts; when this occurs, the underlying data on which the forecasts were based remains untouched.

Adjustment purges happen if:

- Your administrator disables Collaborative Forecasts.
- Your administrator disables manager adjustments. Only adjustments made by forecast managers to their subordinates' forecasts are purged.
- Your administrator disables owner adjustments. Only adjustments made by forecast users to their own forecasts are purged.
- You are no longer a forecast manager. Only adjustments you made to subordinates' forecast amounts are purged.
- You are removed from a role that's set as a forecast manager in the forecast hierarchy. Only adjustments you made to subordinates' forecast amounts are purged.
- Your administrator changes your organization's forecast period setting from quarterly to monthly or monthly to quarterly.
- Your administrator disables a forecast type. Only adjustments for that forecast type are purged.
- Your administrator changes the start month of your fiscal year when the forecast period is set to quarterly. Both quotas and adjustments are purged.
- Your administrator deletes a product family. Both adjustments and quotas are purged for the deleted product family.
- Your administrator changes your organization from cumulative forecast rollups to individual forecast category rollups, or from individual to cumulative rollups.

## Viewing Opportunity Details from a Forecast

View or edit details of opportunities that roll up into each of your forecast amounts.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

From your forecasts detail page or the page of any subordinate, you can view the opportunities that make up a forecast—for a month or month range, for all your subordinates or just one. If your sales team forecasts on product families, you can also view your own or a subordinate’s opportunities for each product family. When you select a cell in the rollup table, the opportunities related to that cell appear in a list at the bottom of the page. You can sort the opportunities by column header.

- **To view opportunities in all forecast categories** for a month, a quarter, or a range of months or quarters, click its table row. All opportunities in all categories appear in the opportunities list.
- **To view opportunities in any single forecast rollup** for a month, a quarter, or a range of months or quarters, click its cell within the row. The opportunities in that rollup appear in the opportunities list.

 **Tip:** Remember that the forecast rollups are dependent on the opportunity stage. To change your forecast category without updating the opportunity stage, go to the opportunity detail page. If your administrator added the `Forecast Category` field to your opportunity page layout, you can click it to open a selection box. In the box, use the Forecast Category drop-down list to update the forecast category for the opportunity.

- **To view the opportunities of a subordinate within a single month**, click the subordinate's row within that month.
- **To view a subordinate’s opportunities for a single product family**, click  next to the subordinate’s name to display the product family rows, and then click the product family name.
- **To view the splits for an opportunity**, hover over the split percent for the opportunity and then click . The Opportunity Splits detail window appears, showing splits that roll up to the selected forecast cell in bold. Other splits on the opportunity that do not roll up to the selected forecast cell appear in gray. Opportunities that contain only a single 100% split for the opportunity owner do not display split details.

Action	Opportunity Name	Account Name	Forecasted Amount	Split
<a href="#">Edit</a>	<a href="#">Canson 55 Widget...</a>	<a href="#">Canson</a>	USD 307,500.00	<b>25.00%</b> 
<a href="#">Edit</a>	<a href="#">Red Packages - 10...</a>	<a href="#">Red Packages</a>	USD 137,500.00	25.00%
<a href="#">Edit</a>	<a href="#">Red Packages - 10...</a>	<a href="#">Red Packages</a>	USD 137,500.00	25.00%
<a href="#">Edit</a>	<a href="#">Canson - 20 Spide...</a>	<a href="#">Canson</a>	USD 43,250.00	25.00%
<a href="#">Edit</a>	<a href="#">Universal Technolo...</a>	<a href="#">Universal Technolo...</a>	USD 14,250.00	25.00%

Opportunity Splits		
<b>25.00%</b>	<b>Kevin Bailey</b>	USD 307,500.00
75.00%	Anna Bressan	USD 922,500.00
Total Opportunity Value:		<b>USD 1,230,000.00</b>

- **To sort the opportunities list**, click the header of any column. Most columns are sorted alphanumerically, but the Category column is sorted by closest to or furthest from closing.
- **To move through a list that's longer than a page**, click **Previous** and **Next** or enter a page number in the Page field.
- **To edit an opportunity** that appears in the list, click **Edit** next to its name.
- **To see any Chatter posts related to the opportunity**, click the opportunity's **Opportunity Name** link to go to its detail page. Click **Show Feed**. Click **Follow** if you want Chatter notifications about all of the opportunity's activity.
- **To adjust a column**, place your cursor over the right or left margin of a column header and adjust the width.

## Understanding Partner Portal User Opportunities in Collaborative Forecasts

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Partner portal users are external to your organization but sell your products or services through indirect sales channels. Your partner portal users use a portal to log into Salesforce. Partners can create opportunities, and users can assign opportunities to them as well. Opportunities that a partner portal user creates can roll up to the forecast of the account owner; note that the account owner must be the person's forecast manager in the forecast hierarchy for the opportunities to roll up into the forecast. For example, say Gordon Johnson:

- Owns a partner account called Acme
- Has an Acme contact named Anne Smith
- Anne is a partner portal user
- Anne reports to Gordon in the forecasts hierarchy

If Anne adds opportunities in her portal, Gordon sees those opportunities in his forecast; because Gordon is Anne's forecast manager, Gordon can adjust forecast amounts based on her opportunities and see how she's tracking against her quota. However, it's important to note that partner portal users don't have access to the Collaborative Forecasts tab or any of its functionality.

## Working with Multiple Currencies in Forecasts

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

This information assumes that your organization uses multiple currencies.

When an administrator sets up Forecasts for an organization, they choose a forecast currency and enable one or more types of forecasts. The forecast currency is either the organization's corporate currency or each forecast owner's personal currency.

When you use Collaborative Forecasts, you also select a *display currency*, which can be any currency enabled in the organization. At the top of the Forecasts page, click  next to *Forecast Name* in *Currency Type* or Units. Under Currency, click **Change currency**. A currency selection box opens for selecting a forecast display currency.

When working with currencies in Forecasts, keep the following in mind.

- If you use revenue-based forecasts, when currency rates change, opportunities and adjustments roll up with the changed value along with values in the forecast table.
- If you use quantity-based forecasts, when currency rates change, opportunities and adjustments roll up with the changed value.
- The processing indicator () displays as changed values roll up.
- All forecast periods (historical, current, and future) are impacted by rate changes.
- Deactivating a currency that is set as a user's personal currency automatically resets the user's currency to the corporate currency.

Users can edit their personal currency settings by editing their personal information.

[Understanding the Elements of a Forecast](#)

[Changing Between Revenue and Quantity Forecasts](#)

## Refreshing Forecasts

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

While you're viewing a forecasts page, your subordinates may be editing related opportunities or adjusting the forecasts of their own subordinates. Or you might be adjusting one of your subordinates' forecasts from your own page. All of these events can change forecast amounts.

When any opportunity update or forecast adjustment occurs for a forecast you've selected in a rollup table, we let you know.

- If the selected forecast has adjustments in process (your own or your subordinate's), you'll see a processing indicator () next to the forecast.
- If any of the selected forecast's related opportunities have been updated, you'll also see the processing indicator in the header of the opportunities list.
- A message, *Processing Changes*, appears in the opportunities list header.

To see the changes, you need to click **Refresh**.

For example, while Gordon Johnson is viewing his team's opportunity revenue forecast for December, his subordinate Renee Reynolds edits an opportunity she expects to close in December. The opportunity is currently in the Commit forecast category. Renee changes the opportunity amount from \$2500 to \$2600. This change affects her December forecast, increasing the amount by \$100.

### EDITIONS

Available in: Salesforce Classic

Available in: **Professional** (no Opportunity Splits or Custom Field forecasts), **Enterprise, Performance, Unlimited, and Developer** Editions

### EDITIONS

Available in: Salesforce Classic

Available in: **Professional** (no Opportunity Splits or Custom Field forecasts), **Enterprise, Performance, Unlimited, and Developer** Editions

When Gordon clicks the forecasts table cell for Renee's December commit forecast, the processing indicator appears within that cell. The indicator tells him that Renee made a change that affects the forecast. He sees the same processing indicator on the opportunities list, so he knows Renee edited an opportunity. He clicks **Refresh**. The opportunity amount changes from \$2500 to \$2600, and Renee's Commit forecast for December reflects the \$100 increase.

[Understanding Adjustments Purges](#)

## Using Forecasting Reports

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

To see if your organization has forecasts reports, go to the Reports tab and click **New Report...** Select the folder in which your administrator has placed the forecasting report types. If you don't see the fields or report type names described in the table, check with your administrator.

When using the reports, follow the best practices described here.

If you want to view	Do this
A forecast summary from a specific user's perspective.	Create a Forecasting Item report and add a filter using <b>Owner: Full Name</b> . Filter by a specific person's name.
The sum of all of a person's revenue opportunities, without adjustments.	Add <b>Owner Only Amount</b> to your Forecasting Item report. For example, if you own two opportunities, each worth \$10,000, the Owner Only Amount is \$20,000. To view the same information, but for quantity, add <b>Owner Only Quantity</b> to the report.
The sum of all of a person's owned revenue opportunities and also his or her subordinates' opportunities, without adjustments. Subordinates include everyone reporting up to a person in the forecast hierarchy.	Add <b>Amount Without Adjustments</b> to your Forecasting Item report. For example, if the sum of the amount of all opportunities owned by you is \$20,000 and the sum of the amount of your subordinates' opportunities is \$55,000, the Amount Without Adjustments is \$75,000. To view the same information, but for quantity, add <b>Quantity Without Adjustments</b> to the report.
The forecast number as seen by the forecast owner. This is the sum of the owner's revenue opportunities and his or her subordinates' opportunities, including adjustments made by the forecast owner on her or her own or subordinates' forecasts. <i>It doesn't include adjustments made by forecast managers above the owner in the forecast hierarchy.</i>	Add <b>Amount Without Manager Adjustments</b> to your Forecasting Item report. For example, say Anne has an Amount Without Adjustments of \$75,000, made up of \$20,000 of her own opportunities and \$55,000 of opportunities owned by her subordinate Ben. Additionally, she adjusted Ben's amount to \$65,000 for a total of \$85,000. If you adjust Anne's number from \$85,000 to \$100,000, then you see \$85,000 in <b>Amount Without Manager Adjustments</b>

### EDITIONS

Available in: Salesforce Classic

Available in: **Professional** (no Opportunity Splits or Custom Field forecasts), **Enterprise, Performance, Unlimited,** and **Developer** Editions

### USER PERMISSIONS

To use Forecasts:

- "Allow Forecasting"

To view the Reports tab:

- "Run Reports"

To create, edit, and delete reports:

- "Create and Customize Reports"

AND

"Report Builder"

**If you want to view****Do this**

The revenue forecast from the forecast manager's perspective and the sum of the owner's and subordinates' opportunities, including all forecast adjustments.

because this is what Anne sees (and Anne can't see your adjustments as you're her manager). To see the amount that includes *your* adjustment to \$100,000, look at **Forecast Amount**. To view the same information, but for quantity, add **Quantity Without Manager Adjustments** to the report.

Whose forecast amounts have adjustments made to them.

Add **Forecast Amount** to your Forecasting Item report. For example, say you're a forecast manager and have another forecast manager reporting to you who has an Amount Without Manager Adjustment totaling \$85,000. If you adjust the forecast to \$100,000, the Forecast Amount is \$100,000. To view the same information, but for quantity, add **Forecast Quantity** to the report.

Add **Has Adjustment** to your Forecasting Item report. For example, if you make a manager adjustment to one of your subordinate's forecast amounts, this box is checked. If your subordinate makes an adjustment to one of his or her subordinate's amounts, this box is also checked. *However, unless you have the "View All Data" permission, if your forecast manager makes an adjustment to your forecast amount, this box remains unchecked; you don't have access to your forecast manager's adjustment information.* Also add **Has Owner Adjustment**. If a forecast user makes an adjustment to their own forecast, this box is checked.

Quota detail for your forecasts.

Create a Forecasting Quotas report. For example, depending on how your administrator set up the report type, you can include fields, such as the full name of the quota owner. You can then filter by your own name to see quotas you created and their related accounts and owners.

How forecast amounts today compare with earlier forecast amounts.

[Create a Forecasts with Historical Trending report](#) and compare the value of the `Forecast Amount` field at the beginning of the month with its value at the end of the month, sorted by owner.

View only results for your direct reports.

When creating a forecasting report, choose **My Direct Reports' <item name>** from the **Show** menu.

See which type of forecast the results are from.

Refer to the Forecasting Type field in the report results. This field is included in the default page layout for Forecasting Item and Quota reports.

 **Important:** Reports contain the latest information at the time you run the report, so if you see a difference between your report amounts and the Collaborative Forecasts pane, it may be because changes were in process while the report was running.

Keep in mind that the data you see in reports depends on what you can view in Collaborative Forecasts. For example, forecast managers can view adjustments made, but a non-forecast manager running a similar report won't see the adjusted amounts in

reports. Since a forecast amount can consist of a rollup of many users' forecast amounts, examine report results closely when using summary fields.

## Forecasts Best Practices

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Consider the following best practices when using Collaborative Forecasts:

- Track important details at the opportunity level.
- Measure everything related to potential deals—activities like emails, meetings, and outreach—to determine their contributions to revenue.
- Create actionable tasks with next steps and completion dates pertaining to opportunities.
- Map your sales stages to forecast categories; adjust close probability based on historical data to increase your forecast accuracy.
- Customize your forecast category names to match your business process and terminology.
- Create dashboards for metrics of all activities related to potential sales.
- When adjusting forecasts, have conversations with your subordinates so that they understand your expectations.
- Use Chatter to share opportunity and forecast information with your team and bring attention to important details.
- Run reports to analyze trends and check performance.
- Revisit forecast adjustments weekly. Because opportunities can change frequently, this will help you avoid out-of-date adjustments.
- Be sure each sales manager with subordinates is designated as a forecast manager in your forecast hierarchy. This ensures that the forecast visibility rolls up to every level of the hierarchy.

[Forecasts FAQ](#)

## Can I adjust my own forecast?

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Your administrator can enable managers to adjust subordinates' forecasts, all forecast users to adjust their own forecasts, or both. If only *manager adjustments* are enabled, non-forecasts managers can't adjust any forecasts. In this case, Collaborative Forecasts managers can adjust forecasts of subordinates who report to them in the hierarchy and not their own forecasts.

If *owner* adjustments are enabled, all forecast users can adjust their own forecast amounts.

SEE ALSO:

[Why can't I adjust forecasts?](#)

[Adjusting Forecasts](#)

## Why can't I adjust forecasts?

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Your administrator can enable managers to adjust subordinates' forecasts, all forecast users to adjust their own forecasts, or both. If only manager adjustments are enabled, you must be a forecast manager to adjust forecasts. If you recently changed job functions, check the forecasts hierarchy to see if you're still a forecast manager. From Setup, enter *Forecasts Hierarchy* in the **Quick Find** box, then select **Forecasts Hierarchy**. If you're a forecast manager, your name appears next to a role that's assigned as a forecast manager.

SEE ALSO:

[Can I adjust my own forecast?](#)

[Forecasts Adjustments Overview](#)

## What determines whose forecasts I can adjust?

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Your administrator can enable managers to adjust subordinates' forecasts, all forecast users to adjust their own forecasts, or both.

If you are a manager and manager adjustments are enabled, the [forecasts hierarchy](#) determines whose forecasts you can see and adjust. Even if someone reports to you in the *role hierarchy*, you can't adjust that person's forecast unless he or she reports to you in the forecasts hierarchy.

If owner adjustments are enabled, all forecast users can adjust their own forecasts.

SEE ALSO:

[Can I adjust my own forecast?](#)

[Why can't I adjust forecasts?](#)

[Forecasts Adjustments Overview](#)

## Why don't I see any opportunities on my forecast page?

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Try one of the following.

- **To view opportunities in all forecast categories** for a month, a quarter, or a range of months or quarters, click its table row. All opportunities in all categories appear in the opportunities list.
- **To view opportunities in any single forecast rollup** for a month, a quarter, or a range of months or quarters, click its cell within the row. The opportunities in that rollup appear in the opportunities list.

 **Tip:** Remember that the forecast rollups are dependent on the opportunity stage. To change your forecast category without updating the opportunity stage, go to the opportunity detail page. If your administrator added the *Forecast Category*

field to your opportunity page layout, you can click it to open a selection box. In the box, use the Forecast Category drop-down list to update the forecast category for the opportunity.

- **To view the opportunities of a subordinate within a single month**, click the subordinate's row within that month.
- **To sort the opportunities list**, click the header of any column. Most columns are sorted alphanumerically, but the Category column is sorted by closest to or furthest from closing.
- **To move through a list that's longer than a page**, click **Previous** and **Next** or enter a page number in the Page field.
- **To edit an opportunity** that appears in the list, click **Edit** next to its name.
- **To see any Chatter posts related to the opportunity**, click the opportunity's **Opportunity Name** link to go to its detail page. Click **Show Feed**. Click **Follow** if you want Chatter notifications about all of the opportunity's activity.

SEE ALSO:

[Viewing Opportunity Details from a Forecast](#)

## How do I view and update the forecasts categories and opportunity stage mappings?

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

You must be an administrator to update forecasts categories and opportunity stage mappings.

1. From the management settings for opportunities, go to Fields.
2. Click **Stage**.
3. Scroll down to Opportunity Stages Picklist Values and look at the row for each stage to see what forecast category it's mapped to; click **Edit** to edit a mapping.

[Forecasts FAQ](#)

## How do I set up quotas for my sales reps?

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

If you have the correct permissions, you can set up quotas for your organization:

1. From Setup, enter *Forecasts Settings* in the **Quick Find** box, then select **Forecasts Settings**.
2. Under Quotas, select **Show Quotas**.
3. Click **Save**.

- To load quota data, use either API version 25 or later, or the Data Loader.

# Estimating Revenue and Sales with Customizable Forecasts

## Customizable Forecasting Overview

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

Customizable forecasting is a flexible solution for estimating how much revenue your organization can generate or how many items your organization can sell. You can set up customizable forecasting to reflect how your organization forecasts its sales. With it, you can forecast on a monthly or quarterly basis, use different dates when applying amounts to forecasts, forecast based on revenue or quantity or both, and define additional quotas based on product families.

Use customizable forecasts to review your forecast and drill down through your forecast amounts to see the opportunities included in your forecast. Override forecast amounts directly from the opportunity, or override the forecast from the Forecasts tab without notifying users below you in the forecast role hierarchy.

Clicking the Forecasts tab displays your forecast for the selected forecast period.

- Click **Submit** to submit a forecast, making a snapshot of the forecast data available in the forecast history and forecast reports. See [Submitting Customizable Forecasts](#).
- Click **Forecast History** to display the forecast data you submitted in the past. Then, click **Forecast Summary** to return to the current forecast data.
- Click **Printable View** to display the selected forecast in a simple, print-ready layout.
- Review your forecast and the forecasts of any direct reports or forecasts that are manually shared with you. See [Viewing Customizable Forecasts](#) for instructions on different viewing options.
- Click the Forecast subtab to see forecast details. See [Viewing Customizable Forecasts](#) for more information.
- Click the Opportunities subtab to see the opportunities that are included in the displayed forecast. On the Opportunities subtab, you can choose, or create, a list view to further filter the displayed opportunities. See [Viewing Customizable Forecasts](#) for more information.
- Click the edit icon (  ) to make changes to the adjusted forecast total, or to add an override to a particular forecast amount. For instructions on overriding forecast amounts, see [Overriding Customizable Forecasts](#).

### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To see forecasts of other users:

- "View All Forecasts"

To override your forecast:

- "Override Forecasts"

If your forecast is not available, contact your administrator about adding you to the forecast hierarchy (or the territory hierarchy, if your organization uses territory management).

 **Note:** The Forecasts tab is unlike other tabs in that it automatically calculates data for you based on your opportunity data. You do not need to create or delete forecast records.

For information on implementing customizable forecasting for your organization, see [Setting Up Customizable Forecasting](#).

#### SEE ALSO:

[Do I Have Customizable Forecasting?](#)

[Managing Customizable Forecasts](#)

## Do I Have Customizable Forecasting?

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

Customizable forecasting may be difficult to distinguish because the tab name does not change when you convert to customizable forecasting. Here's how to tell if you have it:

Click the Forecasts tab.

- If you see either the **Introducing Customizable Forecasting** or **Request Now!** buttons, you don't have customizable forecasting.
- If you don't see either button, your organization already has customizable forecasting.

To enable customizable forecasting:

1. From Setup, enter *Forecasts (Customizable)* in the **Quick Find** box, then select **Forecasts Hierarchy**.
2. Select **Enable Customizable Forecasting**.
3. Once customizable forecasting is enabled, see [Setting Up Customizable Forecasting](#).

## Setting Quotas for Customizable Forecasting

Users with the appropriate permission can set their individual quota. Administrators and users with the appropriate permission can always edit any quota, and managers can always change the quotas of users that report directly to them in the role hierarchy.

1. Do one of the following:
  - To set your personal quota, access your personal information in your personal settings.
  - To change the quota of a user that reports to you, from Setup, enter *Users* in the **Quick Find** box, then select **Users**, and click the full name of the appropriate user.
2. Click **Edit** in the Quotas related list.
3. Select the appropriate range start and range length. If available, select a territory and product family.

 **Note:** If your organization uses custom fiscal years, you cannot set quotas for a period that does not have a defined fiscal year.

4. Enter the quota amounts for revenue and/or quantity.
5. Select the appropriate currency if you work with more than one currency.
6. Click **Save** to save the quota and return to the user detail page, or click **Quick Save** to save the values and continue to edit the quota.

 **Tip:** Using **Quick Save** allows you to quickly set a different quota for each product family.

 **Note:** If these options are not available to you, you may not have customizable forecasting. To determine if your organization has enabled customizable forecasting, see [Do I Have Customizable Forecasting?](#) on page 1462. Delegated administrators won't see the quotas related list on user records.

You can also use tools like the [Data Loader](#) to do mass updates on quotas. When updating quotas, set the quota field value on the `RevenueForecast` or `QuantityForecast` objects.

SEE ALSO:

[Customizable Forecasting Overview](#)

[Managing Customizable Forecasts](#)

## Working with Forecast Categories

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

Your forecast is a representation of your opportunity amounts, dates, and stages. Click the Forecasts tab and notice that your forecast amounts are listed in different categories. Depending on its stage, an opportunity amount can be included in the following forecast categories:

- **Best Case** includes amounts you are likely to close, closed/won opportunity amounts, and amounts in the Commit category.
- **Closed** includes amounts for closed/won opportunities.
- **Commit** includes amounts you are confident about closing and closed/won opportunity amounts.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To set your quota:

- "Edit Personal Quota"

To set any user's quota:

- "Manage Internal Users"

AND

"Modify All Data"

### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

- **Omitted** means the amount does not contribute to your forecast.
- **Pipeline** includes amounts from all open opportunities.

 **Note:** You can edit the forecast category field on opportunities to change the value displayed in reports, opportunity detail and edit pages, opportunity searches, and opportunity list views. For example, you can change the value of the Commit category to Won to make the category name match your business processes.

Each value in the opportunity `Stage` picklist is automatically mapped to a `Probability` and value in the `Forecast Category` picklist. Change the `Stage` of an opportunity and the `Probability` as well as the `Forecast Category` changes with it.

For example, your organization may have mapped the “Negotiation/Review” stage to the “Best Case” forecast category. This means that the amounts of your opportunities in “Negotiation/Review” are included in your “Best Case” forecast amount. Your organization may have set up different mappings but an example of how these fields map is below:

<b>Stage</b>	<b>Probability</b>	<b>Forecast Category</b>
Prospecting	10%	Pipeline
Qualification	10%	Pipeline
Needs Analysis	20%	Pipeline
Value Proposition	50%	Pipeline
Id Decision Makers	60%	Pipeline
Perception Analysis	70%	Pipeline
Proposal/Price Quote	75%	Pipeline
Negotiation/Review	90%	Best Case
Closed Won	100%	Commit

Regardless of whether you use customizable forecasting or not, your forecasts still rely on how your opportunity `Stage` picklist values map to values in the `Forecast Category` picklist.

**SEE ALSO:**

[Customizable Forecasting Overview](#)

[Managing Customizable Forecasts](#)

## Managing Customizable Forecasts

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

Your forecasts represent your opportunity amounts, dates, and stages. To make sure your forecasts are an accurate representation of your revenue potential:

1. Review your forecast amounts. See [Viewing Customizable Forecasts](#) for instructions on different viewing options.
2. Determine if you want to override any amounts.
3. Override amounts if necessary. This requires the appropriate user permission. See [Overriding Customizable Forecasts](#) on page 1467.
4. Submit your forecast to make a snapshot of your forecast data available in your forecast history and forecast reports. See [Submitting Customizable Forecasts](#).

## Viewing Customizable Forecasts

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

When you click the Forecasts tab, review the amounts listed and determine if they are ready to be submitted.

- Initially, your name appears in the title bar and above `Find a Forecast:`, indicating that you are viewing your own forecast. Users with the appropriate permissions can click the magnifying glass icon and select another user or role to view that person's forecast. When you are viewing a forecast other than your own, the role or username will be displayed in the title bar and above `Find a Forecast:`. In addition, your access level will be displayed above `Find a Forecast:`.

 **Note:** [User Sharing](#) does not fully support Customizable Forecasting. You'll see all users in the organization regardless of the organization-wide default for the user object.

- If your organization uses manual forecast sharing, click **Sharing** to view the forecast sharing settings or to share the forecast with other users.
- If your organization uses territories, choose an option from the `Territory` picklist to summarize the forecast by that territory. See [Territory Management Overview](#).
- If your organization uses product families, choose an option from the `Product Family` picklist to summarize the forecast by that product family. Choosing `--All--` product families disables the **Submit**, and **Forecast History** options; choose another product family to use these options. See [Define Customizable Forecast Settings](#) for information on customizing your organization to use product families.
- If your organization forecasts on both revenue and quantity, select whether to include revenue, quantity, or revenue and quantity. This controls which information is displayed for each amount listed.

### EDITIONS

- Developer

### USER PERMISSIONS

To see forecasts of other users:

- "View All Forecasts"

To override your forecast:

- "Override Forecasts"

- Select a date range under **Range Start** to view another forecast period. Forecast details for opportunities that closed more than two years before you implemented Customizable Forecasting or more than 10 years in the future are not available.
  - 📌 **Note:** Organizations that implemented Customizable Forecasting prior to the Salesforce Winter '07 release can see forecasts outside of this range.
- Select a **Range Length** to view fewer or more forecast periods.
  - 📌 **Note:** If you are using custom fiscal years, periods before the first defined custom fiscal year or after the last defined fiscal year use calendar months or calendar quarters (depending on your forecast setting) for the range start and period length.
- Select an option next to **Display Units** to view forecast totals using a different unit of measurement. To display what portion each total is of your quota, choose **% Quota**.

## Viewing Forecast History

When viewing a forecast from the Forecasts tab, click **Forecast History** to view snapshots of your forecast data taken when you submit it. You can also view the submitted forecasts of subordinate users. Click **Forecast Summary** to return to the previous view.

## Viewing Forecast Amount Details

Select the Forecasts subtab to see forecast details. Click any forecast amount to view details of the opportunity amounts included in that forecast amount. From the details page, click any item listed to view it. Click **Edit** to override that item. See [Overriding Customizable Forecasts](#) for instructions on overriding forecast amounts from the opportunity.

If you have direct reports (users that report directly to you), their forecasts display below yours. The **Choose a view** option allows you to change the way forecast information is displayed for your direct reports. Use this option to group forecast data by subordinate or forecast period.

- **View by Period** displays a list of direct reports and their forecasts for each forecast period. Click any name to view the forecast for that user.
- **View by Direct Report** displays a list of forecast totals for each direct report. Click **View** next to any subordinate name to view the forecast for that user.
- Clicking any amount displays the opportunities and forecast overrides included in that amount.

## Viewing Opportunities

Select the Opportunities subtab to see the opportunities that are included in the displayed forecast. On the Opportunities subtab, you can choose, or create, a list view to further filter the displayed opportunities. Click any opportunity to see the opportunity details. To override the opportunity, click **Edit**. For more information on overriding opportunities, see [Overriding Customizable Forecasts](#).

If you have the "View All Forecasts" permission, you can see opportunities on the Opportunities subtab regardless of their sharing settings.

- 📌 **Note:** When a [partner portal is transferred to another account](#), the opportunities on each account are automatically recalculated through your organization's forecast hierarchy.

[Customizable Forecasting Overview](#)  
[Managing Customizable Forecasts](#)

## Overriding Customizable Forecasts

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

You can make your forecast a more accurate assessment of your forecasted sales by overriding forecast amounts as needed. Any user can override a forecast from the opportunity by changing the `Stage` or `Forecast Category` of the opportunity. Users with the “Override Forecasts” permission can override their forecast or any direct report’s forecast at the forecast level.

When an opportunity moves from one forecast category to another, such as from Best Case to Commit, the unadjusted raw amounts change for each of those categories, but any amounts with overrides do not change. You should update or remove your overrides to each forecast category to account for changes in the stage of opportunities.

### Overriding Your Forecast from the Opportunity

1. Click the Opportunities subtab on the Forecasts page.
2. Click **Edit** for the opportunity you want to override.
3. Make any changes to the details. The options available differ depending on whether you own the opportunity.
4. If products are on the opportunity and you want to change the forecast category for that product, select **Change Category**, then select the appropriate `Product Forecast Category`.
5. Click **Save**. The opportunity is marked with the appropriate icon indicating its override status. For a description of each override icon, see [Forecast Override Indicators](#).

Click **Save & Refresh** to update the record and redisplay the totals.

### Overriding Your Forecast Total

1. Click the Forecasts subtab on the Forecasts page.
2. Click the edit icon (  ) to override the adjusted total.
3. Enter a new amount and any comment.
4. Click **Save**. The forecast is marked with the appropriate icon indicating its override status. For a description of each override icon, see [Forecast Override Indicators](#).

### Overriding the Forecast of Your Direct Reports

1. Click the Forecasts subtab on the Forecasts page.
2. Click the edit icon (  ) to override your direct report’s forecast.
3. Choose one of the override options to control which override amounts, if any, are included in the forecast:
  - **Accept John Doe’s forecast**—Use this option to accept the forecast of your direct report, including any overrides that he or she has made.
  - **Reject any override on John Doe’s forecast, but accept forecast overrides from other subordinates**—Use this option to ignore overrides made on your direct report’s forecast, but include any overrides made on forecasts further down in the hierarchy.

#### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

#### USER PERMISSIONS

To see forecasts of other users:

- “View All Forecasts”

To override your forecast:

- “Override Forecasts”

- **Reject all forecast overrides**—Use this option to ignore all forecast-level overrides but include opportunity-level overrides. If you have overridden amounts at the opportunity, your own opportunity forecasts are used in this calculation. Choose this option if you want forecast amounts to be based on opportunity amounts including overrides made at the opportunity level.
  - **Override the forecast and set it to**—Use this option to enter an amount that replaces the current amount in your forecast. Your manager will see this amount in your forecast but your subordinates will not.
4. If you forecast on both revenue and quantity, choose an override option for quantity forecast.
  5. Click **Save**. The forecast is marked with the appropriate icon indicating its override status. For a description of each override icon, see [Forecast Override Indicators](#).
-  **Note:** The Forecasts tab is unlike other tabs in that it automatically calculates data for you based on your opportunity data. You do not need to create or delete forecast records.

## SEE ALSO:

[Customizable Forecasting Overview](#)[Managing Customizable Forecasts](#)

## Forecast Override Indicators

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

An icon displays for each override to indicate the status of the override. Use the following table to determine the status of an override.

Icon	Override Status
	The opportunity has been updated since an override.
	A subordinate has overridden the forecast.
	A person that reports directly to you has overridden the forecast.
	You have overridden the forecast.
	The forecast data is not up-to-date. Refresh your browser in a few minutes.

## Customizable Forecast Fields

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

Here is a description of the fields (in alphabetical order) that make up a forecast in customizable forecasting:

### Forecast Fields

Field	Description
Comments	The comments you enter when overriding your forecast.
Forecast Category	Category determined by the opportunity <code>Stage</code> value. Options are: <ul style="list-style-type: none"> <li>• <b>Omitted</b> means the amount does not contribute to your forecast.</li> <li>• <b>Pipeline</b> includes amounts from all open opportunities.</li> <li>• <b>Best Case</b> includes amounts you are likely to close, closed/won opportunity amounts, and amounts in the Commit category.</li> <li>• <b>Commit</b> includes amounts you are confident about closing and closed/won opportunity amounts.</li> <li>• <b>Closed</b> includes amounts for closed/won opportunities.</li> </ul>
Forecast Item	Record that contributes to the forecast. This displays in the detail of a forecast amount.
Revenue	The total expected revenue amount from the opportunities that fit in a given category.
Quantity	The total number of units that are forecasted to sell as part of the opportunities in a given category.
My Forecast Override	The amount you enter when overriding a forecast amount.
Submitted By	The user who submitted a forecast.
Type	Type of override. Options are "Opportunity" or "Forecast Override."

## Opportunity Forecast Fields

Opportunity Forecast Field	Description
My Forecast Amount	The amount you enter when overriding your direct report's opportunity amount.
My Forecast Category	The category selected when you override the category of an opportunity.
My Forecast Comments	The comments you enter when overriding one of your opportunities or the opportunity of a direct report.
My Forecast Period	The period you selected when overriding a direct report's opportunity period.

SEE ALSO:

[Managing Customizable Forecasts](#)

## Manually Sharing a Forecast

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

Your administrator defines your organization's forecasting hierarchy, which determines which users can view the forecast data. However, your administrator can manually extend sharing privileges for forecast data, and you may be able to manually extend sharing privileges for your own forecast data as well. Manual forecast sharing can only increase access to forecast data; it cannot restrict access for users who already have access. To manually share a forecast, you must be an administrator or a forecast manager who has been given access to share your forecast data.

To see which users can view your forecast or to share your forecast data, do one of the following:

- From Setup, enter *Forecasts Hierarchy* in the Quick Find box, then select **Forecasts Hierarchy**, then click **Share** next to the view you want to share.
- Click **Sharing** on the forecast home page to share your own forecast data.

The User and Group Sharing list shows you all the users who currently have access to this forecast data. It also details the level of access they have, whether they can submit a forecast, and the reason they have that access. The reasons a user might have access to forecast data are:

Reason	Description
Administrator	The user is an administrator, or has the "Modify All Data" permission.
Delegated Forecast Manager	A user has access to forecast data that was granted via the <b>Sharing</b> button on the forecast.
Forecast Manager	A user has access due to being a forecast manager in the forecast hierarchy.
Owner	The owner can always see his or her own forecast data.
View All Forecasts Permission	The user has the "View All Forecasts" permission.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

On the Forecast Sharing Detail page, you can do any of the following:

- To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
- Click **Add** to grant other users or groups access to the forecast data.
  -  **Note:** Manual sharing extends to the opportunity data that makes up the forecast. If a user has permission to override forecast data, then the user also has permission to override the opportunity forecast data.
- Click **Expand List** to [view all users that have access](#) to the forecast data.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level.

SEE ALSO:

[Define Customizable Forecast Settings](#)

[Setting Up Customizable Forecasting](#)

## Submitting Customizable Forecasts

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

On the Forecasts tab, your forecast totals are always available to you and users above you in your role hierarchy. However, forecast totals are only available in forecast history and reports after you submit them. You can submit your own forecast or any forecast data that has been manually shared with you and you have permission to submit.

To submit your forecast:

1. Click **Submit** from your forecast on the Forecasts tab.
2. Click **OK** to confirm. Salesforce takes a snapshot of your forecast totals and makes them available in reports and your forecast history.

## Sharing Salesforce Information with Business Partners

### Salesforce to Salesforce Overview

Salesforce to Salesforce enables business collaboration both within and across Salesforce organizations. This allows you to share [certain records](#) with your business partners that use Salesforce and get real-time updates on the shared data. For example, you can share lead and opportunity data with business partners and manage your entire pipeline and programs within Salesforce.

Salesforce to Salesforce allows you and your business partners to collaborate more easily and effectively. With Salesforce to Salesforce, you can share records with one or more connections, and each connection can accept records you share with them - even if other connections have accepted the same record.

Salesforce to Salesforce allows your business partners to:

- Access all their programs from one place
- Easily integrate your data with the data they manage in Salesforce
- Integrate their business processes with updates received from you

Salesforce to Salesforce allows you to:

- Have 100% visibility into your partner activity
- Manage your entire pipeline, both internal sales and channel sales, in one place
- Rapidly and easily share data across multitiered partnerships
- Integrate your business processes with updates received from your partners using workflow and assignment rules

If you want to connect to partners but aren't sure if they use Salesforce, you can use [connection finder](#) to find out.

If you receive an invitation to connect with a business partner using Salesforce to Salesforce, see [Accepting or Rejecting an Invitation to Join Salesforce to Salesforce](#) on page 1474.

To invite other companies to connect with you using Salesforce to Salesforce, see [Inviting Business Partners to Connect using Salesforce to Salesforce](#).

 **Note:** Salesforce to Salesforce doesn't just let you share information with business partners; it's also part of a high-availability solution called Organization Sync. For information about Organization Sync, see [Organization Sync](#).

## Inviting Business Partners to Connect using Salesforce to Salesforce

Before you can start sharing data with your business partners, you need to set up a connection to them using Salesforce to Salesforce. To create that connection, you need to invite your business partner.

 **Note:** Before beginning the invitation process, you need to create an account and an associated contact for your business partner.

To invite a business partner to connect using Salesforce to Salesforce:

1. Click the Connections tab.
2. Click **New**.
3. Enter a contact name or use the lookup icon to select a contact.
  -  **Important:** Make sure that the email address is valid; otherwise, your invitation may be sent to the wrong person.
4. Optionally, select a related account.
  -  **Note:** The account associated with the connection can be changed after the invitation is sent.
5. Choose a user to manage the connection.
6. Optionally, choose a template to apply to the connection.
7. Click **Save & Send Invite**.

To invite multiple business partners to connect using Salesforce to Salesforce:

1. Click the Contacts tab.
2. Select a standard or custom list view, then click **Go!**.
3. In the list view, select the checkboxes next to the contacts you want to invite.
  -  **Important:** Make sure that the email addresses are valid; otherwise, your invitations may be sent to the wrong people.
4. Click **Invite to Connect**.
5. Choose a user to manage the connection.
6. Optionally, choose a template to apply to the connection.
7. Click **Save & Send Invite**.

The people you invite will receive an email invitation to connect with you using Salesforce to Salesforce. They can choose to accept or decline your invitation. You can check whether they have accepted or declined the invitation by reviewing your connections on the Connections tab. From the Connections tab, you can also resend or cancel the invitation. To learn more about connections, see [Connections Home Page](#) on page 1475.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To invite to a business partner to connect using Salesforce to Salesforce:

- "Manage Connections"

 **Note:** For information about sending an Organization Sync replication connection invitation in Salesforce to Salesforce, see [Connect the Organizations](#).

SEE ALSO:

- [Finding Out if Your Partners Use Salesforce](#)
- [Connection Templates in Salesforce to Salesforce](#)
- [Creating and Applying Connection Templates](#)

## Accepting or Rejecting an Invitation to Join Salesforce to Salesforce

If a business partner sent you an invitation to connect using Salesforce to Salesforce, you can accept or reject that invitation by following these steps:

1. Click the link in the invitation email to go to the Salesforce login page.
2. Log in as the System Administrator or as a user with the “Manage Connections” permission.
3. Review the details of the invitation.
4. Click **Accept** or **Decline**.

If you aren't sure whether you want to accept or decline, click **Decide Later**. The invitation displays on the Connections tab with a connection status of Invitation Received. You can easily accept or decline it at a later date.

When you accept or reject an invitation, the company that invited you receives an email notifying them of your decision. The content of that email can be configured by changing the appropriate email template.

### USER PERMISSIONS

To accept or reject an invitation to connect using Salesforce to Salesforce:

- “Manage Connections”

## Connections Home Page

The Connections tab allows you to manage your Salesforce to Salesforce connections and connection templates. From the Connections tab, you can:

- Select the Connections subtab to manage connections. Connections include everyone that you have invited, whether they have accepted, declined, or have not yet responded, as well as all the invitations you have received. Recent connections are automatically displayed on the Connections subtab.
  - To view details about a connection, click the connection name.
  - To invite new connections, click **New**, then enter the connection details and click **Save & Send Invite**.
  - To deactivate a connection, click **Deactivate**.
  - For invitations to connect that have been sent but not accepted, you can click **Resend** to resend the invitation, or **Cancel Invitation** to cancel the invitation. For more information about inviting connections, see [Inviting Business Partners to Connect using Salesforce to Salesforce](#) on page 1473.
- Select the Templates subtab to manage connection templates. Templates allow you to define and publish sets of objects and fields to one or more standard Salesforce to Salesforce connections. Recent templates are automatically displayed on the Templates subtab.
  - To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
  - To view details about a template, click the template name.
  - To create a new template, click **New**.
  - To edit a template, click **Edit** next to the template you want to edit. For more information about using templates, see [Creating and Applying Connection Templates](#) on page 1478.

 **Note:** To learn about Organization Sync, a high-availability feature built on the framework of Salesforce to Salesforce, see [Organization Sync](#).

### USER PERMISSIONS

To view and manage connections for Salesforce to Salesforce:

- "Manage Connections"

To view and manage templates for Salesforce to Salesforce:

- "Manage Connections"

## Managing Connections

From the Connections tab, you can view connection details and manage connections. The connection details include information on the status of the connection, the owner of the connection, information about the company, published and subscribed fields, and a connection history.

To view a connection:

1. Click the Connections tab.
2. On the Connections subtab, click the name of the connection that you want to view.

From the connection detail page, you can:

### Accept an Invitation

If a business partner has sent you an invitation to connect using Salesforce to Salesforce, click **Accept** to accept the invitation. After you accept the invitation, you can subscribe to objects that the connection has published and begin sharing objects with the connection using the Published Objects and Subscribed Objects related lists on a connection detail page.

### Cancel an Invitation

If an invitation you sent hasn't been accepted, you can cancel the invitation by clicking **Cancel Invitation**. If your partner hasn't received the invitation, click **Resend** to send it again.

### Deactivate Connections

If you have created a connection with a business partner and you no longer wish to use the connection, click **Deactivate**. If a connection is deactivated, you can still view and update records that your connection shared with you, but updates you make won't be sent to your connection. If you sent records to your connection that they didn't accept, the records are removed from their organization, and vice versa.

### Edit Connections

When displaying the connection, you can modify the connection by editing the connection details. To change the objects published to a connection, click **Publish/Unpublish**, or to use a connection template, click **Edit** and select an active template. To edit the published fields on an object, click **Edit** next to the object. To change the objects you're subscribed to, click **Subscribe/Unsubscribe**. For more information, see the following:

- [Publishing Objects in Salesforce to Salesforce](#) on page 1487
- [Subscribing to Objects in Salesforce to Salesforce](#) on page 1480
- [Publishing Fields in Salesforce to Salesforce](#) on page 1488
- [Subscribe to Fields in Salesforce to Salesforce](#) on page 1481

### View Connection History

You can view a detailed history of the connection in the Connection History related list of the connection detail page. To export the connection history, select **Download connection history (csv)**. This lets you download a comma-separated values file that includes the following information:

- Connection status changes
- Changes to which account is associated with the connection
- Changes to which contact is associated with the connection
- Connection owner changes
- Changes to published fields
- Email communications sent to your business partners
- Errors related to validation rules and Apex triggers with validation rules resulting from:
  - Records manually accepted

#### EDITIONS

Available in: Salesforce Classic

[Connection Templates in Salesforce to Salesforce](#)

## Connection Templates in Salesforce to Salesforce

Connection templates allow you to define objects and fields that can be published to connections. Connection templates can be assigned to one or more standard Salesforce to Salesforce connections, making the process of publishing fast and easy. From the Connections tab, click the Templates subtab to view, create, and edit connection templates.

When a connection template is applied to a connection, the object and field rules are applied to that connection.

The following rules apply to connection templates:

- Objects and fields that are not already published but are published in the connection template are published.
- Objects and fields that have the same publish or unpublish status as the template are unchanged.
- Objects and fields that are already published but are not published in the connection template are unpublished.

## Creating and Applying Connection Templates

### Creating and Editing Connection Templates

Connection templates allow you to define object and field publishing rules that can be applied to one or more standard Salesforce to Salesforce connections.

To create a connection template:

1. Select the Connections tab.
2. Select the Templates subtab.
3. Click **New**.
4. Type a name and an optional description.
5. Select the **Active** checkbox if you want to be able to assign the template to standard connections.
6. Click **Save** to save the template, or click **Save & Add Objects** to add objects to the template.
7. If you clicked **Save & Add Objects**, select the checkboxes next to the objects you want to add, then click **Save**.

 **Note:** If you clicked **Save**, you can click **Add/Remove Objects** on the template detail page to add objects.

8. Click **Edit** next to an object you added to the Published Objects related list.
9. Select the fields you want to publish for the object, then click **Save**.
10. Repeat steps 8 and 9 for each object you added to the Published Objects related list.

To deactivate a connection template:

1. On the Templates subtab, click **Edit** next to the template you want to deactivate. Alternatively, click **Edit** on the template detail page.
2. Deselect the **Active** checkbox.
3. Click **Save**.

 **Note:** Only active connection templates can be assigned to connections. If you want to use a template that you had deactivated, you can do so by selecting the **Active** checkbox.

### Assigning Connection Templates to Connections

You can assign connection templates to connections when [inviting one or more new connections](#), or you can assign connection templates to existing connections.

To assign a connection template to an existing connection:

1. Select the Connections tab.
2. Select the Connections subtab.
3. Click the name of the connection you want to assign the template to.
4. Click **Edit**.
5. In the `Template` field, type the name of the template or click the lookup icon to search for a template.

## Sharing Records Using Salesforce to Salesforce

Once you have created a connection to another organization, you can share data with them. Your business partners do not have direct access to your record; they have a record in their organization that is connected, using Salesforce to Salesforce, to your record. Any updates to the shared information on either record is reflected on the other record. You can share records with one or more connections. Each connection has the opportunity to accept shared records, even if other connections have also accepted the same record.

 **Note:** Making records available to business partners using Salesforce to Salesforce is not the same as sharing records within your organization.

You can control the type of records you share with your business partners by selecting which objects and fields to publish.

In addition, you can control how the information your business partner makes available to you is used in your organization by subscribing to objects and mapping the fields on those objects to fields on your own objects.

Individual records and their related records are made available to your connections by forwarding the record to one or more connections, or by assigning the record to a queue that contains connections. When you forward a record to a connection, you can select which related records to include, and you can send your connection contact an email notification that a record has been made available.

Similarly, your business partners can make records available to you. When a record has been made available to you by a business partner, you can view basic details about the record from a view on the object's home page. Then you choose whether to [accept the record](#), and its related records, or not. Additionally, when [subscribing to an object](#), you can specify that the object's records are automatically accepted when shared by your connection. This is particularly helpful if you're expecting the connection to share a large volume of records.

Once you have accepted a record, you can make it available to other connections in the same way you can make any record available using Salesforce to Salesforce. This allows you to work in a multi-tiered business network. In a multi-tiered network, changes made to the shared record in any organization updates the information in all the organizations that are sharing the record.

## Subscribing to Objects in Salesforce to Salesforce

When you are connected to a business partner using Salesforce to Salesforce, you can subscribe to objects that your business partner has published. When you subscribe to an object, you map it to an object in your organization. Standard objects must map to standard objects in your organization, but you can map custom objects to any custom object. For example, if your business partner has published a custom object named Prospects, you can map that to a custom object named Client.

To subscribe to objects for a connection:

1. Click the Connections tab.
2. Click the name of the connection you want to modify.
3. In the Subscribed Objects related list, click **Subscribe/Unsubscribe**.
4. Choose the objects you want to subscribe to by selecting the object in your organization you want mapped to that object. Select `--None--` if you do not want to subscribe to a published object.
5. Select the `Auto-Accept` checkbox next to an object if you want to automatically accept records of that type when shared by your connection. The checkbox appears once you select a mapping.

 **Note:** This checkbox is not available for:

- Child objects. Opportunity products, tasks, and public case comments are [automatically accepted](#) when the parent record is accepted. Attachments are automatically accepted if marked public and the `Share With Connections` checkbox is selected.
- Objects that have one or more master objects, such as custom junction objects or detail objects in a master-detail relationship.

Additionally, `Auto-Accept` does not apply to any record that is shared as the child of another record, for example a case record that is the child of a case record that you already accepted.

6. Click **Save**.

 **Note:** If your business partner stops publishing an object to which you are subscribed, you are automatically unsubscribed from that object.

Once you have subscribed to an object, you can [map published fields](#) on that object to fields on your object. For example, you can map the `Description` field on leads to a custom field on leads called `Partner Description`. This would allow you to use your own field to describe the lead for users within your organization rather than using the description provided by your business partner.

### Additional Considerations

- If you choose to auto-accept leads or cases, any active assignment rules in your organization run when a record is automatically accepted.
- In order to automatically accept a record shared by your connection, the connection owner for that record must be an active user.

#### EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance

- Developer

#### USER PERMISSIONS

To subscribe to published objects :

- "Manage Connections"

## Subscribe to Fields in Salesforce to Salesforce

When you accept an invitation from a business partner to join Salesforce to Salesforce, you can subscribe to fields that your business partner has published and map those fields to your fields. When your business partner updates the fields on a record that you're sharing, the fields will be updated on the shared record in your organization.

For example, if your business partner has published the `Description` field, you could map that field to a custom field called `Partner Description`. This would allow you to use your own field to describe the lead for users within your organization.

Before subscribing to fields, see [Best Practices for Mapping Fields in Salesforce to Salesforce](#).

To map fields on a subscribed object:

1. Click the Connections tab.
2. Click the name of the connection you want to modify.
3. In the Subscribed Objects related list, click **Edit** next to an object.
4. Map your business partner's published fields to your organization's fields by choosing the appropriate field in the drop-down list.

 **Note:** Fields can only be mapped to fields with the same data type, length (for text and numeric fields) and decimal places (for numeric fields), so the drop-down list only shows fields with the correct data type. You can see the data type details of a published field by hovering your mouse over the information icon (i) next to the field. Select `--None--` if you don't want to populate any of your fields with the data from a published field.

5. If the field is a picklist, click **Edit Values** to map each published picklist value to a picklist value in your organization.
6. Click **Save**.

 **Note:** Changes to field mappings and picklist values may not show up in your business partner's organization for up to 15 minutes while Salesforce refreshes the cache. This cache enables us to support larger transaction volumes and reduce the number of API calls that count against your organization's limits.

[Managing Connections](#)

[Publishing Fields in Salesforce to Salesforce](#)

## Best Practices for Mapping Fields in Salesforce to Salesforce

When you subscribe to a field in Salesforce to Salesforce, you need to map it to a field in your organization. This lets updates to that field sync for all shared records. Before you map fields, take a look at these important best practices.

 **Important:** This information applies to standard Salesforce to Salesforce connections. If you're mapping fields for a replication connection as part of Organization Sync, some of this information may not apply.

### Auto-Mapping Fields

- When subscribing to fields, select **Auto-Map Fields** to automatically map your business partner's fields to your fields. After you select this option, click **Save** for your changes to take effect.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To subscribe to published fields :

- "Manage Connections"

### EDITIONS

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

- For any unmapped field, Salesforce checks if the field's API name matches that of any of your fields. If there are no matches, Salesforce checks for matching field labels. If Salesforce still can't find a match, `--None--` is selected.
- Selecting **Auto-Map Fields** doesn't overwrite previous selections, and deselecting it doesn't affect fields that were mapped previously.
- The following standard fields are automatically mapped:
  - Account: `Account Name`, and, if you are using person accounts, `Last Name`
  - Attachment: `Body`, `Content Type`, `File Name`
  - Case: `Subject`
  - Case Comment: `Body` and `Published`
  - Contact: `Last Name`
  - Custom Object: `Name`
  - Lead: `Last Name` and `Company`
  - Opportunity: `Name`, `Closed Date`, and `Stage`
  - Product: `Product Name`
  - Task: `Subject`
  - Opportunity Product: `Quantity`, `Sales Price`

### Mapping Picklist Fields

- If a picklist value is mapped to `--None--`, and your business partner enters a picklist value, your picklist field will be set to the same value. For example, if you subscribe to the Lead Status picklist, and your business partner has the value `Internal` in that picklist, your record will have a lead status of `Internal`.
- To convert a custom field to a picklist field, stop publishing the field, change the field type, then publish the field again.

### Mapping Currency Fields

- If you map a currency field, and a record shared by your connection uses a currency that your organization hasn't enabled, that currency field won't be updated when your organization auto-accepts the record. If you're manually accepting the record, the currency is updated only if your organization uses the same currency as the record.  
For example, suppose your connection has shared an opportunity with you. Your organization uses the Euro only. Your connection updates the opportunity amount to \$300. The opportunity amount won't update in your record because your organization doesn't support the U.S. Dollar.
- If you map a currency field and either you or your connection changes the currency on a record containing that field, updates you make to the field will no longer be propagated to the other organization, and updates your connection makes to the field won't be reflected in your organization.
- You can map roll-up summary fields to currency fields with the same currency type. For example, a roll-up summary with the currency type `U.S. Dollar` can be mapped to a currency field that uses the U.S. Dollar.

### Mapping Quantity and Revenue Schedules

- If Quantity Schedules or Revenue Schedules are enabled in your connection's organization and you subscribe to the Products object from that connection, you must subscribe to the following fields and map them to matching fields in your organization.

Type of Schedule	Fields to Map
Quantity Schedule	<ul style="list-style-type: none"> <li>- Number of Quantity Installments</li> <li>- Quantity Installment Period</li> <li>- Quantity Schedule Type</li> </ul>

Type of Schedule	Fields to Map
Revenue Schedule	<ul style="list-style-type: none"> <li>- Number of Revenue Installments</li> <li>- Revenue Installment Period</li> <li>- Revenue Schedule Type</li> </ul>

### Mapping Different Field Types

- Person account fields should be mapped only to person account fields, and business account fields should be mapped only to business account fields.
- If your connection is using person accounts and you aren't, the person account field `Last Name` is used as the Account Name when your connection shares a person account record with you. If you enable person accounts, you are automatically subscribed to `Last Name`. Any changes to Last Name and Account Name are synced.
- You can't map a standard number field to a custom number field.
- You can map lookup fields to text fields that have a length of 80 or more characters. If your connection edits a lookup field that you mapped to a text field, the text field will be updated with their changes.
- You can map auto-number fields to text fields that have a length of 30 or more characters.
- You can map formula fields to fields of the same data type; for example, a formula field that has a number data type can be mapped to a field with a number data type. If a formula field is a text data type, it can be mapped to a text field with a length of 80 or more characters. Conversely, fields can't be mapped to formula fields; for example, a formula field with a currency data type can be mapped to a currency field, but a currency field cannot be mapped to a formula field. System audit fields are not supported.

### Unsubscribing to Fields

- You are automatically unsubscribed from a field if:
  - Your business partner stops publishing the field
  - You delete a custom field that is mapped to a published field
  - The field type of a custom picklist or custom multi-select picklist is changed (for example, if a custom picklist is changed to a text field)

#### SEE ALSO:

[Subscribe to Fields in Salesforce to Salesforce](#)

## Accepting Records Shared from a Connection

Salesforce to Salesforce allows you to accept records that have been made available to you by business partners with whom you have connections. When accepting a record, you can assign it to yourself, another user, a queue, or, if it is a lead or case, use your organization's assignment rules to automatically assign it. If the record is a child of another record you have accepted, you can assign it to the parent record when accepting it. Additionally, when [subscribing to an object](#), you can specify that the object's records are automatically accepted when shared by your connection.

If validation rules prevent you from accepting shared records, create a validation rule with the `Received Connection Name` field not equal to null; this will ignore validation rules for records you accept from your connections. To create this rule, use the following formula:

```
IF(OR(ISNEW(), ISNULL(Id)), if(ConnectionReceivedId =null,
TRUE, FALSE), NOT(AND(ISCHANGED(ConnectionReceivedId),
NOT(ConnectionReceivedId = null))))
```

You should also create a similar rule for any Apex trigger that has validation checks.

To accept records that have been made available to you:

 **Note:** When you manually accept a record, it takes some time for all mapped fields on the record to be updated.

If an error occurs when accepting a record, see the Connection History for details.

1. Select the tab of the record type you are accepting.
2. Select a connections list view and click **Go!**. For example, on the Leads tab, in the **Leads from Connections** section, select a list view from the drop-down list and click **Go!**
3. For accounts, contacts, and opportunities, click **Accept** next to the record you want to accept. For cases, leads and custom objects, select the checkbox next to the records to accept, then click **Accept**.

 **Note:** If a record is a child of a record you have accepted, the name of the parent record is displayed in the Parent Record Name column. If the record is a parent record or has no parent record, this column is blank.

When you accept a record that has public attachments, the attachments are automatically accepted if you selected the `Share with Connections` checkbox on the attachment.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To accept shared records:

- "Read" and "Edit" on the object

To view records shared by a connection:

- "Manage Connections" or have access to the list view

## Accepting Opportunity Records

When you accept an opportunity, you have the option to relate the opportunity to an object and a price book, and to relate the opportunity to a new account or opportunity, or to use an existing account or opportunity. If you create a new opportunity or account, you can also set the owner of that record.

## Accepting Account Records

When you accept an account, you have the option relate the account to another object and to create a new account, or to use an existing account. If you create a new account, you can also set the owner of that record.

## Accepting Contact Records

When you accept a contact, you have the option relate the contact to another object and to create a new account or contact, or to use an existing account or contact. If you create a new contact or account, you can also set the owner of that record.

## Accepting Case, Lead, and Custom Object Records

When you accept a case, lead or custom object, you have option to relate the case, lead or custom object to another object and to assign the lead or custom object to a new owner.

 **Note:** If you choose to `Assign using active assignment rule` and no assignment rule criteria is met, the lead, case, or custom object is assigned to the Default Lead, Case, or Custom Object Record Owner.

## Accepting Product Records

When you accept a product, you have the option to create a new product or relate the product to an existing product.

## Additional Considerations

- After accepting a shared record, if you update a field that your business partner has subscribed to, the field is automatically updated on the record in your business partner's organization. Likewise, if your business partner updates a field to which you have subscribed, it is automatically updated in your organization. When your business partner updates the record, the `Last Updated By` field will be set to "Connection User".
- Once you have accepted a record, you can make it available to other connections in the same way you can make any record available using Salesforce to Salesforce. This allows you to work in a multi-tiered business network. In a multi-tiered network, changes made to the shared record in any organization updates the information in all the organizations that are sharing the record.
- When your business partner shares child records at a later time using the **Manage Connections** link in the related list of a record you have already accepted, the [child records can be automatically added](#) to your organization.

SEE ALSO:

[Sharing Records Using Salesforce to Salesforce](#)

[Connections Home Page](#)

[Tips for Using Salesforce to Salesforce](#)

## Automatically Accepting Related Records From a Connection

### Rules for Automatically Accepting Related Records From a Connection

When you share records using Salesforce to Salesforce, you can also share child records. When you accept a record from a connection, or when your connection accepts a record from you, the child records can be automatically accepted provided that certain criteria are met. Similarly, when a child record is shared at a later time using the **Manage Connections** link in the related list, and the parent record has already been accepted, the child record can be automatically accepted.

In order for a child record to be accepted automatically, the following criteria must be met:

- The parent record must already be accepted in the organization.
- The record must be related as a child to the parent record.
- The child record cannot have two master records.
- The child record cannot have multiple relationships to the same parent object.
- The connection owner must be an active user.
- The owner of the parent record must be an active user.

 **Important:** When child records are accepted automatically, there may be a slight delay before they are visible in the related list of the parent record. Additionally, when a child record is shared using the **Manage Connections** link in the related list of a parent record, there may be a slight delay before the Sent Connection Name displays.

If a child record does not meet the criteria for automatic acceptance, it will need to be manually accepted from its object tab. For example, an opportunity record will need to be accepted from the Opportunities tab. A child record that needs to be manually accepted will display with the parent record name so that it can be properly assigned. For more information, see [Accepting Records Shared from a Connection](#) on page 1484.

To accept or reject records:

- "Read" and "Edit" on the record

## Publishing Objects in Salesforce to Salesforce

The objects you publish are the objects that your users can share with your business partners using Salesforce to Salesforce. If you have accepted an invitation, created new custom objects, or you have decided to share more information with your business partner, you may want to publish additional objects. Alternatively, you may find that you want to limit the objects you publish to a particular business partner.

You can publish the following objects:

- Account
- Attachment
- Case
- Case Comment
- Contact
- Lead
- Opportunity
- Opportunity Product
- Product
- Task
- Custom Object

To define published objects for a connection:

1. Click the Connections tab.
2. Click the name of the connection you want to modify.
3. In the Published Objects related list, click **Publish/Unpublish**.
4. Select the objects you want to publish to your business partner. Deselect objects you no longer want to publish.
5. Click **Save**.

 **Note:** You cannot publish objects that you do not have permission to edit.

When you update your published objects, an email is sent to your business partner notifying them of the change. You can customize this email by editing the Update Connection communication template.

Your business partner is automatically unsubscribed to objects when you:

- Stop publishing an object
- Delete a custom object to which your business partner is subscribed

Once you have published an object, you can manage the fields you publish on that object. For more information on publishing fields, see [Publishing Fields in Salesforce to Salesforce](#) on page 1488.

### Additional Considerations

- All custom objects in your organization appear in the list of objects, however, Salesforce to Salesforce only supports deployed custom objects. You cannot forward a record for a custom object that has not been deployed.

#### EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

#### USER PERMISSIONS

To publish objects:

- “Manage Connections”

- If you publish the case comment object, all public case comments will be shared with your connections. To avoid sharing a comment on a specific case, select **Make Private**.

## SEE ALSO:

[Publishing Fields in Salesforce to Salesforce](#)

[Forwarding Related Records to a Connection](#)

## Publishing Fields in Salesforce to Salesforce

When working with a business partner in Salesforce to Salesforce, you control which objects you share with them by publishing the objects. In addition, you can control which fields you publish on those objects. By default, the following fields are published:

- Account: `Account Name`, and, if you are using person accounts, `Last Name`
- Attachment: `Body`, `Content Type`, `File Name`
- Case: `Subject`
- Case Comment: `Body` and `Published`
- Contact: `Last Name`
- Custom Object: `Name`
- Lead: `Last Name` and `Company`
- Opportunity: `Name`, `Closed Date`, and `Stage`
- Product: `Product Name`
- Task: `Subject`
- Opportunity Product: `Quantity`, `Sales Price`

Salesforce to Salesforce displays the API label for each field.

In addition to those required fields, you may want to publish more fields, or limit the fields you are currently publishing to a particular business partner.

To define published fields for a connection:

1. Click the Connections tab.
2. Click the name of the connection you want to modify.
3. In the Published Objects related list, click **Edit** next to the published object.
4. Select the fields you want to publish to your business partner. Deselect fields you no longer want to publish.
5. Click **Save**.

 **Note:** You cannot publish fields that you do not have permission to edit.

Changes to fields may not show up in the subscribing connection for up to 15 minutes while Salesforce refreshes the cache. This cache enables us to support larger transaction volumes and reduce the number of API calls that count against your organization's limits.

You cannot publish rich text area (RTA) fields.

Geolocation fields and latitude and longitude on standard addresses aren't supported in Salesforce to Salesforce.

When you change which fields you publish, an email is sent to your business partner notifying them of the change. You can customize this email by editing the Update Connection communication template.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To publish fields:

- "Manage Connections"

Your business partner is automatically unsubscribed to fields when you:

- Stop publishing a field
- Delete a custom field to which your business partner is subscribed
- Change the type of a field to which your business partner is subscribed
- Change the size or precision of a long text area, text, percent, number, or currency field.

These fields remain published, but your business partner must re-subscribe to them.

Occasionally, new releases of the Salesforce service include new standard fields. Because Salesforce organizations around the world aren't upgraded to new releases simultaneously, you can't publish these new fields to a business partner until their organization is upgraded. Service upgrades occur during scheduled system maintenance periods. To view the system maintenance schedule, go to [trust.salesforce.com](https://trust.salesforce.com).

## Other Tips and Considerations

- When publishing fields, consider sending your business partner information about the fields. This helps them to create a mapping strategy that makes sense for your program.
- Translate your published custom field names into the languages your partners use. This allows them to see the field names in their own language.
- If you're using person accounts, and your connection has not enabled person accounts, the person account `Last Name` is used as the `Account Name` when you share a record. If your connection enables person accounts, they are automatically subscribed to `Last Name`. Any changes to `Last Name` and `Account Name` are synchronized.

SEE ALSO:

[Managing Connections](#)

[Subscribe to Fields in Salesforce to Salesforce](#)

## Making Records Available to a Connection

Salesforce to Salesforce allows you to share records with business partners to whom you are connected. There are two ways to share records: forward records directly to connections, or assign records to a queue of connections. You can share the same records with multiple connections. Once shared, connections must choose to accept the records.

 **Note:** Don't forward a record to the connection that originally shared it. Doing so causes errors when Apex triggers run.

### Sharing a Record with Connections

You can share records with business partners to whom you are connected. You can only forward records that you or your subordinates own; System Administrators can forward all records.

 **Note:** Any lead record you are forwarding must include a populated `Company Name` field.

You cannot forward a record for a custom object that has not been deployed.

- To forward a record and its related records:
  - View the record's detail page.
  - In the External Sharing related list, click the forward button.
- To forward multiple records to connections:
  - Select the tab of the type of record you want to forward.
  - Select a list view from the `View` drop-down list, then click **Go!**.
  - In the list view, select the checkboxes next to the records you want to forward. To select all records, select the checkbox in the column header.
  - Click **Forward to Connections**.
- Select the connection(s) to forward the record to in the Available Connections list.
- Click the Add arrow () to move the connection(s) to the Selected Connections list.
- Optionally select **Send Notification Email (new invitees only)** to send email notifying the connection's representative that you forwarded the record. Only new recipients of the record receive the email; connections that you previously forwarded the record to don't receive another email.
- Optionally select the checkboxes next to related records you want to forward. You can also [share related records separately](#).
- Click **Save**.

The records are forwarded to the specified connections.

 **Tip:** Certain fields, like currency fields, must be mapped a certain way in Salesforce to Salesforce. For details, see [Best Practices for Mapping Fields in Salesforce to Salesforce](#).

### Sharing Attachments

You can share attachments as child records of any supported object. Attachments are automatically accepted by a connection, providing the following criteria are met:

- The Attachment object type is published to your connection and your connection is subscribed to the object.

#### EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

#### USER PERMISSIONS

To assign records to a connection:

- "Read" and "Edit" on the record

To stop sharing a record:

- "Read" and "Edit" on the record

To forward multiple records to a connection:

- "Manage Connections"

- The parent record for the attachment is shared with the connection.
- The attachment is not marked “Private.”
- The `Share With Connections` checkbox on the attachment is selected.
- The attachment is 20 MB or less.

## Stop Sharing Records

To stop sharing a record:

 **Note:** You can only stop sharing records that you or your subordinates own. System Administrators can stop sharing all records.

1. View the record's detail page.
2. In the External Sharing related list, click **Stop Sharing**.

When you stop sharing the record with a connection, changes to the record in your organization are not reflected on the record in the connection's organization. The shared record is not deleted from the other organization.

SEE ALSO:

[Sharing Records Using Salesforce to Salesforce](#)

[External Sharing Related List](#)

## External Sharing Related List

Salesforce to Salesforce allows you to share records with one or more connections; each connection has the opportunity to accept records you share with them, even if other connections have already accepted the same record. When working with a record that you have received from a connection, or a record that you have shared with a connection, the record detail page includes a header indicating the record's status. The record may also contain the External Sharing related list, which shows details on which connections this record is shared with, and the sharing status.

Externally shared records will have one of the following statuses:

### Active (sent)

The record has been shared and accepted by an external organization.

### Active (received)

The record has been sent to you from an external organization, and it has been accepted.

### Pending (sent)

The record has been shared, but not accepted by an external organization.

### Inactive

The record is no longer shared with an external organization.

### Inactive (deleted)

The record was accepted by an external organization, but that organization has deleted the record.

### Inactive (converted)

The record is a lead that was accepted by an external organization and converted into an opportunity by that organization. When a lead is converted, Salesforce to Salesforce inactivates the shared record so that it is no longer updated in the subscribing connection.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To see the external sharing status of a record

- “Read” on the record

To stop sharing a record:

- “Manage Connections”

 **Note:** If you change the Lead Status during conversion, it is not reflected in the subscribing connection.

#### SEE ALSO:

[Sharing Records Using Salesforce to Salesforce](#)

[Making Records Available to a Connection](#)

## Forwarding Related Records to a Connection

Salesforce to Salesforce allows you to forward records that are children of records already shared with connections. You select the child record types that can be shared when you [share a parent record](#).

Child records are [automatically shared](#) with connections after the parent record has been accepted by the connection, provided certain criteria are met.

Consider the following tips when sharing related records:

- A related record will no longer be shared with a connection if the related record is edited from an unshared record.
- A maximum of 100 tasks per related record can be shared. This maximum includes open and closed tasks.

To stop sharing a related record from its parent record detail page:

1. Select the parent record's detail page.
2. In the related list of the record you want to stop sharing, click **Manage Connections** in the Sent Connection Name column. For example, to stop sharing a contact related to an account, click **Manage Connections** in the Contacts related list on the account detail page.
3. Select the connection(s) that you want to stop sharing with in the Selected Connections list.
4. Click the Remove arrow () to move the connection(s) to the Available Connections list.
5. Click **Save**.

Alternatively, to stop sharing a related record from its detail page:

1. View the record's detail page.
2. In the External Sharing related list, click **Stop Sharing**.

To stop sharing a case comment or attachment, you must make the records private.

## Sharing Opportunity Products with Connections

An opportunity product is related to both opportunity and product records. For this reason, it can only be shared as a child record of a shared opportunity, provided the associated product is also shared.

If all of the following criteria are met, opportunity products are automatically shared with connections.

- The Opportunity Product object type is published to your connection, and your connection has subscribed to the object.
- The opportunity and the product associated with the opportunity product are shared with your connection.
- In the connection's organization, the opportunity is associated with an active price book during acceptance.
- In the connection's organization, the product is associated with the same active price book as the opportunity.
- In the connection's organization, the product is active.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To assign records to a connection:

- "Read" and "Edit" on the record

To forward related records to a connection:

- "Read" and "Edit" on the record

To stop sharing a record:

- "Read" and "Edit" on the record

- In both organizations, the opportunity currency is the same.

When sharing opportunity products, keep these additional rules in mind:

- If quantity or revenue schedules are enabled in the connection's organization, Quantity and Sales Price fields won't be updated in their organization.
- If the price book associated to the opportunity product is changed or deleted in one organization, the opportunity product will no longer be shared.
- If the opportunity is no longer shared, the opportunity product will no longer be shared.

 **Note:** Currently, if you edit the stage of multiple opportunity records by performing a global find and replace, that change will not be reflected in organizations that you had forwarded the records to in Salesforce to Salesforce.

For example, suppose you perform a global find and replace which causes the stage of all inactive opportunities to change from `Inactive` to `In Review`.

If any of the affected opportunities had been forwarded to a business partner in Salesforce to Salesforce, those opportunities will still be in the `Inactive` stage in your partner's Salesforce organization. For the stage change to be reflected in their organization, they would need to open each affected opportunity, click **Edit**, and click **Save**.

## Sharing Case Comments with Connections

You can share a case comment as a child record of a case. Case comments are automatically accepted by a connection, providing the following criteria are met:

- The Case Comment object type is published to your connection, and your connection has subscribed to the object.
- The case to which the case comment is associated is shared with the connection.
- The case comment is not marked "Private."

[Sharing Records Using Salesforce to Salesforce](#)

## Tips for Using Salesforce to Salesforce

### Managing Connections with Custom Reports

Use custom reports to keep track of Salesforce to Salesforce activity and updates. For details, see [Reporting in Salesforce to Salesforce](#).

#### EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Workflow is available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

## Managing Records

- If validation rules prevent you from accepting shared records, create a validation rule with the `Received Connection Name` field not equal to null; this will ignore validation rules for records you accept from your connections. To create this rule, use the following formula:

```
IF(OR(ISNEW(), ISNULL(Id)), if(ConnectionReceivedId =null,
TRUE, FALSE),NOT(AND(ISCHANGED(ConnectionReceivedId),
NOT(ConnectionReceivedId = null))))
```

You should also create a similar rule for any Apex trigger that has validation checks.

- To track records that you are sharing with connections, create a custom report. For example, you can create a custom report that shows all the leads that you have shared with connections that were deleted by the connection:
  - Use the Leads and Connections report type
  - Enter the filter criteria “Status equals Inactive (deleted)”
- Make your view of unaccepted records from connections more useful by creating a custom list view. For example, create a list view that hides unaccepted leads from connections that are more than a month old.

 **Note:** You must have the “Manage Connections” permission to create these list views.

- Only users with the “Manage Connections” permission can view objects shared from a connection, therefore, you should create custom list views that you can assign to people who need access to this information.
- If you are expecting to receive large volumes of records from a connection, [enable Auto-Accept for the appropriate objects](#) on page 1480. For example, if a connection shares a large number of leads with your organization on a regular basis, select the `Auto-Accept` checkbox next to Opportunity on the Add or Remove Subscribed Objects page.
- To see changes made by a connection, enable field tracking on the object and add the history related list to page layouts. Another option is to create a custom history report that includes the `Received Connection Name` field.
- To automatically assign all incoming leads or cases to a specific user, create an assignment rule that includes the following rule entries:

- *Received Connection Name contains name of connection*
- *Created By contains Connection User*

You can do the same with escalation rules.

- If you want to assign a case to a connection using an escalation rule on the case, you must assign the case to a queue where the connection is a member. For example, if you have a connection that acts as your third-party service agency and all cases meeting certain criteria should be escalated to this connection, you must:
  - Create a queue that contains the connection as a member.
  - Create an escalation rule with the appropriate criteria.
  - Add an escalation action that automatically assigns cases meeting the specified criteria to that queue

## Other Tips

- If you want to connect to partners but aren't sure if they use Salesforce, you can use [connection finder](#) to find out.
- When you convert a lead, Salesforce to Salesforce inactivates the shared record and updates the External Sharing related list in your connection's lead record with an Inactive (converted) status. Due to inactivation of the shared record, changes to the Lead Status during conversion aren't reflected in your connection's lead record.

- To learn how to use workflows to automate updates to records and connections in Salesforce to Salesforce, see [Using Workflows in Salesforce to Salesforce](#).

## Reporting in Salesforce to Salesforce

To track Salesforce to Salesforce activity and updates, create custom reports.

When it comes to using custom reporting to efficiently manage your Salesforce to Salesforce connections, the possibilities are endless! Here are some ways you might use custom reports in Salesforce to Salesforce:

- Create a custom report with the Connections with Accounts report type to track connection activity and other connection details. The report only displays connections that are associated with accounts.
- Create custom report types to view connection information for each of your published or subscribed objects.
- Create a custom report to view records that are shared with multiple connections. Alternatively, to view records shared with multiple connections in a list view, add the `Sent Connection Name` field to an existing or new view and verify that enhanced lists are disabled.
- Create a custom report with the Connections with Leads report type to view all leads that you shared with connections and that the connection then deleted.

## Using Workflows in Salesforce to Salesforce

You can use workflow to automate updates to records and connections in Salesforce to Salesforce.

Workflow rules are only triggered for records shared in Salesforce to Salesforce when:

- You accept a parent record
- A child record is inserted
- You are subscribed to the fields that are configured to trigger the workflow rules

Some suggestions for criteria for workflow rules for Salesforce to Salesforce include:

- `Received Connection Name` field on leads, opportunities, and custom objects
- `Current User` equals `parent`
- `Last Modified By` field equals `Connection User`

For example, you can create a task for a user every time a connection updates a lead:

1. Create a workflow rule with the following criteria:
  - Evaluation criteria: `Evaluate the rule when a record is: created, and every time it's edited`
  - Run the rule when `criteria are met`.
  - Rule criteria: `"Lead: Last Modified By equals Connection User"`.

2. Add a workflow task.

You can use workflows for many Salesforce to Salesforce processes, including updating values on picklists when a connection has edited the field. When you accept a record, workflow rules are only triggered by the following fields:

-  **Note:** If your organization is set up to automatically accept records, workflow rules are triggered by any field to which you subscribed.

Object	Fields Triggering Workflows
Account	<ul style="list-style-type: none"> <li>• Account Name</li> <li>• City</li> <li>• Country</li> <li>• Received Connection Name</li> <li>• Sent Connection Name</li> <li>• State</li> <li>• Type</li> </ul>
Case	<ul style="list-style-type: none"> <li>• Case Number</li> <li>• Priority</li> <li>• Status</li> <li>• Subject</li> <li>• Type</li> </ul>
Contact	<ul style="list-style-type: none"> <li>• Email</li> <li>• Last Name</li> <li>• Mailing Address</li> <li>• Phone</li> <li>• Title</li> </ul>
Lead	<ul style="list-style-type: none"> <li>• Company</li> <li>• Email</li> <li>• Industry</li> <li>• Lead</li> <li>• Lead Source</li> <li>• Name</li> <li>• No. of Employees</li> <li>• Phone</li> <li>• Received Connection Name</li> <li>• Sent Connection Name</li> <li>• State</li> <li>• Status</li> <li>• Title</li> </ul>
Opportunity	<ul style="list-style-type: none"> <li>• Account Name</li> <li>• Amount</li> <li>• Close Date</li> <li>• Name</li> <li>• Received Connection Name</li> </ul>

Object	Fields Triggering Workflows
	<ul style="list-style-type: none"> <li>• Sent Connection Name</li> <li>• Stage</li> </ul>
Custom Object	<ul style="list-style-type: none"> <li>• Connection Name</li> <li>• Name</li> <li>• Sent Date</li> </ul>

All subsequent updates made to any fields on accepted records will trigger workflow rules.

 **Note:** In some cases, it makes sense to use an Apex trigger instead of a workflow. Suppose you have a workflow rule that updates a secondary field, **field B**, when **field A** is updated. Even if your Salesforce to Salesforce partner subscribed to fields A and B, updates to field B that are triggered by your workflow rule aren't sent to your partner's organization. This prevents a loop of updates.

If you want secondary field updates like this to be sent to your Salesforce to Salesforce partners, replace the workflow with an Apex trigger that uses post-commit logic to update the secondary field.

## Verifying Your Business Partners Use Salesforce

### About Connection Finder

If your partners use Salesforce, it is beneficial to connect your Salesforce organizations so that you can share records and collaborate on relevant business processes. Before you can connect, you need to find out if your partners use Salesforce. Use Connection Finder to email your partners a link to a simple survey asking if they use Salesforce. Survey responses are recorded on the contact and account records for each partner. Once you know a partner's status, you can invite them to connect using Salesforce to Salesforce.

## Setting Up Connection Finder

Connection Finder allows you to email surveys to find out if your partners are Salesforce customers. Once you know a partner's status, you can invite them to connect using Salesforce to Salesforce.

To use connection finder, you must perform the following activities:

1. [Enable connection finder](#) in your organization.
2. [Configure connection finder settings](#).
3. Add the **Find Connections** button to the contacts list view by customizing the search layout. Add the button to the contact detail page by customizing the contacts page layout.
4. Add the `Uses Salesforce` field to the contacts page layout.
5. Add the `Salesforce Customer` field to the account page layout.

 **Note:** The `Uses Salesforce` and `Salesforce Customer` fields also appear on the contact and account records in any Customer Portal or partner portal you set up.

## Enabling Connection Finder

To activate connection finder:

1. From Setup, enter *Connection Finder* in the `Quick Find` box, then select **Salesforce to Salesforce Connection Finder**.
2. Click **Edit**.
3. Select `Enabled`.
4. Click **Save**.

The connection finder settings are now available to configure. Additionally, the default email template and required related fields are created and available for use.

 **Note:** Disabling connection finder inactivates outstanding surveys and removes the **Find Connections** button. The `Uses Salesforce` and `Salesforce Customer` fields remain on contact and account records, respectively.

## Configuring Connection Finder Settings

You can determine the content and look of the email you send to partners.

1. From Setup, enter *Connection Finder* in the `Quick Find` box, then select **Salesforce to Salesforce Connection Finder**.
2. Click **Edit**.
3. Select an email template.

The default connection finder template is automatically selected. You can also create custom email templates for your survey.

 **Note:** Custom email templates must contain the survey URL. `{!Contact.PartnerSurveyURL}` is available as a contact merge field when creating templates.

4. Optionally, select a logo using the lookup.

 **Note:** You must first upload your logo to the Documents tab and mark it as `Externally Available Image`.

Salesforce recommends adding a branded logo, as it appears at the top of the survey page. If no logo is selected, the logo portion of the survey page remains blank.

5. Click **Save**.

### USER PERMISSIONS

To enable Connection Finder and edit settings:

- "Modify All Data"

## Finding Out if Your Partners Use Salesforce

If your partners use Salesforce, it is beneficial to connect your Salesforce organizations so that you can share records and collaborate on relevant business processes. Before you can connect, you need to find out if your partners use Salesforce. Use Connection Finder to email your partners a link to a simple survey asking if they use Salesforce. Survey responses are recorded on the contact and account records for each partner. Once you know a partner's status, you can invite them to connect using Salesforce to Salesforce.

1. In the Contact list view, select the partners you want to survey and click **Find Connections**. Alternatively, on a contact detail page, click **Find Connections**.

 **Note:** **Find Connections** doesn't appear if:

- The contact record doesn't have a valid email address
- The contact is not associated with an account

If the contact is a person account, **Find Connections** appears in the list view, but shows an error message if the user clicks the button. **Find Connections** does not appear on the contact detail page.

2. Enter a subject for the email.
3. Edit the body text, supplied by the default template, or click **Change Template** to choose a different email template.

 **Note:** The default email template is selected by your administrator. You can select a different template or edit the body text, however, you must include the survey URL: `{ !Contact . PartnerSurveyURL }`.

You cannot edit body text if you chose multiple recipients.

4. Click **Check Spelling** to spell check the body text.
5. Click **Preview** to see what your email will look like to the recipient.
6. Click **Send**.

The email is sent to the selected partners, who have 90 days to respond to the survey before the link becomes invalid. The partner's response is recorded in the `Uses Salesforce` field on the partner's contact record and the `Salesforce Customer` field on the account record. A closed activity is also added for the contact.

 **Tip:** Salesforce recommends creating a custom list view or custom report so that you can track customer responses in one convenient location.

If the partner's organization uses Salesforce, the survey displays a section asking if the recipient has administrator privileges for Salesforce. If not, the recipient can optionally provide their administrator's contact information and a new contact record is created in Salesforce for that user, unless one already exists.

 **Note:** This section doesn't appear if a contact for that partner, whose `Uses Salesforce` value is *Yes*, *admin user*, already exists in your organization.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited

### USER PERMISSIONS

To email partners asking if they use Salesforce:

- "Send Email" (single recipient)

OR

"Mass Email" (multiple recipients)

## Tips and Additional Considerations for Connection Finder

- Create a custom list view or custom report to track your survey responses in one location. Add the `Uses Salesforce` field to contact list views and reports. Add the `Salesforce Customer` field to account list views and reports.
- Create translated versions of the default connection finder template to send to international partners. To do so, clone the default template, make the necessary language changes, and include the survey URL: `{ !Contact . PartnerSurveyURL }`. You can then choose the appropriate template when sending out requests to your partners.
-  **Note:** The survey page is in English, but includes a `Language` drop-down so that recipients can view the survey in their native language.
- When creating validation rules for the `Uses Salesforce` field, use the API value, not the label seen in the user interface. For example:

```
CONTAINS (TEXT (UseSalesforce), 'YesNotAdmin')
```

<code>Uses Salesforce</code> drop-down value	API value
No	No
No Response	NoResponse
Not Sure	NotSure
Yes, admin user	YesAdmin
Yes, not admin user	YesNotAdmin

- If a partner provides details for their Salesforce administrator, Salesforce checks to see if there is already a contact in your Salesforce organization with that email address. If so, the `Uses Salesforce` field on the contact record is set to *Yes, admin user*. If the field is already set to *No*, it is not updated.
-  **Note:** A partner can only add an administrator if one does not already exist as a contact in your organization.
- The `Salesforce Customer` field is dependent upon the values in its contacts' `Uses Salesforce` field.

## Participating in Social Networks from Within Salesforce

### Salesforce for Twitter and Facebook Overview

Salesforce for Twitter and Facebook gives you an easy way to interact with customers and prospects in real-time on Twitter and Facebook, directly from within Salesforce.

Salesforce for Twitter and Facebook users can search, monitor, join, and respond to social media conversations that are relevant to your company, all from within Salesforce. Users can also:

- Find out what people are saying about your company now
- Create cases, contacts, and leads from Tweets and Facebook wall posts and comments
- Share information with Twitter and Facebook communities
- Engage with millions of people sharing opinions, asking questions, and looking for help

You can enable Salesforce for Twitter and Facebook by downloading the free app from the [AppExchange](#). You can find more documentation from the Resources section of the app listing for Salesforce for Twitter and Facebook.

## Collaborating with Partners to Increase Sales

### Partners Overview

Partners are the companies with which you collaborate to close your sales deals. For each opportunity or account you create, the Partners related list allows you to store information about your partners and the roles they play in the opportunity or account. A partner must be an existing account within Salesforce.

If your organization has been enabled for partners, you can create partner accounts. Partner accounts are business accounts that a channel manager uses to manage partner organizations, partner users, and activities. They are completely separate from account partnerships that are displayed in the Partners related list on an account. For more information about partner portals, see [Partner Portal Overview](#) on page 1504.

 **Tip:** If your organization uses person accounts, you can use partner roles to relate person accounts to each other. For example, if you have individual person account records for several members of a household or family, then you can use partner roles such as “Spouse” or “Sibling” to associate those records.

## Viewing and Adding Partners

The opportunity and account detail pages include a Partners related list for viewing and adding partner relationships.

- To view account information for a specific partner, click the partner's name in the Partners related list.

If you do not have access to view and edit a partner account, the account name appears in the related list but you have no access to other information about that account.

- Click **Del** next to a partner to the partner relationship.

**Note:** If you change the account for an opportunity that has partners, all partners are deleted from the Partners related list.

- To add a partner to an opportunity or account:

- Click **New** in the Partners related list.
- For opportunities only, select the `Primary` option to indicate the primary partner for the opportunity, if applicable.

An opportunity can have only one primary partner. Setting a new primary partner automatically removes the "Primary" status from any existing primary partner.

Marking a partner as "Primary" allows you to report on the partner in all of the opportunity reports.

- In the `Partner` column, enter the name of an existing account by typing into the box or clicking the lookup icon to perform an account search. Alternatively, click **New** from the lookup dialog to create a new account.
- In the `Role` column, choose the role that the partner account plays in the current account or opportunity.

**Note:** Selecting a partner on an account or opportunity automatically creates a reverse partner relationship so that both accounts list the other as a partner. The role you select is applied to the partner account; in the current account, the reverse role is applied.

Your administrator sets the available roles and the corresponding reverse roles when editing the `Partner Role` picklist value.

Your administrator has the ability to customize the columns that display in the related list by editing the page layout. .

AND

"Read" on opportunities

To add partners to an opportunity:

- "Read" on accounts

AND

"Edit" on opportunities

## Partner Fields

A partner has the following fields, listed in alphabetical order.

Field	Description
Partner Name	Name of partner. You can enter an existing account, or use the lookup icon to search for (or optionally, create) a new account.
Primary	Option that specifies the primary partner for the opportunity.
Role	Role of partner for a specific opportunity or account. The role is correlated to the reverse role, applied to the reverse partner relationship. Select from a picklist of available roles, which are set by an administrator.

SEE ALSO:

[Partners Overview](#)

## Deleting Partners

Removing a partner from an opportunity or account removes the partner's relationship with the opportunity or account, but does not delete the partner account.

 **Note:** If you change the account for an opportunity that has partners, all partners are deleted from the Partners related list.

To remove a partner relationship from an opportunity or account, click **Del** next to the partner's name.

Removing a partner affects an opportunity or account in the following ways.

Deleting a Partner From	Does This
An account	Removes the partner from the account and from <i>all</i> opportunities for that account with which the partner was associated.

### EDITIONS

## Sharing Information with Partners

### Partner Portal Overview

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

Partner relationship management allows companies to maximize the return on their channel investments and increase channel revenues by managing, tracking, and forecasting channel business alongside their direct sales business. It also helps partners sell more effectively, close more business, and achieve greater profits.

Empowering your partners with your Salesforce data can help you sell more without spending more. However, you want to control the information your partners can access, and you want your partners to work within an application that uses your company's branding. You can accomplish this by granting your partners access to a Salesforce partner portal.

A partner portal allows partner users to log in to Salesforce through a separate website than your non-partner users. Partner users can only see the data that you have made available to them. Furthermore, partner users can only manipulate data if you give them the appropriate user permissions.

You can customize the web portal to show your branding, and you can configure it to meet your functional and security needs, including enabling single sign-on for portals, so your partners have a single log in to access Salesforce. You can also have multiple portals to meet your different requirements for working with partners.

## Creating Partner Accounts

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

Partner accounts are Salesforce accounts that a channel manager uses to manage partner organizations, partner users, and activities when using the partner portal. Each company with which you partner should be added to Salesforce as a business account. Channel managers are associated with partner accounts by account ownership. A channel manager who owns a partner account can access all the information and manage all the activities of the partner account, including that of any partner user associated with the partner account. This allows the channel manager to easily keep up-to-date on partner activities.

 **Note:** The partner user role is a subordinate of the account owner's role, therefore, all data for the partner user role rolls up to the partner account owner's role. Keep in mind that if you disable a portal user, their partner user role becomes obsolete and their data no longer rolls up to the partner account role.

To create a partner account:

1. Create a new business account.
2. Click **Manage External Account** and then, click **Enable as Partner**.
3. A confirmation dialog will open. Select **Yes, I want to enable this account as a Partner Account**.
4. Click **Confirm**.

 **Note:** If your organization has person accounts, they cannot be used as partner accounts. Only business accounts can be used as partner accounts.

Once you have a partner account created, you can add partner users to the account as contact records. Partner users are Salesforce users with limited capabilities focused on managing leads. Partner users log in to Salesforce through the portal.

 **Note:** Partner accounts can't be deleted, but can be disabled.

To enable a partner account:

- "Manage External Users"

## Disabling Partner Accounts

Disabling a partner account disables external users associated with the account. We recommend disabling a partner account only if the account was accidentally enabled for portal access.

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

You can't delete partner accounts, but you can disable them. Disabling the account permanently disables up to 15 external users associated with the account and removes them from all communities, groups, teams, permission sets, and sharing rules that they're associated with. This includes both active and inactive external users. Additionally, roles and groups associated with the account are permanently deleted and not moved to the Recycle Bin.

 **Note:** You can't disable an account if there are more than 15 active or inactive external users associated with it. You must disable the users before disabling the account.

1. Go to the Account detail page for the account you want to disable.
2. Click **Manage External Account**, then click either **Disable Partner Account**.
3. Click **OK** to confirm.

If you decide to enable the account in the future, you can re-enable individual contacts as partner portal users. Re-enabling a contact for a partner portal creates a new partner user and role that is not associated with the previous partner user and role. You can't restore deleted roles and groups.

[Creating Partner Accounts](#)

## Working with Partner Users

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

Channel managers are associated with the partner users they manage by partner account ownership. A channel manager who owns a partner account can access all the information and manage all the activities of the partner users associated with that account.

Some common tasks when managing your partner users include:

- Creating a partner account
- Creating partner users
- Disabling and deactivating partner users
- [Assigning leads to partner users](#)

### EDITIONS

- Unlimited
- Developer

- [Assigning events to partner users](#)
- [Assigning cases to partner users](#)
- Editing partner user information
- Tracking partner activity
- Giving partner users access to your knowledge base
- Enabling partner users to request meetings

In addition, here are some other ways you can work with your partner users:

### Enable partner super user access

Partner super users have access to data owned by all partner users and partner super users in the same role and those below them in the portal account hierarchy, even if the organization-wide default setting is Private. Partner super user access applies to cases, leads, custom objects, and opportunities only.

### Assign tasks to partner users

If your partner users have the appropriate field-level security settings, they can view and create activities related to leads or opportunities.

Add tasks to leads or opportunities to remind your partner users of particular tasks you would like them to perform. You can view the activity history for a particular lead or opportunity, or use reports to track activities assigned to partner users.

Partner users can only assign tasks to other users in their partner account or to their channel manager.

### Use notes and attachments to communicate with partner users

Partner users can create, view, and edit notes and add attachments from the Notes and Attachments related list on selected detail pages, including lead, solution, and opportunity detail pages. You can use notes and attachments to share documents or information with partner users. If Chatter is enabled for your organization, feed attachments are included in the Notes and Attachments related list. Portal users can download feed attachments, but can't preview, edit, or delete them.

The size limit for an attached file is 5 MB.

### Click Log in to Portal as User to troubleshoot

When you view the contact detail page for a partner user, you can click **Manage External User**, then **Log in to Portal as User**. This opens a new browser window and logs you into the portal as the partner user. Click this button to troubleshoot any issues partner users are experiencing. You may also click this button to ensure that your portal is configured appropriately. The **Log in to Portal as User** button is only available if you have the "Manage External Users" permission and one of the following: the "Modify All Data" permission or you are the partner account owner or higher in the role hierarchy. The **Log in to Portal as User** button does not display if you do not meet these requirements, or if the portal user is inactive.

### Reset a partner user's password

When you view the user detail page for a partner user, you can click **Reset Password** to reset the partner user's password.

Partner users can reset their own password by clicking **Forgot Password?** on the partner portal login page.

### Expose a solution in the portal

Select `Visible in Self-Service Portal` on the solution.

### Add products to opportunities

If the Products related list is available to partner users on opportunities, then you can add products to the opportunities for your partners.

[Managing Partner Users](#)

## Assigning Leads to Partner Users

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

A vital piece of partner relationship management is lead assignment. Your partners can only work with leads that are assigned to them. There are two ways to handle lead assignment for partner users:

- Assign each lead to an individual partner user
- Assign leads to a lead queue and allow partner users to claim leads from the queue

In addition, you can create lead assignment rules that automatically assign leads to partner users or queues based on certain properties of those leads.

 **Note:** Assignment rules cannot be triggered by actions in the portal.

Assigning a lead to a partner user or partner lead queue is just like assigning a lead to any other user or queue.

Leads assigned directly to a user or a queue that is not part of the lead pool are shown on the portal Leads tab. The partner user can see these by selecting an appropriate list view. Until a partner user has reviewed a lead, it displays in bold, and is in the My Unread Leads list view.

If a lead is assigned to a queue that is in the lead pool, the lead displays in the [Available Leads list](#) on the Home tab of the portal.

 **Tip:** Assign partner leads to a single partner user (for example, a sales manager) in the partner account to enable that person to manage lead assignment for the partner users in that account.

## Using Calendars in the Partner Portal

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

If you have added the calendar to the Home page layout for partner portal users, you can assign events to them, and partner portal users with the "Edit Events" permission can create and edit their own events. Note that the following event and calendar features are not supported in the partner portal: spell check, event updates, enhanced list views, drag-and-drop scheduling, calendar sharing, and hover details.

 **Note:** A partner user can only see calendars shared by:

- Other partner users assigned to the same account
- The channel manager for their account

## Assigning Cases in the Partner Portal

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

Before you can assign cases to partner portal users, you must [configure cases for partner users](#). In addition to the required user permissions for this feature, you must have access to view the cases you're updating.

To assign a case to a partner user:

1. On the case detail page, click **[Change]** next to the `Case Owner` field.
2. Select Partner User from the Owner drop-down list and enter the name of the partner user.
3. Optionally, select the `Send Notification Email` checkbox to send an email to the new owner.
4. Click **Save**.

The partner user will be able to view and edit the case from the partner portal.

 **Note:** Case comments added by partner portal users are public and can be viewed by any user that can view the case.

You can also create case assignment rules and escalation rules that automatically assign cases to partner users or queues based on certain properties of those cases.

## About Mobile Access for Partner Users

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

You can enable your partner users to view and modify partner portal data on their BlackBerry®, iPhone®, or Treo® devices using the Salesforce Classic Mobile client application. By granting mobile access to your partner users, you provide them with the flexibility to access their partner portal data from any location, at any time.

Due to memory and screen size limitations of mobile devices, Salesforce Classic Mobile uses data sets, or subsets of Salesforce data, to determine the information that is available to mobile users. Partners using Salesforce Classic Mobile will only be allowed to view objects

## Sharing Information with Partners FAQs

### Can I enable Salesforce for my Partners?

Yes, you can use Communities to connect with your partners and share appropriate Salesforce data.

You can customize communities to meet your business needs, including:

- Choosing which members from your company and which partners can join
- Selecting which Salesforce features to include
- Applying your company's branding so that the community is recognizable
- Enabling your employees and partners to collaborate on Chatter and business processes (records)
- Enabling login options based on SAML for single sign-on for people outside your company
- Enabling users to self register for a community so that the administrator isn't responsible for adding users

To get started using Communities, contact your Salesforce Account Executive.

### Can I share my Salesforce data with other organizations that also use Salesforce?

Yes.

Salesforce to Salesforce enables business collaboration both within and across Salesforce organizations. For example, you can share lead and opportunity data with business partners and manage your entire pipeline and programs within Salesforce.

## Using Salesforce-Integrated Email

---

### Send Email from Salesforce

#### Send Email and Manage Templates Directly from Salesforce Records

It's quick and easy to email contacts, leads, and your own colleagues directly from account, contact, lead, and opportunity records you have access to. Or send to any valid email address. Attach files. Automate with merge fields. Use a template if you want to: either choose from the samples we offer or create and share your own. Task records are created for sent emails. Find a link to sent email in the Activity feed of the record it was sent from or on related records.

IN THIS SECTION:

[Access and Sharing for Email Merge Fields, Templates, and Attachments](#)

Using integrated email in Lightning Experience? It's important to understand how access and sharing work for merge fields, templates, and attachments.

#### EDITIONS

Available in: Salesforce  
Lightning Experience

Developer, Enterprise,  
Group, Professional,  
Performance, and Unlimited  
editions

### [Send Email from a CRM Record](#)

You can send rich text email from a number of CRM features, including accounts, contacts, leads, and opportunities. Use email to collaborate with other Salesforce users at your company, as well. Insert merge fields from the CRM object you're on. Add attachments. If you select a template that has attached files, you need file access to include them in emails you send from that template. Task records are created for sent emails. Find a link to sent email in the Activity feed of the record it was sent from or on related records.

### [Find Email Sent From a Salesforce Record](#)

After you send an email, we create a task so you can review the email details if you need to. The Activity feed includes a link to that task. If you sent email to a contact or lead, each of those records includes a link to the task. For emails that *don't* include any contacts or leads as recipients, the task and the feed item are created for the object you were on when you sent the email.

### [Create a Template to Standardize Common Emails](#)

Create email templates to save time and standardize email sent by you or others in your organization. Use merge fields if you need them. Your page layout and field-level security settings determine which fields are available for merging. Templates you create are automatically public: they're available for use by others in your organization.

### [Use a Template to Standardize Email You Send](#)

Use a template to save time and standardize email you send. You can create your own or use templates created by others in your organization. If you select a template that has attached files, you need file access to include them in emails you send from that template. If you need file access, we'll let you know.

## Access and Sharing for Email Merge Fields, Templates, and Attachments

Using integrated email in Lightning Experience? It's important to understand how access and sharing work for merge fields, templates, and attachments.

### Merge Fields

Merge fields are available from the Account, Contact, Opportunity, Lead, and User objects. From those objects, most commonly-used standard fields (and some custom fields) are available as merge fields. From that set of fields, some fields may not be available to individual users because of field-level security settings.

### Templates

- Templates created in Salesforce Classic can't be used in Lightning Experience, and vice versa.
- Templates created from one object are available for that object only. For example, a template created for leads isn't available for selection from an opportunity record.
- Templates you create are automatically public: they're available for use by others in your organization.

### Attachments

- Chatter must be enabled before you can attach files to emails or templates.
- Content Deliveries must be enabled before you can select and attach files from Salesforce Files.
- Any attachment larger than 3 MB is sent as a content delivery link, not as a file. For emails with multiple attachments, if any one attachment exceeds 3 MB, then *all* attachments are sent as content delivery links.
- If you don't have access to a file, you can't attach it to an email or a template. We let you know if you need access, so you can ask the file's owner.

### EDITIONS

Available in: Salesforce  
Lightning Experience

Developer, Enterprise,  
Group, Professional,  
Performance, and Unlimited  
editions

- Access becomes public, via the link, for files attached to emails from Salesforce Files. Public access allows anyone with the link to view, share, and download the file.

## SEE ALSO:

[Add Images and Files to Email Messages in Case Feed](#)

## Send Email from a CRM Record

You can send rich text email from a number of CRM features, including accounts, contacts, leads, and opportunities. Use email to collaborate with other Salesforce users at your company, as well. Insert merge fields from the CRM object you're on. Add attachments. If you select a template that has attached files, you need file access to include them in emails you send from that template. Task records are created for sent emails. Find a link to sent email in the Activity feed of the record it was sent from or on related records.

1. Open the record from which you want to send the email.
2. Click the Activity tab and then click **Email**.
3. Write your email. Add attachments if you need to.
4. Preview and send.  
Click the Activity tab again to find a link to the email in Past Activity. You can also find a link in the Activity feed on related records.

**Example:** Jane is working a deal, or opportunity, to sell 600 widgets to Acme Corporation. The contact for Acme is John Stamos and the opportunity record is Acme 600 Widgets. Jane needs to send an email to John, including a term sheet, and she wants that activity associated with the 600 widgets opportunity record. It's also handy to have email activity available from John's contact record. Jane opens the Acme 600 Widgets record and writes the email, attaching the term sheet. After she sends the email, she can find a link to a task with email details from the feeds on the Acme 600 Widget opportunity record and the John Stamos contact record.

## Find Email Sent From a Salesforce Record

After you send an email, we create a task so you can review the email details if you need to. The Activity feed includes a link to that task. If you sent email to a contact or lead, each of those records includes a link to the task. For emails that *don't* include any contacts or leads as recipients, the task and the feed item are created for the object you were on when you sent the email.

1. Open either the record that was open when you sent the email or the record for the contact or lead you sent it to.
2. Click the Activity tab to find the email in Past Activity.
3. Click the email link to open its task, where you can view the message and related details.

## Create a Template to Standardize Common Emails

Create email templates to save time and standardize email sent by you or others in your organization. Use merge fields if you need them. Your page layout and field-level security settings determine which fields are available for merging. Templates you create are automatically public: they're available for use by others in your organization.

Templates created from one object are available for that object only. For example, a template created for leads isn't available for use from an opportunity record.

 **Tip:** Found a great template that would work for you with a few modifications? Select that template, then edit away. Save it as a new template.

1. Open a record, such as an opportunity or account, that offers integrated email.
2. Click the Activity tab, then click the Email tab.
3. Compose the email to use as your template. Templates can include all the features of other email: rich text, merge fields, and attachments. Go nuts!
4. Click the Templates icon and then save the template as new.

## Use a Template to Standardize Email You Send

Use a template to save time and standardize email you send. You can create your own or use templates created by others in your organization. If you select a template that has attached files, you need file access to include them in emails you send from that template. If you need file access, we'll let you know.

1. Open the record from which you want to send email.
2. Click the Activity tab, then click the Email tab.
3. To insert a template, click the Templates icon. Select the template you want and its contents appear. Edit as needed, then preview and send!

# Working with Salesforce Email

## Email Overview

There's no limit on sending individual emails to contacts, leads, person accounts, and users in your organization directly from account, contact, lead, opportunity, case, campaign, or custom object pages.

With mass email in Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, you can email a list of contacts, leads, or person accounts for small-scale sales or support. Mass email is intended to facilitate your business processes, not replace your existing email application or handle mass-marketing campaigns.

Using the API or Apex, you can send single emails to a maximum of 1,000 external email addresses per day based on Greenwich Mean Time (GMT). Single emails sent using the Salesforce application don't count toward this limit. There's no limit on sending individual emails to contacts, leads, person accounts, and users in your organization directly from account, contact, lead, opportunity, case, campaign, or custom object pages.

You can send mass email to a maximum of 1,000 external email addresses per day per organization based on Greenwich Mean Time (GMT). The maximum number of external addresses you can include in each mass email depends on your edition:

Edition	External Address Limit per Mass Email
Personal, Contact Manager, and Group Editions	Mass email not available
Professional Edition	250
Enterprise Edition	500
Unlimited and Performance Edition	1,000

### EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Mass email not available in: **Personal, Contact Manager, and Group Editions**

 **Note:** Note the following about email limits:

- The single and mass email limits don't take unique addresses into account. For example, if you have john.doe@example.com in your email 10 times, that counts as 10 against the limit.
- You can send an unlimited amount of email to your organization's internal users, which includes portal users.
- In Developer Edition organizations and organizations evaluating Salesforce during a trial period, your organization can send mass email to no more than 10 external email addresses per day. This lower limit does not apply if your organization was created before the Winter '12 release and already had mass email enabled with a higher limit. Additionally, your organization can send single emails to a maximum of 15 email addresses per day.

When you send an email, you can choose a predefined template for the message. To personalize your message, the template can include merge fields that are replaced with information from the Salesforce record when the email is sent. For instance, your organization may want to use a standard template to communicate solution information to customers with cases. Your administrator maintains organization-wide templates, and you can maintain your own personal templates.

SEE ALSO:

[Edit Email Settings](#)

[Connect for Outlook is Retired](#)

## Mass Email Status Messages

If you're configured to receive email notifications for mass emails, you'll see an auto-generated status email from Salesforce for each mass email you send. The subject line of the status email contains the value you entered in the `Mass Email Name` field when sending the mass email.

The status message shows the number of recipients that the mass email was both addressed and sent to. These numbers may differ because:

- The mass email would cause your organization to exceed its daily mass email limit. Salesforce does not send the message to any of the intended recipients in this case.
- One or more selected recipients opted out of receiving mass email after the mass email was scheduled but before it was processed.
- One or more selected recipient email addresses were removed from the contact or lead after the mass email was scheduled but before it was processed.
- The user who sent the mass email was deactivated after the mass email was scheduled but before it was processed. Salesforce does not send mass emails scheduled by a user who is deactivated.

To turn on the notification option, from Setup, enter `Deliverability` in the `Quick Find` box, then select **Deliverability**. Then select `Notify sender when mass email completes`.

[Guidelines on Sending Mass Email](#)

[Configure Deliverability Settings](#)

[Find Your Personal Settings](#)

## What's Email to Salesforce?

If you use a company-provided or third-party email account, you can use Email to Salesforce to assign emails to leads, contacts, opportunities, and other records in Salesforce. When composing, forwarding, or replying to email, simply enter your Email to Salesforce address in the **BCC** field or any recipient field. Salesforce receives a copy of the email and, depending on your configuration, adds it to either the Activity History related list of the matching records or to the [My Unresolved Items](#) page, where you can manually assign it.

### Tips

- An administrator must activate Email to Salesforce for your organization. After activation, Salesforce generates a unique Email to Salesforce address for each user. Users receive an automated email from Salesforce that contains their Email to Salesforce address. Users can view their Email to Salesforce address in their personal settings. The Email to Salesforce address is automatically generated and cannot be changed.
- You can also save a message as an email activity without sending or resending it to another person. Simply forward the email with your Email to Salesforce address in the **To** field. Be sure that there are no other email address in the **To**, **CC**, and **BCC** fields. Salesforce receives a copy of the email and searches the **From**, **To**, and **CC** fields in the forwarded email for the email addresses of your leads and contacts. If any leads or contacts are found, Salesforce saves the email in the Activity History related list on the appropriate record.
- When you use Email to Salesforce to save a message as an email activity, the default task type is specified by the `Send Email Default` setting. You can change the default value by editing the `Task Type` picklist field.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

- You don't need to configure Email to Salesforce to associate emails to matching records. Salesforce searches emails sent to your Email to Salesforce address for a record ID, then looks for the record. If related records are found, Salesforce adds the email to either the Activity History related list on those records or to the My Unresolved Items page, where you can manually assign them.

## Notes

- You can use Email to Salesforce with email client applications such as IBM® Lotus Notes® and Microsoft® Outlook®, as well as webmail such as Gmail® and Yahoo! Mail®.
- The email addresses you use to send email to Salesforce must be configured in the `My Acceptable Email Addresses` field in the My Email to Salesforce setup page.
- Email to Salesforce attempts to match the email address found in the **To** or **CC** fields with the one in the **Email** standard field. It doesn't support matching on custom email fields.
- The maximum number of email addresses that Email to Salesforce can match is 50. If the combined number of addresses in the **To** and **CC** fields exceeds this limit, Email to Salesforce processes only the first 50 unique addresses in the email.
- If Email to Salesforce matches an email address to multiple lead or contact records in Salesforce, you can choose to associate the email with all matching records, the oldest record, or the record with the most activity.
- If Email to Salesforce matches an email to multiple opportunity records in Salesforce, the email is included in the activity history on all matching open records.
- If you configure Email to Salesforce to associate emails to matching leads or contacts, Salesforce searches the **To** and **CC** fields for the email addresses of your leads or contacts. If any leads or contacts are found, Salesforce saves the email to the Activity History related list on the appropriate record.
- If you configure Email to Salesforce to associate emails to matching opportunities, Salesforce searches the **To** and **CC** fields for the email addresses of your contacts. If contacts are found, Salesforce saves the email to the Activity History related list on all open opportunities, as long as the contact is assigned a contact role on the opportunity. For example, the contact may be assigned the role of Decision Maker on an opportunity.
- Email to Salesforce can create a maximum of 50 email activities for each email it receives. It can relate up to 50 contacts to each email task record.
- The size limit for an attached file is 25 MB when attached directly to the related list. The size limit for multiple files attached to the same email is 25 MB, with a maximum size of 5 MB per file. For each matching record, all attachments sent with the email are duplicated, which affects your data size limit. Any attachments that aren't added are listed in the confirmation email you receive from Salesforce.
- Email text and HTML is automatically truncated to 32 KB.
- Email to Salesforce is required to use the Add Email feature with Salesforce for Outlook. Disabling one feature will automatically disable the other. With Salesforce for Outlook, you add emails using the **Add Email** and **Send and Add** toolbar buttons instead of the **BCC** field.
- If Salesforce can't match any email addresses for recipients that appear in the **To** and **Cc** fields of emails you add to Salesforce, the My Unresolved Items page displays one row for each email.

## SEE ALSO:

[Set Up Email to Salesforce](#)

[Adding Email with Email to Salesforce](#)

## Set Up Email to Salesforce

Before you can use your Email to Salesforce address, configure it.

1. From your personal settings, enter *Email to Salesforce* in the *Quick Find* box, then select **My Email to Salesforce**.
2. Enter the email addresses you'll use to send email in *My Acceptable Email Addresses*. Separate multiple email addresses with commas.

 **Important:** Your Email to Salesforce address accepts only email from addresses you enter. If you don't enter any email addresses, email sent to your Email to Salesforce address won't be associated to any records.

3. Choose whether you'd like either all emails to be sent to *My Unresolved Items* so you can manually assign them to related records, or to have Salesforce first try to automatically assign them.
4. Configure Email to Salesforce to add emails as activities to matching opportunities, leads, contacts, or all three.
5. If you selected leads or contacts, choose how Email to Salesforce should process emails containing lead or contact information that matches duplicate records. Email to Salesforce can add the email activity to either all matching records, the oldest duplicate record, or the record that has greatest number of activities.
6. If you selected leads or contacts, you can select *If no matching records are found, create a task and send it to My Unresolved Items* to have the email sent to *My Unresolved Items* if no matching records are found. If this checkbox isn't selected and Salesforce can't identify the email addresses in the *To* or *From* fields, the email won't be saved in Salesforce.
7. Select *Always save email attachments* to save attachments on emails sent to Salesforce. The size limit for an attached file is 25 MB when attached directly to the related list. The size limit for multiple files attached to the same email is 25 MB, with a maximum size of 5 MB per file.
8. If you want to receive a confirmation email when emails are successfully associated, select *Email me confirmation of association*.
9. Enter email domains you want to exclude from automatic association in *Excluded Domains*. Separate multiple email domains with commas.  
  
Emails coming from these excluded domains go to *My Unresolved Items*. From there, you can choose to either manually assign them, or leave them unassigned.

10. Click **Save**.

 **Tip:** Easily retrieve your Email to Salesforce address by adding it to the address book of your email program.

## Adding Email with Email to Salesforce

You can add emails to matching leads, contacts, or opportunities.

1. Compose an email from a third-party email account that you designate in **My Acceptable Email Addresses** on the My Email to Salesforce setup page.
2. Enter your Email to Salesforce address in the **BCC** field of your email.
3. Enter desired recipients in the **To**, **CC**, and **BCC** fields.
4. Send the email. Salesforce receives the emails and, based on your My Email to Salesforce settings, adds them to either the Activity History related list of matching records or the My Unresolved Items page, where you can manually assign them. Unresolved emails also appear in your open task list.

You can add emails to specific Salesforce records.

1. Compose an email from a third-party email account that you designated in **My Acceptable Email Addresses** on the My Email to Salesforce setup page.
2. In Salesforce, locate the record ID of the record with which you want the email associated. The record ID is the 15-digit, case-sensitive, alphanumeric code that displays at the end of the URL for a record. For example, if you view the detail page of a campaign record, the URL will look similar to this: `https://na1.salesforce.com/701D0000000HQZy`; the record ID for this record is `701D0000000HQZy`.
3. In the subject line or body of the email, type `ref:` followed by the record ID. For example: `ref: 701D0000000HQZy`.

**Note:** Record IDs can either be typed on a separate line or within the email body text if surrounded by (), [], or {}. For example: `(ref: 701D0000000HQZy)`. Multiple record IDs must be separated with commas, for example: `ref: 701D0000000HQZy, 801D0000000IRAz, 901D0000000JSBa`.

4. Enter your Email to Salesforce address in the **To**, **CC**, or **BCC** fields of your email.
5. Optionally enter additional recipients in the **To**, **CC**, or **BCC** fields.
6. Send the email.

Salesforce receives the emails and adds them to the Activity History related list for each record that matches a record ID specified in the email. Invalid IDs or IDs for records that you do not have read access to are ignored.

If Email to Salesforce is configured to associate email with matching leads, contacts, or opportunities, an unresolved task is created when an email is associated to a lead, contact, or opportunity using only a record ID and not a matching email address. For example, if you have configured emails to be associated with matching leads and you send an email directly to your Email to Salesforce address with a lead record ID in the body or subject line of the email, the email is associated to the lead and an unresolved task is created.

### EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

## Sending Email

To send email to a contact, lead, person account, or other user:

1. Click **Send An Email** on the Activity History related list of a record. Or, from a case, click **Send An Email** or **Reply** from the Email related list. This option is available only to organizations using Email-to-Case or On-Demand Email-to-Case.
2. Optionally, specify the sending address of the email from the **From** drop-down list for emails associated with Email-to-Case or On-Demand Email-to-Case; or if the email name or email address in your email settings is different from the email name or email address on your user record.

When creating a new outbound Email-to-Case or On-Demand Email-to-Case message, the **From** address is auto-populated with your name. When replying to an inbound message, the **From** address is auto-populated with the routing address to which the email was sent.

If you [previously defined any organization-wide addresses](#), the email addresses associated with your user profile also appear in this drop-down list. Organization-wide addresses are not available for Mass Email, or Stay-in-Touch requests.

3. If you want to remove any HTML formatting and send a text email, click **Switch to Text-Only**. Click **Switch to HTML** to use HTML formatting or to track the email.
4. Enter a contact, lead, or person account in the **To :** field. Only one name can be entered in the **To :** field. For contacts and leads that have multiple email fields, you can select an email address.
5. Optionally, choose another record, such as an account, case, or custom object, to associate with the email.
6. Optionally, if you want other people to receive the email as primary recipients, enter email addresses in the **Additional To :** field, or click the **Additional To :** link to select individuals from a list. These people do not need to be Salesforce records. Email addresses can be separated by semicolons, commas, spaces, or new lines.
7. In the **CC :** and **BCC :** fields, enter any additional email addresses, or click the **CC** or **BCC** link to select individuals from a list. Email addresses can be separated by semicolons, commas, spaces, or new lines.  
If your organization has enabled compliance BCC emails, the **BCC :** field is not available and your **Automatic Bcc** setting under My Email Settings is disabled.
8. Enter a subject and body for the email, or click **Select Template** to choose a [predefined email template](#). Choose a folder and select a template from the folder. If necessary, you can modify the content of the template in your email; however, you cannot modify Custom templates.

**Warning:** If you modify the template contents, your changes affect only the HTML version of the email template. The changes are not reflected in the text-only version of the email sent to recipients.

When replying to an Email-to-Case or On-Demand Email-to-Case email, the original email is included in the email body. All or parts of this email can be deleted.

9. If you chose an HTML email template, use the format toolbar to format your text. For more information, see [Using the Format Toolbar](#). Available in Professional, Enterprise, Unlimited, Performance, and Developer Editions only.
10. Optionally, select **Attach File** to add a file. You can attach multiple files as long as the total size of all attached files does not exceed 10 MB.
11. If Spell Checker is enabled for your organization, click **Check Spelling** to spell-check the body of the email. Spell Checker does not support all the languages that Salesforce supports. For example, Spell Checker doesn't support Thai, Russian, and double-byte languages, such as Japanese, Korean, or Chinese.

### EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

### USER PERMISSIONS

To send emails:

- "Send Email"

To create an organization-wide address:

- "Modify all Data"

If you are using an email template, the **Check Spelling** button is available for text templates and Visualforce templates without HTML tags.

## 12. Click **Send**.

If the recipient does not have an email address, Salesforce prompts you to edit the person's email address and click:

- **Save Address** to add the email address to the record without sending the email.
- **Save Address and Send** to add the email address to the record and send the email.

SEE ALSO:

[Guidelines for Sending Emails](#)

## Send Mass Email

Send an email message to contacts, leads, person accounts, or coworkers in Salesforce.

Watch a Demo:  [Sending Mass Email](#)

### 1. Choose the type of recipient for your mass email:

#### **Contacts or person accounts**

In the Contacts or Cases tab, in the Tools section at the bottom of the page, click **Mass Email Contacts**. If your Salesforce organization has person accounts, the link also appears in the Accounts tab.

#### **Leads**

In the Leads tab, in the Tools section at the bottom of the page, click **Mass Email Leads**.

#### **Coworkers (other Salesforce users)**

If you have the "Manage Users" permission, from Setup, enter *Mass Email Users* in the Quick Find box, then select **Mass Email Users**.

### 2. Select a list view of recipients and click **Go!**. By default, the My Contacts, My Leads, Active Users, or My Cases views include all records with an email address. To change the list of recipients, create a custom view.

A contact, lead, or person account isn't included in any email list views if the record contains no email address or if **Email Opt Out** is selected. Person accounts are included in contact list views.

### 3. All recipients in the list view are selected by default. To remove recipients, deselect them.

### 4. Click **Next**.

### 5. Choose an email template.

 **Note:** You can't send a mass email using a Visualforce email template.

### 6. To view the templates, click the **Preview** links. In the email template preview window, the template displays any merge fields included in it, such as `{ !Account.AccountNumber }`. When you send your email, data from the recipients' records, or any applicable substitute text, is inserted into the email in place of those merge fields.

### 7. Click **Next**.

#### EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

#### USER PERMISSIONS

To send mass emails to contacts, person accounts, or leads:

- "Mass Email"

To send mass emails to coworkers:

- "Mass Email"

AND

"Manage Users"

To send mass emails and log them in the Activity History related list:

- "Mass Email"

AND

"Edit Tasks"

8. On the confirmation page, select or deselect processing options:

- **BCC me on one message**
- **Store an activity for each message** (selected by default)

The Activity History item is associated with the contact, lead, or person account and displays as “Mass Email:<Template Description>.” The email subject, body, and attachments aren’t stored in the Activity History item. Logging Activity History items requires access for viewing or editing the records in the recipient list and the “Edit Task” permission.

- **Use my signature**

If you like, include your email signature in the email. You can include a signature in text emails only.

- **Mass Email Name**

Enter a name you can use to identify this mass email in the mass email queue. This name appears only in the mass email queue and status messages you receive from Salesforce, not in the mass email you’re sending.

9. In Delivery Options, send the email or choose a date and time zone for sending the email in the future.

**Note:** From your personal settings, you can enter *Mass Emails* in the *Quick Find* box, then select **Mass Emails** or **My Mass Emails** to view and cancel mass emails that you’ve scheduled. If you have the “Manage Users” permission, from Setup, enter *Mass Emails* in the *Quick Find* box, then select **Mass Emails** to view and cancel mass emails scheduled by anyone in your Salesforce organization.

10. Click **Send** and then click **Finished**.

[Guidelines on Sending Mass Email](#)

[Mass Email Status Messages](#)

## Guidelines for Sending Emails

Be aware of these guidelines for general email functions, attachments, and obsolete addresses.

### General Email Functions

#### Who Can Send Email

You can send email related to any record, as long as you have access to view or edit the record.

#### Email Displayed in Activity History

Emails sent using the **Send an Email** button are listed in the Activity History list of the related records. Exception: On lead records, if the sender leaves the *To* field blank, the email doesn’t appear in the activity history.

The Activity History item is titled “Email: *Subject*.” You can click the email subject to view the body of the email.

#### Email on Cases

Emails sent from the Email related list of a case are saved in the Email related list. This functionality is available only for organizations with Email-to-Case or On-Demand Email-to-Case enabled.

#### Visibility of Fields

If your page layout or field-level security settings prevent you from viewing a field, that field isn’t available in email templates.

### EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

## Email with Attachments

### Linking to Attachments

If the combined file size of attachments to an email exceeds 3 MB, or if you use mass email, Salesforce sends any combination of attachments as a single link. For example, suppose you send two attachments, each of which is 1.7 MB. The recipients receive two links because the combined file size is 3.4 MB.

When recipients click the attachment link in the email, the attachment opens in a separate Web browser, and they can download the file. Attachments sent as links are stored for 30 days.

### Storage of Attachments

Attachments aren't stored with email sent from Salesforce. To be saved with an email, an attachment must be either associated with the email later or sent to Salesforce using Email-to-Case, Email-to-Salesforce, On-Demand Email-to-Case, or Salesforce for Outlook.

## Handling of Obsolete Email Addresses

### Updating an Obsolete Email Address

If bounce management is activated and an email bounces, Salesforce displays an error message. To update the email address and send the email to the updated address, click the link in the error message.

SEE ALSO:

[Sending Email](#)

[Send Mass Email](#)

## Guidelines on Sending Mass Email

When sending mass email, note the following.

### Tips

- Before you send a mass email, create a custom view of contacts, leads, person accounts, or cases without an email address. In the search criteria, choose "Email equals," and leave the third field blank. You can then update those records before sending your emails. Unfortunately, there is no way to validate an email address without sending an actual email message.
- If your template contains a merge field for which there is no data in a particular record, that field does not appear in the email you send. To find such blank fields, modify your recipient list view to search for the merge fields you are using in your template, and enter the criterion "<field> equals," leaving the third field blank. Edit those records that have blank fields before you send your emails.
- You can send a mass email to a recipient list that consists of contacts, leads, person accounts, or users you can view in Salesforce.

### Notes

- If the email deliverability option [Notify sender when mass email completes](#) is selected, you receive an auto-generated status email from Salesforce for each mass email you send. The subject line of the status email contains the value you entered in the `Mass Email Name` field when sending the mass email.
- Attachments in mass emails are sent as links rather than as physical files. When recipients click the attachment link in the email, the attachment opens in a separate Web browser, and they can download the file. Attachments sent as links are stored for 30 days.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

## Limitations

- Mass email can only be sent to an address in a standard email field. Mass email using a custom email field is not supported.
- If a standard email field is hidden by field-level security, the **Mass Email** links for contacts and leads don't appear.
- Email templates give you access only to the fields that are accessible to you via your page layout and field-level security settings. (Field-level security is available in Enterprise, Unlimited, Performance, and Developer Editions only.)

### SEE ALSO:

[Send Mass Email](#)

[Configure Deliverability Settings](#)

## Tracking HTML Email

After sending an HTML email, you can track the date it was first opened, the number of times it was opened, and the date it was most recently opened.

Detail pages for contacts, leads, and person accounts include an HTML Email Status related list. Each email you send to a person or mass distribution list is listed, including the date the email was sent, first opened, last opened, and the total number of times it was opened by all users (multiple openings by the same user are counted). This list also includes automatic emails such as those sent through Web-to-Lead and Web-to-Case response rules.

- Click **Send An Email** to create a new message. See [Sending Email](#) on page 1519 for more details on sending an email.
- Click **View All** to view more details about all the items in the HTML Email Status related list.
- Click **Edit** next to an email to add any notes to it.
- Click **Del** to remove an email from the HTML Email Status related list.
- Click the subject of an email to view the entire email message. If the subject is longer than 100 characters, it is truncated with ellipses (...).

To report on the HTML email statistics listed in the HTML Email Status related list, use the HTML Email Status Report available from the Reports tab.

 **Note:** Add the HTML Email Status related list to your contact, lead, and person account page layouts before users send HTML emails that they need to track.

## Resolving Your Unassigned Emails

When emails are sent to Salesforce using Email to Salesforce or Salesforce for Outlook, some are automatically assigned to related records based on your Email to Salesforce settings. The rest are added to My Unresolved Items, where you can either assign them to related Salesforce records or confirm that you want to leave them unassigned.

1. Access your unresolved emails from the sidebar shortcut **Unresolved Items**.
2. Depending on how you want to resolve an email, choose either of these actions.
  - Assign to related records—Enter a related record in one or both fields. If you need to, first select the correct record type from the drop-down list. If you assign a lead, you can't assign additional records. Clear an entry to cancel an assignment.
  - Leave unassigned—Click **Don't Assign**. The text *Unresolved Email:* is removed from the subject line and the email is assigned to you as a completed task. If the task's *Status* picklist includes more than one "completed" status, we use the first one.
3. Click **Save** to save your changes. All modified items are removed from the list. You can return any time to resolve remaining items. Clicking **Cancel** cancels all changes on the page. The email is added to the Activity History or Open Activities related list of the associated records.

### Tips

- Unresolved emails also appear in your open task list. You can resolve an email from the email's task record by assigning it to other Salesforce records. Assigned and completed emails are automatically removed from your unresolved emails and open task lists.
- Click ► next to an email to see its details.
- Click **Email to Salesforce Settings** to view your email assignment settings.

## Email Fields

A Salesforce outbound email has the following fields, listed in alphabetical order.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience (only when prompted to resolve Salesforce for Outlook items from the Windows system tray)

Available in all editions

### USER PERMISSIONS

To view or edit unresolved emails:

- "Edit" on tasks and "Read" on the objects you assign to the email
- AND
- Email to Salesforce
- OR
- Add Email in Salesforce for Outlook and Email to Salesforce

To create new Salesforce records:

- "Edit" on tasks
- AND
- "Show Quick Create" and "Create" on those objects

To see recently used data in the related records fields:

- "Lookup Auto-Completion" in Search Settings

### EDITIONS

Available in: Salesforce Classic

Available in: **All** Editions

Field	Description
Additional To	Other recipients of the email. These people don't need to be associated with Salesforce. You can separate email addresses by semicolons, commas, spaces, or new lines.
Attachment	List of the attached files. The maximum total size of all email attachments is 10 MB.
BCC	List of email addresses to which the email is blind carbon copied. Up to 2000 characters are allowed in this field. You can separate email addresses by semicolons, commas, spaces, or new lines. Emails with addresses that contain parentheses, such as john(smith)@acme.com, will not be sent.  If your organization has enabled compliance BCC emails, the BCC : field is not available.
Body	Main text of the email. Up to 384 KB of data are allowed in this field.
CC	List of email addresses to which the email is copied. Up to 2000 characters are allowed in this field. You can separate email addresses by semicolons, commas, spaces, or new lines. Emails with addresses that contain parentheses, such as john(smith)@acme.com, will not be sent.
Email Format	The format of the email (Text or HTML). To use HTML formatting or to track the email, select <b>Switch to HTML</b> .
From	Automatically generated field containing your email address.
Related To	Existing account, asset, campaign, case, contract, opportunity, product, solution, or custom object that the email is related to. This field is not sent with the email, but is stored in the Activity History with the email.
Signature	Your personalized tag line. Set your signature by going to your personal settings, entering <i>My Email Settings</i> in the Quick Find box, then selecting <b>My Email Settings</b> . It is automatically appended to individual emails. You can choose to append it to mass emails.
Subject	Subject of the email. Up to 80 characters are allowed in this field. The contents of this field display in bold if the email status is New.
To	Name of the contact, lead, or person account to which the email is sent. Only one name can be entered in this field.

## Using Salesforce-Integrated Email FAQs

### Can I use Salesforce to send mass emails?

If you want to send mass marketing emails, we suggest using a third-party application in the [AppExchange](#) that allows you to centrally manage email campaigns and track the responses back to Salesforce. This allows your marketing team to track the number of qualified leads and ROI for their email campaigns.

If you want to send mass sales emails, in Salesforce click **Contacts**. Then, in the Tool section, choose **Mass Email Contacts**, and follow the Mass Email wizard.

SEE ALSO:

- [General Importing Questions](#)
- [Send Mass Email](#)
- [Can I use Salesforce to send HTML emails?](#)

### Can I use Salesforce to send HTML emails?

Yes, you can use Salesforce to send HTML emails to contacts, leads, person accounts, and users in your organization. You can send emails to individuals, send mass emails to multiple contacts, and set up templates for HTML emails you send frequently.

SEE ALSO:

- [General Importing Questions](#)
- [Sending Email](#)

## Generating Form Letters with Templates

### Mail Merge Overview

A mail merge is the process of generating form letters and other Microsoft® Word documents that are personalized for the recipient, who is often a contact or lead. The content of each document is predefined in a mail merge template. Mail merge templates include variables called merge fields where data from your Salesforce records—for example a contact's name and address—displays in the generated document.

### Generating Single Mail Merge Documents

To generate a Microsoft Word document for an individual record, open the record's detail page and click **Mail Merge** on the Activity History related list.

 **Note:** Standard mail merge requires:

- Microsoft® Internet Explorer® versions 9, 10, and 11
- Microsoft Word 2003 or 2007
- Microsoft Windows® XP and Windows Vista® (32-bit only)

#### EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

## Generating Mass Mail Merge Documents

To generate Microsoft Word documents for multiple records, such as when sending a mass mailing, see the [Salesforce Bulk Mail Merge Process](#) document.

Alternatively, if Extended Mail Merge has been enabled for your organization you can easily generate mail merge documents—such as form letters with matching envelopes and address labels—for multiple records at the same time.

### SEE ALSO:

- [Installing the Mail Merge ActiveX Control](#)
- [Generating Mass Mail Merge Documents with Extended Mail Merge](#)
- [Sending Single Mail Merge Documents](#)

## Installing the Mail Merge ActiveX Control

With standard mail merge, the first time you generate a mail merge document you must install an ActiveX control that helps Salesforce communicate with Word. **You must be logged in as a Windows user with sufficient administrative privileges to download ActiveX controls.** If you are unable to download ActiveX controls, contact your IT department or Windows system administrator for assistance.

Standard mail merge requires:

- Microsoft® Internet Explorer® versions 9, 10, and 11
- Microsoft Word 2003 or 2007
- Microsoft Windows® XP and Windows Vista® (32-bit only)

Configure your Web browser to accept ActiveX controls as follows:

1. Click **Tools > Internet Options** to open the Internet Options dialog.
2. Go to the Security tab.
3. Click the icon for the **Internet** zone, then click **Custom level**.
4. In the “ActiveX controls and plug-ins” section, select **Enable** or **Prompt** for the following settings: “Download signed ActiveX controls,” “Run ActiveX controls and plug-ins,” and “Script ActiveX controls marked safe for scripting.”
5. In the “Downloads” section, select **Enable** for the “File download” setting.
6. Click **OK**.
7. Repeat the custom level settings above for the **Trusted sites** zone.
8. Ensure that Salesforce is a trusted site by clicking the **Sites** button and looking for `https://*.salesforce.com` in the list. If it is not there, type `https://*.salesforce.com` in the text box and click **Add**. Click **OK**.
9. Go to the Advanced tab of the Internet Options dialog.
10. In the Security section at the bottom of the Settings box, confirm that “Do not save encrypted pages to disk” is blank and does not have a check mark.
11. Click **OK**.
12. You may need to restart Internet Explorer for your changes to take effect.

If you use Internet Explorer 7 or 8, the first time you perform a mail merge, the popup message `Exception: Automation server can't create object` may occur. You can disregard this message. Click **OK** to close the popup and proceed with your mail merge.

### EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

 **Note:** Extended Mail Merge does not require the installation of an ActiveX control.

SEE ALSO:

[Mail Merge Overview](#)

## Managing Templates

Your administrator can create and maintain templates for defining letterheads, sending outbound email, and generating mail merge documents.

- Letterheads define the look and feel of your HTML email templates. Your HTML email templates can inherit the logo, color, and text settings from a letterhead.
- Email templates allow you to send email to contacts, leads, and others using predefined templates.
- Mail merge templates allow you to create custom documents using the information from your records. For example, you can create a customized thank you letter to a specific lead.

SEE ALSO:

[Create a Letterhead](#)

[Manage Email Templates](#)

[Managing Mail Merge Templates](#)

## Creating New Mail Merge Templates

1. Open a new blank document in Microsoft® Word 2002, 2003, or 2007.
2. Use Word to compose the document so it contains the text, data, and formatting your users require.
3. Locate the text or data variables in your Word document that will change each time the template is used. For example, in the salutation "Dear Bob," "Bob" is a variable because it will change when the letter is sent to a different person.
4. Replace each variable with the appropriate Salesforce merge field.

 **Important:** Each mail merge field label you use must be unique.

- If you have Connect for Office, you can [use Word integration](#) to insert merge fields quickly.
- If you do not have Connect for Office:
  - a. Place your cursor where you want to insert a merge field.
  - b. In Word 2003 and earlier, select **Insert** and then **Field** from the Word menu bar. In Word 2007, select the Insert tab on the Ribbon, click **Quick Parts** in the Text group, and then click **Field**.
  - c. Select **Mail Merge** in the Categories drop-down list.
  - d. Select **MergeField** in the Field names box.
  - e. In the Field Properties area of the Field name box, manually enter the valid merge field, such as `Opportunity_LineItem_ProductName`.

### EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

### EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

### USER PERMISSIONS

To upload mail merge templates:

- "Manage Public Templates"

To edit mail merge templates:

- "Manage Public Templates"

f. Click **OK**.

 **Note:** To list information about all products associated with an opportunity, insert the `Opportunity_LineItem_Start` merge field where you want to begin listing product information. Then, insert all the merge fields you want to include for each product on an opportunity. Finally, insert the `Opportunity_LineItem_End` to end the list.

5. Save your Word document.

6. Proceed to [Uploading Mail Merge Templates to Salesforce](#) on page 1532.

 **Tip:** For best results:

- Do not configure mail merge templates as “protected” or “restricted access” in Microsoft Word. Please refer to Word's help for information about protected Word documents. (In Word, press F1 to open help.)
- Do not connect mail merge templates to external data sources such as Excel worksheets or Access databases. Please refer to Word's help for information about restoring mail merge documents to what Word calls “normal Word documents.”

For details on how to set up your template with these tips in mind, refer to [Guidelines for Uploading Mail Merge Templates](#).

SEE ALSO:

[Managing Mail Merge Templates](#)

[Mail Merge Overview](#)

## Modifying Existing Mail Merge Templates

1. Download the [sample mail merge templates](#) and unzip the files to a convenient directory on your hard drive.
2. Review the instructions provided in `salesforce_mailmerge_templates_howto.doc`.
3. Open the desired sample template in Microsoft Word.
4. Save a copy of the sample template to your computer's desktop or other convenient location:
  - Word 2000, XP, and 2003 users, select **Save As** from the **File** menu then choose an appropriate file name and destination folder.
  - Word 2007 users, select **Save As** from the Office button then choose an appropriate file name and destination folder.
5. Optionally, customize the text and formatting of the template.
6. Press ALT+F9 to display the hidden mail merge field codes.  
Each of the mail merge fields should now appear in curly braces as follows: `{MERGEFIELD Contact_FullName \* MERGEFORMAT}`
7. Change or add merge fields as necessary.
  - If you have Connect for Office, you can [use Word integration](#) to insert merge fields quickly.
  - If you do not have Connect for Office:
    - a. Place your cursor where you want to insert a merge field.

### EDITIONS

To edit mail merge templates:

- “Manage Public Templates”

- b. In Word 2003 and earlier, select **Insert** and then **Field** from the Word menu bar. In Word 2007, select the Insert tab on the Ribbon, click **Quick Parts** in the Text group, and then click **Field**.
- c. Select **Mail Merge** in the Categories drop-down list.
- d. Select **MergeField** in the Field names box.
- e. In the Field Properties area of the Field name box, manually enter the valid merge field, such as `Opportunity_LineItem_ProductName`.
- f. Click **OK**.

 **Note:** To list information about all products associated with an opportunity, insert the `Opportunity_LineItem_Start` merge field where you want to begin listing product information. Then, insert all the merge fields you want to include for each product on an opportunity. Finally, insert the `Opportunity_LineItem_End` to end the list.

8. Save your Word document.
9. Proceed to [Uploading Mail Merge Templates to Salesforce](#) on page 1532.

 **Tip:** For best results:

- Do not configure mail merge templates as “protected” or “restricted access” in Microsoft Word. Please refer to Word’s help for information about protected Word documents. (In Word, press F1 to open help.)
- Do not connect mail merge templates to external data sources such as Excel worksheets or Access databases. Please refer to Word’s help for information about restoring mail merge documents to what Word calls “normal Word documents.”

For details on how to set up your template with these tips in mind, refer to [Guidelines for Uploading Mail Merge Templates](#).

[Mail Merge Overview](#)

## Create Mail Merge Templates with Microsoft® Word

Use the Connect for Office Word add-in, which provides a complete list of valid merge fields for you to insert.

 **Important:** Each mail merge field label you use must be unique.

1. Open Microsoft Word.

### 2. **If you use**    **You’ll**

Word 2003 or earlier    Select **Log In** from the **Salesforce** drop-down menu on the toolbar.

Word 2007    Open the Salesforce tab on the Ribbon, click the **Merge Fields** drop-down menu, and then select **Log In**.

3. Enter your Salesforce username and password.

#### EDITIONS

Available in: Salesforce Classic

Available in all editions

**4.** Click **Login**.

**Note:** When you are successfully logged in and have an active session, the **Log In** command in the drop-down button is disabled. To log out, click **Log Out**.

- 5.** Create your mail merge template from an existing or blank Word document.
- 6.** Place your cursor where you want to insert a Salesforce merge field. To replace an existing merge field, select the entire merge field in your template. Mail merge fields must be unique.
- 7.** In Word 2003 and earlier, select **Insert Merge Field** from the **Salesforce** drop-down menu. In Word 2007, click the **Merge Fields** drop-down menu at the Salesforce tab on the Ribbon, and then select **Insert Merge Field**.
- 8.** In the Insert Merge Fields dialog, select a field type and then select the merge field you want to insert. If you use products in Salesforce, see [Including Opportunity Product Data in Mail Merge Templates](#) on page 1531.
- 9.** Click **Insert** to add the merge field at your current cursor position in your Word document.
- 10.** Insert additional merge fields as desired to build your mail merge template.
- 11.** After your mail merge template is complete, upload it to Salesforce from Setup by entering *Mail Merge Templates* in the **Quick Find** box, then selecting **Mail Merge Templates**.

### Including Opportunity Product Data in Mail Merge Templates

Products are available in Professional, Enterprise, Unlimited, Performance, and Developer Editions. To add opportunity product data to your mail merge template, in the Insert Merge Fields dialog select Opportunity Line Item Fields and then select the fields to insert. This inserts a table with the selected merge fields and special “start” and “end” fields. (You can download sample [default mail merge templates](#) which include a table of opportunity product data.) You can modify this table as needed, but the `Opportunity_LineItem_Start` merge field must be before all opportunity product merge fields and the `Opportunity_LineItem_End` merge field must be after all opportunity product merge fields. These start and end fields trigger Salesforce to list all of the products on the opportunity.

If you also want to insert product merge fields into the table of opportunity product merge fields, you can do so manually without using the Salesforce Word add-in:

- 1.** In your Word document, place your cursor where you want to insert the merge field.
- 2.** In Word 2003 and earlier, select **Insert** and then **Field** from the Word menu bar. In Word 2007, select the Insert tab on the Ribbon, click **Quick Parts** in the Text group, and then click **Field**.
- 3.** Select **Mail Merge** in the Categories drop-down list.
- 4.** Select **MergeField** in the Field names box.
- 5.** In the Field name box in the Field Properties area, enter the merge field name manually, such as `Opportunity_LineItem_ProductName`.
- 6.** Click **OK**.

## Uploading Mail Merge Templates to Salesforce

Administrators and users with the “Manage Public Templates” permission must upload completed Microsoft Word mail merge templates to Salesforce to make them available for use.

 **Tip:** Before uploading a template, we recommend reviewing [Guidelines for Uploading Mail Merge Templates](#).

1. In Salesforce, from Setup, enter *Mail Merge Templates* in the Quick Find box, then select **Mail Merge Templates**.
2. Click **New Template**.
3. Enter a name and description for the template. This will help users correctly choose a template when generating mail merge documents.  
  
If your organization uses Extended Mail Merge, choose the appropriate document type: Document, Label, or Envelope.
4. Click **Browse** to select your Word mail merge template.
5. Click **Save** to finish.

### EDITIONS

Available in: Salesforce Classic

Available in all editions

### EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

### USER PERMISSIONS

To upload mail merge templates:

- “Manage Public Templates”

To edit mail merge templates:

- “Manage Public Templates”

## Using Letterheads

A letterhead defines the logo, page color, and text settings for your HTML email templates. For best results, create a single letterhead to use for all your HTML email templates. You can create letterheads and make them available organization-wide.

To use letterheads, from Setup, enter *Letterheads* in the **Quick Find** box, then select **Letterheads**.

From the Letterheads list page:

- To view a letterhead, select the name from the list.
- To edit a letterhead, click the name from the list and choose one of the edit options: **Edit Properties** or **Edit Letterhead**.
- To delete a letterhead, click **Del** next to the name. You cannot delete a letterhead that is used in any HTML email templates.

SEE ALSO:

[Create a Letterhead](#)

[Letterhead Fields](#)

## Create a Letterhead

Letterheads define the look and feel of your HTML email templates. Your HTML email templates can inherit the logo, color, and text settings from a letterhead.

A letterhead consists of properties and details. The properties are only visible inside your organization; they help users identify a letterhead. The details are applied to an email when using that letterhead. Use the letterhead wizard to create both the properties and details of your letterhead.

1. From Setup, enter *Letterheads* in the **Quick Find** box, then select **Letterheads**.
2. Click **New Letterhead**.

## Setting Letterhead Properties

1. Check **Available For Use** if you would like users to be able to use the new letterhead immediately.
2. Enter a **Letterhead Label**. The label is used to refer to the letterhead on user interface pages.
3. If necessary, change the **Letterhead Unique Name**. This is a unique name used to refer to the component when using the Force.com API. In managed packages, this unique name prevents naming conflicts on package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With the **Letterhead Unique Name** field, a developer can change certain components' names in a managed package and the changes are reflected in a subscriber's organization.
4. Enter a description for this letterhead. The name and description fields are for internal use only to describe the letterhead to other users.
5. Click **Save**. The letterhead detail page appears.

Available in all editions

### USER PERMISSIONS

To create or change letterheads:

- "Manage Letterheads"

## Setting Letterhead Details

1. Set the attributes for the letterhead.

- Click **Edit Background Color**, and enter a color for the background of your letterhead. Click the color picker button to choose a color.
- Click **Edit Header Properties**, and select the color, alignment, and height for the top section of the letterhead.
- Click **Select Logo** to include an image of your company logo in the top or bottom section of the letterhead.

 **Note:** You must upload the logo image to the Documents tab before you can add it to the letterhead. Make sure the document is marked as an `Externally Available Image` so it is visible to non-Salesforce users when it is received in an email. For more information, see “Uploading and Replacing Documents” in the Salesforce Help.

To select an image, choose a folder, and click the document name to attach the document. Alternatively, click **Search in Documents**, and enter the file name to search for documents by name.

- Click **Remove Logo** to delete the image from the letterhead.
- Click **Edit Top Line**, and enter a color and height for a horizontal line below the header. Click the color picker button to choose a color.
- Click **Edit Body Colors**, and enter the background color for the main body of your letterhead.
- Click **Edit Middle Line**, and enter a color and height for the middle border in your letterhead. Click the color picker button to choose a color.
- Click **Edit Footer Properties**, and select a color, alignment, and height for the bottom section of the letterhead.
- Click **Edit Bottom Line**, and select a color and height of a bottom horizontal line. Click the color picker button to choose a color.

2. Optionally, click **Preview** to display the letterhead in a separate browser window.

3. Click **Save**.

To create an HTML email template that contains the settings in your letterhead, see [Create HTML Email Templates](#) on page 1930.

## Letterhead Fields

Here is a description, in alphabetical order, of the fields that appear on the Letterhead Detail page.

Field	Description
Available For Use	Check mark that indicates the letterhead can be applied to an HTML template.
Created By	Name of the user who created the letterhead, including the date and time.
Description	Text that helps distinguish this letterhead from others.
Letterhead Label	Internal name to identify the letterhead.
Letterhead Unique Name	This is a unique name used to refer to the component when using the Force.com API. In managed packages, this unique name

Field	Description
	prevents naming conflicts on package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With the <code>Letterhead Unique Name</code> field, a developer can change certain components' names in a managed package and the changes are reflected in a subscriber's organization.
Modified By	Name of the user who last modified the letterhead, including the date and time.
Namespace Prefix	The namespace prefix used by the email template within the API.

## SEE ALSO:

[Create a Letterhead](#)

## Manage Email Templates

You can create four different types of email templates:

- **Text** - All users can create or change text email templates. See [Create Text Email Templates](#) on page 1538.
- **HTML with letterhead** - Administrators and users with the “Edit HTML Templates” permission can create HTML email templates based on a letterhead. See [Create HTML Email Templates](#) on page 1930.
- **Custom HTML** - Administrators and users with the “Edit HTML Templates” permission can create custom HTML email templates without using a letterhead. You must either know HTML or obtain the HTML code to insert in your email template. See [Create Custom HTML Email Templates](#) on page 1928.
- **Visualforce** - Administrators and developers can create templates using Visualforce. Visualforce email templates allow for advanced merging with a recipient's data, where the content of a template can contain information from multiple records. See [Create Visualforce Email Templates](#).

All of these email templates can include text, merge fields, and attached files. You can also include [images on your HTML and Visualforce templates](#). You can use email templates when you send an email from the Activity History related list of a record. Text and HTML templates can also be used when you send mass email. A button to check the spelling of your template is available for text templates and Visualforce templates without HTML tags.

 **Note:** You can't send a mass email using a Visualforce email template.

To access your email templates, do one of the following:

- If you have permission to edit public templates, from Setup, enter *Email Templates* in the **Quick Find** box, then select **Email Templates**.
- If you don't have permission to edit public templates, go to your personal settings. Enter *Templates* in the **Quick Find** box, then select **Email Templates** or **My Templates**—whichever one appears.
- Click on the name of any email template to go to the [Viewing Email Templates](#) page.
- To edit or delete a template, click **Edit** or **Del** next to the template name in the list.
- Click **New Template** to create any type of email template.

 **Note:** Email templates used in the following features must be both public and active:

- Web-to-Lead
- Web-to-Case
- Email-to-Case or On-Demand Email-to-Case
- Assignment rules
- Escalation rules
- Auto-response rules

### EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Mass email not available in: **Personal, Contact Manager, and Group Editions**

HTML and Visualforce email templates not available in: **Personal Edition**

### USER PERMISSIONS

To create or change HTML email templates:

- “Edit HTML Templates”

To create or change Visualforce email templates:

- “Customize Application”

To create or change public email template folders:

- “Manage Public Templates”

## Viewing Email Templates

To view a template, click the template name in the list. The options vary depending on the template type (custom, HTML, Visualforce, or text):

- For text templates, click **Edit** to change the message content, subject, or merge fields.
- For custom and HTML templates:
  - Click **Edit HTML Version** to change the content or merge fields of the HTML version.
    -  **Note:** All custom and HTML email templates include a text-only version for recipients who are unable to view HTML emails. If you leave the text-only version blank, the text-only version is automatically generated when you edit the HTML version.
  - Click **Edit Text Version** to change the content or merge fields of the text-only version.
    -  **Warning:** Salesforce recommends that you leave the text-only version blank. If you leave it blank, Salesforce automatically creates the text-only content based on the current HTML version. If you don't leave the text-only version blank and instead manually enter content, subsequent edits to the HTML version aren't reflected in the text-only version.
- For Visualforce templates:
  - Click **Edit Template** to change the markup of the template page.
  - The Visualforce Attachments related list indicates which attachments are being generated through Visualforce markup.
  - If the Visualforce markup references components in installed managed packages, such as another class, a trigger, a custom object, and so on, the Version Settings related list shows the package versions of the installed managed packages containing the referenced components.
  - If the email template includes encrypted data, keep in mind that the data displays encrypted within the generated email and when viewing the Visualforce template page. It doesn't display in plain text for security purposes.
- Click **Send Test and Verify Merge Fields** to view a sample of the template populated with data from records you choose and send a test email.
- Click **Attach File** from the Attachments related list to add an attachment to the template. The attached file is included in every email that uses the template.
 

To select a file:

  - Click the **Search in Documents** link to search for files in the Documents tab. If you select an image logo or other graphic file, make sure the document is marked as `Externally Available` on the Documents tab so all email recipients can view the image.
  - Alternatively, choose an option from the **File Location** drop-down list to select a file from your computer or from a document folder.
- If you have the “Manage Public Templates” permission, you can click **[Change]** next to the `Author` field to select a different author. Initially, the author is the person who created the email template.
- Click **Delete** to remove the template.
- Click **Clone** to clone a template. For more information, see [Clone Email Templates](#) on page 1542.
- If “Developer Mode” is enabled, click **Show Dependencies** to see what components the template references.

### EDITIONS

To create or change Visualforce email templates:

- “Customize Application”

To create or change public email template folders:

- “Manage Public Templates”

## Create Text Email Templates

- Do one of the following:
    - If you have permission to edit public templates, from Setup, enter *Email Templates* in the **Quick Find** box, then select **Email Templates**.
    - If you don't have permission to edit public templates, go to your personal settings. Enter *Templates* in the **Quick Find** box, then select **Email Templates** or **My Templates**—whichever one appears.
  - Click **New Template**.
  - Choose the **Text** template type, and click **Next**.
  - Choose a folder in which to store the template.
  - Select the **Available For Use** checkbox if you would like this template offered to users when sending an email.
  - Enter an **Email Template Name**.
  - If necessary, change the **Template Unique Name**. This is a unique name used to refer to the component when using the Force.com API. In managed packages, this unique name prevents naming conflicts on package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With the **Template Unique Name** field, a developer can change certain components' names in a managed package and the changes are reflected in a subscriber's organization.
  - Select an **Encoding** setting to determine the character set for the template.
  - Enter a **Description** for the template. Both template name and description are for internal use only.
  - Enter the **Subject** for the message.
  - Enter the text to appear in the message.
  - Optionally, enter merge fields in the template subject and text body. These fields will be replaced with information from your records when you send an email.
  - Click **Save**.
-  **Tip:** Click **Send Test and Verify Merge Fields** to view a sample of the template populated with data from records you choose and send a test email.

## Attaching Files to Templates

To add an attachment to a template:

- Do one of the following:
  - If you have permission to edit public templates, from Setup, enter *Email Templates* in the **Quick Find** box, then select **Email Templates**.
  - If you don't have permission to edit public templates, go to your personal settings. Enter *Templates* in the **Quick Find** box, then select **Email Templates** or **My Templates**—whichever one appears.
- Select a template.
- Click **Attach File** from the email template detail page.

### EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Mass email not available in: **Personal, Contact Manager, and Group Editions**

HTML and Visualforce email templates not available in: **Personal Edition**

### USER PERMISSIONS

To create or change public email template folders:

- "Manage Public Templates"

- Choose a folder and click the document name to attach the document, or click **Search in Documents** and enter the file name to search for a document by name.

Alternatively, click **My Computer** to attach a file from your computer.

The attached file is included in every email that uses the template. Note that attachments in mass emails are sent as links rather than as physical files (see [Send Mass Email](#) on page 1520).

## Using the Format Toolbar

Use the formatting toolbar to edit text in HTML. Select the text you wish to format and click the appropriate option described below:

Option	Description
<b>Font</b>	Choose a character style. Select the text you want applied to a font and then choose the appropriate font.
<b>Size</b>	Choose a character size. Select the text you want applied to the size and then choose the size.
	Insert a graphic from the documents library. This option is not available when doing some actions such as creating custom home page components.
	Choose a background color
	Choose a font color
	Make text bold
	Make text italic
	Underline text
	Insert a new hyperlink or edit an existing link. Select the text you want to link, click this button, and enter the URL for the link. To use a merge field such as { !Case_Link } as the destination of the link, insert the merge field after the <b>http://</b> .
	Left justify text
	Center text
	Right justify text
	Bullet a list
	Number a list
	Increase text indent
	Decrease text indent

## Create Custom HTML Email Templates

- Do one of the following:
  - If you have permission to edit public templates, from Setup, enter *Email Templates* in the **Quick Find** box, then select **Email Templates**.
  - If you don't have permission to edit public templates, go to your personal settings. Enter *Templates* in the **Quick Find** box, then select **Email Templates** or **My Templates**—whichever one appears.
- Click **New Template**.
- Choose **Custom** (without using Letterhead) and click **Next**.
- Choose a folder in which to store the template.
- Select the **Available For Use** checkbox if you would like this template offered to users when sending an email.
- Enter an **Email Template Name**.
- If necessary, change the **Template Unique Name**. This is a unique name used to refer to the component when using the Force.com API. In managed packages, this unique name prevents naming conflicts on package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With the **Template Unique Name** field, a developer can change certain components' names in a managed package and the changes are reflected in a subscriber's organization.
- Select an **Encoding** setting [to determine the character set for the template](#).
- Enter a **Description** of the template. Both template name and description are for your internal use only. The description is used as the title of any email activities you log when sending mass email.
- Click **Next**.
- Enter the **Subject** to appear in the email you send.
- Enter the HTML source text to appear in the message you send. This should include all the HTML tags.

 **Note:** If you are including an image, we recommend uploading it to the Documents tab so that you can reference the copy of the image that is on our server. For example:

```

```

- Optionally, enter merge fields in the template subject and body. These fields will be replaced with information from your lead, contact, account, opportunity, case, or solution when you send an email.
- Click **Next**.
- Optionally, enter the text-only version of your email or click **Copy text from HTML version** to automatically paste the text from your HTML version without the HTML tags. The text-only version is available to recipients who are unable to view HTML emails.

### EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Mass email not available in: **Personal, Contact Manager, and Group Editions**

HTML and Visualforce email templates not available in: **Personal Edition**

### USER PERMISSIONS

To create or change custom HTML email templates:

- “Edit HTML Templates”

To create or change public email template folders:

- “Manage Public Templates”

 **Warning:** Salesforce recommends that you leave the text-only version blank. If you leave it blank, Salesforce automatically creates the text-only content based on the current HTML version. If you don't leave the text-only version blank and instead manually enter content, subsequent edits to the HTML version aren't reflected in the text-only version.

16. Click **Save**.

 **Tip:** Click **Send Test and Verify Merge Fields** to view a sample of the template populated with data from records you choose and send a test email.

 **Note:** Users cannot modify the content of a custom HTML template when they select it for use in an email.

## Clone Email Templates

Cloning an email template involves saving an existing email template with a new name.

1. Do one of the following:
  - If you have permission to edit public templates, from Setup, enter *Email Templates* in the **Quick Find** box, then select **Email Templates**.
  - If you don't have permission to edit public templates, go to your personal settings. Enter *Templates* in the **Quick Find** box, then select **Email Templates** or **My Templates**—whichever one appears.
2. Click the name of an email template in the list.
3. Click **Clone**.
4. Choose a folder in which to store the template.
5. Select the **Available For Use** checkbox if you would like this template offered to users when sending an email.
6. Enter an **Email Template Name**.
7. Enter a **Description** for the template. Both template name and description are for internal use only.
8. Click **Save**.

### USER PERMISSIONS

To create or change HTML email templates:

- "Edit HTML Templates"

To create or change Visualforce email templates:

- "Customize Application"

To create or change public email template folders:

- "Manage Public Templates"

## Adding Images to Email Templates

You can include images or logos on your HTML and Visualforce email templates. For HTML with letterhead templates, logos or images come from the [letterhead](#) you choose when creating the template.

When creating custom HTML or Visualforce templates, simply include `img` tags that reference the image. We recommend uploading the images to the Documents tab and referencing the copy of the image on the Salesforce server. For example, for HTML:

```

```

Visualforce example:

```
<apex:image id="Logo" value="https://na7.salesforce.com/servlet/servlet.ImageServer?
id=015D0000000Dpwc&oid=00DD0000000FHgG&lastMod=1270576568000"
height="64" width="64"/>
```

## Email Template Fields

An email template has the following fields, listed in alphabetical order.

Field	Description
API Version	(Visualforce email templates only) Displays the version number of the Force.com API the template was created under.

### EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Mass email not available in: **Personal, Contact Manager, and Group Editions**

HTML and Visualforce email templates not available in: **Personal Edition**

### USER PERMISSIONS

To create or change HTML email templates:

- "Edit HTML Templates"

To create or change Visualforce email templates:

- "Customize Application"

To create or change public email template folders:

- "Manage Public Templates"

Field	Description
Author	The person who created the template.
Available for Use	Indicates if users can use the template when sending emails.
Created By	The name of the user who created the template.
Description	Description of the template. This text is used as the title of any activities logged when sending mass email. The Activity History item displays as "Mass Email: {Template Description}".
Template Unique Name	This is a unique name used to refer to the component when using the Force.com API. In managed packages, this unique name prevents naming conflicts on package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With the <code>Template Unique Name</code> field, a developer can change certain components' names in a managed package and the changes are reflected in a subscriber's organization.
Email Layout	(HTML email templates only) Name of the column layout sample that decides the text columns.
Encoding	Indicates the character set for the email template.
Folder	The place where the template is stored.
Last Used Date	The most recent date that any user sent an email using the template.
Letterhead	(HTML email templates only) Name of the letterhead that decides the logo, colors, and text settings. See <a href="#">Letterhead Fields</a> on page 1534 for more details.
Modified By	The name of the user who last modified the template.
Namespace Prefix	The namespace prefix used by the email template within the API.
Subject	Subject of the email. This text appears in the Subject field of every email sent with this template. It is also used as the title of an activity logged when sending a single email. The Activity History item displays as "Email: {Template Subject}". The subject is not stored in Activity History items that you log when sending mass email.
Email Template Name	Name to identify the template.
Text Body	Body of the email. This text appears in the body of every email sent with this template. The maximum size is 384 KB.
Times Used	The total number of times that users have sent emails using the selected template. This includes single and mass emails.

## Merge Fields for Cases

The list of available merge fields depends on the type of data that you're working with. Most of the merge fields for cases correspond directly with a case field. This table explains the more advanced merge fields that represent values derived from processing a case record.

Field	Merge Field	Description
Articles as PDFs	Case.Articles_as_PDFs	Articles associated with the case converted to PDF attachments.  In the Emails related list on the case detail page, users can click <b>Send an Email</b> and choose a template containing this merge field. The attachments can be previewed or deleted before the email is sent.
Email Thread	Case.Email_Thread	A thread of all emails where the case contact is a sender or recipient (To, CC, or BCC). The emails are listed in reverse chronological order so the most recent emails appear at the top of the thread. The thread inserts the text version of the emails. You can't use this merge field in Visualforce pages.  The limits for the email thread are: <ul style="list-style-type: none"> <li>• Maximum number of emails: 200</li> <li>• Email body truncation size: 32 KB</li> </ul>
Last Case Comment	Case.Last_Case_Comment	The description of the most recent comment to be created on a case.
Solution Attachments	Case.Solution_Attachments	Attachments for the case solution..
Solution Description	Case.Solution_Description	The details of the solution associated with the case. If more than one solution is associated with the case, the description of each solution appears in a list.
Solution Subject	Case.Solution_Subject	The title of the solution associated with the case. If more than one solution is associated with the case, the title of each solution appears in a list.
Solution Subject and Description	Case.Solution_Subject_and_Description	The title and details of the solution associated with the case. If more than one solution is associated with the case, the title and description of each solution appears in a list.

### EDITIONS

Available in: Salesforce Classic

The available merge fields vary according to which Salesforce edition you have.

Field	Merge Field	Description
Suggested Solutions	<code>Case.Suggested_Solutions</code>	Links to the subject and description of each suggested solution that may help customers solve their issues.   <b>Note:</b> Sending mass emails using templates with the suggested solutions merge field could take several minutes and is not recommended.
Case Thread Id	<code>Case.Thread_Id</code>	A unique identifier for the case email thread in Email-to-Case. The thread ID is the unique ID of each case email, such as [ref:_DV0Txx._500V0U9YB:ref]. By default, the thread ID is added to both the subject and body of case emails. The default location for the thread ID is at the end of the body. Use this merge field to position it elsewhere in the body.

## Notes on Merge Fields for Cases

### Merge fields for entitlements on cases

Merge fields for entitlements on cases aren't supported. For example, if you add the `Entitlement Name` `{!Case.Entitlement}` merge field to an email template, the field is not populated on the template.

### Merge fields for Email-to-Case or On-Demand Email-to-Case

If you have enabled Email-to-Case or On-Demand Email-to-Case, you can create email templates that support agents can use to respond to case emails. These templates can include merge fields that display information from the original email in the response. See [Manage Email Templates](#) on page 1536.

### Merge fields for Web-to-Case

To reference the name, email, phone, or company of the customer who submitted an online case with Web-to-Case, use the relevant `{!Case_OnlineCustomer...}` field. To reference the contact or account associated with a case, use the relevant contact or account merge fields.

## Merge Fields for Communities

You can add merge fields to Communities email templates.

When you enable Salesforce Communities in your organization, three text-based email templates are created:

- Communities: Changed Password Email
- Communities: Forgot Password Email
- Communities: New Member Welcome Email

These templates use unique merge fields. These merge fields are not available to select and copy when editing a template, but you can enter them manually. These merge fields will only work properly if used in a text or HTML template selected for a community.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Field Name	Description
<code>{!Community_Name}</code>	The name of the community, as entered during community creation.

Field Name	Description
<code>{!Community_Url}</code>	<p>The URL to the login page of a community. For instance, <a href="https://acme.force.com/partners/login">https://acme.force.com/partners/login</a>.</p> <p>If this merge field is part of the welcome email being sent to a new external user, the URL is appended with a link to a reset password page.</p> <p>This field is populated only if:</p> <ul style="list-style-type: none"> <li>The template containing this field is selected as the Welcome New Member template for a community, and Send welcome email is selected, OR</li> <li>The template containing this field is selected as either the Forgot Password or Change Password template and the user receiving the email is an external user who is a member of the community.</li> </ul>
<code>{!Receiving_User.Username}</code>	The user name of the user who will receive the welcome email.

You can create custom email templates for communities using Visualforce, which allows you to use custom company branding in your email templates. For Visualforce email template, use the `$Network` global merge field type and its properties, as described in this table.

Field Name	Description
<code>\$Network.Name</code>	The name of the community, as entered during community creation.
<code>\$Network.NetworkUrlForUserEmails</code>	<p>The URL to the login page of a community. For instance, <a href="https://acme.force.com/partners/login">https://acme.force.com/partners/login</a>.</p> <p>If this merge field is part of the welcome email being sent to a new external user, the URL is appended with a link to a reset password page.</p> <p>This field is populated only if it is used in a Visualforce email template for one of three email types supported for Communities.</p>

If your community is using cases, approvals, or workflows, emails created from an email template that use the `{!<any_object>.Link}` or `{!Case.Link}` merge fields include a link to the record in the community. If the user receiving the email is a member of multiple active communities, the link goes to the oldest active community. If the user is already logged in to a community and clicks the link in the email, the link goes to that community. If the user is not a member of any community, the link goes to the internal organization. If the user is a member of a portal and a community, the link goes to the community.

Field Name	Description
<code>{!Case.Link}</code>	<p>Used in:</p> <ul style="list-style-type: none"> <li>Case comment notifications to contacts and owners</li> <li>Case creation and update notifications to contacts</li> </ul>

Field Name	Description
{!<any_object>.Link}	Used in: <ul style="list-style-type: none"> <li>Approval requests sent to approvers and delegated approvers</li> <li>Workflow email alerts</li> </ul>

To find out if your email templates use these merge fields, from Setup, enter *Email Templates* in the **Quick Find** box, then select **Email Templates**, then click **Edit** next to any email template.

## Generating Mass Mail Merge Documents with Extended Mail Merge

 **Note:** You can generate mail merge documents using the Extended Mail Merge feature. Extended Mail Merge is available by request only. Contact Salesforce Customer Support if you are interested in this feature.

In addition, your administrator must activate the feature before you can use Extended Mail Merge.

With Extended Mail Merge, you can easily generate mail merge Microsoft® Word documents—such as form letters with matching envelopes and address labels—for multiple records at the same time.

1. Click the accounts, contacts, or leads tab. Other kinds of records are not currently supported.
2. In the Tools area, click **Mass Mail Merge** to start the mass mail merge wizard.
3. Choose an appropriate list view from the **view** drop-down list.
4. Select the records to include in the mail merge. To select all records currently displayed on the page, select the checkbox in the column header.
5. Click **Next**.
6. Select the types of Word documents you'd like to generate. The supported document types are documents, envelopes, and labels.
7. Select the **Log an activity...** checkbox to log the generation of these mail merge documents by adding a completed task on each record.
8. Click **Next**.
9. Select the appropriate [mail merge templates](#).

For documents, choose whether to create one Word document that includes all output or a separate Word document for each record.

### EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

### USER PERMISSIONS

To generate mass mail merge documents:

- "Manage Public Documents"

10. Optionally, click **Preview Template** to review the Word document with merge fields but without your data. Note that although you can edit the Word document that opens, those changes won't be applied to your current mail merge request. To make a newly revised template available for mail merge, it must be **uploaded** first.

11. Click **Finish**.

**Note:** If your request exceeds the maximum size limit for Extended Mail Merge, you're prompted to select either fewer records or smaller templates.

Salesforce sends you an email when your generated documents are ready. When mail merge documents are:

- Under 3 MB, Salesforce sends them to your email as either Word document (.doc) or Zip file (.zip) attachments. If the attachment size exceeds your organization's maximum email attachment size, or your administrator has set all mail merge documents to be saved to the Documents tab, Salesforce automatically saves your generated documents to the Documents tab. You'll receive an email with a link to the document's location.
- Over 3 MB, Salesforce saves them to your personal documents folder on the Documents tab.

## Mail Merge Considerations

- Standard mail merge requires:
  - Microsoft® Internet Explorer® versions 9, 10, and 11
  - Microsoft Word 2003 or 2007
  - Microsoft Windows® XP and Windows Vista® (32-bit only)

Extended Mail Merge supports the following additional environments: the Mozilla Firefox Web browser and the Apple Mac OS. Furthermore, it doesn't require the installation of an ActiveX control.

Standard mail merge and Extended Mail Merge support versions of Microsoft Word 2000 and above.

- Standard mail merge currently supports Word 2007 templates saved in .docx or .dotx file formats, but Extended Mail Merge does not.
- Mail merge documents give you access only to the fields that are accessible to you via your page layout and field-level security settings.
- Standard and extended mail merge don't support formatting from rich text area fields.
- Using mail merge from a record detail page automatically triggers standard workflow and validation rules for that record. Using the mass mail merge wizard, however, doesn't trigger those rules.
- With Extended Mail Merge, a mail merge operation can't exceed the following limits:
  - 1,000 records
  - The selected mail merge template(s) total size can't be larger than 1 MB.
  - For mass mail merges, the number of selected records multiplied by the combined sizes of the selected mail merge templates can't be larger than 50 MB.
- When you preview a mail merge document, you see only the template. The preview doesn't populate merge fields with your data because there's no record detail available to the preview template.

SEE ALSO:

[Mail Merge Overview](#)

[Sending Single Mail Merge Documents](#)

## Sending Single Mail Merge Documents

1. Click **Mail Merge** in the Activity History related list on the appropriate record. Accounts, contacts, leads, cases, opportunities, and custom objects are supported.

 **Note:** With standard mail merge, the first time you create a mail merge document you must install an ActiveX control that helps Salesforce communicate with Word. For more information, see [Installing the Mail Merge ActiveX Control](#) on page 1527.

2. Use the lookup to specify the record from which information will be merged.

If your organization uses [person accounts](#), person accounts are returned in both account and contact lookup searches.

3. Select a mail merge template.
4. Optionally, select the checkbox to log a task for the mail merge.
5. Click **Generate**.

If the custom object has a master-detail relationship with opportunities, the primary contact for the opportunity is selected by default.

6. Salesforce then generates your document:
  - If your organization uses standard mail merge, Word opens with your generated document. When the document displays, choose **Save As** from the **File** menu to save the document to your hard drive.
  - If your organization uses Extended Mail Merge and your request exceeds the maximum size limit, you are prompted to select a smaller mail merge template. With Extended Mail Merge, Word does not open when you click **Generate**. Instead, Salesforce sends you an email that either includes your generated Word document as an attachment or provides a link to it on the Documents tab.

7. If you chose to log an activity for the mail merge, enter the task information, and optionally create a follow-up task.

The `Subject` of the mail merge task is set to the mail merge template name by default, and the task is displayed as a completed activity in the Activity History related list. The merged document is not stored with the task.

You can log an activity for mail merge if you have access to view or edit the record you are merging and are able to create tasks (that is, you have the “Edit Task” permission).

8. You can then print and mail your document or send it as an email attachment.

### EDITIONS

## Can I do a mail merge with my data?

Yes. To create a single mail merge document using your data, click **Mail Merge** in the Activity History related list of a record. To do bulk mail merges using your data, see the [Salesforce Bulk Mail Merge Process](#) document for instructions.

## Using Cloud-Based Email Integration with Email Connect

### Syncing with Exchange Sync (Beta)

#### Exchange Sync (Beta) Syncs Your Microsoft® Items from the Cloud

Keep your contacts and events in sync between your email system and Salesforce without installing and maintaining software.

 **Note:** Exchange Sync is currently available through a beta program, which means it's a high quality feature with known limitations.

If your administrator set up your organization to sync contacts and events between your company's email system and Salesforce, you're already on the path to increasing your productivity. That's because there's no need for you to duplicate your work between the two systems.

Depending on the settings your administrator selected, Salesforce for Exchange automatically syncs contacts and events between your company's email system and Salesforce in both directions, or one direction.

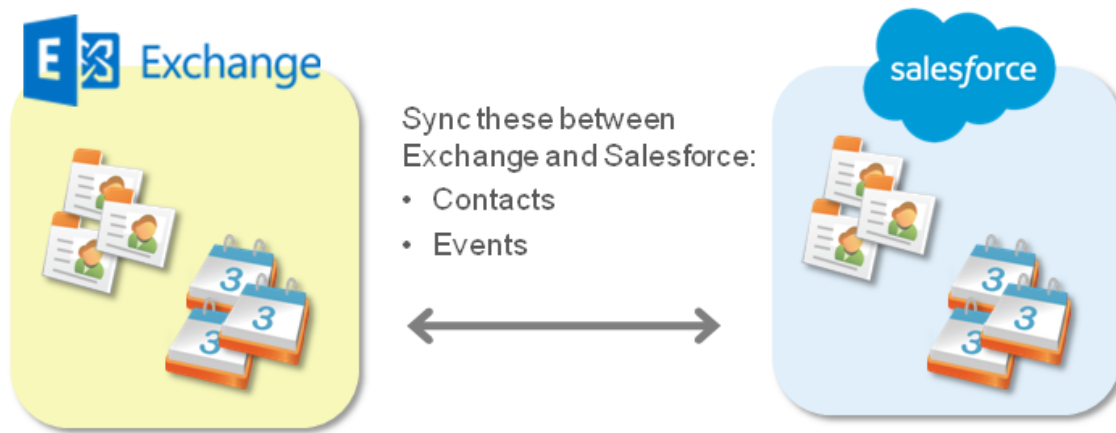

#### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

You can sync contacts and events you create and maintain, either at your desk or on your mobile device.

At this time, Exchange Sync doesn't:

- Sync recurring events
- Sync invitees included in events
- Let you delete records from both systems in one action

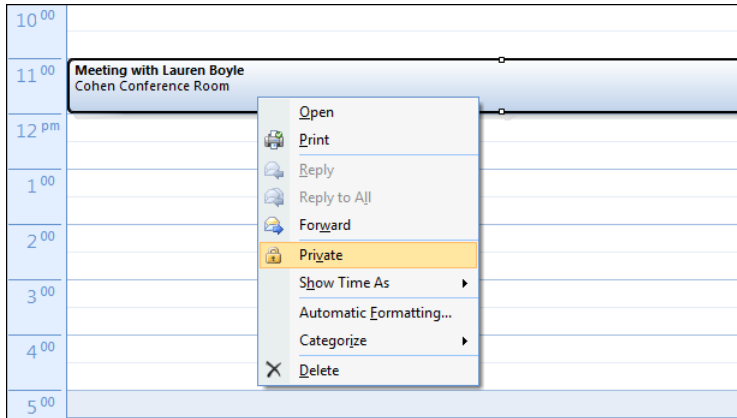

However, you can manage these actions as you always have—by manually updating recurring events, adding event invitees, and deleting records in both systems.

## Get Ready to Sync Events

You can choose which events sync between your company's email system and Salesforce.

If your administrator has set up Salesforce to sync events, your events sync automatically between the calendar in your company's email system and Salesforce.

To prevent events from syncing with Salesforce, assign those events with the `Private` option in your calendar application.

It's best if you update events you don't want to sync before your administrator initiates sync for the first time. If your events begin syncing before you assign the `private` option, you'll have to delete the copy that has already synced to Salesforce.

Events you haven't assigned the `private` option sync to Salesforce every few minutes. If you're syncing a lot of events, your first sync might take some time.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To sync events both ways:

- "Read" and "Edit" on events, AND

Event sync direction set to "Sync both ways" in Exchange configurations

To sync events from Salesforce to Exchange:

- "Read" on events, AND

Events sync direction set to "Salesforce to Exchange" in Exchange configurations

To sync events from Exchange to Salesforce:

- "Create" on events, AND

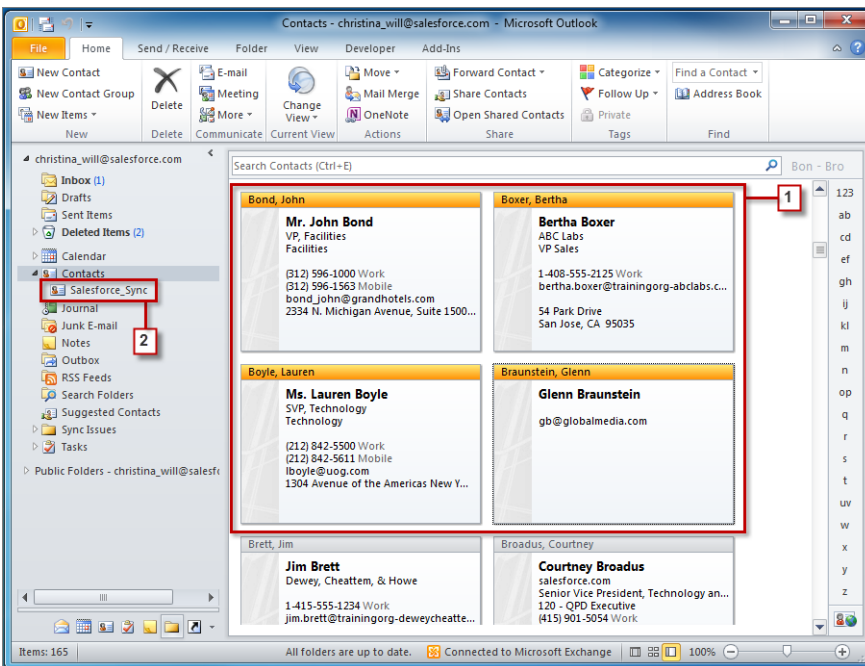

Event sync direction set to "Exchange to Salesforce" in Exchange configurations

## Get Ready to Sync Contacts

Learn how to sync contacts between your company email system and Salesforce. Depending on which direction you're syncing, you'll move the email contacts you want to sync with Salesforce to a special folder in your email application.

After your administrator initiates contacts sync for you, Exchange Sync creates a folder in your email application called `Salesforce_Sync`. You can find the `Salesforce_Sync` folder under your contacts directory. Any contacts that have synced from Salesforce to your email system are in `Salesforce_Sync`. Don't rename, move, or delete the `Salesforce_Sync` folder, or syncing between Salesforce and your email system stops.

1. Ask your administrator which direction you're set up to sync.
  - If you're set up to sync from Salesforce to your email only, syncing is already in progress, and you don't need to do anything else. You're ready to access your Salesforce contacts directly from your email system!
  - If you're set up to sync from your email to Salesforce or to sync both ways, you'll move the email contacts you want to sync to Salesforce now.
2. In your email application, select the contacts you want to sync. You can select multiple contacts at a time.

3. Move—do not copy—your selected contacts to the folder `Salesforce_Sync`. If you copy your contacts, you'll have duplicate ones, which is a hassle!

The contacts you move to the `Salesforce_Sync` folder begin to sync every few minutes. If you move a lot of contacts to `Salesforce_Sync`, your first sync might take some time.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Unlimited
- Developer

### USER PERMISSIONS

To sync contacts both ways:

- "Read" and "Edit" on contacts, and "Read" on accounts, AND

Contact sync direction set to "Sync both ways" in Exchange configurations

To sync contacts from Salesforce to Exchange:

- "Read" on contacts, AND

Contact sync direction set to "Salesforce to Exchange" in Exchange configurations

To sync contacts from Exchange to Salesforce:

- "Create" on contacts, AND

Contact sync direction set to "Exchange to Salesforce"

### Fix Sync Issues

If you have trouble syncing between Microsoft® Exchange and Salesforce, you can have your Salesforce administrator reset your sync process to clear out and then restore the connections between the records in your email and calendar application, and your records in Salesforce.

1. To reset sync for your contacts, make sure your `Salesforce_Sync` folder in your email application contains only the contacts you want to sync with Salesforce.
2. To reset sync for your events, make sure the events that you don't want to sync are assigned the `Private` option in your calendar application.
3. Ask your Salesforce administrator to reset your sync process.

## Getting Salesforce Content in Microsoft® Outlook® Web App and Outlook 2013

### Salesforce App for Outlook

Stay on top of important sales opportunities when you work in your Microsoft® email application. When using Outlook® Web App (OWA), Outlook 2016, or Outlook 2013 along with Microsoft Office 365™, you can manage your sales more efficiently. Add email and attachments to Salesforce records. And, create contacts, or view contacts, leads, person accounts, users, accounts, opportunities, and cases—directly in your email application.

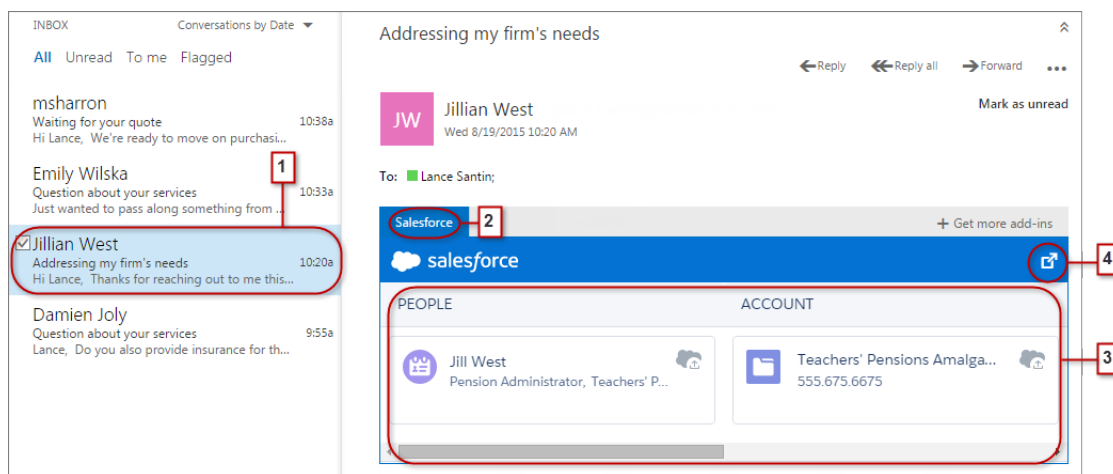

After your administrator enables Salesforce App for Outlook, you complete one-time procedures to get your Salesforce content to appear in your email app.

Then, when you select an email (1) and select `Salesforce` (2), you see relevant sales-related records (3). For the records that appear, you can add the email to multiple contacts—provided your administrator enabled Shared Activities enabled. Also add the email to one other record that accepts tasks, like an opportunity, a lead, or a case. You choose whether to include the email's attachments.

#### EDITIONS

Available in: Salesforce Classic and Lightning Experience

- Available in:

## Syncing with Salesforce for Outlook

### How Salesforce for Outlook Syncs Between Microsoft® Outlook® and Salesforce

Learn how Salesforce for Outlook syncs your contacts, events, and tasks between Microsoft® Outlook® and Salesforce.

Watch a Demo:  [Getting Ready to Integrate Microsoft® Outlook® and Salesforce](#)

Salesforce for Outlook, a Microsoft® Outlook® integration application that you install, syncs contacts, events, and tasks between Outlook and Salesforce. In addition to syncing these items, you can add Outlook emails, attachments, events, and tasks to multiple Salesforce contacts, and view Salesforce records related to the contacts and leads in your emails and events—all directly in Outlook.

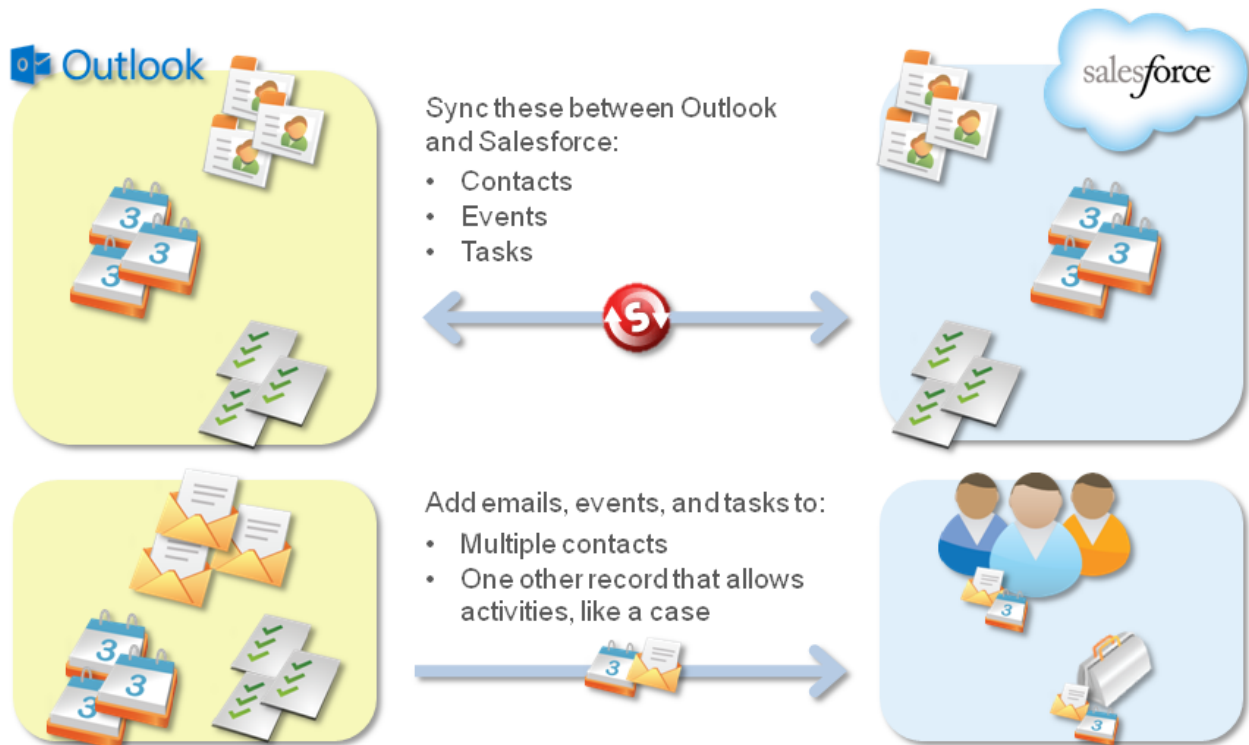

Depending on your organization, you may be able to customize what you sync and the sync directions between Outlook and Salesforce. Your administrator determines the level at which you can customize these settings in Salesforce.

Here's a quick look at how Salesforce for Outlook helps you avoid duplicating your work and boost your productivity.

## Salesforce for Outlook Supported Languages

Salesforce for Outlook supports these languages.

- Chinese (Simplified)
- Chinese (Traditional)
- Czech
- Danish
- Dutch
- English
- German
- Finnish
- French
- Hebrew
- Hungarian
- Italian
- Japanese
- Korean
- Polish
- Portuguese (Brazil)
- Romanian
- Russian
- Spanish
- Spanish (Mexico)
- Swedish
- Thai
- Turkish
- Ukrainian
- Vietnamese

The Salesforce for Outlook installer doesn't support:

- Hebrew
- Portuguese (Brazil)
- Romanian
- Spanish (Mexico)
- Thai
- Vietnamese

### EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

## Download the Salesforce for Outlook Installer

You'll download the installer from Salesforce.

1. Close Microsoft® Outlook®.
2. Close Salesforce for Outlook. To do so, right-click the Salesforce for Outlook icon (🔌) in your system tray, and then click **Exit**.
3. If you're upgrading from Salesforce for Outlook v2.4.2 or earlier, uninstall your current version from the Microsoft Windows® Control Panel. If you need help, contact your Windows administrator. If you're upgrading from Salesforce for Outlook v2.5.0. or later, continue to the next step.
4. From your personal settings, enter *Salesforce for Outlook* in the Quick Find box, then select **Salesforce for Outlook**.
5. Click **Download**. Then click **Save File**. If the **Download** button is unavailable, ask your administrator to assign you to an Outlook configuration.

If you're an administrator, you can deploy installations to multiple users simultaneously using the `.msi` version of the installer.

### EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

### USER PERMISSIONS

To install Salesforce for Outlook:

- Assigned to an active configuration AND Valid data set for each object being synced

To change sync folders:

- Your Outlook profile set as the default in your Mail Settings AND

Allow users to modify "Outlook folder for syncing contacts" in your Outlook configuration

## Install and Set Up Salesforce for Outlook

- Open the installation file you downloaded and saved, and complete the installation wizard.
  - Note:** If you don't yet have .NET 4 installed, the installation wizard installs it for you. Keep in mind that the installation wizard prompts you to restart your machine after it installs .NET 4. You then need to run the installation wizard again to complete the installation process.
- Open Microsoft® Outlook®. The setup wizard opens, and the Salesforce for Outlook icon (🌩) appears in your system tray. If the wizard doesn't open, you can start it manually. Just right-click 🌩 and click **Settings**.
- If you need to log in to a Salesforce site other than the default, click **Change URL** and pick the server to which you want to connect. If the server you want isn't listed, select *Other...* and enter the URL, such as a custom domain used by your organization.
- Enter your Salesforce username and password.
- Click **Approve**. This creates a secure connection between Outlook and Salesforce. You won't need to log in again unless you encounter an error.
  - Note:** If your organization restricts IP addresses, logins from untrusted IPs are blocked until they're activated. Salesforce automatically sends you an activation email that you can use to log in. This lets you connect without IP restrictions from anywhere.
- Click **Next**, and review the sync directions set up by your administrator. If you need to select different folders where your Outlook items will sync, click **Change Folder** and select ones that are within your default folders or the main Mailbox folder.

- Click **Next**, and then select your sync method.
  - Choose to sync all of your contacts, events, and tasks. You'll mark items you don't want to sync with the "Don't Sync with Salesforce" category in Outlook.
  - Choose to sync individual contacts, events, and tasks. You'll mark items you want to sync with the "Sync with Salesforce" category in Outlook.

### EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

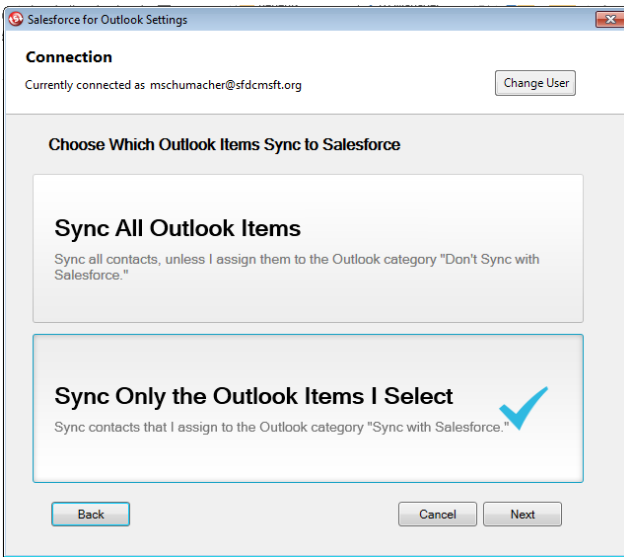

### USER PERMISSIONS

To install Salesforce for Outlook:

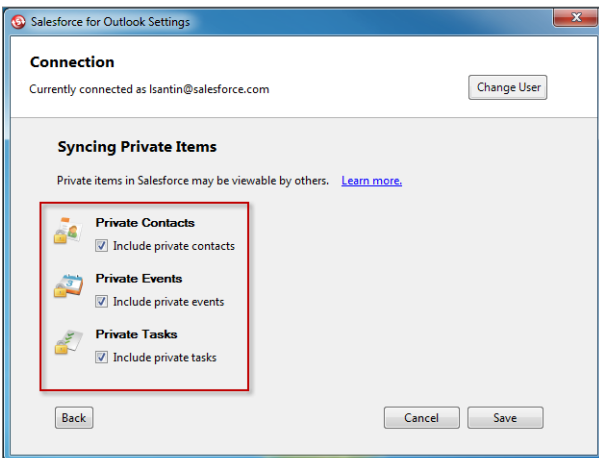

- Assigned to an active configuration AND Valid data set for each object being synced

To change sync folders:

- Your Outlook profile set as the default in your Mail Settings AND Allow users to modify "Outlook folder for syncing contacts" in your Outlook configuration

8. Click **Next**, and then select the kinds of private items you want to sync.

9. Click **Save**. A welcome message appears at the system tray icon (🔄), which is now active. If you're configured to sync Outlook items, and you chose **Sync Only the Outlook Items I Select** for your sync method, all items in the folders you chose sync automatically. The icon spins during every sync cycle.

SEE ALSO:

- [How Salesforce for Outlook Syncs Between Microsoft® Outlook® and Salesforce](#)
- [Salesforce for Outlook System Requirements](#)
- [Download the Salesforce for Outlook Installer](#)
- [Uninstalling Salesforce for Outlook](#)

## Uninstalling Salesforce for Outlook

1. Close Outlook.
2. Right-click the sync icon (🔄) and select **Exit**.
3. Using your Windows Add or Remove Programs tool, remove Salesforce for Outlook.

If you plan to reinstall Salesforce for Outlook, you'll have to first remove the old Salesforce for Outlook database files. Otherwise, Salesforce for Outlook will use your old sync settings. Default database file locations:

- (Microsoft Windows 7 and Vista)  
C:\Users\username\AppData\Roaming\salesforce.com\Salesforce for Outlook\DB\
- (Microsoft Windows XP) C:\Documents and Settings\username\Application Data\salesforce.com\Salesforce for Outlook\DB\

## Managing Your Salesforce for Outlook Configuration

Your version of Salesforce for Outlook has been configured with certain functions, like syncing contacts, events, and tasks, or adding emails to Salesforce. These settings are saved in a Salesforce for Outlook configuration in Salesforce.

1. Access your configuration in any of these ways.
  - Go to the Salesforce for Outlook page in your personal settings in Salesforce. Then click **View My Configuration**.
  - Right-click the system tray icon (🔄) on your desktop, and select **Salesforce > Outlook Configuration**.
2. Depending on your permissions, you may be able to:
  - [Edit your email settings](#)
  - [Edit your sync settings](#)
  - [Edit your sync direction](#)
  - [Edit your conflict settings](#)
  - [View your matching criteria](#)
  - [Edit your field mappings](#)
3. Click **Save**. All changes take effect the next time your data syncs. Return to your original settings any time by clicking **Revert to default** at the top of your modified configuration. Your administrator may change your settings as needed.

## Edit Your Salesforce for Outlook Email Settings

The Email Settings section of your Salesforce for Outlook configuration shows you whether you're allowed to add emails to Salesforce from Outlook. Emails that you add using Salesforce for Outlook are saved in Salesforce and assigned to other records based on your My Email to Salesforce settings.

1. Access your configuration in any of these ways.
  - Go to the Salesforce for Outlook page in your personal settings in Salesforce. Then click **View My Configuration**.
  - Right-click the system tray icon (  ) on your desktop, and select **Salesforce > Outlook Configuration**.

If **Add Email** is selected, you'll see **Add Email** and **Send and Add** buttons in Outlook.

 **Note:** If you don't see the **Add Email** and **Send and Add** buttons, it's possible your administrator hasn't activated Email to Salesforce. It's also possible that your administrator set up your Outlook configuration so that you can use the Salesforce Side Panel, which includes add email controls in the side panel itself. This feature, however, doesn't include send and add functionality.

2. Click **Email to Salesforce Settings**.
3. Enter the email addresses you'll use to send email in `My Acceptable Email Addresses`. Separate multiple email addresses with commas.
4. Choose whether you'd like either all emails to be sent to My Unresolved Items so you can manually assign them to related records, or to have Salesforce first try to automatically assign them.
5. Configure Email to Salesforce to add emails as activities to matching opportunities, leads, contacts, or all three. If you configure Email to Salesforce to associate emails to matching leads or contacts, Salesforce searches the **To** and **CC** fields for the email addresses of your leads or contacts. If any leads or contacts are found, Salesforce saves the email to the Activity History related list on the appropriate record.
6. If you selected leads or contacts, choose how Email to Salesforce should process emails containing lead or contact information that matches duplicate records. Email to Salesforce can add the email activity to either all matching records, the oldest duplicate record, or the record that has greatest number of activities.
7. If you selected leads or contacts, you can select `If no matching records are found, create a task and send it to My Unresolved Items` to have the email sent to My Unresolved Items if no matching records are found. If this checkbox isn't selected and Salesforce can't identify the email addresses in the To or From fields, the email won't be saved in Salesforce.
8. Select `Always save email attachments` to save attachments on emails sent to Salesforce. The size limit for an attached file is 25 MB when attached directly to the related list. The size limit for multiple files attached to the same email is 25 MB, with a maximum size of 5 MB per file.
9. Select `Email me confirmation of association` to receive a confirmation email when an email is sent to Salesforce.
10. Click **Save**.

## Edit Your Salesforce for Outlook Sync Settings

The Sync Settings section of your Salesforce for Outlook configuration tells you which objects you're allowed to sync and the direction data syncs. To view or edit these settings:

1. Access your configuration in any of these ways.
  - Go to the Salesforce for Outlook page in your personal settings in Salesforce. Then click **View My Configuration**.
  - Right-click the system tray icon (📧) on your desktop, and select **Salesforce > Outlook Configuration**.
2. Hover over filter icons (⌵) to see which kinds of records sync.
3. Deselect a checkbox to stop an item from syncing. All fields related to that item are disabled on the page.
4. Click **Save**. All changes take effect the next time your data syncs. Return to your original settings any time by clicking **Revert to default** at the top of your modified configuration. Your administrator may change your settings as needed.

SEE ALSO:

## Edit Your Salesforce for Outlook Sync Direction

If your administrator gave you permission to edit your configuration, you can change the sync direction for contacts, events, and tasks based on your preferences.

1. Access your configuration in any of these ways.
  - Go to the Salesforce for Outlook page in your personal settings in Salesforce. Then click **View My Configuration**.
  - Right-click the system tray icon (📧) on your desktop, and select **Salesforce > Outlook Configuration**.
2. Select one of these options under Sync Direction for a particular object.
  - *Outlook to Salesforce*—During its first sync, a record in Outlook creates or updates a record in Salesforce. During future syncs, changes made to Outlook records appear in Salesforce, regardless of whether the Salesforce version has changed. In addition, deleting a synced record in Outlook deletes its Salesforce counterpart. Salesforce changes are never sent to Outlook. The required conflict behavior setting for this option is *Outlook always wins*. This option isn't available for contacts.
  - *Salesforce to Outlook*—When data first syncs, a record in Salesforce creates or updates a record in Outlook. During future syncs, changes made to Salesforce records appear in Outlook, regardless of whether the Outlook version of the record has changed. In addition, deleting a synced record in Salesforce deletes its Outlook counterpart. Outlook changes are never sent to Salesforce. The required conflict behavior setting for this option is *Salesforce always wins*.
  - *Sync both ways*—When records sync, changes to Outlook records are reflected in Salesforce, and vice versa. If records conflict, the conflict behavior setting determines which record wins.

[Managing Your Salesforce for Outlook Configuration](#)

## Edit Your Salesforce for Outlook Conflict Settings

Conflict behavior settings determine what happens when Salesforce for Outlook encounters a conflict when syncing data both ways. A conflict occurs when the same record is updated in both Salesforce and Outlook or when a record is updated on one side and deleted on the other.

1. Access your configuration in any of these ways.
  - Go to the Salesforce for Outlook page in your personal settings in Salesforce. Then click **View My Configuration**.
  - Right-click the system tray icon (📧) on your desktop, and select **Salesforce > Outlook Configuration**.
2. Under Conflict Behavior for each object you're syncing, select one of these options.
  - *Salesforce always wins*
  - *Outlook always wins*
3. Click **Save**. All changes take effect the next time your data syncs. Return to your original settings any time by clicking **Revert to default** at the top of your modified configuration. Your administrator may change your settings as needed.

## Viewing Your Salesforce for Outlook Matching Criteria

If Salesforce for Outlook finds multiple matching contacts when a contact first syncs from Outlook, we pick a Salesforce contact based on the matching criteria defined by your administrator.

Access your configuration in any of these ways.

- Go to the Salesforce for Outlook page in your personal settings in Salesforce. Then click **View My Configuration**.
- Right-click the system tray icon (📧) on your desktop, and select **Salesforce > Outlook Configuration**.

Then review the matching preference assigned to you. Options are:

- **Most recent activity**—Choose the Salesforce contact that shows the most recent activity (such as a phone call or email), as shown in the contact's Activity History related list. This is the default matching option.
- **Last updated**—Choose the Salesforce contact that was most recently modified.
- **Oldest**—Choose the Salesforce contact that has the earliest creation date.

## Customize the Fields You Sync Between Salesforce and Outlook

Depending on your Salesforce for Outlook permissions, you can customize which Salesforce field syncs to each Microsoft Outlook field when you're syncing items with Salesforce for Outlook. You can customize which fields sync to each other by editing your field mappings in your Salesforce for Outlook configuration.

Field mappings define which Salesforce and Outlook fields correspond when items sync between the two systems. You can edit your field mappings depending on the permissions your Salesforce administrator assigned in your Salesforce for Outlook configuration.

1. Access your configuration in any of these ways.
  - Go to the Salesforce for Outlook page in your personal settings in Salesforce. Then click **View My Configuration**.
  - Right-click the system tray icon (📧) on your desktop, and select **Salesforce > Outlook Configuration**.
2. Under Data Settings, click **Edit Field Mappings** under **Contacts, Events, or Tasks** to display all the fields for records on that object.
3. Review which Salesforce fields are mapping to each Outlook field.
4. Edit the Salesforce or Outlook field mappings you'd like to change, or create mappings for custom fields. Salesforce for Outlook lets you edit any field mapping with a picklist. You can add more mappings at the bottom of the list. You can remove mappings by clicking the X next to the mapping.

**Warning:** If you map a custom field that is universally required, make sure that it has a default value to avoid errors. Also, mapping custom fields that require validation by Salesforce can cause sync errors. For example, if you map a custom Salesforce field that requires a unique value, you could see a sync error if you enter a non-unique value in the Outlook field.

5. Click **Save**. Field mappings begin syncing on an items the next time that items is updated in either Salesforce or Outlook. Return to your original settings any time by clicking **Revert to default** at the top of your modified configuration. Your administrator can change your settings as needed.

- [Access the Salesforce for Outlook online help](#)

### Accessing the System Tray Application

- If you don't see the icon, just restart the application by double-clicking the Salesforce for Outlook shortcut on your desktop or the application in your computer's Programs directory (**Start > All Programs > salesforce.com > Salesforce for Outlook**).
- If the icon is disabled (🔒), you may need to start Outlook.
- If you don't see the icon, you might need to click the arrow next to the system tray and drag the Salesforce for Outlook icon to the system tray.

### Viewing the Salesforce for Outlook Sync Log

The sync log records troubleshooting information for Salesforce for Outlook, including the number of records that had errors and the number of records that were created, updated, or deleted during sync.

To view this log, right-click the system tray icon (🔒) and click **Sync > View Sync Log**.

SEE ALSO:

[Access Salesforce for Outlook Settings and Tools](#)

### Changing Your Salesforce for Outlook Login Information

If your Salesforce username or password changes, you'll need to update your login information in Salesforce for Outlook.

1. Right-click the system tray icon (🔒) on your desktop and select **Settings...**
2. Click **Change User**.
3. Enter your correct Salesforce username and password, and click **Login**. This creates a secure connection between Outlook and Salesforce. You won't need to log in again unless you encounter an error.
4. Click **Next**, and then click **Done**.

 **Note:** If your organization restricts IP addresses, logins from untrusted IPs are blocked until they're activated. Salesforce automatically sends you an activation email that you can use to log in. The email contains a security token that you must add to the end of your password. For example, if your password is *mypassword*, and your security token is *XXXXXXXXXX*, you must enter *mypasswordXXXXXXXXXX* to log in.

## Change Your Salesforce for Outlook Sync Folders

If you want to sync contacts, events, and tasks between Microsoft® Outlook® and Salesforce, you can set up Salesforce for Outlook to sync items in the Outlook folders of your choice.

1. Right-click the system tray icon (🔌) on your desktop and select **Settings...**
2. Click **Change Folder** and select or create a folder that's within your default folders or the main Mailbox folder.
3. Click **Save**.

SEE ALSO:

[Access Salesforce for Outlook Settings and Tools](#)

## Hide Salesforce for Outlook Alerts

If you'd rather not see system tray alerts for sync and other errors, you can hide them.

Right-click the system tray icon (🔌) and click **Hide Alerts**.

SEE ALSO:

[Access Salesforce for Outlook Settings and Tools](#)

## View Salesforce for Outlook Errors

Whenever Salesforce for Outlook has problems syncing your data, the system tray icon changes to an error icon (❗), and the status text at the top of the system tray shortcut menu displays the number of errors.

To view these errors, double-click the system tray icon or click the text in the shortcut menu to open the Salesforce for Outlook Error dialog box. If an error relates to a specific Outlook record, you can click the record's link to edit that record in Outlook.

To refresh the list after you resolve errors, click **Try Again**. Salesforce for Outlook syncs your data and removes any errors that have been resolved.

## Syncing Between Microsoft® Outlook® and Salesforce Overview

Stop duplicating your contacts, events, and tasks in Outlook and Salesforce and start syncing between the two systems with Salesforce for Outlook.

User permissions needed to sync	When you sync	You'll Need
Contacts	From Salesforce to Outlook	"Read" on contacts; Contacts sync direction set to <i>Salesforce to Outlook</i>
	Both ways	"Read" and "Edit" on contacts, and "Read" on accounts; Contacts sync direction set to <i>Sync both ways</i>
Events and tasks	From Outlook to Salesforce:	"Read" and "Edit" on events; Events and Tasks sync direction set to <i>Outlook to Salesforce</i>
	From Salesforce to Outlook	"Read" and "Edit" on events; Events and Tasks sync direction set to <i>Salesforce to Outlook</i>
	Both ways	"Read" and Edit" on events; Events and Tasks sync direction set to <i>Sync both ways</i>
	Multiday events	"Enable Multiday Events" on activities
	Recurring Salesforce tasks to Outlook	"Sync recurring Salesforce tasks to Outlook"

### EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

Before you download and install Salesforce for Outlook, make sure your Outlook folders include the items you want to sync. If you're syncing from Outlook to Salesforce, moving a record out of a synced Outlook folder deletes that record in Salesforce. If you're syncing from Salesforce to Outlook, removing a record from Salesforce deletes that record in Outlook.

### Learning about Sync Schedules

Salesforce for Outlook syncs your items based on your system activity. Events and tasks sync automatically every ten minutes; contacts sync automatically every hour. If, however, Salesforce for Outlook detects keyboard or mouse inactivity for 30 minutes, the sync frequency for events and tasks changes to 30 minutes. After two hours of inactivity, the frequency for all updates changes to hourly, and after four hours, the frequency changes to every four hours.

You can, of course, sync manually whenever you'd like. Just right-click the system tray icon (🔌), and then click **Sync > Sync Now**.

### Excluding Certain Records from Syncing

If you chose the Automatic option for your sync method, you have a couple of options for excluding certain items from syncing with Salesforce for Outlook.

- You can choose to sync items you mark as Private in Microsoft® Outlook®. If you don't want to sync private items, open Salesforce for Outlook Settings, and deselect the types of private items you don't want to sync.

If you have synced items in Outlook that you later mark as Private, those items remain in Salesforce. The corresponding Salesforce items, however, will no longer receive updates if you modify the ones in Outlook.

- If you don't want certain Outlook items to sync, regardless of whether they're marked as Private, assign them to the category *Don't Sync with Salesforce* in Outlook. For details on using categories in Outlook, refer to your Outlook documentation.

**SEE ALSO:**

[My Unresolved Items](#)

## Syncing Contacts with Salesforce for Outlook

You can keep your important Outlook and Salesforce contacts in sync using Salesforce for Outlook. When contacts initially sync, Salesforce for Outlook checks to see whether a contact with the same email address exists in both Outlook and Salesforce. If a matching email address exists, the two contacts are synced. If it doesn't exist, Salesforce for Outlook checks to see whether a contact with the same first name, last name, and company name exists. If it doesn't exist, a new contact is created and the two are synced.

Your Outlook configuration defines which items are set to sync, which direction the data flows between Outlook and Salesforce, and what happens when data conflicts. You can set up Salesforce for Outlook to sync in the following ways, depending on whether your administrator allows you to change sync directions.

- *Salesforce to Outlook*
- *Sync both ways*

Salesforce for Outlook lets you sync up to 5,000 contacts, and isn't case-sensitive when matching contacts.

This diagram shows how contacts sync.

### EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

### USER PERMISSIONS

To sync contacts from Salesforce to Outlook:

- "Read" on contacts

AND

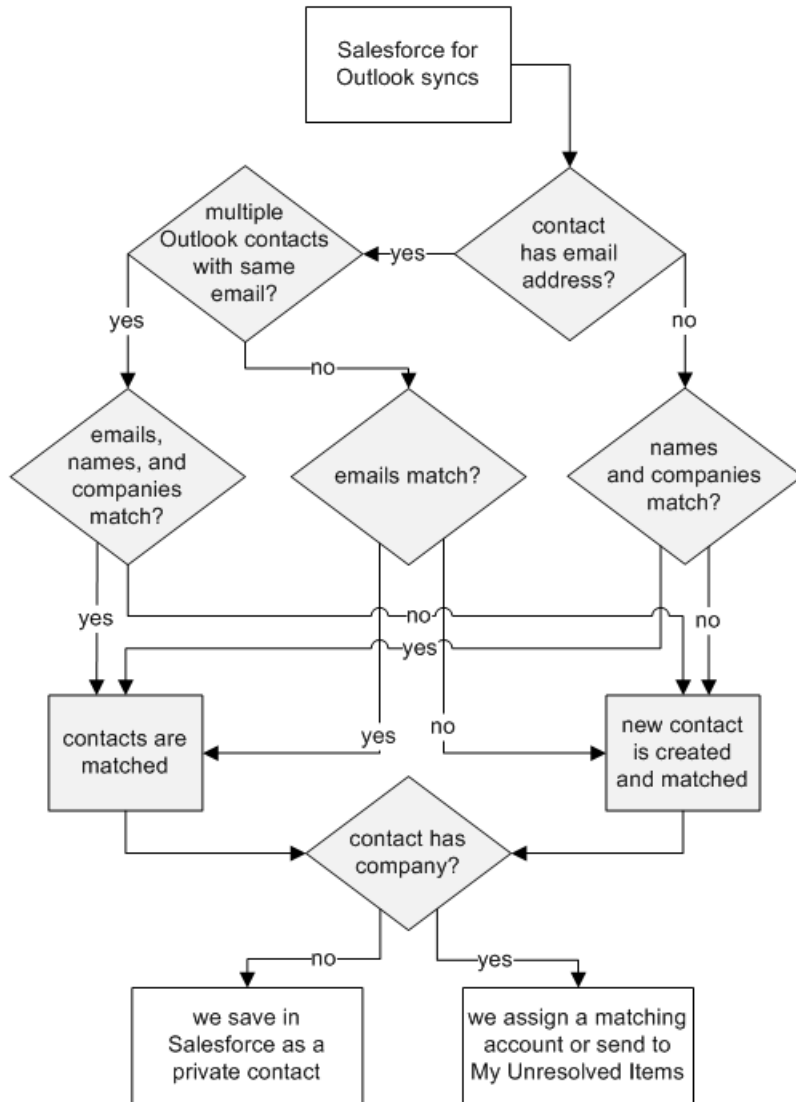

Contact sync direction set to *Salesforce to Outlook*

To sync contacts both ways:

- "Read" and "Edit" on contacts, and "Read" on accounts

AND

Contact sync direction set to *Sync both ways*

Syncing Contacts from Salesforce to Outlook

<b>If</b>	<b>Then</b>
A contact already exists in Outlook	The Salesforce contact replaces the Outlook contact and the two are synced.
A contact doesn't yet exist in Outlook	Salesforce for Outlook syncs the Salesforce contact, which creates the contact in Outlook.
You delete a contact in Outlook	Salesforce for Outlook won't sync the Salesforce contact again.
Multiple matching contacts exist in Outlook	Salesforce for Outlook selects one of them and syncs it.
You update a contact in Salesforce	The Salesforce contact overwrites the Outlook contact.

<b>If</b>	<b>Then</b>
You update a contact in Outlook	The updates remain in the Outlook contact, but won't sync to Salesforce. The next time updates are made to the Salesforce counterpart, the Salesforce counterpart overwrites the Outlook contact.
You delete a Salesforce contact	The Outlook counterpart is also deleted. If the Outlook contact is deleted and the Salesforce contact is updated, the contact is recreated in Outlook.

### Syncing Contacts Both Ways Between Salesforce and Outlook

<b>If</b>	<b>Then</b>
A contact exists on one side only	The contact is automatically created on the other side and the two are synced.
A matching contact exists	One contact record replaces the other one, and the records are synced. If your Outlook configuration specifies that Outlook contacts win, the Outlook version replaces the Salesforce version, and vice versa if Salesforce is set to win. Any change to either record is automatically reflected in the other. If records conflict, the conflict behavior setting determines which record wins.
Multiple matching Salesforce contacts exist	As long as there's only one version of the Outlook contact and that contact has an email address, we sync the Outlook contact with a Salesforce contact based on your matching preference, such as the contact that was most recently updated.
You update a contact	Both contacts are updated with the latest changes. If records conflict, the conflict behavior setting determines which record wins.
You delete a Salesforce contact and update an Outlook contact	The Outlook counterpart is deleted if Salesforce is set to win, and the contact is recreated in Salesforce if Outlook is set to win.
You delete an Outlook contact and update a Salesforce contact	The Salesforce counterpart is deleted if Outlook is set to win, and the contact is recreated in Outlook if Salesforce is set to win.

### Excluding Certain Records from Syncing

If you chose the Automatic option for your sync method, you have a couple of options for excluding certain items from syncing with Salesforce for Outlook.

- You can choose to sync items you mark as Private in Microsoft® Outlook®. If you don't want to sync private items, open Salesforce for Outlook Settings, and deselect the types of private items you don't want to sync.

If you have synced items in Outlook that you later mark as Private, those items remain in Salesforce. The corresponding Salesforce items, however, will no longer receive updates if you modify the ones in Outlook.

- If you don't want certain Outlook items to sync, regardless of whether they're marked as Private, assign them to the category *Don't Sync with Salesforce* in Outlook. For details on using categories in Outlook, refer to your Outlook documentation.

## SEE ALSO:

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)  
[Resolving Your Synced Contacts](#)

## Syncing Events with Salesforce for Outlook

You can keep your Outlook and Salesforce events in sync using Salesforce for Outlook. After an event is in Salesforce, you can assign it to related records, like contacts, accounts, opportunities, and so on. Syncing events also lets you maintain an accurate view of your availability when you create events and request meetings from your Salesforce calendar.

### Which Events Sync

Your Outlook configuration defines which items are set to sync, which direction the data flows between Outlook and Salesforce, and what happens when data conflicts. The event filters in your configuration determine which events sync. The possible filters are:

- *TODAY*—Syncs events that end on or after today. The start time is 12:00 a.m.
- *LAST MONTH*—Syncs events that ended on or after the first day of last month.
- *LAST N DAYS*—Syncs events that ended on or after a specified number of days ago, such as *LAST 30 DAYS*.

Event updates stop syncing once the event falls outside of the range you're configured to sync.

The following items don't sync: all-day events beginning on the first day you're configured to sync, and event attendees. Multiday events sync as single events in either direction. Recurring event patterns must match exactly. Salesforce for Outlook syncs events based on their end dates rather than their start dates. For example, if you're syncing current and future events only, a two-day event that started yesterday still syncs.

### How We Match Events

When events first sync, we either link them with existing events that have the same subject and time or create new events if nothing matches.

### How You Assign Events to Salesforce records

After an event is added to Salesforce, you can assign it to other records using the My Unresolved Items page or the *Related To* and *Name* fields on the event record. The event is added to the associated record's Activity History or Open Activities related list. You can't save changes if your events have a required custom field or an activity custom field becomes required after items are added to your unresolved events list.

### Who Sees Synced Events in Salesforce

Events that aren't marked as private are visible Salesforce to you, those above you in your role hierarchy, and anyone who has access to the records they're associated with. You can also grant access to view your calendar to other users, personal and public groups, roles, or roles and subordinates.

### Excluding Certain Records from Syncing

If you chose the Automatic option for your sync method, you have a couple of options for excluding certain items from syncing with Salesforce for Outlook.

#### EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

#### USER PERMISSIONS

To sync events from Outlook to Salesforce

- "Read" and "Edit" on events, and event sync direction set to *Outlook to Salesforce*

To sync events from Salesforce to Outlook:

- "Read" and "Edit" on events, and event sync direction set to *Salesforce to Outlook*

To sync events both ways:

- "Read" and Edit" on events, and event sync direction set to *Sync both ways*

To sync multiday events:

- "Enable Multiday Events" on activities

- You can choose to sync items you mark as Private in Microsoft® Outlook®. If you don't want to sync private items, open Salesforce for Outlook Settings, and deselect the types of private items you don't want to sync.

If you have synced items in Outlook that you later mark as Private, those items remain in Salesforce. The corresponding Salesforce items, however, will no longer receive updates if you modify the ones in Outlook.

- If you don't want certain Outlook items to sync, regardless of whether they're marked as Private, assign them to the category *Don't Sync with Salesforce* in Outlook. For details on using categories in Outlook, refer to your Outlook documentation.

[Syncing Recurring Events with Salesforce for Outlook Overview](#)

### Syncing Recurring Events with Salesforce for Outlook Overview

If your organization is set up to sync recurring events, you can keep them synced between Outlook and Salesforce using Salesforce for Outlook. You can sync recurrences with the following patterns.

- Daily
- Weekly
- Monthly
- Yearly

After you sync recurring events to Salesforce, you can assign the recurrences to related records, such as contacts, accounts, opportunities, and so on. Syncing recurring events also helps you maintain an accurate view of your availability when you create events and request meetings from your Salesforce calendar.

Recurring events do not appear on the My Unresolved Items page. Instead, you can go directly to the recurring events in your calendar to associate the recurring events with Salesforce records.

#### Understanding Differences Between Outlook and Salesforce

Recurring events work differently between Outlook and Salesforce.

For	You should know that
Ranges of occurrences	If your recurrences include more than 100 occurrences, Salesforce for Outlook creates the series with 100 occurrences in Salesforce.  After the dates of occurrences pass, Salesforce for Outlook then automatically adds another group of occurrences, bringing the total future occurrences up to 100 again. The schedule on which Salesforce adds these groups depends on the number of occurrences that passed and when you last synced, as well as whether you changed any existing occurrences.
Monthly occurrences	Salesforce for Outlook doesn't support the Outlook recurrence pattern option <b>weekend day</b> .
Yearly occurrences	Salesforce for Outlook lets you set up events that recur every year. If you enter a number other than <b>1</b> for the <b>Recur every</b> option in Outlook

#### EDITIONS

Available for set up from:  
both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

#### USER PERMISSIONS

To sync recurring events between Outlook and Salesforce:

- "Recurring Events"

In addition, "Read" and "Edit" on events, and event sync direction set to any of the following directions.

*Outlook to Salesforce,*

*Salesforce to Outlook, or*

*Sync both ways*

For	You should know that
	<p>recurrence patterns, Salesforce for Outlook won't sync the recurring series. This mean that you can set up yearly recurrences, but not recurrences for every other year or every three years.</p> <p>In addition, Salesforce for Outlook doesn't support the Outlook recurrence pattern option <b>weekend day</b>.</p>
Events lasting longer than 24 hours	Salesforce doesn't support recurring events lasting longer than 24 hours.

### Modifying Recurring Series

You can modify recurring series, but it's good to know what to avoid, so that you won't lose any details for occurrences that you've individually modified.

If you modify	You should know that
Recurring series in Outlook	<p>Those changes won't propagate to individually modified occurrences in Salesforce.</p> <p>For example, you modify the appointment time of an occurrence, and then later modify the appointment time for the entire series. The appointment time modification for the series won't propagate to the one modified occurrence.</p> <p>Critical changes include modifications to:</p> <ul style="list-style-type: none"> <li>• Appointment times</li> <li>• Recurrence patterns</li> <li>• Ranges of occurrences</li> </ul> <p>If you make critical changes to recurring series, individually modified occurrences lose their modifications.</p>
Start dates for recurring series in Outlook	Salesforce doesn't support modifications to start dates that already occurred.
End dates for recurring series in Salesforce	<p>This is a critical change in Outlook, and will clear any modifications you make to individual occurrences within the series. Those modifications won't propagate to Outlook. You can, however, modify end dates in Outlook, but that type of critical change will clear all modifications you've made to individual occurrences—in both Outlook and Salesforce.</p>
Individual occurrences	<ul style="list-style-type: none"> <li>• You may lose those changes if you make critical changes to the recurring series.</li> <li>• If you delete an occurrence, and then move the following occurrence into its place, Salesforce for Outlook doesn't update Salesforce correctly. Instead, the occurrence you deleted in Outlook remains in Salesforce along with the occurrence you moved into its place.</li> </ul> <p>For example, you change your recurring event in Outlook. You delete the October 4th occurrence, and move the October 5th occurrence into its place. In Salesforce, you'll see two occurrences on October 4th: the one you deleted, and the one you moved into its place. For October 5th, you'll have no occurrences.</p>

**If you modify****You should know that**

- Outlook modifications propagate to occurrences in Salesforce, regardless of whether the ones in Salesforce include critical modifications. Deleted occurrences in Salesforce, however, remain deleted, and aren't replaced with individually modified occurrences from Outlook.

**Syncing Tasks with Salesforce for Outlook**

Keep Microsoft® Outlook® and Salesforce tasks in sync.

After a task is in Salesforce, you can assign it to related records, like contacts, accounts, and opportunities.

**Which Tasks Sync**

Your Outlook configuration defines which items are set to sync, which direction the data flows between Outlook and Salesforce, and what happens when data conflicts. The task filters in your configuration determine which tasks sync. The possible filters are:

- *TODAY*—Syncs tasks that are due on or after today. The start time is 12:00 a.m.
- *LAST MONTH*—Syncs tasks that were due on or after the first day of last month.
- *LAST N DAYS*—Syncs tasks that were due on or after a specified number of days ago, such as *LAST 30 DAYS*.

Salesforce for Outlook doesn't sync every kind of task. These kinds of tasks sync until they fall outside of the date range set in your task filter:

- Recurring Salesforce tasks to Outlook
- Completed tasks, if marked as completed after Salesforce for Outlook syncs
- Deferred tasks
- In progress tasks
- Not started tasks
- Repeating tasks, which you create in Salesforce
- Tasks flagged for follow-up
- Waiting on someone else tasks

**Which Tasks Don't Sync**

- Recurring Outlook tasks to Salesforce
- Completed tasks, if marked as completed before Salesforce for Outlook syncs
- Tasks created automatically when you flag an email or contact for follow-up

**How We Match Tasks**

When tasks first sync, we link them with existing tasks that have the same subject and due date. If you don't assign due dates to tasks, we link them using the same subject only.

**EDITIONS**

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

**USER PERMISSIONS**

To sync tasks from Outlook to Salesforce:

- "Read" and "Edit" on tasks, and task sync direction set to *Outlook to Salesforce*

To sync tasks from Salesforce to Outlook:

- "Read" and "Edit" on tasks, and task sync direction set to *Salesforce to Outlook*

To sync tasks both ways:

- "Read" and Edit" on tasks, and task sync direction set to *Sync both ways*

### How You Assign Tasks to Salesforce Records

After a task is added to Salesforce, you can assign it to other records using the My Unresolved Items page or the `Related To` and `Name` fields on the task record. The task is added to the associated record's Activity History or Open Activities related list. You can't save changes if your tasks have a required custom field or an activity custom field becomes required after items are added to your unresolved tasks list.

### Excluding Certain Records from Syncing

If you chose the Automatic option for your sync method, you have a couple of options for excluding certain items from syncing with Salesforce for Outlook.

- You can choose to sync items you mark as Private in Microsoft® Outlook®. If you don't want to sync private items, open Salesforce for Outlook Settings, and deselect the types of private items you don't want to sync.

If you have synced items in Outlook that you later mark as Private, those items remain in Salesforce. The corresponding Salesforce items, however, will no longer receive updates if you modify the ones in Outlook.

- If you don't want certain Outlook items to sync, regardless of whether they're marked as Private, assign them to the category *Don't Sync with Salesforce* in Outlook. For details on using categories in Outlook, refer to your Outlook documentation.

### Automatic Account Assignments for Synced Contacts

After syncing contacts from Outlook, Salesforce for Outlook tries to automatically assign them to accounts, as shown in this diagram.

#### EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

#### USER PERMISSIONS

To assign accounts:

- "Read" on accounts and "Edit" on contacts

To create new accounts:

- "Create" on accounts and "Edit" on contacts

AND

"Show Quick Create"

This table describes the account assignment process.

If	Then
A contact's company matches a single Salesforce account	The contact is assigned to that account.
A contact's company matches many Salesforce accounts or none	The contact is sent to My Unresolved Items in Salesforce, which you can access from the Contact home page or the Salesforce for Outlook system tray application. You can use this list to manually assign contacts to existing accounts, create new accounts, or confirm that contacts are private.
A contact doesn't have a company name	The contact is treated as a private contact and is not sent to My Unresolved Items.
A contact's company changes in Outlook	If a matching account is found in Salesforce, the contact is assigned to that account. Otherwise, the contact is sent to My Unresolved Items to be resolved.

If	Then
An unresolved contact is deleted in Outlook	The contact is removed from My Unresolved Items the next time you open the list.
An unresolved contact is changed in Outlook	The contact record is updated in My Unresolved Items. If the contact's company changes, Salesforce checks to see if that information matches any existing accounts and assigns it to an account if it finds a match.

[Resolving Your Synced Contacts](#)

[Managing Your Salesforce for Outlook Configuration](#)

## Manage How Microsoft® Outlook® Items Sync with Salesforce

Manage your contacts, events, and tasks using Outlook categories to get your Outlook items to sync with Salesforce the way you want—by either selecting the items you'd like to sync, or syncing all your items, and selecting the items you'd like to prevent from syncing.

View your sync settings from the Windows® system tray, and then manage how you'll sync your Outlook items with Salesforce.

1. Right click the Salesforce for Outlook icon (📧) in the system tray.

2. Click **Settings**, and then click **Next**.
3. See whether you're set up to sync items with the Sync Only the Outlook Items I Select option or the Sync All Outlook Items option.
  - If you're set up to sync with the Sync Only the Outlook Items I Select option, Salesforce for Outlook syncs only the Outlook items you choose. You'll [assign the category Sync with Salesforce to the items you want to sync](#) on page 1586.
  - If you're set up to sync with the Sync All Outlook Items option, Salesforce for Outlook syncs all your Outlook items. You'll [assign the category Don't Sync with Salesforce to the items you want to prevent from syncing](#) on page 1586.
4. Click **Cancel**.

### EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

## Choose Which Microsoft® Outlook® Items Sync with Salesforce

If you're set up to sync your Outlook contacts, events, and tasks to Salesforce using the `Sync Only the Outlook Items I Select` option in Salesforce for Outlook, you'll need to select which Outlook items you want to sync.

1. In Outlook, select the contacts, events, and tasks you want to sync.
2. On the Outlook ribbon, click **Categorize**.
3. Select the category `Sync with Salesforce`.

The items you categorized will start syncing during the next sync cycle.

## Prevent Which Microsoft® Outlook® Items Sync with Salesforce

If you're set up to sync your Outlook contacts, events, and tasks to Salesforce using the `Sync All Outlook Items` option in Salesforce for Outlook, you can still control which items you don't want to sync.

1. In Outlook, select the contacts, events, and tasks you want to prevent from syncing.
2. On the Outlook ribbon, click **Categorize**.
3. Select the category `Don't Sync with Salesforce`.

The items you categorized will stop syncing after the next sync cycle.

## My Unresolved Items

When you use Salesforce for Outlook, Exchange Sync, or Email to Salesforce to sync items or add emails from your email app to Salesforce, any items that these features can't automatically assign to Salesforce records appear in My Unresolved Items.

As part of your daily routine, you'll use this page to manage the unresolved items that require your attention. Recurring events do not appear on the My Unresolved Items page. Instead, you can go directly to the recurring events in your calendar to associate the recurring events with Salesforce records.

[Resolving Your Synced Contacts](#)

[Resolving Your Synced Events](#)

## Resolving Your Synced Contacts

When contacts sync from your email app with Salesforce for Outlook or Exchange Sync, some contacts are automatically assigned to accounts based on their company. The rest are added to My Unresolved Items, where you can either assign contacts to Salesforce accounts or confirm that you want to leave them unassigned.

1. Access your unresolved contacts from the sidebar shortcut **Unresolved Items**.
2. Resolve each contact in any of these ways.
  - Assign an account.
    - Select an account under Choose Suggested Account in the drop-down list. We suggest accounts only if we detect possible matches based on the contact's company. Suggested accounts always show the `Account Name` field and the first three additional fields defined in your account search layout. If your organization has contact lookup filters that prevent certain accounts from being assigned to contacts, those accounts won't appear as suggested accounts and can't be assigned to contacts.
    - Select `Search Salesforce.com...` In the lookup, either click **New**, enter account information, and click **Save**, or enter search criteria, click **Go!**, and click the right account. If you don't see the lookup, you may need to first allow popups from Salesforce.
  - Leave unassigned—Select `Don't Assign New Account` from the drop-down list if you want to confirm that a contact with no account should remain unassigned. Unassigned contacts aren't related to Salesforce records and are visible to you and your administrator only.
  - Choose an account if there's a conflict—If the email contact and Salesforce contacts' companies are different, click `Don't Assign New Account` in the drop-down list to overwrite one with the other. The Salesforce account overwrites the email contact company if Salesforce is set to win, and the email contact overwrites the Salesforce account if the email contact is set to win.
  - Cancel a selection—Select `None Selected` from the drop-down list.
3. Click **Save** to save your changes. All modified items are removed from the list. Remaining items continue to sync, and you can return any time to resolve them. Clicking **Cancel** cancels all changes on the page. Every contact assigned to an account now appears on the Contacts related list for that account.

### EDITIONS

Available in: both Salesforce Classic and Lightning Experience (only when prompted to resolve Salesforce for Outlook items from the Windows system tray)

Available in all editions

### USER PERMISSIONS

To view or edit unresolved contacts:

- "Edit" on contacts and "Read" on accounts

AND

Sync enabled for contacts

To create new accounts:

- "Edit" on contacts and "Create" on accounts

AND

"Show Quick Create"

 **Note:** You can also resolve a contact from the contact record by marking it private or by assigning it to an account.

Your unresolved contacts list works like a standard list view. Click **Edit** or **Create New View** to define filters and customize columns.

## Resolving Your Synced Events

When non-recurring events sync from your email app with Salesforce for Outlook or Exchange Sync, they appear in your Salesforce calendar and on the My Unresolved Items page. Use this page to either assign events to related Salesforce records or confirm that you want to leave them unassigned.

 **Note:** Recurring events do not appear on the My Unresolved Items page. Instead, you can go directly to the recurring events in your calendar to associate the recurring events with Salesforce records.

1. Access your unresolved events from the sidebar shortcut **Unresolved Items**.
2. Depending on how you want to resolve an event, choose either of these actions.
  - Assign to related records—Enter a related record in one or both fields. If you need to, first select the correct record type from the drop-down list. If you assign a lead, you can't assign additional records. Clear an entry to cancel an assignment.
  - Leave unassigned—Click **Don't Assign**. Unassigned events, such as internal meetings or personal appointments, aren't linked to any other records and are visible to you only.
3. Click **Save** to save your changes. All modified items are removed from the list. Remaining items continue to sync, and you can return any time to resolve them. Clicking **Cancel** cancels all changes on the page. The event is added to the associated record's Activity History or Open Activities related list. You can't save changes if your events have a required custom field or an activity custom field becomes required after items are added to your unresolved events list.

 **Note:** You can also resolve an event from the event record by marking it private or by assigning it to other Salesforce records using the `Related To` and `Name` fields. Assigned and private events are automatically removed from your unresolved events list. Click  next to the subject to see an event's description.

- "Edit" on tasks
- AND
- "Show Quick Create" and "Create" on those objects

To see recently used data in the related records fields:

- "Lookup Auto-Completion" in Search Settings

## Delete Items Syncing with Salesforce for Outlook

Remove an item syncing with Salesforce for Outlook from both Salesforce and Outlook by deleting the item in one system only. Take care to give special treatment to recurring tasks and recently-updated items you want to delete.

First, check the sync direction for the contact, event, or task you want to delete. Next, delete the item from the system in which the item is set to flow from. If your items are set to sync in both directions, you can delete items from either system.

As a result, Salesforce for Outlook automatically removes the corresponding item in the other system.

 **Note:** Recurring tasks only sync from Salesforce, so there’s no need to check the sync direction before deleting those items: always delete recurring tasks in Salesforce.

1. From your personal settings, enter *Salesforce for Outlook* in the `Quick Find` box, then click **View My Configuration**.
2. Review the sync direction setting for the contact, event, or (non-recurring) task that you want to delete.
3. Delete the item in the system from which sync is flowing.  
For example, if you want to delete a contact, and your contacts are set to sync from Outlook to Salesforce, delete the contact in Outlook.  
The item you deleted is removed from both systems during the next sync cycle.

If the item was not removed from both systems, you—or another sales rep—may have updated that record within the same sync cycle and Salesforce for Outlook gave preference to the update over the delete. This behavior happens as a result of `Conflict Behavior` set in someone’s Salesforce for Outlook configuration, which would have let the update in one system “win” over the delete in the other. In this case, delete the record again to remove it from both systems. Or maybe check with your coworker first, who obviously cares about that item!

## View Salesforce Records in Microsoft® Outlook®

### USER PERMISSIONS

Watch a Demo:  [Using the Salesforce Side Panel to Work with Records in Microsoft® Outlook®](#)

When you select an email from the Inbox or an event from the Calendar in Outlook, the Salesforce Side Panel displays related Salesforce contact and lead details directly in Outlook. After your administrator enables the side panel in your Outlook configuration, the side panel displays up to 10 contacts and leads from your email's From, To, and Cc fields.

In addition, the Salesforce Side Panel:

- Displays as many as four activities, opportunities, and cases related to the contacts and leads that appear in the side panel.
- Makes it easy to add Outlook emails and their attachments to multiple Salesforce records, as well as add Outlook events and tasks to multiple contacts, and to one other record with which you can associate tasks, such as an account, a case, or even a custom object record.
- Discovers duplicate contacts or leads. You choose the most appropriate ones to display in the side panel.
- Lets you create Salesforce records directly from the side panel.
- Includes a Search feature to find additional Salesforce records.
- Includes links to view full record details directly in Salesforce.

Here's how you'll use the side panel.

1. Select an email or event in Outlook.
2. Review the Salesforce content that appears in the side panel, which displays contacts and leads based on the order they appear in your email's From, To, and Cc fields. For each contact and lead, it's easy to view related activities, opportunities, and cases. If you want to view full record details, just click on a record's link to open it directly in Salesforce.

To add your email or event to the Salesforce records of your choice, click  or  next to those records. Email attachments are included automatically when you add an email to Salesforce, unless your organization has enabled the feature that allows you to

select specific email attachments. In that case, you'll see  next to the individual attachments in your side panel. Click the icon to add those attachments to Salesforce.

If you have the Social Accounts and Contacts feature enabled in Salesforce, the side panel displays either Facebook® or Twitter™ profile photos—whichever ones you chose to show in Salesforce for those contacts and leads.

3. Select the other contacts and leads related to your email to view their details, along with related activities, cases, and opportunities.
4. Quickly see the Salesforce records to which you've added emails or events. If you'd like to create a new account, case, contact, lead, opportunity, or a custom object record related to your email, click . If you don't see records you're looking for, click  to find other records, and then add emails, events, or tasks from the Outlook tasks list to them. There's even a collapse feature (  ) to hide the side panel.

---

Available in all editions

Keep track of important Outlook emails related to Salesforce records from the Salesforce Side Panel.

You'll complete this procedure using the Salesforce Side Panel, a feature that's available in Salesforce for Outlook. If you're not yet familiar with the side panel, learn about it in [View Salesforce Records in Microsoft® Outlook®](#).

1. In Outlook, either:

- Select an email from your Inbox.
- Create a new email.

You can add an email to multiple contacts and to one other record with which you can associate tasks, such as an account, a case, or an opportunity.

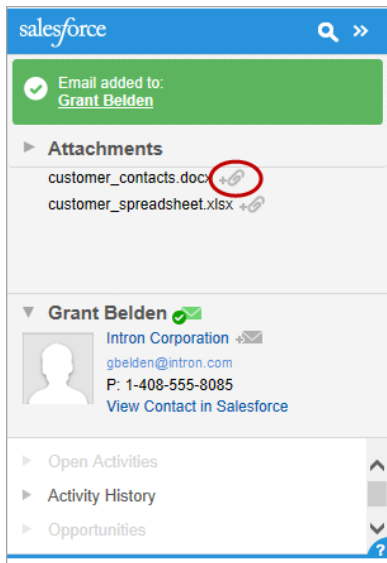

2. In the side panel, click  for the contact, account, case, opportunity, or lead to which you want to add the email. The side panel confirms the Salesforce records to which you added your email.

If you're sending a new email, we'll add it to Salesforce records after you click **Send**.

3. You'll add attachments differently depending on how you're set up to use the side panel.

- If the attachments section appears after you add your email to Salesforce, click  to include specific email attachments on the record.

- If you don't see the option to add attachments, your attachments are included automatically when you add your email to Salesforce.

## Remove Microsoft® Outlook® Emails from Salesforce Records

### USER PERMISSIONS

To display the Salesforce Side Panel in Outlook:	“Side Panel” in your Outlook configuration
To add Outlook emails (including attachments), events, and tasks to Salesforce records:	“Add Email” in your Outlook configuration
To add specific email attachments to Salesforce:	“Allow users to select attachments” in your Outlook configuration
To add emails (including attachments), events, and tasks to multiple contacts:	“Allow Users to Relate Multiple Contacts to Tasks and Events” in Activity Settings
To add emails to multiple Salesforce records that accept tasks:	Contact Salesforce Customer Support

### EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

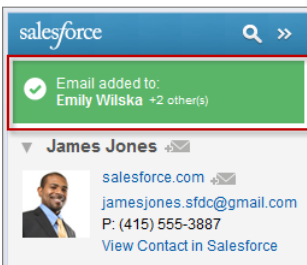

---

Available in all editions

You can remove Microsoft Outlook emails from your Salesforce records with the Side Panel for Salesforce for Outlook.

You'll complete this procedure using the Salesforce Side Panel, a feature that's available in Salesforce for Outlook. If you're not yet familiar with the side panel, learn about it in [View Salesforce Records in Microsoft® Outlook®](#).

1. In Outlook, select the email you want to remove from Salesforce records.
2. In the Salesforce Side Panel, find the Salesforce record from which you want to remove the email. The upper section of the side panel displays the records to which you've already added your email.
3. With your mouse, hover over , which turns to , then click it to remove your email from the Salesforce record. The side panel displays updates for the remaining Salesforce records to which you've added your email.

### SEE ALSO:

- [Add Microsoft® Outlook® Emails to Salesforce Records](#)
- [Searching for Salesforce Records in Microsoft® Outlook®](#)

## Add Microsoft® Outlook® Events to Salesforce Records

Add Outlook events to Salesforce records by using the Salesforce Side Panel. The event is added to the Salesforce record as an activity, which you can see on the record's Activity History or Open Activities related lists.

1. In Outlook, select an event you want to add to Salesforce records. You can add an event to multiple contacts, and to one other record with which you can associate tasks, such as an account, a case, or an opportunity.

### EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

### USER PERMISSIONS

To display the Salesforce Side Panel in Outlook:

- "Side Panel" in your Outlook configuration

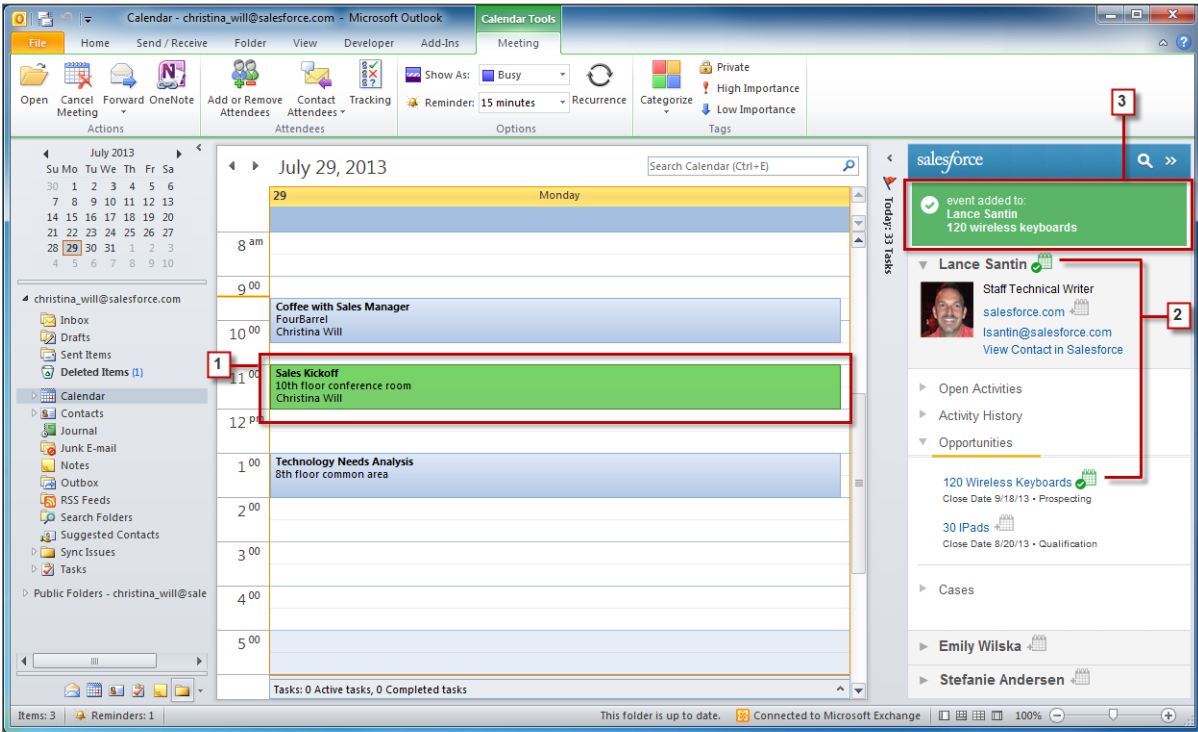

To add Outlook emails (including attachments), events, and tasks to Salesforce records:

- "Add Email" in your Outlook configuration

To add emails (including attachments), events, and tasks to multiple contacts:

- "Allow Users to Relate Multiple Contacts to Tasks and Events" in Activity Settings

2. In the Salesforce Side Panel, click  for the contact, account, case, opportunity, or lead to which you want to add the event. You'll see  after you add the event.
3. Review the Salesforce records to which you added your event.

## Add Microsoft® Outlook® Tasks to Salesforce Records

You can add Outlook tasks to multiple Salesforce contacts and to one other record that accepts tasks, like an account, a lead, or an opportunity. The task is added to the Salesforce record as an activity, which you can see on the record’s Activity History or Open Activities related lists.

Add Outlook tasks to Salesforce records from Tasks in Microsoft Outlook.

1. Select the task that you want to add to a Salesforce record.
2. Click  in the side panel to display the Salesforce record to which you’d like to add the task.
3. Click  next to the record in the search results.

### EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

### USER PERMISSIONS

To display the Salesforce Side Panel in Outlook:

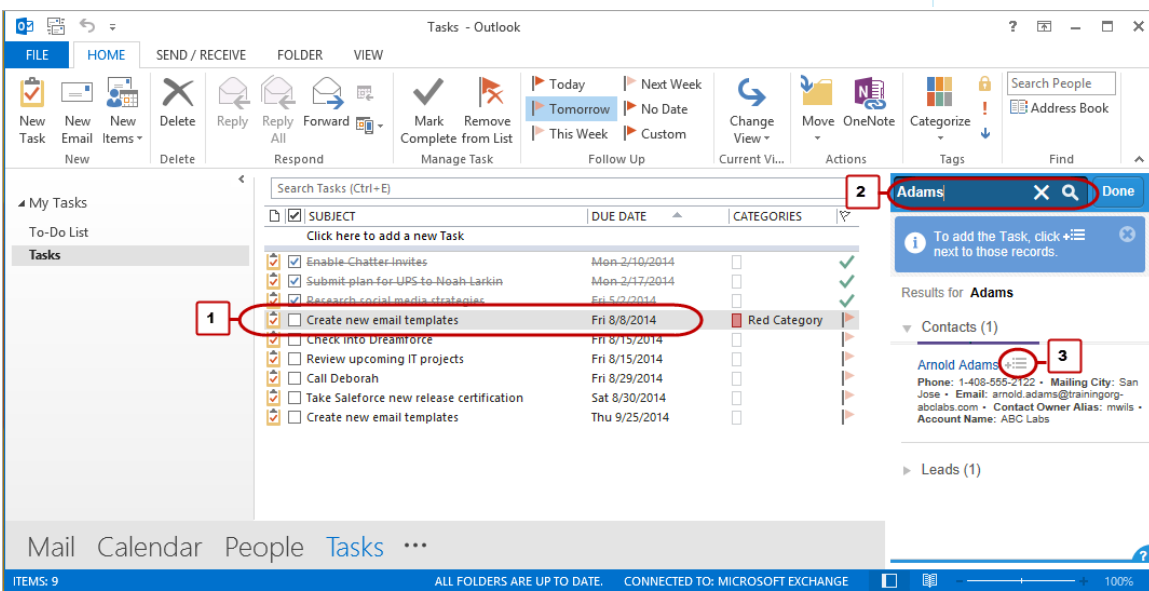

- “Side Panel” in your Outlook configuration

To add Outlook emails (including attachments), events, and tasks to Salesforce records:

- “Add Email” in your Outlook configuration

To add emails (including attachments), events, and tasks to multiple contacts:

- “Allow Users to Relate Multiple Contacts to Tasks and Events” in Activity Settings

You'll see  after you add the task.

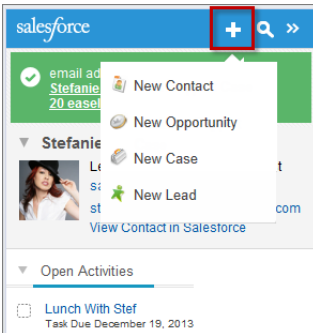

## Create Records Directly from the Salesforce Side Panel

Quickly create different kinds of records directly from the side panel in Microsoft® Outlook®.

Depending on how your administrator set up your Salesforce Side Panel Publisher access, you can create accounts, cases, contacts, leads, opportunities, and other types of records customized for your organization—directly from the side panel.

1. Select an email in Outlook, then click **+**.

You'll see something like this.

2. Choose an action.  
The actions available to you depend on the ones your administrator set up, such as New Contact.
3. Complete the record detail by providing relevant details.

### EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

### USER PERMISSIONS

To display the Salesforce Side Panel:

- "Side Panel" in Outlook configurations

To create new records from the Salesforce Side Panel:

- "Create" and "Read" on all objects that users create records from AND "Visible" on all required fields in records that users create

4. Click  to save the record.  
Keep in mind that email attachments aren't included in the created records.

### Searching for Salesforce Records in Microsoft® Outlook®

#### USER PERMISSIONS

To display the Salesforce Side Panel in Outlook: "Side Panel" in your Outlook configuration

To add Outlook emails (including attachments), events, and tasks to Salesforce records: "Add Email" in your Outlook configuration

#### EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

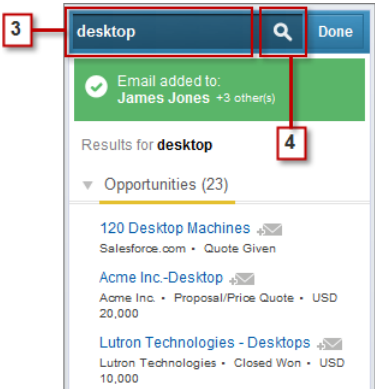

Available in all editions

To add specific email attachments to Salesforce:	“Allow users to select attachments” in your Outlook configuration
To add emails (including attachments), events, and tasks to multiple contacts:	“Allow Users to Relate Multiple Contacts to Tasks and Events” in Activity Settings
To add emails to multiple Salesforce records that accept tasks:	Contact Salesforce Customer Support

You'll complete this procedure using the Salesforce Side Panel, a feature that's available in Salesforce for Outlook. If you're not yet familiar with the side panel, learn about it in [View Salesforce Records in Microsoft® Outlook®](#).

When you're viewing details that appear in the Salesforce Side Panel, you may want to search for additional Salesforce records. Search results display contacts and any other records with which you can associate tasks, such as a campaign, a case, or an opportunity.

1. From Outlook, select an email for which you want to display additional Salesforce records.
2. In the side panel, click .
3. Type your search term. For example, if you want to search for Salesforce records related to *desktops*, type *desktop*.

4. Click the search icon to display Salesforce records related to your search term.

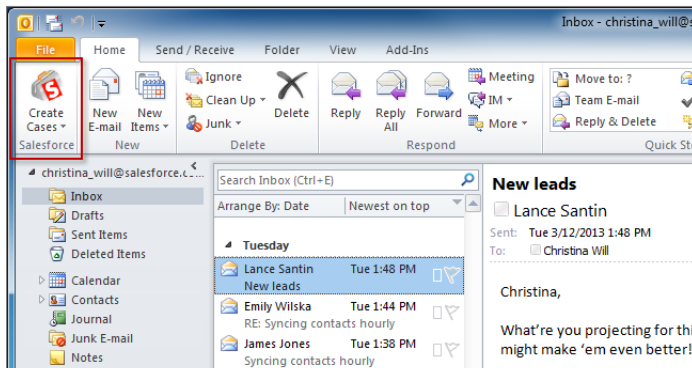

SEE ALSO:

- [View Salesforce Records in Microsoft® Outlook®](#)
- [Add Microsoft® Outlook® Emails to Salesforce Records](#)

## Create Cases from the Outlook Ribbon with Salesforce for Outlook

 **Note:** Before you use this feature, consider [creating records directly from the Salesforce Side Panel](#) instead. Just keep in mind that when you create cases from the side panel, email attachments aren't included.

If you don't see the **Create Cases** drop-down list button in Microsoft® Outlook®, contact your administrator, who can enable this feature.

If you track cases in Salesforce, you can create new ones from your Microsoft® Outlook® emails. Your administrator needs to first create Email-to-Case destinations that appear in the drop-down list button **Create Cases** in Outlook. For each destination, you can choose the assignee, which can be either individual users or queues. When you create cases, you can add up to ten emails simultaneously for each destination.

1. In Outlook, select up to 10 sent or received emails and click **Create Cases**.
2. Select a destination from the drop-down list. Salesforce for Outlook adds the emails you selected as a case in Salesforce.

### What's the difference between private items in both Salesforce and Microsoft® Outlook®?

Private items in Microsoft Outlook and Salesforce differ in ways you may not expect. The following table provides details you should know before choosing whether to include private items when you sync between Outlook and Salesforce.

Item	Private in Outlook	Private in Salesforce
Contacts	Others in your organization, with the exception of your Exchange administrator, can't see your contacts.	<p>Only contacts that aren't associated with accounts are private and not visible to other Salesforce users, except for users above that role in the hierarchy and administrators, who can view, edit, and report on contacts.</p> <p>Contacts associated with accounts, however, are visible to other Salesforce users.</p>

Item	Private in Outlook	Private in Salesforce
Events	Others in your organization, with the exception of your Exchange administrator, can't see your events.	Only blocks of time, and not event details, on your calendar are visible to other Salesforce users, except for users above that role in the hierarchy and administrators, who can view, edit, and report on contacts.
Tasks	Others in your organization, with the exception of your Exchange administrator, can't see your tasks.	Salesforce doesn't include any means for keeping tasks private. So other users in your organization, depending on their role in the hierarchy and administrators, can see your tasks.

**SEE ALSO:**

[How Salesforce for Outlook Syncs Between Microsoft® Outlook® and Salesforce Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

**Can I have Salesforce for Outlook and Connect for Outlook installed at the same time?**

Yes, you can have both products installed, but for best performance, we recommend removing Connect for Outlook and using only Salesforce for Outlook. To hide Connect for Outlook temporarily, right-click your Outlook toolbar and deselect Connect for Outlook.

**SEE ALSO:**

[How Salesforce for Outlook Syncs Between Microsoft® Outlook® and Salesforce](#)

**Does Salesforce for Outlook support terminal servers?**

No. Salesforce for Outlook does not support terminal servers, such as Citrix.

**SEE ALSO:**

[How Salesforce for Outlook Syncs Between Microsoft® Outlook® and Salesforce](#)

**Why is my Salesforce for Outlook installation failing on the prerequisites screen?**

Your system may not meet all system requirements for Salesforce for Outlook. Verify your system meets these requirements, then try installing Salesforce for Outlook again.

**SEE ALSO:**

[How Salesforce for Outlook Syncs Between Microsoft® Outlook® and Salesforce](#)  
[Install and Set Up Salesforce for Outlook](#)  
[Salesforce for Outlook System Requirements](#)

**Why can't I log in to Salesforce for Outlook?**

Your inability to log in may be related to your company's IP address requirements. If your organization restricts IP addresses, logins from untrusted IPs are blocked until they're activated. Salesforce automatically sends you an activation email that you can use to log in. The

email contains a security token that you must add to the end of your password. For example, if your password is *mypassword*, and your security token is *XXXXXXXXXX*, you must enter *mypasswordXXXXXXXXXX* to log in.

SEE ALSO:

[How Salesforce for Outlook Syncs Between Microsoft® Outlook® and Salesforce](#)

### Can I map custom fields I'm syncing with Salesforce for Outlook?

Yes. You can map a Salesforce field to a custom Outlook field, or an Outlook field to a custom Salesforce field using Salesforce for Outlook. These field types are available to map:

- Outlook text fields
- Salesforce text fields
- Some Salesforce picklist fields

To map to custom fields, open an Outlook configuration. Under **Field Mapping**, select *Custom Field...* from the end of the corresponding **Outlook Field** picklist. Enter the field's name and click **OK**.

SEE ALSO:

[Customize the Fields You Sync Between Salesforce and Outlook](#)

### Can I mass configure Salesforce for Outlook?

Yes, you can create a configuration in Salesforce and assign it to profiles or even specific users. When those users set up Salesforce for Outlook, the configuration's settings are automatically deployed to Outlook.

SEE ALSO:

[Managing Your Salesforce for Outlook Configuration](#)

### Can I use filter logic in Salesforce for Outlook data sets?

No, you can't use filter logic to limit which records your users sync using Salesforce for Outlook.

SEE ALSO:

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

### Can I use Outlook categories to indicate what I want Salesforce for Outlook to sync?

No, Salesforce for Outlook uses folders rather than categories to specify which items sync.

SEE ALSO:

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

[Change Your Salesforce for Outlook Sync Folders](#)

### Can I sync person accounts by using Salesforce for Outlook?

No. You can't upload person accounts by using Salesforce for Outlook.

For information on how to import person accounts into your Salesforce organization, see [Import My Person Accounts](#) on page 623.

SEE ALSO:

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

### Can I add cases using Salesforce for Outlook?

Yes, Salesforce for Outlook supports adding emails to Salesforce as cases.

SEE ALSO:

[Create Cases from the Outlook Ribbon with Salesforce for Outlook](#)

[Set Up Create Case for Salesforce for Outlook Users](#)

### Can I associate Outlook records to custom objects using Salesforce for Outlook?

You can assign synced events and tasks to several different objects, including custom objects, but you can assign synced contacts only to accounts.

SEE ALSO:

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

### Why does Salesforce for Outlook create duplicate records in Microsoft® Outlook®?

If you either mark items as Private or assign them to the Outlook category *Don't Sync with Salesforce*, and you sync contacts, events, and tasks from Salesforce to Outlook, Salesforce for Outlook may create duplicate records in Outlook.

This can happen if you have Salesforce items that contain the same information as the Outlook items you either marked as Private or assigned to the category *Don't Sync with Salesforce*. These items were never mapped to each other, so Salesforce for Outlook treats them separately, resulting in duplicates.

If you want to remove duplicates, it's best to remove the ones in Outlook that you either marked as Private or assigned to the Outlook category *Don't Sync with Salesforce*. Doing this ensures that you don't delete information in Salesforce to which other users may have contributed.

SEE ALSO:

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

### Why does Salesforce for Outlook create duplicate contacts in Salesforce and Microsoft® Outlook®?

If you sync your team's records and they include different information for some of the same contacts you own, Salesforce for Outlook may create duplicate contacts in both Salesforce and Outlook.

For example, you and a team member both have a contact for Christina Wills. But the two contacts list different companies for her. Salesforce for Outlook syncs the contacts for you and your team members, resulting in duplicates in Salesforce and Outlook.

To avoid this, coordinate with your team members so you share the same contact information. You'll need to remove the contacts containing the outdated information.

SEE ALSO:

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

### Why does Salesforce for Outlook delete my Outlook records after I sync?

Salesforce for Outlook automatically syncs records you own, as well as records to which you have read/write access that are:

- Associated with accounts you own
- Associated with accounts of which you are an account team member
- Owned by members of your sync profile's groups

If you try to sync a record from Outlook to Salesforce that doesn't fit in the above categories, the sync process may attempt to delete that record from Outlook during a later sync. To avoid deletion of these records, assign them to the Outlook category *Don't Sync with Salesforce*.

SEE ALSO:

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

### Why isn't Salesforce for Outlook adding emails to the right contact or lead in Salesforce?

One of the following may be occurring.

<b>If you have</b>	<b>Salesforce for Outlook may be adding your emails to</b>	<b>You should</b>
Duplicate records in Salesforce for Outlook	The wrong records	Consider merging the duplicate records
No matching record in Salesforce for Outlook	My Unresolved Items list	Add the matching contacts or leads to Salesforce and associate the unresolved emails with your new contacts or leads

SEE ALSO:

[Edit Your Salesforce for Outlook Email Settings](#)

### Why can't I add emails to Salesforce?

If you receive the error message `User is not authorized to send emails to this service` when you use Salesforce for Outlook to add emails, your email address isn't authorized in Salesforce.

To authorize email addresses in Salesforce:

1. From your personal settings, enter *My Email to Salesforce* in the Quick Find box, then select **My Email to Salesforce**.

- In My Acceptable Email Addresses, enter the email addresses you want to authorize. Salesforce allows you to add emails through Salesforce for Outlook from only the addresses listed in this field. You cannot leave this field empty.

SEE ALSO:

- [Edit Your Salesforce for Outlook Email Settings](#)
- [Find Your Personal Settings](#)

### When I add emails to Salesforce, how can I include email attachments?

You can include email attachments when you add emails to Salesforce if you and your administrator have enabled the correct settings, and your Salesforce organization has enough space to store the attachment.

When you add an email to Salesforce, the email is added as a new task. Email attachments are included on the Attachments related lists.

Depending on how your administrator configured your settings, you can add email attachments to Salesforce in one of several ways.

If you're using	You enable	Your administrator enables	Attachments are added to Salesforce like this
Salesforce for Outlook with side panel		Side Panel and Add Email in your Outlook configuration	Automatically, after you add an email to Salesforce from the side panel.
		Side Panel, Add Email, and Allow users to select attachments in your Outlook configuration	When you select  after you add an email to Salesforce from the side panel.
Salesforce for Outlook without side panel	Email to Salesforce in your Email settings, with Always save email attachments selected	Email to Salesforce for your organization and an active Outlook configuration that includes you	Automatically, after you add an email to Salesforce using the Add Emails or Send and Add buttons in Outlook.
Email to Salesforce	Email to Salesforce in your Email settings, with Always save email attachments selected	Email to Salesforce for your organization	Automatically, after you send the email to your Email to Salesforce address.

### How do I enable contacts for sync in Salesforce for Outlook?

Your administrator needs to perform the following two tasks before you can sync contacts between Microsoft® Outlook® and Salesforce.

- Your administrator creates a configuration that allows users to sync contacts.
- Your administrator defines a data set for that configuration.

After your administrator performs those tasks, you may have permissions to enable contacts for sync by completing the following procedure.

1. From your personal settings, enter *Salesforce for Outlook* in the **Quick Find** box, then select **Salesforce for Outlook**.
2. Click **View My Configuration**.
3. Under the Sync Settings section, verify you have **Contacts** selected. If you're unable to select it, contact your administrator, who can enable contact syncing for you.

SEE ALSO:

- [Edit Your Salesforce for Outlook Sync Settings](#)
- [Syncing Contacts with Salesforce for Outlook](#)
- [Learning about Data Sets for Salesforce for Outlook](#)
- [Find Your Personal Settings](#)

### How does Salesforce for Outlook protect emails?

Salesforce supports both delegated authentication and Security Assertion Markup Language (SAML) requirements for Salesforce for Outlook. When using SAML for Salesforce for Outlook, My Domain is required.

SEE ALSO:

- [Edit Your Salesforce for Outlook Email Settings](#)

### Does Salesforce support single sign-on (SSO) for Salesforce for Outlook?

Yes. Salesforce supports both delegated authentication and Security Assertion Markup Language (SAML) requirements for Salesforce for Outlook. When using delegated authentication, users need to log into Salesforce the first time they use Salesforce for Outlook. When using SAML for Salesforce for Outlook, My Domain is required.

### How secure is Salesforce for Outlook?

Salesforce for Outlook, a .NET application you install on your machine, securely connects to Salesforce. Specifically,

<b>For</b>	<b>Salesforce for Outlook uses</b>
Usernames and passwords	OAuth 2.0 to authenticate with Salesforce. We store usernames and encrypted OAuth refresh tokens locally. We never store passwords.
Connections to Salesforce	SSL 128-bit encryption through an HTTPS connection.

# Syncing Salesforce and Microsoft® Outlook® 2007 and Earlier

## Connect for Outlook is Retired

**!** **Important:** Connect for Outlook was retired in Winter '16. This means the product no longer saves your emails or syncs your contacts, events, and tasks between Microsoft® Outlook® and Salesforce. But don't worry! You'll be even more productive when you uninstall Connect for Outlook and migrate to one of our latest email integration features, Email Connect or Salesforce for Outlook. Talk to your Salesforce administrator to learn which feature is compatible with your environment.

Our legacy email integration application, Force.com Connect for Microsoft Outlook, let you interact with Salesforce from Microsoft® Outlook® 2007 and earlier.

# Connect Offline

## Force.com Connect Offline

With Force.com Connect Offline, work on your key deals anywhere, any time—totally unplugged.

Connect Offline is a client application that lets you access a subset of Salesforce records using the same browser-based interface as the online system but without an Internet connection. Use Connect Offline to view, edit, create, and delete accounts, activities, contacts, opportunities, leads, and custom object records (including relationship groups). You can also add and update products and schedules on opportunities.

The subset of Salesforce records accessible in Connect Offline is referred to as a *briefcase*.

Administrators can create *briefcase configurations*, which are sets of parameters that determine the records available in the briefcases of users with a specific profile. Organizations can have multiple briefcase configurations and associate each with a different set of profiles to simultaneously suit the needs of various types of offline users. For example, one configuration might include leads and opportunities in the briefcases of users with a Sales Representative profile, while another configuration includes accounts and related opportunities in the briefcases of users with an Account Executive profile. Users without an assigned briefcase configuration can [configure the settings for their own Connect Offline briefcase](#) and can [manually select the accounts the briefcase includes](#).

When online, users can [synchronize their Connect Offline briefcases with Salesforce](#). During synchronization, the changes to records in the briefcase are implemented in Salesforce, and vice-versa. This ensures that both Salesforce and Connect Offline have the most current records. If updates to a record in the briefcase conflict with updates to a record in Salesforce, Connect Offline displays the conflict resolution tool, which allows users to easily [resolve the conflict](#).

To start using Connect Offline today, log into Salesforce and [install the Connect Offline client application](#).

### SEE ALSO:

[Log in to Connect Offline](#)

[Tabs Available in Connect Offline](#)

### EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Available for an additional cost in: **Professional** Edition

## Log in to Connect Offline

1. On your computer, click **Start > Programs > salesforce.com > Connect Offline**, or double-click the Connect Offline desktop icon.

 **Important:** The first time you log into Connect Offline, you must have an Internet connection.

2. Enter your Salesforce username and password.

 **Note:** If your organization restricts IP addresses, logins from untrusted IPs are blocked until they're activated. Salesforce automatically sends you an activation email that you can use to log in. The email contains a security token that you must add to the end of your password. For example, if your password is *mypassword*, and your security token is *XXXXXXXXXX*, you must enter *mypasswordXXXXXXXXXX* to log in.

3. Select the `Update tab names` checkbox if you want Connect Offline to reflect any changes to the names of fields, objects, and tabs in Salesforce since the last time you selected this option.

 **Note:** Salesforce automatically updates your tabs the first time you log in.

4. Select the `Synchronize my data` checkbox to synchronize your Connect Offline briefcase with Salesforce.
5. Click **Login**.

### EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Available for an additional cost in: **Professional** Edition

### USER PERMISSIONS

#### User Permissions Needed

To view records in Connect Offline:

- "Read" on the appropriate type of record such as accounts, contacts, or opportunities

To update records in Connect Offline:

- "Create," "Edit," or "Delete" on the appropriate type of record such as accounts, contacts, or opportunities

## Briefcase Configuration

### Manage Connect Offline Briefcase Configurations

Connect Offline *briefcase configurations* are sets of parameters that determine the records available in the briefcases of both individual users as well as users with a specific profile. You can create multiple briefcase configurations and associate each with different users and profiles to simultaneously suit the needs of various types of offline users. For example, one configuration might include leads and opportunities for sales representatives, while another configuration includes accounts and related opportunities for account executives.

Users without assigned briefcase configurations see the [default briefcase contents](#) and can manually configure settings for their own Connect Offline briefcase; however, Salesforce recommends using briefcase configurations instead of allowing users to manually configure their own offline briefcases because briefcase configurations provide:

- Centralized configuration
- Synchronization with any custom object, as opposed to personal briefcase settings that only support custom objects related to accounts, contacts, opportunities, or leads
- The ability to define [data sets](#) with greater flexibility and filtering capabilities

To manage briefcase configurations for your organization, from Setup, enter *Offline Briefcase Configurations* in the **Quick Find** box, then select **Offline Briefcase Configurations**.

- To create a briefcase configuration, click **New Offline Briefcase Configuration**.
- To define a data set for an offline briefcase configuration, click the name of the briefcase configuration, then click **Edit** in the Data Sets related list.
- To make changes to a briefcase configuration, click **Edit**.
- To delete a briefcase configuration, click **Del**.
- To view details about a briefcase configuration, click its name.
- To clone a briefcase configuration, select the briefcase configuration you want to clone and click **Clone**.
- To activate a briefcase configuration, click **Edit** next to the configuration you want to activate, select **Active**, and click **Save**.
- To deactivate a briefcase configuration, click **Edit** next to the configuration you want to deactivate, deselect **Active**, and click **Save**.

 **Important:** If you deactivate an active briefcase configuration, users assigned to that configuration cannot synchronize their briefcases.

SEE ALSO:

[What is Your Default Connect Offline Briefcase Contents?](#)

#### EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Available for an additional cost in: **Professional** Edition

#### USER PERMISSIONS

To view Connect Offline briefcase configurations:

- “View Setup and Configuration”

To create, change, or delete Connect Offline briefcase configurations:

- “Manage Mobile Configurations”

## Create an Offline Briefcase Configuration

1. From Setup, enter *Offline Briefcase Configurations* in the Quick Find box, then select **Offline Briefcase Configurations** to access the briefcase configurations list page.
2. Click **New Offline Briefcase Configuration**.
3. Enter a name for the briefcase configuration.
4. Select the **Active** checkbox if you want to activate the briefcase configuration immediately after you create it. The configuration does not work until you select this checkbox.
5. Enter a description for the briefcase configuration.
6. Select users and profiles from the **Available Members** box and click the **Add** arrow to assign them to the briefcase configuration. If you do not immediately see the user or profile you want to add, enter the profile name in the search box and click **Find**. You can assign each user or profile to only one briefcase configuration.

If there are users and profiles in the **Assigned Members** box you do not want to assign to the briefcase configuration, select them and click the **Remove** arrow.

 **Warning:** If you remove a user or profile from an active briefcase configuration, those users can no longer synchronize their briefcases to that configuration. The next time the users synchronize, Connect Offline synchronizes their briefcases with the [default briefcase content](#).

When you assign profiles to a briefcase configuration, the configuration applies to all Connect Offline users with that profile and overrides users' personal briefcase configurations.

7. Click **Save**.
8. Also, you must [create the data sets](#) for this offline briefcase configuration to determine the data that members of the configuration receive in their briefcase.

Note that your offline briefcase configuration is not active until you select the **Active** checkbox. Also, you must [create the data sets](#) for this briefcase configuration to determine the records that users with this configuration can access in Connect Offline.

### SEE ALSO:

### EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Available for an additional cost in: **Professional** Edition

### USER PERMISSIONS

To create, change, or delete briefcase configurations:

- "Manage Mobile Configurations"

## Define Connect Offline Data Sets

After you create a briefcase configuration, define its data sets to specify the records that users can access in Connect Offline if that briefcase configuration is assigned to their profile.

*Data sets* are the parameters in briefcase configurations that determine which records appear in the briefcases of users assigned to the briefcase configuration. Each data set pertains to records of a single object and is classified by the name of that object. For example, the Accounts data set only includes account records. Filters and limits within each data set let you further restrict the records the data set includes.

Data sets can have child data sets for records associated with a top-level (parent) data set. For example, if the first level of your hierarchy has an Accounts data set, you can add a Contacts child data set for all contact records related to the account records.

A single briefcase configuration can have multiple data sets for the same object and at different levels. For example, you can have an Events parent data set and an Events child data set under Leads.

To define the data sets for a briefcase configuration:

1. From Setup, enter *Offline Briefcase Configurations* in the Quick Find box, then select **Offline Briefcase Configurations**.
2. Click the name of the briefcase configuration that you want to modify.
3. In the Data Sets related list, click **Edit**.
4. From the Data Sets page, you can:
  - Add a data set.
  - Remove a data set by selecting the data set you want to remove and clicking **Remove**.
  - Edit a data set by selecting the data set you want to edit in the hierarchy. The right pane displays the filters for that data set.

As you define and modify the data sets, Salesforce automatically saves your changes.

5. In the Test Data Size section, select a user and click **Estimate Data Size** to estimate the amount of data the data sets will synchronize to a user's briefcase. Larger data sets take longer to synchronize and consume more disk space on users' computers.

 **Note:** The `select a user` field defaults to the name of the user currently logged in; however, it is important to test the data size for users who will actually be assigned to the briefcase configuration for which you are defining the data sets.

When the test completes, the Test Data Size section provides data set size summary information, and the data set hierarchy at the top of the page displays the number of records generated by each data set and the size of each data set. Use these statistics to identify data sets that might require additional filtering criteria to reduce the size.

The test statistics in the Test Data Size section do not automatically refresh if you edit the data sets. Click **Refresh Data Size** to update the test results.

6. Click **Done** when you are finished.

## Adding Data Sets

To add a data set:

1. In the hierarchy, select **Data Sets** to create a parent data set, or select an existing data set to create a child data set.
2. Click **Add....**

### EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Available for an additional cost in: **Professional** Edition

### USER PERMISSIONS

To view Connect Offline data sets:

- "View Setup and Configuration"

To create, change, or delete Connect Offline data sets:

- "Manage Mobile Configurations"

3. In the popup window, select the object for the records you want the data set to include. Salesforce lets you create parent data sets for all custom objects and the following standard objects:

- Accounts
- Contacts
- Events
- Leads
- Opportunities
- Products
- Tasks
- Users

For child data sets, the popup window only lists objects that relate to the selected parent data set.

 **Note:** Salesforce automatically transfers parent records of objects if that type of parent record is anywhere in the data set, even if the parent object is not connected to the child object in the hierarchy.

4. Click **OK**. The data set you created appears in the hierarchy.

5. Optionally, use filters to restrict the records that a parent or child data set includes:

a. Use the Filter by Record Ownership options to configure Salesforce to automatically synchronize records based on the owner of the record. The possible options are:

- **All Records:** Salesforce automatically synchronizes all records the user can access.
- **User's Records:** Salesforce automatically synchronizes all records the user owns.
- **User's Team's Records:** Salesforce automatically synchronizes all records owned by the user and the user's subordinates in the role hierarchy.
- **User's Account Team's Records:** Salesforce automatically synchronizes accounts for which the user is an account team member, but does not include accounts owned by the user.
- **User's Opportunity Team's Records:** Salesforce automatically synchronizes opportunities for which the user is an opportunity team member, but does not include opportunities owned by the user.
- **None (Search Only):** Salesforce does not automatically synchronize any records for this data set.

Salesforce only displays options that relate to the selected data set. For example, selecting an account data set displays the **User's Account Team's Records** option, while selecting an opportunity data set displays the **User's Opportunity Team's Records** option.

If your offline needs for an object require a combination of the available record ownership filters, you can add the same object data set up to four times on the same hierarchy level. For example, a sales manager might want to synchronize his opportunities, opportunities owned by his subordinates, and opportunities for which he is an opportunity team member. In this case, you would add an opportunity data set and select **User's Team's Records**, then add a second opportunity data set at the same level in the hierarchy and select **User's Opportunity Team's Records**. Note that objects with only one ownership filter option cannot be added multiple times at the same level of the hierarchy.

b. Set the filter criteria to automatically synchronize only records that meet specific criteria in addition to the Filter by Record Ownership option you selected. For example, you can set the filter to only include opportunity records with amounts greater than \$50,000, or contact records with the title "Buyer." Several \$User global variables are available in offline configuration filters.

Click **Add Filter Logic** to change the default AND relationship between each filter.

- c. To prevent a single data set from consuming a large amount of memory, select the second radio button under Set Max Record Limit and enter the maximum number of records this data set can transfer to a briefcase. Use the Order By and Sort drop-down lists to specify which records are synchronized if the number of records available is higher than the limit you set.

If the limit is reached, Salesforce synchronizes records in accordance with the Order By and Sort settings. For example, if the settings are Last Modified Date and Descending, Salesforce transfers the most recently modified records and removes the same number of records that were least recently modified.

If you selected the `None (Search Only)` Filter by Record Ownership option, the limit you set does not apply because no records are automatically synchronized.

**Tip:** Do not use Set Max Record Limit in place of filters. Only use Set Max Record Limit as a safety mechanism, and use filters as the primary means of limiting the number of records in the briefcase. This ensures that your Connect Offline users receive the correct records.

6. Click **Done** when you are finished.

### Notes on Data Sets

- Connect Offline users can view opportunity contact roles in their briefcases. To add contact roles to a briefcase, include the contact data set as a child of the opportunity data set in your briefcase configuration.
- Recurring events are not available in Connect Offline.
- Each data set can synchronize a maximum of 5,000 records.
- If you add a custom object containing a custom tab icon to a data set, the look and feel of the custom tab defaults to the Star tab style in Connect Offline.
- Connect Offline does not support the Force.com app menu. If your briefcase configuration synchronizes custom objects, all the tabs for those custom objects are visible when you log into Connect Offline, even if they belong to different apps.

## Add Accounts to Your Connect Offline Briefcase Manually

If an administrator doesn't assign a briefcase configuration to your profile, click the **Include Offline** button on any account detail page to manually add the account to your Connect Offline briefcase.

The next time you synchronize your briefcase, Salesforce transfers the account to Connect Offline, as well as:

- All contacts associated with the account, if you have at least read access to the contacts
- All opportunities associated with the account, if you have at least read access to the opportunities. This includes opportunities that have been shared with you, that are owned by users below you in the role hierarchy, or where you are on the opportunity team. Products and schedules for downloaded opportunities are also included.
- All the custom objects that have a master-detail relationship with the account
- Tasks and events related to the included account, according to these guidelines:
  - Events dated this month, the past two months, or up to 24 months in the future
  - All open tasks up to 24 months in the future
  - Closed tasks with a due date this month, the past two months, or 24 months in the future
  - Tasks with a blank due date that were created or modified this month or within the past two months

You can manually add up to 100 accounts in your briefcase.

 **Note:** The **Include Offline** button automatically appears on the account detail page for all Connect Offline users assigned to profiles without any briefcase configurations. You do not need to add the **Include Offline** button to account page layouts.

## Removing Manually-Added Accounts from Connect Offline

You can remove manually added accounts from your briefcase as follows:

1. From your personal settings, enter *Connect Offline* in the *Quick Find* box, then select **Force.com Connect Offline**.
2. Click **Briefcase Setup**.
3. Select the checkbox next to the account to remove.
4. Click **Remove from Briefcase**.

The next time you synchronize your briefcase, Salesforce removes the account from your briefcase, as well as its related contacts, opportunities, and activities, and custom object records that have a master-detail relationship with the account.

## What is Your Default Connect Offline Briefcase Contents?

If your user profile does not have an associated briefcase configuration, your default briefcase automatically includes the following:

- All of your contacts (including your private contacts) and read access to related accounts or opportunities
- All contacts associated with the accounts in your briefcase, if you have at least read access to the contacts
- All opportunities associated with the accounts in your briefcase that are either open or have a close date in the current month, the past two months, or up to 24 months in the future if you have at least read access to the opportunities. This includes opportunities that have been shared

### EDITIONS

- "View" on accounts

### EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Available for an additional cost in: **Professional** Edition

with you, that are owned by users below you in the role hierarchy, or where you are on the opportunity team. Products and schedules for downloaded opportunities are also included.

- All of your leads up to a maximum of 5000
- All custom object records that have a master-detail relationship with any account, contact, or opportunity that is included in your briefcase
- Your tasks and events, as well as tasks and events related to the accounts in your briefcase, according to these guidelines:
  - Events dated the past two months or up to 24 months in the future
  - All of your open tasks up to 24 months in the future
  - Closed tasks with a due date the past two months or up to 24 months in the future
  - Tasks with a blank due date that were created or modified this month or within the past two months

**Note:** For tasks and events that are related to custom objects not available offline, the `Related To` field on the activity indicates that the record is not available in Connect Offline.

If your user profile does not have an associated briefcase configuration, your default briefcase also includes all accounts associated with opportunities you own; however, you can change the account selection in your briefcase to include one of the following options instead:

- Accounts that you manually include
- Accounts related to the activities in your briefcase
- All your accounts

To edit your account selections, edit **Briefcase Setup**.

## Change Your Connect Offline Briefcase Account Selection

If an administrator does not assign a briefcase configuration to your profile, your briefcase contains the [default briefcase contents](#), which includes accounts that are associated with opportunities you own, accounts that you [manually include](#), and accounts related to your contacts. To change the selection of accounts in your Connect Offline briefcase:

1. From your personal settings, enter `Connect Offline` in the `Quick Find` box, then select **Connect Offline**.
2. Click **Briefcase Setup**.
3. Click **Edit** next to Briefcase Settings.
4. Choose one of the following options to specify the accounts you want to include in your briefcase:
  - Manually selected — Up to 100 accounts that you [manually include](#) by clicking the **Include Offline** button on the account detail page, and accounts related to your contacts.
  - Opportunity-based briefcase — Up to 5000 accounts that are associated with opportunities you own (in addition to accounts that you [manually include](#) and accounts related to your contacts). The following restrictions apply:
    - You must have at least read access to the account.
    - The opportunity must be open or have a close date in the past two months or up to 24 months in the future.

### EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Available for an additional cost in: **Professional** Edition

Opportunity-based briefcase is the default briefcase configuration.

- Activity-based briefcase — Up to 5000 accounts related to the activities in your briefcase (in addition to accounts that you [manually include](#) and accounts related to your contacts).
- All my accounts — Up to 5000 accounts you own or where you are on the account team (in addition to accounts that you [manually include](#) and accounts related to your contacts).

5. Click **Save**.

 **Important:** If an administrator assigns a briefcase configuration to your profile after you change the selection of accounts in your briefcase, the assigned briefcase configuration overrides your briefcase account selection the next time you synchronize Connect Offline.

SEE ALSO:

[Log in to Connect Offline](#)

[Find Your Personal Settings](#)

## Synchronize Your Briefcase

When using Connect Offline with an Internet connection, you can synchronize your briefcase with Salesforce. During synchronization, Connect Offline updates Salesforce to reflect any changes you made to your briefcase records while offline. Connect Offline also updates your briefcase records to reflect any changes in Salesforce since your last synchronization. This ensures that both Salesforce and Connect Offline have the most current records.

Your briefcase automatically synchronizes the first time you log into Connect Offline. When you are using Connect Offline with an Internet connection, you can synchronize your briefcase anytime by clicking **Synchronize Briefcase** in the upper right corner of the browser window.

Data conflicts can occur during synchronization if a user modified an online record that you also modified offline. If updates to a record in your briefcase conflict with updates to a record in Salesforce, Connect Offline displays the Conflict Resolution tool, which allows you to easily [resolve the conflicts](#). If you do not want to resolve the conflicts at that time, click **Cancel** to exit the Conflict Resolution tool. You can return to the Conflict Resolution tool later by clicking the link in the Errors section of the Connect Offline Home tab.

### EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Available for an additional cost in: **Professional** Edition

## Emptying Your Briefcase

The **Empty Briefcase** link in the upper right corner of the browser window resets Connect Offline to its initial state.

 **Warning:** If you click the **Empty Briefcase** link, Connect Offline deletes all of your briefcase files and settings. Only empty your briefcase if you change the time zone on your computer or if your administrator requests you to do so.

## Resolve Connect Offline Conflicts

When you synchronize, data conflicts occur if a user modified the same record in Salesforce that you modified in Connect Offline. For example, a conflict occurs if you change a contact's phone number in Connect Offline and another user changes that contact's address in Salesforce before you synchronize.

When a conflict occurs, Connect Offline displays a conflict resolution tool that enables you to resolve the conflict by identifying the most recent and correct values. The left side of the window displays a list of the records that have data conflicts, while the right side of the dialog box displays the fields that have conflicting data for the record you select in the left side.

To use the conflict resolution tool:

1. In the left pane, use the drop-down list to choose whether to display records in a tree or list view, then choose the record that you want to resolve.
2. In the right pane, use the drop-down list to choose whether to display all fields on the record or only those that have conflicting data, then select the radio button next to the correct value.
3. If necessary, click the pencil icon (✎) and manually enter the value you want to save.

 **Note:** The pencil icon is not available for read-only fields on some objects, such as products or opportunities.

4. Repeat these steps for each record listed in the left pane. When you have selected a value to resolve the conflict, the status of the record in the left pane displays a green check.
5. Click **Submit** when you have finished making selections for all records in conflict.

When working with the conflict resolution tool, note the following:

- If you choose not to resolve your data conflicts at this time, click **Cancel**. You can continue to work in Connect Offline, but the conflict resolution tool displays whenever you synchronize your data.
- Connect Offline lets you enter values that violate validation rules; however, such validation rule violations appear as data conflicts in the conflict resolution tool.

The conflict resolution tool displays only one violation at a time. If a record violates multiple validation rules, resolve and synchronize each violation separately.

- The field values on some objects, such as products or opportunities, are read only in the conflict resolution tool; however, you can change these values as follows:
  1. Switch to the tree view in the left pane.
  2. Select the deepest branch after expanding all the branches.
  3. Choose the `Your Values` radio button to save the Connect Offline values, or the `Salesforce Values` radio button to save the ones on the server instead. The values of the read-only fields change accordingly.
  4. Click **Submit**.

If you click **Submit** without choosing an option, Connect Offline stores the value on the client for any read-only values in conflict resolution.

### EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Available for an additional cost in: **Professional** Edition

### USER PERMISSIONS

To view records in Connect Offline:

- "Read" on the appropriate type of record such as accounts, contacts, or opportunities

To update records in Connect Offline:

- "Create," "Edit," or "Delete" on the appropriate type of record such as accounts, contacts, or opportunities

## Tabs Available in Connect Offline

A subset of tabs and features are available in Connect Offline.

The tabs you see may differ if your administrator renames any Salesforce standard tab names or adds custom objects to your briefcase configuration.

### EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Available for an additional cost in: **Professional** Edition

### Home Tab

- View, create, modify, or delete your events and tasks except multi-person events
- Update or empty your briefcase contents
- Synchronize, search, and view recent items in the sidebar
- Expand the Briefcase Info section to see the number of records you have in Connect Offline for each object, and the number of records that you have modified since your last synchronization.

 **Note:** The list of modified records in Briefcase Info does not include deleted records. Also, search results do not include long text area fields like account **Description**.

- Click the icons below the calendar to display different views of activities
- To launch the Conflict Resolution tool, click the “You have conflicts to resolve” link when it displays in the sidebar.

### Accounts Tab

- View your recent accounts on the accounts home page
- Select a standard list view to list the offline accounts
- View, create, modify, or delete accounts
- View, create, modify, or delete [person accounts](#). This feature is available in Connect Offline version 3.5.2.13 or later.
- View, create, modify, or delete custom objects associated with offline accounts
- Link contacts, opportunities, and activities to offline accounts
- Use your organization’s record types, dynamic page layouts, field-level security, and translated values (as defined in the Translation Workbench)
- Update records to which you have edit access. Your Briefcase may include some records that are read only depending on the records’ sharing settings.

### Relationship Groups Tab

- Track the familial and professional roles of different relationship group members
- Assign primary and secondary designations to the two most important members of a relationship group
- View roll-up related lists of all activities for the members of a relationship group
- View roll-up related lists of the custom objects that are related to the accounts in a relationship group

 **Note:** This feature is available in Connect Offline version 3.5.2.13 or later. Related lists on the relationship group detail page are not available in Connect Offline.

### Contacts Tab

- View your recent contacts on the contacts home page
- Select a standard list view to list the offline contacts

- View, create, modify, clone, or delete contacts
- View, create, modify, or delete custom objects associated with offline contacts
- Link activities to offline contacts
- Use your organization's record types, dynamic page layouts, field-level security, and translated values (as defined in the Translation Workbench)
- Update records to which you have edit access. Your briefcase may include some records that are read only depending on the records' sharing settings.

## Opportunities Tab

- View your recent opportunities on the opportunities home page
- Select a standard list view to list the offline opportunities
- View, create, modify, clone or delete opportunities
- View, create, modify, or delete custom objects associated with offline opportunities
- Associate activities and contact roles to offline opportunities
- Add and update contact roles, products, and schedules, and change the price book for an opportunity
- Use your organization's record types, dynamic page layouts, field-level security, and translated values (as defined in the Translation Workbench)
- Update records to which you have edit access. Your briefcase may include some records that are read only depending on the records' sharing settings.

## Leads Tab

- View your recent leads on the leads home page
- Select a standard list view to list the offline leads
- View, create, modify, or delete leads depending on sharing settings
-  **Note:** Changes made to leads in Connect Offline do not trigger assignment rules.
- Link activities to offline leads
- Use record types, dynamic page layouts, field-level security, and translated values (as defined in the Translation Workbench)
-  **Note:** Leads and custom object records are only available in Connect Offline 2.0 and later, which is indicated by the briefcase icon  you use to launch the application.

## Notes on Working with Connect Offline

Consider the following when using Connect Offline:

- Multi-person events are visible in Connect Offline but you can't create or edit them. If you have been invited to an event, but are not the organizer, you can't modify or delete that event offline.
- Automatically generated fields such as formula fields and auto-number fields are not available in Connect Offline.

- Related lists in Connect Offline do not display lookup fields.

#### SEE ALSO:

[What is Your Default Connect Offline Briefcase Contents?](#)

[Log in to Connect Offline](#)

[Troubleshoot Connect Offline](#)

## Troubleshoot Connect Offline

Review the following common situations and solutions to troubleshoot Connect Offline issues.

### Activities

#### Unable to edit the record associated with an activity offline

While you may be able to change the record associated with a task or event in Salesforce, the `Related To` field on an activity is only available in Connect Offline when the related record is available offline. For example, if an event is associated with an account that is not in your Briefcase, you will not be able to change the account on the event using Connect Offline.

#### Visible in Self-Service field is not available offline

While you may see this field in your activity page layouts using Salesforce, it is not visible from Connect Offline because the field indicates if an activity is associated with a case and cases are not available in Connect Offline.

#### Unable to update group events in Connect Offline

Multi-person events are visible in Connect Offline but you can't create or edit them. If you have been invited to an event, but are not the organizer, you can't modify or delete that event offline.

### Briefcase Contents

#### Unable to edit some records in my briefcase

Depending on your briefcase settings, records are read only if they are available offline only because they are associated with records that are included offline due to your briefcase settings. For example, if you have selected an opportunity-based briefcase, some accounts will be read only offline even though they are not related to an opportunity, but because they are related to a contact in your briefcase.

#### Briefcase exceeds limit

Read only records that are included by association with other records in your briefcase do not count toward your limits. For example, the maximum number of accounts you can include is 5000 but your briefcase may contain 5200 if you have 200 accounts included because they are related to other records in your briefcase.

### Browsers

#### Windows XP SP2 displays a warning banner in Connect Offline

To prevent the warning banner from displaying, modify your Internet Explorer settings as follows:

1. Launch Internet Explorer.
2. Click the **Tools** menu and choose **Internet Options**.
3. Select the **Advanced** tab.
4. Locate the Security section.

#### EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Available for an additional cost in: **Professional** Edition

5. Enable `Allow active content to run in files on My Computer`.
6. Click **Apply**.
7. Click **OK**.

### Unable to download and install Connect Offline using Firefox

Although other browsers are supported in Salesforce, you must use Internet Explorer to download and install Connect Offline.

### Receiving error that says “A connection with Salesforce could not be established to update your Connect Offline.”

This message can appear in the following scenarios:

- Your computer is configured to use a proxy server to connect to the Internet that requires authentication. This connection is made automatically using Single Sign-On or another manner to authenticate where you do not have to enter a username or password to connect to the Internet.
- Your computer is behind a firewall
- Your computer is actively running antivirus software

## Conflict Resolution

### Unable to choose fields in conflict resolution

The field values on some objects, such as products on opportunities, are read only in the conflict resolution tool; however, you can change these values as follows:

1. Switch to the tree view in the left pane.
2. Select the deepest branch after expanding all the branches.
3. Choose the `Your Values` radio button to save the Connect Offline values, or the `Salesforce Values` radio button to save the ones on the server instead. The values of the read-only fields change accordingly.
4. Click **Submit**.

If you click **Submit** without choosing an option, Connect Offline stores the value on the client for any read-only values in conflict resolution.

### Conflict resolution prompts me to create a new record or retry

Your sharing settings may have changed. If you have access to perform the action, click **Retry**. Otherwise, create a new record in Connect Offline.

### Cannot change value of dependent picklist in conflict resolution tool

When resolving conflicts for a dependent picklist field, you cannot change the picklist value of the conflicting field. To resolve these types of conflicts, select whether to apply the Salesforce value or the Connect Offline value.

 **Note:** In offline mode, if a dependent picklist's controlling field is hidden by field-level security, the information icon for the dependent picklist displays the controlling field's API name rather than the label name.

## Fields

### Unable to see lookup fields in Connect Offline related lists

Related lists in Connect Offline do not display lookup fields.

### Unable to see custom formula fields and auto-numbers in Connect Offline

Automatically generated fields such as formula fields and auto-number fields are not available in Connect Offline.

### Auto-number fields do not generate in Connect Offline

When you create a record in Connect Offline that increments an auto-number field, Connect Offline displays a label for that field while you are using Connect Offline. When you synchronize, Salesforce inserts the next unique number in the field.

## Home Tab

### Record count is wrong in Home tab list of modified records

In the sidebar, the list of modified records in briefcase Info does not include deleted records.

## Installation

### What gets installed?

Connect Offline installs SForceDB.exe, which runs continuously in the background and hosts the Connect Offline database.

### Unable to install Connect Offline

Connect Offline requires Salesforce to install components that edit the registry on your computer. If your organization imposes security that prevents you from editing the registry, log in as the administrator of your machine before installing these components or contact your IT department for assistance.

### Can I do mass deployments of Connect Offline?

Yes, you can perform system-wide deployments.

### How can I tell what Connect Offline version my users have?

Each user's Connect Offline version is listed in the Login History.

## Leads

### Unable to see leads in Connect Offline

Leads are only available in Connect Offline 2.0 and later. If you are using Connect Offline 2.0 or later, you will launch the application using this icon: . To upgrade Connect Offline:

1. Synchronize your data in Connect Offline.
2. Optionally, remove the previous installation of Connect Offline using Add/Remove Programs in the Windows Control Panel.
3. Install Connect Offline. by going to the Connect Offline page in your personal settings.
4. Synchronize your data in Connect Offline.

Check to make sure you have the appropriate user permissions to view leads.

### Lead assignment rules do not appear to be working

Leads created in Connect Offline will not be automatically assigned based on lead assignment rules. Once connected to Salesforce again, assign them by doing a mass transfer of records.

## Multicurrency Display Differences

### Opportunity amounts display a fractional difference

If your organization has enabled multicurrency, and the currency used for an opportunity is different from the corporate currency, a small display difference may be observed. The converted amount you see in the offline opportunity detail page may be off by a cent or two as compared to the same page in the Salesforce application. There is no error in the actual stored value.

## Relationship Groups

### Unable to see the Relationship Groups tab in Connect Offline

The Relationship Groups tab is only available if the Relationship Groups AppExchange package is installed in the Salesforce organization with which you synchronize Connect Offline.

## Search

### Search results are missing fields

Search results do not include long text area fields such as account `Description`.

## Timeouts, Timestamps, and Time Zones

### The timestamps of files updated in Connect Offline do not appear as expected

For records that you create or update in Connect Offline, the `Created By` and `Modified By` fields reflect the time on your PC, even after synchronization.

Activities that you create in Connect Offline reflect the time you enter and the time zone of your PC. During synchronization, Salesforce converts the activity times to the time zone set in your Salesforce personal information.

If you change the time zone on your computer, empty and synchronize your briefcase to reflect the change in Connect Offline.

### Connect Offline times out when synchronizing large data sets

Edit the `HttpTimeout` registry setting in `HKEY_LOCAL_MACHINE\SOFTWARE\salesforce.com\Offline2`. The default is 360 seconds.

## Edit Stay-in-Touch Settings

To set your preferences for requesting contact information updates:

 **Note:** If your organization uses person accounts, person accounts are also affected by these settings. For more information, see [What Is a Person Account?](#) on page 1008.

1. From your personal settings, enter `Stay-in-Touch` in the `Quick Find` box, then select **My Stay-in-Touch Settings**.
2. Choose `Yes` for `Automatic Bcc` to receive copies of your sent Stay-in-Touch emails. This option is only available if your organization has not enabled compliance BCC emails.
3. Enable the reminder if you would like to be prompted to send a Stay-in-Touch request whenever you save a new contact.
4. Enter a default subject for the email.
5. In the note area, enter a message to the recipient.
6. In the signature area, enter a signature with your contact information.
7. Use the merge fields area at the top of the page to display available merge field values, which you can copy and paste into the subject, note, or signature boxes as needed.
8. Click **Save**.

# SET UP AND MAINTAIN SALES TOOLS

## Welcome, Salesforce Administrators

---

Use this documentation set to get Salesforce and its features configured, so your users can become successful selling to their customers using Salesforce. You'll find that this documentation goes straight into the tasks you need to complete, based on your organization's needs. This documentation, however, doesn't include feature-specific concepts. For those, you can refer to the documentation set for users, *Sell to Your Customers*.

We hope these two sets of documentation provide the complete content you need to get your users up and running with Salesforce. If you need further support, contact Salesforce Customer Support.

## Administering People and Organizations That Users Sell To

---

### Administering Accounts

#### Enabling Person Accounts

**Note:** Once person accounts have been enabled, they can't be turned off.

**Warning:** Person accounts aren't supported in Lightning Experience. For more information, review the Lightning Experience limitations for Sales features.

Before you begin, make sure to:

- Create at least one record type for accounts.
- Grant read permission on contacts for profiles that have read permission on accounts.
- Ensure that the contact sharing organization-wide default is set to "Controlled by Parent."

Once you complete the preliminary steps, contact Salesforce to enable person accounts and then:

1. From the object management settings for person accounts, go to Record Types.
2. Assign person account record types to profiles that require person accounts.

#### EDITIONS

Business accounts available in: Both Salesforce Classic and Lightning Experience

Business accounts available in: **All Editions** except **Database.com**

Person accounts available in: Salesforce Classic

Person accounts available in: **Enterprise, Performance, Unlimited, and Developer Editions**

#### USER PERMISSIONS

To enable person accounts:

- "Customize Application"

 **Note:** Person accounts count against both account and contact storage because the API considers each person account to consist of one account as well as one contact. Additional storage might be necessary when you implement person accounts, so you should review your storage usage.

Enabling person accounts is permanent and cannot be reverted. If you are an existing customer, we recommend [creating a sandbox](#) to preview how person accounts will affect your organization.

## Account Settings

Enable or disable the account hierarchy and Account Insights features.

 **Note:** When enabled, Account Insights uses third parties and other Salesforce technologies, which offer different levels of privacy and security protection. These services can save or process some of your organization's data, such as Account Name and Website. Salesforce is not responsible for the privacy and security of data that is shared with third parties when you use this feature.

1. From Setup, enter *Account Settings* in the **Quick Find** box, then select **Account Settings**.
2. Click **Edit**.
3. Change the settings as needed, then click **Save**.

#### SEE ALSO:

[Accounts](#)

#### EDITIONS

# Administering Relationship Groups

## Install and Implement Relationship Groups

### Obtaining the Relationship Groups Custom App

The relationship groups custom app comes preinstalled in most Salesforce for Wealth Management organizations. If your Salesforce for Wealth Management organization does not have the relationship groups custom app, contact Salesforce to request it.

### Verifying the Installation of the Relationship Groups Custom App

If the relationship groups custom app has been installed in your organization, the Relationship Groups option displays in the Force.com app menu.

In addition, administrators can use the following procedure to verify that the relationship groups custom app was successfully installed:

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps** and verify that the relationship groups custom app is present and has the  Managed - Installed icon.
2. From your management settings for custom objects, verify that the relationship group and relationship group member objects are present and that each has the  Managed - Installed icon.

### Configuring the Relationship Groups Custom App

Perform the following implementation tasks to configure the custom app. If the relationship groups custom app came pre-installed with Salesforce for Wealth Management, some of these configurations may already be set in your organization.

#### Customizing Account Page Layouts

From the object management settings for accounts, go to Page Layouts, then remove the following related lists from the appropriate account page layouts.

- Relationship Groups (Primary Account)
- Relationship Groups (Secondary Account)

#### Customizing Person Account Page Layouts

From the object management settings for person accounts, go to Page Layouts, then edit the appropriate person account page layouts.

1. In the Related List Section, drag and drop to edit the following related lists:
  - Add **Relationship Group Members**
  - Remove **Relationship Groups (Primary Account)**
  - Remove **Relationship Groups (Secondary Account)**
2. Edit the Relationship Group Members related list as follows:
  - At minimum, include the following fields: *Relationship Group*, *Role*, *Priority*, *Include in Roll-Up*
  - Remove the standard **New** button
  - Add the **Add Account to Relationship Group** button

#### EDITIONS

Available in: Salesforce Classic

Available in: Salesforce for Wealth Management

#### USER PERMISSIONS

To install apps:

- “Download AppExchange Packages”

To configure and deploy installed apps:

- “Customize Application”

### Setting Context-Sensitive Help for Relationship Groups

By default, the **Help for this Page** links on relationship group pages open help content about custom objects in general. To redirect those links to help topics that specifically describe relationship groups:

1. Go to the management settings for custom objects.
2. Click **Relationship Group** to open its custom object definition.
3. In the Custom Object Definition Detail section, click **Edit**.
4. For **Context-Sensitive Help Setting**, choose **Open a window using a custom s-control**.
5. For **Custom S-Control**, choose **Relationship Groups Help**.
6. Click **Save**.

**Note:** Repeat this procedure for the Relationship Group Member custom object. This sets an appropriate context-sensitive destination for the help links on the Relationship Group Member related lists.

### Overriding Standard Relationship Group Buttons

To customize the buttons on the relationship group detail page:

1. Go to the management settings for custom objects.
2. Click **Relationship Group** to open its custom object definition.
3. In the Standard Buttons and Links section, click **Override** next to **New** and replace that button with the **NewHousehold s-control**.

### Customizing Relationship Group Search Layouts

To customize the search layouts for relationship groups:

1. Go to the management settings for custom objects.
2. Click **Relationship Group** to open its custom object definition.
3. In the Search layouts section, click **Edit** to modify the appropriate search layout. At minimum, we recommend setting the following columns for search results:
  - Relationship Group Name
  - Primary Account
  - Secondary Account
  - Last Modified By

### Customizing Relationship Group Page Layouts

To customize the layout of the relationship group detail page, from the object management settings for relationship groups, go to Page Layouts, then click **Edit** next to the appropriate page layout name. Edit the page layout as follows:

1. Remove the **Clone** button from the detail page.
2. Edit the Open Activities related list as follows:
  - Remove the standard **New Task** and **New Event** buttons
  - Add the custom **New Task** and **New Event** buttons
3. Edit the Activity History related list as follows:
  - Remove the standard **Log a Call**, **Mail Merge**, **Send an Email**, **Request Update**, and **View All** buttons
  - Add the custom **Log a Call**, **Mail Merge**, and **Send an Email** buttons
4. In the Relationship Group Members related list, include the following fields, at minimum:

- Relationship Group
- Role
- Priority
- Include in Roll-Up

### Overriding Standard Relationship Group Member Buttons

To customize the buttons on the relationship group member detail page:

1. Go to the management settings for custom objects.
2. Click **Relationship Group Member** to open its custom object definition.
3. In the Standard Buttons and Links section, click **Override** next to **New** and replace it with **Edit** buttons with the `Edit Household Members` s-control.

After configuring the relationship groups custom app, verify that a Relationship Groups option displays in the Force.com app menu.

#### Note:

- In some cases, the custom app and its custom objects may have the label “Households” instead of “Relationship Groups” throughout. Whatever the labels are, they cannot be changed because the app is a managed package.
- Installing the Relationship Groups custom app may cause an error if your organization has fewer than 21 account records. You may ignore this error and continue the installation process.
- For all installations, the API names of the custom objects begin with the namespace prefix `household__`.
- The Relationship Group Member object is only supported in API version 11.0 and later.

#### SEE ALSO:

- [Relationship Groups Overview](#)
- [Creating Relationship Groups](#)
- [Find Object Management Settings](#)

## Testing the Relationship Groups Package

The relationship groups managed package provides unit tests that run when you install the package in your sandbox or production organization. In some cases, a component like an Apex trigger, validation rule, workflow rule, or custom field prevents the unit tests from completing successfully.

If the unit tests fail, do the following before running the tests again:

- Install the latest version of the relationship groups managed package. The functionality of the new version is the same as the older version except the unit tests have been enhanced. Contact Salesforce and request the latest version of the package (not available on the AppExchange).
- Deactivate components that prevent account, household, or household member objects from being edited or deleted. Apex triggers are a common cause of failed unit tests.

To ensure the relationship groups package runs successfully in your organization, the unit tests attempt to edit and delete some account, household, and household member objects. These

#### EDITIONS

Available in: Salesforce Classic

Available in: Salesforce for Wealth Management

#### USER PERMISSIONS

To install apps:

- “Download AppExchange Packages”

To configure and deploy installed apps:

- “Customize Application”

tests do not permanently modify your organization's data. If a platform element prevents these objects from being edited or deleted, the unit tests fail.

[Relationship Groups Overview](#)

## Configuring Contacts

### Enable Social Accounts, Contacts, and Leads

Increase your users' access to social intelligence by enabling the Social Accounts, Contacts, and Leads feature for your organization or Salesforce1.

The Social Accounts, Contacts, and Leads feature and access to all available social networks are enabled by default for organizations created after the Spring '12 release. If your organization was created before that, you must enable the feature manually.

 **Note:** If the Social Accounts, Contacts, and Leads feature is already enabled and but users can't see one or more social networks, see [Troubleshoot Social Accounts, Contacts, and Leads](#).

1. From Setup, enter *Social Accounts* in the **Quick Find** box, then select **Social Accounts and Contacts Settings**.
2. Select **Enable Social Accounts and Contacts**.
3. Select the social networks that users in your organization can access. By default, all social networks are selected.  
In Salesforce Lightning Experience and the Salesforce1 mobile app, users can access Twitter only, even if other networks are enabled.
4. Click **Save**.
5. To make Twitter accessible in the Salesforce1 mobile app, add the Twitter card to the Mobile Cards section of the accounts, contacts, and leads page layouts.
6. Let your users know that they can configure Social Accounts, Contacts, and Leads for their individual use.

#### USER PERMISSIONS

To enable, configure, or disable Social Accounts, Contacts, and Leads:

- "Customize Application"

## Enabling the Customer Portal for Contacts and Person Accounts

To allow a customer to access your Salesforce Customer Portal, you must enable the customer's contact or person account record as a Customer Portal user.

You can either [disable or deactivate Customer Portal users](#) at any time.

To enable the Customer Portal for a customer:

1. Click **Manage External User** and choose **Enable Customer User** from the drop-down button on the contact or person account detail page.
2. Verify the general information and locale settings, and enter any missing information. Note that the customer's `Username` defaults to his or her `Email`.
3. Select a portal user license. The user license you choose determines the permission sets, user profile, and role hierarchy options you can select for the Customer Portal user. See [Customer Portal User Licenses](#) on page 2336.
4. Select `Generate new password and notify user immediately` to email a Customer Portal username and password to the customer.

If your organization uses multiple Customer Portals, a portal user can access all the Customer Portals assigned to his or her profile with one username and password. See [Creating Multiple Customer Portals](#) on page 2307.

5. Click **Save**.

To troubleshoot or confirm the portal configuration, on the contact detail page, click **Manage External User** and choose **Log in to Portal as User**. This opens a new browser window and logs you into the portal as the partner user.

### Tips on Enabling the Customer Portal for Contacts

Consider the following when enabling the Customer Portal for contacts:

- To view or edit an enabled contact's access to your Customer Portal, on the contact detail page, click **Manage External User** and choose **View Customer User**.
- You cannot enable the contact for the Customer Portal unless the owner of the contact's account is associated with a role in your organization.
- The first time you enable a contact for the Customer Portal on an account, you cannot assign the contact to a portal role. The contact is automatically assigned to the Customer User role, which includes the name of the contact's account. You can update contact's portal role later.

This behavior doesn't apply to [high-volume portal users](#) because they don't have roles and aren't included in the role hierarchy.

- A contact can be either a partner or Customer Portal user, but not both. If a user is a partner user *and* a Customer Portal user, then you need to create two contact records for the user so that he or she can have a separate username and password for each portal. However, a contact can be a Self-Service user as well as a partner *or* Customer Portal user. Any data created or owned by a Self-Service user can be visible to a partner or Customer Portal user associated with the same contact.

 **Note:** Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

- You cannot delete an active Customer Portal user; you can only disable or deactivate his or her access to the Customer Portal.

The following table describes whether you can delete contacts that are associated with portal users:

#### EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

#### USER PERMISSIONS

To enable Customer Portal users, or to log in as a portal user:

- "Edit" on the account associated with the Customer Portal user
- AND
- "Edit Self-Service Users"

State of Portal User Associated to Contact	Can You Delete the Contact?
Active portal user	No. This is to ensure that the contact is available if you choose to reactivate the portal user.
Inactive portal user	No. This is to ensure that the contact is available if you choose to reactivate the portal user.
Disabled portal user	Yes. Deleted contacts are sent to the Recycle Bin.

- You can [change the account on the contact](#) at any time.
- You can [merge contacts](#) enabled to use a Customer Portal.
- The user's `Nickname` defaults to his or her email alias unless you specify otherwise. For example, if the user's `Email` is "jsmith@company.com," the user's `Nickname` defaults to "jsmith" when you click **Save**.
- Delegated administrators can't assign the High Volume Customer Portal license to contacts.
- When you create a Customer Portal user from a contact, the Chatter Answers User permission is automatically selected for the user. However, when you create a Customer Portal user from the API, the Chatter Answers User permission is not automatically selected for the user.

## Tips on Enabling the Customer Portal for Person Accounts

Consider the following when enabling the Customer Portal for person accounts:

- After the person account is enabled, click **Manage External User** and choose **View Customer User** on the person account detail page to view or edit a person account's access to your Customer Portal.
- You can't delete a person account enabled to use a Customer Portal.
- You can't import person accounts to be automatically enabled to use a Customer Portal. For more information on importing person accounts, see [Import My Person Accounts](#) on page 623.
- Person account users can't self-register for a Customer Portal. When they try to do so, they receive an email notification that instructs them to contact the portal administrator. See [Enable Customer Portal Login and Settings](#) on page 2314.
- You can't merge person accounts enabled to use a Customer Portal.

# Let Users Get New Accounts, Contacts, and Leads

## Implement Data.com Prospector

Implementing Data.com Prospector is easy. Here's what you need to know.

To take full advantage of Data.com's data, your organization needs to purchase Data.com Prospector licenses and set up the feature. We offer two versions of the Data.com Prospector product that let you search and add data from Data.com: Data.com Corporate Prospector and Data.com Premium Prospector. Both are easy to set up, but Data.com Premium Prospector includes a few additional steps. *Some of the steps are the same for both products, so let's start with those.*

To implement Data.com Prospector, you need to:

1. [Understand Data.com licenses, limits, and products.](#)
2. [Enable users for Data.com, assign type for each user, and assign record addition limits.](#)
3. Add the Data.com tab to user profiles.
4. [Install any of the Data.com reports packages you want to use.](#)
5. Depending on the version of Data.com Prospector you're using, you'll complete a few more steps. Check out these topics for complete details.

 **Tip:** To find out which Data.com Prospector product your organization has, from Setup, enter *Licenses & Limits* in the *Quick Find* box, then select **Licenses & Limits**. On the Licenses & Limits page, check the Data.com Prospector Licenses section. You'll see either "Corporate" or "Premium."

- [Configure Data.com Corporate Prospector](#)
- [Configure Data.com Premium Prospector](#)

If you're using Data.com Clean along with Data.com Prospector, see [Implement Data.com Clean](#) on page 1657.

## Implementation Tips and Best Practices

 **Note:** If a search produces a large number of results, users won't see all data past page 10. Contact Salesforce customer support to enable unlimited view.

- If a user adds more than 200 leads to Salesforce at one time, any lead assignment rules your organization uses won't run. To make sure your lead assignment rules run, instruct your users to limit their additions to fewer than 200 leads at any time.
- If your organization uses validation rules on fields that are mapped to Data.com, either deactivate the rules or make sure they match Data.com field names to avoid errors when you add records.

To install AppExchange packages:

- "Download AppExchange Packages"

## How Do Data.com User Types, Licenses, and Record Addition Limits Work?

User types, licenses, and record addition limits control what users can access Data.com and what Data.com users can do.

### IN THIS SECTION:

#### [Check Data.com License Information, Record Addition Balances, and Limits](#)

Check important license, record addition, and limits information from the Data.com Licenses & Limits page in Setup. This page also shows daily API limits for Data.com.

#### [How Do Licenses Work for Data.com Prospector?](#)

Data.com Prospector user licenses let users search Data.com for accounts and contacts, and add them as records to Salesforce. Users can be assigned one of two types of licenses—Data.com User and Data.com List User—and each type has its own characteristics.

#### [How Do Licenses Work for Data.com Clean?](#)

If your organization uses Data.com Prospector, users with those licenses can manually clean the account, contact, and lead records they have access to. If your organization purchased a Data.com Clean product, you can also run automated jobs to clean records, and all Salesforce users (not just those with Data.com Prospector licenses) can manually clean records.

### SEE ALSO:

[Using Data.com FAQ](#)

[Set Up Data.com Users](#)

## Check Data.com License Information, Record Addition Balances, and Limits

Check important license, record addition, and limits information from the Data.com Licenses & Limits page in Setup. This page also shows daily API limits for Data.com.

 **Tip:** To see how many records each user has added or exported, check the All Data.com Users page. From Setup, enter *Users* in the **Quick Find** box, then select **Prospector Users**. Or, if your organization has access to custom report types, you can use the Data.com Usage object to create a report that shows more detailed usage information.

1. From Setup, enter *Licenses & Limits* in the **Quick Find** box, then select **Licenses & Limits**.

Available with a Data.com Clean license in:  
**Professional, Enterprise, Performance,** and **Unlimited** Editions

### USER PERMISSIONS

“To view Data.com Setup pages:”

- “Customize Application”

## How Do Licenses Work for Data.com Prospector?

Data.com Prospector user licenses let users search Data.com for accounts and contacts, and add them as records to Salesforce. Users can be assigned one of two types of licenses—Data.com User and Data.com List User— and each type has its own characteristics.

 **Important:** You need to assign a license directly to a user in order for that user to add and export files from Data.com.

### Data.com User

Data.com Users get a limited number of account, contact, and lead records to add or export per month. The default number of records per licensed user is 300. The record addition limit for each licensed user refreshes at midnight on the first of the month (based on the time zone of the organization) regardless of your contract start date. Unused record additions expire at the end of each month, *do not* rollover to the next month, and are not refundable.

 **Example:** The sales division of Universal Telco has 14 sales reps, and they purchase 20 Data.com Prospector licenses, each of which has a record addition limit of 300. This means that Data.com Users within the organization can add as many as 6,000 records per month. The Universal Telco administrator distributes the Data.com Users' monthly record addition limits as follows.

- Ten of the sales reps have limits of 300 each
- Two of the sales reps have limits of 500 each
- Two of the sales reps have a limit of 1,000 each

### Data.com List User

Data.com List Users get a limited number of account, contact, and lead records to add or export per month. Unused record additions expire at the end of each month and *do not* rollover to the next month. After the monthly limit is used, List Users draw record additions from a pool that is shared by all List Users in the organization. Unused pool additions expire one year from purchase. Only Data.com List Users can draw from the organization's pool limit. If a Data.com User wants to draw from the organization's pool limit, you need to change that user to a Data.com List User.

 **Example:** The marketing division of Universal Telco has four marketing reps. Each rep has a Data.com Prospector license and each is a Data.com List User. Universal Telco purchases enough monthly record additions so that each Data.com user has a monthly default limit of 300 records. The company also purchases a record addition pool of 5,000 records. This means that after each marketing rep uses his monthly limit, he can start using the pool limit. Together, all four marketing reps can add 5,000 records from the pool. One rep might add 2,500 records, leaving 2,500 to be added by one or more of the other three users.

### SEE ALSO:

[How Do Data.com User Types, Licenses, and Record Addition Limits Work?](#)

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

## How Do Licenses Work for Data.com Clean?

If your organization uses Data.com Prospector, users with those licenses can manually clean the account, contact, and lead records they have access to. If your organization purchased a Data.com Clean product, you can also run automated jobs to clean records, and all Salesforce users (not just those with Data.com Prospector licenses) can manually clean records.

The Data.com Licenses & Limits page in Setup shows which users can clean records and whether your organization can use automated clean jobs.

**Note:** If your organization purchased only Data.com Prospector, only users with licenses can clean records.

### SEE ALSO:

[How Do Data.com User Types, Licenses, and Record Addition Limits Work?](#)

## Set Up Data.com Users

Give users access to Data.com and set their record addition limits so they can start taking advantage of Data.com's rich database of accounts, contacts, and leads.

When you go to the All Data.com Users page, you see users grouped by type: Data.com User and Data.com List User.

- Data.com Users get a limited number of account, contact, and lead records to add or export per month, and their unused additions expire at the end of each month.
- Data.com List Users have the same monthly limits as Data.com Users. After the monthly limit is used, List Users draw record additions from a pool that is shared by all List Users in the organization. Unused pool additions expire one year from purchase. Because List Users have a monthly record addition limit *and* access to the record pool, they'll be listed in both user type sections of the All Data.com Users page.

Set up each Data.com user on his or her User Edit page.

1. From Setup, enter *Users* in the **Quick Find** box, then select **Prospector Users**, then click **Edit** next to the name of the user you want to enable.
2. In the **Data.com User Type** drop-down, select the user type.
3. For Data.com Users, in the **Data.com Monthly Addition Limit** drop-down, select the number of account, contact, and lead records the user can add each month. You can select up to the organization limit for any user or all users, but once the organization's monthly limit is reached, users won't be able to add more records.  
For example, if your organization's monthly addition limit is 3,000 records, you might assign one user a monthly addition limit of 500 records, another user a limit of 1,000 records, and another user the organization limit (in this case 3,000 records). If the second user adds all 1,000 of his records right away, the third user will be able to add only up to 2,000 records, and depending on how many the third user adds, the first user may not be able to add any records.

**Tip:** You can find your organization's monthly organization addition limit on the Data.com Licenses & Limits page. From Setup, enter *Licenses & Limits* in the **Quick Find** box, then select **Licenses & Limits**.

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

Available with a Data.com Clean license in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

### USER PERMISSIONS

To implement Data.com:

- "Customize Application"

To enable Data.com users:

- "Manage Internal Users"

To install AppExchange packages:

- "Download AppExchange Packages"

- Click **Save**, or **Save and New** if you want to set up other users for Data.com.

 **Tip:** You can also use the Apex Data Loader to set up Data.com users, select the Data.com user type, and set the monthly addition limit, if applicable. To do so, export your user records to a `.csv` file, change the necessary fields for each user you want to set up, and then import the `.csv` file into Salesforce. The fields to export from the User object are `LastName`, `FirstName`, `UserPermissionsJigsawProspectingUser`, `JigsawImportLimitOverride`, and `UserPreferencesJigsawListUser`. For more information about the User object, see the “SOAP API Developer’s Guide.”

The number of Data.com users you can set up—within Salesforce or via the Data Loader—depends on the number of Data.com licenses you purchased. Make sure you stay within that limit when setting up users via the Data Loader.

#### SEE ALSO:

[Data.com Product Suite](#)

[How Do Data.com User Types, Licenses, and Record Addition Limits Work?](#)

## Enable Data.com Clean for Data.com Prospector

Data.com Prospector lets users *manually* clean Salesforce account, contact, and lead records—regardless of whether they were added from Data.com. If you use Data.com Prospector, Clean is automatically enabled for you so your users can manually clean their records. If you use the Data.com Premium Prospector version of the product, your users can also manually clean D&B Company records that are linked to account or lead records.

#### Note:

- If you’ve purchased Data.com Clean, you can clean account, contact, and lead records manually *and with automated jobs*. If you’ve purchased the Data.com Premium Clean version of the product, you can also use automated jobs to clean D&B Company records that are linked to account or lead records. For complete details, see [Implement Data.com Clean](#).
- Enabling Clean *does not* clean your records immediately, and you can click **Disable** to turn the feature off.

- From Setup, enter *Clean Settings* in the **Quick Find** box, then select **Clean Settings**
- Confirm that Data.com Clean is enabled.

#### SEE ALSO:

[Data.com Clean](#)

[Implement Data.com Clean](#)

#### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

Available with a Data.com Clean license in: **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

#### USER PERMISSIONS

To enable or disable Data.com Clean:

- “Customize Application”

## Configure Data.com Corporate Prospector

Data.com Corporate Prospector provides a basic set of Dun & Bradstreet account and lead data, including D-U-N-S Number, NAICS Code, Tradestyle, and more. Here's how to implement this product.

 **Note:** To find out which Data.com Prospector product your organization has, from Setup, enter *Licenses & Limits* in the Quick Find box, then select **Licenses & Limits**. On the Licenses & Limits page, check the Data.com Prospector Licenses section. You'll see either "Corporate" or "Premium."

1. Make sure you've [implemented Data.com](#).
2. [Enable Data.com Clean so your users can manually clean account, contact, and lead records](#).
3. [Configure your account, contact, and lead page layouts with the buttons and fields you need](#).
4. If you use Enterprise, Unlimited, or Performance Editions, you'll need to [update your field-level security so users see fields provided by D&B](#).

### Best Practices for Your Configuration

If your organization uses either version of Data.com Prospector, and you create validation rules for the fields that the product provides, those rules will still attempt to run even if you stop using the product, so disable any validation rules using those fields in that case. Data.com Prospector fields are identified in the help topics "Account Fields" and "Lead Fields".

## Configure Data.com Premium Prospector

Data.com Premium Prospector is an upgrade to Data.com Corporate Prospector. With Premium Prospector, you get all the features and fields available in Corporate Prospector, plus over 70 additional D&B fields for accounts and leads you add to Salesforce from Data.com. Like Data.com Corporate Prospector users, Premium Prospector users can also view a limited number of D&B fields on account and lead records.

 **Note:** To find out which Data.com Prospector product your organization has, from Setup, enter *Licenses & Limits* in the Quick Find box, then select **Licenses & Limits**. On the Licenses & Limits page, check the Data.com Prospector Licenses section. You'll see either "Corporate" or "Premium."

Here's how to configure Data.com Premium Prospector.

1. Make sure you've [implemented Data.com Prospector](#).
2. [Confirm that Data.com Clean is enabled, so your users can manually clean account, contact, and lead records](#).
3. [Configure your account, contact, and lead page layouts with the buttons and fields you need](#).
4. If you use Enterprise, Unlimited, or Performance Editions, you'll need to [update your field-level security so users see fields provided by D&B](#).
5. Add the D&B Companies tab to user profiles.
6. (Optional) We've created a default layout for D&B Company records, but you may want to use the Enhanced Page Layout Editor to customize the page layout.

Available with a Data.com Clean license in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

### USER PERMISSIONS

To implement Data.com Premium Prospector:

- "Customize Application"

## Best Practices for Your Configuration

- You can let your users view and delete D&B Company records. To do this, you'll assign permissions to standard and custom profiles. For standard profiles, assign the permission `Delete D&B Company records` in addition to the preassigned permission `Read D&B Company records`. For custom profiles, assign both of the permissions `Read D&B Company records` and `Delete D&B Company records`.
- If your organization uses either version of Data.com Prospector, and you create validation rules for the fields that the product provides, those rules will still attempt to run even if you stop using the product, so disable any validation rules using those fields in that case. Data.com Prospector fields are identified in the help topics "Account Fields" and "Lead Fields".

## Considerations for Allowing Duplicate Data.com Records in Salesforce

Organizations that use a sharing model may want to allow Data.com users to add duplicate account, contact, or lead records to Salesforce.

Keep these considerations in mind when setting your duplicate preferences.

- Records are considered duplicates when they have the same Data.com ID number in the `Data.com Key` field. This includes records that were added from Data.com as both contacts and leads.
- You can allow duplicates by object for the entire organization—not for individual users. If, however, you want to prevent a user or profile from being able to add duplicates, you can create a trigger.
- Records that are already in Salesforce are marked with a green dot (●) in search results. These records can be re-added by any Data.com user if your organization allows duplicates for the object.
- Records that have been added to Salesforce from Data.com are marked with a blue checkmark (✓) in search results. These records can be re-added by any Data.com user if your organization allows duplicates for the object. Adding a record affects the record balance only the first time that record is added to Salesforce: adding duplicates *does not* affect the record balance.
- If your Data.com preferences are set to allow duplicates but your organization also uses duplicate rules to prevent the creation of duplicate records, the duplicate rule will determine if the duplicate record is allowed or blocked.

To implement Data.com:

- “Customize Application”

## Considerations for Custom Mapping of Data.com and Salesforce Fields

Custom mappings put Data.com values in the Salesforce account, contact, and lead fields where you want those values. Before mapping fields, make sure you understand how mapping works, what preparations to make, and what kind of results you should expect.

Not all Data.com fields are available for all Salesforce fields. To be mappable, the new Salesforce field must be the same data type as the default field. For example, the `Description` field can be mapped to a long text area field with 1,000 characters or more.

Custom field mappings apply when:

- Data.com records are added to Salesforce
- Salesforce records are matched with Data.com records and cleaned either manually or with automated jobs

Before you map fields, make sure you understand these potential outcomes and the related actions you should take.

- Mapping fields or updating mappings forces a full sync with Data.com: all records of enabled CRM objects (accounts, contacts, and leads) are updated, even if no records have changed.
- Data.com field mappings may conflict with any Salesforce field customizations (such as approvals, workflow rules, or Apex triggers) you use for accounts, contacts, leads, or D&B Company records. Review and edit your customizations as needed so they will work with the values supplied by your mappings.
- You can skip mapping individual Data.com fields, but values for skipped fields won't be added, exported, or considered when we calculate a record's clean status.
- Skipping or changing mappings for fields used to match Salesforce and Data.com records may change some records' clean status to `Not Found`.
- For account records, skipping or changing the mapping for the `D-U-N-S Number` field will cause all account jobs to use the Data.com matching service, rather than the `D-U-N-S Number` field, to rematch account records.
- If you map fields and also set Clean job preferences to flag, auto-fill, or overwrite Salesforce fields, you'll see any *custom-mapped* fields when you set those preferences. Default mappings (such as from the Data.com `Phone` field to the Salesforce `Phone` field) do not appear.

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

Available with a Data.com Clean license in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

- If you export Data.com search results, the column headers in your Excel file will show the mapped field names. For example, if you map the Data.com `Phone` field to the Contact object's `Mobile` field, you'll see a header called "Mobile" for contacts, not "Phone".
- If you map Data.com fields that do not have values, some Salesforce records might revert to `Not Found` clean status.
- If you map a Data.com field to a custom Salesforce field, the custom field's label will appear on the Clean comparison page.
- If you want to track changes to field mappings, you'll find them in the Setup Audit Trail. From Setup, enter *View Setup Audit Trail* in the `Quick Find` box, then select **View Setup Audit Trail**.

## Default Data.com-to-Salesforce Field Mappings

This topic shows which Salesforce fields get values from Data.com when you add records with Data.com Prospector or update records with Data.com Clean. Salesforce admins can customize these field mappings.

### Accounts

Data.com Field	Account Field
Annual Revenue (in US dollars)*	Annual Revenue
Company Description	Description
D-U-N-S Number	D-U-N-S Number
Facsimile Number	Fax
Location Type	Account Site
Mailing Address**	Shipping Address
Number of Employees-Total	Employees
Ownership Type Indicator	Ownership
Primary Address	Billing Address
Primary Business Name	Account Name
Primary NAICS Code	NAICS Code
Primary NAICS Description	NAICS Description
Primary SIC Code	SIC Code
Primary SIC Description	SIC Description
Primary Tradestyle	Tradestyle
Telephone Number	Phone

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in:  
**Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

Available with a Data.com Clean license in:  
**Professional, Enterprise, Performance,** and **Unlimited** Editions

Data.com Field	Account Field
Ticker Symbol	Ticker Symbol
URL	Website
Year Started	Year Started

 **Tip:** Not all Data.com fields are mapped by default to the Account page. To map more Data.com fields to Account fields, see [Customize Data.com-to-Salesforce Field Mappings](#) on page 1646, and check out the latest release notes to find new mappable fields.

## Contacts

D&B Field	Contact Field
Primary Address	Mailing Address
Primary Business Name	Account Name

## Leads

D&B Field	Lead Field
Annual Revenue* (in US dollars)	Annual Revenue
Company Description	Description
D-U-N-S Number	Company D-U-N-S Number
Number of Employees-Total	No. of Employees
Primary Address	Address
Primary Business Name	Company

\* The Data.com Annual Revenue field is not directly accessible. It's only used to populate the Annual Revenue field in Salesforce.

\*\*Data.com Clean does not use the Mailing Address mapping for accounts. It only uses the Primary Address value to update accounts.

## Customize Data.com-to-Salesforce Field Mappings

Create custom mappings so you can put Data.com values in the Salesforce fields where you want them.

Custom field mappings apply when:

- Data.com records are added to Salesforce
  - Salesforce records are matched with Data.com records and cleaned either manually or with automated jobs
-  **Note:** Not all Data.com fields are available for all Salesforce fields. To be mappable, the new Salesforce field must be the same data type as the default field. For example, the `Description` field can be mapped to a long text area field with 1,000 characters or more.
1. Before you change any field mappings, it's important to [understand how mapping works, what preparations to make, and what kind of results you should expect](#)
  2. From Setup, enter *Field Mapping* in the `Quick Find` box, then select **Field Mapping**.
  3. For each Data.com field you want to map, select a Salesforce field. If you don't want to map a field, select *Skip Mapping*.

Available with a Data.com Clean license in: **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

### USER PERMISSIONS

To implement Data.com:

- "Customize Application"

To enable Data.com users:

- "Manage Internal Users"

To install AppExchange packages:

- "Download AppExchange Packages"

## Uninstall Jigsaw for Salesforce

 **Important:** Jigsaw for Salesforce is no longer available for new organizations and will be retired for existing organizations in Summer '14. If you use Jigsaw for Salesforce, you'll need to uninstall it and migrate to the equivalent Data.com products that are built in to Salesforce (Data.com Corporate Prospector or Data.com Premium Prospector and Data.com Clean). For information about migrating, contact your Salesforce account manager. You should not attempt to migrate to any of the built-in Data.com products without having first purchased them through your Salesforce account manager.

To uninstall Jigsaw for Salesforce, follow the instructions in the [Jigsaw for Salesforce Uninstall Guide](#).

SEE ALSO:

[Data.com Product Suite](#)

## Limit What Users Can Do with Data.com Search Results

Use the **Add to Salesforce** and **Export Results** to limit what users can do with Data.com search results for Data.com features that use the search results.

 **Warning:** Changing button preferences impacts all features associated with **Find Contacts** and **Find Accounts**. For example, if you clear the **Add to Salesforce** checkbox under **Find Accounts**, the **Add accounts** feature is disabled in **Company Hierarchy**.

1. From Setup, enter *Preferences* in the **Quick Find** box, then select **Prospector Preferences**.
2. In the **Button Preferences** section of the page, deselect what you want to remove from the **Find Contacts** and **Find Accounts** tabs.

### EDITIONS

### USER PERMISSIONS

To implement Data.com:

- "Customize Application"

## Respect Do-Not-Contact Settings in Data.com Search Results and Exports

In Data.com search results and export files, you can prevent certain contact information from being displayed.

In particular, you can mask out or remove:

- Email and phone values for contact and lead records already in Salesforce that have `Do Not Call` or `Email Opt Out` selected; and
- Email values for all contact and lead records with Canada addresses (to support Canada's privacy requirements)

For example: You have a lead record in Salesforce for Sally Larkin and on that record the `Do Not Call` checkbox is selected. You search for Sally Larkin as a contact on the Data.com tab and her record appears in the search results list, marked as already in Salesforce (●). The `Phone` field is masked in the search results list, and also on Sally's contact card. If you export the record, its `Phone` field is blank in the `.csv` file.

1. From Setup, enter *Preferences* in the `Quick Find` box, then select **Prospector Preferences**.
2. Select `Respect Do-Not-Contact Settings and Canada's Privacy Requirements`.

For records that have `Do Not Call` or `Email Opt Out` selected, `Phone` or `Email` field values are masked in the search results and on the contact card, and blank in `.csv` files created when you export records. For records with Canada addresses, `Email` field values are masked in the search results and on the contact card, and blank in `.csv` files created when you export records.

## Install and Implement the Data.com Get Contacts for Salesforce1 AppExchange Package

The Data.com Get Contacts for Salesforce1 AppExchange package lets your Salesforce1 users quickly add new contacts for accounts while on their phone or tablet. It's a great way to expand networks and find new customers while on the go.

You need to install the package for your organization and complete a few setup steps in the full Salesforce site. Then, any users with a Data.com Prospector license can get started adding new Data.com contacts simply by tapping **Get Contacts** on an account record and selecting which contacts to add.

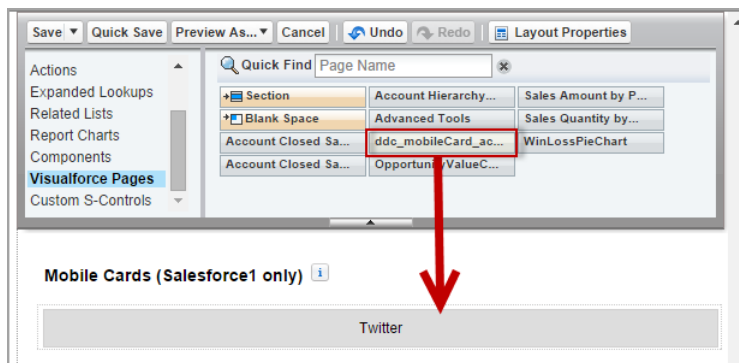

**Important:** The package does not:

- Allow users to add contacts as leads.
- Populate the `Lead Source` field for any added contacts. As a result, you may have to adjust any triggers, workflow rules, and other automation based on this field.
- Respect your organization's Data.com Duplicate Preferences. This means users will not be allowed to add duplicate contacts to Salesforce.
- Show which records have already been purchased, which is usually indicated by a blue checkmark (✓). Users will not lose a credit for adding an already purchased contact.

1. Go to the [Data.com Get Contacts for Salesforce1](#) package on the AppExchange.
2. Click **Get It Now**.
3. Install the package.

Depending on your browser, you may need to zoom out to see all steps in the installation procedure.

4. Add the **ddc\_mobilecard\_account** Visualforce page to the Mobile Cards (Salesforce1 only) area of the account page layouts used by Data.com users.

5. Click to edit the properties for the **ddc\_mobilecard\_account** Visualforce page you added.
6. Change the `Height` to `55`.
7. Click **OK**.
8. Save changes to the layout.
9. Let your Data.com users know that they can get contacts for an account in Salesforce1.

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in:

**Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

### USER PERMISSIONS

To install packages:

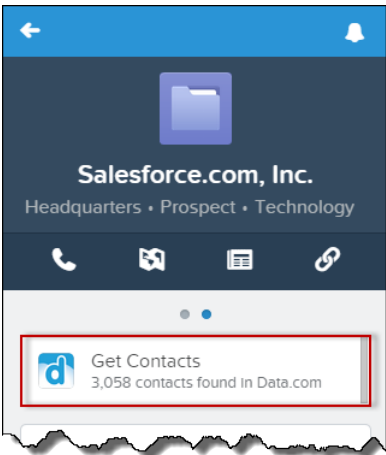

- "Download AppExchange Packages"

To customize page layouts:

- "Customize Application"

To add Data.com contacts:

- "Create" on contacts

## Let Users Get Expanded Data for Accounts and Leads

### Implement D&B Companies

If your organization has purchased Data.com Premium Prospector or Data.com Premium Clean, you have access to the D&B Companies object, which provides D&B data for accounts and leads you add to Salesforce.

Cleaning an account or lead record, either manually or via automated jobs, also creates a D&B Company record if you don't yet have one in Salesforce.

The D&B Companies tab lists all the D&B Company records you have in Salesforce.

Each D&B Company record displays a large set of [D&B fields](#). If you've purchased Data.com Premium Clean, you can also use automated jobs to clean D&B Company records. Cleaning a D&B Company record automatically fills blank fields and overwrites old data with new. If you've purchased Data.com Premium Prospector, but have not purchased Premium Clean (which includes automated jobs), your users can manually refresh D&B Company records.

Setting up D&B Companies is easy to do—just follow the steps for [configuring Data.com Premium Prospector](#), and keep these guidelines in mind.

**Tip:** To find out which Data.com Prospector product your organization has, from Setup, enter *Licenses & Limits* in the *Quick Find* box, then select **Licenses & Limits**. On the Licenses & Limits page, check the Data.com Prospector Licenses section. You'll see either "Corporate" or "Premium."

### Implementation Guidelines

- Make sure you add the D&B Companies tab to user profiles.
- Add the **Refresh** button to your D&B Company page layouts.
- If you use the Data.com Clean product and want to automatically update D&B Company records, define that preference.

#### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in:  
**Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

Available with a Data.com Clean license in:  
**Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

#### USER PERMISSIONS

To implement D&B Companies:

- "Customize Application"

- The D&B fields that also exist on the account object (such as `D-U-N-S Number`, `SIC Code`, and `NAICS Code`) are *managed* fields, and they are updated by both manual and automated clean processes. Automated clean jobs are available if you use the Data.com Clean product.
- Because the D&B Company object is read-only (except for Data.com Clean updates), you can't create task and field update workflow rules for it. Rules that are triggered by D&B field changes that act on other objects are permitted, however. For example, you can create a workflow rule that updates a custom field on an account record when a D&B Company record is created.
- You can enable users to view and delete D&B Company records by [assigning the appropriate profile permissions](#). Standard profiles automatically have the `Read D&B Company records` permission, but need to be assigned the `Delete D&B Company records` permission. Custom profiles need to be assigned both permissions.

## SEE ALSO:

[Understand D&B Company Records](#)

[Configure Page Layouts for Data.com Prospector and Data.com Clean](#)

## Maintain Linked Salesforce and D&B Company Records

If you use Data.com Premium Prospector or Data.com Premium Clean, when an account or lead record is added to Salesforce from Data.com, a D&B Company record is automatically created and linked to that record via the `D&B Company` field.

The `D&B Company` field on a Salesforce record links to the D&B Company record, which includes over 70 additional D&B fields. Cleaning an account or lead record, either manually or via automated jobs, also creates a D&B Company record if you don't yet have one in Salesforce. If you delete an account or lead, you might also want to delete the D&B Company record.

 **Important:** Because the `D&B Company` field is editable on account and lead records, more may be associated to a single D&B Company record. We recommend that you *do not* delete D&B Company records that are linked to more than one account or lead record.

System administrators are enabled by default to delete D&B Company records, but if you need to enable other users to delete these records, you must first [create a permission set that allows them to do that](#).

## SEE ALSO:

**Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

Available with a Data.com Clean license in:  
**Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

## USER PERMISSIONS

To enable deletion of D&B Company records:

- "Customize Application"

## Create a Permission Set for Deleting D&B Company Records

System administrators are enabled by default to delete D&B Company records, but if you need to enable other users to delete these records, you must first create a permission set that allows them to.

1. From Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**.
2. Click **New**.
3. In the **Label** field, enter a name related to the permission you're granting. For example: *D&B Company Delete*. In the **User License** field, select *Salesforce*. Click **Save**.
4. On the permission set's overview page, click **App Permissions**.
5. On the App Permissions page, click **Edit**, then select *Delete D&B Company records*. Because the *Read D&B Company records* permission is also required before you can delete D&B Company records, that permission's checkbox is selected automatically.
6. Click **Save**.  
A **Delete** button now appears on all D&B Company records.

### USER PERMISSIONS

To delete D&B Company records:

- "Read D&B Company records" AND "Delete D&B Company records"

## Add Critical Company Information to Your Leads Using Data.com APIs

Make it easier for your sales and marketing teams to pursue the most promising Salesforce leads and assign them to the right territories and campaigns. Using the Data.com APIs, you can enrich leads with critical company information even if you don't find a match in Data.com. You get a ton of great data, including number of employees, annual revenue, NAICS description, and over 50 more fields from Dun & Bradstreet®.

One of your organization's best sources for new opportunities is the lead form on its website. But what if that doesn't give you enough information to find a contact match in Data.com? Then, you don't have enough data to determine which leads are worth pursuing and which territories or campaigns to assign them to.

With the Data.com APIs, there's no need to worry about this situation anymore.

If your organization has a Data.com Premium Clean license, you can easily add valuable company and location information to leads. Then, you can make an educated decision about which leads to pursue and which territories and campaigns to assign them to, and your company can save time and money.

### EDITIONS

}
]
}

```

- Using the [Salesforce API](#), add matching records to Salesforce as new leads.
- Using the Data.com Search API, search Data.com for each unmatched record. In particular, use: Name and LocationStatus. For Name, use the domain name from the unmatched lead's email address. For example, use *BNSF* for cken@bnsf.com. For LocationStatus, use *1*, which returns only headquarters or parent location information. This example shows a Data.com Search API SOQL query.

```

SELECT Country, Name, EmployeesHere, SalesVolume, YearStarted, PrimaryNaicsDesc,
PrimarySicDesc
FROM DataCloudDAndBCompany
WHERE LocationStatus IN ('1') AND (Name LIKE '%BNSF%')

```

This example shows the results for a Data.com Search API SOQL query.

	Country	Name	EmployeesHere	SalesVolume	YearStarted	PrimaryNaicsDesc	PrimarySicDesc
1	United States	Burlington Northern Santa Fe, LLC	0.0	2.7969E9	2010	Freight Transportation Arrangement	Freight Transportation Arrangement
2	United States	Bnsf Railway Company	1800.0	3.541E9	1961	Line-Haul Railroads	Railroads, Line-haul Operating

- To the name and email of the unmatched lead, append the correct company information from the Data.com Search API results.
- Using the [Salesforce API](#), add this data to Salesforce as a new lead.

Automate this process.

# Let Your Organization Clean CRM Records

## Best Practices for Data.com Clean

Here are some tips and best practices for implementing, monitoring, and working with Data.com Clean.

- [Understand how matching works.](#)
- Use your sandbox environment to try out the automated clean jobs before running them in your production org with live data:
 

After Data.com Clean is provisioned in your production org, refresh your sandbox so it has the same permissions and data. Then follow the steps in [Implementing Data.com Clean](#) to set up Clean in your sandbox. If everything runs smoothly in your sandbox environment, follow the same implementation steps in your production org.
- [Check your match and update rates on the Clean Metrics & Analytics page.](#) There, you'll find information about the total number of records cleaned, how many have been matched, and how many have been updated. Figures represent all processed records (whether cleaned manually, from a list, or from automated Clean jobs) and reflect your rates since your organization implemented Data.com Clean.
- Schedule regular backups of your account, contact, and lead data. It's always a good practice, and if your Salesforce records are ever matched inappropriately, you can revert to previous versions. Backups are most important if you clean records from lists or with automated Clean jobs, because those Clean methods allow you to auto-fill blank fields.
- Set up field history tracking for accounts, contacts, and leads. Field history tracking helps you identify changes to field values, and tracks who made changes and when. If you use field history tracking, make sure you add the Account History, Contact History, and Lead History related lists to those objects' respective page layouts.
- [Install and use Data.com Reports.](#)

To back up data:

- "Data Export"

To set field history tracking:

- "Customize Application"

To set field-level security:

- "Customize Application"

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Clean license in:  
**Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

Implement Data.com Clean so your organization can keep account, contact, and lead records up to date—manually or with automated jobs.

 **Note:** If you're using Data.com Prospector together with Data.com Clean, see [Implement Data.com Prospector](#) on page 1636.

#### IN THIS SECTION:

1. [Confirm that Data.com Clean Is Enabled](#)

Learn how to enable Data.com Clean so your organization can start keeping its records up to date.

2. [Configure Page Layouts for Data.com Prospector and Data.com Clean](#)

When you implement Data.com Prospector and Data.com Clean, so that users can use the product, you need to add buttons and fields to your Account, Contact, and Lead page layouts. If you use Data.com Premium Prospector or Data.com Premium Clean, you can add a button to your D&B Companies page layouts so users can refresh linked D&B Company records.

3. [Set Field-Level Security for Data.com](#)

If your organization uses Data.com Prospector or Data.com Clean, you can view a number of D&B fields on account records, and those fields are included when users manually clean records. To make sure your users can read and edit the fields and their values, and that they appear on the Account Card, you need to set field-level security.

4. [Define Your Preferences and Select an Account Matching Service for Data.com Clean](#)

Clean preferences let you specify which objects' records you want to clean and how you want to clean them. This includes selecting the matching service that's used to clean accounts.

5. [Set Up Data.com Clean Jobs](#)

If your organization has a Data.com Clean license, you can set up automated jobs to clean your records.

6. [Review Triggers and Workflow Rules for Clean Compatibility](#)

If your organization uses triggers or workflow rules on objects enabled for Clean (Account, Contact, Lead, or D&B Company), review the triggers and workflows and consider making adjustments or bypassing them so users don't encounter unexpected results when records are cleaned.

7. [Configure List Views for Data.com Clean](#)

Before your Data.com Clean users can clean records from a list, you'll need to add the `Clean Status` field to your organization's list views.

8. [Install and Implement Data.com Reports AppExchange Packages](#)

Get access to additional reports that help your users analyze account, contact, and lead data.

9. [Review Data.com Clean Match Results](#)

After you complete your Data.com Clean implementation and your first Clean jobs are complete, you should regularly review your Data.com Clean match results to make sure your records are being matched accurately. Run the Accounts by Clean Status report to get started.

10. [View Your Data.com Clean Record Match Rates \(Data.com Clean Only\)](#)

Data.com Clean metrics and analytics tell you how your organization's accounts, contacts, and leads have been matched and updated with Data.com data, so it's important to check your match and update rates on a regular basis.

11. [Report on Salesforce Records with a Specific Clean Status](#)

Create a custom report to show Salesforce account, contact, or lead records that have a specific clean status (such as `Different`).

#### SEE ALSO:

[Data.com Clean](#)

## Confirm that Data.com Clean Is Enabled

Learn how to enable Data.com Clean so your organization can start keeping its records up to date.

Data.com Clean ensures that your CRM records are always up to date. You can use Clean with all your account, contact, and lead records—not just those added from Data.com. When you purchase the Data.com product, Clean is automatically enabled, so you can set up automated Clean jobs and users can clean individual records manually or clean groups of records from a list view.

Enabling Clean makes clean features available to your organization, and it causes the **Preferences** and **Jobs** links to appear in Setup under the Clean section.

 **Note:** Enabling Clean *does not* clean your records immediately, and you can click **Disable** to turn the feature off.

1. From Setup, enter *Clean Settings* in the Quick Find box, then select **Clean Settings**.
2. Confirm that Data.com Clean is enabled.

SEE ALSO:

[Data.com Clean](#)

[Implement Data.com Clean](#)

## Configure Page Layouts for Data.com Prospector and Data.com Clean

When you implement Data.com Prospector and Data.com Clean, so that users can use the product, you need to add buttons and fields to your Account, Contact, and Lead page layouts. If you use Data.com Premium Prospector or Data.com Premium Clean, you can add a button to your D&B Companies page layouts so users can refresh linked D&B Company records.

 **Note:** If your organization uses Professional Edition, custom page layouts and field-level security are not available, so you must add *all* available Data.com fields and buttons to your page layout for each object (accounts, contacts, leads, and D&B Companies).

1. From the object management settings for accounts, go to Page Layouts.
2. From the list of page layouts, click **Edit** next to the layout(s) your Data.com Prospector or Data.com Clean users will use.
3. On the Account Layout page, from the list of page element categories, click **Fields**.
4. Drag the `Clean Status` field into place on the page where you want it to appear.
5. If you use Data.com Corporate Prospector or Data.com Premium Prospector, add the D&B fields you want users to see. These include `Account Site`, `D-U-N-S Number`, `NAICS Code`, `Tradestyle`, and more. For a complete list of the D&B fields available on account records, see [Account Fields](#).

 **Tip:** We recommend creating a section for D&B fields and grouping them there. To create a section, from the **Fields** group, just drag the `Section` element into place on the page.

### USER PERMISSIONS

To customize page layouts:

- “Customize Application”

To view page layouts:

- “View Setup”

6. If you want your users to be able to refresh D&B Company records, add the **Refresh** button to D&B Company page layouts.
7. If you use the Do Not Auto-Update validation rule provided in the Data.com Reports AppExchange package, add the `Data.com Does Not Auto-Update` field.
8. From the list of page element categories, click **Buttons**. Drag the **Clean, Get Contacts, Prospecting Insights, and Company Hierarchy**\* buttons into place on the page.  
\*Available only with a Data.com Premium Prospector license
9. Click **Save**.
10. From the object management settings for leads, go to Page Layouts.
11. Repeat the steps to add the `Clean Status` field and the **Clean** button to your Lead page layouts.
12. If you use Data.com Corporate Prospector, add the `Company D-U-N-S Number` field. If you use Data.com Premium Prospector, add the `Company D-U-N-S Number` and `D&B Company` fields.
13. If you use the Do Not Auto-Update validation rule provided in the Data.com Reports AppExchange package, add the `Data.com Does Not Auto-Update` field.
14. From the object management settings for contacts, go to Page Layouts.
15. Repeat the steps to add the `Clean Status` field and **Clean** button to your Contact page layouts. (Contacts does not include any D&B fields.)
16. If you use the Do Not Auto-Update validation rule provided in the Data.com Reports AppExchange package, add the `Data.com Does Not Auto-Update` field.
17. If you use Data.com Premium Prospector, from the object management settings for D&B Companies, go to Page Layouts.
18. Add the **Search Global Ultimate D-U-N-S** button.

## Set Field-Level Security for Data.com

If your organization uses Data.com Prospector or Data.com Clean, you can view a number of D&B fields on account records, and those fields are included when users manually clean records. To make sure your users can read and edit the fields and their values, and that they appear on the Account Card, you need to set field-level security.

Set field-level security for these fields.

- `Account Site`
- `D&B Company` (Data.com Premium Prospector only)
- `D-U-N-S Number`
- `NAICS Code`
- `NAICS Description`
- `Ownership`
- `SIC Code`
- `Ticker Symbol`

### EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited

### USER PERMISSIONS

To set field-level security:

- "Customize Application"

- Tradestyle
- Year Started

There are multiple ways to set field-level security (such as by profile or permission set), but because you need to set field-level security for only ten fields, we recommend starting from the fields and choosing the user profiles for users who use Data.com.

1. From the management settings for accounts, go to the fields section.
2. Click the field label to open the detail page for each of the fields.
3. On each field's detail page, click **Set Field-Level Security**. For each profile whose users need to read and edit the fields, select **Visible**. For example, if users in the Standard User profile will use Data.com Clean, select **Visible** for that profile.

 **Note:** Because these fields are maintained by Data.com Clean, making them editable by setting the field-level security to **Visible** could create mismatched data when a Clean job is run.

SEE ALSO:

[Implement Data.com Clean](#)

[Find Object Management Settings](#)

## Define Your Preferences and Select an Account Matching Service for Data.com Clean

Clean preferences let you specify which objects' records you want to clean and how you want to clean them. This includes selecting the matching service that's used to clean accounts.

If your organization does not have a Data.com Clean license, you won't be able to select preferences for jobs.

1. Review the [guidelines](#) for selecting a matching service that's used to clean accounts.
2. From Setup, enter *Preferences* in the **Quick Find** box, then select **Preferences** under the Clean section.
3. Select the matching service for cleaning accounts. If you select D&B DUNSRight™ matching service, adjust your confidence code if needed.  
D&B's Confidence Code ranks Data.com match candidates based on how similar they are to your record, from 1 (not similar) to 10 (identical or highly similar). We won't *automatically* match any Data.com record below the code you select here, and if we have multiple records at or above your selection, we'll match the best quality record. When you *manually* clean a record, you may be able to select a match between our preset confidence code (5) and the code you select here.
4. Review the [guidelines](#) for selecting job preferences.
5. Make sure the **Enable Clean jobs** checkbox is selected for each object whose records you want to clean. If your organization has a Data.com Premium Clean license and you want to clean D&B Company records, select the **Enable Clean jobs for D&B Companies** checkbox.
6. For each object you've enabled, select your clean preference.
7. Save your preferences.

## Guidelines for Selecting an Account Matching Service

If you use Data.com Prospector or Data.com Clean, you can select the matching service your organization uses to clean account records. It's important to understand each service, its clean behaviors, and related considerations before selecting your service.

The available matching services are:

### Data.com matching

Data.com's own matching technology, which matches on the `Account Name`, `Billing Address`, `Website`, and `Phone` fields.

The Data.com matching service is always used when cleaning accounts that have a valid `D-U-N-S Number`, even if the DUNSRight matching service is selected.

### D&B DUNSRight™ matching

D&B's proprietary data-quality technology, which uses a rigorous process to normalize data and match D&B company records to your account records. The process also employs the D&B Confidence Code, which ranks Data.com match candidates based on how similar they are to your record, from 1 (not similar) to 10 (identical or highly similar). D&B also provides letter-coded match grades for individual fields. For details about how D&B DUNSRight matching works, see [D&B Entity Matching](#).

#### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in:  
**Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

Available with a Data.com Clean license in:  
**Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

Attribute	Data.com matching	DUNSRight™ matching
Default matching service	✓	
Includes D&B's Confidence Code		✓
Supports broad international matching <sup>1</sup>		✓
Supports non-English speaking countries		✓
Requires default mapping for <code>D-U-N-S Number</code>		✓

<sup>1</sup>D&B DUNSRight matching provides matching records for over 200 more countries than Data.com matching. DUNSRight matching *does not* support these countries and regions: Admiralty Islands; Åland Islands; Antarctica; Ascension Island; Bonaire; Bouvet Island; British Indian Ocean Territory; Caroline Islands; Cocos (Keeling) Islands; Cuba; Curaçao; French Southern Territories; Guernsey; Heard Island and McDonald Islands; Isle of Man; Jersey; Korea, Democratic People's Republic of; Mayotte; Micronesia, Federated States of; Midway Islands; Mongolia; Niue; Palau; Palestinian Territory Occupied; Pitcairn; Saint Barthélemy; Saint Eustatius and Saba; Saint Martin (French part); Sint

Maarten (Dutch part); South Georgia; South Sandwich Islands; Svalbard and Jan Mayen; Timor Leste; Turkish Cyprus; United States Minor Outlying Islands; Wake Island; Wallis and Futuna; Western Sahara.

[Considerations for Scheduling Data.com Clean Jobs](#)

[Guidelines for Selecting Data.com Clean Job Preferences](#)

[Set Up Data.com Clean Jobs](#)

[Define Your Preferences and Select an Account Matching Service for Data.com Clean](#)

## Guidelines for Selecting Data.com Clean Job Preferences

Before you define your Data.com Clean jobs, it's important to understand the preferences you can set.

- Data.com Clean offers three options for cleaning your data with jobs. Jobs can:
  - Flag all differences per record to *only identify* fields whose values are different from Data.com values
  - Flag differences and auto-fill blank fields to identify fields whose values are different *and fill blank fields* with values from Data.com.
  - Customize settings field by field.
- If you select the `Customize` option for any object, you can:
  - Flag fields on your Salesforce records that have different values from matched Data.com records.
  - Flag different field values on your Salesforce records and automatically fill blank fields with Data.com values.
  - Overwrite different field values on your Salesforce records with Data.com values. If you overwrite Salesforce record values, you should set history tracking for those fields.
- You can set flag-only and flag and auto-fill preferences for entire records or by field. You set overwrite preferences by field.
- If you use Data.com Premium Clean, you can also clean D&B Company records that are linked to accounts and leads. D&B Company clean jobs automatically fill or overwrite field values on D&B company records, but do not change data on linked account or lead records.
- Your preferences take effect when the next scheduled clean job runs, and users will see the flags, as appropriate, when they clean records manually.
- If, after changing matching services, you want to do a one-time rematch using the new matching service, you can manually remove the `D-U-N-S Number` on account records to force the matching service to rematch the records. Be aware that this might affect your match rates.
- We don't recommend mapping a custom field or skipping mapping for either matching service.
- Converted leads are excluded from Lead clean jobs.
- If you select a field to be overwritten by Clean jobs, and a user marks that field as *wrong* on a record, jobs will not overwrite that field on that record.

#### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Clean license in:  
**Professional, Enterprise, Performance, and Unlimited** Editions

- Person accounts are excluded from Account and Contact clean jobs.

## Set Up Data.com Clean Jobs

If your organization has a Data.com Clean license, you can set up automated jobs to clean your records.

## IN THIS SECTION:

[Considerations for Scheduling Data.com Clean Jobs](#)

Here's some things to understand before you start keeping your records clean automatically with jobs.

[Schedule Data.com Clean Jobs](#)

To keep your records' clean status up to date, schedule automated jobs to compare your records with Data.com. Jobs are only available to organizations with a Data.com Clean license.

[Schedule a Full Sync of Your Salesforce Account Records with Data.com Clean](#)

If you use the D&B DUNSRight™ Matching service, you can schedule a full sync of your account records with Data.com's the next time your account clean jobs run. The full sync compares all of your account records with records from Data.com, and may find matches for records that were not matched during previous jobs.

[Prevent Data.com Clean Jobs from Updating Records](#)

You can prevent individual account, contact, and lead records from being updated with Data.com data when automated jobs run.

[View Data.com Clean Job History \(Data.com Clean Only\)](#)

The Data.com Clean Job History table lets you review your current jobs and access job error logs.

[Data.com Clean Job History Log](#)

Data.com Clean job history logs tell you everything you need to know about your clean jobs.

## Considerations for Scheduling Data.com Clean Jobs

Here's some things to understand before you start keeping your records clean automatically with jobs.

-  **Important:** If you have set up triggers to run when account, contact, or lead records are updated, and your triggers perform SOQL queries, the queries may interfere with jobs for those objects. Your Apex triggers (combined) can't exceed 200 SOQL queries per batch. If they do, your job for that object will fail. In addition, if your triggers are @future methods, they are subject to a limit of 10 @future calls per batch.

- Jobs are only available to organizations with a Data.com Clean license.
- You must have jobs scheduled for at least one day in a week them to run.

## EDITIONS

Available in: Salesforce Classic

Available with a Data.com Clean license in:

**Professional, Enterprise, Performance, and Unlimited** Editions

## EDITIONS

Available in: Salesforce Classic

Available with a Data.com Clean license in:

**Professional, Enterprise, Performance, and Unlimited** Editions

- Jobs only process records of enabled objects
- In a full sync job, all records are cleaned, regardless of their clean status. In an *incremental sync* job, only records with a `Not Compared` clean status are cleaned.
- When a full sync job runs, it runs instead of an incremental sync job.
- If a full sync job is scheduled to run, it runs even if no records have changed.
- The duration between jobs is counted from the time the previous job finishes to the start of the next job.
- Jobs are queued according to your scheduling settings, and they run independently for accounts, contacts, and leads. If you use Data.com Social Key, jobs also run a process that finds and associates social handles for your contacts and leads.
- How long it takes for a job to complete depends on several things, including which matching service you've selected (for account jobs), how many records your job cleans, and overall Salesforce performance. Using Data.com matching, it takes about a day for jobs to clean 3,000,000 records. Using DUNSRight™ matching, it takes about a day for jobs to clean 750,000 records.
- Jobs scheduled in a sandbox environment expire after 30 days.
- For best results, we recommend including a valid value for the `Country` and `State/Province` fields.
- Jobs do not process person account records.

- "Customize Application"

## Schedule a Full Sync of Your Salesforce Account Records with Data.com Clean

If you use the D&B DUNSRight™ Matching service, you can schedule a full sync of your account records with Data.com's the next time your account clean jobs run. The full sync compares all of your account records with records from Data.com, and may find matches for records that were not matched during previous jobs.

After the requested full sync has run, the option is turned off. You can turn it back on and schedule another full sync every 30 days. We'll let you know when your full sync is in progress, or how long it's been since your last full sync was run.

1. From Setup, enter *Jobs* in the *Quick Find* box, then select **Jobs** under Data.com.
2. Click the button next to **Full Sync With Next Job** to turn full sync **On**.  
After the requested full sync runs, the button changes to **Off**.

SEE ALSO:

- [Implement Data.com Clean](#)

### USER PERMISSIONS

To schedule Data.com Clean jobs and view job history:

- "Customize Application"

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Clean license in:  
**Professional, Enterprise, Performance, and Unlimited** Editions

Use **Skipped** Clean Status to Prevent Data.com Clean Jobs from Updating Records

Use the **Skipped records** Data.com Clean job bypass preference, which makes sure records with a **Clean Status** of **Skipped** are not updated by jobs. This is the recommended method of preventing jobs from updating records.

1. From Setup, enter *Preferences* in the **Quick Find** box, then select **Preferences** under the **Clean** section.
2. Select **Skipped records** from the **Job Bypass Preferences for Accounts, Contacts, and Leads** jobs.
3. Save your preferences.
4. Set the **Clean Status** to *Skipped* for records that you don't want jobs to update.

 **Tip:** You can use the Salesforce API, the Data Loader, or an Apex trigger to set the **Clean Status** for multiple records.

5. To make sure the **Clean Status** for **Skipped** records does not change when records are updated, create an Apex trigger. When a record is updated, the trigger sets its **Clean Status** back to **Skipped**. Then, jobs won't update the record.

## SEE ALSO:

[Use Custom Fields and Validation Rules to Prevent Data.com Clean Jobs from Updating Records](#)

## Use Custom Fields and Validation Rules to Prevent Data.com Clean Jobs from Updating Records

Use a custom field to identify the records you don't want auto-updated. Then, create a validation rule that tells jobs to skip these records.

 **Important:** If you create a validation rule to prevent auto-updates, keep this best practice in mind.

The validation rule generates entries and related messages in Data.com Clean job logs, but your jobs may generate other entries and errors, as well, so make sure that you examine your job logs carefully.

1. Create a custom field for each object in which there are records you want to prevent Clean jobs from automatically updating. Here's an example of how to define the custom field.

Field	Value or Selection
Field Type	Checkbox
Field Label	<i>Data.com Does Not Auto-Update</i>
Default Value	Unchecked
Description	<i>Prevents automated Clean jobs from updating fields with the matched Data.com record's values.</i>

Error Condition Formula (for Leads)	<pre>(<b>YOUR CUSTOM FIELD API NAME</b>) &amp;&amp; (\$User.Alias = "autocln") &amp;&amp; (ISCHANGED( Company )    ISCHANGED( Title )    ISCHANGED( Email )    ISCHANGED( Phone</pre>

Field	Value or Selection
	<code>)    ISCHANGED( Street )    ISCHANGED( City )    ISCHANGED( State )    ISCHANGED( PostalCode )    ISCHANGED( Country )    ISCHANGED( NumberOfEmployees )    ISCHANGED( AnnualRevenue )    ISCHANGED( Industry )    ISCHANGED( CompanyDunsNumber ) )</code>
Error Message	<i>This record has been excluded from automated field updates from Data.com Clean jobs.</i>

- Open each record that you don't want to be auto-updated, and select `Do Not Auto-Update` (or whatever you've named the custom field).

When automated jobs run, for each record that is not updated, you see a message in the job log: "This record has been excluded from automated field updates from Data.com Clean jobs."

 **Tip:** You can use the Data Loader or a custom trigger to select this checkbox for multiple records.

## View Data.com Clean Job History (Data.com Clean Only)

The Data.com Clean Job History table lets you review your current jobs and access job error logs.

-  **Important:** If you use the Do Not Auto-Update validation rule to prevent selected records from being automatically updated by Data.com Clean jobs, make sure you understand its effects on Clean job logs. The rule generates entries and related messages in job logs, but your jobs may generate other entries and errors, as well. So make sure you examine your job logs carefully. The validation rule is available in the Data.com Reports AppExchange package.

- From Setup, enter `Jobs` in the `Quick Find` box, then select `Jobs`.
- View job details in the Clean Jobs History section.
- If the job encountered errors when processing records, click the link in either the `Batch Errors` or `Entity Errors` columns to download the job log `.csv` file.

We store job logs for 21 days.

Here are the definitions for the table columns.

Column Heading	Definition
Date	The date the job was run.

#### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Clean license in:

**Professional, Enterprise, Performance, and Unlimited** Editions

#### USER PERMISSIONS

To schedule Data.com Clean jobs and view job history:

- "Customize Application"

Column Heading	Definition
Time Submitted	The time the job was submitted to the job queue. Jobs run independently, so this might not be the exact time the job was run.
Job Type	<p>The type of job: for Accounts, D&amp;B Companies, Contacts, or Leads. There are multiple types of account jobs.</p> <p><b>Account (Data.com Matching)</b>: the Data.com matching service was used to match the account records.</p> <p><b>Account (DUNSRight Matching)</b>: the DUNSRight matching service was used to match the account records.</p> <p><b>Account (D-U-N-S Number Lookup)</b>: the D-U-N-S Number field, if present, was used to rematch (or look up) the account records.</p>
Job Status	<p>The status of the job:</p> <p><b>Queued</b>: the job is in the queue to run. For jobs in this status, the <b>Time Submitted</b> column displays a dash (-).</p> <p><b>Preparing</b>: the job is being prepared to run.</p> <p><b>Processing</b>: the job is in process.</p> <p><b>Completed</b>: the job has finished running (with or without errors).</p> <p><b>Failed</b>: the job failed to run.</p> <p><b>Aborted</b>: the job was aborted before or while it ran.</p>
Records	The total number of Salesforce records processed by the job.
Matched	The total number of Salesforce records the job matched to Data.com records.
Unmatched	The total number of Salesforce records the job did not match to Data.com records.
Inactive	The number of Salesforce records that are marked as <b>Inactive</b> in Data.com.
Batch Errors	The total number of batch errors a job encountered while it ran. A dash indicates either no errors or no data. If the job produces a batch error job log, click the link to download and open its .csv file.
Entity Errors	The total number of entity errors a job encountered while it ran. A dash indicates either no errors or no data. If the job produces an entity error job log, click the link to download and open its .csv file. There you'll find an explanation of any entity error that was produced because a record failed to save—for example, because of a validation rule failure. Entity errors usually result from validation rule failures or required field violation. If an explanation exists, we'll provide it.

**Column Heading****Definition**

The unique ID of a record that produced an error during the job. To open the record, append the 15-digit ID to the URL of your Salesforce instance. For example:  
<https://na1.salesforce.com/0013000000hKBTq>.

## Review Triggers and Workflow Rules for Clean Compatibility

If your organization uses triggers or workflow rules on objects enabled for Clean (Account, Contact, Lead, or D&B Company), review the triggers and workflows and consider making adjustments or bypassing them so users don't encounter unexpected results when records are cleaned.

For example: your organization has a trigger that creates and assigns a task every time a lead record is updated by any means. If you clean leads using Clean jobs, your users could get more tasks than expected, so you might want to adjust the trigger so that tasks are only created and assigned when records are *manually edited* or *cleaned by Salesforce users*. You can determine who last updated a record by checking the `Last Modified By` field. Records last updated by a Clean job show `Data.com Clean` in that field, and records updated by users show the first and last name of the user.

1. If you use triggers on any object that's cleaned manually or by Clean jobs, from the object's management settings, go to Triggers.
2. Open and examine each trigger to make sure that your system or users won't encounter any unexpected results when records are cleaned. If you find that one or two triggers might cause unexpected results, you may be able to adjust those triggers. If you use Clean jobs and find multiple triggers that may cause unexpected results, consider bypassing triggers when jobs are run. You can select that option on the Clean Preferences page: from Setup, enter *Preferences* in the `Quick Find` box, then select **Preferences** under Clean.
3. If you use workflows, from Setup, enter *Workflow Rules* in the `Quick Find` box, then select **Workflow Rules**.
4. Open and examine each workflow rule to make sure that your system or users won't encounter any unexpected results when records are cleaned. If you find that one or two workflow rules might cause unexpected results, you may be able to adjust those rules. If you use Clean jobs and find multiple rules that may cause unexpected results, consider bypassing workflow rules when jobs are run. You can select that option on the Clean Preferences page. You can select that option on the Clean Preferences page: from Setup, enter *Preferences* in the `Quick Find` box, then select **Preferences** under Clean.
5. For all triggers and workflow rules you're using, check results on affected object records after the next Clean job runs for that object.

## Configure List Views for Data.com Clean

Before your Data.com Clean users can clean records from a list, you'll need to add the `Clean Status` field to your organization's list views.

1. Click the tab (Accounts, Contacts, or Leads) for the object whose records you want to clean from your list.

 **Note:** If your organization uses DUNSRight matching to clean account records, list view cleaning is not available for account records.

2. Select a view from the drop-down and click **Edit**.
3. Scroll down the Available Fields list to find the `Clean Status` field, then add it to the list of Selected Fields.  
The **Clean** button will automatically be added to the list view.
4. If you use Data.com Social Key, you can also add the fields for the social networks you've enabled (LinkedIn®, Twitter, or Facebook) to your contact list views.  
The social network fields aren't available on the lead list views.

**Available AppExchange Reports Package****Contents****Considerations**[Data.com Premium Reports](#)

Dashboard and associated reports utilize the rich set of D&B Company data to give you and your users unparalleled insight into your accounts, to help improve sales planning and business strategy.

To install this package, your organization must use Data.com Premium Prospector or Data.com Premium Clean.

[Data.com Data Assessments](#)

Tells you how Data.com can enrich your data.

Your organization can request one assessment every 30 days.

1. Go to the Data.com reports package you want to download.
2. Click **Get it Now**.
3. Install the Data.com reports packages you want to use.
4. If your organization uses Professional Edition, add these fields to your page layouts. If you don't, these fields won't be included on your reports.

**Page Layout****Fields**

Account

Sourced from Data.com

Contact

Sourced from Data.com

Lead

Sourced from Data.com

Opportunity

Sourced from Data.com

5. Let your users know which Data.com reports and dashboards are available.

## Review Data.com Clean Match Results

After you complete your Data.com Clean implementation and your first Clean jobs are complete, you should regularly review your Data.com Clean match results to make sure your records are being matched accurately. Run the Accounts by Clean Status report to get started.

**Important:** If your records appear to be matched incorrectly with Data.com records, think carefully before selecting **Flag differences** and **auto-fill blank fields** as a clean preference. If mismatches occur with a large number of your records, contact Salesforce Support.

1. Click the Dashboards tab, then select Data.com Analytics. Run the Accounts by Clean Status report.  
If your clean jobs have run successfully, you'll find your accounts grouped by their clean status values.
2. On the report, find any Salesforce records with a clean status of **Different**. Open several records and click **Clean** to look at the differences.
3. Repeat the comparison process with records that have a clean status of **Not Found**.

## View Your Data.com Clean Record Match Rates (Data.com Clean Only)

Data.com Clean metrics and analytics tell you how your organization's accounts, contacts, and leads have been matched and updated with Data.com data, so it's important to check your match and update rates on a regular basis.

1. From Setup, enter *Metrics* in the **Quick Find** box, then select **Metrics & Analytics** under the Clean section.
2. To find out when the last calculation occurred, check the **Last Calculated** field above the table.

**Note:** The data in the tables is calculated daily, but we store the time and calculate the date based on GMT, so depending on time adjustments, the date shown may be different from the date when the calculations occurred. Also, because this data is calculated once per day, it may differ slightly from the data in Data.com dashboards and reports.

3. View match and update information in the Match and Update Rates section.  
The data represents records that have been matched and updated since your organization implemented Data.com. Here are the definitions for the table columns.

Available with a Data.com Clean license in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

### USER PERMISSIONS

To view Data.com Clean match rates:

- "Customize Application"

Column	Definition
Records	The object enabled for Data.com Clean: accounts, contacts, or leads.   <b>Note:</b> If your Salesforce organization uses person accounts, the figures in the <code>Total</code> and <code>Processed</code> columns may differ. Person accounts are included in the account total, but are not processed by Data.com Clean jobs.
Total	The number of object records (accounts, contacts, or leads) that your organization has in Salesforce.
Processed	The number of each type of Salesforce record (accounts, contacts, or leads) processed by Data.com Clean.
Matched	The number of each type of processed Salesforce record (accounts, contacts, or leads) that match with Data.com records.
Updated	The number of each type of processed Salesforce record (accounts, contacts, or leads) that have been updated.

Column	Definition
Records	The object enabled for Data.com Clean: accounts, contacts, or leads.
Match Rate (% of Processed)	The percentage of each type of processed Salesforce record (accounts, contacts, or leads) that match with Data.com records.
Update Rate (% of Processed)	The percentage of each type of processed Salesforce record that have been updated.

## Report on Salesforce Records with a Specific Clean Status

Create a custom report to show Salesforce account, contact, or lead records that have a specific clean status (such as *Different*).

Choose fields to display from the Account, Contact, or Lead objects. Using data from companion Clean Info objects, show Salesforce and Data.com record values side by side. Report results can help you identify consistent reasons records might have a specific clean status. Use what you learn to manage how records are cleaned in your organization.

For example, you can create a report to show all records whose clean status is *Different* side by side with their matched Data.com records. If you identify patterns in your data that cause this status, you might create triggers or API customizations to adjust your data and have more records with *In Sync* status..

Let's create a Contacts by Clean Status report.

1. Before you can create the Contacts by Clean Status report, make sure your organization has a custom report type that links the Contact object to the Contact Clean Info object and makes fields from both objects available to report on.
2. Create your report: click the Reports tab, then click **New Report**.
3. Select *Contacts by Clean Status* as the report type.
4. Click **Create**.
5. From the parent object, Contacts, select the fields you want to report on. For example, you might choose:
  - Contact ID
  - Clean Status
  - Full Name
  - Mailing Address
  - Phone
  - Email
6. From the related object, Contact Clean Info, select fields that correspond to the Contact object fields. For contact clean info, you might choose:
  - Contact Clean Info ID
  - First Name
  - Last Name
  - Address
  - Phone
  - Email
  - Last Match Date
7. Add a field filter to the report: For the field, select *Clean Status*. For the operator, select *equals*, and for the value, select *Different*.
8. Define the remaining fields.
9. Save the report and run it.

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in:  
**Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

Available with a Data.com Clean license in:  
**Professional, Enterprise, Performance,** and **Unlimited** Editions

### USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"
- AND
- "Report Builder"

10. Examine the report to see if you can identify patterns in your data that cause certain records to have a clean status of `Different`.

SEE ALSO:

[Create a Custom Report Type for Account, Contact, or Lead Clean Info](#)

[What's the Account Clean Info Object?](#)

[What's the Contact Clean Info Object?](#)

[What's the Lead Clean Info Object?](#)

## Leverage Account, Contact, and Lead Clean Information

### What's the Account Clean Info Object?

Account Clean Info is a background object that stores the metadata used to determine an account record's clean status.

Account Clean Info provides a snapshot of the data in your Salesforce account record and its matched Data.com record at the time the Salesforce record was cleaned.

Account Clean Info includes a number of bit vector fields, whose component fields each correspond to individual object fields and provide related data or status information about those fields. For example, the bit vector field `IsDifferent` has an `IsDifferentState` field. If the `IsDifferentState` field's value is `False`, that means the `State` field value is *the same* on the Salesforce account record and its matched Data.com record.

These are the bit vector fields.

- `CleanedBy` indicates who (a user) or what (a Clean job) cleaned the account record.
- `IsDifferent` indicates whether or not a field on the account record has a value that differs from the corresponding field on the matched Data.com record.
- `IsFlaggedWrong` indicates whether or not a field on the account record has a value that is flagged as wrong to Data.com.
- `IsReviewed` indicates whether or not a field on the account record is in a `Reviewed` state, which means that the value was reviewed but not accepted.

Administrators can modify a limited set of Account Clean Info fields from the Account Clean Info page.

Developers can create triggers that read the Account Clean Info fields to help automate the cleaning or related processing of account records. For example, you might create a trigger that reads the `Clean Status` field on the Account object. If an account record's `Clean Status` field value is `Different` but the record has no `Billing Street` value, the trigger could update the record's status to `Not Compared`.

## What's the Contact Clean Info Object?

Contact Clean Info is a background object that stores the metadata used to determine a contact record's clean status.

Contact Clean Info provides a snapshot of the data in your Salesforce contact record and its matched Data.com record at the time the Salesforce record was cleaned.

Contact Clean Info includes a number of bit vector fields, whose component fields each correspond to individual object fields and provide related data or status information about those fields. For example, the bit vector field `IsDifferent` has an `IsDifferentEmail` field. If the `IsDifferentEmail` field's value is `False`, that means the `Email` field value is *the same* on the Salesforce contact record and its matched Data.com record.

These are the bit vector fields.

- `CleanedBy` indicates who (a user) or what (a Clean job) cleaned the contact record.
- `IsDifferent` indicates whether or not a field on the contact record has a value that differs from the corresponding field on the matched Data.com record.
- `IsFlaggedWrong` indicates whether or not a field on the contact record has a value that is flagged as wrong to Data.com.
- `IsReviewed` indicates whether or not a field on the contact record is in a `Reviewed` state, which means that the value was reviewed but not accepted.

Developers can create triggers that read the Contact Clean Info fields to help automate the cleaning or related processing of contact records.

SEE ALSO:

[SOAP API Developer's Guide](#)

## What's the Lead Clean Info Object?

Contact Clean Info is a background object that stores the metadata used to determine a lead record's clean status.

Lead Clean Info provides a snapshot of the data in your Salesforce lead record and its matched Data.com record at the time the Salesforce record was cleaned.

Lead Clean Info includes a number of bit vector fields, whose component fields each correspond to individual object fields and provide related data or status information about those fields. For example, the bit vector field `IsDifferent` has an `IsDifferentTitle` field. If the `IsDifferentTitle` field's value is `False`, that means the `Title` field value is *the same* on the Salesforce lead record and its matched Data.com record.

These are the bit vector fields.

- `CleanedBy` indicates who (a user) or what (a Clean job) cleaned the lead record.
- `IsDifferent` indicates whether or not a field on the lead record has a value that differs from the corresponding field on the matched Data.com record.
- `IsFlaggedWrong` indicates whether or not a field on the lead record has a value that is flagged as wrong to Data.com.
- `IsReviewed` indicates whether or not a field on the lead record is in a `Reviewed` state, which means that the value was reviewed but not accepted..

## Create a Custom Report Type for Account, Contact, or Lead Clean Info

Create custom report types to report on clean information for accounts, contacts, and leads. Clean Info custom report types can help you easily see clean information for multiple records in one report. Use that information to identify patterns and trends in your data and to manage or modify how your records are cleaned.

1. From Setup, enter *Report Types* in the **Quick Find** box, then select **Report Types**.
2. Click **New Custom Report Type**.
3. For Primary Object, select *Accounts*, *Contacts*, or *Leads*—whatever object you want to report on—and define the other required fields.
4. For Category, select either *Accounts & Contacts* or *Leads*, as appropriate.
5. Click **Next**.
6. Relate the companion Clean Info object (Account Clean Info, Contact Clean Info, or Lead Clean Info) to the primary object you selected. Accept the default for **A to B Relationship**.
7. Select a deployment status.
8. Click **Save**.

Now you can create custom reports based on your new custom report types.

## Automatically Add Critical Information to Your Sales and Marketing Reps' Records

Help your sales and marketing teams maintain great relationships with customers and pursue the most promising opportunities by automatically adding the latest information to Salesforce accounts, contacts, and leads using Data.com clean rules.

IN THIS SECTION:

[How Is Information Automatically Added to Records?](#)

It's not magic but it's pretty close. Just set up and activate the Data.com clean rules. Then, information—from latitude and longitude for account addresses to company information for leads—is added to existing Salesforce records. And, new and updated records get this information when they're saved. If you want to do any testing before you add information to all your records, there's even a quick way to manually add information to an individual record.

[Considerations for Adding Information to Records](#)

Review these considerations before using Data.com clean rules to add information to your Salesforce records.

### [Automatically Add Geocode Information for Your Addresses \(Beta\)](#)

Help your sales and marketing reps find nearby accounts and contacts, assign territories and campaigns, segment markets, target specific areas, and analyze demographics. All of this is a cinch with geocode information. Using Data.com geocode clean rules, you can add geocode information to all your existing Salesforce accounts, contacts, and leads; and new and updated records automatically get geocode information when they're saved.

### [Automatically Add Critical Company Information to Your Leads \(Pilot\)](#)

Make it easier for your sales and marketing reps to pursue the most promising leads and immediately assign them to the right territories and campaigns. Using a Data.com clean rule, you can add valuable company information like D-U-N-S number and number of employees to all your existing Salesforce leads; and, new and updated leads automatically get company information when they're saved.

### [Standard Data.com Clean Rules](#)

Learn key details about the standard clean rules, which help you automatically add information to your Salesforce records. Find a description of how each clean rule works and the fields it updates.

## How Is Information Automatically Added to Records?

It's not magic but it's pretty close. Just set up and activate the Data.com clean rules. Then, information—from latitude and longitude for account addresses to company information for leads—is added to existing Salesforce records. And, new and updated records get this information when they're saved. If you want to do any testing before you add information to all your records, there's even a quick way to manually add information to an individual record.

With clean rules, you can make it easier for your sales and marketing teams to get the most up-to-date data in real time, so they can maintain relationships with key customers, pursue the most promising opportunities, and immediately assign leads to the right territories and campaigns!

So how do these mysterious clean rules work?

It's simple! Clean rules control how your Salesforce records are cleaned with Data.com.

When you clean a record, you compare it to a matching record from a data service. Then, you update your record using values from the matching record. It sounds easy, but how do you determine the fields to update and the data service to use? And how do you make sure that triggers aren't activated and workflow rules don't run during cleaning? That's where clean rules come in.

A clean rule is used every time a record is cleaned to specify things like:

- The data service for cleaning, which includes source that your records are compared to and the processes that figures out if your records match records from the data source
- The object that's cleaned
- The fields used to match your records with records from the data service
- The fields that are updated when a match is found
- How fields are updated when records are cleaned (for example, values on Salesforce fields are overwritten with data from the data service)
- If triggers and workflow rules run when records are cleaned

After you activate a rule, it immediately goes to work. New and updated records are automatically cleaned when they're saved. In addition, you can manually clean individual records at any time, and you can set up the rule to clean all your existing records.

 **Example:** You have an app that assigns leads to territories based on the latitude and longitude of lead addresses. There's just one problem: Your lead addresses in Salesforce don't have updated values for latitude and longitude. No need to worry! Just set

## Automatically Add Geocode Information for Your Addresses (Beta)

Help your sales and marketing reps find nearby accounts and contacts, assign territories and campaigns, segment markets, target specific areas, and analyze demographics. All of this is a cinch with geocode information. Using Data.com geocode clean rules, you can add geocode information to all your existing Salesforce accounts, contacts, and leads; and new and updated records automatically get geocode information when they're saved.

 **Note:** This feature is available through a closed beta program. Contact Salesforce to enable it for your organization. Unreleased services or features referenced in this document, press releases, or public statements are not currently available and may not be delivered on time or at all. Customers who purchase our services should make their purchase decisions based on features that are currently available. Salesforce Customer Support provides limited support for this feature during the beta period. Ask for help and provide feedback in the [Salesforce Success Community](#).

 **Important:** Geocode information is added to records using Data.com technology. However, a Data.com license is *not* required to use this feature.

1. From Setup, enter *Clean Rules* in the **Quick Find** box, then select **Clean Rules**.
2. Edit a geocode rule. There are four [geocode clean rules](#) available.
3. To add geocode information to all existing records, select **Clean all records when this rule is activated or saved**.

### USER PERMISSIONS

To use the Salesforce API:

- "API Enabled"

The screenshot shows a Salesforce Contact record with the following details:

- Contact Owner: Admin User [Change]
- Name: Howard Jones
- Account Name: Acme
- Title: Buyer
- Phone: (212) 555-5555
- Email: info@salesforce.com
- Reports To: [View Org Chart]

Below the contact details are sections for Address Information, Additional Information, and System Information. At the bottom, there is a section titled "Clean This Record with Data.com" which contains a table:

Action	Clean Status	Clean Rule Name	Data Service	Last Cleaned
Clean	In Sync	Contact Geo Clean Rule for Mailing Address	Data.com Geo	Just now

If the geocode rule's clean status is set to `In Sync`, the record has up-to-date geocode information from the data service.

2. Make sure that there are values in the geocode fields using the Salesforce API.
  - a. Get the value of the `Id` field for a record.
  - b. Using the `Id`, query the address fields and geocode fields. (Alternatively, you can query all records or the first `x` number of records for an object.)

### Example: Salesforce Object Query Language (SOQL) Query for Contacts

```
SELECT Name, Email, MailingAddress, MailingCity, MailingState, MailingCountry,
MailingLatitude, MailingLongitude, MailingGeocodeAccuracy
FROM Contact
WHERE Id IN ('003D000000QRoqW', '003R0000001ySoG', '003D000000QRoqU');
```

- c. Verify that there are values for the geocode information fields.

## SEE ALSO:

### Accuracy Values

Accuracy tells you more about the location of a latitude and longitude. For example, zip means the latitude and longitude indicate the point at the center of the zip code area for an address. In this case, a match for the exact street address couldn't be found.

Accuracy Value	Description
Address	In the same building
NearAddress	Near the address
Block	Midway point of the block
Street	Midway point of the street
ExtendedZip	Center of the extended zip code area

Accuracy Value	Description
Zip	Center of the zip code area
Neighborhood	Center of the neighborhood
City	Center of the city
County	Center of the county
State	Center of the state
Unknown	No match for the address was found

# Find Out if Your Organization Can Improve Its CRM Records

## Analyze Data Quality with Data.com Data Assessments

How many of your organization's records can Data.com enrich with more and better data? Data.com Assessments can tell you. It can also identify how many of your records have been marked as `Inactive` in Data.com or appear to be duplicates.

Data assessments also lists the fields on accounts, contacts, and leads, and tell you how many are blank within your records and how many have different values from Data.com's. (For example, you may have 10 account records in which the `PHONE` field value is blank, or five contacts in which the `ACCOUNT_NAME` field is blank.) You can use it to help you decide whether to purchase Data.com Clean, which will update fields with blanks or out-of-date values. If you already use Clean, it can help show you the value you're getting.

Data.com Data Assessments is a freeAppExchange package.

1. [Install the Data.com Assessment app from the AppExchange.](#)
2. [Set up and run an assessment.](#)

## Run Data.com Data Assessments

To run a data assessment, your organization must have the Data.com Data Assessments AppExchange app installed. Contact your salesforce.com sales rep if you need Data Assessments.

Data.com Data Assessments is a Salesforce AppExchange package that tells you how many of your organization's records Data.com can enrich with more and better data. It can also tell you how many of your records have been marked as `Inactive` in Data.com, and if you request, how many records in your Salesforce organization appear to be duplicates. Data assessments also list the fields on accounts, contacts, and leads, and tell you how many are blank within your records and how many have different values from Data.com's. Your organization can request one assessment every 30 days.

1. From the Force.com app menu, select Data.com Assessment to open the Data Assessment app.
2. Click the Data.com Assessment tab and define your assessment preferences.
3. Click **Start My Assessment**. We'll tell you how long we expect it to take. The completion calculation is based on 15 records per second, and we round up to the nearest hour. So if you have 200,000 accounts, for example, your assessment will take about 3 hours and 45 minutes to complete. We'll estimate it at 4 hours.

To view a Data.com data assessment:

- No permissions required

## View and Understand Data.com Data Assessments

When your Data.com data assessment is complete, you can take a look, and learn how Data.com can enhance your CRM records. You can also view previous assessments run by you or other users in your organization.

### Tip:

- For more information about clean status values, including those provided in data assessments (*In Sync*, *Different*, and *Inactive*) see [Data.com Clean Statuses](#) on page 1162.
- To learn more about how Data.com matching works, check out our white paper: [Data.com Record Matching in Salesforce](#).

1. If you need to, from the Force.com app menu, select **Data.com Assessments**.
2. Click the Data.com Assessment tab, then click the Assessments tab.
3. Click **View Assessments** next to the assessment you want.
4. Click through the assessment tabs. Here's what you'll find.

Tab	What it Tells You
Summary	Breaks down the set of records we analyzed for the assessment. It tells you how many we can enrich with better data, how many records are likely to be inactive in Data.com and if you requested it when you ran the assessment, how many of your records are likely to be duplicates. We also tell you how many of your records were matched to Data.com records and how many were not.
Accounts	Breaks down the account records we matched, showing the number and percentage of records by status and identifying the match percentage. Data assessments also list Account fields and for a given field, tell you how many records have blank values for that field and how many have values that are different from Data.com's. (For example, you may have 10 account records in which the <code>PHONE</code> field value is blank.)
Contacts	Breaks down the contact records we matched, showing the number and percentage of records by status and identifying the match percentage. Data assessments also list Contact fields and for a given field, tell you how many records have blank values for that field and how many have values that are different from Data.com's. (For example, you may have five contact records in which the <code>ACCOUNT</code> field value is blank.)
Leads	Breaks down the lead records we matched, showing the number and percentage of records by status and identifying the match percentage. Data assessments also list Lead fields and for a given field, tell you how many records have blank values for that field and how many have values that are different from Data.com's. (For example, you may have 12 lead records in which the <code>TITLE</code> field value is different from Data.com's.)

### USER PERMISSIONS

To run a Data.com data assessment:

- No permissions required

To view a Data.com data assessment:

- No permissions required

Tab	What it Tells You
Unmatched	Data.com's matching algorithm uses key fields to identify matching records. This tab lists those fields, and shows you the number and percentage of blank field values within your unmatched records. Adding valid data to these fields will most likely improve your organization's match results.
DUNSRight	Shows the expected account match rate using D&B DUNSRight Matching. The confidence code is a number from 1 to 10. A match confidence code of 10 is the most precise and the most exact match. You can set a confidence level threshold that identifies records as Matched or Select Match. Matched records are automatically added to your automated clean process. You can manually add Select Match records to your automated clean process.

## Data.com Reports and Dashboards

Want to analyze the impact of Data.com data on your business? Use the free Data.com reports packages from the AppExchange to easily analyze account, contact, and lead data.

There are multiple Data.com reports packages available on the AppExchange. Each report package offers a dashboard and several preconfigured reports to help you analyze account, contact, and lead data.

Before you can use any of the reports or dashboards, your system administrator needs to install it. To see which reports are available to you, click the Reports tab. To run one of the reports, click the appropriate folder to expand the report list, then select the report you want.

Available AppExchange Reports Package	Contents
Data.com Prospector Reports	Dashboard and associated reports used primarily by sales management uses to see the value Data.com provides in terms of converted leads, sales forecast, and revenue.
Data.com Clean Reports	Dashboard and associated reports used primarily by sales operations and those responsible for keeping Salesforce data clean.
Data.com Premium Reports	Dashboard and associated reports utilize the rich set of D&B Company data to give you unparalleled insight into your accounts, which will help improve sales planning and business strategy.

# Let Your Users Get Social Network Info for Their Contacts and Leads

## Implementing Social Key

Implementing Data.com Social Key is easy. Just follow a few simple steps.

**Important:** As of Spring '16, Data.com Social Key and the Data.com Social Profile Match API are no longer available. At that time, social profile handles, such as those from LinkedIn®, aren't added to records that are cleaned with Data.com. And, you can't use the Data.com Social Profile Match API to search for social profile handles.

1. [Enable Social Key](#).
2. If you haven't yet, [enable Social Accounts, Contacts, and Leads](#) and [select the social networks you want to get social profiles from](#).
3. [Make sure your Data.com Clean settings, preferences, and job schedule are configured for Social Key](#).
4. [Make sure the Clean Status field has been added to your contact and lead list views, and, optionally, add the fields for the social networks that you've enabled to your contact list views](#).
5. After jobs have run, you can [check out their Social Key job history](#).

## Enable Social Key

Before your organization can use Social Key to find and associate social handles for your contact and lead records, you must enable the feature.

**Important:** As of Spring '16, Data.com Social Key and the Data.com Social Profile Match API are no longer available. At that time, social profile handles, such as those from LinkedIn®, aren't added to records that are cleaned with Data.com. And, you can't use the Data.com Social Profile Match API to search for social profile handles.

1. From Setup, enter *Social Key Settings* in the *Quick Find* box, then select **Social Key Settings**.
2. Click **Enable Social Key**.

If you also need to enable and set up Social Accounts and Contacts, we'll let you know after you enable Social Key.

## Configuring Data.com Clean Jobs for Social Key

Social Key provides social handles through Data.com Clean jobs. You need to make sure your Clean jobs are configured for Social Key.

 **Important:** As of Spring '16, Data.com Social Key and the Data.com Social Profile Match API are no longer available. At that time, social profile handles, such as those from LinkedIn®, aren't added to records that are cleaned with Data.com. And, you can't use the Data.com Social Profile Match API to search for social profile handles.

Social Key works with Social Accounts and Contacts and Data.com Clean to make it easier to follow your contacts and leads on social networks. From Social Accounts and Contacts, select the social networks you want. The Social Key process runs during your automated Clean jobs, so to use Social Key, you need to make sure Clean is enabled, and select and schedule the jobs you'll need.

When you enable Social Key, the next scheduled Clean job will run a full sync with Data.com for the objects you've enabled for clean jobs (contacts, leads, or both). Social Key will provide social handles at regular intervals after that, at the same time as your Clean jobs. For example, if you run your clean jobs once per week, on Wednesday, the Social Key job will do a full sync every other Wednesday.

 **Note:** If a Clean job fails, the Social Key process fails, as well. To view Clean and Social Key job histories, from Setup, enter *Jobs* in the *Quick Find* box, then select **Jobs**.

If you need guidance on setting up Data.com Clean or verifying your preferences or settings, just click **Help for this Page** on any Clean setup page.

1. From Setup, enter *Clean Settings* in the *Quick Find* box, then select **Clean Settings**.
2. Confirm that Data.com Clean is enabled.
3. From Setup, enter *Preferences* in the *Quick Find* box, then select **Preferences** under Clean.
4. Confirm that Clean jobs are enabled for the objects for which you want to get social handles. We provide them for contacts and leads.
5. From Setup, enter *Jobs* in the *Quick Find* box, then select **Jobs**.
6. Confirm that Clean jobs are scheduled.

## Configuring Data.com Clean List View Cleaning for Social Key

Social Key provides social handles when users clean contact or lead records from a list. You'll need to add a few fields to your organization's list views.

**Important:** As of Spring '16, Data.com Social Key and the Data.com Social Profile Match API are no longer available. At that time, social profile handles, such as those from LinkedIn®, aren't added to records that are cleaned with Data.com. And, you can't use the Data.com Social Profile Match API to search for social profile handles.

Social Key works with Social Accounts and Contacts and Data.com Clean to make it easier to follow your contacts and leads on social networks. From Social Accounts and Contacts, select the social networks you want. The Social Key process runs when users clean records from a list.

1. Click the tab for the object whose records you want to clean from a list: Contacts or Leads.
2. Select a view from the drop-down and click **Edit**.
3. Make sure the `Clean Status` field has been added to the Selected Fields. Adding this field automatically adds the **Clean** button to the list view.
4. Optionally, add the fields for the social networks you've enabled (LinkedIn, Twitter, or Facebook) to your contact list views.  
The social network fields aren't available on the lead list views.

## Viewing Data.com Social Key Job History

The Data.com Social Key Job History lets you review your current jobs and access job error logs.

**Important:** As of Spring '16, Data.com Social Key and the Data.com Social Profile Match API are no longer available. At that time, social profile handles, such as those from LinkedIn®, aren't added to records that are cleaned with Data.com. And, you can't use the Data.com Social Profile Match API to search for social profile handles.

The Data.com Social Key process runs during your automated Data.com Clean jobs to find and associate social handles for contacts and leads. The Social Key Jobs History table lists recent clean jobs and provides details related to Social Key. If a Clean job fails, the Social Key process fails, as well.

1. From Setup, enter `Jobs` in the `Quick Find` box, then select **Jobs**.
2. Review general Clean job history if you need to.
3. View job details in the Social Key Jobs History section.
4. If the job encountered any errors when processing one or more records, click the link in the `Entity Errors` column to download the job log `.csv` file.

We store job logs for seven days.

Here are the definitions for the table columns.

Column Heading	Definition and Troubleshooting Guidelines
Date	The date the job was run.
Time Submitted	The time the job was submitted to the job queue. Jobs run independently, so this might not be the exact time the job was run.
Job Type	The type of job: Contacts or Leads.
Job Status	The status of the job: <b>Processing:</b> the job is in process. <b>Completed:</b> the job has finished running (with or without errors). <b>Failed:</b> the job failed to run. <b>Aborted:</b> the job was aborted before or while it ran.
Records	The number of Salesforce records processed and matched by the Clean job.
Records with Handle	The number of Salesforce records processed that were updated with one or more social handles.
Records without Handle	The number of Salesforce records processed that weren't updated with any social handles.
LinkedIn Handles	The number of LinkedIn social handles the job attempted to update Salesforce records with.
Twitter Handles	The number of Twitter social handles the job attempted to update Salesforce records with.
Facebook Handles	The number of Facebook social handles the job attempted to update Salesforce records with.
Entity Errors	The total number of entity errors a job encountered while it ran. A dash indicates either no errors or no data. If the job produces an entity error job log, click the link to download and open its .csv file. There you'll find an explanation of any entity error that was produced because a record failed to save—for example, because of a validation rule failure. Entity errors usually result from validation rule failures or required field violation. If an explanation exists, we'll provide it.  The unique ID of a record that produced an error during the job. To open the record, append the 15-digit ID to the URL of your Salesforce instance. For example: <a href="https://na1.salesforce.com/0013000000hKBTq">https://na1.salesforce.com/0013000000hKBTq</a> .

## Viewing Your Data.com Social Key Update Rates

Data.com Social Key metrics and analytics tell you how your organization's contacts and leads have been updated with social data, so it's important to check your update rates on a regular basis.

**Important:** As of Spring '16, Data.com Social Key and the Data.com Social Profile Match API are no longer available. At that time, social profile handles, such as those from LinkedIn®, aren't added to records that are cleaned with Data.com. And, you can't use the Data.com Social Profile Match API to search for social profile handles.

Social Key update rates are organized by both record type (so you can see how many contacts and leads in your organization were updated with social handles) and social handle (so you can see which handles were available most often).

1. From Setup, enter *Metrics & Analytics* in the Quick Find box, then select **Metrics & Analytics**.

2. To find out when the last calculation occurred, check the *Last Calculated* field above the table.

**Note:** The data in the tables is calculated daily, but we store the time and calculate the date based on GMT, so depending on time adjustments, the date shown may be different from the date when the calculations occurred. Also, because this data is calculated once per day, it may differ slightly from the data in Data.com dashboards and reports.

3. View update information in the Social Key Update Rates section.

The data represents records that have been updated since your organization started using Social Key. Here are the definitions for the table columns.

**Table 4: Records Updated**

Column	Definition
Records	The object for which Social Key jobs ran (contacts or leads).
Processed	The number of each type of Salesforce record (contacts or leads) processed by Social Key.
Updated	The number of each type of processed Salesforce record (contacts or leads) that have been updated with at least one social handle.
Update Rate (% of Processed)	The percentage of each type of processed Salesforce record (contacts or leads) that have been updated with at least one social handle.

**Table 5: Social Handles Updated**

Column	Definition
Social Handle	The social handles enabled for Social Key (LinkedIn®, Twitter®, or Facebook®).
Contacts	The number of social handles (LinkedIn, Twitter, or Facebook) that have been added to contact records.

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Clean license in:  
**Professional, Enterprise, Performance, and Unlimited Editions**

### USER PERMISSIONS

To view Social Key update rates:

- "Customize Application"

Column	Definition
Leads	The number of social handles (LinkedIn, Twitter, or Facebook) that have been added to lead records.
Total	The number of social handles (LinkedIn, Twitter, or Facebook) that have been added to contact <i>and</i> lead records.

**Table 6: Social Handle Update Rate (by Social Network)**

Column	Definition
Social Network	The social network for which we provide the social handles (LinkedIn, Twitter, or Facebook).
Update Rate	The percentage of total updated social handles that are from LinkedIn, Twitter, or Facebook.

## Understand Key Concepts About Data.com Products for Administrators

### Data.com Product Suite

Data.com offers a suite of products to keep your CRM up-to-date and clean. That way, your team can spend less time entering and updating data and more time growing your business. Leverage valuable account information from D&B and millions of crowd-sourced contacts to get the data that your business needs.

The free version of Data.com is available to all Salesforce organizations and includes the following functionality.

- For organizations with Professional Edition and above, administrators can use Duplicate Management tools to control whether and when users can create duplicate records inside Salesforce. Administrators can customize the logic that's used to identify duplicates and can create reports on the duplicates that they allow users to save.
- All users can search across the complete Data.com database of accounts and contacts. However, free version users can't see phone and email information for contacts, see account cards or D&B data on account records, add records to Salesforce, or clean records. To take full advantage of Data.com's data, purchase Data.com licenses and set up the feature.

The Data.com product suite includes Data.com Prospector, Data.com Clean, and these related Data.com features: [Social Key](#), [Reports and Dashboards](#), and [Data Assessments](#).

 **Note:** For organizations with Performance Edition, users automatically get Data.com Corporate Prospector and Data.com Corporate Clean. For an additional cost, you can upgrade to Data.com Premium Prospector and Data.com Premium Clean.

#### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

Available with a Data.com Clean license in: **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

## IN THIS SECTION:

[Data.com Prospector](#)

Use Data.com Prospector to search valuable company information from Dun & Bradstreet and millions of crowd-sourced contacts to find the records your business needs. Add these records to Salesforce as new accounts, contacts, and leads, or export them to use in other apps. It's a great way to get the data you need to plan your sales territories, segment campaigns, find new accounts to engage, and expand your sales network.

[Data.com Clean](#)

Data.com Clean provides a number of ways to keep your Salesforce CRM records up to date by leveraging company information from D&B and millions of crowd-sourced contacts. There are two versions of the Data.com Clean product: Corporate Clean and Premium Clean. They differ based on the D&B fields that are available when you clean account or lead records.

[Data.com Social Key](#)

Data.com Social Key works with Social Accounts and Contacts and Data.com Clean to make it easier to learn more about your contacts and leads in Salesforce or on social network sites. Your organization must have Data.com Clean enabled to use Social Key.

## SEE ALSO:

[Data.com Clean](#)[Get New Salesforce Accounts, Contacts, and Leads from Data.com](#)[How do I know which Data.com product my organization has?](#)[What product should my organization use to clean our account, contact, and lead records?](#)[Data.com Editions and Pricing](#)

## Data.com Prospector

Use Data.com Prospector to search valuable company information from Dun & Bradstreet and millions of crowd-sourced contacts to find the records your business needs. Add these records to Salesforce as new accounts, contacts, and leads, or export them to use in other apps. It's a great way to get the data you need to plan your sales territories, segment campaigns, find new accounts to engage, and expand your sales network.

All Salesforce users can search Data.com for accounts and contacts. Users with a Data.com Prospector license can:

- Add accounts and contacts to Salesforce, and add contacts as leads.
- Add contacts for an account directly from the account record.
- Export accounts and contacts from Data.com.
- Manually clean Salesforce account, contact, and lead records, regardless of whether they were added from Data.com.
- Get prospecting insights into accounts' business, financial, competitive, and industry details.
- Get company hierarchical views of parent-child relationships and account information, such as the annual revenue, ownership, and number of employees. (Available to Data.com Premium Prospector users as a beta feature.)

There are two versions of Data.com Prospector: Corporate Prospector and Premium Prospector. They differ based on the Dun & Bradstreet fields that are included when you add or manually clean account or lead records. Premium Prospector users also have access to the Company Hierarchy page.

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in:  
**Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

**Data.com Prospector Version****Dun & Bradstreet (D&B) Fields**

Data.com Corporate Prospector

Basic set of Dun &amp; Bradstreet fields.

Data.com Premium Prospector

Basic set of Dun & Bradstreet fields, plus the `D&B Company` field. This field links to an associated Dun & Bradstreet Company record with over 70 additional Dun & Bradstreet fields that are accessible on the `D&B Companies` tab. The Company Hierarchy page provides a hierarchical view of Dun & Bradstreet company relationships.

Organizations that purchased Data.com prior to December 16, 2011 may still be using an earlier version of the product with a limited set of fields. We're retiring this version in Summer '14. For information about upgrading to Data.com Prospector, contact your Salesforce account manager. The Salesforce Help refers to the Data.com Prospector product unless otherwise noted.

**Data.com Clean**

Data.com Clean provides a number of ways to keep your Salesforce CRM records up to date by leveraging company information from D&B and millions of crowd-sourced contacts. There are two versions of the Data.com Clean product: Corporate Clean and Premium Clean. They differ based on the D&B fields that are available when you clean account or lead records.

Clean compares your Salesforce account, contact, and lead records with records from Data.com and creates a link between your Salesforce record and its matching Data.com record. Clean also provides [clean status information for Salesforce accounts, contacts, and leads](#) on page 1162.

Users with a Clean license can:

- Manually compare individual Salesforce records side by side with matched Data.com records, and update Salesforce records field by field.
- Select account, contact, and lead records from a list, and clean them all at once.
- Manually refresh D&B Company records linked to accounts (Premium Clean only).

Your organization can also:

- Configure and run automated Clean jobs to flag field value differences on Salesforce records, fill blank fields, overwrite field values.
- Use the [Data.com Match API](#) to create a custom solution for specific business purposes like cleaning leads as they are created and cleaning custom objects.

Data.com Clean does not support person accounts.

There are two versions of Data.com Clean: Corporate Clean and Premium Clean. They differ based on the D&B fields that are available when you clean account or lead records, either manually or via automated jobs.

**Data.com Clean Version****D&B Fields**

Data.com Corporate Clean

Basic set of D&amp;B fields.

Data.com Premium Clean

Basic set of D&B fields, plus the `D&B Company` field. This field links to an associated D&B Company record with over 70 more D&B fields that are accessible on the `D&B Companies` tab. If the Salesforce records's `D&B Company` field is blank, a link is created, if available, when the record is cleaned.

**EDITIONS**

Available in: Salesforce Classic

Available with a Data.com Clean license in:  
**Professional, Enterprise, Performance, and Unlimited Editions**

 **Note:**

- Prospector or Clean Corporate licenses can't be purchased for organizations that already have Prospector or Clean Premium licenses. If you want to purchase Corporate licenses, you'll need to convert your Premium licenses.
- Prospector or Clean Premium licenses can't be purchased for organizations that already have Prospector or Clean Corporate licenses. If you want to purchase Premium licenses, you'll need to convert your Corporate licenses.
- Data.com Clean must be purchased 1:1 for Sales Cloud and Service Cloud seats.

[Using Data.com FAQ](#)[Clean Records Manually with Data.com Clean](#)[Clean a List of Salesforce Records with Data.com Clean](#)[Implement Data.com Clean](#)[Confirm that Data.com Clean Is Enabled](#)[Analyze Data Quality with Data.com Data Assessments](#)[Data.com Social Key](#)

## Data.com Social Key

Data.com Social Key works with Social Accounts and Contacts and Data.com Clean to make it easier to learn more about your contacts and leads in Salesforce or on social network sites. Your organization must have Data.com Clean enabled to use Social Key.

 **Important:** As of Spring '16, Data.com Social Key and the Data.com Social Profile Match API are no longer available. At that time, social profile handles, such as those from LinkedIn®, aren't added to records that are cleaned with Data.com. And, you can't use the Data.com Social Profile Match API to search for social profile handles.

When Clean jobs are run or records are cleaned from a list, Social Key finds and associates social handles for your contacts and leads. Social Key currently provides social handles for LinkedIn®, Twitter®, and Facebook® for contacts and leads in the United States only. Your administrator selects the social networks you want.

Users log in to a social network from a contact or lead's detail page and view the associated profile from within the Social Accounts and Contacts viewer or on the social network site. There's no manual search required.

 **Note:** Depending on contacts' and leads' privacy settings, as well as the permissions set by their friends or connections and the site's terms of use, users might not see as much information as they would if logged in to their social network accounts directly.

Data.com Clean must be enabled to use Social Key.

## How Are Salesforce and Data.com Records Matched?

If you clean your Salesforce account, contact, and lead data with Data.com, it's important to understand how your Salesforce records are compared and matched with records from Data.com.

-  **Tip:** For complete details about how the Data.com matching service works, including a graphic overview and extensive examples, please see our white paper, [Data.com Record Matching in Salesforce](#).

Watch a Demo:  [Understanding Matching Rules](#)

Salesforce and Data.com records can be compared and matched in two ways.

- Manually, when a user clicks **Clean** on an individual account, contact, or lead record.
- Via Clean jobs, which automatically attempt to match all your account, contact, or lead records.

*Automated* clean jobs are only available to organizations that purchase Data.com Clean. *Manual* clean is available to all licensed Data.com Prospector users.

The first time a Salesforce record is cleaned—either manually or via automated job—the matching service searches Data.com for similar records. It examines the field values in each record and looks for enough identical or similar information to indicate that the two records represent the same entity (that is—the same account, contact, or lead). If Data.com finds a match, the two records are linked by a numeric value in the `Data.com Key` field. For contact and lead records, every time the Salesforce record is cleaned, the matching service is used to match the record. For account records, every time the Salesforce record is cleaned, the `D-U-N-S Number` field is used to match (or look up) the record. If the `D-U-N-S Number` field is blank, the matching service will be used to find a match. If the Salesforce record changes substantially, the next time it is cleaned, the matching service may look for a better match from other Data.com records.

### Note:

- If you prefer to rematch account records with the matching service, regardless of whether a D-U-N-S Number is present, please contact Salesforce Customer Support. Doing so, however, may cause some account records to have the `Data.com Clean Not Found` status.
- If you've remapped or skipped mapping for the `D-U-N-S Number` field, or if your organization purchased Data.com prior to December 16, 2011, the matching service will automatically be used to rematch account records.

For contacts and leads, the important fields are:

- Name
- Email

Ideally, use a direct email address rather than a group address like `info@org.com`. (Identical Email values will almost always trigger a match unless other values in the record conflict.) **Note:** Data.com does not store emails that may be personal contact information, such as those from Gmail or Yahoo.

- Account Name for contacts; Company for leads.
- Title
- Phone

For accounts, the important fields are:

- Account Name
  - Make sure the account name doesn't contain any unrelated artifacts, such as numbers (1002), special characters (!#@#), or unrelated words. (These symbols are acceptable if they are part of the company's name.)
  - Try to avoid country and state names as values unless they are part of the company's name.

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

Available with a Data.com Clean license in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

- If the account name contains more than one word, like *DSGI Business (PC World Business)* try both of them.
- If an account name is also a Website (like *salesforce.com*), try leaving off the subdomain (.com and the like).
- **Billing Address**
  - Use a full address, if possible.
  - Try to specify a value for the **Country** field. This will optimize your match rates.
  - Try to specify a value for the **State** or **ZIP code** field.
  - If you know the account's street name but not its street number, use the street name only. A street name without a street number is better than no value.
- **Website**
- **Phone**

## How Are API Limits Defined for Data.com?

Data.com call limits are calculated based on the number and type of Data.com licenses you purchased. The listed information is read only. Use this information to track Data.com API call usage.

Call quotas are enforced at the Salesforce organization level.

Limit	Definition
Total Match Calls	Total number of API calls available in a 24 hour rolling call limit period
Remaining Number of Match Calls	The number of API calls still available for use by this API for the 24 hour rolling call limit period
Total Search Calls	Total number of API calls available in a 24 hour rolling call limit period
Remaining Number of Search Calls	The number of API calls still available for use by this API for the 24 hour rolling call limit period.

### EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

Available with a Data.com Clean license in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

Here is how to calculate your quota:  $1000 \times (\text{number of licenses}) = (\text{API call quota})$ .

The call quota for the Match API is based on the number of Data.com Clean licenses you have. The call quota for the Search API is based on the number of Data.com Prospecting licenses you have.

## Enable or Disable Data.com API Functionality

Data.com API functionality is enabled by default. You can disable or enable Data.com API functionality by selecting or deselecting the Enable Data.com API checkbox.

To disable the Data.com APIs follow these steps.

1. From Setup, enter *Data.com Administration* in the **Quick Find** box, then select **API Preferences**.
2. To disable access, deselect the **Allow Data.com API Access** checkbox.
3. To apply and save your changes, **Click Save**.

To enable the Data.com APIs follow these steps.

1. From Setup, enter *Data.com Administration* in the **Quick Find** box, then select **API Preferences**.
2. To enable access, select the **Allow Data.com API Access** checkbox.
3. Select **"I have read and agreed to the aforementioned terms."** checkbox and click **Confirm**.

#### Legal Notice:

Data.com API enables you to customize, build and integrate Data.com Prospecting and Clean functionalities, as the case may be, into your own business processes and workflows. Now that administrators have broader flexibility and discretion on how to process and clean Customer Data as part of these functionalities, it is important to remind you that as noted in your applicable master subscription agreement documentation covering the Data.com Prospecting and Clean functionality, and as further described in the Data.com Security, Privacy and Architecture Documentation accessible via [help.salesforce.com](https://help.salesforce.com), the Customer Data fields which you elect to process and/or clean may be transferred to the Data.com infrastructure for purposes of interoperation. If this broader flexibility poses any additional privacy or data security concerns for your organization, we encourage you to limit the types of Customer Data fields which you elect to process and clean, or instead opt-out of accessing the Data.com API by unselecting the 'Allow API Access' checkbox.

4. Click **Save** to enable Data.com API access.

## Administering Data.com FAQ

## What Salesforce Fields Are Affected by Data.com Clean?

### Note:

- These fields may be different if your organization uses customized Data.com-to-Salesforce field mappings.
- If you can't edit one or more fields on an account, contact, or lead record, you may receive a message that says, *You have limited access to data, so you can not completely clean this record* or *You have limited access to account fields, so you can not update all the fields shown here*. If this happens, ask your administrator for help.

When you use Data.com Clean to clean a Salesforce record, either manually or with automated jobs, the record's fields are updated with Data.com data. Here's a list of the fields that are updated.

### Account Fields

Account Name	Industry
Account Site	NAICS Code
Annual Revenue	NAICS Description
Billing Address	Ownership
Clean Status	Phone
D&B Company (Premium Prospector and Clean only)	SIC Code
Data.com Key	SIC Description
D-U-N-S Number	Ticker Symbol
Description	Tradestyle
Employees	Website
Fax	Year Started

### Contact Fields

Clean Status	Mailing Address
Data.com Key	Phone
Email	Title
Name	

### EDITIONS

## Lead Fields

Address	Email
Annual Revenue	Industry
Clean Status	Name
Company	No. of Employees
Company D-U-N-S Number	Phone
D&B Company (Premium Prospector and Clean only)	Title
Data.com Key	

### SEE ALSO:

[Why did I receive a message that says, You have limited access to data, so you can't completely clean this record?](#)  
[Clean Records Manually with Data.com Clean](#)

## What product should my organization use to clean our account, contact, and lead records?

You have a number of options. For complete details on the Data.com product suite and to learn about the clean options each one provides, check out [Data.com Product Suite](#).

Contact Salesforce support if you need assistance getting Clean for your organization.

### SEE ALSO:

[Data.com Clean](#)

## What should I do if my Data.com Users reach their addition limits and we need more prospecting capacity?

If you need to purchase additional licenses for Data.com Users, contact your Salesforce account executive.

### SEE ALSO:

[How Do Data.com User Types, Licenses, and Record Addition Limits Work?](#)

## Can I prevent Data.com Clean jobs from automatically updating records?

You sure can. Just follow [these guidelines](#).

### SEE ALSO:

[Data.com Clean](#)

[Prevent Data.com Clean Jobs from Updating Records](#)

## Why did I receive a message that says, **You have limited access to data, so you can't completely clean this record?**

If you can't edit one or more fields on an account, contact, or lead record, you'll see this message when you use Data.com Clean to manually clean the record. You'll still be able to clean the fields that you can edit.

Ask your administrator to make sure you can edit the [Salesforce fields affected when cleaning records](#), including D&B fields. How your administrator does this depends on which edition of Salesforce your company uses.

- For Contact Manager, Group, and Professional editions, make sure the fields are on the appropriate page layout.
- For Enterprise, Performance, and Unlimited editions, make sure field-level security is set to `visible` for the fields.

[What Salesforce Fields Are Affected by Data.com Clean?](#)

[Using Data.com FAQ](#)

## How Often Are *All My Accounts, Contacts, and Leads Updated with Data.com Clean Jobs?*

You choose when you want jobs to run using the Clean Jobs page. There are two types of jobs.

### Full Sync Job

All records are cleaned, regardless of their clean status.

 **Note:** If your jobs are set to bypass skipped records, records with a `skipped` clean status are not cleaned.

### Incremental Sync Job

Only records with a `Not Compared` clean status are cleaned.

For a full sync job to run, you must have jobs scheduled for at least one day of the week.

For contacts and leads, a full sync job runs every 14 days for all eligible records.

For accounts, how often a full sync job runs depends on the matching service you select and whether accounts have a value for the `Company D-U-N-S Number` field. For accounts *with* a D-U-N-S number, a full sync job runs every 14 days, regardless of the matching service. For accounts *without* a D-U-N-S number, check out this table.

Matching Service	How often can a full sync job clean accounts <i>without</i> a D-U-N-S number?
Data.com matching	Every 14 days
DUNSRight matching	Every 30 days   <b>Note:</b> You must set the <code>Full Sync With Next Job</code> option on the Clean Jobs page to <code>On</code> each time you want to run a full sync job for accounts without a D-U-N-S number. After a full sync job runs, this option changes to

<b>Matching Service</b>	<b>How often can a full sync job clean accounts <i>without</i> a D-U-N-S number?</b>
	Off, and it can't be toggled to On for 30 days from the time the last full sync job finished.

## Letting Users Share Information with Partners

### Partner Portals Overview

You can create partner portals to help you better manage your partners.

The following table briefly describes the partner portal:

	<b>Partner Portal</b>
<b>Purpose</b>	Provides your business partners access to Salesforce data that you have made available to them
<b>User Interface</b>	Includes a highly customizable user interface using a point-and-click editor, and functionality similar to Salesforce, such as: permissions, custom objects, sharing rules, and Web tabs
<b>Supported Record Types</b>	Accounts, contacts, documents, ideas, leads, opportunities, solutions, and custom objects
<b>Quantity</b>	Contact Salesforce for more information
<b>Administrator Controls</b>	Administrators can: <ul style="list-style-type: none"> <li>• Generate partner portal usernames and passwords</li> <li>• Manage the information of partner portal users</li> <li>• Manage partner portal users using permissions, roles, and sharing rules</li> </ul>
<b>User Controls</b>	Partner users can update their own user information

## SEE ALSO:

## Setting Up Your Partner Portal

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

To set up your partner portal:

### 1. Create one or more portals.

For each portal:

#### a. Configure the settings and communication templates.

The [Convert Portal User Access wizard](#) automatically displays after the first time you save settings for your first portal, whether it is the Customer Portal or partner portal. You can use this wizard to help ensure that records and folders owned by Salesforce users are not shared with portal users.

#### b. Customize the fonts and colors.

#### c. Customize the available tabs and tab order.

#### d. Configure portal languages.

### 2. Optionally, enable Salesforce CRM Content, Salesforce Knowledge, Entitlement Management, Ideas, or Answers as needed.

### 3. Create partner profiles.

For each partner profile:

#### a. Customize page layouts.

#### b. Customize list views.

Partner portal users can automatically see any list view with visibility settings marked `This view is accessible by all users`. We recommend that you create specific list views on all objects accessible to portal users, and then assign portal users to only the list views you want them to view.

#### c. Customize search layouts.

The search layouts in your Salesforce organization are the same search layouts used in your partner portal. Verify that search layouts on objects accessible to portal users only include fields you want them to view in search results.

### 4. Assign partner profiles to partner portals.

### 5. Optionally, enable single sign-on.

### 6. Enable login on each partner portal.

### 7. Create partner users.

## Creating Partner Portals

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

After you have enabled the Salesforce partner portal, you can create partner portals to satisfy the various business needs of your customers.

 **Note:** You can create a maximum of 5 partner portals in your organization. Increases to that number are subject to product manager approval and require detailed use cases.

To create a partner portal:

1. From Setup, enter *Partners* in the **Quick Find** box, then select **Settings**.
2. Click **New**.
3. Set the following options:

Setting	Description
Name	<p>Name of the partner portal as displayed on the portal's detail and edit pages, as well as the partner portal setup page. The name of the partner portal is not displayed on portal pages, but it does display in the browser title bar.</p> <p>The name of your portal must be unique for your organization and not already in use by a Customer Portal or partner portal. Furthermore, an error may occur if you name a Customer Portal "partner portal" Customer Portal</p>
Description	<p>A description of the partner portal as displayed on the portal's detail and edit pages. The description of the partner portal is not displayed in the portal.</p>
Login Enabled	<p>Allows users to log in to the partner portal.</p> <p>We recommend that you do not select this checkbox until you have completed configuring your portal.</p> <p> <b>Note:</b> When you enable the partner portal, the default portal will be set as <code>Login Enabled</code>.</p> <p>Users must be able to log in to the partner portal, be within their user profile's restricted IP range, and be within designated Login Hours in order to be able to reset their passwords.</p>

### EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To create partner portals:

- "Customize Application"

Setting	Description
Administrator	<p>Click the lookup icon (  ) to choose a default administrator for your partner portal. All email notifications regarding your partner portal will be sent to this Salesforce user.</p> <p>When choosing an administrator for your partner portal, you can only select users that have the “Manage External Users” and “Customize Application” user permissions, and have access to the Documents folder that contains your partner portal <a href="#">Header</a>. You cannot deactivate a user selected as a portal administrator.</p>

### Portal Default Settings

Setting	Description
Logout URL	The URL of the Web page that displays when users log out of the partner portal, for example, “http://www.acme.com.” If a logout URL is not specified, portal users return to the login page when they log out.
Show Action Confirmation	<p>Allows users to view confirmation messages after they complete an action in the partner portal. For example, after a user creates a lead in your partner portal, he or she views the message: “Lead has been created” if this setting has been enabled.</p> <p>Confirmation messages may help users clearly understand actions they have completed in your partner portal.</p>
HTML Messages Default Language	Specifies the language that portal HTML messages are displayed in when custom language portal HTML messages are not configured. This setting is only available for organizations that have multiple languages enabled.

### Email Notification Settings

Setting	Description
From Email Address	The email address from which all partner portal communication templates are sent, for example, “support@acme.com.” Salesforce sends the emails automatically, but they appear to portal users as if they were sent from this email address. If a portal user responds to a communication template, the response is sent to this address.
From Email Name	The name associated with the “From” Email Address, for example, “Acme Partner Support.”
New User Template	The email template used to send a username and initial password to all newly-enabled partner portal users. By default, a sample

## Email Notification Settings

Setting	Description
	template is automatically selected for you. This template must be marked as <code>Available for Use</code> .
New Password Template	The email template used to send a new password to existing partner portal users when you reset their passwords.
Lost Password Template	The email template used to send a new password to existing partner portal users when they reset their own passwords by clicking <b>Forgot your password?</b> on the login page of the partner portal.
Change Owner to Portal User Template	The email template used to send a notification to partner portal users when they become the new owner of a record in the portal.

## Look and Feel

Setting	Description
Header	<p>A text or HTML file that allows you to incorporate your organization's branding into the header of your partner portal. Click the lookup icon (  ) to choose a file that has been uploaded to a publicly accessible folder on the Documents tab.</p> <p>The files you include in the <code>Header</code> and <code>Footer</code> lookup fields can have a combined size of up to 10 KB.</p> <p>We recommend that you do not add a header <i>and</i> a logo to your portal because they may not display properly together.</p> <p>You can position the logout link anywhere on the header by using the HTML tag: <code>&lt;a href="/secur/logout.jsp"&gt;Logout&lt;/a&gt;</code></p>
Footer	<p>A text or HTML file that allows you to incorporate your organization's branding into the footer of your partner portal. Click the lookup icon (  ) to choose a file that has been uploaded to a publicly accessible folder on the Documents tab.</p> <p>The files you include in the <code>Header</code> and <code>Footer</code> lookup fields can have a combined size of up to 10 KB.</p>
Logo	<p>An image file (.jpg, .gif, .png) that allows you to incorporate your organization's branding into the top left header of your partner portal. Click the lookup icon (  ) to choose a file that has been uploaded to a publicly accessible folder on the Documents tab and marked as an <code>Externally Available Image</code>.</p> <p>The file you include in the <code>Logo</code> lookup field can be up to 20 KB.</p>

## Look and Feel

Setting	Description
	We recommend that you do not add a header <i>and</i> a logo to your portal because they may not display properly together.
Login Message	<p>A text or HTML file that allows you to incorporate your organization's branding into the header of the login page, forgot password page, and change password page of your partner portal. Click the lookup icon (🔍) to choose a file that has been uploaded to a publicly accessible folder on the Documents tab.</p> <p>The file you include in the <code>Login Message</code> lookup field can be up to 2 KB.</p> <p> <b>Note:</b> JavaScript and CSS code are automatically removed from HTML files used as the portal login message.</p>

- Click **Save**.

 **Note:** Contact Salesforce for information about the number of partner portals you can activate for your organization.

## Setting Fonts and Colors for Your Partner Portal

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

You can customize the fonts and colors of the Salesforce partner portal to reflect your company's branding. Your portal's fonts and colors are specified in a portal "color theme." Select a predefined color theme and optionally, customize it to better match your branding. You can click the **See examples** link to see all of the theme attributes you can customize.

- From Setup, enter *Partners* in the `Quick Find` box, then select **Settings**.
- Select the name of your partner portal.
- Click **Change Portal Fonts and Colors**.
- Select a color theme from the `Color Theme` drop-down list. Select Custom from the `Color Theme` drop-down list to create your own theme from scratch. A preview of the color theme you select is automatically displayed in the Preview sections.

### EDITIONS

Available in: **Salesforce Classic**

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To configure the fonts and colors for a partner portal

- "Customize Application"

5. Optionally, customize the color of any theme you select by either:

- Entering a hexadecimal value into any theme attribute, or
- Clicking the hexadecimal value of any theme attribute and selecting a color from the point-and-click editor

When you customize a theme, it is automatically renamed `Custom` when saved. You can customize the following options, which when customized, automatically display in the Preview sections:

### Tab Styles

Theme Attribute	Description
Current Tab Text	Text color of the tab users have selected.
Current Tab Background	Background color of the tab users have selected.
Current Tab Border	Border color of the tab users have selected.
Other Tab Text	Text color of the tabs users have not selected.
Other Tab Background	Background color of the tabs users have not selected.
Other Tab Border	Border color of the tabs users have not selected.
Tab Bar Background	Background color behind all tabs.

### Page Styles

Theme Attribute	Description
Page Background	Portal background color, excluding search, related lists, recent items, solution categories, document folders, and the Create New drop-down list.
Text	Text color, size, and font on all portal items, except for tabs, buttons, headers, and field labels.  Optionally, you can change the percent displayed in the percent field to increase or decrease the size of all portal items. Additionally, you can change the font of all portal items, except for tabs, buttons, headers, and field labels from the drop-down list.
Field Label Text	Text color of the field names on records.  Optionally, you can change the font of the text from the drop-down list.
Link	Text color of all links.
Link Hover	Text color of all links when a user hovers the mouse over them.
Field Separator	Color of the lines that separate fields on records.
Bottom Border	Color of the line bordering the bottom of the portal.

## Section Styles

Theme Attribute	Description
Header Background	Background color of all headings, including search, recent items, related lists, solution categories, documents folders, and the selected tab.
Section Header Text	Text color and font on the headers of search, related lists, recent items, solution categories, and document folders. Optionally, you can change the font of the text from the drop-down list.
Left Border	Border to the left of search, related lists, recent items, solution categories, document folders, and the Create New drop-down list. Optionally, you can change the number of pixels displayed in the pixel field to increase or decrease the thickness of the border. Additionally, you can select the style of the line displayed for the border from the drop-down list.
Right Border	Border to the right of search, related lists, recent items, solution categories, document folders, and the Create New drop-down list. Optionally, you can change the number of pixels displayed in the pixel field to increase or decrease the thickness of the border. Additionally, you can select the style of the line displayed for the border from the drop-down list.
Top Border	Border above search, related lists, recent items, solution categories, document folders, and the Create New drop-down list. Optionally, you can change the number of pixels displayed in the pixel field to increase or decrease the thickness of the border. Additionally, you can select the style of the line displayed for the border from the drop-down list.
Bottom Border	Border underneath search, related lists, recent items, solution categories, document folders, and the Create New drop-down list. Optionally, you can change the number of pixels displayed in the pixel field to increase or decrease the thickness of the border. Additionally, you can select the style of the line displayed for the border from the drop-down list.
Section Background	Background color of search, related lists, recent items, solution categories, document folders, and the Create New drop-down list.

## List Styles

Theme Attribute	Description
List Header Text	Text color of the field names selected as column headings on list views.  Optionally, you can change the font of the text from the drop-down list.
Header Underline	Color of the lines underneath column headings on related lists and list views.
Separator	Color of the lines between records on list views.
Row Highlight	Color of a record when a user hovers the mouse over it on list views.

6. Click **Save** to save all changes to the theme values.

 **Tip:** Changes are visible to partner portal users when they refresh their browsers. Therefore, we recommend updating your portal color theme at times when users are least likely to visit your partner portal.

## Customizing Your Partner Portal Tabs

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

In addition to custom objects, the following tabs can be displayed in the partner portal:

- Accounts
- Answers
- Articles (requires Salesforce Knowledge)
- Cases
- Contacts
- Documents
- Ideas
- Leads
- Opportunities
- Entitlements

### EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To customize partner portal tabs:

- "Customize Application"

- Service contracts
- Solutions
- Salesforce CRM Content tabs
- Reports

You can choose which tabs display to users logged in to a Salesforce partner portal, and customize the order in which tabs display to portal users:

1. From Setup, enter *Partners* in the *Quick Find* box, then select **Settings**.
2. Select the name of your partner portal.
3. Click **Customize Portal Tabs**.
4. To add or remove tabs, select a tab title, and click the **Add** or **Remove** arrow to add or remove the tab to or from the Selected Tabs box. To change the order of the tabs, select a tab title in the Selected Tabs box, and click the **Up** or **Down** arrow.
5. Optionally, from the *Default Landing Tab* drop-down, you can select which tab to display to users when they log into your portal.
6. Click **Save**.

You can further specify which tabs users can access by editing tab settings in users' associated profiles and permission sets.

The page layouts of tabs on the partner portal are controlled by the page layouts configured in the profiles assigned to the portal.

To edit the tab layouts for a profile:

1. From Setup, enter *Partners* in the *Quick Find* box, then select **Settings**.
2. Select the name of your partner portal.
3. Select the name of the profile you want to edit from the Assigned Profiles related list.
4. Click **View Assignment** under page layouts next to the standard or custom object you want to edit.
5. Click **Edit Assignment**.
6. Select a new page layout next to the profile name you are editing.
7. Click **Save**.

## Enabling Calendar and Events on the Home Tab

You can allow partner users to view a calendar and list of scheduled events on the Home tab of the partner portal. The calendar and events in the partner portal work the same as the calendar and events on the Home tab of Salesforce, with the following exceptions: spell check, event updates, enhanced list views, drag-and-drop scheduling, calendar sharing, and hover details are not supported in the partner portal.

 **Note:** A partner user can only see calendars shared by:

- Other partner users assigned to the same account
- The channel manager for their account

Portal users can view tasks and events from their calendar. Additionally, portal users with the "Edit Events" permission can create, edit, and delete events.

## Enabling the Welcome Component on the Home Tab

Include the Partner Portal Welcome component on home page layouts assigned to partner portal users. When users log in to your portal they receive a welcome message with their name, their channel manager's name, and links to both their company and personal profiles.

They can click the linked channel manager name to send an email to that person. When portal users change information about themselves their user record is automatically updated but their contact record is not.

 **Note:** The Partner Portal Welcome component is also available for the Customer Portal home page, however, it only provides a welcome message with the user's name.

## Allowing Portal Users to View the Reports Tab

To allow portal users to view the Reports tab:

1. Grant portal users access to the folders on your Salesforce Reports tab that contain the reports you want them to run.
2. Set the organization-wide default sharing model to Private on objects you want portal users to report on.
3. Grant the "Run Reports" permission to portal users.

When you add the Reports tab to your partner portal, portal users:

- Can run reports but cannot customize reports or filter report results.
- Can export reports to Excel if they have the "Export Reports" permission.
- Do not have access to the Unfiled Public Reports and My Personal Custom Reports folders.
- Receive an insufficient privileges error if they run a report that contains objects they do not have permission to view.

 **Note:** The Reports tab is only available to partner users with Gold Partner licenses.

## Configure Multilingual HTML Messages for Partner Portals

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

If your organization has multiple languages enabled, you can upload HTML messages in any of the languages supported by Salesforce and configure the messages to display in the portal based on portal user language settings. For example, you can upload an HTML message in French to display on the Home tab for portal users with French language settings, and an HTML message in English to display on the Home tab for portal users with English language settings.

Note the following before configuring multilingual HTML messages:

- Before you can add a multilingual HTML message to a portal, you must upload the HTML-formatted file in the Documents tab.
- Even if configured, portal HTML messages will not display on the Ideas, Reports, Content, or Solutions tabs.

To configure multilingual HTML messages:

### EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise

## Creating Partner Users

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

Once you have a partner account created, you can add partner users to the account as contact records. Partner users are Salesforce users with limited capabilities focused on managing leads. Partner users log in to Salesforce through the portal.

Before creating partners, you should configure your portals; otherwise, your partner users may attempt to log into your portal before your portals are ready.

To create a partner user:

1. View the partner account for which you want to create a partner user.
2. Create a new contact for the partner user. Choose **New** from the Contacts related list. Fill in the appropriate details, and click **Save**.
3. On the contact detail page, click **Manage External User** and choose **Enable Partner User**.
4. Edit the user record for this partner.
5. Click **Save**.

Once a partner user has been created, the partner account and the partner user can be edited independently. Changes made to one are not reflected in the other.

To troubleshoot issues or ensure the portal is configured appropriately, on the contact detail page, click **Manage External User** and choose **Log in to Portal as User**. A new browser window opens and you are logged into the portal as the portal user.

### Tips on Creating Partner Users

Consider the following when creating partner users:

- If you have enabled a user as a delegated administrator, the user cannot create an external user unless at least one partner profile has been added to the Assignable Profiles related list and the user has the "Manage External Users" permission.
- The **Role** drop-down is read-only the first time you enable a contact as a partner or customer user for an account. The next time you enable a contact on this account as a customer or partner user, you can select a **Role** for the user.
- The available profiles for the partner user are limited to the Partner User profile or profiles that have been cloned from it. Unlike a standard user, the partner user role is automatically assigned based on the account name. The partner user role is a subordinate of the account owner's role, therefore, all data for the partner user role rolls up to the partner account owner's role. Keep in mind that if you disable a portal user, their partner user role becomes obsolete and their data no longer rolls up to the partner account role.
- Partner users and contacts cannot be deleted. If you no longer want a partner user to have access to the portal, deactivate the partner user.

## Enabling Features in the Partner Portal

### Enable Cases in the Partner Portal

- 📌 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

When you enable cases in the partner portal, you can [assign cases to partner users](#) directly or using assignment or escalation rules. Partner users can edit cases, create new cases, add case comments, reassign cases, find case solutions, and create case teams. Partner users cannot edit case comments, associate assets with cases, or delete cases.

- 📌 **Note:** Case comments added by partner portal users are public and can be viewed by any user that can view the case.

To enable cases in the partner portal:

1. Add the Cases tab to the list of [available tabs in the partner portal](#).
2. In the partner user profile, verify that the cases tab setting is set to `Default On`.
3. In the partner user profile, enable the "Read," "Create," and "Edit" object permissions for cases.

After enabling cases in the partner portal, consider the following tips:

- Specify a case creation template to allow partner users to send a notification email to new contacts assigned to cases. From Setup, enter `Support Settings` in the `Quick Find` box, then select **Support Settings**.
- Configure case team roles to allow your partners to add case team members. From Setup, enter `Case Team Roles` in the `Quick Find` box, then select **Case Team Roles**.
- When viewing an email associated with a case, **Email Message List**, **Next**, and **Previous** links are not available to portal users.

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

Salesforce CRM Content is available in the partner portal. Two levels of access to Salesforce CRM Content can be granted to partner portal users:

- Portal users without a Salesforce CRM Content feature license can download, rate, comment on, and subscribe to content if they have the "View Content on Portals" user permission. They cannot view potentially sensitive data such as usernames and download, version, and subscriber history. The content delivery feature is not available to portal users.
- Portal users with a Salesforce CRM Content feature license can access all Salesforce CRM Content features granted by their library permission(s), including contributing content, moving and sharing content among libraries, and deleting content. They can also view Salesforce CRM Content reports. The content delivery feature is not available to portal users.

### Enable Salesforce CRM Content for Non-Licensed Users

After you have [enabled the partner portal](#), complete the following steps to enable Salesforce CRM Content in your portals. Use these steps if you have not purchased Salesforce CRM Content feature licenses for your portal users.

1. Update your cloned Partner User profiles:
  - a. Include the "View Content on Portals" user permission.
  - b. Change the tab visibility for the Libraries, Content, and Subscriptions tabs from Tab Hidden to Default On.
  - c. Assign the updated profile to partner portal users as needed.
2. Determine what privileges your portal users will have in each Salesforce CRM Content library by creating one or more library permissions.

 **Note:** A library permission can only grant privileges that a user's feature license or profile permits. For example, even though `Tag Content` is a library permission option, selecting it does not allow portal users without a Salesforce CRM Content feature license to tag content.

3. Determine which libraries you want your portal users to have access to. Ensure that confidential content is not available in these libraries.
4. Add portal users to libraries. Portal users with the Partner User profile or a clone of that profile can only be added to a library as part of a public group.
5. [Add the Salesforce CRM Content tabs](#) to each partner portal.

 **Note:** The Documents tab is not part of Salesforce CRM Content.

### Enable Salesforce CRM Content for Licensed Users

After you have [enabled the partner portal](#), complete the following steps to enable Salesforce CRM Content in your portals. Use these steps if you have purchased Salesforce CRM Content feature licenses for your portal users.

1. Update your cloned Partner User profiles:
  - a. Optionally, add the "Create Libraries" user permission if you want to allow portal users to create and administer new libraries.
  - b. Change the tab visibility for the Libraries, Content, and Subscriptions tabs from Tab Hidden to Default On.
  - c. Assign the updated profile to partner portal users as needed.
2. Select the `Salesforce CRM Content User` checkbox on the user detail page for each partner portal user.
3. Determine what privileges your portal users will have in each Salesforce CRM Content library by creating one or more library permissions.

 **Note:** A library permission can only grant privileges that a user's feature license or profile permits. For example, even though `Tag Content` is a library permission option, selecting it does not allow portal users without a Salesforce CRM Content feature license to tag content.

4. Determine which libraries you want your portal users to have access to. Ensure that confidential content is not available in these libraries.
5. Add portal users to libraries. Portal users with the Partner User profile or a clone of that profile can only be added to a library as part of a public group.
6. [Add the Salesforce CRM Content tabs](#) to each partner portal.

 **Note:** The Documents tab is not part of Salesforce CRM Content.

## Enabling Email in the Partner Portal

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

Enabling email in the partner portal allows partner users to send email from Activity History related lists in the partner portal. For example, a partner user can click the `Send An Email` button in the Activity History related list on a lead to send an email to the lead and log the email in the related list.

To allow partner users to send email from the partner portal, grant them the "Send Email" permission. For partner users to use email templates, you must make the templates available to them.

## Enable Ideas in the Partner Portal

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

After you set up your partner portal, follow the steps below to enable ideas in your portal:

1. To create an ideas community that's active and configured to be displayed in the portal, from Setup, enter `Ideas Zones` in the `Quick Find` box, then select **Ideas Zones**.
2. [Add the Ideas tab to your partner portal.](#)
3. If your organization has the Ideas and Answers Portal license, hide the Reports tab in the partner portal. Otherwise, your partner portal users receive an Insufficient Privileges message when they click the Reports tab.

## Enabling Entitlement Management in the Partner Portal

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

You can use the partner portal to provide your partners with access to entitlements, service contracts, or contract line items.

After you have set up entitlement management and enabled a partner portal, complete the following steps to add entitlement management to your portals.

1. Update your cloned Partner User profiles:
  - a. Include the "Read" permission on entitlements, service contracts, or contract line items.
  - b. Optionally, on the profiles of [delegated partner user administrators](#), include the "Create" and "Delete" permissions on entitlement contacts. This lets delegated external user administrators update entitlement contacts.
  - c. Verify that the tab visibility for the Entitlements or Service Contracts tabs are Default On. Contract line items display on service contracts.
2. At the bottom of the partner portal detail page, click **Edit Profiles** and activate the new profile.
3. Customize case page layouts to add the `Entitlement Name` lookup field. This lets partner users add entitlements to cases.
 

 **Tip:** Don't add the following entitlement process fields to case page layouts for portal users because portal users shouldn't access information related to your internal support processes: `Entitlement Process Start Time`, `Entitlement Process End Time`, `Stopped`, and `Stopped Since`.
4. Optionally, customize related lists on accounts and contacts to add Entitlements. This lets delegated external user administrators create cases automatically associated with the right entitlements.
5. Add the Entitlements or Service Contracts tabs to each partner portal.
6. Assign the cloned profiles to your partner portal users:
  - a. To create a new partner portal user, click **Manage External User** and choose **Enable Partner User** on the contact detail page. To update an existing user, click **Manage External User** and choose **View Partner User**.
  - b. For a new user, select the cloned profile from the **Profile** drop-down menu. For an existing user, click **Edit** and then select the profile.
  - c. Click **Save**.

## Enabling Answers in the Partner Portal

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

You can use the partner portal to provide your partners with access to an answers community.

To enable answers in your portal.

### 1. Set up your partner portal.

When customizing your portal fonts and colors, note that answers only supports the following changes:

- All tab styles
- The following page styles:
  - Page Background
  - Text
  - Link
  - Link Hover

### 2. Set up answers, making sure that your answers community is configured to display in the partner portal.

### 3. Add the Answers tab to your partner portal.

### 4. Create partner portal users.

### 5. If you want your partner portal users to have different category group visibility settings than the account owner, change the visibility settings for the partner portal user.

By default, partner portal users inherit which categories they can access from the account owner. For example, if the account owner has a role of CEO and the CEO role has full access to all the data categories in the category group assigned to answers, then partner portal users can also access all categories in the answers community. In some cases, you may want to limit which categories a partner portal user can access.

### 6. If your organization has the Ideas and Answers Portal license, hide the Reports tab in the partner portal. Otherwise, your partner portal users receive an Insufficient Privileges message when they click the Reports tab.

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

Because your Salesforce partner portal has functionality that is similar to Salesforce, you manage your partner portal users in much the same way as you manage your Salesforce users.

Consider how the following items affect how you manage partner portal users:

### Partner Portal Profiles

The permissions you assign to partner portal users define what functions they can perform within your organization's partner portal, such as whether users can view, create, or edit cases and custom object records. When you enable a partner portal, the Partner User profile is automatically created for your organization. The Partner User profile cannot be modified.

To enable partner users to log in to a partner portal, create profiles for your partners cloned from the Partner User profile. For each cloned profile, verify that the "API Only User" permission is not selected; if this permission is selected, users associated with the profile will not be able to log in to the partner portal. Cloning these profiles or creating permission sets also allows you to specify what portal users can do.

### Partner Portal Sharing Rules

After you enable your partner portal, the following groups and sharing rule category are created:

Group or Category	Description
All Partner Portal Users group	Contains all partner portal users in your organization
All Internal Users group	Contains all Salesforce users in your organization
Roles and Internal Subordinates sharing rule category	Allows you to create sharing rules in which you can choose specific Salesforce users in your organization by role plus all of the users in roles below that role, excluding any partner portal roles

You can use these groups and the sharing rule category to easily create sharing rules that grant all of your partner portal or Salesforce users access to specific data. You can also create sharing rules between partner portal users and Salesforce users, but not between partner users associated with different partner accounts.

If Salesforce Knowledge is enabled in your partner portal, portal users can see articles as permitted by the category group visibility settings.

### Partner Portal Role Hierarchy

A portal user role hierarchy is created for an account and its contacts when you enable the first partner portal user on that account. The account is added to the role hierarchy beneath the user that owns the account. Whenever you enable a contact as a partner portal user, he or she is automatically assigned to the User role in the account's portal role hierarchy. The default number of roles in portal accounts is three. You can reduce the number of roles or add roles to a maximum of three. Partner users can be assigned one of three roles:

- Executive
- Manager
- User

The Partner Executive role is immediately under the channel manager's role in the role hierarchy. The Partner Manager role is immediately under the Partner Executive role. The Partner User role is immediately under the Partner Manager role. Each role includes the partner account name as part of the role name. For example, if the partner account name is Acme, the three roles are Acme Partner Executive, Acme Partner Manager, and Acme Partner User. If the ownership of a partner account is changed to another channel manager, the partner user role is moved to that location in the role hierarchy.

 **Note:** Be careful managing your role hierarchy. Partner users at a given role level are always able to view and edit all data owned by or shared with users below them in the hierarchy, regardless of your organization's sharing model. Use administrative reports to manage your partner roles.

Accounts with different portal types have a separate role hierarchy for each portal. Role names include the portal type with which they are associated. For example, if Account A has both a partner portal and a Customer Portal, then roles for the Customer Portal are named "Account A Customer User" and roles for the partner portal are named "Account A Partner User."

All users in a partner user role have read access to all contacts under their partner account even when the contact sharing model is private. Partner users have read-write access to tasks associated with any object they can access. They also have read access to events associated with any object they can access. Partner users have the same access to Salesforce Knowledge articles as the account owner.

To view the roles assigned to your partner portal users, create a custom report, choose Administrative Reports, select Users as the data type, and add `Role` to your report columns.

### Deletion of Partner Portal Roles

When you delete partner portal roles, the roles are renamed to maintain the hierarchy. For example, if the Manager role is deleted from a three-role hierarchy of Executive, Manager, and User, then the Executive role is renamed to Manager but its ID remains the same. When you create a partner portal role, the hierarchy of the new portal role is automatically determined and created bottom-up.

You can delete multiple roles in bulk for better performance. For example, if most of your users are assigned the User role, you can delete the Executive and Manager roles. For more information on deleting partner roles, see the [SOAP API Developer's Guide](#).

### Super User Access

Users can be assigned super user access to give them access to data owned by other users belonging to the same role or those below in the hierarchy. For example, a Partner Manager with super user access can see data owned by other users in the Partner Manager role and the Partner User roles.

### Partner Portal User Licenses

Partner portal users cannot perform all of the functions that a Salesforce user can because partner portal users are assigned to a special type of user license.

SEE ALSO:

[Partner Portal Overview](#)

[Enable the Partner Portal](#)

### Assigning Partner Super User Access

Partner users can be assigned one of three roles: Partner Executive, Partner Manager, or Partner User (worker role).

Partner Super Users with Role	Can Access
Partner Executive	Data owned by all partner users and partner super users in the same role and those below them in the hierarchy (Manager and User roles).
Partner Manager	Data owned by all partner users and partner super users in the same role and those below them in the hierarchy (User roles).
Partner User (worker role)	Data owned by all partner users and partner super users in the same role (User roles).

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

To enable Partner Super User Access for your partner portal, see [Enabling Partner Super User Access](#).

- To assign super user access, go to the contact detail page of a partner account, click **Manage External User** and select **Enable Super User Access**.
- To remove partner super user access, go to the contact detail page of a partner account, click **Manage External User** and choose **Disable Super User Access**.

 **Example:** Consider these guidelines:

- Partner super users can access the data owned by other partner users and partner super users of the same role or those below them in the portal account hierarchy, even if the organization-wide default setting is Private.
- Partner super user access applies to cases, leads, custom objects, and opportunities only. Consider two partner super users with the same role under the same account, User A owns a few opportunities, and User B has manual share to another opportunity. Then User A will have access to all opportunities including those that User B has access to.

## Enabling Partner Users to Request Meetings

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

After you enable your partner portal and set up the Request a Meeting feature, complete the following steps to let your Partner users request meetings with contacts, leads, and person accounts:

1. Update your custom Partner User profiles:
  - a. Include the "Send Email" and "Edit Events" user permissions.
  - b. Verify that the tab visibility for the Contacts and Leads tabs is Default On.
2. Ensure that the custom Partner User profile is active and assigned to your Partner users.

## Delegating Partner User Administration

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

You can delegate a subset of administrative rights to external users that have a partner user license. Delegated external user administrators can perform any of the following tasks for users, including both customer users and partner users, associated with their account:

- Create external users
- Edit external users
- Reset passwords for external users
- Deactivate existing external users

 **Note:** When a delegated external user administrator deactivates a portal user, the administrator doesn't have the option to remove the portal user from any teams that user is a member of.

You must use the original profile user interface to delegate administration rights for a partner user. If you're using the enhanced profile user interface, disable it temporarily in the User Interface settings to complete this procedure.

To delegate a partner user administration rights:

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles** and click a custom partner profile.  
You cannot edit the Partner User profile.
2. Click **Edit**.
3. Select **Delegated External User Administrator**.
4. Click **Save**.
5. Click **Edit** in the Delegated External User Profiles related list.
6. Select the external user profiles you want users with this profile to be able to administer. An external user delegated administrator can manage external users with Customer Portal, partner portal, or Communities profiles, as long as the users with the profile are under the same account.
7. Click **Save**.

To change which profiles a delegated external user administrator can edit:

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles** and click a custom partner profile.  
You cannot edit the Partner User profile.
2. Click **Edit** in the Delegated External User Profiles related list.
3. Select the external user profiles you want users with this profile to be able to administer.
4. Click **Save**.

Delegated portal user administrators can click **Manage External User**, then **View Partner User** on the contact's detail page to view and edit the partner portal user's details:

### EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To manage partner portal users:

- "Manage External Users"

To create, edit, and delete profiles:

- "Manage Profiles and Permission Sets"

- Click **Edit** to edit a partner portal user's details.
  - Click **Reset Password** to reset the partner portal user's password.
  - Click **Edit** and deselect the `Active` checkbox to deactivate the user.
-  **Note:** Delegated partner user administrators can update portal users on any account to which they are transferred.

### Tips on Setting Up Delegated Portal User Administration

Consider the following when setting up delegated portal user administration:

- On the profile of users for which you are granting delegated portal administration:
  - Add the “Create” and “Edit” permissions on contacts so that delegated portal administrators can create and update contacts related to their account.
  - Set the Accounts and Contacts tab settings to Default On so that delegated portal administrators can view the Accounts and Contacts tabs and easily manage contacts related to their accounts.
- [Add the Accounts and Contacts tabs to your portal.](#)
- Set field level security and page layouts so that delegated portal user administrators can only access the account, contact, and case fields you specify.

## Enable the Partner Portal

-  **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

To enable the partner portal:

1. From Setup, enter `Partners` in the `Quick Find` box, then select **Settings**.
2. Click **Edit**.
3. Select the `Enable Partner Portal` checkbox.
4. Click **Save**.

-  **Note:** After you enable the partner portal, you cannot disable it. However, you can prevent users from logging into your partner portal. For more information, see [Partner Portal Configuration](#) on page 1741.

After you enable the partner portal for your organization, you can then [create one or more partner portals](#) to satisfy the various business needs of your customers..

-  **Note:** You can create a maximum of 5 partner portals in your organization. Increases to that number are subject to product manager approval and require detailed use cases.

#### EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

#### USER PERMISSIONS

To enable the partner portal:

- “Customize Application”

When you enable the partner portal, the following items are automatically added to your organization:

#### Partner User profile

You can assign partner portal users to profiles cloned from this profile. For each cloned profile, verify that the “API Only User” permission is not selected; if this permission is selected, users associated with the profile will not be able to log in to the partner portal.

#### Enable As Partner button on account records

Allows you to create a partner account.

#### Enable Partner Portal User and View Partner Portal User buttons on contact records

Allows you to create a new partner user or view existing partner users.

#### “All Partner Portal Users” and “All Internal Users” groups along with the “Roles and Internal Subordinates” sharing rule category

You can use these groups and the sharing rule category to easily create sharing rules that grant all of your partner portal or Salesforce users access to specific data.

Group or Category	Description
All Partner Portal Users group	Contains all partner portal users in your organization
All Internal Users group	Contains all Salesforce users in your organization
Roles and Internal Subordinates sharing rule category	Allows you to create sharing rules in which you can choose specific Salesforce users in your organization by role plus all of the users in roles below that role, excluding any partner portal roles

## Partner Portal Configuration

**Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

Once you have created a partner portal, you can customize it to meet your business needs. By customizing your partner portal, you can satisfy the needs of your various channels.

To customize your partner portal:

1. From Setup, enter *Partners* in the **Quick Find** box, then select **Settings**.
2. Click the name of the portal you wish to customize.
3. Configure the portal settings and communication templates.
4. Configure the fonts and colors used on the portal.
5. Configure the available tabs for the portal.

### EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

### USER PERMISSIONS

To configure a partner portal:

- “Customize Application”

6. Assign partner profiles to the portal.
7. Configure portal languages.
8. Optionally, add the Partner Portal Welcome component to home page layouts assigned to portal users. The welcome component displays a welcome message with the user's name, their channel manager's name, and links to their company and personal profiles.
9. Optionally, add the Partner Portal Lead Inbox component to home page layouts assigned to portal users. When a user logs in to your portal, they see a list of leads for their lead queues. The user can click **Accept** next to a lead to take ownership of it; they won't see complete lead details until they click **Accept**.

[Partner Portal Overview](#)

[Partner Portal Settings](#)

## Assigning Partner Profiles to Partner Portals

**Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

Portal users can only log into partner portal assigned to their profile. To assign a profile to a partner portal:

1. From Setup, enter *Partners* in the **Quick Find** box, then select **Settings**.
2. Select the name of your partner portal.
3. Click **Edit Profiles** in the Assigned Profiles section.
4. Select the **Active** checkbox next to the profile you want to assign to the portal.

A portal user can access all the partner portals assigned to his or her profile with one username and password.

You can view the number of active users associated with each profile assigned to a partner portal on the **Users** field on the Assigned Profiles section.

## Implementation Tips

- Portal users can only log into partner portals assigned to their profile.

A portal user can access all the partner portals assigned to his or her profile with one username and password.

You can view the number of users associated with each profile assigned to a partner portal on the `Users` field on the Assigned Profiles section.

- The login URL of each partner portal you create contains a unique identifier, such as `portalId=060D00000000Q1F`. You can find this identifier on the portal detail page. The unique identifier determines the specific portal a user can access. If a user accesses a login URL that does not contain a unique identifier, they are automatically directed to the login URL of the first partner portal you created. Note that portal users can only log into a partner portal using the portal's login page and not through the Salesforce login page.
- The settings on the following items apply to both your organization *and* your partner portals:
  - List views
  - Search layouts
  - Workflow alerts

## Best Practices

- Because you can uniquely customize the fonts, colors, email templates, and login message of each partner portal you create, you can build a partner portal for each partner organization supported by your organization, or for different partner tiers or communities.

-  **Note:** JavaScript and CSS code are automatically removed from HTML files used as the portal login message.

- You cannot delete a partner portal, but you can prevent users from logging into a portal by deselecting the `Login Enabled` checkbox.
- You can create multiple partner portals that display different tabs for users with the same profile, as long as the profile has access to each object displayed on a tab.
- You can set the default number of roles for partner portal accounts. This benefits your partner portal by reducing the number of unused roles.
- When you enable the partner portal, the default portal will be set as `Login Enabled`. Disable that setting, and re-enable it when the default portal is ready for partner users to login.
- Let your partner users know they can make their channel manager the owner of an object.
- Create a home page layout for your partner users with custom links to frequently used features.
- Include the Partner Portal Welcome component on home page layouts assigned to partner portal users. When users log in to your portal they receive a welcome message with their name, their channel manager's name, and links to both their company and personal

profiles. They can click the linked channel manager name to send an email to that person. When portal users change information about themselves their user record is automatically updated but their contact record is not.

- Customize the Custom Links home page component to include links that your partner users can use, or remove it from the home page layout.
- Partner users cannot set reminders on tasks. Create a process to help them manage their tasks without reminders.
- You can add the [Partner Portal Lead Inbox component](#) on home page layouts assigned to partner portal users. We recommend hiding important lead fields, such as `Company Name` and `Lead Name`, from partner portal users so that they don't selectively choose which leads to accept.

## Tips for Setting Up Partner Portal Channel Managers

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

Channel managers are the internal users that manage your partners. Before enabling a portal, you need to ensure your channel managers have the appropriate permissions so they can manage partners.

The two main areas available for configuring your channel managers are profiles and roles.

## Channel Manager Roles

Your role hierarchy determines what data your users can access. Users can always view and edit records that they own. In addition, users can always view, edit, and report on data owned by or shared with users below them in your role hierarchy. Channel manager roles are always directly above their partner users' roles in the hierarchy, giving channel managers access to all of the data owned by the partners they manage. When partner users are created on a partner account, Salesforce automatically places the partner users' role beneath the role of the channel manager who owns that partner account. To help you manage your channel managers and partner users, create a logical channel manager role structure.

## Channel Manager Profiles

Profiles determine the permissions users have, page layouts they see, the tabs and record types available to them, and other settings. Create a unique profile and design its settings specifically for channel managers. Use these tips when creating this profile:

### Make the following tabs available to channel managers

Leads, Accounts, Contacts, Opportunities, Documents, and Products. Also, if you plan to use Solutions or custom objects, make them available to your channel managers.

### Assign record types

Assign the appropriate lead record types to your channel manager profiles.

**Assign page layouts**

Assign the appropriate page layouts to your channel manager profiles. Ensure that the **Enable Partner Portal Login** and **View Partner Portal User** buttons are included on the contact page layout for your channel managers.

**Enable the “Manager Partners” permission**

When this permission is enabled, channel managers can enable new partner accounts and partner users.

**Make the `Partner Account` field visible to channel managers on leads, accounts, and opportunities**

This allows channel managers to create list views or reports for tracking partner user activity.

**Make the `Last Transfer Date` field visible to channel managers on leads**

This allows channel managers to create lists views or reports for tracking partner user activity.

**Additional Tips**

- Create a public group for channel managers. You can use this group for filtering and controlling access to documents.
- Create a lead queue for channel managers. You can use this queue for lead assignment rules.

**Partner Portal Default Communication Templates**

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

You can set default communication templates for your partner portals. Default communication templates will be used for partner communication unless you have specified templates for a particular portal. In addition, if a partner user is assigned to more than one portal, the default communication templates will be used when communicating with that user.

To set the default communication templates for the partner portal:

1. From Setup, enter *Partners* in the *Quick Find* box, then select **Settings**.
2. Click **Set Default Email Templates for All Portals**
3. Click **Edit**.
4. Set the following options:

**Email Notification Settings**

Setting	Description
From Email Address	The email address from which all partner portal communication templates are sent, for example, “support@acme.com.” Salesforce sends the emails automatically, but they appear to portal users as if they were sent from this email address. If a portal user

**USER PERMISSIONS**

To modify default partner portal communication templates:

- “Customize Application”

**Email Notification Settings**

Setting	Description
	responds to a communication template, the response is sent to this address.
From Email Name	The name associated with the "From" Email Address, for example, "Acme Partner Support."
New User Template	The email template used to send a username and initial password to all newly-enabled partner portal users. By default, a sample template is automatically selected for you. This template must be marked as <code>Available for Use</code> .
New Password Template	The email template used to send a new password to existing partner portal users when you reset their passwords.
Lost Password Template	The email template used to send a new password to existing partner portal users when they reset their own passwords by clicking <b>Forgot your password?</b> on the login page of the partner portal.
Change Owner to Portal User Template	The email template used to send a notification to partner portal users when they become the new owner of a record in the portal.

5. Click **Save**.

## Customizing the Partner Portal Lead Inbox Component

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

Include the Partner Portal Lead Inbox component on home page layouts assigned to partner portal users. When a user logs in to your portal, they see a list of leads for their lead queues. The user can click **Accept** next to a lead to take ownership of it; they won't see complete lead details until they click **Accept**.

 **Note:** The Lead Inbox only displays on the user's home page when there are leads to accept. When the user accepts a lead, they become the owner of the lead and the lead disappears from the Lead Inbox.

After you add the component to home page layouts assigned to portal users, you can choose the columns that show up:

1. From Setup, enter *Partners* in the *Quick Find* box, then select **Settings**.
2. Click the name of your partner portal.
3. Click **Customize Lead Inbox**.
4. Add, remove, or rearrange fields from the Selected Fields list.

 **Note:** We recommend hiding important lead fields, such as *Company Name* and *Lead Name*, from partner portal users so that they don't selectively choose which leads to accept.

5. Click **Save**.
