If you've already opted to use the advanced page layout editor to configure the publisher for a layout, choose `Edit detail view` to add, change, or remove actions.

3. Under `Articles Tool Settings`, check **Enable attaching articles inline**.
4. Click **Save**.
5. From Setup, enter `Knowledge Article Types` in the `Quick Find` box, then select **Knowledge Article Types**.
6. Click on the label or name of the article type you'd like to share via email.
7. Under Communication Channel Mappings, click **New** or **Edit**.
8. Enter a Label and Name.
9. Select and add `Email` to the Selected Channels list.
10. Select and add the fields you'd like included in the body of an email.

 **Note:** Smart links can't be included in the email and the following fields are not supported:

- ArticleType
- isDeleted
- Language
- MultiPicklist
- Picklist
- Publish Status
- Source

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To administer Salesforce Knowledge and create, edit, and delete page layouts:

- "Customize Application"
- AND
- "Manage Salesforce Knowledge"

- Validation Status

11. Click **Save**.

 **Example:** While solving customer cases, agents with the permission can insert article content into the body of an email. Anywhere agents can attach articles to cases, such as the Knowledge One sidebar in the Salesforce Console, the Articles list in the case feed, the Article widget, or the suggested articles in a Knowledge One search, they can email any article of that type within the body of an email by selecting **Email article with HTML** in the action drop down. The article content is inserted at top of email thread or wherever the agent left their cursor. Once an article has been emailed on the case an envelope icon appears to the left of the title. When the article has files that exceed the 10mb attachment limit, agents are asked to select which files to attach and retry sending the email.

 **Note:** If rich text is not enabled on your case feed layout for the article type, only article text is embedded into the email and the action changes to **Email article text only**.

Creating Search Synonyms

Create synonym groups to define words and phrases that are treated as equivalents in searches.

When building synonym groups, work with knowledge managers and other subject matter experts in your organization to create relevant synonyms.

To create a synonym group:

1. From Setup, enter *Knowledge Synonyms* in the **Quick Find** box, then select **Knowledge Synonyms**.
2. Click **New**.
3. Enter at least two synonyms. A synonym can be any word or phrase.
4. Select at least one language. If the synonyms are specific to a single language, select only that language. For example, if *zum biespiel* and *zB* apply to German users only, select only German. If the synonyms apply regardless of the language that your users are searching in, select several languages for one synonym group. For example, if the synonym group *Business Objects* and *BO* applies to English, German, and Spanish users, select all of these languages.
5. Click **Save**.

You can add up to 1,000 synonym groups.

 **Note:** You can't use the following symbols in synonyms:

Symbol	Description
*	Asterisk
?	Question mark
"	Quotation mark
(Open parenthesis
)	Closed parenthesis

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To create, edit, and delete synonym groups:

- "Manage Synonyms"

Search Synonyms

Synonyms are words or phrases that are treated as equivalent in searches so that you can optimize search results. When searching Salesforce Knowledge articles, users can enter search terms that don't match any terms in those items but are synonymous with the terms.

For example, if you define a synonym group with these synonyms:

CRM, customer relationship management, Salesforce

then a search for *customer relationship management* matches articles that contain *customer relationship management* and articles that contain *CRM* or *Salesforce*.

Synonyms affect search behavior in the following ways:

Priority

If a search term is part of a synonym group, the search results list items that contain the search term, followed by items that contain other terms in the synonym group.

For example, if this synonym group is defined:

fruit, oranges

Then a search for *oranges* matches a list of items containing *oranges*, followed by items containing *fruit*.

Note: In the Article Management tab, if you sort the list by clicking a column header, the sort order, not priority, persists in the current and additional searches.

Wildcards

If a wildcard is used in a search, the wildcard expands the search term, but the search doesn't match any synonyms, even if the search phrase contains a defined synonym.

For example, if these synonym groups are defined:

fruit, oranges, apples

cabbage, lettuce

Then a search for *orang* lettuce* matches items that contain *orange* and *oranges*, but doesn't match items that contain *fruit*, *apples*, and *cabbage*.

Operators

If a search phrase contains an operator (AND/OR/AND NOT), synonym matches are returned only if the entire search phrase is a defined synonym.

For example, if these synonym groups are defined:

fruit, oranges and apples

vegetables, carrots

Then a search for *oranges and apples* returns matches for all items that contain the literal string *oranges and apples* as well as items that contain the term *fruit*.

However, if the search phrase is *fruit and vegetables*, which is not a defined synonym, the search matches only those items that contain both the terms, *fruit* and *vegetables*.

In this case, AND functions as an operator and synonym matches are not returned in the search results. In terms of this example, items that contain a synonym of either *fruit* or *vegetables* (items that contain the term *carrots* or the phrase *oranges and apples*) are not returned.

Exact phrase matches

If a defined synonym is only a part of a longer exact phrase search, the search doesn't treat it as a synonym.

For example, if this synonym group is defined:

oranges apples, fruit

Then an exact phrase search for "*raspberries oranges apples*" doesn't match items that contain the word *fruit*.

Lemmatization

Synonyms do not under go lemmatization in search results; rather, they are matched as an exact phrase. However, the search term does under go lemmatization.

For example, if this synonym group is defined:

quench, drink orange juice

Then a search for *quench* matches items that contain *quench, quenched, quenching, and drink orange juice*, but doesn't match items that contain *drinking orange juice*.

Ignored words

Words that are normally ignored in searches, such as *the, to, and for*, are matched if the word is part of a defined synonym.

For example, if this synonym group is defined:

peel the orange, cut the apple

Then a search for *peel the orange* matches items that contain the exact string *peel the orange*.

Overlapping synonyms

If a search term consists of overlapping synonyms from different groups, the search matches synonyms in all of the overlapping synonym groups.

For example, if these synonym groups are defined:

- *orange marmalade, citrus*
- *marmalade recipe, sugar*

Then a search for *orange marmalade recipe* matches items that contain *orange marmalade, citrus, marmalade recipe, and sugar*.

Subsets

If one synonym group includes a synonym that is a subset of a synonym in another group, a search for the subset term doesn't match items that contain synonyms from the subset synonym group.

For example, if these synonym groups are defined:

- *orange, apple*
- *orange marmalade, citrus*
- *marmalade, jam*

Then a search for *orange marmalade* matches items that contain *orange marmalade* and *citrus*, but doesn't match items that contain *apple* or *jam*.

Enabling Topics for English Articles

Attach topics to an English article to improve search quality. Suggested topics are automatically provided.

With topics on English articles, you can classify and search articles by assigning topics. Topics can be added from the article view and detail pages. Suggested topics are terms extracted from the article, so that they are more concrete and precise than a data category assignment. When searching, topics can be used to index the article, so the matched articles are more relevant to keyword searches.

 **Note:** Topics are only supported on English articles.

Topics for articles is set for each article type. To enable topics for articles:

1. From Setup, enter *Topics for Objects* in the **Quick Find** box, then select **Topics for Objects**.
2. Click on the article type name where you want to enable topics.
3. Check **Enable topics**.
4. Select which fields you want to use for suggestions.
5. Click **Save**.
6. Via profile or permission set, under System Permissions, define which users can assign, create, delete, and edit topics.

Search Highlights and Snippets

Quickly identify the best article and see how articles match your search terms with relevant text and highlighted search terms in the search results.

Search highlights and snippets gives your agents and users context as to why the particular result matched their search query. The relevant text appears below the title with the search terms in bold. You can enable search highlights and snippets on the [Salesforce Knowledge settings page](#) on page 2600.

 **Note:** Search highlights and snippets are not generated for searches with wildcards.

Search highlights and snippets are generated from the following fields:

- Email
- Long text area
- Rich text area
- Text area

Search highlights and snippets aren't generated from the following fields:

- Checkbox
- Currency
- Date
- Date Time
- File
- Formula

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To enable topics:

- "Customize Application"

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

- Lookup
- Multi-picklist
- Number
- Percent
- Phone
- Picklist
- URL

 **Note:** If a snippet is not generated, the article's summary field is shown instead.

Managing Promoted Search Terms

View, edit, and delete—from a single page—all the promoted search terms that are associated with Salesforce Knowledge articles.

1. From Setup, enter *Promoted Search Terms* in the **Quick Find** box, then select **Promoted Search Terms**.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

Use More Keywords to Find Articles From a Case

Use keywords from a case for an more refined article search.

When searching articles from a case, by default, only the case title is used in the search. Often, you want to use more information from the case for more accurate search results, you want to search a source other than Salesforce Knowledge, or you want to create a custom search button

Luckily, Salesforce Knowledge search pages accept other parameters:

- **id=<case id>**: The ID of the current case.
- **search=<keywords>**: The keywords to be searched.
- **articleType_<article type dev name>=on**: multiple parameters possible, article types to select (if no article type is selected, then all article types are selected)
- **ct_<data category group internal name>=<data category internal name>**: multiple parameters possible, filter pre-selection

To take advantage of those parameters, add a custom button to the case detail page containing a few lines of javascript that extract keywords from the case and hide the default article search button.

 **Note:** You can also create a custom article widget with `support:caseArticle`.

1. From the object management settings for cases, go to Buttons, Links, and Actions.
2. Click **New Button or Link**.
3. Enter a unique Label, Name, and Description.
4. Select **Detail Page Button** for Display Type.
5. Select **Execute JavaScript** in the Behavior drop down.
6. Select **OnClick JavaScript** in the Content Source drop down.
7. Enter code for extracting case data and setting up parameters for the article search page.

For example:

```
// article search page URL
var url = '/knowledge/knowledgeHome.apexp';

// ID of the current case
url += '?id={!Case.Id}';

// use the case subject as the search keywords
url += '&search={!Case.Subject}';

// read case attributes
var caseType = '{!Case.Type}';
var caseProduct = '{!Case.Product__c}';

// if the case is of a certain type, select only 2 of the article types available
// in other cases, we keep the default behavior (all article types selected)

if (caseType=='Problem' || caseType=='Question') {
  url += '&articleType_FAQ_kav=on';
  url += '&articleType_How_To_kav=on';
}
```

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To create or change custom buttons or links and create a Visualforce page:

- "Customize Application"

```
// preselect a data category for search results based on the category

var product = '';
if (caseProduct=='Home')
    product = 'Home';
if (caseProduct=='SMB')
    product = 'Small_and_Medium_Business';
if (caseProduct=='Large enterprise')
    product = 'Large_Enterprise';

if (product.length>0)
    url += '&ct_Products2=' + product;

// once the logic is executed, we go to the article search page
window.location = url;
```

8. Click **Save**.
9. From the object management settings for cases, go to Page Layouts.
10. Click **Edit** next to Case Layout.
11. Drag your custom button for article search into the case layout.
12. Click **Save**.
13. Create a Visualforce page named *CaseDetailsWithoutStandardKBSearchButton* with the following code:

```
<apex:page standardController="Case">
  <style type="text/css">
    div.knowledgeBlock input {display: none}
  </style>
  <apex:detail/>
</apex:page>
```

14. Back in the Buttons, Links, and Actions area for cases, click **Edit** next to View.
15. Select **Visualforce Page** in Override with.
16. Select **CaseDetailsWithoutStandardKBSearchButton** from the drop down.
17. Click **Save**.

Play Videos from Any Provider with a Custom Visualforce Page

Using a custom Visualforce page and the HTML editor, you can insert videos from any provider into your Salesforce Knowledge articles.

For example, create a Visualforce page:

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To create a Visualforce page

- "Customize Application"

To create articles:

- "Manage Articles"

AND

"Read" and "Create" on the article type

To edit draft articles:

- "Manage Articles"

AND

"Read" and "Edit" on the article type

To edit published or archived articles:

- "Manage Articles"

AND

"Create," "Read," and "Edit" on the article type

```
<apex:page showHeader="false" showChat="false" sidebar="false">
  <iframe width="560" height="315"
    src="http://myvideo.provider.com/embed/{!$CurrentPage.parameters.VideoID}"
    frameborder="0" allowfullscreen="true">
  </iframe>
</apex:page>
```

Then, with the HTML editor, authors can reference videos using this code:

```
<iframe frameborder="0" height="315"
  src="https://<salesforce_instance>/apex/Video?videoID=12345"
```

```
width="560">
</iframe>
```

Setting up a Multilingual Knowledge Base

To set up your knowledge base to support multiple languages:

1. If you will send articles to a vendor for translation, you must create a translation queue. For a description of the translation process, see [Supporting Multiple Languages in Your Knowledge Base](#) on page 2626.
2. In Setup, enter *Knowledge Settings* in the Quick Find box, then select **Knowledge Settings** and click **Edit**.
3. Select **Multiple Languages** and add the languages you want to include in your knowledge base. You can only add languages supported by Salesforce.

 **Note:** You can't remove a language once you've added it to your knowledge base.

4. Optionally, choose the following settings for each language:

Setting	Description
Active	Only active languages appear in the New Article dialog and the Submit for Translation dialog. Also, active/inactive status determines whether a published article is visible. For example, if articles are published in Spanish to your partner portal and then you make Spanish an inactive language, the articles are no longer visible to partners.
Default Assignee	This value appears in the Assign To field of the Submit for Translation dialog. Choose a person or a queue: the individual responsible for translating articles into this language, or the queue used for exporting articles to a localization vendor.
Default Reviewer	Select the person who should be assigned to review or publish translations imported in this language.

5. Click **Save**.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To set up multiple languages for Salesforce Knowledge:

- "Customize Application"
AND
"Manage Salesforce Knowledge"

Supporting Multiple Languages in Your Knowledge Base

Watch a Demo:  [Supporting Multiple Languages with Salesforce Knowledge](#)

With multiple languages for Salesforce Knowledge you can lower support costs by translating articles into the languages your audience prefers. After an administrator [selects your language settings](#), two translation methods are available: translating articles in-house using the editing tool in the knowledge base, or sending articles to a localization vendor. Different languages can use different methods. For example, you may want to export articles to a vendor for French translations, but assign articles to a Salesforce Knowledge user for Spanish translations.

Translating an article within the knowledge base usually follows these steps:

1. An author or reviewer [submits an article for translation](#) to another knowledge base user (the assignee).
2. The assignee [translates the article](#) using the article editor, then [assigns](#) the finished translation to a reviewer or publisher.
3. The reviewer [publishes the article](#). Publishing an article automatically includes both the source article and its completed translations. Note that a translated version of an article can be published before its source article, but it will only be visible to readers when its source article is also published.

Translating an article using a vendor usually follows these steps:

1. An author or reviewer [assigns an article to a queue for translation](#).
2. An administrator [creates an export file from the queue](#) and sends the file to the localization vendor.
3. After the vendor returns the translated articles, an administrator [imports the translated articles into the knowledge base](#). Imported articles can be published automatically or assigned to a reviewer.
4. If the translations weren't published automatically, the assignee reviews and publishes them.

Implementation Tips

- Before you add languages to your knowledge base, decide for each language whether you want to translate articles directly in Salesforce or export articles to a translation vendor. Communicate your decision to the people involved in the translation process (authors, reviewers, translation managers, publishers).
- When adding a language to your knowledge base, keep in mind that it can't be deleted; however, you can hide a language by making it inactive. Deactivating a language means it no longer appears as a choice in the New Article dialog or the Submit for Translation dialog. Also, if articles are already published in the language, those articles are no longer visible to readers as soon as the language is deactivated.
- You can only add languages supported by Salesforce to your knowledge base.
- To enable the article export feature, you must [create one or more queues](#); authors and reviewers will select the queue when they submit an article for translation. Make sure they know which queue to choose for which language.
- You must place all the translation files (meaning, those exported from Salesforce and translated by your vendor) in a folder whose name is the same as the language code. For example, put French articles in an `fr` folder. Zip up this folder to create your import file.

Best Practices

- To hide translated articles for a specific language, deactivate the language by unchecking `Active` on the Settings page.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

- To import translated articles successfully, verify that the file structure and their extensions match the file structure and extensions of files exported from Salesforce Knowledge for translation. For example, if the target language is French, the file structure begins as follows:

```
import.properties
-fr
--articletypearticlename_kav
---articlename.csv
---[Article collateral, html, images, etc.]
```

SEE ALSO:

[Setting up a Multilingual Knowledge Base](#)

[Export Articles for Translation](#)

[Translating Articles within Salesforce Knowledge](#)

Importing Article Translations

Consider the following before importing translated articles into Salesforce:

- You can only import articles that have been exported from the same Salesforce organization. For example, you can't export articles from your test or sandbox organization and import them into your production organization.
- You must place all the translation files (meaning, those exported from Salesforce and translated by your vendor) in a folder whose name is the same as the language code. For example, put French articles in an `fr` folder. Zip up this folder to create your import file.
- To import translated articles successfully, verify that the file structure and their extensions match the file structure and extensions of files exported from Salesforce Knowledge for translation. For example, if the target language is French, the file structure begins as follows:

```
import.properties
-fr
--articletypearticlename_kav
---articlename.csv
---[Article collateral, html, images, etc.]
```

To import translated articles:

1. From Setup, enter *Import Article Translations* in the Quick Find box, then select **Import Article Translations**.
2. Choose how Salesforce handles translations after they're imported.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To import articles:

- "Manage Salesforce Knowledge"

AND

"Manage Articles"

AND

"Manage Knowledge Article Import/Export"

AND

"Read," "Create," "Edit," and "Delete" on the article type

To view articles:

- "Read" on the article type

To create articles:

- "Manage Articles"

AND

"Read" and "Create" on the article type

Option	Description
Review imported translations on the Article Management tab before publishing	Add imported translations to a queue from which users can review them.
Publish translations immediately on import	Publish imported translations without reviews.

3. Select the language of the articles you're importing.
4. Optionally, if you chose to have articles reviewed before publishing, select to send the files to a user or a queue and then select the name of the user or queue.
5. Click **Browse**, choose the translation .zip file to upload, and click **Open**.
6. Click **Import Now**.

If you have more translated articles to upload, repeat steps four through six.

7. Click **Finish**.

An email notification is sent to you when your import finishes. You can view the status of your import from Setup by entering *Article Imports and Exports* in the Quick Find box, then selecting **Article Imports and Exports**.

SEE ALSO:

[Setting up a Multilingual Knowledge Base](#)
[Export Articles for Translation](#)

Export Articles for Translation

If your organization sends Salesforce Knowledge articles to a vendor for translation, articles are put into a translation queue.

 **Note:** You can have up to 50 exports in 24 hours and a maximum of 15 pending exports (exports that have not entered a final state such as Completed, Failed, or Cancelled).

To generate an export file containing the articles that have been submitted for translation:

1. From Setup, enter *Export Articles for Translation* in the **Quick Find** box, then select **Export Articles for Translation**.
2. Select the queue that contains the articles you're exporting.
3. Click either:
 - **All articles** to export every article in the queue.
 - **Updated articles** to only export articles that have been modified or added.
4. Click **Continue**.
5. Select the source and target language pairs you want to export. Salesforce creates a separate .zip file for every article type in each language pair.

 **Important:** You must retain the .zip file structure for a successful import. For more information, see [Importing Article Translations](#) on page 2628.

6. To have the files reviewed or published after being translated, select a user or a queue and then select the name of the user or queue.
7. Select the file character encoding:
 - ISO-8859-1 (General US & Western European, ISO-LATIN-1)
 - Unicode
 - Unicode (UTF-8) *default*
 - Japanese (Windows)
 - Japanese (Shift_JIS)
 - Chinese National Standard (GB18030)
 - Chinese Simplified (GB2312)
 - Chinese Traditional (Big5)
 - Korean
 - Unicode (UTF-16, Big Endian)
8. Select the delimiter for the .csv files. The delimiter is the separator for columns when the file is converted to table form. Your options are:
 - Tab (This is the default.)
 - Comma

9. Click **Export Now**.

You're notified by email when your export is complete. You can also check the status of your export by viewing the Article Import and Export Queue. From Setup, enter *Article Imports and Exports* in the **Quick Find** box, then select **Article Imports and Exports**.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To export articles:

- "Manage Salesforce Knowledge"

AND

"Manage Articles"

AND

"Manage Knowledge Article Import/Export"

To view articles:

- "Read" on the article type

To create articles:

- "Read" and "Create" on the article type

For description of status states, see [Viewing Salesforce Knowledge Import and Export Status](#) on page 2688.

10. Unzip the exported files, but retain the file structure for a successful import.

SEE ALSO:

[Setting up a Multilingual Knowledge Base](#)

Creating and Activating Knowledge Actions

Knowledge actions are templates that link a workflow action to an article type.

When knowledge actions are enabled, you can use them to link article types to specific workflow article actions, such as publishing. For example, if you want to have each FAQ published as a new version each time it completes the approval process, you can create a knowledge action that links the FAQ article type to the `Publish as New` action. Then, when you [create an approval process](#) for FAQs, select the new Knowledge Action.

 **Note:** When you create the approval process, make sure to change the final approval action to `Unlock the record for editing` to let users publish the article.

To maximize memory usage when publishing large groups of articles, Salesforce may delay publication and adds the articles to the publication queue. This happens when the number of articles and translations multiplied by the number of rich text areas is greater than 100. You can view the publishing queue to check the status of the articles on the Automated Process Actions page.

1. From Setup, enter `Knowledge Action` in the `Quick Find` box, then select **Knowledge Action**.
2. Click **New Knowledge Action**.
3. Select the article type for the action. The workflow rules and approval process that you associate with the action must belong to the same article type.
4. Enter a unique name for the knowledge action.
5. Select the type of action you want to apply to the article type. For example, `Publish as New` publishes the article as a new version.
6. Enter a description.
7. Click **Save**.
The Knowledge Action detail page appears showing you the rules and approval processes that use the knowledge action.
8. When you're ready to use the knowledge action in an approval or workflow process, click **Activate** on the Knowledge Action detail page.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To enable Salesforce Knowledge Actions:

- "Customize Application"

Assigning Article Actions to Public Groups

Article actions allow users to manage the article publishing and translation processes. By default all article actions are assigned to users with the “Manage Articles” user permission, and users can complete an action as long as they also have the correct article type permissions (as described in the table below). You can set up more granular control of article actions by restricting them to public groups.

This table summarizes the article type permissions that are required for each article action.

Article Action	Create	Read	Edit	Delete
Publish Articles	✓	✓	✓	✓
Archive Articles	✓	✓	✓	✓
Delete Articles		✓	✓	✓
Edit Published and Archived Articles		✓	✓	
Submit Articles for Translation	✓	✓	✓	
Publish Translation	✓	✓	✓	✓
Edit Translation	✓	✓	✓	

Note:

- To delete published article and translations, first remove them from publication by choosing edit or archive.
- When a user without delete access cancels the editing on published article, the newly created article draft is not deleted automatically.

To assign article actions to public groups:

1. Create a public group for each set of users.

 **Note:** Although you can add any Salesforce user to a public group, only users with the “Manage Articles” user permission and the appropriate object permissions can perform article actions.

2. From Setup, enter *Knowledge Article Actions* in the *Quick Find* box, then select **Knowledge Article Actions** and decide which users need to perform which actions. For example, you might decide that a group named Publishers needs to publish, archive, and delete articles and that a group named Translators needs to submit articles for translation and publish and archive translated articles.
3. Assign the public groups to article actions:
 - a. From Setup, enter *Knowledge Article Actions* in the *Quick Find* box, then select **Knowledge Article Actions** and click **Edit**.
 - b. For the action you want to modify, select the appropriate radio button and choose a public group. If you don't modify an article action, all users with the “Manage Articles” permission can perform that action.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To create public groups and assign them to article actions:

- “Customize Application”
AND
“Manage Users”
AND
“Manage Salesforce Knowledge”

- c. Click **OK** and **Save**.

SEE ALSO:

[Setting Up Salesforce Knowledge](#)

Archiving Articles and Translations

Archiving removes published articles that are obsolete so they no longer display to agents and customers on your organization's Salesforce Knowledge channels.

To archive articles:

1. On the Article Management tab, select `Published Articles` in the View area, select the articles to archive, then click **Archive...** Alternatively, click **Archive...** on the detail page of a published article.
2. Select `Archive article(s) now` or `Schedule archive on` to choose the date to archive the article.
3. Click **OK**.

Articles you're archiving now move directly to the Archived Articles view. Articles you scheduled for archiving at a later date continue to display on the Published Articles view, now with the pending icon (🕒) next to the article title. Hover over the icon to see the archive date. On the archive date, the article automatically moves to the Archived Articles view.

Note:

- Conflicts may occur when different users perform actions on the same articles simultaneously. Depending on who performs the action first, the articles will not be available for subsequent users though the articles still display momentarily in the articles list. Performing an action on these articles results in a conflict error message.
- If you [edit](#) a published article that is scheduled for archiving, you also cancel the archiving.
- If an article has a published translation with a draft version, on archive, the draft version is deleted. Published translations are archived along with the article.

 **Tip:** To cancel a scheduled archive, click **Cancel Archive** on the article detail page.

EDITIONS

Available in: Salesforce Classic

Creating and Modifying Category Groups

Category groups can be used by [Salesforce Knowledge](#) (articles) or [answers communities](#) (questions). In both cases, category groups are containers for individual data categories. For example, a Contracts category group might contain Fixed Price, Cost Reimbursement, and Indefinite Delivery categories. For more information, see [What Are Data Categories?](#) on page 2636

To create or edit a category group:

1. From Setup, enter *Data Category* in the Quick Find box, then select **Data Category Setup**.
2. To create a new category group, click **New** in the Category Groups section. By default, you can create a maximum of five category groups and three active category groups. Contact Salesforce to request additional category groups.

To edit an existing category group, hover your cursor over the category group name and then click the **Edit Category Group** icon ().

3. Specify the *Group Name*. This name appears as the title of the category drop-down menu on the Article Management and Articles tabs, and, if applicable, in the public knowledge base. The *Group Name* does not appear on the Answers tab.
4. Optionally, modify the *Group Unique Name*. This is a unique name used to identify the category group in the SOAP API.
5. Optionally, enter a description of the category group.
6. Click **Save**. You receive an email after the save process completes.

You can now [add categories](#) to your category group. When you create a new category group, Salesforce automatically creates a top-level category in the group named **All**. Optionally, double-click **All** to rename it.

Activating Category Groups

When you add a new category group, it's deactivated by default and only displays on the administrative setup pages for Data Categories, Roles, Permission Sets, and Profiles. Keep your category groups deactivated to set up your category hierarchy and assign visibility. Until you manually activate a category group, it does not display in Salesforce Knowledge or your answers community. In addition to activating the category group, for answers communities you must assign the category group to a zone before the categories are visible on the Answers tab.

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise, Performance, Unlimited, and Developer** editions.

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

What Are Data Categories?

Data categories can be used by [Salesforce Knowledge](#) (articles and article translations) and [Answers](#), and Chatter Answers to help users classify and find articles or questions. Administrators can use data categories to control access to articles and questions.

Salesforce Knowledge supports a five-level hierarchy of data categories within each category group. You can classify articles in the knowledge base according to multiple categories that make it easy for users to find the articles they need. For example, to classify articles by sales regions and business units, create two category groups, Sales Regions and Business Units. The Sales Regions category group could consist of a geographical hierarchy, such as All Sales Regions as the top level, North America, Europe, and Asia at the second level, and so on.

In an answers zone, data categories help organize questions for easy browsing. Each answers zone supports one category group. For example, if you're a computer manufacturer you might create a Products category group that has four sibling categories: Performance Laptops, Portable Laptops, Gaming Desktops, and Enterprise Desktops. On the Answers tab, zone members can assign one of the four categories to each question and then browse these categories for answers to specific questions.

Benefits of Data Categories

Logical Classification of Articles

As a knowledge base administrator, you can organize your knowledge base articles into a logical hierarchy and tag articles with the attributes that are significant to your business.

Easy Access to Questions

As an answers administrator, you can choose which data categories are visible on the Answers tab. Zone members can tag a question with a category, which makes finding questions and answers easier for other members.

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise, Performance, Unlimited, and Developer** editions.

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To view the Data Categories page:

- "View Data Categories"

To create, edit, or delete data categories:

- "Manage Data Categories"

Control of Article and Question Visibility

As a knowledge base or answers community administrator, you can centrally control the visibility articles or questions by mapping roles, permission sets, or profiles to categories in the category groups. When an article or question is categorized, users with visibility can automatically see it.

Article Filtering

As a support agent, when articles are classified into logical categories, you can quickly and easily locate the article you need by filtering your organization's knowledge base. To ensure you see all relevant articles, filtering by category has expansive results that include a category's upward and downward relatives in the category hierarchy. For example, if your category hierarchy for products has the levels All Products > Computers > Laptops > Gaming Laptops and you are helping a customer with a laptop problem, filtering by Laptops returns articles classified with Laptops as well as articles classified with Computers, All Products, or Gaming Laptops. Effectively, you are made aware of useful related articles like a free shipping offer for all products or an upgrade offer for gaming laptops. (To prevent irrelevant results, category filtering doesn't return nonlinear relatives like siblings and cousins. Articles about Desktops, a sibling of Laptops, would not display.)

Article and Question Navigation

As an end user, you can navigate the categories on the Articles tab or Answers tab to find the information you need to solve your problem.

Managing Category Groups for Articles and Questions

If your organization has Salesforce Knowledge and an answers community, you can create separate category groups or use the same category group for articles and questions.

Overview of Data Categories in Articles

A category group is the container for a set of categories. In Salesforce Knowledge it corresponds to the name of the category drop-down menus. For example, if you use the Data Categories page in Setup, (enter *Data Category* in the *Quick Find* box, then select **Data Category Setup**) to create and activate a category group called Products, a Products menu displays on the Article Management tab, the article edit page, the Articles tab in all channels, and the public knowledge base.

As an illustration, the figure below shows a knowledge base administrator's view of an article about laptop deals; using the article edit page, the administrator has classified the article with Laptops in the Products category group, and USA in the Geography category group.

An Article About Laptop Deals on the Article Management Tab

The next figure now illustrates an agent finding that same article published on the Articles tab; the agent has selected Laptops and USA respectively in the Products and Geography drop-down menus to retrieve an article that is classified with both Laptops and USA.

An Article About Laptop Deals on the Articles Tab

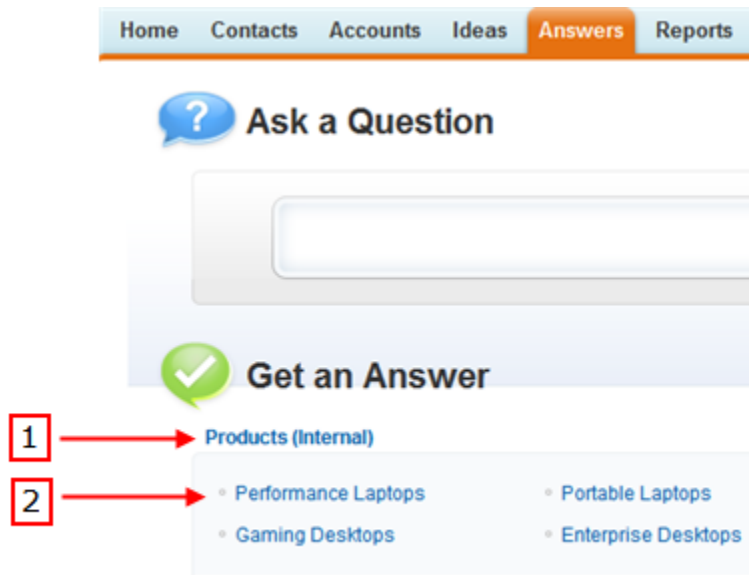

When you add categories to a category group, you build a hierarchy that can contain up to five levels of depth and up to 100 categories total. Each category can have one parent, many siblings, and many children. A robust and well-organized category hierarchy helps users find the articles that are relevant to them quickly and easily.

By default, all Salesforce Knowledge users have access to all categories; however, you can [restrict category visibility by role, permission set, or profile](#).

Overview of Data Categories in Answers Zones

An answers zone supports one category group, and members can assign one category to each question. Even though you can create up to five hierarchy levels of categories in a category group, only the first level of categories is supported in your answers community. Child categories below the first level are not displayed in the community, and community members can't assign these child categories to questions. The categories within the group display on the Answers tab below the zone name.

Answers tab displaying categories

By default, all zone members have access to all categories; however, you can [specify category visibility](#).

Implementation Tips

Consider the following information when planning and implementing data categories for your organization:

- You can create up to three category groups with a maximum of five hierarchy levels in each group. Each category group can contain a total of 100 categories.
- If you want to use data categories with Answers, after creating your category group you must assign it from Setup by entering *Data Category Assignments* in the **Quick Find** box, then selecting **Data Category Assignments** under Answers. You can only assign one category group to an answers community. Salesforce Knowledge supports multiple category groups.
- Even though you can create up to five hierarchy levels of categories in a category group, only the first level of categories is supported in your answers community. Child categories below the first level are not displayed in the community, and community members can't assign these child categories to questions. Salesforce Knowledge supports a hierarchy of data categories.
- Category groups are hidden from users until they are activated. Do not activate a category group until you have finished defining its categories and their access settings, including their visibility.
- When assigning categories to articles, you can choose up to eight categories in a category group.
- If an article has no categories, it displays only when you choose the **No Filter** option in the category drop-down menu.
- When searching for articles or article translations, selecting a category automatically includes the parent and children of that category and any grandparents, up to and including the top level. Sibling categories are not included. For example, if a category hierarchy has the levels All Products, Switches, Optical Networks, and Metro Core, selecting "Optical Networks" from the category drop-down menu returns articles assigned to any of the four categories. However, if the Switches category has a sibling category called Routers, selecting "Optical Networks" does not return articles classified within Routers. Category visibility settings may limit the specific articles you can find.
- Once [visibility settings](#) have been chosen for the categories:
 - Users who are not assigned visibility can only see uncategorized articles and questions unless [default category visibility](#) has been set up.
 - For role-based visibility, Customer Portal users and partner portal users inherit the category group visibility settings assigned to their account managers by default. You can [change the category group visibility settings](#) for each portal role.
 - If you only have access to one category in a category group, the category drop-down menu for that category group does not display on the Articles tab.
- Deleting a category:
 - Permanently removes it. It cannot be restored. It never appears in the Recycle Bin.
 - Permanently deletes its child categories.
 - As applicable, removes the category and its children from the Answers tab, the Article Management tab, the Articles tab in all channels, and your company's public knowledge base.
 - Removes associations between the category and articles or questions. You can reassign articles and questions to another category.
 - Removes its mapping to visibility. Users lose their visibility to articles and answers associated with the deleted category.
- Deleting a category group:
 - Moves it to the Deleted Category Groups section, which is a recycle bin. You can view items in this section but not edit them. It holds category groups for 15 days before they are permanently erased and cannot be recovered. During the 15-day holding period, you can either restore a category group, or permanently erase it immediately.
 - Deletes all categories within that group.
 - Removes all associations between the group's categories and articles or questions.
 - Removes all associations between the group's categories and visibility.
 - As applicable, removes the category drop-down menu from the Articles tab in all channels, the Article Management tab, and your company's public knowledge base.
- You can translate the labels of categories and category groups using the Translation Workbench.

Best Practices

Consider the following tips when using data categories:

- To quickly manage data categories, use [keyboard shortcuts](#).
- After creating or updating categories, set up [category group visibility rules](#).
- Save your changes frequently. The more actions you perform before clicking **Save**, the longer it takes to save.

SEE ALSO:

[Managing Data Categories](#)

Managing Data Categories

Administrators can create data categories for [Salesforce Knowledge articles](#) or [questions in a zone](#) to help users classify and find articles or questions. Administrators can also use data categories to control access to articles and questions. For more information, see [What Are Data Categories?](#) on page 2636.

From Setup, enter *Data Category* in the **Quick Find** box, then select **Data Category Setup** to view the Data Categories page, where you can:

- [Create a category group](#). A category group is the container for a set of categories. In Salesforce Knowledge it appears as the name of the category drop-down menu on the Article Management and Articles tabs. For example, if you create two category groups called Geography and Products, the Article Management and Articles tabs will have two category menus from which to pick specific categories: Geography and Products. In Chatter Answers zones, the category group drop-down menu is available on the Q&A tab and in Chatter Answers sites and portals. If you have set up categories for your zone, users can select a category for their question when they post a question to the zone.
 - [Add categories to a category group](#). After creating a category group, you can create a hierarchy of categories within that group. These are the values that users select when assigning a category to an article or question and when searching for articles or questions.
 - [Modify existing categories](#). You can change a category's name, update its other attributes, move it to another location in the hierarchy, or reorder categories alphabetically.
 - [Delete a category group](#). You can delete, restore, or permanently erase a category group.
 - [Delete a category](#). You can permanently remove any category.
 - Translate categories. You can translate your categories with the languages you want to support.
 - Hover over a category group to view its properties and see whether it is used in Salesforce Knowledge or an answers community.
-  **Note:** By default, Salesforce Knowledge users and answers community members have access to all articles and questions associated with any category. If you want to restrict access to articles and questions, you can [modify visibility settings for data categories](#).

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise, Performance, Unlimited, and Developer** editions.

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To view the Data Categories page:

- "View Data Categories"

To create, edit, or delete data categories:

- "Manage Data Categories"

Deleting Data Categories

 **Warning:** Deleting categories can result in long processing times, changes to the visibility of articles and questions, changes to the categorization of articles and questions, and other significant consequences. Read this entire topic carefully before deleting categories.

To delete a category:

1. From Setup, enter *Data Category* in the **Quick Find** box, then select **Data Category Setup**.
2. Click a category group name.
3. Click a category name. If necessary, click **Expand All** to display all categories in the category group.
4. Press DELETE, or choose **Delete Category** from the Actions drop-down list.
5. Click **OK** in the confirmation dialog box.
6. Choose how you want to reclassify articles associated with the deleted category or the deleted category's children:
 - Assign the deleted category's parent category.
 - Assign a different category. You can select any other category in this category group.

 **Note:** The category you select cannot be deleted itself before you save your work.

- Do not assign the articles a new category in this category group.

In all cases, the articles retain their categories from other category groups.

7. Click **Save**.

Deleting a category:

- Permanently removes it. It cannot be restored. It never appears in the Recycle Bin.
- Permanently deletes its child categories.
- As applicable, removes the category and its children from the Answers tab, the Article Management tab, the Articles tab in all channels, and your company's public knowledge base.
- Removes associations between the category and articles or questions. You can reassign articles and questions to another category.
- Removes its mapping to visibility. Users lose their visibility to articles and answers associated with the deleted category.

 **Important:** Modify the category hierarchy when user activity is low. Because the save process involves potentially large and complex recalculations, it may take a long time to complete. During processing, users may experience performance issues when searching for articles or questions or using category drop-down lists.

Modifying and Positioning Data Categories

 **Warning:** Modifying categories can result in long processing times, changes to the visibility of articles, changes to the categorization of articles and questions, and other significant consequences. Read this entire topic carefully before modifying categories.

To modify the data categories in a category group and their positions in the hierarchy:

1. From Setup, enter *Data Category* in the **Quick Find** box, then select **Data Category Setup**.
2. Click a category group name.
3. Optionally, click **Expand All** to display the full category hierarchy, or **Collapse All** to display only the top-level categories.
4. Double-click a category to edit its name or its unique API name.
5. Use drag-and-drop editing to reposition a category in the hierarchy. As you drag, a red icon indicates an invalid destination, while a green icon indicates a valid destination:
 - Drag a category on top of another category to reposition it as a child of the destination category. For example, drag USA on top of North America to make USA one level below North America. After dragging, the category displays below the other child categories at that level.
 - Drag a category to a line that borders another category to reposition it as a sibling of that category. For example, to position USA between Canada and Mexico, drag it to the line between Canada and Mexico.
6. Hover your cursor over a category name, then choose *Order Child Categories Alphabetically* from the **Actions** drop-down list to reorder that category's children in alphabetical order. This only affects the first level children, not grandchildren or deeper levels.
7. As you modify the category hierarchy, click **Undo** to cancel your last actions. Similarly, click **Redo** to step forward through your flow of performed actions.
8. Click **Save**. You will receive an email when the save process completes.

 **Note:** Save your changes frequently. The more actions you perform before clicking **Save**, the longer it takes to save.

The save process recalculates the following:

- The contents of the category drop-down menu.
- The articles and questions visible to each user.
- The articles and questions associated with categories.

 **Important:** Modify the category hierarchy when user activity is low. Because the save process involves potentially large and complex recalculations, it may take a long time to complete. During processing, users may experience performance issues when searching for articles or questions or using category drop-down lists.

Example: How Changing the Hierarchy Affects Article Visibility

Changing the category hierarchy potentially changes which articles users can see. In the example shown in the following graphic, the category PDAs moves from the original parent category Computers to the new parent category Consumer Electronics.

 **Note:** When a category moves to a new parent category, users that have no visibility on the new parent category lose their visibility to the repositioned category.

EDITIONS

Data categories and answers are available in **Enterprise**, **Performance**, **Unlimited**, and **Developer** editions.

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

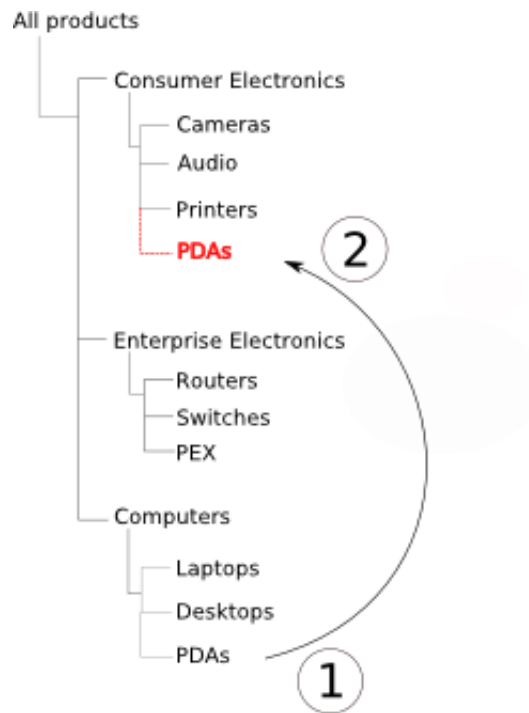

To view the Data Categories page:

- "View Data Categories"

To create, edit, or delete data categories:

- "Manage Data Categories"

Moving the category “PDAs”

To understand how this change affects which users can see articles classified with the PDAs category, see the following table.

When my role, permission set, or profile is mapped to:	Could I see PDA articles in their old location under Computers?	Can I see PDA articles in their new location under Consumer Electronics?	Why?
All products	Yes	Yes	When your role, permission set, or profile is mapped to the top-level “All products” category, you can see everything in the category hierarchy.
Computers	Yes	No	You don't have access to the branch of the category hierarchy where PDAs is now located.
Consumer Electronics	No	Yes	PDAs has moved to the branch of the category hierarchy where you have been granted access.

Example: How Changing the Hierarchy Affects Article Classification

Classifying an article with a parent category implicitly grants access to that category's children. You cannot explicitly apply both a parent category and one of its children to an article. From the article edit page, selecting a parent category grays out its child categories—you cannot select them in addition to the parent category. Salesforce respects this fact when you move a category to a new parent. It prevents explicitly adding a child category to an article when the new parent category is already present.

In the example depicted above, the category PDAs moves from the original parent category Computers to the new parent category Consumer Electronics. As a result, articles' classifications may or may not change:

- Articles formerly classified with both Consumer Electronics and PDAs lose PDAs, because having Consumer Electronics now implies having PDAs.
- Articles formerly classified with only Consumer Electronics but not PDAs do not change. Access to PDAs is now implied.
- Articles formerly classified with only PDAs, but not Consumer Electronics, retain PDAs.

Deleting and Undeleting Category Groups

 **Warning:** Deleting a category group deletes all of its categories and removes all associations between the categories and articles or questions. Read this entire topic carefully to understand the consequences of deleting category groups.

To delete a category group:

1. From Setup, enter *Data Category* in the *Quick Find* box, then select **Data Category Setup**.
2. Hover your cursor over the category group name.
3. Click the *Delete Category Group* icon ()
4. Select the checkbox in the confirmation dialog, then click **OK**.

Consequences of Deleting Category Groups

Deleting a category group:

- Moves it to the Deleted Category Groups section, which is a recycle bin. You can view items in this section but not edit them. It holds category groups for 15 days before they are permanently erased and cannot be recovered. During the 15–day holding period, you can either restore a category group, or permanently erase it immediately.
- Deletes all categories within that group.
- Removes all associations between the group's categories and articles or questions.
- Removes all associations between the group's categories and visibility.
- As applicable, removes the category drop-down menu from the Articles tab in all channels, the Article Management tab, and your company's public knowledge base.

Undeleting Category Groups

To restore a deleted category group:

1. In the Removed Category Groups section, hover your cursor over the category group name.
2. Click the *Undelete Category Group* icon ()

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise**, **Performance**, **Unlimited**, and **Developer** editions.

Adding Data Categories to Category Groups

Administrators can create data categories for [Salesforce Knowledge articles](#) or [questions in a zone](#) to help users classify and find articles or questions. Administrators can also use data categories to control access to articles and questions. For more information, see [What Are Data Categories?](#) on page 2636.

By default, you can create up to 100 categories in a data category group and have up to 5 levels in a data category group hierarchy. To request additional categories or hierarchy levels, contact Salesforce.

 **Note:** Because only first-level data categories display on the Answers tab, when creating data categories for a portal or community ensure that the categories you want visible have a sibling relationship and not a parent-child relationship.

To add categories to a category group:

1. From Setup, enter *Data Category* in the **Quick Find** box, then select **Data Category Setup**.
2. Click the category group name.
3. Click a category that is directly above where you want to add a category (a parent), or at the same level (a sibling).
4. Click **Actions**, then select an action: **Add Child Category** or **Add Sibling Category**.
5. Enter a category name.
If possible, Salesforce automatically reuses the name you entered as the **Category Unique Name**, a system field which the SOAP API requires.
6. Click **Add**. Alternatively, press Enter.
7. Click **Save**. Save your changes frequently. The more actions you perform before clicking **Save**, the longer it takes to save.

Prefilter Articles with Data Category Mapping — Beta

Data category mapping allows you to prefilter articles based on case information in the Article tab, advanced search, and the article sidebar component based on case information.

 **Important:** Prefiltering articles based on case information is only supported in text and picklist fields.

Data category mapping allows you to define which articles appear in the Articles tab, advanced search, and the article sidebar component based on case information. For information on data categories, see [What Are Data Categories?](#) on page 2636

To implement data category mapping, select which case fields map to which data category groups and set a default data category for cases that have no value for the mapped fields.

1. From Setup, enter *Data Category Mappings* in the **Quick Find** box, then select **Data Category Mappings**.
2. In the **Case Field** column, use the drop-down list to add a field.
3. In the **Data Category Group** column, use the drop-down list to map the information from the lookup field to a data category group.
4. In the **Default Data Category** column, use the drop-down list to assign a data category when the field value does not match any categories from the category group.
5. Click **Add**.

 **Example:** For example, you can map a products custom case field to a products data category group to filter the articles for the customer's products.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To map data category groups

- "Customize Application"
- AND
- "Manage Salesforce Knowledge"

Edit Category Group Visibility

USER PERMISSIONS

To view role details:	"View Setup and Configuration"
To edit and delete roles:	"Manage Roles"
To edit and delete permission sets and profiles:	"Manage Profiles and Permission Sets"
To view users:	"View Setup and Configuration"
To edit users:	"Manage Internal Users"
To view categories:	"View Data Categories"

Data category visibility can be set with roles, permission sets, or profiles. Data category visibility determines the individual data categories, categorized articles, and categorized questions that a user can see. There are three types of visibility:

- All Categories: All categories are visible
- None: No categories are visible
- Custom: Selected categories are visible

With custom data category visibility, users can only see the data categories permitted by their role, permission sets, or profile.

To edit data category visibility settings:

1. Go to the data category visibility settings page in Setup.
 - For roles: enter *Roles* in the **Quick Find** box, then select **Roles**.
 - For a role on the Customer Portal or partner portal: enter *Users* in the **Quick Find** box, then select **Users**.
 - For permission sets: enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**.
 - For profiles: enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Open a data category group for edit.
 - For roles, in the Category Group Visibility Settings related list, click **Edit** next to the category group you want to modify.
 - For permission sets and profiles:
 - a. Click on a permission set or profile name.
 - b. Click **Data Category Visibility**.
 - c. Click **Edit** next to the data category group you want to assign.
3. Select a visibility setting:

Visibility Setting	Description
All Categories	Users can see all categories in the category group. This option is only available for the topmost role in the role hierarchy. When you create a new category group, its visibility is defaulted to All Categories.
None	Users cannot see any categories in the category group.

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise, Performance, Unlimited, and Developer** editions.

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

Visibility Setting	Description
Custom	<p>Users see your custom selection of categories. For roles, you can choose from the categories that are visible to the parent role. If the parent role's visibility changes to be less than its child's visibility, the child role's category visibility is reset to its parent's category visibility.</p> <p>To select categories, double-click the category in the <code>Available Categories</code> box. Alternatively, select a category and then click Add. Selecting a category implicitly includes its child and parent categories as well. Categories that are grayed out are not available for selection because their parent has already been selected.</p> <p> Note: If you are customizing a role, permission set, or profile that was previously set to <code>All Categories</code>, you must first remove All from the <code>Selected Categories</code> box before you can select specific categories.</p>

4. Click **Save**.

Implementation Tips

- When you create a new category group, its visibility is defaulted to `All Categories`.
- When you grant visibility to a category, you also grant visibility to its child and parent categories. If you want to give access to all categories in a branch of the category hierarchy, select the top level category `All Categories`.
- Users who are not assigned to a category's visibility by role, permission set, or profile can only see uncategorized articles and questions unless:
 - The user has the “View all Data” permission.
 - A category group has been made visible to all users on the Default Data Category Visibility page in Setup.
- For role-based visibility, Customer Portal users and partner portal users inherit the role assigned to their account managers by default. You can change the category group visibility settings for each portal role.

Best Practices

- Keep your category groups deactivated to set up your category hierarchy and assign visibility. Until you manually activate a category group, it does not display in Salesforce Knowledge or your answers community
- For role-based visibility, always set up data category visibility in a top-down approach from the top of the role hierarchy down to the bottom. Give the highest roles the most visibility and give subordinate roles reduced visibility.

About Category Group Visibility

USER PERMISSIONS

To view role details:	“View Setup and Configuration”
To edit and delete roles:	“Manage Roles”
To edit and delete permission sets and profiles:	“Manage Profiles and Permission Sets”
To view users:	“View Setup and Configuration”
To edit users:	“Manage Internal Users”
To view categories:	“View Data Categories”

Data category visibility can be set with roles, permission sets, or profiles. Data category visibility determines the individual data categories, categorized articles, and categorized questions that a user can see. There are three types of visibility:

- All Categories: All categories are visible
- None: No categories are visible
- Custom: Selected categories are visible

With custom data category visibility, users can only see the data categories permitted by their role, permission sets, or profile.

Enforcement of Visibility Settings

To ensure that users obtain a wide range of relevant information, category group visibility is broadly interpreted. Setting a category as visible makes that category and its entire directly related family line—ancestors, immediate parent, primary children, other descendants—visible to users. For example, consider a Geography category group with continents such as Asia and Europe at the top level, various countries at the second level, and cities at the third level. If France is the only visible category selected, then you can see articles classified with Europe, France, and all French cities. In other words, you can see categories that have a direct vertical relationship to France but you cannot see articles classified at or below Asia and the other continents.

 **Note:** Only the first-level categories in the category group are visible on the Answers tab. In the Geography example, only the continent categories appear on the Answers tab; therefore, if France is the category selected as visible in category group visibility settings, zone members can see questions classified with Europe.

Category group visibility settings are enforced on the Answers tab, the Article Management tab, the Articles tab in all channels (internal app, partner portal, Salesforce.com Community, and Customer Portal), and the public knowledge base. In the following areas, users only see the categories that their visibility settings allow:

- On the Article Management tab, when creating or editing articles
- On the Article Management tab and the Articles tab, the category drop-down menu for finding articles
- On the Answers tab, the categories listed below the zone name

Initial Visibility Settings

If role, permission set, or profile data category visibility has not been set up, all users can see all data categories. However, if data category visibility is set up, users who are not assigned data category visibility by a role, permission set, or profile, only see uncategorized articles and questions unless you make the associated categories visible by default. Role, permission set, and profile visibility settings restrict

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise, Performance, Unlimited,** and **Developer** editions.

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

default visibility settings; in other words, even if a data category is visible by default, it cannot be seen by a user whose role restricts access to that data category.

 **Note:** If data category visibility is defined with roles, permission sets, and profiles, Salesforce uses a logical **OR** between the definitions to create a visibility rule for each user.

Inheritance of Role-Based Visibility Settings

Child roles inherit their parent role's settings and are kept in sync with changes to the parent role. You can customize and reduce the child role's visibility, but you cannot increase it to be greater than that of the parent role. By default, Customer Portal users and partner portal users inherit the category group visibility settings assigned to their account managers. You can change the category group visibility settings for each portal role. Because high-volume portal users don't have roles, you must designate visibility settings by permission set or profile before these users can view categorized articles and questions.

Visibility of Categorized Articles

A user can see an article if he or she can see at least one category per category group on the article. For example, consider an article that is classified with *California* and *Ohio* in the Geography category group and *Desktop* in the Products category group:

- If you have visibility on Ohio and Desktop (but not California), you can see the article.
- If you don't have visibility on either California or Ohio but do have visibility on Desktop, you do not see the article.
- If you have visibility on California but not Desktop, you do not see the article.

Revoked Visibility

Data category visibility can be revoked (set to **None**) for a particular category group. Users in the target role, permission set, or profile can only see articles and questions that aren't classified with a category in that category group. For example, if a user's role has revoked visibility in the Geography category group but visibility to the Products category group, he or she can only see articles that have no categories in Geography and are classified with a category in Products. Because an answers zone can only be assigned to one category group, if the Geography category group was assigned to the zone and a member's role visibility was revoked for that group, the member could only see uncategorized questions.

How Category Visibility Differs from Other Salesforce Models

Data category visibility can be set with roles, permission sets, or profiles. Data category visibility determines the individual data categories, categorized articles, and categorized questions that a user can see. There are three types of visibility:

- All Categories: All categories are visible
- None: No categories are visible
- Custom: Selected categories are visible

With custom data category visibility, users can only see the data categories permitted by their role, permission sets, or profile.

These settings are unique to articles and questions and differ from other Salesforce models:

Exclusive to articles and questions

Access to articles and questions are determined by [category group visibility settings](#). Although they are standard objects, articles and questions do not have organization-wide defaults, sharing rules, manual record sharing, or object-level permissions like “Create” or “Read.”

Access

Category group visibility settings are based on the user’s role, permission set, or profile. Child roles cannot see more categories than their parent role. To change a user’s visibility to categories and therefore categorized articles and questions, you must [change the visibility settings for the user’s role, permission set, or profile](#), or, if custom data category visibility is not assigned, [make certain categories visible to all users](#).

Broad interpretation of visibility settings

To ensure that users obtain a wide range of relevant information, category group visibility is broadly interpreted. Setting a category as visible makes that category and its entire directly related family line—ancestors, immediate parent, primary children, other descendants—visible to users. For example, consider a Geography category group with continents such as Asia and Europe at the top level, various countries at the second level, and cities at the third level. If France is the only visible category selected, then you can see articles classified with Europe, France, and all French cities. In other words, you can see categories that have a direct vertical relationship to France but you cannot see articles classified at or below Asia and the other continents.

 **Note:** Only the first-level categories in the category group are visible on the Answers tab. In the Geography example, only the continent categories appear on the Answers tab; therefore, if France is the category selected as visible in category group visibility settings, zone members can see questions classified with Europe.

Modifying Default Data Category Visibility

Data category visibility can be set with roles, permission sets, or profiles. Data category visibility determines the individual data categories, categorized articles, and categorized questions that a user can see. There are three types of visibility:

- All Categories: All categories are visible
- None: No categories are visible
- Custom: Selected categories are visible

With custom data category visibility, users can only see the data categories permitted by their role, permission sets, or profile.

To modify the default visibility for data categories:

1. From Setup, enter *Default Data Category Visibility* in the Quick Find box, then select **Default Data Category Visibility**. All active and inactive category groups are listed.
2. Pick a category group and click **Edit**.
3. Choose **All Categories** to make all the categories in the category group visible by default, **None** to make none of the categories visible by default, or **Custom** to make some of the categories visible by default.
4. If you chose Custom, move categories from the Available Categories area to the Selected Categories area as needed. Selecting a category implicitly includes its child and parent categories as well. Move categories from the Selected Categories area back to the Available Categories area to remove default visibility.

For important information about how visibility settings are applied, see [About Category Group Visibility](#) on page 2651.

To view categories:	"View Data Categories"

Data category visibility can be set with roles, permission sets, or profiles. Data category visibility determines the individual data categories, categorized articles, and categorized questions that a user can see. There are three types of visibility:

- All Categories: All categories are visible
- None: No categories are visible
- Custom: Selected categories are visible

With custom data category visibility, users can only see the data categories permitted by their role, permission sets, or profile.

To understand the settings and their impact, see [About Category Group Visibility](#) on page 2651.

Viewing a Role's Category Group Visibility

To view a role's category visibility setting, from Setup, enter *Roles* in the *Quick Find* box, then select **Roles**, and select a role. To view the category visibility settings for a Customer Portal or partner portal role, from Setup, enter *Users* in the *Quick Find* box, then select **Users** and click the name of the role.

The Category Group Visibility Settings related list summarizes which categories users in the role can see, according to category group. The following table explains the possible values in the Visibility column of the related list:

Visibility	Description
All Categories	Users can see all categories in the category group. This option is only available for the topmost role in the role hierarchy. When you create a new category group, its visibility is defaulted to <i>All Categories</i> .
None	Users cannot see any categories in the category group.
Custom	Users can view a selection of categories in the category group.

In the Category Group Visibility Settings, you can:

- Click a category group to view its setting details.

[Examples of Category Group Visibility Settings for Articles](#)

Modifying Category Group Assignments in Salesforce Knowledge

Salesforce Knowledge uses data categories to classify articles. Authors can assign up to eight data categories from one category group to an article so that users searching for articles can find and filter by category. For more information, see [What Are Data Categories?](#) on page 2636.

Data categories are organized by category group. After [creating category groups](#), you can decide which groups should be used for Salesforce Knowledge articles. For example, if your organization uses both the Answers and Salesforce Knowledge, you may want one category group to be used by the answers community and two other category groups to be used for articles. Answers and articles can use the same category group.

By default, all the category groups you create are assigned to Salesforce Knowledge. To modify the assignment:

1. From Setup, enter *Data Category Assignments* in the Quick Find box, then select **Data Category Assignments** under Knowledge. A list of all category groups appears.
2. Click **Edit** and move any category groups that you don't want available for articles from the Selected Category Groups list to the Available Category Groups list. Later, you can choose to make a hidden category group visible.
3. Click **Save**.

Note: The order of category groups is not preserved from the edit page to the data category assignment page.

You receive an email after the save process completes. Authors can now assign categories in the selected groups to articles on the Article Management tab. Note that authors can only access categories if the category group is active and the author's [data category visibility settings](#) provide access to the category.

EDITIONS

Examples of Category Group Visibility Settings for Articles

Data category visibility can be set with roles, permission sets, or profiles. Data category visibility determines the individual data categories, categorized articles, and categorized questions that a user can see. There are three types of visibility:

- All Categories: All categories are visible
- None: No categories are visible
- Custom: Selected categories are visible

With custom data category visibility, users can only see the data categories permitted by their role, permission sets, or profile.

These examples are based on two sample category groups, Products and Geography:

 **Note:** Although category group visibility settings are available with answers communities (questions) and Salesforce Knowledge (articles), the examples below apply to articles only. Answers communities support one category group and one data category per question.

Products Category Group

- All Products
 - Consumer Electronics
 - Cameras
 - Audio
 - Printers
 - Enterprise Electronics
 - Routers
 - Switches
 - PEX
 - Computers
 - Laptops
 - Desktops
 - PDAs

Geography Category Group

- All Countries
 - Americas
 - USA
 - Canada
 - Brazil
 - Asia
 - China
 - Japan
 - India

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise, Performance, Unlimited,** and **Developer** editions.

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

- Europe
 - France
 - United Kingdom
 - Poland

Example 1: A Role Hierarchy

In this example, the Acme Electronics organization manufactures hardware and provides customer support for both consumers and enterprises. The Engineering department is organized by products. The Support department is organized geographically. Europe and the Americas are managed by corporate teams, but Asia is outsourced. Within the corporate and outsourced teams, there are subteams dedicated either to consumer or enterprise support.

The table below shows the categories visible to each role in the Acme Electronics organization, and states whether the visibility settings are inherited from the parent role or [custom](#).

Acme Electronics Role Hierarchy	Visible Geographic Categories	Visible Product Categories
CEO	All Countries	All Products
VP of Engineering	All Countries <i>Inherit from CEO</i>	All Products <i>Inherit from CEO</i>
Consumer Engineering Team	All Countries <i>Inherit from VP of Engineering</i>	Consumer Electronics <i>Custom</i>
Enterprise Engineering Team	All Countries <i>Inherit from VP of Engineering</i>	Enterprise Electronics <i>Custom</i>
Computers Engineering Team	All Countries <i>Inherit from VP of Engineering</i>	Computers <i>Custom</i>
VP of Support	All Countries <i>Inherit from CEO</i>	All Products <i>Inherit from CEO</i>
VP of Corporate Support	Europe, America <i>Custom</i>	All Products <i>Inherit from VP of Support</i>
Director of Corporate Consumer Support	Europe, America <i>Inherit from VP of Corporate Support</i>	Consumer Electronics, Computers <i>Custom</i>
Director of Corporate Enterprise Support	Europe, America <i>Inherit from VP of Corporate Support</i>	Enterprise Electronics, Computers <i>Custom</i>
Outsourced Support	Asia <i>Custom</i>	All Products <i>Inherit from VP of Support</i>

Acme Electronics Role Hierarchy	Visible Geographic Categories	Visible Product Categories
Consumer Support Team	Asia <i>Inherit from Outsourced Support</i>	Consumer Electronics, Computers <i>Custom</i>
Enterprise Support Team	Asia <i>Inherit from Outsourced Support</i>	Enterprise Electronics, Computers <i>Custom</i>

Example 2: Article Visibility

The table below is an in-depth example of how [category visibility settings](#) restrict what users see. This example has three sample users whose category settings are noted in parentheses.

Table 39: Example: How Category Visibility Settings Restrict What Users See

Categories	When User 1's visibility is All countries/Computers, the category is:	When User 2's visibility is America/All products, the category is:	When User 3's visibility is France/None, the category is:
All countries/Laptop	VISIBLE	VISIBLE	NOT VISIBLE
Canada/Computers	VISIBLE	VISIBLE	NOT VISIBLE
USA/All products	VISIBLE	VISIBLE	NOT VISIBLE
Europe/Switches	NOT VISIBLE	NOT VISIBLE	NOT VISIBLE
Europe/No Categories	VISIBLE	NOT VISIBLE	VISIBLE

User 1: The user must be granted visibility in each category that classifies the article, or each category that classifies the article must be visible by default. In this example, User 1 can see Europe, because Europe is the child of All Countries, but he cannot see Switches, because Switches does not belong to Computers. That's why User 1 cannot see articles classified with Europe/Switches.

User 2: When a category is made visible to a user through custom settings or is made visible by default, its child and parent categories are implicitly included; therefore, User 2 can see articles categorized with All Countries because it is the parent category of America. He can also see Articles classified with USA because it is the child of America.

User 3: If a user has no access to the whole category group, he can only see articles that are not categorized in that group. User 3 cannot see the articles categorized with All countries/Laptop because he has no visibility in the category group that includes Laptop, but he can see articles categorized with Europe/No categories.

[How Category Visibility Differs from Other Salesforce Models](#)

Granting Permissions for Salesforce Knowledge Users

User permissions control access to different features in Salesforce Knowledge. We recommend using permission sets or custom profiles to grant users the permissions they need. For example, you might want to create a permission set called “Article Manager” that includes the permissions needed to create, edit, publish, and assign articles.

When creating Salesforce Knowledge profiles, keep the following in mind.

- Users who will create article types, manage article actions, and modify settings need the “Manage Salesforce Knowledge” permission. This permission is on by default in the System Administrator profile.
- Users who will search for and view articles from the Articles tab need the “Read” permission for the article types they need to access, see [Creating and Assigning Salesforce Knowledge Users](#) on page 2664.
- Users who will edit draft articles, manage the publishing process, or manage the translation process need the “Manage Articles” permission and the appropriate article type permissions. “Manage Articles” is on by default in the System Administrator profile.
- Users with the “Manage Articles” permission are assigned all article actions automatically. [Article actions](#) on page 2632 allow users to do things like publish and archive articles or manage the translation process.
- Users who will create data categories need the “Manage Data Categories” permission. This permission is on by default in the System Administrator profile.
- Users who will import articles or import or export translations need the “Read,” “Create,” “Edit,” and “Delete” permissions.

Refer to this table for details on permissions associated with Salesforce Knowledge tasks.

Salesforce Knowledge Task	User Permissions Needed
To create article types:	“Manage Salesforce Knowledge”
To manage article actions:	“Manage Salesforce Knowledge”
To create articles from cases using the simple editor:	“Read” and “Create” on the article type
To create articles from cases using the standard editor:	“Manage Articles” AND “Read” and “Create” on the article type
To search articles from cases and attach articles to cases:	“Read” on the article type
To create articles from answers:	“Read” and “Create” on the article type
To search for and read articles from the Article or Knowledge tab:	“Read” on the article type
To create or edit articles from the Article Management tab:	“Manage Articles” AND

Overview of Setting Up Salesforce Knowledge Users

To give people in your company access to various features in Salesforce Knowledge, you need to create Knowledge user profiles with the appropriate user permissions, and then assign users to these profiles. In addition, you need to specify which users in your company are Salesforce Knowledge users. Optionally, you may want to create public groups for certain article actions, such as publishing, translating, or archiving.

Creating and Assigning Salesforce Knowledge Users and Groups

Creating and Assigning Salesforce Knowledge Users

Your organization has available Salesforce Knowledge licenses, if the Knowledge User checkbox appears on a user's detail page. If it does not appear, verify that your organization has purchased enough feature licenses.

Full Salesforce license users can read published articles, but not archived or draft articles, without the Knowledge User license. However, other actions (create, edit, delete, and publish) require the Knowledge User license, the Manage Articles permission, and the article action on the article type.

License	Published Article Read Access	Create, Edit, Delete, and Publish Access
Service cloud (Enterprise and Unlimited editions)	Read on the article type	Users need: <ul style="list-style-type: none"> Knowledge User license Manage Articles permission Article action on the article type
Service cloud (Performance edition)	Read on the article type	Users need: <ul style="list-style-type: none"> Manage Articles permission Article action on the article type
Sales cloud (Enterprise, Unlimited, and Performance editions)	Read on the article type	Users need: <ul style="list-style-type: none"> Knowledge User license Manage Articles permission Article action on the article type
Social Intranet	Read on the article type	Not applicable
Communities and Portals	Read on the article type	Not applicable
Chatter Plus	Users need: <ul style="list-style-type: none"> Knowledge User license Read on the article type 	Users need: <ul style="list-style-type: none"> Knowledge User license Manage Articles permission Article action on the article type
Force.com	Users need: <ul style="list-style-type: none"> Knowledge User license Read on the article type 	Users need: <ul style="list-style-type: none"> Knowledge User license Manage Articles permission Article action on the article type

To create or assign Salesforce Knowledge users:

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
2. Click **Edit** next to the user's name or click **New** to create a new user.
3. If you are creating a new user, complete all the required fields.
4. Select the **Knowledge User** checkbox.
5. Verify that the user has the required permissions. See [Granting Permissions for Salesforce Knowledge Users](#).
6. Click **Save**.

Assigning Article Actions to Public Groups

The "Manage Articles" user permission provides Salesforce Knowledge users with access to all the article actions available from the Article Management tab, including publishing, translating, and archiving articles. You can control article action access by assigning public groups to article actions. Then, you add Salesforce Knowledge users who need to perform an article action to the article action's public group. For example, you might create a public group called Superusers and assign it to the Delete Translated Articles action. Only article managers who are members of Superuser can delete translated articles. See [Assigning Article Actions to Public Groups](#) for more information on limiting access to article actions by assigning them to public groups.

Enabling Knowledge One with Profiles

To switch users from the Articles tab to the Knowledge tab, add the **Knowledge One** permission to their profiles.

To add the **Knowledge One** permission to a profile:

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Click the profile you want to add the Knowledge One permission to.
3. In the **Find Settings...** box, enter *Knowledge*.
4. Select **Knowledge One** from the list of suggestions.
5. Click **Edit**.
6. Under **Knowledge Management**, check **Knowledge One**.
7. Click **Save**.

Once Knowledge One is available for your users, you'll need to define your [external data sources](#). Your external data sources appear under your articles both in the search results and the left-side panel.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To create or edit profiles:

- "Manage Profiles and Permission Sets"

To create and edit external data sources:

- "Customize Application"

Enabling Knowledge One with Permission Sets

To switch users from the Articles tab to the Knowledge tab, add the `Knowledge One` permission to their permission sets.

To add the `Knowledge One` permission to a permission set:

1. From Setup, enter `Permission Sets` in the `Quick Find` box, then select **Permission Sets**.
2. Click the permission set you want to add the Knowledge One permission to.
3. In the  **Find Settings...** box, enter `Knowledge`.
4. Select **Knowledge One** from the list of suggestions.
5. Click **Edit**.
6. Under `Knowledge Management`, check the Enabled check box for `Knowledge One`.
7. Click **Save**.

Once Knowledge One is available for your users, you'll need to define your [external data sources](#). Your external data sources appear under your articles both in the search results and the left-side panel.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To create or edit permission sets:

- "Manage Profiles and Permission Sets"

To create and edit external data sources:

- "Customize Application"

Customizing Salesforce Knowledge

Depending on how you want to customize Salesforce Knowledge, such as integrating the knowledge base with cases or giving portal users access to articles, complete the following optional steps.

- [Set up workflow rules or approvals processes](#) for some or all article types to help your organization manage article creation and publication.
- [Enable multiple languages](#) if your organization will translate and publish articles in more than one language.
- If you have an existing knowledge base, [import your articles into Salesforce Knowledge](#).
- [Enable Salesforce Knowledge in the Customer Portal](#) to make articles visible to portal users.
- [Enable Salesforce Knowledge in the partner portal](#) to make articles visible to portal users.
- [Create a synonym group](#) to allow Salesforce Knowledge users to search for articles using synonyms as keywords.
- Add the Articles related list to case page layouts. The Articles related list lets users search for articles while working on a case. You can also allow case users to:
 - [Attach PDF versions of articles to case emails](#).
 - [Create articles when closing a case](#).
 - [View a list of suggested articles based on case information](#).
- To allow users to follow articles in Chatter, enable feed tracking for article types.
- If you want visitors to your public website to view Salesforce Knowledge articles, install the [Public Knowledge for Mobile, Web, and Facebook](#) app from the AppExchange. For information on installing, configuring, and customizing your public knowledge base, see the [guide](#) available with this package.

To manage synonyms:

- “Manage Synonyms”

To create data categories:

- “Manage Data Categories”

Salesforce Knowledge Workflow Rules and Approval Processes

Creating workflow rules and approval processes lets your organization automate many of the tasks involved with managing its knowledge base. When implementing Salesforce Knowledge, you can create workflow rules and approval processes for some or all of the article types used by your organization.

Workflow rules let you create email alerts, update fields, or send outbound API messages when an article meets certain criteria. For example, you could create a workflow rule that sends an email alert to the article owner when a new article is created from a case. Note that tasks are not supported by article type workflow.

Approval processes automate the approval of articles. When implemented with Salesforce Knowledge, approval processes give you additional control over the content of your articles and the process used to approve them. For example, you can create a process that requires legal and management teams to approve articles containing sensitive information.

 **Note:** Tasks aren't available for article type workflow rules.

Tips for Creating Approval Processes

Keep the following in mind when creating approval processes for article types.

- Before you create an approval process, determine which approval process wizard to use.
- Adding an approval process to an article type lets your organization ensure that the required reviewers approve the article before it's published. When an approval process is enabled for an article's article type, the Approval History related list displays on the article details page.
- When creating an approval process, change the final approval action to "Unlock the record for editing" to allow users to publish the article.
- Articles aren't published automatically at the end of an approval process. Users must click **Publish...** to make the article available in the publishing channel(s).
- When an approval process is associated with an article type, users with the "Manage Articles" permission might see both the **Publish...** and the **Submit for Approval** buttons on an article's detail page. (Which buttons they see is determined by both permissions and article actions). These users can publish an article without submitting it for approval. To prevent this from affecting many users, assign the "Publish Articles" article action to a limited group of users instead of giving it to all users with the "Manage Articles" permission. For more information, see [Assigning Article Actions to Public Groups](#) on page 2632. You'll still want to make sure that the users with direct publishing capability know which articles need approval before publication.
- Article approvers require the "Manage Articles" permission and at least the "Read" permission on the article type associated with articles they review. These permissions let them access the article in a draft state. Without these permissions, approvers can reassign but not approve articles.
- Workflow rules and approval processes apply to the "Draft to Publication" portion of the article publishing cycle. Workflow rules aren't available for archiving. Approval processes aren't available for translation or archiving.

 **Note:** When an article is published from the edit page, the article is first saved and then published. Workflow rules apply to the saved draft article but not the published article.

To view workflow rules and approval processes:

- "View Setup and Configuration"

To create or change workflow rules and approval processes:

- "Customize Application"

Defining Validation Status Picklist Values

This page enables you to add or edit article validation statuses for article types.

When the `Validation Status` field is enabled on the Knowledge Settings page, you can create picklist values that show the state of the article in the article publication lifecycle. For example, values in the article lifecycle could be `Validated`, `Not Validated`, or `Needs Review`.

 **Note:** Validation status picklist values aren't retained when you export articles for translation. Articles with picklist values can be imported, however, and their values are retained as long as the values exist in your organization.

1. From Setup, enter `Validation Statuses` in the `Quick Find` box, then select **Validation Statuses**.
2. On the picklist edit page, click **New** to add new values to the validation status field. You can also edit, delete, reorder, and replace picklist values.
When you replace a picklist value, the system replaces it in all versions of the article, including any archived versions.
3. Add one or more picklist values (one per line) in the text area.
4. To set the value as the default for the picklist, be sure to select the `Default` checkbox.
5. Click **Save**.

Creating an Article Queue

If your organization wants to use queues in approval processes or send articles for translation outside of Salesforce, you need to create one or more queues. See [Creating Queues](#) on page 2711. When authors or reviewers submit an article for review or translation, they select the appropriate queue. For reviews, you can create queues made up of reviewers with different areas of expertise. For translation queues, you can create one queue for each language or combine languages within queues.

To create an article or translation approval queue, add Knowledge Article Version as the object available to the queue.

- AND
- "Manage Public List Views"

To create or change queues created by other users:

- "Customize Application"
- AND
- "Manage Public List Views"
- AND
- "Manage Users"

Custom Field Types on Articles

The first step in creating a custom field for articles is choosing the field type. This table describes all available custom field types.

Field Type	Description
Article Currency	In a multiple currency organization, an article can have an article currency field to set the article's currency ISO code.
Currency	<p>Allows users to enter a currency amount. The system automatically formats the field as a currency amount. This can be useful if you export data to a spreadsheet application. You can make this field required so a user must enter a value before saving an article.</p> <p> Note: Salesforce uses the round-half-to-even tie-breaking rule for currency fields. For example, 23.5 becomes 24, 22.5 becomes 22, -22.5 becomes -22, and -23.5 becomes -24. Values lose precision after 15 decimal places.</p>
Date	Allows users to enter a date or pick a date from a popup calendar. In reports, you can limit the data by specific dates using any custom date field. You can make this field required so a user must enter a value before saving an article.
Date/Time	Allows users to enter a date or pick a date from a popup calendar, and enter a time of day. They can also add the current date and time by clicking the date and time link next to the field. The time of day includes AM or PM notation. In reports, you can limit the data by specific dates and times using any custom date field. You can make this field required so a user must enter a value before saving an article.
Email	Allows users to enter an email address, which is validated to ensure proper format. Character limit is 80. If this field is specified for contacts or leads, users can choose the address when clicking Send an Email . Note that you can't use custom email addresses for mass emails. You can make this field required so a user must enter a value before saving an article.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To create or change custom fields:

- "Customize Application"

To modify article-types:

- "Manage Salesforce Knowledge"

Field Type**Description**

File

Allows users to upload and attach a file to an article. You can make this field required so a user must enter a value before saving an article. Note the following caveats about File fields:

- The maximum attachment size is 25 MB.
- You can add up to 5 File fields to each article type; contact Salesforce to increase these limits.
- If the `Disallow HTML documents and attachments` security setting is enabled, File fields do not support HTML files.
- Text content in a File field attachment is searchable. You can search up to 25 MB of attached files on an article. For example, if an article has six 5 MB file attachments, the first 4.16 MB of each file is searchable.
- You cannot attach Salesforce CRM Content files using the File field.
- The File field type is not supported in Developer edition.
- The filename cannot exceed 40 characters.
- You cannot convert a File field type into any other data type.

Formula

Allows users to automatically calculate values based on other values or fields such as merge fields.

 **Note:** Salesforce uses the round half up tie-breaking rule for numbers in formula fields. For example, 12.345 becomes 12.35 and -12.345 becomes -12.34.

In Database.com, the Formula editor does not provide a **Check Syntax** button. Syntax checking occurs when the user attempts to save the formula.

Lookup Relationship

Creates a relationship between two records so you can associate them with each other. For example, opportunities have a lookup relationship with cases that lets you associate a particular case with an opportunity. A lookup relationship creates a field that allows users to click a lookup icon and select another record from a popup window. On the associated record, you can then display a related list to show all of the records that are linked to it. You can create lookup relationship fields that link to users, standard objects, or custom objects. If a lookup field references a record that has been deleted, Salesforce clears the value of the lookup field by default. Alternatively, you can choose to prevent records from being deleted if they're in a lookup relationship. You can make this field required so a user must enter a value before saving an article.

Lookup relationship fields are not available in Personal Edition.

Field Type	Description
Number	<p>Lookup relationship fields to campaign members are not available; however, lookup relationship fields from campaign members to other objects are available.</p> <p>Allows users to enter any number. This is treated as a real number and any leading zeros are removed. You can make this field required so a user must enter a value before saving an article.</p> <p> Note: Salesforce uses the round half up tie-breaking rule for number fields. For example, 12.345 becomes 12.35 and –12.345 becomes –12.34. Salesforce rounds numbers referenced in merge fields according to the user’s locale, not the number of decimal spaces specified in the number field configuration.</p>
Percent	<p>Allows users to enter a percentage number, for example, '10'. The system automatically adds the percent sign to the number. You can make this field required so a user must enter a value before saving an article.</p> <p> Note: If the decimal value is greater than 15, and you add a percent sign to the number, a runtime error occurs.</p> <p>Values lose precision after 15 decimal places.</p>
Phone	<p>Allows users to enter any phone number. Character limit is 40. You can make this field required so a user must enter a value before saving an article.</p> <p>Salesforce automatically formats it as a phone number.</p> <p>If you are using Salesforce CRM Call Center, custom phone fields are displayed with the  button, allowing click-to-dial functionality. Consequently, Salesforce recommends that you do not use a custom phone field for fax numbers.</p>
Picklist	<p>Allows users to select a value from a list you define.</p>
Picklist (Dependent)	<p>Allows users to select a value from a list dependent on the value of another field.</p>
Picklist (Multi-select)	<p>Allows users to select more than one picklist value from a list you define. These fields display each value separated by a semicolon.</p>
Text	<p>Allows users to enter any combination of letters, numbers, or symbols. You can set a maximum length, up to 255 characters. You can make this field required so a user must enter a value before saving an article.</p>
Text Area	<p>Allows users to enter up to 255 characters that display on separate lines similar to a <code>Description</code> field. You can make this field required so a user must enter a value before saving an article.</p>

Field Type**Description**

Text Area (Long)

Allows users to enter up to 131,072 characters that display on separate lines similar to a `Description` field. You can set the length of this field type to a lower limit, if desired. Any length from 256 to 131,072 characters is allowed. The default is 32,768 characters. Every time a user presses `Enter` within a long text area field, a linebreak and a return character are added, both count toward the character limit. Also, smart links add more characters than what is displayed.

 **Note:** If you lower the character limit and you have articles that surpass the new limit. Those articles can't be edited until the limit is reset higher than their character counts.

Text Area (Rich)

Allows users to enter up to 131,072 characters of HTML-supported

text including code samples () and [smart links](#) between Salesforce Knowledge articles.

There are two ways to create smart links:

- [Search for the article.](#)
- [Enter the article URL.](#)

 **Note:**

- You can have up to 100 links to different Salesforce Knowledge articles in one rich text field.
- When you convert a text area (rich) field to a text area (long) field, links are displayed as link reference numbers, not URLs.
- The upgraded editor doesn't support Internet Explorer version 7 or version 8 in compatibility mode. If you are using these browsers, you will use the older editor.

URL

Allows users to enter up to 255 characters of any valid website address. When users click the field, the URL opens in a separate browser window. Note that only the first 50 characters are displayed on the record detail pages. You can make this field required so a user must enter a value before saving an article.

SEE ALSO:

[Adding Custom Fields to Article Types](#)

Set Up Knowledge One Widget

Knowledge One is available as a widget you can plug in to the Salesforce Console for Service.

If you are using the Knowledge tab, you get the same easy-to-use interface for articles and external sources on cases and within the Salesforce Console for Service. You can search, send, and create articles, all without leaving the case.

Of [all the Salesforce Knowledge article widgets](#), the Knowledge One widget lets you:

- Attach a published Salesforce Knowledge article to the case in one click.
- Share an article as a URL, if it is shared on a public channel.
- Email an article as a PDF, if it is shared on a public channel.
- Create and manage articles.
- Make adjustments based on your window width. In the console, in windows smaller than 600 pixels, the searchable objects are displayed in a drop-down menu.

 **Note:** The article widget in a case feed search doesn't necessarily use the agent's language. If the agent's language isn't a Salesforce Knowledge supported language but their locale language is, the locale language is the search language. If neither the agent's language nor local language are supported, the search language is the default Salesforce Knowledge language, which you can find and set on the Knowledge Settings page.

1. From the object management settings for cases, go to Page Layouts and open your case page layout for edit.
2. Disable previous article sidebar components.
 - To disable the Knowledge sidebar, click **Layout Properties** and ensure `Knowledge Sidebar` is unchecked.
 - To disable the case feed article tool, click **Feed View** and ensure `Use Case Feed Article Tool in the Console` is unchecked.
3. In the page layout editor, click **Custom Console Components**.
4. In the sidebar where you want the Knowledge One widget, select `Knowledge One` in the Type drop down and set the sidebar parameters.

 **Tip:** If you can't see the Knowledge One sidebar, increase its width to 250 (height to 150) in the page layout. These are the minimum measurements for the Knowledge One sidebar to display properly.

EDITIONS

Available in: Salesforce Classic

Enabling Salesforce Knowledge in the Partner Portal

You can use the partner portal to provide your partners with access to Salesforce Knowledge articles. Portal users can view and rate articles but cannot create or edit articles.

After you have set up Salesforce Knowledge in your organization and enabled your partner portal, complete the following steps to enable Salesforce Knowledge in your portals.

1. Update your cloned Partner User profiles:
 - a. Include the “Read” user permission on article types you want to share with partners.
 - b. Verify that the tab visibility for the Articles tab is Default On.
2. At the bottom of the partner portal detail page, click **Edit Profiles** and activate the new profile.
3. Add the Articles tab to each partner portal.
4. Assign the cloned profiles to your partner portal users:
 - a. To create a new partner portal user, click **Manage External User** and choose **Enable Partner User** on the contact detail page. To update an existing user, click **Manage External User** and choose **View Partner User** on the contact detail page.
 - b. For a new user, select the cloned profile from the **Profile** drop-down menu. For an existing user, click **Edit** and then select the profile.
 - c. Click **Save**.
5. If you want your partner portal users to have different category group visibility settings than the account owner, change the visibility settings for the partner portal user.

By default, partner portal users inherit which categories they can access from the account owner. For example, if the account owner has a role of CEO and the CEO role has full access to all the data categories in the category group assigned to Salesforce Knowledge, then partner portal users can also access all categories in the knowledge base. In some cases, you may want to limit which categories a partner portal user can access.
6. Notify users who create articles that they must select **Partner** as a channel option when creating or modifying an article. If the Partner channel is not selected, the article will not appear in the portal.
7. To allow users to search for articles from the Home tab, add the Article Search component to the home page layout. Ensure that you assign the layout to the partner user profiles.

Preparing Articles for Import to Salesforce Knowledge

 **Important:** You must import articles one [article type](#) at a time.

To prepare articles for importing:

1. Sort your existing articles by information type. For example: FAQ, product information, or offer.
2. Ensure that each information type has a corresponding [Salesforce Knowledge article type](#) that matches its structure and content. For example, if you are importing FAQs, ensure that Salesforce Knowledge has an FAQ article type with enough question and answer fields to accommodate the largest FAQ article.

 **Note:** The article importer does not support sub-fields. If you have fields within fields, you'll need to adjust your structure and content before importing into Salesforce Knowledge.

3. Verify that the article's [field-level security settings](#) allow you to edit the fields.

If your articles contain .html files, use an article type that contains a rich text area field and ensure that the HTML is compliant with the tags and attributes supported in the rich text area field.

 **Tip:** Test your import using a small set of articles.

Creating a .csv File for Article Import

Each .csv file imports articles into one article type and maps the imported articles' content with the article type's fields. For example, a .csv file might map articles' titles with the standard field `Title` in an article type, meaning that each article's title is imported into the `Title` field.

1. Create one .csv file per article type.
 - There can only be one .csv file and one .properties file.
 - The .csv file and the .properties file must be in the root directory.
 - The compression process must preserve the folder and subfolder structure.
 - The .zip file name can't contain special characters.
 - The .zip file can't exceed 10 MB and the uncompressed files can't exceed 100 MB.
 - .csv files can't have more than 10,000 rows, including the header row. Therefore, you can have a maximum of 9,999 articles and translations.
 - .csv file rows can't exceed 400,000 characters.
 - .csv file cells can't exceed 32 KB.
 - Each article in the .csv file can't have more than 49 translations.
2. In the first row, specify the article type's fields and metadata (such as language [data categories](#) or [channels](#)). Enter one item in each column. You can use the following fields and metadata to import content:
 - `isMasterLanguage`—identify the article as a master (1) or translation (0). Required to import articles with translations, however, it can't be in a .csv file to import articles without translations. Translations must follow their master articles so that they are associated with the master article preceding it.
 - `Title`—the article or translation's title. Required for all imports.
 - Standard or custom fields—refer to an article type's standard fields using field names and refer to custom fields using API names. Leaving a row cell empty may cause your articles to be skipped if the related article-type field is mandatory.
 - Rich text area field—use the [rich text area](#) custom fields to import .html files or images. Refer to an article type's rich text area field using its API name.
 - File field—use the [file](#) custom fields to import any file type (.doc, .pdf, .txt, etc.). Refer to an article type's file field using its API name.
 - To [categorize](#) the imported articles, use category groups; refer to a category group using its unique name prefixed with `datacategorygroup`. For example, use `datacategorygroup.Products` to specify the category group Products.
 - To specify where the imported articles are available, use the keyword `Channels`.
 - Language—specify the articles' language. Required to import articles with translations. Optional to import articles without translations. If you don't include this column, the articles will automatically belong to the [default knowledge base language](#) and you can't import translations along with the master articles.
3. In subsequent rows, specify the articles you want to import. Use one row per article and enter the appropriate information in each article type field column or metadata column.
 - Standard or custom fields—enter the articles' data for each field, except for rich text area fields where you must enter the relative path to the corresponding .html file in your .zip file.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To import articles:

- "Manage Salesforce Knowledge"

AND

"Manage Articles"

AND

"Manage Knowledge Article Import/Export"

AND

"Read," "Create," "Edit," and "Delete" on the article type

To view articles:

- "Read" on the article type

To create articles:

- "Manage Articles"

AND

"Read" and "Create" on the article type

-  **Note:** The article importer does not support sub-fields. If you have fields within fields, you'll need to adjust your structure and content before importing into Salesforce Knowledge.
- Rich text area field—always enter the .html file path relative to the location of the .csv file. Never enter raw text. If the specified path doesn't exist, the related article isn't imported. Note the following information about importing HTML and images:
 - We recommend that you create separate folders for the .html files (for example, /data) and the images (for example, data/images).
 - To import images, include the images in an .html file using the `` tag and `src` attribute. Ensure that the `src` value is a relative path from the .html file to the image folder.
 - Images must be .png, .gif, or .jpeg files.
 - Each image file can't exceed 1 MB.
 - .html files can't exceed the maximum size for their field.
 - If a date doesn't match the date format specified in the property file, the related article isn't imported.
 - If an .html file references a file that isn't allowed, the related article isn't imported.
 - If an .html file references an image that's missing, the related article is imported without the image.
 - File field—enter the path relative to the file's location. If the specified path doesn't exist, the related article isn't imported. Note the following information about importing files:
 - We recommend that you create a folder for your files (for example, /files).
 - Each file must not exceed 5 MB.
 - Category groups—use category unique names to categorize articles. Use the plus symbol (+) to specify more than one category. For example, Laptop+Desktop. Note the following information about data category groups:
 - Leaving the cell row empty causes your article to be set to No Categories.
 - If you specify a category and its parent (for example, Europe+France) the import process skips the child category France and keeps the parent category Europe, because application of a parent category implicitly includes the category's children.
 - When importing articles with translations and associated data categories, only the master article retains the data categories. The article translations have no associated data category upon import.
 - Channels—specify articles' channels using the keywords:
 - `application` for Internal App. If you don't specify a channel, `application` is the default.
 - `sites` for Public Knowledge Base.
 - `csp` for Customer.
 - `prm` for Partner.

Use the plus (+) symbol to specify more than one channel (for example, `application+sites+csp` to make an article available in all channels).

 **Note:** When importing articles with translations and associated channels, only the master article retains the channels. The article translations have no associated channels upon import.

The following example .csv files import articles in a Product Offer article type. The first example is for imports of articles without translations. The second is for imports with translations. The .csv files contain titles, summaries, and descriptions. They also classify the articles in the category group Products and make them available for specific channels. The `description__c` field is a rich text area and only supports paths to .html files. The `summary__c` field is a text field and only supports raw text. The “Best Desktop Computer Deals” article has no summary; the cell is left blank because the `summary__c` field is not mandatory.

Title	summary__c	description__c	datacategorygroup.Products	Channels
Free Digital Camera Offer	Get the new Digital Camera.	data/freecam.html	Consumer_Electronics	application+csp
Best Desktop Computer Deals		data/bestdeals.html	Desktop	application+csp
Free Shipping on Laptop and Desktops		data/freeship.html	Laptop+Desktops	application+csp

Example articlesimport.csv file:

```
Title,summary__c,description__c,datacategorygroup.Products,Channels
Free Digital Camera Offer,Get the new Digital Camera.,data/freecam.html,Consumer_Electronics,application+csp
Best Desktop Computer Deals,,data/bestdeals.html,Desktop,application+csp
Free Shipping on Laptop and Desktops,,data/freeship.html,Laptop+Desktops,application+csp
```

isMaster Language	Title	summary__c	description__c	datacategorygroup.Products	Channels	Language
1	Free Digital Camera Offer	Get the new Digital Camera.	data/freecam.html	Consumer_Electronics	application+csp	en_US
0	Libérer l'Offre d'Appareil photo digital	Obtenir le nouvel Appareil photo digital.	data/freecam/fr.html			fr
0	Liberte Oferta Digital de Cámara	Consiga la nueva Cámara Digital.	data/freecam/es.html			es
1	Best Desktop Computer Deals		data/bestdeals.html	Desktops	application+csp	en_US

0,Liberte Franqueo en Laptops y Ordenadores,,data/freeship/es.html,,,es
```

SEE ALSO:[Importing Articles](#)[Preparing Articles for Import to Salesforce Knowledge](#)[Specifying Parameters for Article Import](#)

Specifying Parameters for Article Import

Specify import parameters in a property file using key names and corresponding values. For example, use the key `DateFormat` to specify that a date custom field appears in the `DateFormat=dd/MM/YYYY` format or specify the character encoding to be used for the import.

Create a file with the `.properties` extension and specify the required parameters, as described in this table.

Key	Description	Default Value
<code>DateFormat</code>	Format of the date to read in the <code>.csv</code> file	<code>yyyy-MM-dd</code>
<code>DateTimeFormat</code>	Format of the date and time to read in the <code>.csv</code> file	<code>yyyy-MM-dd HH:mm:ss</code>
<code>CSVEncoding</code>	Character encoding used to read the <code>.csv</code> file	<code>ISO8859_15_FDIS</code>
<code>CSVSeparator</code>	<code>.csv</code> file separator	<code>,</code>
<code>RTAEncoding</code>	Default encoding used for the HTML files (if not specified in the <code>charset</code> attribute from the HTML <code>meta</code> tag).	<code>ISO8859_15_FDIS</code>

 **Note:** Salesforce does not support UTF-32 character encoding. We recommend using UTF-8. If you use specify UTF-16 character encoding, ensure your HTML files specify the right byte-order mark.

 **Note:** You must specify only Java date formats. Make sure the date format is not misleading. For example, if you choose the format `yyyy-M-d`, a date entered as `2011111` can be interpreted as `2011-01-11` or `2011-11-01`. Specify at least :

- Two digits for month and day format (MM, dd)
- Four digits for year format (yyyy)

If a date in the `.csv` file does not match the date format specified in the property file, the related article is not imported.

Example `offerarticlesimport.properties` property file:

```
DateFormat=yyyy-MM-dd
DateTimeFormat=yyyy-MM-dd HH:mm:ss
CSVEncoding=ISO8859_15_FDIS
```

EDITIONS

[Importing Articles](#)

[Creating a .csv File for Article Import](#)

[Creating a .zip File for Article Import](#)

Creating a .zip File for Article Import

To complete the import, create a .zip file containing:

- The .csv file.
- The folder containing the .html files to import.
- The folder containing the image files referenced in the .html files.
- The .properties file.

The import .zip file must meet the following requirements:

- There can only be one .csv file and one .properties file.
- The .csv file and the .properties file must be in the root directory.
- The compression process must preserve the folder and subfolder structure.
- The .zip file name can't contain special characters.
- The .zip file can't exceed 10 MB and the uncompressed files can't exceed 100 MB.
- .csv files can't have more than 10,000 rows, including the header row. Therefore, you can have a maximum of 9,999 articles and translations.
- .csv file rows can't exceed 400,000 characters.
- .csv file cells can't exceed 32 KB.
- Each article in the .csv file can't have more than 49 translations.

Upload your .zip file:

1. From Setup, enter *Import Articles* in the **Quick Find** box, then select **Import Articles**.
2. Select the appropriate **Article Type** for the imported articles.
3. Click **Browse** to select the .zip file, and click **OK**.
4. If your import contains translations, select the *Contains translations?* checkbox.

Note: If this checkbox is selected, your .csv file must contain the *isMasterLanguage*, *Title*, and *Language* columns. If this checkbox is not selected, your csv file can't contain the *isMasterLanguage* column but must contain the *Title* column. The *Language* column is optional for imports of articles without translations.

5. Click **Import Now**.

[Viewing Salesforce Knowledge Import and Export Status](#)

Viewing Salesforce Knowledge Import and Export Status

To check the status of your imports and exports, from Setup, enter *Article Imports* in the **Quick Find** box, then select **Article Imports**. If you've enabled multiple languages for Salesforce Knowledge, you see two tables: one for article and translation imports and another for exports for translation.

Import information includes:

- Possible actions
- .Zip file names
- Who submitted it and when
- Status
- Started and completed dates
- Article types

Export information includes:

- Possible actions
- Zip file names
- Who submitted it and when
- Status
- Started and completed dates

Status descriptions are as follows:

Status	Description	Possible Action
Pending	The import or export will start as soon as the previous pending import or export completes.	You can click Cancel to cancel the import or export.
Processing	The import or export is processing.	If you want to stop the process, or if the process has been stopped, call Salesforce Support. Salesforce may stop an import or export if a maintenance task has to be performed or the import or export exceeds one hour.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

AND

"Read" and "Create" on the article type

Status	Description	Possible Action
Stopping/Stopped	Salesforce Support is stopping or has already stopped the import or export.	Contact Salesforce Support to restart the import or export, or click Cancel to cancel an entry.
Aborted	The import or export has been canceled. The articles that already imported or exported successfully are available in Salesforce.	You can restart an import or export, click Del to delete an entry, or click Email Log to receive the completion email and check the details of your import or export.
Completed	The import or export is complete. Successfully imported articles are visible on the Article Management tab on the <code>Articles</code> subtab. Successfully imported translations are visible on the Article Management tab on the <code>Translations</code> subtab.	Note that this status doesn't mean the import or export is successful. Click Email Log to see the log file attached to the completion email and check the details of your import or export. Click the exported .zip file name to save or open the file on your system.

Salesforce Knowledge Implementation Tips

Consider the following information when planning and implementing Salesforce Knowledge for your organization.

- For detailed implementation instructions, see [Setting Up Salesforce Knowledge](#) on page 2600.
- If you want to make articles visible on your website, install the *Sample Public Knowledge Base for Salesforce Knowledge* app from the AppExchange.
- Public knowledge base users cannot rate articles.
- The [File custom field type](#) allows users to attach documents to articles. Note the following caveats about File fields:
 - The maximum attachment size is 25 MB.
 - You can add up to 5 File fields to each article type; contact Salesforce to increase these limits.
 - If the `Disallow HTML documents and attachments` security setting is enabled, File fields do not support HTML files.
 - Text content in a File field attachment is searchable. You can search up to 25 MB of attached files on an article. For example, if an article has six 5 MB file attachments, the first 4.16 MB of each file is searchable.
 - You cannot attach Salesforce CRM Content files using the File field.
 - The File field type is not supported in Developer edition.
 - The filename cannot exceed 40 characters.
 - You cannot convert a File field type into any other data type.
- You will lose your data if you convert a custom field on an article type into any other field type. Do not convert custom fields unless no data exists for the field.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

- When renaming Salesforce Knowledge labels note that standard field names, like title and type, are fixed. These fields do not change the labels on the article create and edit pages. If the organization is set to another language, these fields remain in the fixed label for that language.
- The Salesforce Knowledge search engine supports lemmatization, which is the process of reducing a word to its root form. With lemmatization, a search can match expanded forms of a search term. For example, a search for *running* matches items that contain *run*, *running*, and *ran*. Lemmatization is available only for articles that are marked as being in one of these languages: Danish, Dutch, English, French, German, Hebrew, Italian, Korean, Norwegian, Portuguese, Romanian, Russian, Spanish, or Swedish. Additionally, the search must be initiated by a user who is viewing the application in one of these languages. You can edit the default language for your organization on the Company Information page.
- Make sure that you have a clear understanding of the type of articles your organization will implement, and how users will need to interact with these article types. This will determine the article type permissions and article actions that you need to assign to Salesforce Knowledge users, which you can then use to create the set of profiles or permission sets required by your organization. For more information, see [Granting Permissions for Salesforce Knowledge Users](#) on page 2660.
- Determine if you need to create workflow rules for some of your article types. For example, you can create a rule that sends an email to an article manager when an agent creates a new article upon closing a case.
- Determine if you need to create approval processes for some of your article types. For example, if you have a type of article that must have legal and management approval before it can be published externally, you should create an approval process for the article type.

Consider the following tips if your organization plans to use data categories.

- You can create up to three category groups with a maximum of five hierarchy levels in each group. Each category group can contain a total of 100 categories.
- If you want to use data categories with Answers, after creating your category group you must assign it from Setup by entering *Data Category Assignments* in the **Quick Find** box, then selecting **Data Category Assignments** under Answers. You can only assign one category group to an answers community. Salesforce Knowledge supports multiple category groups.
- Even though you can create up to five hierarchy levels of categories in a category group, only the first level of categories is supported in your answers community. Child categories below the first level are not displayed in the community, and community members can't assign these child categories to questions. Salesforce Knowledge supports a hierarchy of data categories.
- Category groups are hidden from users until they are activated. Do not activate a category group until you have finished defining its categories and their access settings, including their visibility.
- When assigning categories to articles, you can choose up to eight categories in a category group.
- If an article has no categories, it displays only when you choose the **No Filter** option in the category drop-down menu.
- When searching for articles or article translations, selecting a category automatically includes the parent and children of that category and any grandparents, up to and including the top level. Sibling categories are not included. For example, if a category hierarchy has the levels All Products, Switches, Optical Networks, and Metro Core, selecting "Optical Networks" from the category drop-down menu returns articles assigned to any of the four categories. However, if the Switches category has a sibling category called Routers, selecting "Optical Networks" does not return articles classified within Routers. Category visibility settings may limit the specific articles you can find.
- Once [visibility settings](#) have been chosen for the categories:
 - Users who are not assigned visibility can only see uncategorized articles and questions unless [default category visibility](#) has been set up.
 - For role-based visibility, Customer Portal users and partner portal users inherit the category group visibility settings assigned to their account managers by default. You can [change the category group visibility settings](#) for each portal role.
 - If you only have access to one category in a category group, the category drop-down menu for that category group does not display on the Articles tab.
- Deleting a category:

- Permanently removes it. It cannot be restored. It never appears in the Recycle Bin.
- Permanently deletes its child categories.
- As applicable, removes the category and its children from the Answers tab, the Article Management tab, the Articles tab in all channels, and your company's public knowledge base.
- Removes associations between the category and articles or questions. You can reassign articles and questions to another category.
- Removes its mapping to visibility. Users lose their visibility to articles and answers associated with the deleted category.
- Deleting a category group:
 - Moves it to the Deleted Category Groups section, which is a recycle bin. You can view items in this section but not edit them. It holds category groups for 15 days before they are permanently erased and cannot be recovered. During the 15–day holding period, you can either restore a category group, or permanently erase it immediately.
 - Deletes all categories within that group.
 - Removes all associations between the group's categories and articles or questions.
 - Removes all associations between the group's categories and visibility.
 - As applicable, removes the category drop-down menu from the Articles tab in all channels, the Article Management tab, and your company's public knowledge base.
- You can translate the labels of categories and category groups using the Translation Workbench.

[Setting Up Salesforce Knowledge](#)

Salesforce Knowledge Best Practices

Consider the following tips when planning and using Salesforce Knowledge:

- Take full advantage of multiple article types as custom containers for your articles. Organizing articles by type helps differentiate content and allows users greater flexibility when searching for articles.
- Create synonym groups in Salesforce Knowledge. Synonyms are words or phrases that are treated as equivalent in article searches, letting you optimize search results. For more information see [Creating Search Synonyms](#) on page 2617.
- Before setting up data categories, carefully plan your category groups and their hierarchies. Also, consider how your category hierarchy will map to your role hierarchy. For more information, see [About Category Group Visibility](#) on page 2651.
- Create custom reports on your Salesforce Knowledge data. You can also install the *Knowledge Base Dashboards and Reports* app from the AppExchange to receive over two dozen helpful reports.
- Multiple users can edit the same article at the same time. If that occurs, your changes may be overwritten by a colleague without warning, even if you save your work frequently. To avoid accidental data loss, instruct all users who edit articles to only edit the articles they're assigned.
- Know the maximum limits for articles, article types, and data categories.

EDITIONS

Available in: **Salesforce Classic**

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

- Review your usage regularly to avoid storage shortages: from Setup, enter *Storage Usage* in the *Quick Find* box, then select **Storage Usage**.

Adding Solutions

HTML Solutions Overview

HTML solutions provide a more flexible way to create solutions, by allowing you to easily format paragraphs, and insert images and links. Using HTML solutions, you create solutions with an HTML editor and display those solutions to users in Salesforce, the Self-Service portal, the Customer Portal, and as public solutions.

Using the HTML editor, you can:

- Change fonts
- Increase or decrease font sizes
- Insert images from the Documents tab
- Set text color
- Set the background color of text
- Insert hyperlinks
- Change paragraph alignment
- Create bulleted and numbered lists

 **Note:** By default, solutions are created and displayed in text format. Your administrator must enable HTML solutions.

Before you begin creating HTML solutions for your organization, review the following implementation tips and best practices.

Implementation Tips

- Once you enable HTML solutions, you cannot disable it.
- If you open a text solution with the HTML editor and save it, the solution becomes an HTML solution.
- HTML solutions are presented as such to Self-Service portal, public solutions, Customer Portal, and Salesforce users.
- Any HTML tags entered into the HTML editor will display to users as text when the solution is saved.
- When the HTML solution detail is displayed in list views and search results, only the first 255 characters are displayed. This number includes HTML tags and images that are removed.
- Each HTML solution can contain up to 32000 characters, including HTML tags.
- HTML formatting is preserved in the printable view of a solution.
- Hyperlinks in HTML solutions open in a new browser window when users click on them.
- All images that you want to include in your HTML solutions must be uploaded to the Documents tab. Images in HTML solution details will not show up in list views and reports.
- HTML solutions can be created in any of the languages supported by Salesforce.

USER PERMISSIONS

To create solutions:

- "Create" on solutions

Best Practices

The following HTML tags are allowed in HTML solutions imported into Salesforce:

<a>	<dt>	<q>
<abbr>		<samp>
<acronym>		<small>
<address>	<h1>	
	<h2>	<strike>
<bdo>	<h3>	
<big>	<h4>	<sub>
<blockquote>	<h5>	<sup>
 	<h6>	<table>
<caption>	<hr>	<tbody>
<cite>	<i>	<td>
<code>		<tfoot>
<col>	<ins>	<th>
<colgroup>	<kbd>	<thead>
<dd>		<tr>
		<tt>
<dfn>	<p>	
<div>	<pre>	<var>
<dl>		

Within the above tags, you can include the following attributes:

alt	face	size
background	height	src
border	href	style
class	name	target
colspan	rowspan	width

The above attributes that can include a URL are limited to URLs that begin with the following:

- http:

- `https:`
- `file:`
- `ftp:`
- `mailto:`
- `#`
- `/` for relative links

[Categorizing Solutions](#)

[Creating Solutions](#)

Multilingual Solutions Overview

The multilingual solutions feature helps you translate solutions and solution categories into the languages supported by Salesforce so that customers and support reps can find answers to inquiries in the language with which they are most comfortable.

Multilingual solutions can lower support costs by:

- Improving customer satisfaction by answering inquiries in the languages preferred by customers
- Deflecting unnecessary incoming calls by providing solutions in languages that are the most useful for customers
- Managing inquiries in multiple languages from one location, anytime and anywhere

Review the following key terms for multilingual solutions:

Master Solution

A solution created in any language supported by Salesforce. A master solution can have zero or more translations associated with it; it cannot be linked to another master solution.

Translated Solution

A solution translated into another language supported by Salesforce and associated with exactly one master solution. A translated solution cannot have the same language as its master solution or any other translated solutions associated with that master solution. A translated solution cannot have other translated solutions associated with it. Translated solutions are represented by the  icon on solution detail pages, solution edit pages, solution list views, and solution search results.

You can work with multilingual solutions from the following:

Solutions Tab

When creating a new solution, users can choose a language in which to write the solution from the `Language` picklist field. Once the solution is saved, it becomes a master solution. Users can then create a translated solution by clicking **New** on the Translated Solutions related list of the master solution detail page. When a master solution is modified, users can adjust the statuses of its translated solutions to indicate that they may need translating.

Cases Tab

When users search for relevant solutions on a case by entering keywords in the Solutions related list and clicking **Find Solution**, search results include solutions in all languages that have matching keywords. Alternatively, if suggested solutions is enabled for cases, users can click **View Suggested Solutions** to find relevant solutions in multiple languages if they share common words with the case.

EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Self-Service Portal

If multilingual solution search is enabled for your Self-Service portal, customers automatically view solution search results in their preferred language as specified in their Self-Service user information settings. Customers can also choose to view solution search results in a specific language or all supported languages via a language drop-down list. By default, the Login Page of your Self-Service portal displays in your organization's language.

Public Solutions

If multilingual solution search is enabled for your public solutions, customers can choose to view solution search results in a specific language or all supported languages via a language drop-down list. By default, public solutions display in your organization's language.

Solution Categories

Users with the "Manage Translation" permission can use the translation workbench to translate solution categories so that they display in the language of each user on the Solutions tab and in the preferred language of each customer on the Self-Service portal as specified in the customer's user settings. Solution categories are not translated for public solutions.

Reports

You can track translated solutions marked `Out of Date` by choosing the Translated Solutions report. Running this report also lists the title and details of translated solutions. You can also create a custom report for multilingual solutions using the Master and Translated Solutions report type.

List Views

You can see which translated solutions are marked `Out of Date` and may need translating by creating a custom list view on the Solutions tab and entering the following search criteria: "Out of Date equals True".

Import

The Data Import Wizard includes options to import master and translated solutions and associate them with each other.

To learn more about enabling multilingual solutions, see [Enabling Multilingual Solutions](#) on page 2700.

SEE ALSO:

[Categorizing Solutions](#)

[Creating Solutions](#)

Suggested Solutions Overview

The suggested solutions feature displays up to ten relevant solutions that may help users and customers solve a particular case from the case detail page, Salesforce Customer Portal, or the Self-Service portal.

Suggested solutions can lower support costs by:

- Reducing the time it takes for customer support reps to solve cases
- Improving customer support reps' productivity by offering them proactive access to all solutions for any case
- Enabling customers to solve and close their own cases

The solutions displayed are not simply found via a keyword search. Rather, the following variables are entered into a formula that automatically scores the relevancy of each solution to the particular case:

- Word frequency in all solutions
- Word frequency in similar cases with related solutions
- Proximity of the keywords within the solutions
- Word similarities to self-closed cases and solutions rated useful by Self-Service users
- The number of additional cases associated with a solution

You can enable suggested solutions for the following:

Cases tab

Users can click **View Suggested Solutions** from the case detail page to view a list of solutions relevant to their case. If multilingual solutions is enabled for your organization, search results return solutions in all languages that have matching keywords. However, search results across all languages might not be reliable because terms searched from one language to another are processed differently.

Customer Portal and Self-Service portal

Customers can view solutions relevant to their case when they submit a case or view cases online.

Customers can self-close their cases using suggested solutions.

When customers log new cases or click the **View Suggested Solutions** button on an existing case in the Customer Portal or Self-Service portal, a list of suggested solutions is displayed, including solutions in multiple languages for organizations with multilingual solutions enabled. When customers select a solution from the list, they can click **Yes** after **Does this Solution help you answer your question?** and then select a reason as to why they closed their case. The case will close with an indication on the `Closed by Self-Service User` case field. If the customer clicks **No**, they will be returned to the list of suggested solutions. If no suggested solutions are found, the Suggested Solutions Page is bypassed, and the customer is directed to their case.

Case auto-response rules and emails

Your support team can help customers solve their own cases without the assistance of customer support reps. Simply create email auto-responses for cases submitted via email, Web-to-Case, or the Self-Service portal. Within the auto-response email template, include the suggested solutions merge field, `{!Case_Suggested_Solutions}`, which provides outbound emails with direct links to the subject and description of each solution that may help customers answer their inquiries.

 **Note:** Sending mass emails using templates with the suggested solutions merge field could take several minutes and is not recommended.

The `Closed by Self-Service User` field, along with a `Closed When Created` field, can be added to case [page layouts](#). These fields are automatically set by Salesforce and can't be modified. You can run reports on the `Closed by Self-Service User` and `Closed When Created` fields to see how cases have been closed.

EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To enable suggested solutions:

- "Customize Application"

To modify Self-Service pages:

- "Manage Self-Service Portal"

AND

"Customize Application"

- Report on the `Closed by Self-Service User` field to see how many cases have been closed by users via suggested solutions on the Self-Service portal
- Report on the `Closed When Created` field to see how many cases have been immediately saved and closed upon creation by support reps.

 **Note:**

- Suggested solutions don't display [Salesforce Knowledge](#) articles.
- Suggested solutions isn't available for the public solutions because public solutions users don't have an authenticated login that allows them to create or access cases.

[Multilingual Solutions Overview](#)

Customizing Solution Settings

To customize solution settings:

1. From Setup, enter `Solution Settings` in the `Quick Find` box, then select **Solution Settings**.
2. Click **Edit**.
3. Select `Enable Solution Browsing` to turn on the ability to browse for and find solutions by category.

This setting enables solution browsing on the Solutions tab, Customer Portal, and when solving a case.

4. Select `Enable Multilingual Solutions` to turn on the ability for users to [translate solutions](#) into multiple languages.

You can deselect the `Enable Multilingual Solutions` checkbox at any time, but deselecting it removes all associations between master and translated solutions and automatically disables the `Enable Multilingual Solution Search in Self Service Portal` and `Enable Multilingual Solution Search for Public Solutions` settings. If you select the `Enable Multilingual Solutions` checkbox again, the associations between master and translated solutions are restored.

5. Select `Enable Multilingual Solution Search in Self-Service Portal` to add a language drop-down list to the Self-Service portal that automatically restricts search results to solutions that match the Self-Service portal user's language. From the language drop-down list, Self-Service portal users can choose whether to search for solutions in a specific language or any language supported by Salesforce.

Deselecting this checkbox removes the language drop-down list from the Self-Service portal, and search results include solutions in all languages, regardless of the Self-Service portal user's language.

6. Select `Enable Multilingual Solution Search for Public Solutions` to add a language drop-down list to public solutions so that public solutions users can choose which language to search for solutions. From the language drop-down list, public solutions users can choose whether to search for solutions in a specific language or any language supported by Salesforce. Deselecting this checkbox removes the language drop-down list from public solutions, and search results include solutions in all languages.

USER PERMISSIONS

To change solution settings:

- "Customize Application"

7. Select **Enable HTML Solutions** to create and display solutions in HTML. When enabled, solutions appear in HTML in Salesforce, public solutions, Self-Service portal, and Salesforce Customer Portal. Using [HTML Solutions](#) allows users to easily format solution details by changing fonts and colors, and adding images and hyperlinks.

 **Warning:** Once you select **Enable HTML Solutions**, you cannot disable it.

8. Select **Solution Summary** to display up to 150 characters of the solution details in the solution search results. Deselecting this checkbox removes the solution summary from the results.
9. Select **Inline Category Breadcrumbs** to display up to 150 characters of the breadcrumb trail of categories to which the solution belongs in the search results. Deselecting this checkbox removes the breadcrumbs from the results.
10. Click **Save**.
11. To enable solution browsing by customers in public solutions or your Self-Service portal, see [Enabling Public Solutions](#) on page 2702 and [Enable Self-Service Features and Settings](#) on page 2363.

In addition, you can customize the top-level category accessible by public solutions and Self-Service users. You do not need to modify this setting if you want customers to view all categories and all solutions that are visible in the Self-Service portal or visible in public solutions.

-  **Note:** Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

SEE ALSO:

[Categorizing Solutions](#)

[Managing Solution Categories](#)

[Enabling Multilingual Solutions](#)

Getting Started with Categories

Follow these steps to ensure a successful rollout of solutions:

1. Plan which categories your support team needs.

Keep in mind that you can also allow customers to find solutions by category in public solutions and your Self-Service portal. You can specify that customers can view only solutions in a particular category and all of its subcategories.

 **Note:** Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.
2. Define your categories; see [Defining Solution Categories](#) on page 2699.
3. Categorize your solutions; see [Categorizing Solutions](#) on page 2197. Administrators, and users with the "Manage Categories" permission, can categorize solutions prior to enabling solution categories for the entire organization.
4. Create a custom report of type Solution Categories to verify that all solutions are categorized appropriately. To find any uncategorized solutions, use the advanced report filters; choose the **Category Name** field and the "equals" operator, and leave the third field blank. Administrators, and users with the "Manage Categories" permission, can create solution category reports prior to enabling solution categories for the entire organization.
5. Enable solution category browsing for the Solutions tab; see [Customizing Solution Settings](#) on page 2697.

USER PERMISSIONS

To create or change solution categories:

- "Manage Categories"

6. Enable solution category browsing for customers using public solutions and your Self-Service portal. See [Enabling Public Solutions](#) on page 2702 and [Enable Self-Service Features and Settings](#) on page 2363.
7. Specify the top-level category accessible by customers using public solutions and your Self-Service portal. This is useful if you want to have certain categories available only to internal staff.

Leave this blank if you want customers to view all categories and all solutions that are visible in Self-Service portal or visible in public solutions.

SEE ALSO:

[Managing Solution Categories](#)

Defining Solution Categories

Begin by creating your solution categories. The All Solutions category is automatically created for you as the top of your solution hierarchy. Users cannot add solutions to this category or translate it.

1. From Setup, enter *Solution Categories* in the Quick Find box, then select **Solution Categories**.
2. Click **Add Category** to create a subcategory below a specific category.
3. Enter the category name. Category names cannot include the backslash “\” character.
4. Select a different parent category, if desired. The parent category is the category directly above this category in the hierarchy.
5. Select a sort order for any subcategories you create under this category.
 - Choose Alphabetical Order to sort subcategories alphabetically.
 - Choose Custom Order to sort subcategories in the order you specify; see [Adding and Sorting Subcategories](#) on page 2699.
6. Click **Save**.
7. After creating categories, categorize your solutions. See [Categorizing Solutions](#) on page 2197. Administrators, and users with the “Manage Categories” permission, can categorize solutions prior to enabling solution categories for the entire organization.
8. Then, after categorizing solutions, turn on solution category browsing on the Solutions tab. See [Customizing Solution Settings](#) on page 2697.
9. To enable solution category browsing for the public knowledge base or your Self-Service portal, see [Enabling Public Solutions](#) on page 2702.

Editing and Deleting Categories

From the list of solution categories, you can:

- Click **Edit** to modify the category name, parent category, or sort order.
- Click **Del** to delete the category. The solutions associated with the category are not deleted.
 -  **Note:** You cannot delete a category in use by a Salesforce Customer Portal. For more information, see [Enable Customer Portal Login and Settings](#) on page 2308.
- Click the category name to view the category details.

Adding and Sorting Subcategories

From a category detail page, you can:

- Click **New** to add a subcategory below the category.

- Enter a custom sort order for the subcategories.
 1. Edit the category to set the `Subcategory Sort Order` to Custom Order.
 2. Enter numbers in the Order column to specify the order of the subcategories.
 3. Click **Reorder**.

SEE ALSO:

[Categorizing Solutions](#)

Managing Solution Categories

Create solution categories so that users can group similar solutions together. Once your solutions are categorized, users can browse for and find solutions by category from the Solutions tab or when solving a case. Customers can also browse solutions by category in public solutions, the Self-Service portal, and the Customer Portal.

- **Note:** Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

[Getting Started with Categories](#)

[Defining Solution Categories](#)

Enabling Multilingual Solutions

You can turn on multilingual solutions so users have the ability to translate solutions into multiple languages.

Preparing for Multilingual Solutions

Before you enable multilingual solutions:

- Run solution reports to locate any existing solutions that are already translated and will need to be converted to translated solutions after you enable multilingual solutions.

When multilingual solutions is enabled for the first time, all existing solutions automatically become master solutions. You can create translated solutions from master solutions by associating a master solution without any translated solutions with a master solution of a different language via the `Master Solution` lookup field.

- Translate any existing solution categories.

USER PERMISSIONS

To create or change solution categories:

- "Manage Categories"

EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To enable multilingual solutions:

- "Customize Application"

Translated solutions inherit the solution categories of their master solution. We recommend that you translate your solution categories before enabling multilingual solutions and then associate solutions with each other. This will help you associate solutions with the correct categories.

Enabling Multilingual Solutions

To enable multilingual solutions:

1. From Setup, enter *Solution Settings* in the Quick Find box, then select **Solution Settings**.
2. Click **Edit**.
3. Select **Enable Multilingual Solutions**.

Optionally, select **Enable Multilingual Solution Search in Self-Service Portal** and **Enable Multilingual Solution Search for Public Knowledge Base** to allow customers to view solution search results in a specific language or all supported languages via a language drop-down list.

4. Click **Save**.
5. Customize solution page layouts to include the **Master Solution Title** field, **Master Solution Details** field, **Out-of-Date** field, and the Translated Solutions related list. The **Language** picklist and **Master Solution** lookup fields are automatically added to solution page layouts when you enable multilingual solutions.

 **Tip:** You can make solution edit pages easier for users to translate multilingual solutions by setting the Detail Information section to two columns and placing the **Master Solution Title** and **Master Solution Details** fields alongside each other. Underneath those fields, place the **Solution Title** and **Solution Details** fields alongside each other so that users can effortlessly compare the master and translated solutions. Note that the **Master Solution Title** and **Master Solution Details** fields display only on the translated solution edit page.

6. Set the field-level security settings of the **Master Solution** lookup field to editable for profiles or permission sets with the “Create” and “Edit” permissions on solutions.

When the **Master Solution** lookup field is editable, users can associate translated solutions with master solutions.

Field-level security is available in Enterprise, Unlimited, Performance, and Developer Editions only.

7. Set the field-level security settings of the **Out of Date** checkbox field to visible for all profiles or permission sets with the “Read” permission on solutions.

Field-level security is available in Enterprise, Unlimited, Performance, and Developer Editions only.

8. As a best practice, add a long text area custom field to solutions called **Translation Comments** and include it on solution page layouts so that users can add any comments regarding the translation of the solution. Users should include a date with their comments so that other users can see when each comment was added.

 **Note:** You can deselect the **Enable Multilingual Solutions** checkbox at any time, but deselecting it removes all associations between master and translated solutions and automatically disables the **Enable Multilingual Solution Search in Self Service Portal** and **Enable Multilingual Solution Search for Public Solutions** settings. If you select the **Enable Multilingual Solutions** checkbox again, the associations between master and translated solutions are restored.

Rolling Out Multilingual Solutions

After enabling multilingual solutions:

- Associate any existing translated solutions with the appropriate master solutions.

You can do this manually using the `Master Solution` lookup field, or you can export a report of existing translated solutions and then import those solutions to associate them with a master solution. For each translated solution you import, include the 15 to 18 character `Solution ID` field of its master solution in a master solution column on your import file. To view the `Solution ID` field for master solutions, run the Translated Solution report. If you import solutions by mistake, you can use mass delete to remove them from your organization.

[Multilingual Solutions Overview](#)

[Categorizing Solutions](#)

Enabling Public Solutions

 **Note:** Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

Using the Solutions tab, your customer support team can create solutions that people outside of your organization may find helpful. Using HTML code supplied by Salesforce, and with the help of your website administrator, you can add a search box and button to your website that allows your customers to search for solutions. This functionality is known as Public Solutions.

With public solutions, your customers can find answers to frequently asked questions without having to call your customer support center. All solutions with a `Status` of Reviewed and the `Visible in Public Knowledge Base` field checked will be available as public solutions, including any solution attachments.

Public solutions are different from the Self-Service portal and Salesforce Customer Portal because users are not required to log in, and they can only search for solutions, not submit cases. For more information about the Self-Service and Customer Portal, see [Setting Up Self-Service](#) on page 2362 and [Setting Up Your Customer Portal](#) on page 2300.

 **Note:**

- The search box and button are displayed in a frame; your website must support frames in order for the solution search feature to work.
- Suggested solutions don't display [Salesforce Knowledge](#) articles.

To enable Web access to solutions:

1. From Setup, enter `Public Solutions` in the `Quick Find` box, then select **Public Solutions**.
2. Click **Edit**.
3. Check `Public Solutions Enabled`.
4. If your organization uses solution categories, check `Enable Solution Browsing` to allow customers to browse solutions by category. Solution categories cannot be translated into other languages for public solutions.

If multilingual solutions is enabled for your organization, you can add a language drop-down list to public solutions so that customers can choose which language to search for solutions. For more information, see [Customizing Solution Settings](#) on page 2697.
5. If solution category browsing is enabled, select the `Top-Level Category` accessible by customers in public solutions. Customers can view all solutions in this category and its subcategories if they are marked `Visible in Public Knowledge Base`. Leave `Top-Level Category` blank if you want customers to view all solutions in all categories when they are visible as public solutions.

EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To enable web access to solutions:

- "Customize Application"

6. If desired, you can change the appearance of the frame on your website by specifying the `Maximum Page Width` and `Minimum Page Height`.
7. Provide the URL of your CSS page in `Style Sheet URL`. The CSS file does not have to exist yet; you can download a sample file as a starting point later, or use your own file.
8. You can change the word or phrase that is used to describe solutions in the frame in `Alternative Term`. Provide singular and plural versions of the term.
9. Click **Save**.
10. If desired, click **Download Sample CSS File** to get the Salesforce style sheet.
11. Click **Generate HTML**.
12. Copy the resulting HTML code and click **Finished**.
13. Send the HTML (and the CSS file, if you downloaded it) to your website administrator to be added to your site as follows:
 - Add the HTML to your Web page.
 - Customize the downloaded style sheet.
 - Host the style sheet in a publicly accessible location on your Web server.

Configuring Support Teams

Setting Up Case Teams

A case team is a group of people that work together on a case, such as a support rep, support manager, and a product manager.

Every member of a case team has a role that he or she plays for the case, such as “Customer Contact” or “Case Manager.” Roles determine access to the case, like Read Only or Read/Write access, and whether the member in the role is visible to users in the Customer Portal.

To set up case teams:

1. [Define case team roles](#).
2. Add the Case Team related list to case page layouts.

The Case Team related list enables users to add case team members and predefined case teams to cases.
3. Optionally, [predefine case teams](#) so that users can easily add the users they usually work with to cases.
4. [Set up workflow alerts](#) to specify what actions on a case will send an email notification to case team members.
5. Optionally, create assignment rules so that when a case matches assignment rule criteria, a predefined case team is automatically added to the case.

Tips on Setting Up Case Teams

Consider the following when setting up case teams:

- Case teams are not available for the partner portal.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To set up case teams:

- “Customize Application”
- AND
- “Manage Users”

To add team members:

- “Edit” on cases

- Customer Portal users can view the Case Team related list if it is included on case page layouts associated with their profile. However, Customer Portal users cannot update case teams or view case team role details on cases.
- Case teams count towards your organization's overall storage limit. Each team member on a case counts towards 2 KB of storage space.

SEE ALSO:

[Case Teams](#)

Case Teams

A case team is a group of people that work together on a case, such as a support rep, support manager, and a product manager.

You can build a case team on the Case Team related list of a case. When selecting a team member, choose a role to indicate the role the person plays on the case. Case team roles determine the level of access each case team member has to the case. For example, you can choose a role that gives some team members read only access and others read and write access to the case. Furthermore, administrators can set up workflow alerts to specify which actions on a case send an email notification to case team members. For example, an administrator could set up workflow alerts to send notifications to case team members when a new case comment is added to a case.

If you have the “Customize Application” permission, you can [predefine case teams](#). Predefined case teams can include the users that you normally work with on your cases. Administrators can create assignment rules that automatically add predefined case teams to all cases that match assignment rule criteria.

You can filter case lists by case teams where you are a member. Simply select the **My Case Teams** filter on case list views. You can also report on case teams in which you are a member. After you run a case report, select **My team's cases** from the **view** filter.

Define Case Team Roles

A case team is a group of people that work together on a case, such as a support rep, support manager, and a product manager. Every member of a case team has a role that he or she plays for the case, such as “Customer Contact” or “Case Manager.” Roles determine access to the case, like Read Only or Read/Write access, and whether the member in the role is visible to users in the Customer Portal.

To access the Case Team Roles page, from Setup, enter *Case Team Roles* in the Quick Find box, then select **Case Team Roles**. From the Case Team Roles page, click the appropriate links to perform the following actions.

Create Team Roles

To create a case team role:

1. Click **New**.
2. Enter a name for the role.
3. From the *Case Access* picklist, select the role's level of access to cases. The possible access levels are:

Access Level	Description
Read/Write	User can view and edit the record, and add associated records, notes, and attachments to it.
Read Only	User can view the record, and add associated records to it. They cannot edit the record or add notes or attachments.
Private	User cannot access the record in any way.

4. Optionally, select *Visible in Customer Portal* if you want the users in this role visible to Customer Portal users viewing cases.

Customer Portal users included in a case team can view themselves on the Case Team related list of cases, even if they are in a role where the *Visible in Customer Portal* checkbox is not selected.

5. Click **Save**. Alternatively, click **Save & New** to save the role and begin creating another new role.

After you create case team roles, you can predefine case teams.

Update Team Roles

To update a case team role:

1. Click **Edit** next to the name of the case team role you wish to update.
2. Update the appropriate fields.
3. Click **Save**.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To set up case teams:

- “Customize Application”

AND

“Manage Users”

To add team members:

- “Edit” on cases

Replace Team Roles

To replace a case team role and globally replace the role in all existing cases:

1. Click **Replace** next to the name of the case team role you wish to replace.
2. Choose a case team role with which to replace the existing role.
3. Click **Save**.

Tips on Defining Case Team Roles

Consider the following when defining case team roles:

- By default, case owners have full access to cases they own. Case team roles cannot update case owners' access level to cases.
- You can add contacts and Customer Portal users to roles that have Read/Write access on cases. However, only contacts enabled as Customer Portal users can access cases, as contacts cannot log in to Salesforce.
- Currently, you can create an unlimited amount of roles for case teams. Yet, because case team roles cannot be deleted, we recommend that you create no more than 20 roles so that users do not have too many roles to choose from when working with case teams.
- If your organization has only one case team role, you cannot replace it.

SEE ALSO:

[Case Teams](#)

[Setting Up Case Teams](#)

Predefining Case Teams

A case team is a group of people that work together on a case, such as a support rep, support manager, and a product manager.

After you [define case team roles](#), you can predefine case teams so that users can quickly add a team of specific users to the Case Team Members related list on cases.

To access the Predefined Case Teams page, from Setup, enter *Predefined Case Teams* in the **Quick Find** box, then select **Predefined Case Teams**. From the Predefined Case Teams page, click the appropriate links to perform the following actions:

Create Predefined Case Teams

To create a predefined case team:

1. Click **New**.
2. Enter a name for the team.
3. Optionally, enter a description for the team.
4. Optionally, add team members:
 - a. Select the type of user from the **Team Member** picklist, either User, Contact, or Portal User; then click the Lookup icon () to choose a specific user to add to the team.
Contacts can only view cases via a Customer Portal.
 - b. Select the case team role to apply to the team member from the **Member Role** picklist.

USER PERMISSIONS

To set up case teams:

- "Customize Application"
- AND
- "Manage Users"

To add team members:

- "Edit" on cases

Every member of a case team has a role that he or she plays for the case, such as “Customer Contact” or “Case Manager.” Roles determine access to the case, like Read Only or Read/Write access, and whether the member in the role is visible to users in the Customer Portal.

5. Click **Save**.

Add Team Members to Predefined Case Teams

To add a new member to a predefined case team:

1. Select the name of the predefined case team.
2. Click **Add Team Member**.
3. Select the type of user from the **Team Member** picklist, either User, Contact, or Portal User; then click the Lookup icon () to choose a specific user to add to the team.

Contacts can only view cases via a Customer Portal.

4. Select the case team role to apply to the team member from the `Member Role` picklist.

Every member of a case team has a role that he or she plays for the case, such as “Customer Contact” or “Case Manager.” Roles determine access to the case, like Read Only or Read/Write access, and whether the member in the role is visible to users in the Customer Portal.

5. Click **Save**.

Update Predefined Case Teams

To update a predefined case team:

1. Click **Edit** next to the name of the predefined case team you wish to update.

Optionally, click **Del** to delete the predefined case team.

When you delete a predefined case team, the case team is automatically removed from all cases with which it is associated. Furthermore, you cannot retrieve deleted predefined case teams from the Recycle Bin.

2. Update the appropriate fields.
3. Click **Save**.

Update Predefined Case Teams Members

To update the team members on a predefined case team:

1. Select the name of the predefined case team.
2. Optionally, click:

- A member's name to view that user's details.

If you have the “Manage Internal Users” permission, you can update the user's details and reset the user's password from the user's detail page.

- A member's case team role to update the details of the case team role.

Every member of a case team has a role that he or she plays for the case, such as “Customer Contact” or “Case Manager.” Roles determine access to the case, like Read Only or Read/Write access, and whether the member in the role is visible to users in the Customer Portal.

3. Click **Edit**.**4.** Optionally:

- Click the **Remove** link next to an existing team member to remove him or her from the case team.

When you remove a member from a predefined case team, the user is automatically removed from all cases with which he or she is a member of that case team.

- Click the **Add 1 Row** link to add a new row with which you can add a case team member.
- On existing team member rows, you can:
 - Select the type of user from the **Team Member** picklist, either User, Contact, or Portal User; then click the Lookup icon () to choose a specific user to add to the team.

Contacts can only view cases via a Customer Portal.

- Select the case team role to apply to the team member from the `Member Role` picklist.

Every member of a case team has a role that he or she plays for the case, such as “Customer Contact” or “Case Manager.” Roles determine access to the case, like Read Only or Read/Write access, and whether the member in the role is visible to users in the Customer Portal.

5. Click **Save**.

Tips on Predefining Case Teams

Consider the following when predefining case teams:

- You cannot delete a predefined case team if it is associated with an assignment rule. To delete the predefined case team, you must first remove it from any assignment rules.
- When you delete a predefined case team, the case team is automatically removed from all cases with which it is associated. Furthermore, you cannot retrieve deleted predefined case teams from the Recycle Bin.
- When you remove a member from a predefined case team, the user is automatically removed from all cases with which he or she is a member of that case team.

Set Up Email Alerts for Case Team Members

A case team is a group of people that work together on a case, such as a support rep, support manager, and a product manager.

You can set up email alerts for case team members so that each time a case is updated or created, team members associated with the case are automatically notified.

To set up email alerts for members on case teams:

1. Create email templates with which to notify case team members.

Optionally, enter merge fields in the template subject and text body. These fields will be replaced with information from your records when you send an email.

2. Set up workflow rules that specify what actions on a case trigger email notifications to case team members:

- a. From Setup, enter *Workflow Rules* in the *Quick Find* box, then select **Workflow Rules**.

- b. On the workflow rules list page, click **New Rule**.

- c. Choose Case from the *Select object* picklist and click **Next**.

- d. Enter a rule name.

- e. Optionally, enter a description for the rule.

- f. Choose the evaluation criteria.

We recommend that you set the evaluation criteria to *Evaluate the rule when a record is: created, and every time it's edited* because this ensures that every case is evaluated as to whether it should trigger notifications to case team members.

- g. Enter your rule criteria.

We recommend that you choose *criteria are met* and select the filter criteria that a case must meet to trigger notifications to case team members. For example, set the filter to *Case: Status equals New* if you want case team members to receive a notification each time a case's status is set to New.

- h. Optionally, enter filter logic.

- i. Click **Save & Next**.

3. Add email alerts to the workflow rule so that notifications are sent to case team members when actions on cases match rule criteria:

- a. Click **Add Workflow Action** and choose **New Email Alert** from the drop-down button.

- b. Enter a description for the email alert.

The object is read only if the new email alert is associated with a workflow rule for a particular object.

- c. Choose an email template.

- d. Select the type of recipients who you want to receive this email alert.

Optionally, select Case Team from the *Recipient Type* picklist to choose all users with a particular case team role as recipients.

The recipients that match your search results appear in the Available Recipients list.

[Setting Up Case Teams](#)

Creating Queues

1. From Setup, enter *Queues* in the *Quick Find* box, then select **Queues**.
2. Click **New**.
3. Enter the Label and Queue Name. The Label is the queue label as it appears on the user interface. The Queue Name is a unique name used by the API and managed packages, and can only contain alphanumeric characters and underscores.
4. Choose email notification settings for the queue:

To Notify	You Must
One email address when new records are placed in the queue	Add an email address to <i>Queue Email</i> . You can add an email address for an individual user or an email distribution list.
All queue members individually when new records are placed in the queue	Leave <i>Queue Email</i> blank.
All queue members and the <i>Queue Email</i> individually when new records are placed in the queue	Add an email address to <i>Queue Email</i> and check <i>Send Email to Members</i> .

5. If your organization uses divisions, select the default division for the queue.
This determines the division for a record when it's assigned to the queue via assignment rules or a manual change of ownership. Note that cases inherit the division of the contact they're related to, or they're assigned to the default global division if no contact is specified.
6. Choose the objects available to the queue.
7. Choose queue members.
You can select individual users, roles, public groups, territories, connections, or partner users. Only queue members and users above them in the role hierarchy can take ownership of records in the queue, depending on your organization's sharing settings.
8. Click **Save**.

Tips on Creating Queues

- When you create a queue, Salesforce automatically creates a corresponding list view. Users can access the queue list view from the Cases, Leads, Service Contracts or custom object tabs. Only queue members and users above them in the role hierarchy have access to the queue list view, depending on your sharing settings.
- After you have defined a queue, you can set up lead or case assignment rules to automatically reassign ownership of leads and cases to the queue.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer
- Database.com

USER PERMISSIONS

To create or change queues:

- "Customize Application"
- AND
- "Manage Public List Views"

To change queues created by other users:

- "Customize Application"
- AND
- "Manage Public List Views" and "Manage Users"

- After you have defined a queue for a custom object, you can set up a workflow rule that automatically reassigns ownership of custom object records to the queue via a field update on the record owner field.

[Managing Queues](#)

Queues Overview

Queues help your teams manage leads, orders, cases, service contracts, and custom objects. Once records are placed in a queue manually or through an automatic case or lead assignment rule, records remain there until they're assigned to a user or taken by one of the queue members. Any queue member or users above them in the role hierarchy can take ownership of records in a queue. For example:

Lead queues

Help you manage the distribution of leads. For example, you may have a lead queue for a Western Region team and one for an Eastern Region team. You can put leads in different queues, either manually or automatically via a lead assignment rule as leads are imported, created or edited manually, or captured from the Web. Make salespeople members of one or more lead queues.

Case queues

Help you manage your support workload and differentiate cases based on support levels. With queues, you can ensure that cases are resolved quickly even if a specific user is on vacation. By creating queues for different support levels, such as Gold Service and Silver Service, cases are automatically prioritized. You can put cases in different queues, either manually or automatically via a case assignment rule as cases are generated from the Web or created manually. Make support agents members of case queues.

Knowledge article version queues

Help you manage the distribution of versions of Salesforce Knowledge articles for translation. For example, if multiple languages are used for your knowledge base, you can assign new versions of articles to a queue of users who can translate the article into a specific language.

Service contract queues

Help you manage the distribution of service contracts. For example, you may have a dedicated group of users who review service contracts. When a service contract is created, assign it to a queue so queue members can review the service contract.

Custom object queues

Help you manage the distribution of custom object records. When a custom object record is created, manually assign it to a queue so that the users assigned to the queue can access it and take ownership of it.

Lead queues, case queues, and service contract queues are not available in **Database.com**

USER PERMISSIONS

To create or change queues:

- "Customize Application"
- AND
- "Manage Public List Views"

To change queues created by other users:

- "Customize Application"
- AND
- "Manage Public List Views" and "Manage Users"

Viewing and Editing Queues

To view or edit a queue:

1. From Setup, enter *Queues* in the *Quick Find* box, then select **Queues** and select the queue name.
2. Click:
 - **Edit** to make changes to the queue.
 - **Delete** to remove the queue.
You can't delete a queue if it's in an assignment rule or has records in it.
 - **View All Users** to view the queue's members plus any users who have the same access as queue members because they're higher in your organization's role hierarchy.
You can click **View Queue Members** to return to the Queue Members related list.
3. If you edited the queue, click **Save**.

Adding Social Customer Service

Welcome to Social Customer Service

Social Customer Service lets you respond to your customers via social networks and capture important case information.

 **Important:** You must log a Salesforce support ticket to enable the Social Objects and Social Publisher organization permissions. Once enabled, you can use the starter pack if you have two or fewer social accounts to track. Otherwise, you must have sufficient Radian6 managed accounts or Social Studio Social Accounts. If you are switching from the Social Studio (Radian6) for Salesforce package, make note of it in your support ticket.

Watch the following video for a brief overview on getting started with Social Customer Service.

[Support Your Customers on Their Social Networks\(2:58\)](#)

Social Customer Service integrates with Radian6 and Social Studio so service agents and sales representatives can engage customers by responding to cases and leads created from Twitter and Facebook. Administrators can customize how the inbound social content is processed using an Apex class and configure who in their organization has permission to respond using the social channels. Feed items are created on the case or lead for inbound and outbound content, making it easy for support agents to solve customers' questions and for sales representatives to communicate with prospects.

 **Note:** When a lead is converted to an account or contact, the social items in the feed are removed.

If Quick Text is enabled, agents can create ready-to-send responses to social customers. See [Enable Quick Text](#) and [Create Quick Text Messages](#).

In Salesforce1, agents can see and reply to social content from mobile devices.

For Twitter accounts, agents can use case and lead feeds to see the content they are responding to, retweet, mark as favorite and follow tweets, send replies to tweets and direct messages, and delete tweets managed by your social accounts.

For Facebook accounts, cases and leads are created from your managed Facebook page and agents can use the feeds to see the content they are replying to, like posts and comments, send posts, comments, replies, and private messages, and delete posts managed by your social accounts.

[Social Action Tips](#)

EDITIONS

Available in: Salesforce Classic

Social Customer Service is available in **Enterprise**, **Performance**, and **Unlimited** editions.

USER PERMISSIONS

To administer Social Customer Service:

- "Manage Users"
- AND
- "Customize Application"

To create case feed items:

- Feed Tracking for All Related Objects on the Case object

To send and receive social media posts or messages:

- Case Feed enabled

AND

Access to a social account

Implementing Social Customer Service

Enable social customer service in your organization and customize your support agents' experience.

- [Set up Social Customer Service](#)
- [Create the Social Action Interface](#)
- [Enable Moderation for Social Customer Service](#)
- [Modify the Default Apex Class](#)

SEE ALSO:

- [Social Action Tips](#)
- [Managing Social Posts](#)
- [Managing Social Personas](#)

Set up Social Customer Service

Enable Social Customer Service, install the socialcustomerservice package, sync your social accounts, and assign social handles.

Important: You must log a Salesforce support ticket to enable the Social Objects and Social Publisher organization permissions. Once enabled, you can use the starter pack if you have two or fewer social accounts to track. Otherwise, you must have sufficient Radian6 managed accounts or Social Studio Social Accounts. If you are switching from the Social Studio (Radian6) for Salesforce package, make note of it in your support ticket.

Your organization must have Radian6 or Social Studio set up with a data source to gather inbound social content from Twitter and Facebook. If you use the starter account, Salesforce will set this up for you.

Important: Case Feed Tracking for All Related Objects must be enabled for case feed items to be created. See [Set Up Case Feed](#) on page 2521. For Leads, from Setup, enter *Feed Tracking* in the Quick Find box, then select **Feed Tracking** and ensure **Enable Feed Tracking** and **All Related Objects** are checked. When a lead is converted to an account or contact, the social items in the feed are removed.

1. From Setup, enter *Social Customer Management* in the Quick Find box, then select **Settings**.
2. On the Settings tab, check **Enable Social Customer Service**.
The socialcustomerservice package is installed.

EDITIONS

Available in: Salesforce Classic

Social Customer Service is available in **Enterprise**, **Performance**, and **Unlimited** editions.

USER PERMISSIONS

To administer Social Customer Service:

- "Manage Users"
- AND
- "Customize Application"

To create case feed items:

- Feed Tracking for All Related Objects on the Case object

EDITIONS

Available in: Salesforce Classic

Social Customer Service is available in **Enterprise**, **Performance**, and **Unlimited** editions.

USER PERMISSIONS

To administer Social Customer Service:

- "Manage Users"
- AND
- "Customize Application"

To create case feed items:

- Feed Tracking for All Related Objects on the Case object

3. If you want posts approved before they send, check `Enable approvals for social posts`.

As part of a job training or quality review process, you may require some agents to have their posts approved rather than allowing them to post freely. With approval processes and user permissions, selected agents can submit social posts for approval, recall the posts, and retry or resubmit them. Approvers can approve and reject posts for publication. See [Enable Social Post Approvals](#) on page 2719.

4. Under `Radian6 Credentials`, either create a Radian6 or Social Studio account with the starter pack by clicking **Create Account**, or click **Login** and enter your Radian6 or Social Studio credentials.

 **Note:** With the Social Customer Service Starter Pack, you can enable Social Customer Service and up to two social accounts from any social network. For example, if you add one Twitter account, you can only add one Facebook account. You can't downgrade from a Radian6 or Social Studio account to the starter pack. The starter pack doesn't support the moderation feature (all posts become cases) and the default Apex code can't be customized.

5. On the Social Accounts tab, click **Add Account** and select your social network, for example Twitter or Facebook.

The social network opens and asks you to authenticate the account. Once your account is authenticated, Salesforce returns you to the Social Accounts tab.

 **Note:** If you receive an error "We're sorry, but we currently do not support Facebook business accounts registration." or "Your Facebook account can't be added due to unsupported features.", you might need to set a user name on your Facebook page.

6. Click the refresh icon next to **Add Account**.

 **Note:** Social accounts that a user no longer has access to are automatically disabled and hidden from the active accounts.

7. If you are using the Starter Pack, check the `Case Creation` box to indicate that you want cases created automatically when posts come from the social account.

For example, if you have two Twitter handles, one for support and one for marketing or brand-focused information, you can have cases created automatically only from the support handle. The tweets from the marketing handle go in a social post queue for review. See [Managing Social Posts](#) on page 2284.

 **Note:** If you are using the full Social Customer Service version, you can set up case moderation through Radian6 or Social Studio. See [Enable Moderation for Social Customer Service](#) on page 2720.

8. If you have a portfolio of managed social accounts, set the `Default Responses From` for each Twitter, Instagram (pilot), and Sina Weibo (pilot) accounts. This lets you standardize and raise awareness of your brand's support by setting a dedicated support handle, for example @acmehelp or @acmesupport. Also, agents have fewer clicks when they are sending outbound posts because the chosen account appears as the default value in the account drop-down in the social publisher. The default response handle doesn't apply for Twitter direct messages and doesn't affect Facebook, Google Plus, or LinkedIn, as they are restricted to the page handle itself.
9. On the `Inbound Settings` tab, you can see which Apex class controls how the inbound content is processed in your organization and which user it's set to run under. If you are using the default Apex class, you can select inbound business rules to determine how incoming social data is handled.

Enable Case Reopen

If a new post, from the same social persona, is associated to a closed case, the case is reopened within the designated number of days. The number must be greater than or equal to 1 and less than or equal to 3000.

Use Person Accounts

Assign a person account of the selected type for the social persona parent record.

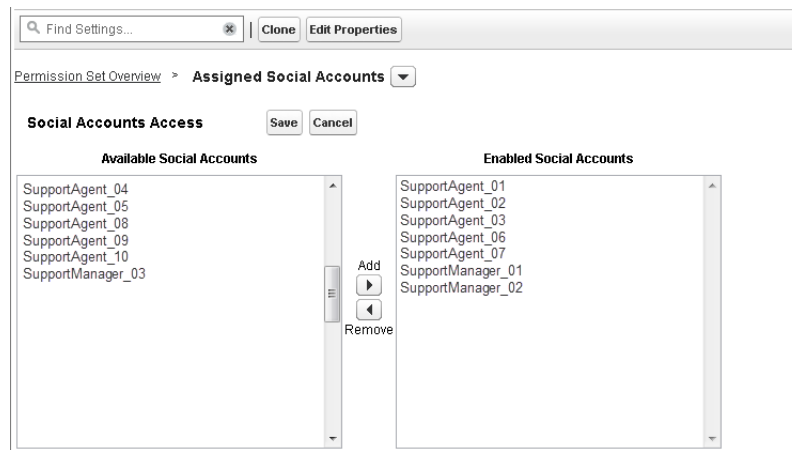

Create Case for Post Tags

Override the social hub's case creation rules and create a case when selected post tags are present on a social post. Post Tags are used to answer the question "What is the topic of this one post?". Post tags, set in Social Hub, help to provide further context to what the individual post is about.

The default Apex class creates a social post, social persona, case, contact, and supports common use cases. For information on modifying the default Apex class, see [Modify the Default Apex Class](#).

 **Note:** If you are using the starter pack, the Apex class can't be changed but you can change the user it is run under.

10. To assign social handles to a profile or permission set, still within Setup:
 - Enter *Profiles* in the **Quick Find** box, then select **Profiles**.
 - Enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**.
11. Click an existing profile or permission set or create a new one.
12. In the Apps section, click **Assigned Social Accounts**.
13. Click **Edit**.

14. Assign the social accounts you need to make available to your users with this profile or permission set.
 -  **Important:** All users must have the profile or permission set you chose or created in step 8.
15. Save your changes.
16. Ensure that the profile or permission set has the correct field visibility.
 - For profiles, from Setup, enter *Profiles* in the **Quick Find** box, select **Profiles**, then select the profile you chose or created earlier. Next, in the Field Level Security section, select **Social Post**.
 - For permission sets, from Setup, enter *Permission Sets* in the **Quick Find** box, select **Permission Sets**, then select the permission set you chose or created earlier. Next, click **Object Settings**, and then select **Social Post**.
17. Click **Edit**. Under Field Permissions, ensure all fields available are set to Visible (not Read-Only) for profiles or Edit for permission sets. Click **Save**.
18. Optionally, set up Quick Text so agents can create ready-to-send responses to social networks. See [Enable Quick Text](#).
19. Optionally, give social post read access to external community and portal users.

There are three requirements to make social posts available in communities and portals.

- Ensure the user has access to cases in the community.
- Give users read permission to social posts on their profiles.
- On your organization's Social Post object, enable visibility to individual fields through the field level security settings.

 **Note:** Once these requirements are met, external users can see all social posts exposed to them. For example, if a case or lead feed is exposed externally, all social posts in the feed are visible. There is currently no way to limit visibility at the social post object level.

Turning on history tracking on for the Social Persona and Social Post objects is recommended for the first few months of using Social Customer Service. History tracking helps identify who made what changes when and for differentiating between automatic and manual changes.

SEE ALSO:

[Track Field History](#)

Enable Social Post Approvals

Social care agents are both problem solvers for your consumers and the voice of your brand on social networks like Facebook and Twitter. You may have guidelines so your agents write with a consistent tone and syntax that's in line with your organization's social media strategy. For example, you may require social agents to sign their tweets in a standard manner, such as "~John."

Salesforce Admins can create approval processes and assign agents and approvers permissions accordingly.

1. From Setup, enter *Social Customer Management* in the Quick Find box, then select **Settings**.
2. Select **Enable approvals for social posts**.
3. Build and activate approval processes for social posts using either the [Jump Start Wizard](#) or the [Standard Setup Wizard](#).

 **Important:** The Jump Start Wizard is a popular streamlined way to create approval processes in Salesforce. However, the **Let the submitter choose the approver manually** option is not supported in the Jump Start Wizard. Choosing that option results in an error later when an agent submits a post for approval.

4. From Setup, go to **Administer > Manage Users > Permission sets**.
5. Enable the new **Require Social Post Approvals** user permission.
6. Assign the **Require Social Post Approvals** user permission with a [permission set](#) to agents that may need their posts reviewed before they are sent.

When assigning user permissions remember these two points.

- Because approving a post automatically submits it for publishing, approvers must have the same access to social accounts as the agents whose work they're reviewing. Otherwise, the posts they approve result in an error.
- If your user permissions include **Require Social Post Approvals**, then the submit button on the social publisher always reads **Submit for Approval** rather than "Comment," "Tweet," or other words. This is true even if no active approval process apply to the user. In that situation, clicking **Submit for Approval** publishes the social post normally since there is no active approval process in effect.

EDITIONS

Available in: Salesforce Classic

Social Customer Service is available in **Enterprise**, **Performance**, and **Unlimited** editions.

USER PERMISSIONS

To administer Social Customer Service:

- "Manage Users"

AND

"Customize Application"

To create case feed items:

- **Feed Tracking for All Related Objects on the Case object**

For more information, see [Create an Approval Process](#) on page 4123, the [Approval Process Checklist](#) on page 4116, and [Useful Approval Processes](#).

 **Tip:** If your agents work with social post record detail pages, rather than in the case feed, we recommend removing the approvals related list from the page layout. The same page layout is shared between inbound and outbound social posts. Removing the approvals related list avoids confusion when viewing an inbound post that is an invalid candidate for an approval process. Approvers can still approve or reject posts through all other normal means such as email, Chatter, and list views.

Enable Moderation for Social Customer Service

Use moderation to manage incoming post and only create cases for those posts needing assistance. This helps your organization focus on real customer issues and avoid opening unnecessary cases.

Not all posts require a case, for example, a complimentary tweet or post does not need agent assistance. However, with standard social customer service set up cases are automatically created from each social post. Using moderation, agents can manage which posts get cases and which are ignored. Moderation is enabled with a Social Hub rule in your Radian6 or Social Studio account to turn off automatic case creation.

 **Note:** If you are using the Starter Pack, you can decide whether you want cases created automatically or not when posts come from a particular social account on the Social Accounts tab. See [Set up Social Customer Service](#) on page 2717.

1. From your Radian6 or Social Studio account, click on the **Rules** tab.
2. Create a rule, or use an existing one, to indicate no case is created in Salesforce.
For example, the rule should have the following setup.
 - a. Action: send to Salesforce.
 - b. `Create Case` checkbox unchecked.
3. Save and enable your rule.

 **Note:** You can enable your rule for all social posts or only those coming from certain managed accounts.

Case creation can also be customized by implementing a custom Apex case logic. To do so, from setup, enter *Social Customer Management* in the `Quick Find` box, then select **Settings**. See [Modify the Default Apex Class](#).

EDITIONS

Available in: Salesforce Classic

Social Customer Service is available in **Enterprise**, **Performance**, and **Unlimited** editions.

USER PERMISSIONS

To administer Social Customer Service:

- "Manage Users"
- AND
- "Customize Application"

Create the Social Action Interface

The social action is created when you install Social Customer Service. You can add, remove, and organize fields to suit your organization.

The social action is created when Social Customer Service is enabled.

1. From the object management settings for cases, go to Button, Links, and Actions.
2. Click **Layout** next to the social action.
3. Edit the desired fields.

 **Note:** Changing field values could invalidate incoming posts against the Social Customer Service [Apex class](#).

To send social content, the social action must have the following fields:

- In Reply To:
- Managed Social Account
- Message Type
- Content

Headline and Name are required fields. To remove them, create a predefined value for each field and remove them from the action. See [Set Predefined Field Values for Quick Action Fields](#).

4. Click **Save**.
5. From the object management settings for cases, go to Page Layouts.
6. In Case Page Layouts, click **Edit** next to Feed-Based Layout.
7. In the palette, click **Quick Actions**.
8. Ensure that the social action is in the Quick Actions in the Salesforce Classic Publisher section of the layout.
9. Optionally, repeat steps 5 through 8 for the Leads object to enable the social action on leads (from the object management settings for leads, go to Page Layouts).

Modify the Default Apex Class

You can customize the default Apex class to specify how inbound social content is processed.

The [default Apex class](#) for Social Customer Service creates a social post, social persona, case, contact, and supports common use cases. You may want to customize how information is processed by creating a new Apex class.

 **Important:** If your agents use the Social Customer Service feature to send private messages to Facebook users, errors can be prevented or resolved by upgrading your Apex classes to the latest available version of the Salesforce API. In particular, the Apex class that inserts the post must be version 32 or higher.

If you alter the default Apex class, be sure to select your new Apex class on the setup page, where you can also see Apex processing errors. From Setup, enter *Social Customer Management* in the `Quick Find` box, then select **Settings**. An email is sent to the administrator when there are errors and, in most circumstances, the data is saved and can be reprocessed. If too many errors are waiting for reprocessing, the Salesforce Social Hub rules are automatically paused to ensure social content is not missed.

EDITIONS

Available in: Salesforce Classic

Social Customer Service is available in **Enterprise**, **Performance**, and **Unlimited** editions.

USER PERMISSIONS

To administer Social Customer Service:

- “Manage Users”

AND

“Customize Application”

To create case feed items:

- Feed Tracking for All Related Objects on the Case object

EDITIONS

Available in: Salesforce Classic

Social Customer Service is available in **Enterprise**, **Performance**, and **Unlimited** editions.

We have provided [tests for the default Apex class](#). If you alter your Apex class you must alter the tests accordingly.

-  **Note:** Social personas created after the Summer 15 have a field indicating which social network created the persona: `SourceApp`. This field is set on creation and is not updateable. If your organization uses custom Apex, you need to update it to use this field. Keep in mind that personas created before the Summer 15 release do not have the field. Also, every time new fields are added to the social action you must update your Apex version or the new fields aren't saved.

To create a new Apex class, in Setup, enter `Apex Classes` in the `Quick Find` box, then select **Apex Classes**. You can use the following code to:

- Support person accounts
- Designate a default account ID
- Change the number of days before closed cases are reopened

```
global class MyInboundSocialPostHandlerImpl extends
Social.InboundSocialPostHandlerImpl implements Social.InboundSocialPostHandler {
    global override SObject createPersonaParent(SocialPersona persona) {
        String name = persona.Name;
        if (persona.RealName != null && String.isNotBlank(persona.RealName))
            name = persona.RealName;

        String firstName = '';
        String lastName = 'unknown';
        if (name != null && String.isNotBlank(name)) {
            firstName = name.substringBeforeLast(' ');
            lastName = name.substringAfterLast(' ');
            if (lastName == null || String.isBlank(lastName))
                lastName = firstName;
        }

        //You must have a default Person Account record type
        Account acct = new Account (LastName = lastName, FirstName = firstName);
        insert acct;
        return acct;
    }

    global override String getDefaultAccountId() {
        return '<account ID>';
    }

    global override Integer getMaxNumberOfDaysClosedToReopenCase() {
        return 5;
    }
}
```

You can use the following code to implement your own social customer service process.

```
global class MyInboundSocialPostHandlerImpl implements Social.InboundSocialPostHandler {
    global Social.InboundSocialPostResult handleInboundSocialPost(SocialPost post,
        SocialPersona persona, Map<String,Object> data) {
        Social.InboundSocialPostResult result = new Social.InboundSocialPostResult();

        // Custom process

        return result;
    }
}
```

```

    }
}

```

The [default Apex class](#) sets the contact as the persona parent. To set the persona parent as an account, person account, or lead, create a method to override the persona parent.

Default Apex Class Reference

Social customer service's full default Apex class code.

```

global virtual class InboundSocialPostHandlerImpl implements Social.InboundSocialPostHandler
{
    final static Integer CONTENT_MAX_LENGTH = 32000;
    Boolean isNewCaseCreated = false;

    // Reopen case if it has not been closed for more than this number
    global virtual Integer getMaxNumberOfDaysClosedToReopenCase() {
        return 5;
    }

    // Create a case if one of these post tags are on the SocialPost, regardless of the
    skipCreateCase indicator.
    global virtual Set<String> getPostTagsThatCreateCase(){
        return new Set<String>();
    }

    global virtual String getDefaultAccountId() {
        return null;
    }

    global Social.InboundSocialPostResult handleInboundSocialPost(SocialPost post,
    SocialPersona persona, Map<String, Object> rawData) {
        Social.InboundSocialPostResult result = new Social.InboundSocialPostResult();
        result.setSuccess(true);
        matchPost(post);
        matchPersona(persona);

        if ((post.Content != null) && (post.Content.length() > CONTENT_MAX_LENGTH)) {
            post.Content = post.Content.abbreviate(CONTENT_MAX_LENGTH);
        }

        if (post.Id != null) {
            handleExistingPost(post, persona);
            return result;
        }

        setReplyTo(post, persona);
        buildPersona(persona);
        Case parentCase = buildParentCase(post, persona, rawData);
        setRelationshipsOnPost(post, persona, parentCase);

        upsert post;
    }
}

```

```
        if(isNewCaseCreated){
            updateCaseSource(post, parentCase);
        }

        return result;
    }

    private void updateCaseSource(SocialPost post, Case parentCase){
        if(parentCase != null) {
            parentCase.SourceId = post.Id;
            update parentCase;
        }
    }

    private void handleExistingPost(SocialPost post, SocialPersona persona) {
        update post;
        if (persona.id != null)
            updatePersona(persona);
    }

    private void setReplyTo(SocialPost post, SocialPersona persona) {
        SocialPost replyTo = findReplyTo(post, persona);
        if(replyTo.id != null) {
            post.replyToId = replyTo.id;
            post.replyTo = replyTo;
        }
    }

    private SocialPersona buildPersona(SocialPersona persona) {
        if (persona.Id == null)
            createPersona(persona);
        else
            updatePersona(persona);

        return persona;
    }

    private void updatePersona(SocialPersona persona) {
        try{
            update persona;

Reporting on Support Activity

Use support reports to track the number of cases created, case comments, case emails, case owners, case contact roles, cases with solutions, the length of time since the case last changed status or owner, and the history of cases.

You can also report on the solutions for your organization, including solution history, the languages in which solutions have been written, and whether translated solutions are out of date. If you have enabled the Self-Service portal, you can run reports to track usage of your Self-Service portal.

IN THIS SECTION:

[Using Custom Report Types to Report on Support Activity](#)

Cases and Solutions come with a number of custom report types that you can use to track your team's work with cases and solutions.

[Tips for Effective Support Reporting](#)

You can get a lot of useful information out of your cases and solutions data if you keep a few tips and best practices in mind.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com** (The edition determines which reports you see.)

Using Custom Report Types to Report on Support Activity

Cases and Solutions come with a number of custom report types that you can use to track your team's work with cases and solutions.

Use the built-in custom report types to create reports on the number of cases created, case comments, case emails, case owners, case contact roles, cases with solutions, the length of time since the case last changed status or owner, and the history of case fields.

You can also report on your organization's solutions, including solution history, the languages in which solutions have been written, and whether translated solutions are out of date.

Some custom report types become available only when you enable their related features. For example, when you enable historical trend reporting for Cases, you automatically get a Cases with Historical Trending custom report type.

Cases with Historical Trending

Use the Cases with Historical Trending custom report type to analyze changes in case data over time. Available when Historical Trend Reporting is enabled.

Cases and Emails

Create a custom report to view a list of both inbound and outbound emails by case by choosing the Cases and Emails report type. This type of report is available when Email-to-Case or On-Demand Email-to-Case is enabled.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com** (The edition determines which reports you see.)

Translated Solutions

Choose the Translated Solutions report to summarize the translated solutions associated with each master solution.

Contact Role

Choose the Contact Role report to show all cases with their associated contact roles.

Cases with Articles

Choose the Cases with Articles report to see the articles attached to cases. This report is available if Salesforce Knowledge is enabled.

The report displays articles even if they're not marked as available for the internal app channel.

Case Lifecycle

Run case lifecycle reports to view the results of the `Range` field, which indicates the length of time since the case last changed status or owner. Each time the status or owner changes, the counter begins again at zero.

Service Contracts with Entitlements

Use the Service Contracts with Entitlements report type to report on the services your customers are entitled to. Available when Service Contracts with Entitlements is enabled.

Accounts with Entitlements with Contacts

Lists accounts with entitlements that include contacts (named callers). Available when Service Contracts with Entitlements is enabled.

Service Contracts with Contract Line Items

Lists service contracts with contract line items (products). Available when Service Contracts with Contract Line Items and Entitlements is enabled.

Cases with Milestones

You can create a custom report to view a list of cases with milestones by choosing the Cases with Milestones report type. This report type is available if entitlements is enabled.

Note: Milestone status in list views and reports is based on the related entitlement process' end time. If a user's profile doesn't include access to the `Entitlement Process End Time` case field, reports and list views that they view may show an incorrect milestone status on cases. The case record and Case Milestones related list will still display the correct milestone status values.

Case History/Solution History

Use the Case History and Solution History report types to track the history of standard and custom fields on cases and solutions where field histories are set up for tracking. Use these reports to see tracked fields' old and new values. You can't use filter conditions to search the results of the `Old Value` and `New Value` fields.

Entitlements and Contracts

Use custom report types to define report criteria from which users can run and create reports on entitlements, service contracts, and contract line items. After entitlement management is enabled, Salesforce automatically includes the following custom report types:

Custom Report Type	Description	Report Type Location
Accounts with entitlements with contacts	Lists accounts with entitlements that include contacts (named callers).	Accounts & Contacts
Service contracts with contract line items	Lists service contracts with contract line items (products).	Customer Support Reports
Service contracts with entitlements	Lists service contracts with entitlements.	Customer Support Reports

Tips for Effective Support Reporting

You can get a lot of useful information out of your cases and solutions data if you keep a few tips and best practices in mind.

- When reporting on cases, add the `Parent Case Number` field to your report. This field indicates if a case is associated with a parent case.
- When reporting on first-call resolution of cases, add the `Closed When Created` field to your report. This field indicates cases that were closed by support reps via the **Save & Close** button during the creation of the case.
- You can create a case report containing contact email addresses, export that data to Excel, and then do a mass mail merge using Microsoft Word.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com** (The edition determines which reports you see.)

Standard Report Types

- Choose the Translated Solutions report to summarize the translated solutions associated with each master solution.
- Choose the Contact Role report to show all cases with their associated contact roles.
- Choose the Cases with Articles report to see the articles attached to cases. This report is only available if Salesforce Knowledge is enabled.

The report displays articles even if they're not marked as available for the internal app channel.

Custom Report Types

- You can create a custom report to view a list of cases with milestones by choosing the Cases with Milestones report type. This report type is only available if entitlements is enabled.
- Choose the Case History and Solution History report types to track the history of standard and custom fields on cases and solutions where field histories are set up for tracking. Use these reports to see tracked fields' old and new values. You can't use filter conditions to search the results of the `Old Value` and `New Value` fields.
- You can create a custom report to view a list of both inbound and outbound emails by case by choosing the Cases and Emails report type. This type of report is only available to organizations with Email-to-Case or On-Demand Email-to-Case enabled.
- You can run case lifecycle reports to view the results of the `Range` field, which indicates the length of time since the case last changed status or owner. Each time the status or owner changes, the counter begins again at zero.

Cases in Portals

If you have enabled the Self-Service portal, you can run reports to track usage of your Self-Service portal.

- When reporting on case comments, use the `Public Case Commented` field to indicate if the comment is private or public. Public comments are indicated with a check mark. To limit report results to public comments, customize the report and add a field filter where `Public Case Commented equals True`. Likewise, the filter `Public Case Commented equals 0` yields only private case comments.
- Choose the `Closed by Self-Service User` field to report on how many cases have been closed by users via suggested solutions on the Self-Service portal.

Solution Categories

Create a custom report that sorts solutions by category. Select the `Category Name` field to display the solution's category and the `Parent Category Name` field to display the category directly above the solution's category.

- If you restrict your report to solutions in a particular category, the report includes only solutions that are directly associated with that category. It does not include solutions in subcategories of the specified category.
- To report on uncategorized solutions, use the advanced report filters. Choose the `Category Name` field and the "equals" operator, and leave the third field blank.

Team Members

- You can report on case teams in which you are a member. After you run a case report, select `My case team's cases` from the `Show` drop-down.
- `Owner Role` for case reports is defined differently than for other objects. For most objects, `Owner Role` is defined in the `Role Name as displayed on reports` field on the user's role. Cases uses the `Label` field instead.
- You can limit any case report to cases owned by users or cases in queues. Choose `User Owned Cases` or `Queue Owned Cases` from the `View` drop-down at the top of a case report.

COLLABORATE WITH EVERYONE

Welcome, Collaboration Tool Users

No man is an island, even in Salesforce. Complete tasks quickly and efficiently by collaborating with people either inside or outside of your organization.

Refer to this documentation for information on collaboration tools like Chatter, Salesforce CRM Content, and even documents. There's no limit to what you can accomplish with others—figure out the best way to do it here.

Collaborate within Your Company

Share Updates with People (Chatter)

Chatter Overview

Chatter is a Salesforce collaboration application that helps you connect with people and share business information securely and in real time.

Use Chatter features like feeds, profiles, groups, and more to share information, collaborate, and keep up with the latest updates in your company.

Chatter works in accordance with all of the security and permission settings in your Salesforce organization. Chatter is enabled by default for organizations created after June 22, 2010. For existing organizations, your administrator must enable Chatter. You can access the Chatter app in the app menu in the top right corner of any page. If your administrator added Chatter tabs to other apps and you previously customized your display, you need to add the tabs manually.

Some third-party Web browser plug-ins and extensions can interfere with the functionality of Chatter. If you experience malfunctions or inconsistent behavior with Chatter, disable the Web browser's plug-ins and extensions and try again.

Chatter is not supported:

- Using Microsoft® Internet Explorer version 6.0
- For external users in Customer Portals or partner portals
- In the Console tab

Posts and comments that users make in Chatter are retained during the entire time that a customer's applicable organization remains provisioned. We reserve the right to enforce limits on:

- The number of system-generated tracked feed updates. Currently tracked feed updates that are older than 45 days and have no likes or comments are deleted automatically. The tracked feed updates no longer appear in the feed. However, if auditing is enabled for a tracked field, the audit history for that field is still available.
- The number of email notifications that can be sent per organization per hour.

The limits are subject to change. Contact Salesforce for more information.

Get Started with Chatter

Chatter Tab Overview

The Chatter tab is your collaboration home base and gives you instant access to most of the collaboration features in Chatter.

From the Chatter tab you can:

- [Make a post](#) that's shared with people who follow you, or comment on someone else's post.
- [Like posts or comments](#) to show your support.
- [Share a post](#) to your profile or to a group, or send a link to the post to other Chatter users in an email or instant message.
- [View, filter, and sort your feed](#) on the left side to view posts from people and records you follow and groups you're a member of, posts that mention you, posts you bookmarked, or all posts from your company.
- [Search the feed](#) to quickly find information in the feed posts and comments on the Chatter tab.
- [Bookmark a post](#) to keep track of future comments on the post, or to remember to follow up on the post later.
- [Add topics to a post](#) to categorize the post and give it more visibility.
- Access your [people](#), [groups](#), [files](#), and [topics](#) lists.
- [View or update your profile](#), such as your profile photo or your contact information.
- [Read or send private messages](#) that are only visible to certain people.
- [Access your favorites](#) to see the latest posts and comments for your favorite topics, list views, and Chatter feed searches.
- [View your recommendations](#) for people, groups, files, and records that closely relate to your job and interests.
- [View trending topics](#) that people are discussing in Chatter right now.
- [Invite people to join your Chatter network](#) if they don't have Salesforce licenses to use Chatter.

Chatter Desktop

Chatter Desktop Overview

Chatter Desktop is a free desktop application that lets you collaborate in Chatter without a browser. Use Chatter Desktop to post and comment in Chatter, and receive updates about your groups and the people, records, and files you follow. Chatter Desktop also supports chat, private Chatter messages, and displays Chatter updates and private messages as popup notifications in your Windows taskbar or Mac OS X Dock.

-  **Note:** Customer users can install and use Chatter Desktop but can't access all of its functionality. For example, customer users can't follow users or records, chat, or access administration options.

Install Chatter Desktop

Salesforce provides two Chatter Desktop installers: a standard version for individual installations and a managed version for enterprise deployments.

The following are the minimum requirements for using Chatter Desktop:

- Windows
 - 2.33GHz or faster x86-compatible processor, or Intel Atom™ 1.6GHz or faster processor for netbook devices
 - Microsoft® Windows® XP, Windows Server® 2003, Windows Server 2008, Windows Vista® Home Premium, Business, Ultimate, or Enterprise (including 64 bit editions) with Service Pack 2, or Windows 7
 - 512MB of RAM (1GB recommended)
- Mac
 - Intel® Core™ Duo 1.83GHz or faster processor
 - Mac OS X v 10.5, 10.6, or v10.7
 - 512MB of RAM (1GB recommended)

 **Important:** Chatter Desktop uses Adobe® Integrated Runtime (AIR®), Adobe's cross-platform runtime environment for desktop applications, and only runs on operating systems that Adobe AIR supports. Chatter Desktop does not run on operating systems that Adobe AIR does not support, such as 64-bit Linux. See the Adobe website for information on Adobe AIR.

The standard version:

- Requires administrator privileges on your machine
- Doesn't require administrator privileges in Salesforce
- Automatically installs the required version of Adobe® Integrated Runtime (AIR®)
- Requires acceptance of an end user license agreement the first time Chatter Desktop launches
- Posts "Installed Chatter Desktop" to Chatter the first time Chatter Desktop launches
- Periodically checks Salesforce for new versions

To install the standard version:

1. From your personal settings, enter *Chatter Desktop* in the **Quick Find** box, then select **Chatter Desktop**.
2. Click the **Download Now** badge.
3. Follow the on-screen instructions.

 **Note:** Administrators can disable the Chatter Desktop download page and block users from accessing Chatter Desktop.

 **Important:** Chatter Desktop uses Adobe® Acrobat® Reader to preview PDF files. Before previewing files with Chatter Desktop, download Adobe Acrobat from [Adobe's website](#), install it, and open it at least once to complete the installation.

Connecting Chatter Desktop

If you have multiple Salesforce or Chatter logins, create a connection for each login. The connection lets Chatter Desktop access the Chatter data you can access with that login on the Web.

1. Click  and select **Settings**.
2. In the Connections section, enter a name for the connection and the URL from which you log in. The URL must begin with `https://` and end with `salesforce.com` or `chatter.com`. For example, if your organization has a European division that you log into from `https://emea.salesforce.com`, enter that URL and name the connection *Europe*.

By default, Chatter Desktop connects to your main instance of Salesforce (Production) or your Force.com sandbox.
3. Click **Authorize** and follow the on-screen instructions to authorize Chatter Desktop to connect using the login.

Use the radio buttons on the Settings screen to specify a default connection. To quickly switch connections while using Chatter Desktop, click , select **Switch Connection**, and choose the connection.

 **Note:** You can create multiple connections, but Chatter Desktop can log into only one connection at a time. You cannot use Chatter Desktop to display data from multiple connections simultaneously.

Configuring Chatter Desktop

The default Chatter Desktop configuration is appropriate for most users, but several Chatter Desktop settings are configurable. To access Chatter Desktop settings, click  and select **Settings**. From the Settings screen, you can:

- Configure Chatter Desktop to launch when you start your computer.
- Configure Chatter Desktop to minimize when you close it.
- Turn popup notifications on or off. Popup notifications are enabled by default.
- Manage alerts for new feed posts and comments (advanced settings).
- Configure Chatter Desktop to always display in the foreground (advanced settings).
- Move the chat window to the foreground when you receive a new message.
- Play sounds when someone starts a new chat with you, or play a sound for every chat message when a chat is minimized or out of focus (for example, if you have multiple chats or are using another application).
- Edit your [connections](#).

Using Chatter Desktop

In the Chatter Desktop window:

Click: To:

Your profile photo Change your chat status. Select  **Available**,  **Away**, or  **Offline**. People can't chat with you when you're  **Offline**.

See feed updates from everyone and everything you follow, and post an update.

- For any feed post, click **Comment** to add a comment, **Like** to receive email notifications if others comment on that post, or **Delete** to delete the post, if you have access.
- To post a file from your computer, drag the file to , or click , which appears when you type a post.
- To post a link, type the link in the text box at the top of your feed, or click , which appears when you type a post.
- Use the **Sort By** filter at the top of a feed to sort updates:
 - Post Date—Sorts feeds by post date. To see comments, you must click **Show All Comments** below a post.
 - Post and Comment Date—Sorts feeds by post and comment date. Each comment appears again when you click **Show All Comments** under its associated post.

See and comment on updates directed to you.

Chat with people and see their updates. Chat messages are displayed in a separate window.

- Click **Chat Favorites** to see people or chats you've added as favorites. To add a favorite, click  next to someone's name or in any active chat with one or more people.
- Click **Following** or **Followers** then click a person's name to see their updates or post to their feed.
- Hover over someone's name:
 - Click  to send them a private message.
 - Click  to add them as a favorite chat. Their name appears in your **Chat Favorites** list.
 - Click  to follow someone or  to stop following them.
 - Click  to start a chat. You can then add up to 10 people to the same chat by clicking  in the chat window and searching for people to add. You can't chat with people who are  **Offline**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Enterprise
- Professional
- Performance
- Unlimited
- Contact Manager
- Developer

 **Note:** Chat is only available if it's enabled in your organization.

Read and reply to private Chatter messages. Click a message to view it, or click **New Message** to send a new message.

 **Note:** Messages are only available if they are enabled in your organization.

See feed updates from groups:

- Click a group name or search for a group to view its feed or to post updates. You can post in all public groups and any private groups that you belong to.
- Click **Join** to join a group, or **Member** to leave the group.
- Click  to view the group description.

See and comment on records you follow. From the drop-down menu at the top, select the type of record you want to view, for example, Account. If you're not following records, there won't be any records in the list. Click a record's name to view its details. Chatter Desktop shows the first eight fields on a record.

Edit your [Chatter Desktop settings](#) or [switch your connection](#).

Instantly synchronize your data. While Chatter Desktop synchronizes your data automatically, it does not always happen instantly.

If Your Organization Has:	Users You Follow	Records You Follow
16 or more users	Up to 25 users in your organization, including (if available): <ul style="list-style-type: none"> • Your manager • Users that report to your manager • Your subordinates • Teammates on your account teams • Teammates on your opportunity teams 	Up to 25 of your most recently used records, in the following order: <ol style="list-style-type: none"> 1. Open opportunities you own 2. Accounts you own 3. Open cases you own 4. Contacts you own 5. Open opportunities you created 6. Accounts you created 7. Open cases you created 8. Contacts you created 9. Open opportunities you last modified 10. Accounts you last modified 11. Open cases you last modified 12. Contacts you last modified 13. Open opportunities you viewed 14. Accounts you viewed 15. Open cases you viewed 16. Contacts you viewed

 **Note:** The auto-follow setting for records only applies to the records that already exist at the time your administrator turns on Chatter. For any future records you create, auto-follow is disabled by default to reduce the number of updates you receive in your Chatter feed. However, if you want to receive updates on all future records you create, you can enable auto-follow in your personal settings.

Liking Posts and Comments

Like posts or comments to show your support and receive email notifications if others comment on that post.

Below a post or comment, click **Like**.

After you click **Like** on a post, you receive email notifications if others comment on that post. If you click **Like** on a comment, only the user who posted the comment receives an email notification, but you receive an email notification for any subsequent comments. You can change your [email notification settings](#) on page 2751.

- To stop liking a post or a comment, click **Unlike**. When you stop liking a post or a comment, you don't receive email notifications for subsequent comments or likes.
- View the profiles of others who have liked a post by clicking their name at the bottom of the post or comment, for example, "**John Smith** likes this."
- If more than three people like a post, click the link to see the full list; for example, "You, **John Smith**, and **2 others** like this." From that list, you can follow or stop following people.
- Likes on comments show how many people have liked the comment, for example, "**1 person**" or "**7 people**". To see their names, click the link.

[Guidelines for Managing Your Personal Chatter Email Settings](#)

Replying to Chatter Email Notifications

When you receive certain email notifications, you can conveniently perform some actions by replying directly from your email. You can reply to the types of email listed in the table, or any notification that displays a From address of `reply@chatter.salesforce.com`.

 **Note:** To reply to email notifications, your administrator must enable email replies for your organization.

Action	Type of Email	Text to Include in Your Reply	Limits
Bookmark a post	Someone posted to your profile or a group, mentioned you in a post, or shared your post	<i>bookmark</i>	N/A
Comment on a post	Someone posted, commented on your post, also commented after you, or mentioned you in a post or comment	The text of your comment	1,000 characters maximum. Replies that exceed the limit are truncated to the first 1,000 characters.
Follow someone	Someone posted, commented on your post, also commented	<i>follow</i>	N/A

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

- Performance
- Unlimited
- Contact Manager
- Developer

Action	Type of Email	Text to Include in Your Reply	Limits
	after you, or mentioned you in a post or comment		
Like a comment	Someone commented on your post or also commented after you	<i>like</i> or <i>+1</i>	N/A
Like a post	Someone posted to your profile or a group, mentioned you in a post, or shared your post	<i>like</i> or <i>+1</i>	N/A
Mute a post	Any post or comment email when you no longer want to receive notifications for the original post	<i>mute</i>	N/A
Respond to a Chatter message	Someone sent you a message	The text of your response	10,000 characters maximum. Replies that exceed the limit are truncated to the first 10,000 characters.
Unfollow someone	Someone posted, commented on your post, also commented after you, or mentioned you in a post or comment	<i>unfollow</i>	N/A
Unlike a post	Someone posted, commented on your post, or also commented after you on a post that you previously liked	<i>unlike</i> or <i>-1</i>	N/A

Consider these tips when sending email replies.

- Replies must be sent from the email address specified on your profile. If you use email aliases or email forwarding services that send replies from a different email address, your replies aren't processed.
- Replies to bookmark, mute, like or unlike, and follow or unfollow must contain only the single word or exact text, such as *like* (case insensitive) or *+1*. If you include extra white spaces or the original message that some email applications automatically include, we ignore them and process the reply as a like, bookmark, etc. However, if you include any other text in the body, such as *Like!* or *Like this?*, we process your reply as a comment rather than a like, bookmark, etc.
- If replies contain your personal email signature, the signature text is treated as part of your comment. Default signatures inserted by mobile devices, such as *Sent from my iPhone*, are automatically removed from replies. Before replying, delete custom signatures and any extra text you don't want posted to Chatter. Or, add a separator line to the top of your signature to have it automatically removed. The separator line must have a minimum of one of the following characters:
 - Dash (–)
 - Equal sign (=)
 - Underscore (_)

You can also use any combination of these characters.

- Attachments and mentions in replies are ignored.
- Before replying, check the email address that displays in the **To** field of your email. Valid addresses contain tokens, or long character strings, both before and after the @ symbol, such as `w8t27apy1@j321imd9gbs.d8rx.d.chatter.na1.salesforce.com`. Some email applications automatically use the **From** address from the original email, `reply@chatter.salesforce.com`, which is not a valid address for receiving replies. If you see this shortened address in the **To** field of your reply email, replace it with the valid reply-to address in the email header information. For example, in an application such as IBM® Lotus Notes®:
 1. Open the original email.
 2. Click **View > Show > Page Source**.
 3. In the **Reply-To** section, copy the email address that looks like:
`w8t27apy1@j321imd9gbs.d8rx.d.chatter.na1.salesforce.com`.
 4. Paste the reply-to address in the **To** field of your reply email.

[Liking Posts and Comments](#)

Navigate to Chatter Email Settings

Find your Chatter email settings so you can change your preferences for receiving email notifications and digests.

- From your personal settings, enter *Chatter* in the **Quick Find** box, then select **Chatter Email Settings** or **Email Notifications**—whichever one appears.
- Or, from any group page, click **Email Me... > Email Settings**.

To receive Chatter email notifications and digests, your administrator must enable email notifications for your organization. Select **Receive emails** to receive Chatter email.

 **Warning:** Deselecting this option prevents you from receiving all Chatter email notifications.

Chatter Email Digests

Email digests conveniently summarize recent activity in Chatter so you don't miss important discussions. You can choose to receive daily or weekly summaries of updates from your personal feed or any group's feed.

Personal digests include the updates you see in your own Chatter feed, such as updates about the people, records, and files you follow and your groups. Group digests include the updates you see in a particular group's Chatter feed.

Daily digests include the 50 latest posts from the previous day while weekly digests include the 50 latest posts from the week. Both include the three latest comments on each post. Chatter sends daily digests at approximately 12:00 a.m. every day, and weekly digests at approximately 12:00 a.m. on Sunday. For user digests, the time is according to the user's time zone. For group digests, the time is according to the organization's time zone. Neither time is configurable.

When you join or are added to a group, you don't receive email notifications initially because they're turned off by default. You can use `Set default frequency for groups I join:` to choose how often you want to receive emails when joining new groups. Changing the default frequency doesn't affect the groups you already belong to. If your organization existed before Summer '11 and is a Professional, Enterprise, Unlimited, or Developer Edition organization, you might still be receiving daily digests by default.

[Navigate to Chatter Email Settings](#)

[Guidelines for Managing Your Personal Chatter Email Settings](#)

Guidelines for Managing Your Personal Chatter Email Settings

Control the number of Chatter emails you receive by choosing the most important emails and the appropriate frequency of personal and group digests.

Email Me When Someone

Be selective about your personal email settings. They should help you stay on top of important discussions without becoming overwhelmed by too much email.

Option	Most Important	Recommendations and Notes
Follows me		If you're not already following the person, you can click a link in the email to start following your new follower.
Posts on my profile	✓	People reach out to you directly by posting questions or information on your profile, so make sure that you get notified.
Shares a post I made		
Likes a post or a comment I made

Option	Most Important	Recommendations and Notes
Comments on my status or a change I made	✓	Get notified so you don't miss follow-up discussions.
Comments on a post on my profile		
Comments after me		After you've commented on an item, get notifications for up to 10 comments after yours. Commenting again later in the post resets the count, so you receive notifications for up to another 10 subsequent comments.
Comments on an item I bookmarked	✓	If you use bookmarks to track items you're interested in, get an email each time someone comments. If you typically use likes to track items of interest, then this option is less important.
Comments on an item I like	✓	After you like an item, get notifications for up to 10 comments after your like.
Mentions me in a post	✓	People use mentions to ask for your input and draw you into discussions, so make sure that you get notified.
Mentions me in a comment	✓	People use mentions to ask for your input and draw you into discussions, so make sure that you get notified.
Sends me a message	✓	Get Sends me a message notifications when people send you private Chatter messages, including notifications about files that have been shared with you.
Endorses me on a topic		

Set Frequency for Personal Digest

Option	Recommended	Recommendations and Notes
Daily	✓	Daily digests include the 50 latest posts from the previous day and the three latest comments on each post.
Weekly		Weekly digests include the 50 latest posts from the week and the three latest comments on each post.
Never		If you're selective about the options in the "Email me when someone" section, you might not need to receive personal digests at all.

Personal digests aren't supported in communities.

Set Default Frequency for Groups I Join

Changing the default frequency for groups you join doesn't affect the groups you already belong to.

Option	Recommended	Recommendations and Notes
Email on each post		In communities, the <code>Email on Each Post</code> option is disabled once a group exceeds 10,000 members. All members who had this option selected are automatically switched to <code>Daily Digests</code> .
Daily digests		Daily digests include the 50 latest posts from the previous day and the three latest comments on each post.
Weekly digests		Weekly digests include the 50 latest posts from the week and the three latest comments on each post.
Never	✔	Keep this default setting for all new groups. Whenever you join a group that you expect to monitor and contribute to actively, such as one for an important team or project, you can change to more frequent notifications for that specific group only.

[Navigate to Chatter Email Settings](#)

What do “company” and “organization” mean in Chatter?

An organization is a single deployment of Salesforce with a defined set of licensed users who may or may not use Chatter. The words “company” and “organization” are used interchangeably in Chatter. So for example, if you see “share a file with all Chatter users in your company,” it means you're sharing with everyone in a specific Salesforce organization who uses Chatter.

SEE ALSO:

[Chatter Overview](#)

Can I invite people from my company who don't have Salesforce licenses?

If enabled by your administrator, you can invite other people from your company. Invited users can view profiles, post on their feed, and join groups, but can't see your Salesforce data or records.

You can [invite users](#) from the People tab or when adding members to a group.

Additionally, you can add customers to private groups you own or manage.

Work with Feeds

Feeds Overview

Chatter feeds show you posts and comments you and other people make, as well as record updates across your Salesforce organization.

When you follow people and records, you see their updates in your Chatter feeds. Chatter feeds display on profiles, groups, the Home tab, topic detail pages, and on record detail pages. Typically, you see feed updates for:

- Chatter feed comments and posts
- Posts, comments, and files on Chatter groups you're a member of
- Shared files and links
- Tasks and events
- Converted leads
- Record field changes, like changes to record owner and closed opportunities and cases.

Record updates are also called system-generated posts. They are updates that Salesforce automatically generates when someone creates a record or changes a tracked field on a record.

The record updates you see depend on how your administrator has configured feed tracking and whether you have access to the record. You don't see tracked feed updates that are older than 45 days and have no likes or comments, because they are deleted automatically.

SEE ALSO:

[Sharing a Chatter Post](#)

View a Particular Feed

Change your Chatter feed to display a particular subset of posts.

By default, you see your What I Follow feed when you go to your Chatter page. Use the feed selections on the left sidebar of the Chatter page to view a subset of posts in your feed. For example, view only posts that mention you, or posts you bookmarked, or all posts in your company.

1. Click  **Feed** to see the available feeds.
2. Click a feed to display the associated subset of posts in your feed.

What I Follow

Shows updates for everything you follow, including posts from people you follow, groups you are a member of, and files and records you're following. Use the drop-down list at the top of your feed to further narrow the subset of posts.

To Me

Shows posts that are made on your profile page, including

- Posts others make on your profile page
- Posts and comments where you have been mentioned
- Posts you made that have comments

Bookmarked

Shows your bookmarked posts in your feed.

All Company

Shows posts and comments from your entire company, including posts and comments from:

- People in your company
- Public groups
- Private groups you are a member of
- Feed tracked changes for records and fields and system-generated posts, if someone liked or commented on the post. You must have access to the record to see the post.

SEE ALSO:

[Filter Your Files List](#)

Filter and Sort Your Feeds

Use the filter and sort options to see updates that are relevant to you.

Filtering and sorting your feed is useful when you want to view a particular set of posts instead of all posts in your feed.

IN THIS SECTION:

[Filter Your Feed](#)

Use filters to condense the number of posts that appear in your feed.

[Sort Your Feed](#)

Sort your feed by most recent posts or by most recent comments.

[Available Feed Filters per Feed](#)

The feed filter options vary, depending on how your administrator set up Salesforce and which feed you're viewing. Not all filters are available on all feeds.

Filter Your Feed

Use filters to condense the number of posts that appear in your feed.

The filters you see depend on how your administrator has set up Salesforce. Filter your feed on the Chatter page, your profile, group pages, record detail, and search result pages. Not all filters are available on all feeds.

- Above a feed, click next to Show and select a filter option.

All Updates (Default)

Shows all posts and comments from people and records you follow, posts from groups you're a member of, and all [system-generated posts](#).

Fewer Updates

- Shows all posts and comments from people and records you follow and groups you're a member of
- Hides system-generated posts from records that nobody has commented on

People

Shows the posts and comments from people you follow.

EDITIONS

Groups

Shows the posts in groups you're a member of.

Files

Shows posts that include:

- Files you follow
- File posts that someone you follow has commented on

 **Example:** Use the Fewer Updates filter to hide system-generated posts. For example, you're following the Acme account, and the account executive for Acme creates an opportunity. Later, the account executive also changes a tracked field on the Acme account. In both cases, Salesforce automatically generates an update about each change and posts the updates in your Chatter feed and the feed on the Acme account detail page. The Fewer Updates filter hides these system-generated posts in your feed, unless someone has commented on the posts. If you want to see the system-generated posts, select the All Updates filter.

SEE ALSO:

[Available Feed Filters per Feed](#)

Sort Your Feed

Sort your feed by most recent posts or by most recent comments.

1. Above a feed, click  next to Show.
2. Below Sort By, select **Post Date** to sort by most recent posts, or **Most Recent Activity** to sort by posts with the most recent comments, including polls with new comments.

Your feed is sorted by Most Recent Activity by default. You can toggle between sorting by Post Date and Most Recent Activity at any time.

 **Example:** For example, let's say you're following many people and records and bookmarked the posts you're interested in. At the end of your work day, you want to know whether there are any updates for your bookmarked posts. You click **Bookmarked** to view all your bookmarked posts and then sort the posts using the Most Recent Activity filter. The posts are listed in the order of recent comments, starting with the post that has the latest comment.

Feeds FAQs

I see updates to private groups in my profile feed. Who else can see these updates?

Only the members of a private group can see updates to that group, even on your profile feed.

SEE ALSO:

[Post Visibility](#)

Can I see a list of records and people I'm following?

To see people and records you follow, view the Following list on your profile and filter the results by user or by an object type. You can also see a list of people following you in the Followers list on your profile.

SEE ALSO:

[Chatter Profile Overview](#)

Why do I only see certain people and records in my Chatter feed?

You only see updates by people and records that you follow. Follow more records and people to see more updates in your Chatter feed on your Home tab and Chatter tab. Click **People** on the Chatter tab to find a list of people in your organization to follow or unfollow.

SEE ALSO:

[The People and Records You Auto-Follow Initially](#)

Bookmark Posts

Bookmarks Overview

Bookmarking lets you keep track of individual posts you're interested in.

After you bookmarked a post, you can quickly find it using the **Bookmarked** feed on the left sidebar. The **Bookmarked** feed shows you only the posts you bookmarked.

When someone comments on a post you bookmarked, you receive an email notification. Email notifications for bookmarks are enabled by default, but you can change your [email notifications](#) on page 2751.

Bookmarks are private and other users can't see which posts you bookmark. There is no limit on the number of bookmarks you can add. When you are no longer interested in a post you saved, you can remove the bookmark and the post no longer appears in your saved posts when you click **Bookmarked**.

SEE ALSO:

[Liking Posts and Comments](#)

[View a Particular Feed](#)

[Guidelines for Managing Your Personal Chatter Email Settings](#)

Bookmark a Post

Track the posts you're interested in and view your saved posts in your Bookmarked feed.

1. Click  at the top right corner of the post you want to bookmark to expand the drop-down menu.
2. Click **Bookmark**.
The bookmark icon () displays next to the post to indicate that you successfully saved the post to your bookmarks.

Click  **Feed > Bookmarked** on the Chatter sidebar to see your saved posts in your feed.

There is no limit for the number of bookmarks. You can add as many bookmarks as you like.

Remove a Bookmark

1. Click **Feed** > **Bookmarked** on the sidebar to see your saved posts in your Chatter feed.
2. Find the saved post in your Chatter feed.
3. Click  at the top right corner of the post to expand the drop-down menu.
4. Click **Remove Bookmark**.

When you remove a bookmark from a post, the post no longer appears in your saved posts when you click **Bookmarked**.

Create a Task from a Post

Read a post that you want to follow up on? Use the Create New Task action to create a task directly from that post.

You can create a task from any post made by you or someone else in your organization, including posts with attachments. You can't create a task from a system-generated post, like a record update.

1. Click  on a post.
2. Click **Create New Task**.
If you don't see the Create New Task action, your Salesforce administrator didn't enable this action for your organization.
3. In the Create New Task dialog, add a subject and a due date. If applicable, associate the task with a contact or lead and an object, like an account. Use the search boxes to find available contacts, leads, and objects.
4. Click **Create**, when you're done.

The task is assigned to you and posted to your profile feed. The task also appears in your My Tasks section on your Home tab.

Click the task subject link (1 or 2) to open the task. Click the post link (3) to display the post from which the task was created.

Viewing Your Recommendations

Chatter provides recommendations to help you identify the people, groups, files, and records that closely relate to your job and interests. The more recommendations you accept, the more updates you see in your feed.

- Click **Follow** next to the person, record, or file you want to follow.
- Click **Join** to become a group member.
- Click **x** to dismiss a recommendation.
- Click **More** to display the Recommendations page where you can use the side filters to narrow your recommendations to people, files, records, or groups.

Find Information in Feeds

Searching in Feeds

Quickly find information in posts and comments across Chatter.

- Use the header search box (Global Search) to find information in feeds across Chatter.
- To find information in a specific Chatter feed, use [feed search](#) () in that context.
- To create a quick shortcut to a frequently performed search in Chatter, [save a feed search as a favorite](#) and click the favorite link from the Chatter page.

Chatter Feed Search Results

Watch a Demo:  [Search in Salesforce Classic](#)

Search results for Chatter feeds display posts and comments that include your search terms.

Chatter feed searches aren't affected by your search scope; Chatter feed search results include matches across all objects.

-  **Note:** Changes to record fields aren't included in search results. For example, if you've enabled feed tracking on the `Billing Address` field for the Acme account and modified the Acme billing address, search results for `Acme` include **Acme — Suzanne Powell** *Looking for volunteers to help with the Acme account*, but don't include **Acme — Suzanne Powell** *changed Billing Street to 10 Main Road*.
- Sort your search results by posts only or by posts and comments, just as in feeds.
- Comment on, like, share, bookmark, and delete posts in the search results, just as in feeds.
- Add, edit, or delete topics on posts in the search results, just as in feeds.
- Follow, share, download, preview, and upload new versions of files in the search results, just as in feeds.

- View the detail pages for Chatter files, groups, topics, and people by clicking the respective name in the update.
- [View a single feed update](#) by clicking the timestamp below the update, for example, **Yesterday at 12:57 AM**.
- Click **Add to Favorites** to save a Chatter feed search to your [favorites](#) on the Chatter tab.

To view search results for records, such as accounts, contacts as well as Chatter people, groups, topics, and files, click **Records** at the top left of the page.

 **Tip:** For a more focused search of the feeds in a specific group, profile, record, or other Chatter feed, use [feed search](#).

Searching in a Specific Feed

Use feed search to find information in a specific context.

You can search for information in feeds on records, groups, topic pages, user profiles, and on the Chatter and Home tabs. A contextual feed search is helpful when you want to confirm if something was once discussed in that specific feed.

1. Click  above the feed to look for information in that feed. For example, use the feed search on a group's page to find information in that group.

2. Type your search terms and press ENTER or click .

You can search for hashtag topics, mentions, and files posted in the feed, or refine your search using wildcards, operators, and quotation marks to match on exact phrases.

 **Tip:** To search for hashtag topics with multiple words, use brackets after the hashtag and around the words. For example, to find all instances of #Universal Paper, type `#[universal paper]` in the search box.

Search results display with matching terms highlighted. Filters or sorting criteria used in the feed apply to feed search results as well.

Click  to clear your search results and return to the feed.

Feed search behavior may vary slightly depending on where you perform the search.

- Feed search is not supported for feeds on list views.

EDITIONS

Available in: Salesforce Classic

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Contact Manager
- Developer

- You can only search feeds you have access to via sharing rules.
- On the Chatter tab, feed search results are also limited by your [feed type selections](#). For example, if you select the To Me feed type, and select additional [filters](#) and [sorting criteria](#), all of those criteria apply to the feed search results.
- Feed search results are limited to the [posts that are accessible](#) from the context you search within. For example, if you search the feed on a user's profile, the results include the posts and comments accessible from the user's profile. This includes both the posts and comments shared by or with the user.
- Feed search returns matches for file or link names shared in posts, but not in comments.
- Record field changes aren't included in record feed search results.

Adding a Chatter Feed Search as a Favorite

Add a Chatter feed search as a favorite to access feed updates quickly without leaving the Chatter tab.

EDITIONS

- Contact Manager
- Developer

The screenshot shows the Salesforce Chatter interface. At the top, there is a search bar with the text 'Search...' and a 'Search' button (callout 1). Below the search bar is a navigation menu with tabs for Home, Chatter, Profile, Groups, Files, Leads, Accounts, Contacts, Opportunities, and Reports. The main content area is titled 'Search Results' and contains a 'Search Feeds' button (callout 2) and a search input field with the text 'acme'. Below the search input is a 'Search Chatter Feeds' button. The search results are displayed under the heading 'Updates for everything at my company' and are sorted by 'Post Date'. The first result is from 'Madeleine Rigby' and the second is from 'All MR Associates'. To the right of the search results is an 'Add to Chatter Favorites' button (callout 3) with a subtext: 'Add this feed search to your favorites on the Chatter page to easily track updates. [Learn more.](#)'

1. Enter terms in the header search box and click **Search**.
2. Click **Search Feeds** to see the posts and comments that include your search terms.
3. Click **Add to Favorites**.

 Example:

The favorite name on the Chatter page is the same as the search terms you entered. For example, if you searched for *competitive analysis*, your favorite is **competitive analysis**.

Tip: Save a search for a Chatter group name as a favorite to quickly access the group feed from the Chatter page. Similarly, save a search for a person's name as a favorite to quickly see that person's posts, comments, and mentions.

SEE ALSO:

[Chatter Feed Search Results](#)

Chatter Favorites Overview

Chatter favorites on the Chatter tab give you easy access to list views, Chatter feed searches, and topics that you want to stay on top of. For example, if you and your coworkers use the hashtag topic #acme to track information about your customer Acme, you might want to add #acme as a favorite so you can easily access these updates without leaving the Chatter tab.

You can have up to 50 favorites. If you haven't added any favorites, the Favorites section doesn't appear on the Chatter tab.

Chatter displays the four favorites most recently added or viewed.

- Click a favorite to see the updates.
- Click **x more** to see all your favorites.
- Click , which appears on hover, to remove a favorite.

Work with Posts

Posting Overview

Share information and collaborate with other people inside and outside your organization. Use the Chatter publisher to make posts, delete posts, ask questions, and create polls.

The publisher appears on your Home tab, Chatter tab, user profile page, group, and record detail pages. Use publisher to write a post (1), attach a file (2) or link (3) to your post, add a poll (4) or ask a question (5). Posts and comments can be up to 10,000 characters long. Use the rich text editor to format your posts (6).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Enterprise
- Professional
- Performance
- Unlimited
- Contact Manager
- Developer

By default, the publisher displays the Post, File, Link, Poll, and Question actions. Your Salesforce administrator can change the order of the actions and add more actions. Therefore, which actions you see, depend on how your administrator configured the publisher.

When you post to a feed, everyone with access to the post can comment on the post, like the post, and share it (1). From the drop-down menu (2), they can also bookmark the post and add topics.

Click **Edit** to modify your own posts and comments. If you're a group owner or manager, you can also edit other people's posts on the group feed. Click **Delete** to remove your post from the feed. However, you can't delete other people's posts or posts that are automatically generated by Salesforce. For example, you can't delete record updates like a post about a changed field on an account.

 **Note:** If the Edit option isn't available, your administrator disabled this feature for your organization.

Everyone with permission to access the record can see your post on the record detail page, on your profile, in feed search results, and in the All Company feed.	If you attach a file to the post, the file is associated with the record. Everyone with sharing rights to the record has access to the file.

 **Note:** You can't create new posts on archived groups. Comments on existing posts in an archived group follow the same visibility settings as before the group was archived.

Can I prevent people from seeing my posts?

Anyone except [customers](#) can see your posts on your profile, and people following you can see your posts in their Chatter feed. However, if you change a record, only people who have permission to see the record can see the record update a feed.

SEE ALSO:

[Sending Chatter Messages](#)

Do posts that I make on a group appear on my profile where others can see them?

Yes, but who can see the posts depends on the [type of group](#). If you post to a group that is:

- Public, anyone except customers can see the post on your profile.
- Private, only other group members can see the post on your profile.
- Private and allows customers, all members can see the post in the group. Customers who are members of the group can see your posts on the group page but not on your profile.
- Unlisted, only group members and users with the "Manage Unlisted Groups" permission can see the post on your profile. Customers who are members of the group can see your posts on the group page but not on your profile.

[Chatter Groups](#)

Mute a Post

Control what appears in your news feed and mute posts you're no longer interested in.

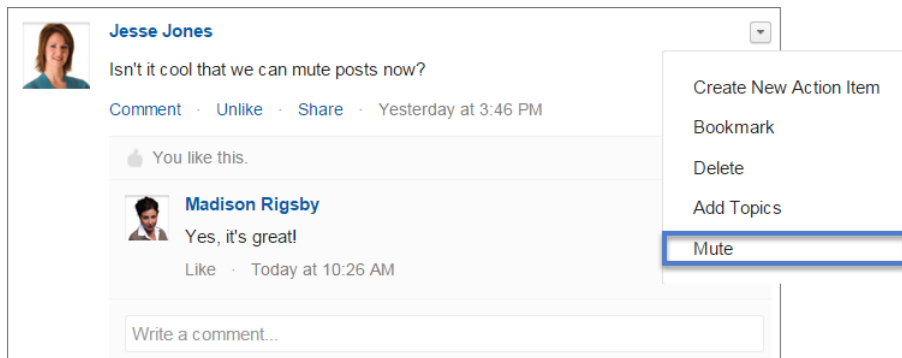

To mute a post, select **Mute** from the post's drop-down menu. You can mute posts in your feed on the Home and the Chatter tab, but not on group, profile, or record feeds. If your administrator enabled email replies, you can mute posts by replying to post emails with the single word *mute*.

After you muted a post,

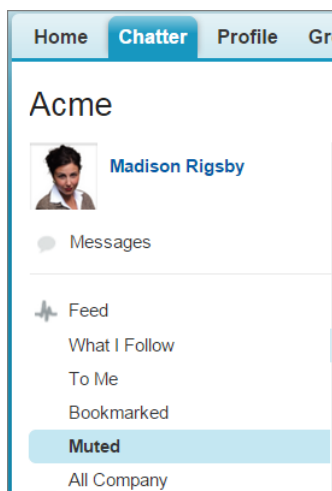

- The post no longer appears in your feed on the Home and Chatter tab
- You no longer get notifications for updates to that post
- You can use the Muted filter on the side panel to view your muted posts
- If someone mentions you on a muted post, the post is automatically unmuted. It reappears in your feed and if you have email notifications enabled, you get a notification about the update.
- If the post was originally posted to a group, profile, or record feed, it still appears on that feed.

For example, someone posts to a group that you're a member of. The post appears on the group feed and your news feed on the Home and Chatter tab. You can mute the post in your news feed, but the post remains visible in the group feed.

 **Example:** Here's how you mute a post from the drop-down menu.

To view all posts you muted, select the Muted filter.

Mention People and Groups

@Mention People and Groups in Posts and Comments

@Mention individual people or a group to keep them informed when you're discussing something relevant to them.

1. When you write a post, type @ followed by the first few letters of the person or group name.
2. Select the person or group from the list of matches.

The list includes all matches for

- People, including people you don't follow
- Public groups
- Private groups you're a member of

You can have up to 25 mentions in a single post or comment. You can't mention archived groups, unlisted groups, customer groups, and private groups you're not a member of.

3. Click **Share** to post your update.

After you posted your update,

- The person's name becomes a link to their profile, and the group name becomes a link to the group page.
- For people you mention, your update appears on the mentioned person's profile feed and in their To Me feed.
- Chatter sends an email notification to people you mention.
- For groups you mention,
 - Your update appears on the group feed and each group member's What I Follow feed.
 - Chatter sends an email notification to the group members who enabled the Email Every Post preference for the group.
 - If the mention is on a record feed, the record appears in the group records list.

 **Example:** Your coworker Madison posts that she is looking for information about an Acme product feature. You reply to Madison's post with the comment: "Talk to @Bob Smith—he is the Acme account manager. @Acme Products, do you have any additional information for Madison about this feature?" Both Bob Smith and members of the Acme Products group get an email notification about your post. Madison can click **@Bob Smith** in the update to view Bob's profile, or click @Acme Products to see their group page.

Chatter enforces security and sharing rules in Salesforce. Let's say you make a post to a record or a private or unlisted group and @mention someone who doesn't have access to that record or isn't a member of the group. In this case, the @mention appears as a gray link. The mentioned person can't see your post and doesn't get notified about the post. For example, Madison creates a private group for her project team and forgets to add her coworker Sandy Dunn to the group. When Madison posts an update to this group and @mentions

EDITIONS

- Contact Manager
- Developer

Sandy Dunn, Sandy isn't notified about the update. Sandy also can't see the update because she's not a member of the private group. If Madison later adds Sandy to the group, Chatter doesn't notify Sandy about the previous mentions.

[User and Group @Mentions—Visibility](#)

User and Group @Mentions—Visibility

When you @mention people or groups in an update, anyone who has access to the update can see the post and all comments.

This table describes where you can find posts and comments that mention people, public groups, and private groups. You can't mention private groups with customers and unlisted groups.

If the post was made on	And mentions	Then these people can see the post and comments
A person's profile	Other people	Anyone with access to the person's profile.
	Public group	Anyone with access to the person's profile.
	Private group	Anyone with access to the person's profile, even if they're not a member of the private group.
Public group A	Other people	Anyone with access to public group A.
	Public group B	Anyone with access to public group A.
	Private group	Anyone with access to public group A, even if they're not a member of the private group.
Private group A	Other people	Members of private group A.
	Public group	Members of private group A.
	Private group B	Members of private group A, even if they're not a member of private group B. People who are members of both private groups can also see the post in the feed of private group B.
Unlisted group A	Other people	Members of unlisted group A and users with the "Manage Unlisted Groups" permission.
	Public group	Members of unlisted group A and users with the "Manage Unlisted Groups" permission.
	Private group B	Members of private group B who are members of unlisted group A or have the "Modify Unlisted Groups" permission.
Record detail page	Other people	People with sharing access to the record.

If the post was made on	And mentions	Then these people can see the post and comments
	Public group	People with sharing access to the record.
	Private group	People with sharing access to the record, even if they're not a member of the private group.

The visibility of posts and comments depends on sharing access to the post. Anyone with access to the original post also has access to all subsequent comments on the post.

Feed Attachments

Share files and links with people by attaching them to posts or comments.

Attach links and files to posts and comments from your computer, Salesforce CRM Content libraries, Chatter feeds, and the Files list. All file types are supported, including everything from Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs, image files, audio files, and video files.

This table describes who can see a file you attached and where it appears:

If You Attach a File:	Who Can See It?	Where Does it Appear?
On a Chatter feed	All Chatter users in your company	<ul style="list-style-type: none"> In your and your followers' Chatter feeds, and profile On the Files list and Salesforce CRM Content of all Chatter users in your company
On your profile or on someone else's profile	All Chatter users in your company	<ul style="list-style-type: none"> In your feed, their feed, your followers' feeds, and their followers' feeds and profiles In the Files Owned list on your profile On the Files list and Salesforce CRM Content of all Chatter users in your company
On a public group	All Chatter users in your company	<ul style="list-style-type: none"> In your feed, your followers' feeds, and the group members' feeds In your feed on your profile In the feed on the group In the Group Files list on the group

Attach Files or Links

Attach a File to a Post or Comment

Share files and links from Salesforce or from your computer with people by attaching them to posts or comments.

You can attach all file types, including Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs, image files, audio files, and video files. The maximum file size is 2 GB.

When you attach a file, consider the following:

- When a file is posted to a feed, everyone in your company can see it even if the file started out as private. Only files posted in a private group stay private within that group.
 - Attaching a file from a group or library creates a reference to the file. If you update a file in Salesforce CRM Content, the updates are also reflected in the feed.
1. Click **File** at the top of your feed to attach a file to a post, or **Attach File** below a comment to attach a file to a comment.
If you're commenting on an update resulting from feed tracking on a file, the **Attach File** option isn't available.
 2. Do one of the following:
 - Click **Select a file from Salesforce** to attach a file that has already been uploaded or synced from your Salesforce Files Sync folder.
 - Click **Upload a file from your computer** to attach new files from your computer.
 3. Browse for the file you want to attach.
Links, Google docs, documents from the Documents tab, and attachments from the Notes and Attachments related list aren't included in the Select a File to Attach list. For more information about finding files to attach, see [Searching for Files to Attach to a Chatter Feed](#).
 4. Add a post or comment about the file.
If you don't enter any text, a generic update is posted with your attachment.
 5. Below the text box, select **My Followers** to publish the post on your profile. To post to a group, select **A Group**. Type part of the group's name in the Search Groups field, and select the group from the drop-down list. You can only select a group you're a member of.
 6. Click **Share**.

Searching for Files to Attach to a Chatter Feed

When you click **File** and **Select a file from Salesforce** on a Chatter feed, a list of files you own and have access to from Chatter and Salesforce CRM Content is displayed. The 25 most recently viewed files are listed by default. When you find the file you want to attach, click **Attach** next to that file.

From the Select a File to Attach list you can see and search a certain group of files by clicking a specific filter on the sidebar.

- **All Files**—All files you own and have access to, including:
 - Files that have been shared with you
 - Files you're following
 - Files in your Chatter groups
 - Files in your libraries
 - Files attached by other people to a Chatter feed. This includes files attached to all public groups, whether you're a member or not, and private groups you're a member of, but not private groups you're not a member of.

This filter is not available for users who have the “Sync Files” permission.

- **Recent**—The most recent files you've viewed.
- **MY FILES**—All files you own, files shared with you, and files you follow.
 - **Owned by Me**—Files you have:
 - Uploaded on the Home or Files page. These are private and not shared with anyone, but you can view them, perform actions, share them, and attach them to Chatter feeds.
 - Attached to Chatter feeds from your computer.
 - Synced using your Salesforce Files Sync folder.
 - Uploaded to Salesforce CRM Content libraries you're a member of and your private library.
 - **Shared with Me**—All files that have been shared with you either by a private share or a public post to your profile.
 - **Following**—All files that you're following.
- **FILES IN MY GROUPS**—All files you and other people shared to groups you're a member of. The last five groups you've visited are listed.
- **FILES IN MY LIBRARIES**—All files you and other people uploaded to libraries you're a member of and all files you uploaded to your private library. The first five libraries you're a member of, including your private library, are listed. If you're a member of more than five libraries, click **More** to see a complete list.
- **Synced**—All files that have been synced in your Salesforce Files Sync folder. This filter is available only to users who have the “Sync Files” permission.

Note:

- Only files from libraries that you're a member of and where you have `Post Content to Chatter Feeds` or `Manage Library` checked in your library permission definition are listed.
- Users who have the “Sync Files” permission don't see the **All Files**, **MY FILES**, or **FILES IN MY GROUPS** filters. Users who don't have the “Sync Files” permission don't see the **Synced** filter.

To search for files from the search box:

1. Optionally, click a filter on the sidebar to restrict your search to a specific set of files.
2. Enter your search terms in the search box. You can search by file name, description, owner, type, or within the file's text.

EDITIONS

3. Click **Search** to see a filtered list of all relevant files based on your search terms. Or click  to clear your search terms.

The Select a File to Attach list doesn't include:

- Documents from the Documents tab.
- Attachments from the Notes and Attachments related list.
- Links attached to posts in Chatter
- Files from your personal library

Performing Actions on a File in a Chatter Feed

You can perform the following actions on files in feeds.

- Preview—Click the file thumbnail or click **More Actions > Preview** next to the file.
- Download—Click **More Actions >  Download** next to the file.
- Upload new version—Click **More Actions > Upload New Version** next to the file.
- View file detail page—Click the file name or **More Actions > View File Details** next to the file.
- Follow—Click  **Follow** next to a file to receive updates about the file in the Chatter feed. Click  to stop receiving updates about the file.
- Share—Click **More Actions > File Sharing Settings** next to the file to share the file with people, groups, or via link.
- If you have the “Sync Files” permission and are the owner of the file, click  **Sync** to [sync a file](#) between your Salesforce Files Sync folder on your computer and Chatter. Click  **Unsync** to stop syncing the file.

To learn who can perform which actions on a file, see [File Sharing Settings and Permissions](#).

Downloading and Previewing a File in a Chatter Feed

Not only can you download and save files posted to Chatter feeds, you can also preview files in your browser without downloading them.

There are several places in Chatter where you can download and preview files:

- On the **Files** page—Click  >  **Download** or click the preview () icon next to the file.
- On any Chatter feed—Click **More Actions** >  **Download** next to the file, or to preview the file, click on the file thumbnail or click **More Actions** >  **Preview**.
- On the Files Owned by list on a profile—Click  >  **Download** or click the preview () icon next to the file.
- On the Files Shared with list on a group—Click  >  **Download** or click the preview () icon next to the file.
- In the Notes and Attachments related list on a record, click **Download** next to the feed attachment, or to preview the file, click **Preview** next to the feed attachment.

Previewing a file opens it in your browser with the enhanced document viewer. The enhanced document viewer provides the following capabilities for viewing documents:

- In addition to using the next page () , previous page () , first page () , and last page () icons on the document toolbar, you can navigate page-by-page through a document by right-clicking and choosing **Next Page** and **Previous Page**.
- You can use the scroll bar to move continuously through a document without needing to click the **Next Page** and **Previous Page** icons. Continuous scrolling is not available for PowerPoint files.
- You can jump directly to a page by entering the page number in the page field and pressing Enter.
- From the right-click menu you can choose **Fit Width** to expand the width of the document, or **Fit Full Page** to preview the whole page of the document. The fit width icon () and fit full page icon () are also available on the toolbar.
- From the right-click menu you can choose **Full Screen** to preview the document in full screen mode, or **Exit** to exit full screen mode. The full screen icon () and exit icon () are also available on the toolbar.
- From the right-click menu you can **Zoom In** or **Zoom Out**. The zoom-in icon () and zoom-out icon () are also available on the toolbar.
- You can use the keyboard arrow keys to navigate page-by-page through a document. Click on the document viewer and use the keys as follows:
 - Right-arrow key: moves a PowerPoint document forward one slide and moves a PDF, Word, or Excel document forward one page.
 - Left-arrow key: moves a PowerPoint document backward one slide and moves a PDF, Word, or Excel document backward one page.
 - Up-arrow key: moves a PowerPoint document forward one slide and scrolls a PDF, Word, or Excel document up the page.
 - Down-arrow key: moves a PowerPoint document backward one slide and scrolls a PDF, Word, or Excel document down the page.

Note:

- Not all files can be previewed, such as encrypted files, password-protected files, copy-protected PDFs, unknown file types, and any file larger than 25 MB. For files that can't be previewed, the **Preview** option isn't available on feeds or list views, and files appear as generic file type icons in the feed. Some Microsoft Office 2007 features don't display correctly in previews. If a file can be previewed, but a preview doesn't exist, contact your Salesforce administrator who may be able to regenerate the preview.

EDITIONS

[Feed Attachments](#)

[Removing and Deleting Files and Links from a Chatter Feed](#)

Removing and Deleting Files and Links from a Chatter Feed

There are different ways to remove and delete Chatter files and links depending on where they appear. To remove a file or delete a link from a Chatter feed, you must delete its post. To delete a file, you must go to the file detail page or content detail page. You can only delete a file if you are the file owner. Users with the “Modify All Data” permission can delete all comments, posts, files and links.

Removing a File from a Chatter Feed

To remove a file from a Chatter feed, you must delete its post. When you delete a post that includes a file, you're not deleting the file, just the reference to the file; the file remains in its original location. If the file was attached to a post and not shared in other locations, deleting the post also removes the reference to the file and the file goes back to being private, but can be shared again later.

Removing a File from a Chatter Feed on a Record

There are two ways to remove a file on a Chatter feed on a record:

- Remove the file on a Chatter feed by deleting its post. This deletes the post, removes the file from the feed and from the Notes and Attachments related list, but the file remains in its original location. If the file isn't posted anywhere else, it goes back to being private, but can be shared again later.
- Remove the file on a Chatter feed by clicking **Del** next to the feed attachment on the Notes and Attachments related list. This removes the file from all Chatter feeds where it's been shared and deletes the file from the Notes and Attachments related list. Restore the file by clicking on the Recycle Bin, selecting the file, and clicking **Undelete**. If the file was attached from your computer, a Chatter feed, group, or a Salesforce CRM Content library, deleting it from the Notes and Attachments related list also removes it from the post, but doesn't delete it from its original location.

Deleting a link from a Chatter Feed

To delete a link on a Chatter feed, you must delete its post.

Deleting a File from a File Detail Page

Click **Delete** on a [file's detail page](#) to delete the file and remove it from all locations where it's been shared. If the file is shared via link, anyone with the link will no longer have access to the file. To restore the deleted file, click on the **Recycle Bin** link on the **Home** page. Select the file and click **Undelete**. The file is restored as well as all of the shares that were associated with it.

Deleting a File from a Content Detail Page

When you post a file in Chatter, the file also appears in Salesforce CRM Content. To delete the file from Chatter, Salesforce CRM Content, and all locations where it's been shared, click the name of the file on the Libraries, Content, or Subscriptions tab. From the content details

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Enterprise
- Professional
- Performance
- Unlimited
- Contact Manager
- Developer

page, click **Edit > Delete Content** to delete the file. Deleting a Chatter file from the content details page deletes the file from Salesforce CRM Content and from Chatter. Select the checkbox for the content file you want to restore, and click **Undelete**.

SEE ALSO:

[Post Visibility](#)

Attaching a Link to a Post

Share links with people by attaching them to a post.

If you share a URL for which we provide rich media support, your post shows a preview of the linked content. For information about currently supported URLs, see [Sites That Generate a Preview in Posts](#).

1. Above your feed, click **Link**.
2. Type the URL to share.
3. Optionally, type a `Link Name`.
If you leave the Link Name field blank, the preview shows the title or name from the site URL.
4. Optionally, type a post.
If you don't type any text, a generic update is posted with your link.
5. Below the text box, select **My Followers** to publish the post on your profile. To post to a group, select **A Group**. Type part of the group's name in the Search Groups field, and select the group from the drop-down list. You can only select a group you're a member of.
If you're posting on someone else's profile or on a record, the **My Followers** and **A Group** options aren't available.

6. Click **Share**.

SEE ALSO:

[Sites That Generate a Preview in Posts](#)

Sites That Generate a Preview in Posts

Salesforce provides rich media support for various URLs. When you share a supported URL in a post, your post shows a preview of the content in the link.

Previews are powered by Embed.ly, a third-party service, and include thumbnails, descriptions, and video players for links to videos. If a post doesn't render a link as a rich preview, the URL domain isn't supported or Embed.ly was unable to return the preview content.

We don't share any content, user, organization, or account data with Embed.ly. We only share the URLs that are on the domain whitelist. All of our URL requests pass through a Salesforce proxy. Embed.ly never receives calls directly from the client and therefore doesn't have information about who's making the URL request.

We display previews for links to content on various sites.

Post a Poll

Polls

Use polls to conduct a survey. A poll contains a list of choices in a feed post that lets people cast a vote by selecting one of the choices.

Polls are a great way to get people's opinions. For example, you are in charge of planning an annual sales meeting and need to find out when most people are available to attend the meeting. Instead of emailing everybody in the sales organization, you could create a poll in the Sales Chatter group that lists possible dates and ask people to vote for the date that works best for them.

When you create a poll, anybody with access to the feed or the poll can vote on the poll. So when you post a poll, consider who you want to participate. For example, if you post a poll in a private group, only the members of that group can see the poll and vote. Keep the following in mind about polls:

- When you create a poll, you can add up to ten choices.
- When voting on a poll, you can only select one choice.
- Polls are anonymous. You can see how many people voted, but you can't see who voted.
- Click **Refresh** to see the latest poll result and the number of votes that were cast.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Enterprise
- Professional
- Performance
- Unlimited
- Contact Manager
- Developer

- You can't repost a poll.
 - People can only cast one vote, but they can change their vote.
 - You can mention someone and include hashtag topics in the poll question.
 - You and others can add topics to your poll question after posting.
 - The email notification options you enabled in your Chatter Email Settings apply to polls just as they do to posts. For example, if you get a notification whenever someone comments on a post you made, you also get an email notification when someone comments on a poll you posted.
-  **Note:** The poll result doesn't always add up to 100 percent due to rounding. For example, if a poll has three choices and each gets one vote, the result adds up to 99 percent.

SEE ALSO:

[Liking Posts and Comments](#)

Create a Poll

Post a poll in your feed to gather people's opinions.

1. Above the feed, click **Poll**.
2. Type a question in the text box.
Add a hashtag or mention someone.
3. Type at least two choices.
Click **Add more choices** to add another choice. You can enter up to ten choices.
4. Select to post the poll to your followers or to a group.
If you're posting the poll to a group, select the name of the group from the drop-down list.
5. Click **Share** to post the poll.

SEE ALSO:

[Vote on a Poll](#)

Vote on a Poll

1. In the post that contains the poll, select your choice.
You can only select one choice.
2. Click **Vote**.
The post shows the current result of the poll. To change your vote click **Change vote** and select your new choice.

-  **Note:** The poll result doesn't always add up to 100 percent due to rounding. For example, if a poll has three choices and each gets one vote, the result adds up to 99 percent.

Categorize Posts with Topics

Viewing All Topics

Use the topics list to discover the topics that people are talking about in your organization. All topic names appear in this list, including topics used solely in private groups or on records.

Watch a Demo:  [Discover and Organize with Chatter Topics](#)

To view the topics list, on the left side of the Chatter page, click  **Topics**.

In the topics list, you can:

- Click a topic name to see the topic detail page.
- Click  **Follow** to see updates in your Chatter feed.
- [Filter the list of topics](#) to narrow down what you're looking for.
- Search for topics by name.

 **Tip:** Use global search to search topic names and descriptions.

Filters for Sorting the Topics List

Use the topic filters to narrow the topics list to your favorite topics or topics you use, and then sort the topics by the number of people talking about them or alphabetically by name.

On the [Topics list](#), under Show, you can filter the topics.

All

All topics that have been added to posts in your organization

My Favorites

Topics you added to your favorites

Topics I Use

Topics you added to posts and topics on posts that you commented on

Within the topics you filtered, you can sort by the following columns.

People Talking About This

Sorts by the number of people talking about the topic. This includes:

- The number of people adding the topic to updates
- The number of people commenting on posts with the topic

Name

Sorts alphabetically by the topic name.

Viewing Details about a Topic

View a topic detail page to see the topic description and a feed with topic updates from all users and public groups.

To open a topic detail page, click a topic or hashtag. On the topic detail page, you can:

- [Search a topic feed](#) to quickly find relevant information. Or scan the feed to learn about the topic and discover which people and public groups are interested in it.
- Add a post directly to the topic feed. Your followers automatically see the post, and you can even add the post to a group you're a member of. Because you added the post on the topic feed, the topic is automatically added to your post.
- Discover [who's knowledgeable](#) about the topic and endorse people you think are knowledgeable. If you appear in the Knowledgeable People list and you don't want to, you can hide yourself.
- Click **+ Follow** to follow the topic and see updates to the topic in your feed.
- Edit the topic name and description. In the upper right, click , and choose Edit Details. You can change only the capitalization and spacing of topic names.

 **Note:** Topic names and descriptions are not private, even those that appear solely in private groups and on records. Posts and records with topics have the same security and privacy as those without topics.

- If available, find out more about a topic using the lists on the right.

Related Topics

Other topics that were added together with the current topic.

Recent Files

Files you have access to that were most recently posted to the topic feed.

Groups Talking

Public groups and groups you're a member of that most recently used the topic.

Following Topics

Follow topics so you can see updates in your Chatter feed.

To follow a topic, click **+ Follow** on the:

- Topic detail page
- Topics list

You can follow a maximum combined total of 500 people, topics, and records. To see how many items you're following, view the Following list on your profile.

To stop following a topic, click  next to Following. After you stop following a topic, you don't see future updates to the topic in your Chatter feed.

If your administrator disables feed tracking for topics, you can't follow new topics but you continue to follow the ones you followed when feed tracking was enabled. These topics count toward the maximum number of people, topics, and records that you can follow. To stop following a topic after your administrator disables feed tracking, you must use the Chatter REST API.

Find and Endorse People Knowledgeable about a Topic

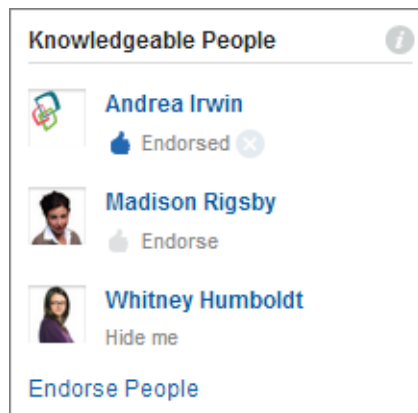

Discover and recognize experts using the Knowledgeable People section of topic pages and the Overview tab of user profile pages.

The topic page shows the five most knowledgeable people based on their activity on the topic and recognition received for the topic. For example, Chatter considers how often people:

- Were mentioned in posts or in comments on posts with the topic
- Received likes on comments on posts with the topic
- Received endorsements for the topic

Endorsements are a strong signal of knowledge, so if someone endorses you, you're automatically included in the list of knowledgeable people.

 **Note:** Knowledgeable people are calculated and updated once a day.

To change endorsements:

- Endorse someone you think is knowledgeable about a topic by clicking **Endorse** under the person's name. If the person you want to endorse doesn't appear in the Knowledgeable People section, click **Endorse People** to see the full list and to search for other people. (You can't endorse yourself, Chatter Free users, or customers.)
- Remove your endorsement of someone at any time by clicking  next to Endorsed under the person's name. Removing your endorsement of someone doesn't necessarily remove them from the knowledgeable people list; they might be endorsed by other people or have significant activity on the topic.

To remove yourself from the knowledgeable people list:

- Opt out by clicking **Hide me** under your name. No one can see you in the list after you hide yourself. If you change your mind, you can opt back in by clicking **Endorse People** and then **Show me** next to your name.

To see a person's full range of expertise:

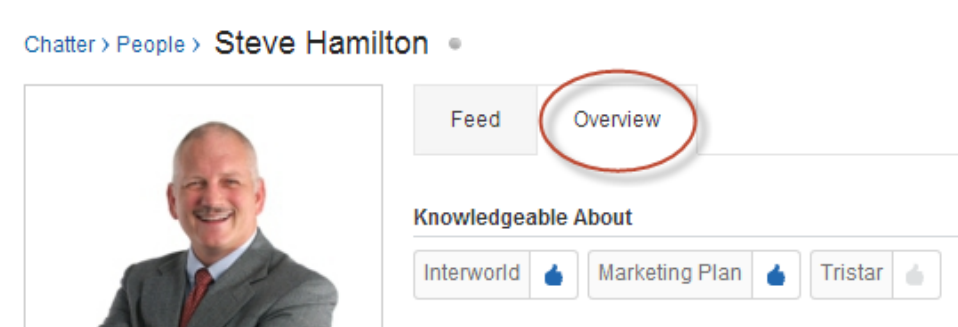

- Navigate to their user profile page, and click the Overview tab. Then click topic names to see topic detail pages, or click thumbs-up icons to add or remove your endorsements.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Enterprise
- Professional
- Performance
- Unlimited
- Contact Manager
- Developer

Important: If Work.com Skills are enabled, they replace knowledgeable topics on profile pages. (For Salesforce Communities users, skills replace topics only in the default community.) Self-declared skills are considered when calculating knowledge levels.

SEE ALSO:

[Skills Overview](#)

Adding Topics to Posts

Add topics to posts to organize them or to increase their visibility. You can add topics to your own posts immediately after posting, or you can add topics to any posts at any time directly in the feed.

Note: All topic names appear in the topics list and all topic names and descriptions are searchable, including topics used solely in private groups or on records.

1. In the top corner of the post, click .
2. Click **Add Topics** or **Edit Topics**.
3. In the topic editor, start typing your text. As you type, you can pick a topic from the list of suggestions, or keep typing to create your own unique topic. To add more than one topic, type a comma after each topic.

Commas (,) and closing square brackets (]) automatically end a topic. Other punctuation, symbols, and separators are supported in topic names.

Posts can have up to 10 topics.

4. When you're done adding topics, click **Done** or press ENTER.

The topics you add become links to the topic detail pages.

SEE ALSO:

[Adding Hashtag Topics to Posts and Comments](#)

[Adding a Topic as a Favorite](#)

EDITIONS

Available in: Salesforce Classic

USER PERMISSIONS

To add existing topics to posts and comments:

- "Assign Topics"

To add new topics to posts and comments:

- "Create Topics"

Adding Hashtag Topics to Posts and Comments

Add topics to posts and comments to organize them or to increase their visibility.

For example, if you post that you're working on a sales presentation for your customer Universal Paper, you might want to add the hashtag topic **#Universal Paper** in your update. Anyone can click the topic to find out more information about Universal Paper and to see which people and groups are talking about Universal Paper.

To add a hashtag topic:

1. When writing an update, type # followed by any text. As you type, you can pick a topic from the list of suggestions, or press ENTER at any time to add a new topic that can be up to three words.

Commas (,) and closing square brackets (]) automatically end a topic. Other punctuation, symbols, and separators are supported in topic names.

2. Click **Share**.

The hashtag topic becomes a link to the topic detail page. The topic (without the hashtag) is also automatically added to the top-level post in the update. For example, if you include **#Universal Paper** in a comment under your coworker's post, the topic **Universal Paper** is added to your coworker's post.

Once you post an update, the only way to remove a hashtag topic is to delete the entire post or comment. You can, however, remove the topic from the top-level post.

SEE ALSO:

[Adding Topics to Posts](#)

Removing Topics from Posts

Remove a topic from a post if it no longer applies.

You can remove topics from posts in the feed; however, you can't remove hashtag topics. Removing topics doesn't delete them. Before you remove a topic from a post, consider whether you or someone else added it. Someone else may be tracking the update with topics you're not aware of.

1. In the top corner of the post, click .
2. Click **Edit Topics**.
3. Click  next to the topic you want removed from the post.
4. Click **Done** or press ENTER.

Removing a topic from a post removes the post from the topic feed on the topic detail page and from the feeds of any followers.

Adding a Topic as a Favorite

Add a topic as a favorite to quickly see the latest on the topics you're interested in.

1. Click a topic name to navigate to the topic detail page.
2. In the upper-right, click , and choose **Add to Favorites**.
The favorite name is the same as the topic name.

 **Tip:** When viewing a topic favorite, you can click the topic name at the top of the feed to go directly to the topic detail page.

SEE ALSO:

[Viewing All Topics](#)

Viewing the Topics People Are Talking About

The topics you're talking about appear in your Chatter profile in the Recently Talked About section. This section helps people learn which topics you're knowledgeable about or interested in. These are the topics that you and others have frequently and recently (within the last two months) added to your posts and to posts you've commented on. For privacy reasons, Recently Talked About topics don't include topics used solely in private groups or record feeds. You can see up to five topics, with the most frequently and recently added topic appearing first. If you're new to topics or if you haven't used topics in the last two months, the Recently Talked About section doesn't appear until you start using topics more frequently. Click a topic in this section to see the topic detail page.

 **Note:** If the Knowledgeable About list or Work.com Skills are enabled, those features replace the Recently Talked About section on profile pages.

View the Topics Groups Are Talking About

The topics that a group is talking about appear on the group detail page in the Recently Talked About section. This section helps people understand which topics a group is knowledgeable about or interested in. These are the topics most frequently and recently added to group posts over the last two months. You can see up to five topics, with the most frequently and recently added topic appearing first. If a group isn't using topics, the Recently Talked About section doesn't appear until the group starts using topics more frequently. Click a topic in this section to see the topic detail page.

Viewing Your Company's Trending Topics

The Trending Topics area on the Chatter tab shows the topics being discussed right now in Chatter. The more frequently people add a specific topic to their posts and comments and comment on or like posts with the same topic over a short period of time, the more likely it is to become a trending topic. For example, if your coworkers are attending the upcoming Dreamforce conference and have started discussing it in Chatter, you may see a trending topic for Dreamforce. A trending topic is not solely based on popularity and usually relates to a one-time or infrequent event that has a spike in activity, such as a conference or a project deadline. For privacy reasons, Trending Topics don't include topics used solely in private groups or record feeds.

Share Posts

Sharing a Chatter Post

Sharing lets you quickly copy a public post to your profile or a group.

You can share public Chatter posts that contain text, links, or files to your profile, with a group, or using a link to the post.

When you share a post, keep in mind:

- You can share a post to your own profile, but not to another person's profile.
- You can share the original post, including any files and attachments, but you can't share any comments or likes.
- You can comment on the shared post, but you can't edit a shared post.
- You can't share feed tracked items and custom feed items, such as approvals, dashboard snapshots, or case interactions.
- You can only share posts with a group you're a member of.
- You can share a post to a group that allows customers. However, customers and other group members can't share posts from a private group.
- Only Chatter users inside your company can see a post that you shared using a link in an email or instant message.

When someone shares your post, you receive an email notification. To change your email notifications, from Setup, enter *Chatter Email Settings* in the Quick Find box, then select **Chatter Email Settings**.

Sharing a Chatter Post to Your Profile

Copy a public post to your profile to share it with the people who follow you.

You can share public posts, but you can't share feed tracked items and custom feed items, such as approvals, dashboard snapshots, or case interactions.

1. Find the post you want to share in your Chatter feed.
2. Click **Share**.
3. Write a comment about the post or leave the comment field blank.
4. In the drop-down list, select **My profile**.
5. Click **Share**.
The shared post appears in the Chatter feed on your profile.

SEE ALSO:

[Post Visibility](#)

Sharing a Chatter Post with a Group

You can share posts with a group that you're a member of.

You can share public posts, but you can't share feed tracked items and custom feed items, such as approvals, dashboard snapshots, or case interactions. You can't share posts with archived or unlisted groups.

1. Find the post you want to share in your Chatter feed.
2. Click **Share**.
3. Type a comment about the post or leave the comment field blank.
4. In the drop-down list, select **A group**.
5. Type part of the group name and select the group from the list.
If you are sharing a post with a file, select **Viewers** to allow group members to only view the file, or select **Collaborators** to allow group members to download and modify the file.
6. Click **Share**.
The shared post appears in the feed of the group.

Sharing a Link to a Chatter Post

Share a post with other Chatter users via email or instant message.

When sharing a link to a post, keep in mind:

- You can't share a link to a post from a private group.
 - You can share public posts, but you can't share feed tracked items and custom feed items, such as approvals, dashboard snapshots, or case interactions.
 - In order to see the post, the people to whom you send the link to the post must be Chatter users.
1. Find the post you want to share in the Chatter feed.
 2. Click **Share**.
 3. In the top corner, click **Show link to post**.
 4. Copy and paste the link in an email or instant message and send it to the people with whom you want to share the post.
When recipients of the email or instant message click the link to the post, the post appears in their Chatter updates.

SEE ALSO:

[Post Visibility](#)

View a Single Chatter Post

You can view a single Chatter post in a feed for a user, record or group.

- In a feed, click the timestamp displayed below the post, for example, **Yesterday at 12:57 AM**.
- In a Chatter email notification, click the link in the body of the email to view only the related post.
- To view the full feed, above the post, click **All Updates**.

People In Your Organization

People Overview

The People tab and the People list on the Chatter tab display a list of the users in your organization.

- Click a person's name or photo to view his or her profile.
- Click **Follow** to see a person's updates in the Chatter feed. You can't follow [customers](#).
- Click **Following** to stop seeing a person's updates in the Chatter feed.
- Click a column header to sort the list:
 - **Name** sorts alphabetically by name. By default, the list is sorted alphabetically, in ascending order.
 - **Following** sorts based on who you're following and not following.
- Search for users by typing characters of a first or last name in the search box at the top of the page. The list automatically filters based on what you type.
- At the top of the list, click a letter to list everyone whose last name begins with that letter.
- Your organization's size determines what you see in the people list. For example, in the largest organizations, we don't display any users until you start searching for a person's name. We count all Salesforce user license types when calculating the approximate number of users, including internal users, Communities users, and Chatter users.

Profile Best Practices

When using profiles, consider these tips:

- Information in the About Me section is searchable and makes you more visible to others.
- Your posts display in your Feed tab and the feeds of people following you. To delete your posts from feeds, hover over the post and click .
- To change your email address in your contact information, you must click the link in the confirmation email sent to your new email address.
- Not all users have profiles. This includes portal users and the Connection User in organizations using Salesforce to Salesforce.

Using the Following and Followers Lists

View the Following and Followers lists on your profile to see who, what, and how many items you're following, and who is following you. If you're not following anyone, click **Find people to follow** in the Following list to view the People list and start following people. You can also view the Following and Followers lists on other people's profiles.

Note: When your administrator turns on Chatter, you automatically follow some users and records in your organization.

In either list, click **Show All** to view the full list in alphabetical order.

- Use the **Next** and **Previous** links to see more of the list.
- Optionally filter the Following list by people or objects, for example, accounts or files.
- In your Following list, click  to stop following a person or record.
- In another person's Following list, click  **Follow** to follow a person or record.
- In any Followers list, click  **Follow** to follow a person, or  to stop following them.

[People Recommendations](#)

People Recommendations

Chatter recommends people in your organization that you might want to follow based on similar interests. For example, Chatter recommends people who:

- Follow the same people as you.
- Are in your management hierarchy, such as your manager, people who report to your manager, and people who report to you.

Salesforce uses the `Manager` field on your personal information page to determine these recommendations. If this field is blank, Chatter won't recommend people based on your management hierarchy. Only your Salesforce administrator can edit the `Manager` field.

- Are popular, which means they have many followers.
- Are new to Chatter.
- Are interested in the same records as you. For example, someone who has looked at or edited an account that you've recently viewed.
- Are often followed together with people you already follow. For example, if you follow Madison Rigsby, you get a recommendation for Suzanne Powell if many people who follow Madison also follow Suzanne.

To see an expanded list of your recommendations, click **More** in the Recommendations section. If no recommendations appear, then you're already following all the recommended people.

SEE ALSO:

[Chatter Profile Overview](#)

Give Thanks to Your Coworkers

Recognize your coworkers with badges and post your thanks directly to their Chatter feed.

- **Note:** The Chatter Free license has limited functionality with Thanks features. Rewards features require a Work.com license. This includes giving, creating, or receiving badges tied to rewards.

Thank someone if they've done a great job or to recognize an achievement.

[Walk Through It: Give Thanks in Chatter](#)

1. From the Chatter publisher, click **Thanks**.
If **Thanks** isn't displayed, click **More** and select **Thanks** from the publisher's drop-down menu.
2. Type the name of the person you want to thank.
Currently, you can only thank one person at a time, but you can mention other people in your post's message.

5. Select your audience.

- **My Followers** to post to all your followers
- **A Group** to post to a specific group. Search for the group and select the group from the list. The person you're thanking is @mentioned at the beginning of the post's message. When you post to a private group, only the group's members can see your post to the group. However, the badge will also appear publicly on the Recognition tab of the recipient's profile.

6. Click **Share**.

Your Thanks post appears in your feed and the feed of the person you're thanking. If you're posting to a public group or a record page, the post appears on the group or record feed and their profile. If you're posting to a private group, only members of the private group can see your post to the group. However, the badge will also appear publicly on the Recognition tab of the recipient's profile.

Files Owned Lists on Profile Pages

The Files Owned list on a person's profile shows the files that person most recently attached to a Chatter post.

The list includes files that the profile owner attached to a post on the profile, a group, or record page, or uploaded to Salesforce CRM Content libraries. Hover to see available options or click the file name to go to the file detail page.

Click **Show All** to see a list of all the files the profile owner attached and uploaded. The list doesn't include files you don't have access to, documents from the Documents tab, and attachments from the Notes and Attachments related list. On this list you can:

- Upload private files or share files with people, groups, or via a link
- Preview a file, if a preview is available
- Follow a file to receive updates in your feed
- Click the file name to view the file detail page

Chatter Activity and Influence

See your personal Chatter activity statistics, such as how many posts you've made and how many likes you've received, and check your relative Chatter influence.

Chatter activity statistics include how many posts and comments you've made, how many comments you've received, and how many people liked your posts and comments. Chatter influence shows how your activity stacks up to other people's.

- Top Influencers lead collaboration efforts by regularly sharing essential content.
- Active Influencers encourage others to get involved and share knowledge.
- Observers are quiet participants or just getting started in Chatter.

You can see your Chatter activity statistics and influence on your profile under your photo. You can also see your coworkers' Chatter activity and influence on their profiles. When viewing a profile, hover over  under the profile photo for details about how that person is uniquely influential.

[Chatter Profile Overview](#)

Inviting People to Join Chatter

You can invite people from your company that don't have Salesforce licenses to use Chatter. Invited users can view profiles, post on their feed, and join groups, but can't see your Salesforce data or records.

To invite people to Chatter:

1. Click **Invite People to Chatter** on the People page or **Invite Coworkers!** on the Chatter page.

Note: You can only invite people with email addresses in your company's domains.

Portal users can't send invitations.

2. To send invitations from Chatter, enter email addresses and click **Send**.
3. To send invitations using your own email account, click **send your own email invitation**. If you have a default email client set, an email containing an invitation link opens in your mail program. Otherwise, you see an invitation link that you can copy and paste into an email.

You can also invite coworkers to join a public group even if they don't use Chatter yet. Additionally, owners and managers of private groups can send invitations. If customer invitations are enabled, owners and managers can also invite [customers](#). When someone accepts an invitation to join the group, they join Chatter as well.

1. Click **Groups** and click on a group name.
2. In the Members section on the group detail page, click **Invite People**.
If you are the group owner or manager, you can also click **Add/Remove Members**, then click **Invite them to Salesforce Chatter!**
3. Enter email addresses and click **Send**.

USER PERMISSIONS

To invite people to Chatter:

- "Allow Invitations"

 **Note:** If a user doesn't accept the invitation within the first day, Chatter sends an email reminder the second day. If the user doesn't accept that invitation, Chatter sends another reminder the following day.

A user has up to 60 days to accept an invitation to join Chatter. If during that time, an administrator deselects **Allow Invitations** or removes the user's domain from the list, the user can't accept the invitation.

When delegated authentication single sign-on is enabled in your organization, invited users bypass the password registration page. If their username already exists, they won't be able to accept the invitation.

Moderate Chatter Free Users

Chatter Moderators

A moderator is a Chatter user with some additional privileges such as:

- [Activate or deactivate Chatter Free users](#)
- [Assign a Chatter Free user as moderator or take the privilege away](#)
- Delete posts and comments that they can see

You can tell if someone is a moderator by the special banner on their profile picture.

USER PERMISSIONS

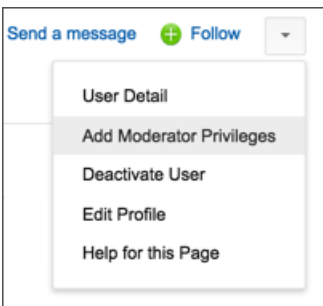

To moderate Chatter:

- "Moderate Chatter"

Assign Moderator Privileges to Chatter Free Users

As a moderator, you can assign moderator privileges to Chatter Free users in your organization. You can also remove them if needed.

1. Go to the person's profile page by clicking their name in the People tab or on a feed.
2. On the profile page, you can take these actions from the user action menu.

- If you want the person to be a moderator, select **Assign Moderator Privileges**.
- If the person is a moderator and you want to revoke those privileges, select **Remove Moderator Privileges**.

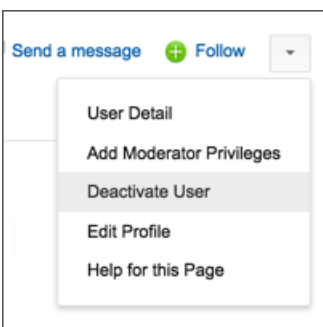

SEE ALSO:

[Change Chatter Group Roles](#)

Deactivate Chatter Free Users

As a moderator, you can deactivate Chatter Free users if, for example, they left the company.

1. Go to the person's profile page by clicking their name in the People tab or on a feed.
2. On the profile page, click **Deactivate User** from the user action menu.

If you need to re-activate a Chatter Free user, you must use global search to find their profile, as deactivated users don't show up on the People tab. To activate a user:

1. Find the person's profile using global search.

Viewing Updates on Records and List Views

Automatically Follow Records You Create

When you follow records you create, updates are sent to your Chatter feed when you or someone else changes a tracked field on those records.

By default, you don't automatically follow the records you create. If you want to automatically follow the records you create, enable auto-follow in your Chatter Settings.

1. From your personal settings, enter *My Feeds* in the **Quick Find** box, then select **My Feeds**.
2. Select **Automatically follow records I create**.
3. Click **Save**.

Consider the following tips around auto-following records:

- When you create a child record, the owner of the parent record becomes the owner of the child record by default. So you don't automatically follow the child record, unless you're the owner of the parent record.
- The **Account Owner** field of a record is updated to change the account owner. The new account owner only follows the account automatically, if the **Account Owner** field is feed-tracked and the new account owner has auto-follow enabled.
- If a workflow changes the **Account Owner** field while the record is created, the user who created the record doesn't automatically follow the account.

Consider the following scenario. You are creating a record. Saving the record starts a workflow that immediately reassigns the **Account Owner** field to another user and then saves the record. Meaning, the workflow changes the **Account Owner** field before the record is saved. In this case, you don't follow the record automatically, because you never were the record owner, even though you technically created the record.

Viewing Record Feeds

View the Chatter feed associated with a record you follow to see updates about the record.

Record feeds allow you to track information for records you have access to. On the record detail page, click **Show Feed** to display the record feed above the account details.

In the record feed, you can

- View posts, comments, and tracked field changes
 - Write an update about the record and share it with other people who follow the record
- Updates on the record detail page also display on the Chatter page of people who follow the record, and anyone who has access to the records can see the update on the All Company feed.
- See who is following the record
 - Search the [record feed](#) (🔍)

 **Note:** Record field changes in the feed aren't included in the search results.

Can I create a custom report for records I'm following?

Currently, you can't customize a report based on records you're following in Chatter.

SEE ALSO:

[The People and Records You Auto-Follow Initially](#)

Can other people follow records I own?

Yes, provided that they can already see the record. People can only follow records they can see, and by extension, can only see updates to records they can see.

SEE ALSO:

[Record Recommendations](#)

Record Recommendations

Following records helps keep you up-to-date on important changes to accounts, contacts, opportunities, and more. Chatter recommends records that you've viewed or edited, records that you own (and aren't already following), and parent accounts of records that you're following.

Chatter won't recommend records that your Salesforce administrator has disabled feed tracking for. Only opportunities, accounts, leads, contacts, and articles are included in record recommendations.

To see an expanded list of your recommendations, click **More** in the Recommendations section. To see your record recommendations by object, click the object in the side filters. For example, click **Accounts** to view only your account recommendations.

[Viewing Record Feeds](#)

Viewing Chatter Feeds on List Views

Switch to an object's Chatter feed directly from a list view to see updates for the records included in the list view.

If Chatter is enabled for your organization, Chatter feeds on list views are available for most feed-tracked objects. Some feed-tracked objects don't have a Chatter feed associated with their list view. Currently, you can view Chatter feeds on list views for opportunities, accounts, cases, leads, campaigns, contacts, and custom objects.

- Click  **Chatter** on a standard or custom object list view to see a Chatter feed with updates from the last 30 days for the records included in the list view.
If drag-and-drop scheduling on list views is enabled, you won't see Chatter feeds on the list views for accounts, contacts, or leads.
- Click **List** to display the list view again.

SEE ALSO:

[Viewing Record Feeds](#)

Adding a List View as a Chatter Favorite

Add a list view as a Chatter favorite to monitor key business processes directly from your Chatter tab.

1. Open an existing list view or create a list view for a set of records, like for example accounts, opportunities, or leads.
2. Click  **Feed** in the top-right corner to see the Chatter updates for the list items.
3. Click **Add to Favorites**.
The favorite name on the Chatter tab is the same as the list view name.

Dashboards and Dashboard Components

Following Dashboard Components

If feed tracking is enabled for dashboards, you can view updates and field changes in the Chatter feed. You can also follow dashboards and certain dashboard components.

Following components isn't supported for dynamic dashboards.

Only unfiltered data is used to generate alerts. This prevents alerts being sent out (incorrectly) because a component's value appeared to cross a breakpoint as a result of filtering.

If you don't see feeds, ask your administrator to enable feed tracking for dashboards.

For example, to receive alerts when total sales for a gauge fall below a certain amount, set conditional highlighting on that component, then follow it.

- Hover over a component to display the  menu. To clear the hover menu, click an empty part of the screen.
- Click **Follow this Component**.

To stop following a component, click  and select **Following**.

SEE ALSO:

[Viewing Record Feeds](#)

About Posting Snapshots to User and Group Feeds

When you post a component snapshot to a Chatter feed, consider who you would like to share and comment on the component.

A snapshot is a static image of a dashboard component at a specific point in time posted to a Chatter feed. Post a component snapshot to a user or group feed to share and comment on that component. For example, post a snapshot of this month's sales to your team.

Each snapshot has a "Viewing As" label. This is the name of the running user whose dashboard component you're viewing.

You can also post snapshots of filtered components (except Visualforce or s-control components). When viewers click the snapshot title in the feed, they're taken to your filtered view of the dashboard if the filters are still valid. If the filters aren't valid, they see the unfiltered dashboard.

If you don't see the option to post a snapshot, talk to your administrator about enabling dashboard component snapshots.

 **Important:** Posting a snapshot to a user or group feed makes it potentially visible to the entire organization:

- Posting to a user feed makes the snapshot public. Anyone who views that user's profile can see it.
- Posting to a public group makes the snapshot public. Anyone who views your profile or the group feed can see it.
- Posting to a private group shows the snapshot to all group members.

People can see it whether they have access to the dashboard or not. Make sure the component doesn't contain sensitive information!

SEE ALSO:

[Following Dashboard Components](#)

Posting Snapshots to Chatter

Post a snapshot of a dashboard component to a Chatter feed to help other users follow changes in the data.

A snapshot is a static image of a dashboard component at a specific point in time posted to a Chatter feed.

- Post a component snapshot to its dashboard feed to share information with everyone following the dashboard. For example, post a snapshot of a regional sales chart to let your team know that sales are down in the Midwest.
- Post a component snapshot to a user or group feed to spark comment or action from that user or group.

Each snapshot has a "Viewing As" label. This is the name of the running user whose dashboard component you're viewing.

You can also post snapshots of filtered components (except Visualforce or s-control components). When viewers click the snapshot title in the feed, they're taken to your filtered view of the dashboard if the filters are still valid. If the filters aren't valid, they see the unfiltered dashboard.

If you don't see feeds, ask your administrator to enable feed tracking for dashboards.

1. Hover over a component to display the  menu.
To clear the hover menu, click an empty part of the screen.
2. Choose where you want your snapshot to appear.
 - a. To show it in a dashboard, click **Post Snapshot to Dashboard Feed**.
 - b. To show it to a user or group, click **Post Snapshot to User or Group Feed**.
3. Write a comment in the text box and click **OK**. If you're posting a filtered component, you may want to mention that in your comment. The snapshot and comment immediately appear in the dashboard feed.

 **Note:** Snapshot images display in feeds for four months. After four months, only the comments remain.

Collaborate in Chatter Groups

Chatter Groups

Chatter groups let you collaborate with specific people. For example, if you're working on a team project, you can create a group for your team to share project-related files and information.

You can join up to 100 groups, and your company can have a total of 10,000 groups. Chatter groups have different levels of access:

- **Public:** Anyone can see and add posts, comments, and files. Anyone can join a public group.
- **Private:** Only group members can see and add posts, comments, and files. People must ask to join or be added by the group's [owner or managers](#). Users with the "Modify All Data" and "View All Data" permission can see group posts, updates, and files across the organization. Users with the "Manage All Data" permission can also join private groups directly and change group settings.
- **Unlisted:** Only group members and users with the "Manage Unlisted Groups" permission can see and add posts, comments, and files. People cannot ask to join and must be invited by the group's owner or managers. Unlisted groups offer [more privacy](#) and nonmembers cannot see or access unlisted groups in list views, feeds, and in search results. Unlisted groups aren't available by default; your administrator must enable them for your organization.
- Optionally, select **Allow Customers**. The group owner and managers can invite [customers](#) to join a private or unlisted group. You can easily identify groups with customers by the orange upper left corner of the group photo.

After you allow customers in a group, you can't change the group access level.

Additionally, if your administrator has enabled the feature, some groups may be archived. When a group is archived, users can't create new posts but group data is retained for reference.

SEE ALSO:

[What Your Chatter Group Role Allows You To Do](#)

[About Chatter Customers in Private Groups](#)

Unlisted Groups Overview

Unlisted groups offer more privacy for compared to private groups. Only group members and users with the "Manage Unlisted Groups" permission can access unlisted groups in list views, feeds, and search results.

Unlisted groups are similar to private groups, in that, only members can view an unlisted group's detail page, feed, or files. However, unlisted groups provide more privacy compared to private groups.

- Unlisted groups don't display in list views, feeds, and search results for nonmembers. Only members and users with the "Manage Unlisted Groups" permission can find and access unlisted groups.
- Nonmembers can't visit the group detail page.
(With private groups, nonmembers can see a truncated version of the detail page, which shows the name, description, and member list, but not the feed or files.)
- You can convert unlisted groups to public or private groups, but not the other way around.

- Only group owners, group managers, and users with the “Manage Unlisted Groups” permission can add group members. Users can’t ask to join them.
- Users can’t see unlisted groups on other user profiles unless they have access to the group.
- Files shared in unlisted groups are visible only to the members of the unlisted group. If the file is shared outside the unlisted group, then other users with permissions can update the file.
- Even users with the “Modify All Data” or “View All Data” permissions can’t access an unlisted group or its files unless they’re members. They also can’t change group settings unless they own or manage the group.
- Only users with the “Manage Unlisted Groups” permission can access or modify unlisted groups and its files and feed content without membership.

Limitations

If you decide to create an unlisted group, make sure that you consider these limitations.

- Custom pages or third-party applications integrated with Salesforce could expose unlisted group information to users who don’t have access via the Salesforce UI. Check in with your administrator about who can access information in unlisted groups in your organization.
- You can’t use topics in unlisted groups. You can add a hashtag topic when writing a post or comment in an unlisted group, and the topic will be formatted as a link after you post. However, a topic detail page isn’t created, and the link won’t work.
- You can’t mention unlisted groups in posts or comments.

SEE ALSO:

[Enable Unlisted Chatter Groups](#)

[Unlisted Group Limitations](#)

Broadcast Groups

Broadcast groups are a special type of public, private or unlisted group where only group owners and managers can create new posts. Group members can comment on the posts created by the group owner or manager.

By restricting the ability to post to a few individuals, group owners and managers can keep group discussions focused and relevant by cutting down noise from off-topic posts. Public, private, and unlisted groups support this feature.

To set a group to broadcast mode, select **Broadcast Only** in the group settings.

Group Edit

Release Coordinators

Save Cancel Archive Delete

Basic Information

Group Name

Owner

Description

A group to coordinate among all teams involved with the Winter '16 release.

Automatic Archiving
 Archive this group if there are no posts or comments for 90 days.
 Don't automatically archive this group.

Group Access

Public Everyone can see updates and join.

Private Only members can see updates. Membership requires approval. [i](#)

Unlisted Group is hidden from lists, feeds, and search. Only members and users with the Manage Unlisted Groups permission can see updates. [i](#)

Allow Customers You can invite customers to this group. [i](#)

Broadcast Only Only group owners and managers can create new posts. Group members can comment on the posts. [i](#)

Save Cancel Archive Delete

Example: Creating broadcast groups are ideal when one person or a fixed set of individuals regularly needs to communicate or share information with a large group of people. Some examples include:

- Organization-wide updates from the executive leadership in the company
- Policy changes from your company's HR department
- Event updates from the organizer of large events or company conferences
- Important action alerts from key IT personnel, including their awesome Salesforce administrator

Note: Broadcast groups is currently available to select customers through a pilot program. To be nominated to join this pilot program, contact Salesforce. Additional terms and conditions may apply to participate in the pilot program. Please note that pilot programs are subject to change, and as such, we cannot guarantee acceptance into this pilot program or a particular time frame in which this feature can be enabled. Any unreleased services or features referenced in this document, press releases, or public statements are not currently available and may not be delivered on time or at all. Customers who purchase our services should make their purchase decisions based upon features that are currently available.

Using the Chatter Groups Page

The Groups page displays a list of the Chatter groups in your company.

Click **Groups** on the sidebar of the Chatter page to display the list of Chatter groups. On the Groups page you can

Create a new group

Click **New Group** to access the New Group page and create your group.

Filter and sort the groups list

Use the following filters to filter your groups.

- **Recently Viewed** shows the groups you recently looked at, starting with the group you viewed last
- **My Groups** shows the groups you belong to, own, or manage
- **Active Groups** shows the active groups in your company
- **My Archived Groups** shows the archived groups you belong to, own, or manage.

Click a column header to sort the list. The Group column sorts by group name; the Last Activity column sorts by the date of the last post or comment on a group; the Membership column sorts based on your membership status.

Search for a group

Search for groups by typing two or more letters of a group name or description in the **Find Groups** box. The list automatically filters based on what you type.

View a group

Click a group name to view the group. You can view all groups, but you'll only see updates and files for public groups, and for private groups you belong to. Groups that [allow customers](#) say (With Customers).

Join a public group or ask to join a private group

Click **Join** to join a public group. For private groups, click **Ask to Join** to email a request to join to the group's owner and managers. Users with the "Modify All Data" permission can directly join private groups, and therefore see **Join** for private groups.

Leave a group or withdraw a request to join a group

Click **x** to leave a group or to withdraw a request to join a group.

View the group owner's profile

Click a group owner's name to see his or her [profile](#).

Get a group recommendation

View the groups that Chatter recommends you join based on the group's popularity and the number of connections you have in the group in the Recommendations section. Click **More** to see the full list. If you don't see recommendations, you already belong to all the recommended groups.

Join or Leave Groups

Join groups to collaborate with other people on projects or common areas of interest. Share project-related files and information with the group.

1. Go to group's detail page.
2. To join a public group, click **Join** or **Join Group**. To join a private group, click **Ask to Join**. Your request is sent to the private group's owner and managers, who accept or decline your request.

You can join up to 100 groups. All groups count toward this limit, except archived groups. For example, if you're a member of 100 groups, of which 10 are archived, you can join 10 more groups.

To leave a group you joined or withdraw your request to join a private group, go to the group detail page and click **×** or **Leave Group**.

Create and Manage Groups

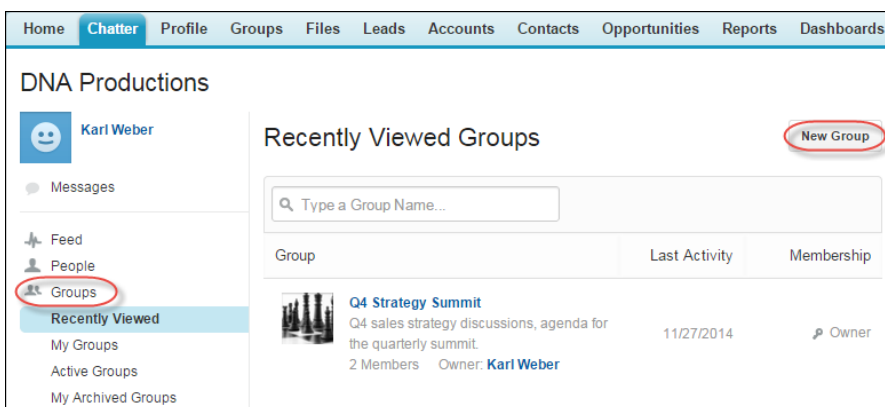

Create Chatter Groups

Create public, private, and unlisted Chatter groups to collaborate with your teams and work together on projects.

1. Navigate to the list of groups.
 - In Salesforce Classic, click the **Groups** tab.
 - In Lightning Experience, click  in the navigation menu.
2. To the upper-right, click **New Group**, and enter a group name and description.

 **Note:** Group names must be unique across public and private groups. Unlisted groups don't require unique names.

If Communities is enabled, public and private group names must be unique within the community.

3. Select an access level:
 - **Public:** Anyone can see and add posts, comments, and files. Anyone can join a public group.

USER PERMISSIONS

"To create groups"

- "Create and Own New Chatter Groups"

- **Private:** Only group members can see and add posts, comments, and files. People must ask to join or be added by the group's [owner or managers](#). Users with the "Modify All Data" and "View All Data" permission can see group posts, updates, and files across the organization. Users with the "Manage All Data" permission can also join private groups directly and change group settings.
- **Unlisted:** Only group members and users with the "Manage Unlisted Groups" permission can see and add posts, comments, and files. People cannot ask to join and must be invited by the group's owner or managers. Unlisted groups offer [more privacy](#) and nonmembers cannot see or access unlisted groups in list views, feeds, and in search results. Unlisted groups aren't available by default; your administrator must enable them for your organization.
- Optionally, select **Allow Customers**. The group owner and managers can invite [customers](#) to join a private or unlisted group. You can easily identify groups with customers by the orange upper left corner of the group photo.

After you allow customers in a group, you can't change the group access level.

4. Optionally, if your administrator has enabled group archiving, change the automatic archiving settings for the group. Disable automatic archiving only if a group must remain active at all times, despite extended periods of inactivity.
5. Click **Save**.

Note: You [own](#) groups you create. To assign a new owner, finish creating the group, then [edit the group settings](#).

SEE ALSO:

[Can I change a group's access level, for example, to make a private group public?](#)

Edit Group Settings

Edit the group settings to change the owner, modify archiving settings, group access level, and delete the group.

You can edit settings for Chatter groups you own or manage.

1. Click **Group Settings** on the group detail page in the Salesforce Classic. In the Lightning Experience, click **Edit Group** from the buttons in the group header.
2. Optionally, edit the group name and description.
3. Optionally, type a name or click the lookup icon to search the group members to assign a new **Owner**. Only the current owner or people with the "Modify All Data" permission can change the owner, and you must choose the owner from existing members. Customers can't own groups.
4. Optionally, if your administrator has enabled archiving for groups, edit the automatic archiving settings for the group. Disable automatic archiving only if a group must remain active at all times, despite extended periods of inactivity.
5. Optionally, change the access level for the group. For example, you can convert an unlisted group to a public or private group if you want to open it up to a wider audience.

 **Note:** If you change a private group to public, updates and files are visible to all users, all pending requests to join the group are accepted, and anyone can join the group. Private groups with customers can't be converted to other group types.

- **Public:** Anyone can see and add posts, comments, and files. Anyone can join a public group.
- **Private:** Only group members can see and add posts, comments, and files. People must ask to join or be added by the group's **owner or managers**. Users with the "Modify All Data" and "View All Data" permission can see group posts, updates, and files across the organization. Users with the "Manage All Data" permission can also join private groups directly and change group settings.
- **Unlisted:** Only group members and users with the "Manage Unlisted Groups" permission can see and add posts, comments, and files. People cannot ask to join and must be invited by the group's owner or managers. Unlisted groups offer **more privacy** and nonmembers cannot see or access unlisted groups in list views, feeds, and in search results. Unlisted groups aren't available by default; your administrator must enable them for your organization.
- Optionally, select **Allow Customers**. The group owner and managers can invite **customers** to join a private or unlisted group. You can easily identify groups with customers by the orange upper left corner of the group photo.

After you allow customers in a group, you can't change the group access level.

6. Click **Save**.

If you have the necessary permissions, you can also:

- [Archive the group](#).
- [Delete the group](#).

USER PERMISSIONS

To edit public or private Chatter groups:

- Group owner or group manager role

OR

"Modify All Data" to edit public and private groups

OR

"Manage Unlisted Groups" to edit unlisted groups

Can I change a group's access level, for example, to make a private group public?

If you're a group owner or manager, you can change groups from private to public, or from public to private by [editing the group settings](#). If you change a private group to public, updates and files are visible to all users, all pending requests to join the group are accepted, and anyone can join the group. Private groups with customers can't be converted to other group types. You can't change the group access level for private groups that allow customers.

SEE ALSO:

[What Your Chatter Group Role Allows You To Do](#)

Add and Remove Chatter Group Members

Own or manage a Chatter group? Here's how you add or remove group members.

1. In Salesforce Classic, on a group detail page, click **Add/Remove Members**. In Lightning Experience, click **Add Member** from the group highlights panel (your administrator must add this quick action to the group publisher).
2. Start typing the name of the user you want to add or remove to filter the list of users.
3. Click **Add** to add a member, or **x** to remove a member. For people who have requested to join, click **Accept** to accept the request, or **x** to decline.
4. Click **Done** when you're finished.

SEE ALSO:

[View Chatter Group Members](#)

Accept or Decline Private Group Requests

z

As the owner or manager of a private Chatter group, you can accept or decline requests to join the group. Additionally, users with the "Modify All Data" permission can view and manage requests for all public and private groups, and users with "Manage Unlisted Groups" can manage group membership requests for all unlisted groups in the organization.

1. View the list of requests by doing one of the following:
 - On a group detail page, click the **Request** link, for example, **3 Requests**
 - On a group detail page, click **Add/Remove Members** and then click the **Requests** filter, or scan for requests in the **Everyone** filter
 - Click the link provided in the email request

2. Accept or decline the requests.

Note: An email is sent to each person to tell them that their request was accepted or declined.

- Click **Accept** to accept. If there are more than two requests, you can accept them all by clicking **Accept x of y**, for example, **Accept 3 of 3**.
- Click **x** to decline. Optionally enter a message that will be included with your decline email and click **Send**. If you change your mind, you can click **Cancel** to go back.

3. Click **Done** to close the window.

If you make a private group public, any pending requests are automatically accepted.

Group Roles

What Your Chatter Group Role Allows You To Do

This table describes the actions that can be performed by members, managers, and owners of public and private Chatter groups. [Customers](#) can be group members and managers, but not owners.

Action	Owner	Manager	Member
Post, comment, and search group feeds	Yes	Yes	Yes
Add and remove records in groups (if configured)	Yes	Yes	Yes
Post group announcements	Yes	Yes	
Delete posts and comments	Yes	Yes	
Add and remove members	Yes	Yes	
Change member roles	Yes	Yes	
Edit group settings	Yes	Yes	
Edit the Information field	Yes	Yes	
Archive groups and activate archived groups	Yes	Yes	
Change group owner	Yes		
Delete group	Yes		

Users with the "Modify All Data" permission can perform all actions on all private and public groups, and users with the "View All Data" permission can view details of all private and public groups, regardless of membership.

Additionally, in unlisted groups:

- Users with the "Manage Unlisted Groups" permission can find and perform all of these actions in unlisted groups, even if they aren't members.

USER PERMISSIONS

"To create groups"

- "Create and Own New Chatter Groups"

- Users with the “Modify All Data” or “View All Data” permission can only find and access unlisted groups if they are members. Unlike public and private groups, users with the “Modify All Data” permission can’t perform group owner actions in unlisted groups. They can perform group manager actions if that role is assigned to them in the unlisted group.

SEE ALSO:

[What happens when the owner of a Chatter group is deactivated?](#)

Change Chatter Group Roles

To change Chatter group [roles](#) for groups you own or manage:

1. Click **Change Roles** on a group detail page.
2. To search for members, start typing in the search box. Optionally sort the list by toggling between **Managers** and **All Members**.
3. Select the Manager checkbox for people you want to be managers. If a customer is selected as a manager, they will be able to see people who ask to join the group, even if they aren't in other common groups, and will be able to approve requests.

 **Note:** To [change the group owner](#), you must own the group. Users with the “Modify All Data” permission can also change the owner in public and private groups, and users with the “Manage Unlisted Groups” permission can do this for unlisted groups. Click the **Group Settings** link next to the current owner to assign a new owner.

4. Click **Done**.

SEE ALSO:

[What happens when the owner of a Chatter group is deactivated?](#)

What happens when the owner of a Chatter group is deactivated?

The deactivated user still owns the group, but a user with the “Modify All Data” permission can assign a new owner for a public or private group. In the case of unlisted groups, a user with the “Manage Unlisted Groups” permission can assign a new owner.

Archiving and Activating Chatter Groups

Archived Chatter Groups

When a Chatter group is archived, group members can no longer make posts or share files with the group. Previous posts, comments, and files remain available in the group for future reference.

Users can still comment on existing posts, mention people, and search the feed in archived groups. Users can also join and leave archived groups, create reports that include archived groups, and use global search to find archived groups and their content. Group owners and group managers can [archive](#) groups, [activate](#) them, and [enable and disable automatic archiving](#) for groups at any time. Users with the “Modify All Data” permission can perform these actions on public and private groups in their organization, while users with the “Manage Unlisted Groups” permission can perform these actions on unlisted groups.

Archived groups allow users to focus on the active groups in your organization:

- Archived groups don't count toward a user's group membership limits.
- Posts from archived groups don't display in Chatter feeds, unless someone adds a new comment. Posts with new comments display in the All Company feed and the feed of each group member.
- File and feed sharing is limited to active groups only, making group searches more efficient.
- Archived groups display only in My Archived Groups and not in the Active Groups list.

Example: Archiving the group is useful for groups that have little or no feed activity, but contain useful information that you want to retain. Some examples include:

- A group that a sales team created while pursuing a deal. Though there probably won't be much group activity after lead conversion, the sales team can still access important information about the customer.
- A group used for planning a company event. It can be archived after the event to reuse vendor information and planning discussions.
- A service desk type group used to track key issues for a major deployment for a customer. Archiving it after deployment issues are ironed out still gives support agents access to relevant information for future troubleshooting.
- When a legacy group is replaced by a new group that serves the same or broader purpose, the legacy group can be archived to redirect traffic to the new group.
- Team groups can be archived when a team changes or team members leave the company, while preserving team discussions for future reference.

Turning off automatic archiving is useful for groups that aren't updated on a regular basis but contain important information, such as a group used for company-wide announcements. This way groups without activity for more than 90 days won't get archived and users won't miss any important posts.

Archive Chatter Groups

Archive a group manually or edit automatic archiving settings.

Feed activity in groups is reviewed on a weekly basis. If a group has no new feed posts or comments for 90 consecutive days, the group is archived automatically. Mentioning a group doesn't count as feed activity and doesn't delay group archiving. Group owners, group managers, and users with the "Modify All Data" permission can manually archive or edit automatic archiving settings for groups at any time.

1. Click **Group Settings** on the group detail page in the Salesforce Classic. In the Lightning Experience, click **Edit Group** from the buttons in the group header.
2. Configure archiving for the group in one of two ways:
 - Click **Archive** to archive the group right away.
 - Select **Archive this group if there are no posts or comments for 90 days** and click **Save** to set up automatic archiving.

After you archive a group:

- The publisher on the group page is hidden and members can't create new posts or share files in the group.
- The group no longer appears in the Active Groups filter on the Groups tab.
- Previous group posts and comments no longer appear in the Chatter feed, unless someone adds a new comment. Posts with new comments display in the All Company feed and the feed of each group member.

Use the **My Archived Groups** filter in the Groups list to find the archived groups that you own, manage, or belong to. You can also use global search to find archived groups or associated content. Note that archived groups don't count toward your group membership limit.

Note:

- Group members don't receive email notifications when a Chatter group they own, manage, or belong to is archived or activated.
- If your administrator disables archiving for groups, you can't archive groups or edit automatic archiving settings. You can activate archived groups at any time, even if the feature is disabled.

Activate Archived Chatter Groups

Group owners, group managers, and users with the “Modify All Data” permission can activate an archived Chatter group from the group detail page.

1. Navigate to the group you want to activate.
 - Use the **My Archived Groups** filter on the Groups list view to find the archived groups you own, manage, or belong to.
 - To find other archived groups, use global search, run a report, or ask your administrator for help.
2. Click **Activate** on the group detail page. You can also activate an archived group from the group settings page.

After a group is activated, the group detail page displays with the publisher enabled so members can create new posts and share files with the group.

Note:

- Group members don't receive email notifications when a Chatter group they own, manage, or belong to is archived or activated.
- You can only activate one group at a time. To activate multiple groups at once, use the Salesforce API.

SEE ALSO:

[Archived Chatter Groups](#)

[Archive Chatter Groups](#)

Delete Chatter Groups

Only the group owner and users with the “Modify All Data” permission can delete a group.

In Lightning Experience, you can delete the group by clicking **Delete Group** from the buttons in the group highlights panel.

In Salesforce Classic:

1. Edit the group settings. Click **Group Settings** on a group detail page.
2. Click **Delete**.
3. Click **OK**.

Deleting a group permanently deletes the updates of the group, including any links posted to the group. When you delete a group that includes files, you're not deleting the files, just the references to the files. The files remain in their original location, such as in each file owner's **Owned by Me**. If the files were posted to the group and not shared in other locations, deleting the group also removes the references to the files. The files remain in the file owner's **Owned by Me**, where they're private but can be shared again later.

Working in Chatter Groups

Get Familiar with Your Chatter Group

Click a group's name in a feed, in the Groups list, or on someone's profile to see the group's updates, files, and group members.

How much detail you see and what you can do on a group's page depends on the type of group, whether you're a member, owner or manager of the group, and on your group role.

Non-Members of Public Groups

If you're viewing the group detail page of a public group you're not a member of, you can

Post and comment

Type an update above the feed or comment below a post in the feed and click **Share**.

Join the group

Click **Join** to join the group.

View group description and information

The group description and information display in a separate column next to the feed.

View the group's members

The Group Members section shows the group's current members, including any customers invited to the group.

View, download, and search files posted to the group

Files posted to the group feed or shared with the group appear in the Group Files section.

View the topics the group is talking about

The group's topics display below posts in the group feed.

Search for group information

Click  above the feed to search for information in the group.

Non-Members of Private Groups

If you're viewing the group detail page of a private group you're not a member of, you can only

Ask to join the group

Click **Ask to Join** to send an email to the owner and managers of a private group requesting to join.

View the group's picture and description

The group description displays below the group photo.

View the group's members

The Group Members section shows the group's current members, including any customers invited to the group.

Nonmembers of Unlisted Groups

If you're not a member of an unlisted group, you can't view the group detail page.

Group Members of Public, Private, and Unlisted Groups

When you're a member of a public, private, or unlisted group, you can also

Change Email Settings and In-App Notifications for Salesforce1 Mobile Apps

In Salesforce Classic, click **Email Me...** to be emailed about activity in the group, either every time someone posts, daily, or weekly. Selecting **Every Post** also turns on in-app notifications for groups in the Salesforce1 mobile apps. To stop receiving email and mobile notifications for the group's activity, click **Turn Off Group Email**. Click **Email Settings** to modify all your Chatter email settings.

In Lightning Experience, click **Email Notifications** from the group highlights panel to modify your group email settings.

Invite People

If your administrator has enabled invitations, click **Invite People** to [invite people not using Chatter](#) to join the group. For private groups, only the group manager, group owner, or users with the "Modify All Data" permission can invite people. For unlisted groups, only the group manager, group owner, or users with the "Manage Unlisted Groups" permission can invite people.

Leave the group

Click , or to withdraw a request to join a private group. To leave a group you own, you must first [assign a new owner](#).

Group Owners and Group Managers

When you're the owner or manager of a public, private, or unlisted group, you can also

[Add or remove group members](#)

[Change the group photo](#)

[Edit group settings](#)

Edit the Information section

Click **Add Information** or  in the Information section to add additional information for the group's members. You can customize this section, including its title, to say anything you want.

Edit the Description section

Click **Add Description** or  in the Description section to add a description of the group.

[Change member roles](#)

[Accept or decline requests for private groups](#)

SEE ALSO:

[Group Files Lists](#)

View Chatter Group Memberships

The Groups list on your profile shows you the Chatter groups you belong to, sorted by the most recent activity date. You can join or create groups on the groups tab. You can also view the Groups list on other people's profiles to see their group memberships.

 **Note:** On other people's profiles, you can see unlisted group memberships only if you're also a member.

- To view the full list in alphabetical order, click **Show All**.
- To see more of the list, use the **Next** and **Previous** links.
- To leave a group or withdraw a request to join, click .
- To join a public group on another person's groups list, click **Join**.
- To send a request to join a private group on another person's groups list, click **Ask to Join..**
- To close the window, click **Done**.

SEE ALSO:

[What Your Chatter Group Role Allows You To Do](#)

View Chatter Group Members

The Members section on a Chatter group page shows all of the members of a group, including customers.

1. Click **Show All** in the Members section to view the full group member list in alphabetical order. In the Members window, you can:
 - Filter the list to see all members, managers, or the owner
 - Use the **Next** and **Previous** links to see more of the list
 - Search using the `Find Members` search box
 - Click **Follow** or  next to a person's name to start or stop following them. You can't follow customers.
2. Click **Done** to close the window.

Chatter Group Recommendations

Chatter recommends groups that you might want to join based on:

- The popularity of the group determined by the number of members.
- The number of people you're following in the group. Chatter recommends groups with the most members you're following.
- If the group is new (created in the last month).

To see an expanded list of your recommendations, click **More** in the Recommendations section. If no recommendations appear, then you already belong to all the recommended groups. Hover over the recommendations and click  to dismiss them, and they won't appear again.

Use Email to Post to Chatter Groups

Email your posts to Chatter groups you have access to.

If your admin has enabled this feature, you can email your posts to any public group. Additionally, your admin can allow you to include attachments. You can email posts to a private or unlisted group only if you're a member. You must use the email address associated with your Salesforce user account.

1. In Salesforce Classic, from the group detail page, click **Post by email** below the group description to launch a blank email to the group using your local email client.
2. Type your message in the email body, including attachments if needed, and send the email. Attachments to the email are added as files in Chatter and shared with the group.

The email content displays as a post on the group detail page. Any hashtags you include in the email body (for example, #TeamExcellence) are converted to topics on the post. If more than one attachment is included with the email, the first attachment is included as part of the post. Additional attachments are added in comments.

 **Tip:** Save the group's email address as a contact in your mail client or mobile device for easy access in the future. If you copy and paste the `mailto:` link directly into the contact's email field, some mail clients may consider the link invalid and prevent you from sending email to the contact. Try removing the parenthetical group name from the first part of the email address. For example, remove (My Group) from (My Group) `0f9b000000004cmkaq@post.k-pxyvmac.kp0.chatter.salesforce.com`.

The following limitations apply to posting to a group using email:

- The 10,000 character limit for Chatter posts applies to posts created using email. Any text in your email beyond this limit is not included in the post.
- The maximum message size is 25 MB, including text and attachments.
- The email subject is not included in the post.
- You can create text posts using email and include links in the text. You can also include up to 25 attachments. You can't mention people, create polls, or give titles to links when posting to the group by email.
- Character-level formatting, such as the use of bold or different type sizes, is not supported.

- Email addresses must be unique at the group level. If multiple user profiles in your organization use the same email address, and that email address is used to post to a group, then the user profile associated with that particular group is used for the post in the group feed. If the email address is shared between multiple user profiles in the same group, the email is blocked.
- Signature text is treated as part of your post. Default signatures inserted by mobile devices, such as *Sent from my iPhone*, are automatically removed. Before sending your email, delete custom signatures and any extra text you don't want posted to Chatter. Or, add a separator line to the top of your signature to have it automatically removed. The separator line must have a minimum of one of the following characters:
 - Dash (–)
 - Equal sign (=)
 - Underscore (_)

You can also use any combination of these characters.

Post Announcements in Chatter Groups

Post group announcements to highlight important messages on the group page.

Only group owners, group managers, and users with the “Modify All Data” permission can post and delete group announcements.

1. On the group page, click **Announcement** in the publisher.
2. Type your message. The character limit is 5,000, and you can include links or mention users and groups in your announcement. Due to space constraints, approximately 137 characters of the announcement displays on the group page. Click **More** to see the rest of the message.
3. Specify an expiration date for the announcement.
4. Click **Share**.

Group announcements display until 11:59 p.m. on the selected expiration date, unless they're replaced by a new group announcement. Users can discuss, like, and post comments on announcements in the group feed. Group members receive an email notification when you post an announcement, same as for other posts, depending on their selected group email notification frequency.

Deleting the feed post deletes the announcement. To remove the announcement from the group page without deleting the feed post, click  in the top corner of the announcement, then select the option to dismiss the banner.

 **Note:** Groups display the global publisher layout by default. If the Announcement action doesn't appear in groups, ask your administrator to override the global publisher and add the Announcement action to a custom group publisher layout.

Group Files Lists

The Group Files list on a Chatter group page shows the recent files posted to that group.

Hover to see available options or click the file name to go to the file detail page. To see a list of all the files posted to a group, to search for a specific file, or to perform actions on a file, expand the files list **Show All**. The 25 most recently viewed files are listed by default. On this list you can:

- Search for files that have been posted to the group. The list includes files that you and other people have [attached to the Chatter feed on the group](#). The list doesn't include:
 - Documents from the Documents tab.
 - Attachments from the Notes and Attachments related list.
- [Upload private files](#) or upload and share files with [people, groups](#), or via a [file link](#).
- [Preview a file](#) without downloading it.
- [Follow and receive updates about a file](#) in the Chatter feed. Click  next to the file you're following to stop receiving updates about the file.
- Click  to download, upload a new version, share with people, groups, or via link, and see sharing settings.
- Click a file name to view the [file detail page](#). You can view detail pages for all files, but you'll only see updates in the Chatter feed for files you follow.
- Click a file owner's name to see his or her [profile](#).

Note:

- Not all files can be previewed, such as encrypted files, password-protected files, copy-protected PDFs, unknown file types, and any file larger than 25 MB. For files that can't be previewed, the **Preview** option isn't available on feeds or list views, and files appear as generic file type icons in the feed. Some Microsoft Office 2007 features don't display correctly in previews. If a file can be previewed, but a preview doesn't exist, contact your Salesforce administrator who may be able to regenerate the preview.
- Files without a file extension or with an unrecognized file extension show "unknown" in the Type column.

Records in Chatter Groups

Create Records in Chatter Groups

Use the group publisher to create records in Chatter groups.

The actions available to you in the group publisher depend on your permissions, your role in the group, the type of group, and how your administrator has [configured the group publisher](#).

- Depending on how your administrator configures the groups publisher layout, you can create account, contact, lead, opportunity, contract, campaign, case, and custom object records. Other objects aren't supported.
- When you create a record in a group, a record creation post displays several places, including in the group feed, on your profile, in the record feed, and in your company's Chatter feed. Only users with the necessary permissions (via license, profile, permissions, and sharing rules) can view the record and the record creation feed post.

 **Tip:** Filter the group feed to **Show All Updates** to view record creation posts.

- All comments on the record creation post display in the group feed. This includes comments made on the post in the record feed, and those made by users who don't belong to the group.

For example, John creates a record in a private group and the record creation post displays in the group feed and in the record feed. Sally isn't a member of the same private group, but she has access to the record detail page and the record feed. Sally comments on the record creation post in the record feed, and it appears in the private group's feed.

- Record visibility in groups respects user permissions and sharing access rules in your organization. Group members with permissions can view the record and comment on it from any context (in a group, on the owner's profile, on the record detail page, in the company's Chatter feed).
Group members without permissions, such as Chatter Free users, can't see the record or the record feed in the group or anywhere else.
- You can't create records in groups that allow customers.
- If your administrator has enabled the ability to [add records to groups](#), as well:
 - Creating a new record within a group automatically creates a group-to-record relationship, same as when you add an existing record.
 - The group records list displays the records you create, in addition to the records you add.

You can [remove records from Chatter groups](#).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

USER PERMISSIONS

To create a record in Chatter groups:

- "Create" on the object

Add Existing Records to Chatter Groups

Add records to groups so you can collaborate on and discuss the records as a team.

1. From the group publisher, click **Add Record**.

 **Note:** If you don't see this option, your administrator needs to include the Add Record action to the group publisher. Groups that allow customers don't allow you to add records.

2. Select the type of record from the **Record** list.

You can add account, contact, lead, opportunity, contract, campaign, case, and custom object records. Other objects aren't supported.

3. In the blank search field, type the name of the record you want to search for and click  .
Leave the field blank to search for all available records of the selected type.

4. From the lookup search results list, click the record you want to add to the group to select it.

5. Click **Create**.

A success message confirms when the record is added to the group and the record appears in the Group Records list. If your administrator has added the Groups related list to the record detail page, you can also see the list of groups the record is associated with on the record detail page. There is no limit to the number of records you can add to a group.

 **Note:** Adding a record to a group doesn't affect its visibility. Only users with the necessary permissions (via license, profile, permission sets, or sharing) can see the records in a group. For example, Chatter Free users don't see any records in groups. Or, a user with permissions to view accounts and contacts can't view any case records in the group. This sometimes means that users see fewer records than the actual count indicated on the group records list.

 **Example:** Here are some ways to use Chatter groups as a collaboration space for records that you're working on.

- A sales team working together on an account can track the related opportunities, contacts, and leads in one group. Team members with permissions can access records directly from the group. New team members can use the group as a one-stop reference to familiarize themselves with historical discussions about the account and its child records.
- Customer service teams can use groups to track the cases they handle. The group can become the team's forum to monitor cases, discuss solutions, and analyze trends in common problem areas.
- Marketing teams can use groups to track their campaigns, plan events, and discuss the potential leads and contacts to invite for the event. Groups also make for a great space to collaborate on marketing content or campaign artifacts.

USER PERMISSIONS

To view a group record or add a record to a group:

- "Read" on the record
- Access to the group

Remove Records from Chatter Groups

Remove records you no longer use from your Chatter groups.

Anyone with access to the record in a group can remove it from the group.

1. On the group detail page, click **Show All** next to the Group Records list.

 **Note:** The group records list appears on the group detail page only if your administrator allows you to add existing records to groups.

2. Optionally, select an option from the **Filter By** list to view records of that type.
3. Find the record you want to remove, then click **Remove** next to the record's name.

Removing a record from a group deletes the group-record relationship, but not the record itself. You can restore the group-record relationship from the Recycle Bin.

Chatter Messenger (Chat)

What is chat?

Chat lets you chat instantly and securely with people in Chatter. You don't have to manually add anyone to a buddy list—everyone you follow in Chatter shows up automatically in your chat list.

SEE ALSO:

[Using Chatter Messenger](#)

Using Chatter Messenger

Click the Chat header to expand or minimize chat. To get the most out of your chat experience, click  in the chat list to pop it out to a separate browser window. Then, you can easily chat with people while you browse other sites and use other applications.

A few considerations apply to using Chatter Messenger:

- Your administrator can disable Chatter Messenger at the organization level. In addition, you can access Chatter Messenger only if your administrator has selected "API enabled" in your profile permissions. If you don't see Chatter Messenger when you log in to Salesforce, ask your administrator if they have disabled the feature and granted the necessary permissions to access Chatter Messenger.
- Chatter Messenger is not available with Communities. It is available for internal users only when the organization-wide default for the user object is set to Public Read Only.
- Chatter Messenger is not supported on Microsoft® Internet Explorer® version 7.0. Internet Explorer 7 users appear offline to other Chatter Messenger users.

With chat, you can:

- [Let people know if you're available](#) to chat.
- [Chat with people](#).
- [Add people to](#) and [remove people from](#) your My Favorites list.
- [Pop out your chat](#) to a separate browser window.
- [Use emoticons when you chat](#) with people.

Using the Chat List

Tips for using the chat list.

- Use the search box at the top of your chat list to quickly find and chat with any online Chatter user, including the people you don't follow.
- Switch between active chats by clicking a chat in the Current Chats list.
- To add someone to your chat list, follow them in Chatter.
- Add people you chat with frequently to your [My Favorites list](#).
- Click  to [customize your chat options](#).
- Click your status at the top of the chat list to [change your chat status](#).
- When a chat is minimized, you'll see the new message indicator  for new messages.

SEE ALSO:

[Changing Your Chat Status](#)

Adding People to the My Favorites List in Chat

The list of people you follow in Chatter can be long. Add up to 100 chats with one or more people to your My Favorites list and they'll always show up at the top of your chat list.

- In an active chat with one or more people, click  to save the chat as a favorite.
- You can also click and drag a single person's name from the People I Follow list to the My Favorites list.
- You can rename a chat with multiple people in your My Favorites list. Click **Edit** next to My Favorites, click the multiple-person chat you want to rename, and type a new name. For example, if you have a favorite chat with *Sue, John, Jeff*, you could rename it to *Sales Team*. All names must be unique.

Removing People from the My Favorites List in Chat

Remove chats with one or multiple people from your My Favorites list if you chat with them less often. People you follow in Chatter will still show up in your People I Follow list.

1. Next to the My Favorites list, click **Edit**.
2. Next to the name of the chat you want to remove, click the **x** button.
3. When you've finished deleting chats from the list, click **Done** next to the My Favorites list.

You can also remove chats from the My Favorites list by clicking the  icon in an active chat.

SEE ALSO:

[Adding People to the My Favorites List in Chat](#)

Changing Your Chat Status

Let people know if you're available to chat, or set your status to **Offline** if you don't want to chat.

People can see your status:

- In their chat lists
- On [your profile](#)
- On people hovers

To change your chat status, click **Available**, **Away**, or **Offline** at the top of your chat list. For example, if your status is set to Available but you don't want to chat with others, click **Available** and choose **Offline**.

Your status automatically changes to idle if you're idle for 15 minutes. To change this setting, click **Chat** >  > **Options**, then select **General Settings**.

 **Tip:** Administrators enable or disable Chat for an organization.

Chatting with People

Chat with one or more people in Chatter.

1. Start a chat with any online Chatter user.
 - Use the search box at the top of Chatter Messenger to find and start a chat with anyone in your organization. Alternatively, click a name in the People I Follow or My Favorites list.
 - From a person's profile, click  **Start Chat**.
 - From any feed, hover over a person's name and click  **Start Chat**.
2. Optionally, add up to 10 people to the chat.
 - a. Drag people from your chat list to the active chat, or click  at the top of the active chat to search for and add any online user in Chatter.
 - b. Repeat until you've added everyone you need for the chat.

Click  to see a list of everyone in the chat.

-  **Note:** When you leave a chat with multiple people, the other people in the chat can continue chatting without you. You need to be added back to the chat to participate again.

SEE ALSO:

[Changing Your Chat Status](#)

Chat History

View your chat history.

When you start a chat with someone, your conversations with them from the last 72 hours are automatically shown. To see a list of all conversations from the last 72 hours:

1. Click the Chat header to expand the chat window.
2. Click .
3. Click someone's name to see your chat history with them.

Editing Chat Options

To edit your chat options, click  in the top-right corner of the chat window, then click **Options**.

Tip: When you click , you can also quickly toggle the visibility of **My Favorites**, **People I Follow**, and **Offline People** in your chat list. You can also toggle the options to **Play sounds** and **Show emoticons**.

General Settings

Option	Description
Change status to Idle after 15 minutes	When selected, your status changes to “idle” if you are idle in your Salesforce app for the length of time you specify.
Show emoticons	When selected, graphics such as 😊 or 😞 display when people you chat with type standard textual emoticons such as :-) or :- (.
Show a timestamp only when I hover over a message	When selected, the timestamp for chat messages displays only when you hover over an individual message. When not selected, the timestamp displays inline with each chat message and status change.

Private Messages

Chatter Messages

Chatter messages let you have secure private conversations with other Chatter users. Use messages to send your manager a question privately, or to communicate with a few select people when a discussion isn't relevant to everyone you work with. Messages are also used to notify people when a file has been shared with them.

Messages don't appear in your feed, your profile, global search results, or any other part of Chatter that's publicly visible.

View your messages by clicking the **Messages** link in the Chatter tab. On the My Messages page, you can:

- See the most recent message in each of your conversations. The most recent message displays at the top of the list.
- See the photo of the person who sent the most recent message in a conversation.
- See if you have unread messages (●).
- See if you sent the most recent reply (↩) in a conversation.
- Click any message to view the full history of messages exchanged in that conversation.
- Send a message by clicking **New Message**.

Your messages are organized into conversations, with each conversation defined by the unique combination of people participating in it. For example, let's say you send a message to Sally Smith. When Sally replies, her message continues your one-on-one conversation. Every new message you send to Sally—even if it's about a different topic—also continues the same conversation. Over time, you build a rich conversation history with Sally that contains every message you've ever exchanged with her. At the same time, let's say you send a message to both Sally Smith and Bob Johnson. That message is considered part of a separate conversation between you, Sally, and Bob. When Sally replies, her message continues a separate conversation from your one-on-one conversation with Sally.

Consider these tips for using Chatter messages.

- You can send messages to anyone in your Chatter organization. It doesn't matter who you follow, who's following you, what groups you belong to, or if the recipient is a customer.
- Conversations can involve just one other person, or up to 10 people total, including yourself. You can't send a message to yourself.
- Conversation participants are established when someone sends the first message in the conversation. No one can add people or remove people from the conversation after the first message is sent.
- As others reply, the **Messages** link on the Chatter tab shows the number of conversations with new messages. If you're already receiving Chatter email notifications, you'll automatically be notified of new messages.
- You can't delete messages or conversations.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Enterprise
- Professional
- Performance
- Unlimited
- Contact Manager
- Developer

- If after reading the messages in a conversation you want to mark the conversation unread, you can do so only via the Chatter REST API, not via the user interface.

SEE ALSO:

[What is chat?](#)

Searching for Chatter Messages

To search for people and text in your Chatter messages:

1. In My Messages, enter your search terms in the search box above your messages. Keep in mind these simple search tips:
 - If you're viewing your list of conversations, search looks for matches across all conversations. If you're viewing a single conversation, search looks for matches only within that conversation.
 - Searching for a person's name (such as *bob johnson*) finds both the conversations where Bob Johnson is named in the text as well as conversations where he's a participant. If you search for your own name, search results will include all of your messages and conversations because you're a participant in every conversation.
 - Searching for *bob jo* finds both Bob Jones and Bob Johnson. We automatically search for terms starting with *bob jo*, as if you had entered the * (asterisk) wildcard (*bob jo**).
 - If you search for the term *customer*, you'll see matches on that term within the text of messages. Matches don't include people who are identified as customers in a conversation's participant list.
2. Click **Search**.
3. Once you see the search results, you can:
 - Refine your search by entering additional search terms or using wildcards or operators.
 - Click a message to view the full conversation if you initially searched across all conversations.

If there are matches on names in the participant list and the conversation involves lots of people, the match might not be visible because the participant list doesn't show everyone's name. In other words, you'll see the conversation included as a match but the highlighted name match might be hidden from view.

Clear your search terms by clicking . Chatter automatically clears your search when you enter a reply, send a new message, or leave My Messages.

Sending Chatter Messages

Send messages to communicate privately in Chatter.

To send a Chatter message:

1. Start the message from one of these locations:
 - Click the **Messages** link on the Chatter tab, then click **New Message** in My Messages.
 - Click a person's name anywhere in Chatter to view their profile and click **Send a message**.
 - Click **Send a message** on a person's hover.
 - When viewing the full message history of a conversation, use the text box under the most recent message to send a reply.
 - When viewing the email notification about a message you've received, if email replies to Chatter are enabled, reply to the email.

Sharing a file with people is another way to send a Chatter message. When you share a file, recipients automatically receive a message that lets them know the file has been shared, as well as any additional information you provided.

2. If you started in the Send a Message dialog box, you can add people's names to the recipient list. Type a name in the **To** field and click the name to select it. Add more people to the conversation by entering additional names. If you're replying within a conversation or via email, the conversation participants can't be changed.
3. Write your message. Messages can be up to 10,000 characters.
4. Submit your message using the appropriate method:
 - In the Send a Message dialog box, click **Send**.
 - If you're replying within a conversation, click **Reply** (or **Reply All** if the conversation involves multiple recipients).
 - If you're replying via email, use the Send option in your email application.

If your message continues an existing conversation, your reply is added to the conversation and appears at the top of the list in My Messages. If your message starts a new conversation because you haven't previously exchanged messages with that unique combination of recipients, your message appears at the top of the list in My Messages as a brand new conversation.

Chatter Questions

Chatter Questions

Extend the best possible self-service community by promoting community engagement internally and externally with questions in Chatter.

With Chatter Questions, users can ask questions in their Chatter feed, in groups, and in records by selecting **Question** in the action drop-down menu of the Chatter Publisher. After a question is asked, moderators and the person who asked the question can select a best answer. The best answer is prominently displayed in the feed, allowing other users to quickly and easily find the information they need.

Your users can organize their information with the question title and details about their question. They can ask the question to their followers, to a group, or to a specific person, as they can with other Chatter feed items.

EDITIONS

Available in: Salesforce Classic

Available in:

- Group
- Professional
- Developer
- Performance
- Enterprise
- Unlimited

To enable Chatter Questions in your organization, add the Question action to the global publisher layout. If your organization was created after Summer '14, the Question action is automatically added, but we recommend dragging it to the far left to increase its visibility. If you're using a customized publisher layout in groups or on records, make sure that the Question action is added to those layouts as well.

Chatter Desktop doesn't support Chatter Questions.

[Track Chatter Questions Use in Your Salesforce Organization and Communities](#)

[Chatter Questions FAQ](#)

Display Similar Questions and Articles in Chatter

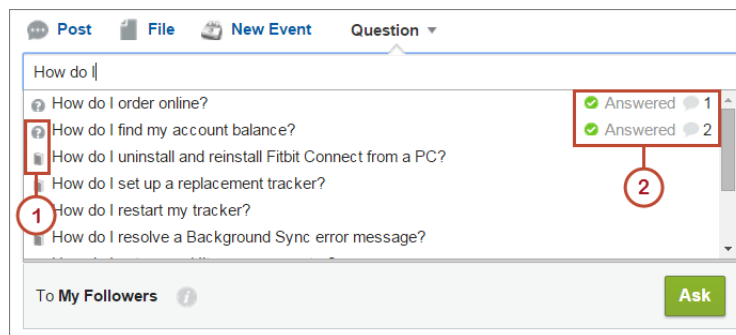

Your users might ask similar questions. Chatter Questions helps reduce duplicate content in your Salesforce organization—and in any communities with Chatter—by showing similar questions and relevant Salesforce Knowledge articles when a user is entering a question in Chatter.

Note:

- Communities with Chatter include those built with Salesforce Tabs + Visualforce.
- The Similar Questions and Similar Articles search features are also available in communities built on the Napili template. For more information, see [Display Similar Questions and Articles in the Napili Search](#).
- Similar Questions and Similar Articles aren't available in Salesforce1 or mobile browsers.

When a user enters a question in Chatter, similar questions automatically appear in a drop-down list below the question title field. To display relevant Knowledge articles along with similar questions, [enable Similar Articles](#).

Drop-down search results of similar questions and articles:

- **1:** Book and question mark icons indicate whether a search result is an article or a question.
- **2:** Question results show the question title, the number of answers, and a green flag with the text `ANSWERED` if a best answer was selected.

Users see up to 10 results in the drop-down list, with questions appearing before articles. Salesforce displays an equal number of questions and articles, but if there aren't enough of one result type, extra results of the other type are displayed. If no question or article title matches the text entered by the user, the drop-down list doesn't appear.

The drop-down results are based on whether the question or article **title** contains the text entered by the user. The search accounts for partially matching terms and non-adjacent terms; for example, the results for "best backpack" could include a question titled "Which backpack is best for day hikes?", and the results for "backpack" could include an article titled "Backpacking Tips."

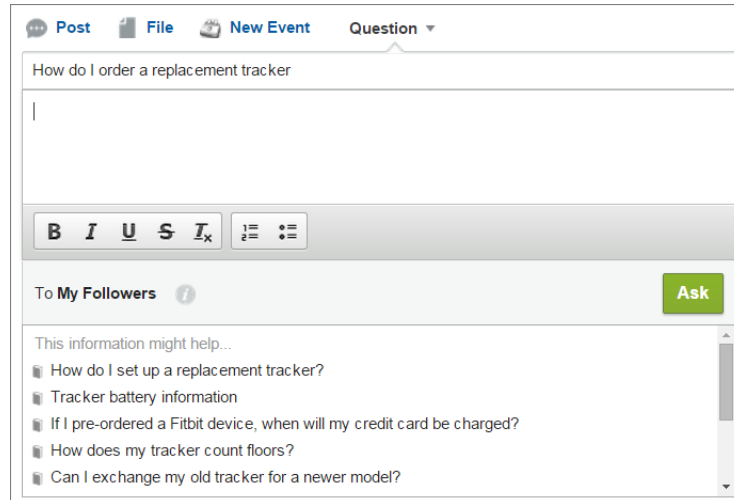

If the user wants to conduct a more in-depth search that also scans question descriptions and article text, they can press TAB or click out of the title field. This displays a separate drop-down list of results below the question publisher.

Advanced drop-down search results of similar questions and articles:

EDITIONS

Available in: Salesforce Classic

Chatter Questions is available in: **Group, Professional, Developer, Performance, Enterprise, and Unlimited** Editions.

If none of the results answer the user's question, they can post their question by clicking **Ask**.

SEE ALSO:

[Track Chatter Questions Use in Your Salesforce Organization and Communities](#)

Display Similar Questions and Articles in the Napili Search

Your community users may ask similar questions. Chatter Questions helps reduce duplicate content in self-service communities built on the Napili template by showing similar questions and relevant Salesforce Knowledge articles when a user is entering a question in the Search field.

 **Note:** Similar Questions and Similar Articles are also available in internal Salesforce organizations with Chatter and in communities built with Salesforce Tabs + Visualforce. To learn more, see [Display Similar Questions and Articles in Chatter](#).

When a user in a Napili community enters a question in the Search field, similar questions and Knowledge articles automatically appear in a drop-down list below the field. The drop-down list contains two tabs: **Articles** and **Questions**. To also expose an **All** tab that shows combined results (recommended), [enable Similar Articles](#).

By default, each tab contains up to six results. The **All** tab shows both matching articles and questions, with articles appearing first. It displays an equal number of questions and articles, but if there aren't enough of one type of result, more results of the other type are displayed to reach the maximum. To see results of a particular type, users can click the **Articles** and **Questions** tabs. If a search only returns one result type (for example, questions), users still see all of the tabs.

 **Note:** For a community user to see similar articles, Knowledge must be enabled in the community and the user must have access to it.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

- **1:** The **Articles** and **Questions** tabs let users view results of each type. Users can use the Up and Down arrow keys to navigate between results on any of the tabs. Clicking a question or article in the drop-down list navigates directly to it.
- **2:** Text and chat bubble icons indicate whether a search result is an article or a question.
- **3:** Questions in the list show the number of answers and a green checkmark with the text **Best Answer** if one was selected.
- **4:** The drop-down search results are based on whether the question or article title contains the text entered by the user. When the user performs a full search by clicking **Search**, the search engine also scans question descriptions and article text for matching terms.

You can customize the search settings by editing the properties of the Search Publisher component in Community Builder. For details, see [Using Templates to Build Communities](#).

SEE ALSO:

[Enable Similar Articles for Chatter Questions](#)

[Question-to-Case Overview](#)

Enable Similar Articles for Chatter Questions

When users ask questions in Chatter, similar questions appear as they type. If you'd like relevant Salesforce Knowledge articles to appear as well as questions, enable Similar Articles.

 **Note:** Chatter and Salesforce Knowledge must be enabled in your organization.

Enabling Similar Articles turns on the feature in your internal Salesforce organization as well as in any communities built with Salesforce Tabs + Visualforce or the Napili template.

1. From Setup, enter *Knowledge Settings* in the Quick Find box, then select **Knowledge Settings**.
2. Under Chatter Questions Settings, select **Display relevant articles as users ask questions in Chatter (also applies to communities with Chatter)**.

To learn more about how Similar Articles and Similar Questions work, see:

- [Display Similar Questions and Articles in Chatter](#)
- [Display Similar Questions and Articles in the Napili Search](#)

SEE ALSO:

- [Display Similar Questions and Articles in the Napili Search](#)

Selecting a Best Answer for a Question in Chatter

One of the advantages of asking a question in Chatter is that users can select the best answer for a question. When a question has a best answer, your users can quickly resolve their issue by going directly to the best answer.

Moderators and the person who asked the question can:

- Select the best answer for a question
- Remove the best answer status from an answer

Only one answer can be selected as the best answer. Moderators can be the Chatter moderator, the community moderator, or the Salesforce administrator. If a user doesn't have permission to select the best answer for a question, they don't see the **Select as Best** option.

 **Noah Larkin** asked a question. ▼

What is the best monitor for playing video games?

I was using a Cirrus 27" monitor before, but I want to move to a dual monitor setup. And I want the images to be really sharp. #Monitor #Videogames

Topics: Videogames, Monitor

Answer · Like · Today at 2:29 PM

 **Allison Wheeler**

I've actually found that dual monitors aren't great for video game play. I find it distracting and hard to use. Quite often the graphics card won't keep up. However, if you're set on using a dual-monitor setup, I recommend the AW-PX16 graphics card and any monitor will do.

Like Select as Best · Today at 2:32 PM

 **Yuko Ishikawa**

I have the AW-900a monitor, and I love it!

 **AW-900a**
Download png (53 KB) · More Actions ▼

Like Select as Best · Today at 2:35 PM

 **Conner McCoy**

I've had a lot of different setups. @Allison Wheeler is right--you'll need a good graphic card. For the monitor, the 29" AW-TXi is best for graphics and gaming.

Like Select as Best · Today at 2:37 PM

Chatter Questions FAQ

Chatter Questions lets users in communities and Salesforce ask questions in the feed. Take a look at some common questions about the feature.

Why should I use Chatter Questions instead of asking my question in a Chatter text post?

Asking a question in Chatter saves you time. When you ask a question, similar questions and articles appear as you enter your question. Chances are that someone already asked the same question, and it could have many answers or a best answer. Chatter Questions harnesses the value of content that already exists in Chatter.

Can I filter the Chatter feed to show only questions?

Yes. At the top of your Chatter feed, click  next to **Show** and select **Questions**.

Can I search for questions in Chatter?

Yes. Use the Search This Feed button () at the top of your Chatter feed. Questions are included in the feed search results.

Is Chatter Questions available in Salesforce1?

Currently, Chatter Questions is available in the Salesforce1 mobile browser only.

What happens when someone asks a question?

Their question appears in the Chatter feed for their followers or the person or group they asked the question of. An email notification is also sent to the person or group they asked the question of. After a user asks a question, other users can then answer the question directly in Chatter.

Who can select a best answer for a question?

The person who asked the question and moderators can select the best answer for a question. Moderators can be the Chatter moderator or the community moderator. Your Salesforce administrator can also select the best answer for a question. For details, see [Selecting a Best Answer for a Question in Chatter](#).

Can I track Chatter Questions use and adoption in my Salesforce organization?

Yes. For details, see [Track Chatter Questions Use in Your Salesforce Organization and Communities](#).

SEE ALSO:

[Display Similar Questions and Articles in Chatter](#)

Track Chatter Questions Use in Your Salesforce Organization and Communities

Keep tabs on the use and adoption of Chatter Questions in your organization or community with out-of-the-box reports and dashboards.

Reports on Chatter Questions help you answer questions such as:

- What kinds of questions are users asking?
- How many questions were asked in the past month?
- What percentage of questions go unanswered?
- Which topics do users ask the most questions about?
- Which departments are asking the most questions?

To track the use of Chatter Questions in your *Salesforce organization*, download the [Salesforce Chatter Dashboards](#) on the AppExchange. For help getting started, see [Report on Chatter with the Dashboards Package](#).

To track the use of Chatter Questions in your *communities*, download the [Salesforce Communities Dashboards \(for Communities with Chatter\)](#) on the AppExchange. For help getting started, see [Report on Communities with the Dashboards and Insights Package](#) on page 3083.

Differences Between Q&A Features in Salesforce

Salesforce offers a variety of question-and-answer features that you can implement in your Salesforce organization and communities. Because some of these features use similar terminology, take a moment to review the differences between them.

Salesforce has released three features that let users post questions and answers in a public forum setting. While these features share a common purpose, they represent an evolution of Salesforce's Q&A features.

Q&A Feature	Description	Structure	How Users Access It
Version 1: Answers	Answers was Salesforce's first Q&A feature for communities, released in Winter '11. Starting in Summer '13, Answers is not available for new organizations.	Answers is built on the Question standard object.	Internal users access the Answers feature via the Answers tab in Salesforce.
Version 2: Chatter Answers	Chatter Answers, released in Spring '12, is intended for customers who liked the Answers user experience but wanted additional functionalities. Chatter Answers lets companies maintain an out-of-the-box, self-service site where users can help address each other's questions, and provides a feed view of users' questions.	Chatter Answers is built on the Question standard object.	Internal users access Chatter Answers via the Q&A tab, and moderators can view a list of questions in the Questions tab.
Version 3: Chatter Questions	Chatter Questions, released in Winter '15, represents the most advanced developments in Salesforce Q&A functionality. Because it takes advantage of	Chatter Questions is built on the Chatter data model, and uses the Feed Post and Feed Comment objects.	Internal users access Chatter Questions within Chatter. They use the Question action in the Chatter publisher to post a question, and all

Question-to-Case Overview

Question-to-Case lets moderators create cases from questions in Chatter, which makes it easier to track and resolve your customers' issues. Question-to-Case is available in the full Salesforce site and the Salesforce1 mobile browser app, as well as in communities where Chatter Questions is enabled.

When a customer uses the Question action in Chatter to ask a question, similar questions and Knowledge articles appear below the Chatter publisher. If the similar questions and articles don't address the issue, the customer posts the question.

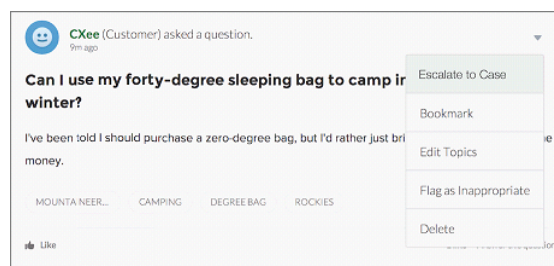

If a question isn't resolved, you can escalate the question to a case. Users with the "Moderate Chatter" or "Moderate Communities Feeds" user permission can create cases from questions directly in the feed, or you can set up processes—similar to workflow rules—in the Lightning Process Builder to automatically create cases from questions that meet specified criteria. Cases from questions are added to a queue so support agents can claim them.

When a customer's question is turned into a case, the customer receives an email with the case number and a link to the case. The customer can view the case via a link on the question that's visible only to them, while moderators see a note on the question indicating that a case was created.

 **Note:** The person who asked the question must have access to cases so they can view their case.

Moderator Flag

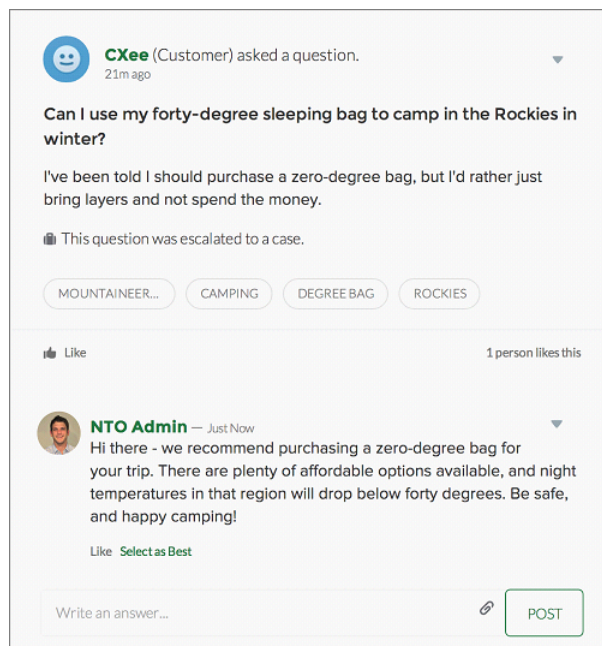

Customer Flag

 **Note:** On escalated questions in Salesforce (as opposed to communities), the notification is visible to all users, not just moderators.

When agents find a solution, they can respond to questions directly from the console, and the customer sees the agent’s response on the question or in the My Cases view. Agents choose whether the reply is visible to the community, or only to the customer who asked the question.

To get started, see [Set Up Question-to-Case](#).

USER PERMISSIONS

To enable Question-to-Case:

- "Customize Application"

Add the `Question from Chatter` Field to the Case Detail View

When a case is created from a question in Chatter, the `Question from Chatter` field on case detail pages displays a link to the original question. This field helps agents quickly navigate to the feed.

First, use field-level security to specify which users can see the `Question from Chatter` field on case detail pages.

1. From the object management settings for cases, go to Fields.
2. Click **Question from Chatter**.
3. Click **Set Field-Level Security**.
4. Select **Visible** for any profile that you want to be able to use Question-to-Case.
5. Click **Save**.

After you make the field visible to users, you can choose to add it to the Case Details view.

1. From the object management settings for cases, go to Page Layouts.
2. Click **Edit** next to the page layout that you want to customize.
3. Drag the `Question from Chatter` field from the Fields section of the page layout editor palette to the Case Information section of the page.
4. Click **Save**.
5. Click **Page Layout Assignment** to confirm that the user profiles which need Question-to-Case are assigned to the page layout that you customized. In addition, assign internal users who need access to the `Question from Chatter` field on cases to that page layout.

Add the Escalate to Case Action to the Feed Item Layout

Give moderators the ability to create cases from questions by adding the Escalate to Case action to Chatter Questions pages. This action is created automatically when Question-to-Case is enabled in your organization.

1. From Setup, enter *Feed Item* in the **Quick Find** box, then select **Feed Item Layouts**.
2. Click **Edit** next to Feed Item Layout.
3. Drag the Escalate to Case action from the Quick Actions category in the palette to the Quick Actions in the Salesforce Classic Publisher section.
4. Click **Save**.
5. Click **Page Layout Assignments** to confirm that the user profiles that need Question-to-Case are assigned to the Feed Item Layout.

SEE ALSO:

[Confirm Access to the Escalate to Case Action](#)

Confirm Access to the Escalate to Case Action

Does your organization use more than one record type for cases? Make sure that the profiles that need Question-to-Case have access to the record type associated with the Escalate to Case action. If your organization has only one record type for cases, skip this process.

First, check which record type is assigned to the profiles that need access to the Escalate to Case action.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Click the name of a profile.
3. In the Record Type Settings section, make a note of which case record types the profile uses.
4. In the Permissions section, make sure that the user profile has either the **Moderate Chatter** or **Moderate Communities Feeds** permission enabled.

Then, check which record type the Escalate to Case action uses, and change it if necessary.

1. From Setup, enter *Actions* in the **Quick Find** box, then select **Feed Item Actions**.
2. Click **Edit** next to the Escalate to Case action.
3. Confirm that the **Record Type** field shows a record type that's assigned to the profiles that need access to this action. If it doesn't, select an appropriate record type from the drop-down list.
4. Click **Save**.

Choose which fields appear on the Escalate to Case action, and in what order, based on the information you need to track for each case.

1. From Setup, enter *Actions* in the *Quick Find* box, then select **Feed Item Actions**.
2. Click **Layout** next to the Escalate to Case action.
3. Drag any fields you want to add to the action from the action layout editor palette, and reposition them if necessary.
4. Click **Save**.

 **Note:** In public communities, you can't look up a contact when the case is submitted, so we recommend that you remove the *Contact* field from the Case Action layout.

SEE ALSO:

[Automatically Assign Cases from Questions to a Queue](#)

Automatically Assign Cases from Questions to a Queue

Case assignment rules aren't supported in Question-to-Case, so by default, cases created from questions are assigned to the moderator who escalates the question. If you'd like, you can write a workflow rule or process that automatically adds questions that were created from cases to a queue so agents can claim them.

You can assign escalated questions to a queue in several ways. The basic approach is to write a process in the Lightning Process Builder that automatically assigns a case to a specified queue if the *Type* field on the case is equal to *Question*. You can also build the process to accommodate multiple queues. For example, have your process assign cases with a certain topic to a different queue.

The way you use queues in escalated questions will depend on your users, your goals, and more. Find an approach that best fits your business needs.

To learn how to create a queue, see [Creating Queues](#).

Automatically Create Cases from Unresolved Questions in Chatter

As your community or organization develops, ensure that users get speedy answers to their questions. Question-to-Case lets moderators escalate unresolved questions to cases in the feed, but you can make your case resolution process even more efficient by setting up processes—similar to workflow rules—in the Lightning Process Builder. Set up a process that automatically creates a case from questions that meet specified criteria.

 **Important:** These steps apply only to organizations and communities that use Chatter Questions. Not sure if that's you? See [Differences Between Q&A Features in Salesforce](#) on page 2846.

You can use Question-to-Case in processes in several ways. For example, consider setting up processes that:

- Create a case from a question if a week has passed, the question has received more than ten likes, and a best answer hasn't been selected.
- Create a case from a question immediately if the question contains the word "competitor."

Processes related to Question-to-Case act on the Feed Item object. The process includes a flow that evaluates whether question posts meet your escalation criteria. You can create flow variables based on several Feed Item fields, including:

- `BestCommentId`: The ID of the comment that was selected as the best answer. If no comment has been selected as the best answer, this field is null.
- `CommentCount`: The number of comments on a question.
- `LikeCount`: The number of likes on a question.

 **Tip:**

- Each flow variable's data type must match the feed item field's data type. `CommentCount` and `LikeCount` are number fields, while `BestCommentId` is a text field.
- The creation of a feed item can trigger a process, but updates to feed items (such as likes and comments) cannot. Depending on your process, you might need to specify how much time must pass before a related flow runs.

Beyond the Basics

Robert, a Salesforce administrator, wants questions to be automatically escalated to cases if they meet these criteria:

- 24 hours have passed
- The question received more than four comments
- A best answer wasn't selected

Step 1: Create a Process

First, Robert creates a process in the Process Builder on the Feed Item object. The process runs only when feed items are created.

EDITIONS

Available in: Salesforce Classic

Question-to-Case is available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

The Lightning Process Builder is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Choose Object and Specify When to Start the Process ?

Object*

Feed Item ▼

Start the process*

only when a record is created

when a record is created or edited

Allow process to evaluate a record multiple times in a single transaction? i

Yes

Save
Cancel

Step 2: Add Criteria

Robert adds criteria to his process that check whether newly created feed items are questions. He uses the following settings:

- Criteria Name = `Is Question`
- Criteria for Executing Actions = `Filter conditions are met`
- Filter Condition = `[FeedItem].Type Equals Question Post`
- All of the conditions are met (AND)

Define Criteria for this Action Group ?

Criteria Name* i

Is Question

Criteria for Executing Actions*

Filter conditions are met

Formula evaluates to true

No criteria—just execute the actions!

Set Filter Conditions

Field*	Operator*	Value*
1 [FeedItem].Type ▼	Equals ▼	Question Post ▼
+ Add Row		

Filter Conditions*

All of the conditions are met (AND)

Any of the conditions are met (OR)

Customize the filter logic

Save
Cancel

Step 3: Add a Flow

Robert creates a simple flow named “Escalate Question to Case” in the Cloud Flow Designer. The flow includes three elements: a *record lookup*, a *decision*, and a *quick action*. It checks whether a question has received four or more comments, and whether a best answer has been selected.

The *record lookup* element retrieves the record ID of a question post. It uses the following settings:

- Name = Question ID
- Lookup = FeedItem
- Field = Id
- Operator = equals
- Value = {!QuestionID}

 **Note:** For the Value field, Robert creates a text variable named {!QuestionID} with an Input/Output type of Input and Output.

The *decision* element specifies whether the question should be escalated to a case. It uses the following settings:

- Name = Should be escalated
- Default Outcome = No
- Editable Outcome = Yes
 - Flow Conditions = {!BestCommentId} is null {!\$GlobalConstant.True} AND
 {!CommentCount} greater than or equal to 4
 - All conditions must be true (AND)

 **Note:** For the Flow Conditions, Robert creates two new variables: a text variable named {!BestCommentId} and a number variable named {!CommentCount}, both with an Input/Output type of Input and Output.

The **FeedItem.EscalateQFToCase** Quick Action escalates the question to a case if the conditions for the **Yes** outcome are met. It uses the follow settings:

- Name = Escalate to case
- In the Inputs section, Related Record ID = `{!QuestionId}`

 **Warning:** Do not edit the name of the **FeedItem.EscalateQFToCase** Quick Action. Editing the name of the action causes it to appear in the action drop-down menu of text, attachment, and link feed posts as well, leading to errors.

Step 4: Add the Flow to the Process

After completing the flow, Robert incorporates it into his process as a scheduled action. First, he specifies that the flow must run 24 hours after a feed item has been created.

Next, he adds the flow to the process with a variable that uses information from the feed item record. He uses the following settings:

- Action Name = Escalate to Case
- Flow = Escalate_Question_to_Case
- **Variable:**
 - Flow Variable = QuestionId
 - Value = `[FeedItem].Id`

Launch a Flow ?

Action Name* i

Escalate to Case

Flow* i

Escalate_Question_to_Case

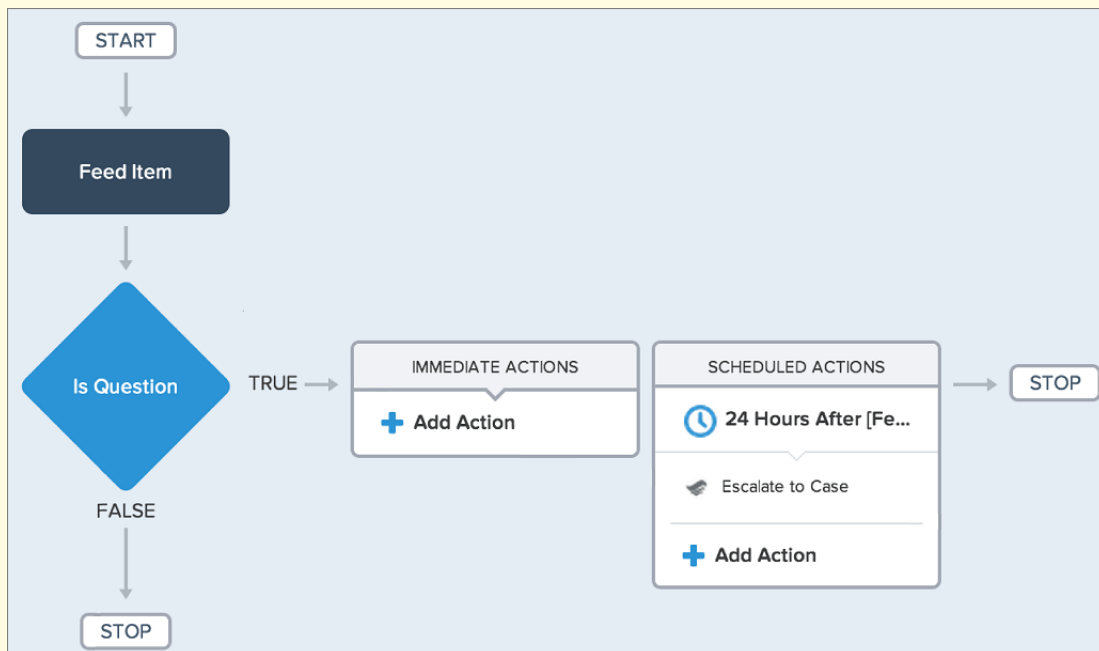

Set Flow Variables

Flow Variable*	Value*
QuestionID	[FeedItem].Id

+ Add Row

Step 5: Save and Activate the Process

Take a look at Robert's completed process.

After Robert activates his process, it will run on all future questions that are posted in communities and in Salesforce.

Tip: Robert may want to create a similar process that escalates questions to cases after they receive ten or more likes. He can save time by cloning this process and associating it with a flow that checks the number of likes on questions.

[Cloud Flow Designer](#)

Create a Case from a Question in Chatter

If a question in Chatter hasn't been resolved, moderators can create a case from the question. Question-to-Case must be enabled in your organization or community.

1. Navigate to the question in the feed.
2. Select **Escalate to Case** in the action drop-down menu.

EDITIONS

Available in: Salesforce Classic

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create a case from a question in Salesforce:

- "Moderate Chatter" OR "Modify All Data"

AND

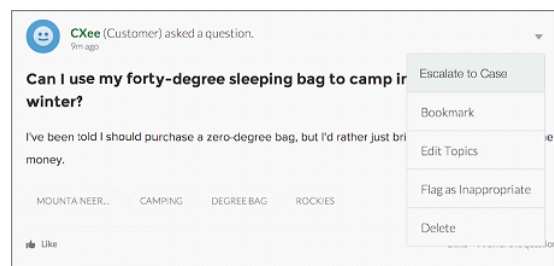

"Create" on cases

To create a case from a question in a community:

- "Moderate Chatter" OR "Modify All Data" OR "Moderate Communities Feeds"

AND

"Create" on cases

A window appears that's pre-populated with the case subject, contact, and description. Unless Question-to-Case has a queue associated with it, the case is automatically assigned to you.

3. If needed, edit the case details.
4. Create the case.

After a case is created from a Chatter question, the customer who asked the question receives an email notifying them that a case was created from their question. The email provides the case number and a link to the case.

Agents can post a response to the question directly from the case feed using the Community action in the publisher. Agents choose who can view the response by selecting either “Customer Only” or “Everyone”. They can also navigate to the original question from the case’s detail page by clicking the link in the `Question from Chatter` field.

Chatter Files

Files Overview

Use the **Files** tab to work with files in Salesforce.

Working with files in Salesforce means:

- Collaborating with coworkers by posting files to feeds and directly to records, such as Accounts, Cases, Leads, and more.
- Sharing files with customers in the secure Salesforce cloud.
- Syncing files between your local drive and Salesforce.
- Learning how users work with files by running standard and custom file reports.

The **Files** tab provides a powerful toolset for working with and managing your files.

The screenshot shows the Salesforce Files interface. At the top, there are navigation tabs: Home, Chatter, Profile, Groups, **Files**, Content, Libraries, Leads, Accounts, Contacts, Opportunities, and Reports. Below the tabs is a banner for "Get Salesforce Files Sync on your desktop!" with a "Get" button. The main content area is titled "Files" and "Files I've recently viewed, downloaded, added, or modified". On the left, there is a sidebar with filters: "Recent" (highlighted), "Owned by Me", "Shared with Me" (1), "Following", and "Synced". Below the filters are "FILES IN MY LIBRARIES" with sub-items: "Private Library", "Customer Presentations", and "White Papers". The main area features an "Upload files or drag and drop to add files..." prompt (2) and a search bar "Search all files..." (3) with a "Search" button. Below the search bar is a table of files with columns: Actions, Name, Owner, Sync, and La. A context menu is open over a file named "Photo Apr 02, 15 44 35", showing options: "Download png (5.0 MB)" (4), "Upload New Version", "Share with people", "Share with groups", "Share with library", "Share via link", and "Sharing Settings".

- Filter your file list (1) so that it only shows the files you want to see. Click on any of the filter names to change the scope of your file list.
- Select or drag one or more files to upload (2) them to Salesforce. All file types are supported, including everything from Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs, image files, audio files, and video files.
- Use the files-specific search tool (3) to find the files you need. Filtering your file list also filters your search. Search all files you have access to from the Recent filter.
- Preview, follow, download, version, share, and sync files directly from the file list (4). Click on a file name to open the file detail page. On the file detail page, you can run reports about the file, see who is following the file, edit details about the file, and more.
- Download Salesforce Files Sync (5) to sync files between your computer and Salesforce.

Files are automatically added to the file list when:

- You upload a file.
- You or someone else attaches a file to a Chatter feed or comment. This includes files attached to all public groups, whether you're a member or not, and private groups you're a member of, but not private groups you're not a member of.

- You sync a file in your Salesforce Files Sync folder.
- Someone else shares a file privately with you using the Sharing dialog box.
- You upload a file to a Salesforce CRM Content library.
- Someone else uploads a file to a library you're a member of.
- You or someone else creates a content pack or uploads a Web link in Salesforce CRM Content. You only see files from content packs and Web links you have access to.

 **Note:** In Internet Explorer 11, the **Preview** option redirects to the file detail page.

As you work with files in Salesforce, keep these file limits in mind:

Feature	Limit
File size	<ul style="list-style-type: none"> • 2 GB when uploaded via the Web interface • 2 GB when uploaded via the Salesforce Files Sync desktop client (or 500 MB when using proxy) • 100 MB when uploaded from a mobile device
Maximum number of versions per file	2,048 versions
Maximum number of synced files and folders	Users can sync up to 10,000 files.
Maximum number of users who can sync the same file simultaneously	1,000 users

 **Note:**

- For information about the different file tools and solutions in Salesforce, see [Differences between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments](#).
- To learn who can perform which actions on a file, see [File Sharing Settings and Permissions](#).
- File syncing functionality, such as the Synced filter, is only available if Salesforce Files Sync is set up for you and your organization.
- Files connected to Salesforce from repositories such as Microsoft® SharePoint® are only available if Salesforce Files Connect is enabled for you and your organization.

Search for Files

Use the files-specific search field on the **Files** tab in Salesforce to find just what you're looking for.

The **Files** tab lists the files you own and have access to, including files posted to feeds. The 25 most recently viewed files are listed by default. You can see and search a certain group of files by clicking a specific filter on the sidebar. The search results are filtered based on the terms entered.

 **Note:** Users who have the “Sync Files” permission don't see the **All Files, MY FILES, or FILES IN MY GROUPS** filters. Users who don't have the “Sync Files” permission don't see the **Synced** filter.

- **All Files**—All files you own and have access to, including:
 - Files that have been shared with you
 - Files you're following
 - Files in your Chatter groups
 - Files in your libraries
 - Files attached by other people to a Chatter feed. This includes files attached to all public groups, whether you're a member or not, and private groups you're a member of, but not private groups you're not a member of.

This filter is not available for users who have the “Sync Files” permission.

- **Recent**—The most recent files you've viewed.
- **MY FILES**—All files you own, files shared with you, and files you follow.
 - **Owned by Me**—Files you have:
 - Uploaded on the Home or Files page. These are private and not shared with anyone, but you can view them, perform actions, share them, and attach them to Chatter feeds.
 - Attached to Chatter feeds from your computer.
 - Synced using your Salesforce Files Sync folder.
 - Uploaded to Salesforce CRM Content libraries you're a member of and your private library.
 - **Shared with Me**—All files that have been shared with you either by a private share or a public post to your profile.
 - **Following**—All files that you're following.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Enterprise
- Professional
- Performance
- Unlimited
- Contact Manager
- Developer

- **FILES IN MY GROUPS**—All files you and other people shared to groups you're a member of. The last five groups you've visited are listed.
- **FILES IN MY LIBRARIES**—All files you and other people uploaded to libraries you're a member of and all files you uploaded to your private library. The first five libraries you're a member of, including your private library, are listed. If you're a member of more than five libraries, click **More** to see a complete list.
- **Synced**—All files that have been synced in your Salesforce Files Sync folder. This filter is available only to users who have the “Sync Files” permission.

To search for files using the Files search:

1. Optionally, click a filter on the sidebar to restrict your search to a specific set of files.
2. Enter your search terms in the Search field on the **Files** tab. You can search by file name, description, owner, type, or within the file's text.
3. Click **Search** to see a filtered list of all relevant files based on your search terms. Or click  to clear your search terms.

You can also search for files from the header search field. Use [feed search](#) to find files posted in a specific Chatter feed, such as on a profile, on a record, or in a group.

 **Note:** Feed search returns matches for file or link names shared in posts, but not in comments.

The Files list doesn't include:

- Documents from the Documents tab.
- Attachments from the Notes and Attachments related list.

Search supports several file types and has file size limits. If a file exceeds the maximum size, the text within the file isn't searched, but the file's name, description, type, and owner are.

File Type	File Extensions	Maximum File Size for Text Within the File to be Searchable
HTML	.htm, .html, .xhtml	5 MB
PDF	.pdf	25 MB
PPT	.ppt, .pptx, .pptm	25 MB
RTF	.rtf	5 MB
Text	.c, .cpp, .css, .csv, .ini, .java, .log, .sql, .txt	5 MB
Word	.doc, .docx, .docm	25 MB
XLS	.xls, .xlsx, .xlsm	5 MB
XML	.xml	5 MB

Upload and Share Files

Upload Files

Upload files in Chatter feed posts or comments, on user or group profile pages, and on opportunities or other records.

[Upload and share files](#) from:

- Any Chatter feed post or comment field
- **Files** home
- **Files** card or list on groups, user profiles, opportunities, and other records

All file types are supported, including everything from Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs, image files, audio files, and video files. Files up to 2 GB can be uploaded by default. However, your maximum file size is determined by your organization.

Files Home

When you upload files, they're added to the **Owned by Me** filter on **Files** home. Files you upload from **Files** home are automatically uploaded as private. You own files you upload.

You can also add files to Salesforce by:

- [Attaching a file to a Chatter feed.](#)
- [Uploading files to Salesforce CRM Content](#) private and shared libraries.
- [Syncing a file in your Salesforce Files Sync folder.](#)
- [Creating content packs](#) or [uploading Web links](#) in Salesforce CRM Content.

The Files list doesn't include:

- Documents from the Documents tab.
- Attachments from the Notes and Attachments related list.

Note:

- Files without a file extension or with an unrecognized file extension show "unknown" in the Type column.
- Users who have the "Sync Files" permission don't see the **All Files**, **MY FILES**, or **FILES IN MY GROUPS** filters. Users who don't have the "Sync Files" permission don't see the **Synced** filter.

Private Files

A private file is private, not shared with anyone, and you are the file owner. Only file owners and users with the "View All Data" permission can see private files. Private files are indicated by the word "Private" and a lock  icon in both the **MY FILES** and **Owned by Me** lists and on the file's detail page. You can search for your private files in Chatter and on the Files list.

Sharing Private Files

You can share private files from the file detail page or by [attaching](#) them to a Chatter feed, a profile, a record, or a group. You can also [share a file via a link](#). When you share a private file, it's no longer private. To learn who can perform which actions on a file, see [File Sharing Settings and Permissions](#).

SEE ALSO:

- [File Size Limits in Salesforce](#)
- [Freeze Sharing of a File](#)

Upload Files

You can upload files from the Files page, the Files related card or list on any record, or in any Chatter feed post or comment.

Depending on your browser and settings, you may only be able to upload one file at a time. For information on browsers that support uploading multiple files, see [Browsers that Support Uploading Multiple Files](#). Multiple file upload is available only in Salesforce Classic.

1. On the Files page, [the Files filter on the Chatter tab](#), [the Files Shared With list on a group](#), or [the Files Owned by list on a profile](#), click **Upload a File**.
2. In your browser's file selection dialog box, select the files you want to upload. Press CTRL to select multiple files.

Tip: You can also drag the selected files onto the Files list. This is not supported in Internet Explorer.

3. In the Upload to My Files dialog box, view the status of your file uploads. If you decide not to upload the files you've selected, do one of the following:
 - a. To cancel uploading a particular file, to the right of the upload status indicator, click **x**.
 - b. To cancel all remaining files, at the bottom of the dialog box, click **Cancel Remaining Uploads**. You'll need to [manually delete files](#) that were uploaded before you clicked **Cancel Remaining Uploads** from the [file detail page](#).
4. When your files have been uploaded, click **Close**.

When you upload files from the Files page, the files are private. You must manually share the files with [people](#) or [groups](#).

[Upload Files](#)

Upload a New Version of a File

You can upload a new version of a file so your viewers and collaborators always have access to the latest and greatest. If your original file was uploaded via a feed post, use **Upload New Version** to replace the old with the new, without needing to create a whole new post.

Uploading a new version replaces all previous versions, but [previous versions](#) are still available by clicking **Show all versions** on the file detail page.

1. Click **Upload New Version** from any of these locations:
 - The file detail page
 - The file previewer
 - The **Files** page, via the actions arrow for the file
 - On a file in a feed, via the **More Actions** arrow (available in Salesforce Classic only)
2. Click **Choose File**, and select a file from your computer.
3. Optionally, enter a note about what changed in the **What Changed?** field. This information is shown on the [Version History](#) list.
4. Click **Upload New Version** (Salesforce Classic) or **Start Upload** (Lightning Experience).

The file detail page and any previous posts show the updated version.

Note:

- Only file owners, collaborators, and users with the “Modify all Data” permission can upload new versions. To learn who can perform which actions on a file, see [File Sharing Settings and Permissions](#).
- The file owner doesn't change when a collaborator uploads a new version.
- If the file is from Salesforce CRM Content, you can't upload a new version from the file detail page. You can click **Go to Content Detail Page** and upload a new version there. (Available in Salesforce Classic only.)

File Sharing Settings and Permissions

This table describes file sharing settings which are determined by how the file is shared. The sharing setting and icon appear on a file's detail page and on the Shared With list on a file detail page.

Sharing Setting	Definition	When Does a File Have This Setting?
 Private	The file is private. It hasn't been shared with anyone else besides the owner. Only the file owner and users with "Modify All Data" permission can find and view this file, unless it is in a private library, then only the file owner has access to it.	<p>A file is private when you:</p> <ul style="list-style-type: none"> • Upload it on the Home or Files page • Publish it to your private library • Sync a file in your Salesforce Files Sync folder • Stop sharing it with everyone (Make Private) • Delete posts that include the file and the file isn't shared anywhere else
 Privately Shared	The file has only been shared with specific people, groups, or via link. It's not available to all Chatter users in your company. Only the file owner, users with "Modify All Data" or "View all Data" permission, and specific file viewers can find and view this file.	<p>A file is privately shared when it's:</p> <ul style="list-style-type: none"> • Only shared with specific people or a private group • Posted to a private group • Shared via link • Posted to a feed on a record • Published to a shared library
 Your Company	All Chatter users in your company can find and view this file.	A file is shared with your company when it's posted to a feed on the Home page, Chatter page, a profile, a record, or a public group.

This table describes the actions that can be performed by users based on their permission:

Action	File Owner	File Collaborator	File Viewer
View/Preview	Yes	Yes	Yes
Download	Yes	Yes	Yes
Share	Yes	Yes	Yes
Attach a File to a Post	Yes	Yes	Yes
Sync a File	Yes	Yes	Yes
Upload New Version	Yes	Yes	
Edit Details	Yes	Yes	
Change Permission	Yes	Yes	
Make a File Private	Yes		
Restrict Access	Yes		
Delete	Yes		

**Note:**

- No access means that no one in your company can find or view the file unless the file is specifically shared with them or a private group they're a member of.
- Users with "Modify All Data" permission can view, preview, download, share, attach, make private, restrict access, edit, upload new versions, and delete files they don't own. However, if the file is in a private library, then only the file owner has access to it.
- Users with "View All Data" permission can view and preview files they don't own. However, if the file is in a private library, then only the file owner has access to it.
- Users must have the "Sync Files" permission to sync files.
- Groups (including group members) and records have viewer permission for files posted to their feeds.
- Permissions for files shared with libraries are determined by the library.

[Freeze Sharing of a File](#)

Changing File Permissions

File owners and collaborators can change file permissions for people and groups from viewer to collaborator and vice versa. They can also change file permissions for files shared with their company to viewer, collaborator, or no access.

- Viewers can view, download, and share files.
- Collaborators can view, download, share, change permission, edit the file, and upload new versions.
- No access means that no one in your company can find or view the file unless the file is specifically shared with them or a private group they're a member of.

To change a file permission:

1. On a file detail page, click **Share File** > **Sharing Settings**.
2. Find the person or group whose permission you want to change. Or change permission for `Any Chatter user in your company`.
3. Click the Permission drop-down and select **Viewer**, **Collaborator**, or **No Access** (for your company). The change happens immediately.
4. Click **Close**.

Note:

- A file is shared with your company when it's posted to a feed on the Home page, Chatter page, a profile, a record, or a public group. `Any Chatter user in your company` is given viewer permission by default. If you change the permission from viewer or collaborator to no access, you remove the share to company and to public groups.
- When you share a file with someone, they are given collaborator permission by default. When you share a file with a group, the group members are given viewer permission by default. You can change the default permissions when you share a file for the first time. File owners and collaborators can change permissions after a file has been shared.
- File link recipients can only view and download files. They can't be collaborators.

Making a File Private

File owners and users with the “Modify All Data” permission can make a file and file link, if applicable, private (🔒) if they decide they don't want it to be shared anymore. Making a file private removes it from any posts it's attached to and removes it from everywhere it's been shared. Only the owner and users with the “Modify All Data” permission will have access to it. Alternately, file owners and users with the “Modify All Data” permission can restrict access to a file that originated in a Salesforce CRM Content library to remove the file from everywhere it's been shared, except the library.

If the file is shared using a content delivery, the content delivery becomes inaccessible, but is not deleted. If the file is shared using **Share via link** in Chatter, the link to the file is deleted.

1. From the file detail page of the file you want to make private or restrict access, click either  **Share File > Sharing Settings** or **Show All** on the Shared With list.
2. On the Sharing Settings dialog box, click **Make private** (or **Restrict access** if the file originated in a Salesforce CRM Content library).
3. On the confirmation dialog box, click **Make private** (or **Restrict access**).

SEE ALSO:

[Post Visibility](#)

[View Where a File is Shared](#)

[Freeze Sharing of a File](#)

Share Files with Groups

Share files in Chatter with public or private groups so that members of the groups can view and download the files from their feed.

Share a file with a private or unlisted group so only members of that group can see it, or share a file with a public group so members of that group and all Chatter users in your company can see it. Anyone who can see a file can share it.

To share a file with one or more Chatter groups:

1. Share the file from one of these locations:
 - On the detail page of the file you want to share—Click  **File Sharing Settings > With group**. Or click **Show All** on the Shared With list then click **Groups** on the Sharing Settings dialog box.
 - Next to the file in a feed—Click **More Actions > File Sharing Settings** then click **Groups** on the Sharing Settings dialog box.
 - Next to the file on the Files page, the Files Owned by list, or the Group Files list—Click  **Share with groups**.
 - On a file hover—Click  **Share File** then click **Groups** on the Sharing Settings dialog box.
 - In your Salesforce Files Sync folder on your desktop—Right-click on a file, hover on **Salesforce Files Sync**, then click **Share with groups**.
2. Type the name of the group you want to share the file with and click the name to select it. Repeat this step to share with more groups.
3. Select access levels for each group. By default, private group access is set to **Collaborator**, while public group access is set to **Viewer**.

- Optionally, add a message to your post. You can @mention people and groups in your message to notify them and post the file in their feed.
- Click **Share** and **Close**. The file is posted to each group you shared it with and @mentioned.

A private file shared with a private or unlisted group becomes a privately shared file and displays the privately shared icon (👤). The file is posted to the group's feed and only the file owner and group members can find and view the file. Any file shared with a public group is viewable by all users in your company, displays the your company icon (🏢), and is posted to the group's feed.

On the Sharing Settings dialog box, click  next to a person's or group's name to stop sharing the file with them.

Note:

- Documents from the Documents tab and attachments from the Notes and Attachments related list aren't listed on the Files tab and can't be shared in Chatter.
- Content files in Chatter may be shared with more people than shown in **Share with People** if they are part of a content pack or delivery.
- The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

SEE ALSO:

[Group Files Lists](#)

[View Where a File is Shared](#)

Share Files with People

Share files in Chatter with people to send them a private message with access to the file. Set **Viewer** or **Collaborator** access for each person you share the file with.

Share a file privately so only specific Chatter users in your company can see it. Anyone who can see a file can share it.

To share a file with one or more Chatter users in your company:

- Start by sharing the file from one of these locations:
 - On the detail page of the file you want to share—Click either  **File Sharing Settings** > **With people**. Or click **Show All** on the Shared With list then click **People** on the Sharing Settings dialog box.
 - Next to the file in a feed—Click **More Actions** > **File Sharing Settings** then click **People** on the Sharing Settings dialog box.
 - Next to the file on the Files page, the Files Owned by list, or the Group Files list—Click  **Share with people**.
 - On a file hover—Click  **Share File** then click **People** on the Sharing Settings dialog box.
 - In your Salesforce Files Sync folder on your desktop—Right-click on a file, hover on **Salesforce Files Sync**, then click **Share with people**.
- Type the name of the person you want to share the file with and click the name to select it. They are given [collaborator permission](#) by default which lets them view, download, share, change permission, edit the file, and upload new versions.
- Optionally, select **Viewer** to give the person permission to view, download, and share files.
- Optionally, share with more than one person by entering another name.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

5. Optionally, add information to the message that recipients receive.
6. Click **Share** and **Close**. Recipients receive a Chatter message on their My Messages page on the Chatter tab. The message lets the recipient know you shared a file with them and any additional information you provided. If they're already receiving Chatter email notifications, they'll also be notified of new messages.

Unless the file was already shared with your company, it's privately shared and displays the privately shared icon (👤). It's not posted anywhere and only the people you specifically shared it with can find and view it. If it was already shared with your company, it retains the your company icon (🏢) and all Chatter users in your company can find and view it.

On the Sharing Settings dialog box, click  next to a person's or group's name to stop sharing the file with them.

Note:

- Documents from the Documents tab and attachments from the Notes and Attachments related list aren't listed on the Files tab and can't be shared in Chatter.
- Content files in Chatter may be shared with more people than shown in **Share with People** if they are part of a content pack or delivery.
- The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

SEE ALSO:

[View Where a File is Shared](#)

Share Files with Libraries

Share files from Chatter with libraries to take advantage of the permission-setting capabilities of content libraries.

If your administrator has turned on this feature for your organization, you can share any file from Chatter with a library. The **Libraries** tab in Salesforce lists the libraries in your company along with the permissions assigned to each. The **Share with library** option in Chatter lets you share Chatter files with a library, leveraging the permissions set for the library.

Note: Sharing Chatter files (files listed on the **Files** tab) with libraries requires that:

- Your user detail page has the **Salesforce CRM Content User** setting enabled. Your administrator can enable this setting.
- Your organization has the **Files user interface allows sharing files with libraries** setting enabled. Your administrator can enable this setting on the Salesforce CRM Content page in Setup.

1. On the **Files** tab, click  next to the file you want to share with a library.
2. Select **Share with library**. Or, for external file references (only applicable for Files Connect users), select **Share a reference**, and choose **Library** in the **Sharing Settings** dialog box.
3. Do one of the following, depending on what happens next:
 - If the **Publish Content to Multiple Libraries** dialog box appears, this means the file is already managed by a library. Select one or more additional libraries, and click **Publish**.
 - If the **Share files with a library** confirmation message appears, it means that the file has been shared with people who have Collaborator access, or it has been synced. If you proceed, Collaborators and those who have synced the file will have only Viewer access. (A library administrator can give them editing access later.) Click **Share** to continue, or **Cancel** if you've changed your mind.
 - If the **Publish Content** dialog box appears, enter a title for the file. Select the library you want to share it with, and enter any tags as metadata. Select a record type, enter any optional information, and click **Publish**.

The file is now listed on the **Libraries** tab and in **Files in My Libraries** on the **Files** tab.

Freeze Sharing of a File

Freezing the sharing of a file means preventing the file from being shared, without affecting any existing shares. If Salesforce CRM Content is enabled for your org, and your admin has added the Freeze Sharing field to the page layout that is used for content files, file owners and admins who have Collaborator access can freeze sharing of files.

- Salesforce CRM Content must be enabled for your org
 - An admin must add the **Freeze Sharing** field to the page layout that is used for the Content Detail page
1. On the **Files** tab, find the file you want. Click it to open the File Detail page. Click **Go to Content Detail Page**. (Or, if the file is in a library, open the Content Detail page from the **Libraries** tab.
 2. Select the **Freeze Sharing** checkbox.
 3. Click **Save**.

Example: Let's say I post a file in Chatter, and share it with a private group. I'm okay with members of the group having access to the file, but I don't want them to share it further. I can freeze sharing of the file so the existing shares remain but new ones can't be added, except by me or an admin.

You can also freeze sharing of a file in the API by using the `SharingOption` field on `ContentVersion` and other objects.

See File Updates in Your Feed

Follow a File

Follow a file to see updates in your Chatter feed, including when a new version of the file is uploaded. If you stop following a file, the file remains in your Files list, but you won't see updates about it in your feed anymore.

Click **+ Follow** to start seeing updates, or click **x Unfollow** to stop seeing updates. In Lightning Experience, follow a file from the file detail page. In Salesforce Classic, follow a file from a feed, file detail page, or files list.

File Previews and Details

View the File Detail Page

Open a file detail page by clicking a file name on a Chatter feed, on a files list, on a file hover, or by clicking **More Actions** > **Preview** next to the file in a feed. On the file detail page, you can see details about Chatter files and Salesforce CRM Content files.

From a file detail page, you can:

- View the file without downloading it. If the file has multiple pages, click on the [enhanced document player](#) or use the arrow keys on your keyboard to see each page, zoom in or out, or change the preview width and screen size. Files owners and anyone with access to the file can preview it.
 -  **Note:** Not all files can be previewed, such as encrypted files, password-protected files, copy-protected PDFs, unknown file types, and any file larger than 25 MB. For files that can't be previewed, the **Preview** option isn't available on feeds or list views, and files appear as generic file type icons in the feed. Some Microsoft Office 2007 features don't display correctly in previews. If a file can be previewed, but a preview doesn't exist, contact your Salesforce administrator who may be able to regenerate the preview.
- See if the file is private () , privately shared () , or shared with your company () .
- Click  **Download** to open or save the file. Anyone who can see a file can download it.
- Click  **File Sharing Settings** to share a file with [people](#), [groups](#), or via [file link](#), or see the [Sharing Settings](#). Anyone who can see a file can share it.
- Click **Make private** on the Sharing Settings dialog box to remove the file and file link, if applicable, from everywhere it's been shared. Or click **Restrict access** if the file originated in a Salesforce CRM Content library to remove the file from everywhere it's been shared except the library. Only owners and users with the "Modify all Data" permission can [make a file private](#) () or [restrict access](#).
- Click  **Upload New Version** to [update the file with a newer version](#). Only file owners, collaborators, and users with the "Modify all Data" permission can upload a new version of a file.
- Click  **Edit Details** to [edit the name or description of the file](#). Only file owners, collaborators, and users with the "Modify All Data" permission can edit file details.
- If you have the "Sync Files" permission and are the owner of the file, click  **Sync** to [sync a file](#) between your Salesforce Files Sync folder on your computer and Chatter. Click  **Unsync** to stop syncing the file.
- Click  **Delete** to [delete the file](#). Only file owners and users with the "Modify All Data" permission can delete files.
- See who the file is owned by and when it was last modified.
- See the file's description and click the edit icon () to [edit the description](#), or add a description by clicking **Add Description**.
- See the file's current version number and click **Show all versions** to see the file's [version history](#).
- Click  **Show file report** to [see data about the file](#), such as how many times the file has been downloaded, shared, liked, and commented on. **Show file report** is visible only to users with the "Run Reports" and "View Reports in Public Folders" permissions.
- Click  **Follow** to [follow the file](#) or click  to stop following the file.
- See who's following the file.
- See [who and what locations the file is shared with](#).
- If the file originated in Salesforce CRM Content, click **Go to Content Detail Page** to see the [content detail page](#) of that file. Most actions performed on files that originated in Salesforce CRM Content must be done on the file's [content detail page](#) instead of the file detail page.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Enterprise
- Professional
- Performance
- Unlimited

Editing File Details

To edit a file's name and description:

1. On a file detail page, click  **Edit Details** or click the edit icon () next to the description.
2. Optionally, edit the file name and description.
3. Click **Save**.

If there is no description and you want to add one, click **Add Description** or click the edit icon () next to the description.

File owners, collaborators, and users with the “Modify All Data” permission can edit file details.

SEE ALSO:

[View the File Detail Page](#)

View Where a File is Shared

Find out who can see a file, and what level of access they have. From the File Detail page, you can access a full list of every person or object the file is shared with.

The **Shared With** list on a file detail page shows you who the file is shared with, and their level of access.

In Salesforce Classic, click **Show All** to open Sharing Settings, where you can:

- See who the file is shared with and their [permission](#): owner, collaborator, viewer, or no access.
- Click **People** on the Sharing Settings dialog box to [share the file with specific people](#).
- Click **Groups** on the Sharing Settings dialog box to [share the file with specific groups](#).
- Click **Library** to share the file with a library.
- Click **Anyone with link** on the Sharing Settings dialog box to [create and share a file link](#).
- Click **Make private** to remove the file and file link, if applicable, from everywhere it's been shared. Or click **Restrict access** if the file originated in a Salesforce CRM Content library to remove the file from everywhere it's been shared except the library. Only owners and users with the “Modify all Data” permission can [make a file private](#) () or [restrict access](#).
- On the Sharing Settings dialog box, click  next to a person's or group's name to stop sharing the file with them.

File and Content Engagement Report

See how many times a file has been downloaded, shared, liked, and commented on.

From the file detail page, click  **Show file report** to run and view the File and Content Engagement report, which has these fields.

Field	Number of times users...
Total Downloads	Downloaded the file.
Posts	Posted the file to a feed. This number doesn't count the number of times the file has been attached to comments on posts.
Post Comments	Commented on file posts in feeds.
Likes	Liked file posts on feeds. This number doesn't count likes received by comments on the file post.
Shares	Shared the file using Share with people and Share with groups . If a user clicks Share on a file post, it's counted as a post and not as a share.
Links	Shared the file using Share via link . If the file is uploaded to a Salesforce CRM Content library, then content deliveries are also counted.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Enterprise
- Professional
- Performance
- Unlimited

Sync Files

Get Started with Salesforce Files Sync

Salesforce Files Sync makes file management, syncing, and sharing easier than ever!

Watch a Demo: [Get Started with Salesforce Files Sync](#)

Getting started with Salesforce Files Sync is almost effortless. Just save your files in the Salesforce Files Sync folder on your desktop, and Salesforce Files Sync does the rest.

Access your synced files anywhere

Saving a file in Salesforce Files Sync means that the file is automatically available everywhere you need it. Just look in the Synced filter on the Files tab in both Chatter and Salesforce1 — it'll be there.

Share files right from the Salesforce Files Sync folder on your desktop

Right-click on a file to share it with people and groups in Chatter, or share the file with anyone using a link.

Always have the latest version of every file

Whenever you or one of your collaborators edit a file saved in the Salesforce Files Sync folder on your desktop, the file is instantly updated for everyone. Salesforce Files Sync supports versioning via Chatter, so you can access older versions of the file, just in case.

Salesforce Files Sync System Requirements

Salesforce Files Sync runs best on systems that meet the minimum recommended system requirements.

To use Salesforce Files Sync, we recommend:

System Requirement	Windows	Mac
Supported operating systems	Microsoft® Windows® 7 and later	Apple® Mac OS X 10.8 Mountain Lion and later
Processors	2.33 GHz or faster x86-compatible processor, or Intel® Atom™ 1.6 GHz or faster processor for netbook devices	Intel® Core™ Duo 1.83 GHz or faster processor
Memory	512 MB of RAM (1 GB recommended)	512 MB of RAM (1 GB recommended)
Hard drive	4 GB of free space recommended for sync operations	4 GB of free space recommended for sync operations

Install Salesforce Files Sync

Install the Salesforce Files Sync client on your desktop to sync files between your computer, Salesforce, and Salesforce1 on mobile devices.

1. From your personal settings, enter *Files Sync* in the **Quick Find** box, then select **Salesforce Files Sync**. Multiple results? Select the one under Personal Setup.
2. Click **Download**.
3. Follow the installation instructions for your operating system.
4. Log in with your Salesforce credentials.

After Salesforce Files Sync is installed, you're notified automatically when an update is available.

 **Note:** Salesforce Files Sync client must run on a local drive. External locations such as network drives or mounted devices are not supported.

Salesforce Files Sync System Requirements

Salesforce Files Sync runs best on systems that meet the minimum recommended system requirements.

To use Salesforce Files Sync, we recommend:

System Requirement	Windows	Mac
Supported operating systems	Microsoft® Windows® 7 and later	Apple® Mac OS X 10.8 Mountain Lion and later

System Requirement	Windows	Mac
Processors	2.33 GHz or faster x86-compatible processor, or Intel® Atom™ 1.6 GHz or faster processor for netbook devices	Intel® Core™ Duo 1.83 GHz or faster processor
Memory	512 MB of RAM (1 GB recommended)	512 MB of RAM (1 GB recommended)
Hard drive	4 GB of free space recommended for sync operations	4 GB of free space recommended for sync operations

Connect Salesforce Files Sync to Other Salesforce Organizations

Configure Salesforce Files Sync to connect to other Salesforce organizations.

After disconnecting Salesforce Files Sync from one Salesforce organization, your synced files are backed up in a folder called "Salesforce Files_Old." On Windows, the backup folder is located at `C:\Users\User Name\Salesforce Files_Old` where *User Name* is your Windows user name. On Mac, the backup folder is located at `/Users/User Name/Salesforce Files_Old` where *User Name* is your Mac user name. Your synced files are always accessible online in the Salesforce organization they're synced with.

Warning: Before connecting Salesforce Files Sync to a new Salesforce organization, close all files and folders saved in your Salesforce Files Sync folder. Any files and folders that are open when you disconnect Salesforce Files Sync from a Salesforce organization aren't backed up and automatically sync with the next Salesforce organization that you connect Salesforce Files Sync to.

To sync files with a different Salesforce organization, set up a new connection for Salesforce Files Sync.

1. In your system tray or menu bar, right-click  **Salesforce Files Sync**.
2. Click **Preferences**.
3. If necessary, click **Log out** to disconnect your from your current Salesforce organization.
4. Under New Connection, enter a `Name` for the new connection.
5. Enter the `https://` login URL for your Salesforce organization.
6. Click **Log in**.
7. Enter your login credentials and click **Log in**.
8. Click **Allow** to enable Salesforce Files Sync.

After connecting to the new organization, any files you add to your Salesforce Files Sync folder sync with that organization. If you've already synced files with the organization that you're connecting to, the synced files automatically download to the Salesforce Files Sync folder on your desktop.

Sync Files and Folders

Sync files and folders by saving them in your Salesforce Files Sync folder on your computer or by clicking  **Sync** while viewing a file in a feed post, comment, file list, or file detail page.

Watch a Demo:  [Salesforce Files Sync](#)

Before you can sync files, you must install Salesforce Files Sync on your desktop.

USER PERMISSIONS

To sync files:

- "Sync Files"

Synced files are private by default. That means that after saving a file in your Salesforce Files Sync folder on your desktop, only you can access it in Salesforce online. Collaborate with others by sharing your synced files.

You always have the latest version of synced files available in your Salesforce Files Sync folder on your desktop, online in Salesforce, and in Salesforce1 on mobile devices. Just like other files in Salesforce, you can access previous versions of synced files in Chatter.

To sync your files:

1. From the Salesforce Files Sync client, either save your files in your Salesforce Files Sync folder or drag and drop the files you'd like to sync into your Salesforce Files Sync folder.

On Windows, your Salesforce Files Sync folder is located at `C:\Users\User Name\Salesforce Files`, where *User Name* is your Windows user name. On Mac, your Salesforce Files Sync folder is located at `/Users/User Name/Salesforce Files`, where *User Name* is your Mac user name.

From the **Files** tab, a feed post, or anywhere in the full Salesforce site where a file is posted or listed, click  **Sync**.

2. The files sync.

After your files sync, you can easily access them in Salesforce online and in Salesforce1 on mobile devices. If you delete a file from your Salesforce Files Sync folder, you can still access the file online by visiting the Owned by Me filter on the Files tab in Chatter.

Accessing Synced Files on Your Computer, Online, and on Mobile Devices

Access synced files in your Salesforce Files Sync folder on your desktop, in Salesforce online, and in Salesforce1 on your mobile device.

Find Synced Files on Your Desktop

On your desktop, your synced files are kept in your Salesforce Files Sync folder. On Windows, the Salesforce Files Sync folder is located at `C:\Users\User Name\Salesforce Files`, where *User Name* is your Windows user name. On Mac, the Salesforce Files Sync folder is located at `/Users/User Name/Salesforce Files`, where *User Name* is your Mac user name.

To open your Salesforce Files Sync folder from your system tray or menu bar, right-click  **Salesforce Files Sync > Open Salesforce Files Sync Folder**.

 **Warning:** Moving your Salesforce Files Sync folder from its default directory location prevents file syncing. To ensure that your files always sync, don't move your Salesforce Files Sync folder.

Find Synced Files Online

Online, your synced files are available on the Files tab in Chatter.

From the Files tab, click **Synced** to view your synced files and folders. Your most recently synced files are listed first.

Find Synced Files on Your Mobile Device

On your mobile device, your synced files are accessible in Salesforce1.

From the Files page, tap  and select **Synced** to view a list of your synced files.

Working with Synced Files and Folders

Synced files and folders are just like any other file in Salesforce, but they have a few additional features.

Synced files are private by default. That means that after saving a file in your Salesforce Files Sync on your desktop, only you can access it in Salesforce online. Collaborate with others by sharing your synced files.

You always have the latest version of synced files available in your Salesforce Files Sync folder on your desktop, online in Salesforce, and in Salesforce1 on mobile devices. Just like other files in Salesforce, you can access previous versions of synced files in Chatter.

SEE ALSO:

[Find Your Personal Settings](#)

Share Synced Files

Synced files can be shared directly from the Salesforce Files Sync folder on your desktop.

Share synced files with people and Chatter groups in your organization, or people outside your organization using a generated link. Synced files are private by default, but when you share them you can assign view-only or collaborator privileges.

If you share a file with a person or group with Collaborator rights, then when collaborators download, edit, and upload a new version of the file, you'll get the latest version automatically synced. When you edit and sync a new version of the file, the people and groups you've shared with will automatically get the latest version too.

To share a file directly from your Salesforce Files Sync folder:

1. On your desktop, in your Salesforce Files Sync folder, right-click the file you'd like to share.
2. Choose a menu option under **Salesforce Files Sync**: share with people in your organization, with Chatter groups, or with people outside your organization via link.
3. When prompted, enter the names of the people or groups in your organization, assign `Viewer` or `Collaborator` permission, and enter an optional message to share the file with them. If you're sharing the file via link, copy the link.
4. Click **Share**.
An email notification is sent to everyone you shared the file with.

Managing Versions of Synced Files

Just like all Chatter files, you can work with prior versions of a synced file as needed.

After you first sync a file, you see that file as Version 1 in your files list. If you make changes to it on your computer or mobile device, a new version is automatically created each time you save the file. To view previous versions, just visit the file's detail page in Chatter.

Anyone who is following the synced file receives a notification in their Chatter feed when new versions are created. File collaborators can upload new versions of your synced files.

 **Warning:** If a synced file is open on your desktop when a collaborator uploads a new version, then you won't receive the new version until you close the file without saving. If you save your open file, your version will overwrite your collaborator's changes.

Salesforce Files Sync Limits

Be aware of file syncing limits while using Salesforce Files Sync.

Feature	Limit
Organization-wide storage	Storage is based on the number of Salesforce licenses purchased. Additional storage can be purchased. For more information, refer to Salesforce Files Sync Storage Limits .
Maximum number of synced files	Users can sync up to 10,000 files.
Maximum number of synced folders	500 folders

Feature	Limit
File size	<ul style="list-style-type: none"> • 2 GB when uploaded via the Web interface • 2 GB when uploaded via the Salesforce Files Sync desktop client (or 500 MB when using proxy) • 100 MB when uploaded from a mobile device
Maximum number of versions per file	2,048
Maximum number of users who can sync the same file simultaneously	1,000 users
Maximum number of Connect API calls	<p>10,000 per user, per hour, per connected application from the Salesforce Files Sync desktop client</p> <p>Salesforce Files Sync temporarily stops syncing files if you reach the Maximum number of Connect API calls. Syncing resumes automatically in about an hour.</p>

Salesforce Files Sync continues to sync existing files, but won't sync new files if:

- Your Salesforce Files Sync folder exceeds 10 GB of files.
- Your organization reaches its shared file storage limit.
- Your Salesforce Files Sync folder contains more than 10,000 files or 500 folders.
- The new file's file size exceeds the individual file size limit.

Salesforce Files Sync stops syncing files if:

- You move your Salesforce Files Sync folder from its default directory location. On Windows, the default directory location is `C:\Users\User Name\Salesforce Files`, where *User Name* is your Windows user name. On Mac, the default directory location is `/Users/User Name/Salesforce Files`, where *User Name* is your Mac user name. Salesforce Files Sync resumes syncing after the Salesforce Files Sync folder is returned to the default directory location.

Salesforce Files Sync Storage Limits

Two storage limits affect Salesforce Files Sync: shared organization-wide storage and individual storage.

Shared Organization-Wide Storage

Your organization's shared file storage is calculated by multiplying a per-user file storage allocation by the number of users in your organization and adding a per-organization allocation. For example, a Professional Edition organization with 10 users receives 11 GB of file storage, or 100 MB per user multiplied by 10 users plus an additional 10 GB. A Professional Edition organization with 100 users receives 20 GB of file storage, or 100 MB per user multiplied by 100 users plus an additional 10 GB.

If your organization is using its entire shared storage allocation, then Salesforce Files Sync will continue to sync your existing files, but won't sync new files unless you or your organization removes existing files or purchases more storage from Salesforce.

Salesforce Edition	File Storage Allocation Per Organization	File Storage Allocation Per User License
Contact Manager	11 GB	612 MB

Salesforce Edition	File Storage Allocation Per Organization	File Storage Allocation Per User License
Group	11 GB	612 MB
Professional	11 GB	612 MB
Enterprise	11 GB	2 GB
Performance	11 GB	2 GB
Unlimited	11 GB	2 GB
Developer	20 MB	N/A
Personal	20 MB	N/A

 **Note:** If your organization uses custom user licenses, contact your administrator to determine if these licenses provide additional storage.

Individual Storage

Salesforce Files Sync syncs up to 10 GB of files between the Salesforce Files Sync folder on your desktop, Salesforce on the Web, and mobile devices with Salesforce1. Salesforce Files Sync will continue to sync your existing files, but won't sync your new files if you add more than 10 GB of files to your Salesforce Files Sync folder. If you reach the individual 10 GB storage limit, you must remove existing files to sync new files.

File Names and Extensions that Prevent Syncing

Some file characteristics can prevent files from syncing between your devices and the Web.

- Zero-byte files
- Files without an extension
- Files with names that start with:
 - AUX.
 - CLOCK\$.
 - COM1.
 - COM2.
 - COM3.
 - COM4.
 - COM5.
 - COM6.
 - COM7.
 - COM8.
 - COM9.
 - CON.
 - LPT1.
 - LPT2.

- LPT3.
- LPT4.
- LPT5.
- LPT6.
- LPT7.
- LPT8.
- LPT9.
- NUL.
- PRN.
- ~
- .
- Files with these names:
 - desktop.ini
 - thumbs.db
 - .DSStor
- Files with these extensions:
 - .tmp
 - .conflicted
 - .part
 - .partial
 - .download
 - .crdownload
 - extensions starting with .sb-
- Different operating systems have different file name restrictions. Salesforce Files Sync syncs any file whose name is allowed by your operating system. That means that if you can name a file on your desktop, you can sync it using Salesforce Files Sync. If you sync a file from Mac® OS X®, it will sync to the Web, but if the file name isn't allowed by Microsoft Windows®, the file won't download to your Windows desktop.

To ensure all your files sync between all your computers, avoid using these characters in file names:

- \ (backslash)
- : (colon)
- * (asterisk)
- ? (question mark)
- ' (apostrophe)
- < (less than sign)
- > (greater than sign)
- / (slash mark)
- | (pipe)
- ™ (trademark symbol)
- ∞ (infinity sign)

- § (section)
 - • (bullet point)
 - ≠ (not equal to)
 - ` (grave accent)
 - “ (quotation marks)
 - … (ellipsis)
 - ≥ (greater than or equal to sign)
 - ≤ (less than or equal to sign)
 - & (ampersand)
- Files with names longer than 254 characters

Synced Folder Name Restrictions

Some folders aren't synced by Salesforce Files Sync because of folder name restrictions.

Different operating systems have different folder name restrictions. Salesforce Files Sync syncs any folder whose name is allowed by your operating system. That means that if you can name a folder on your desktop, you can sync it using Salesforce Files Sync. If you sync a folder from Mac® OS X®, it will sync to the Web, but if the folder name isn't allowed by Microsoft Windows®, the folder won't download to your Windows desktop.

To ensure all your files sync between all your computers, avoid using folder names that:

- Contain these characters:
 - / (forward slash)
 - \ (backslash)
 - : (colon)
 - * (asterisk)
 - ? (question mark)
 - “ (quotation marks)
 - < (less than sign)
 - > (greater than sign)
 - | (pipe)
- Exceed 255 characters
- Are identical to another folder name in the same directory

Deleting a File from the File Detail Page

Click **Delete** on a [file's detail page](#) to delete the file and remove it from all locations where it's been shared. If the file is shared via link, anyone with the link will no longer have access to the file. To restore the deleted file, click on the **Recycle Bin** link on the **Home** page. Select the file and click **Undelete**. The file is restored as well as all of the shares that were associated with it.

 **Note:** Only file owners and users with the “Modify All Data” permission can delete files. To learn who can perform which actions on a file, see [File Sharing Settings and Permissions](#).

SEE ALSO:

[Removing and Deleting Files and Links from a Chatter Feed](#)

External Files

Provide Your Credentials for External Data Sources

If your administrator configured a data source like SharePoint to use per-user authentication, provide your credentials in Salesforce.

 **Tip:** When you first access an external system in Salesforce, it asks you to enter your credentials. Click the provided link to automatically complete most of these steps.

1. From your personal settings, enter *Authentication* in the *Quick Find* box, then select *Authentication Settings for External Systems*.
2. Click **New**.
3. From the *Parent Object Type* menu, select “External Data Source.”
4. From the *External Data Source* menu, select a data source created by your administrator.
5. For SharePoint 2010 or 2013, set the following options:
 - *Authentication Protocol*—Choose “Password Authentication.”
 - *Username*—Enter your SharePoint username.
 - *Password*—Enter your SharePoint password.
6. For Google Drive, SharePoint Online, or OneDrive for Business, set the following options:
 - *Authentication Protocol*—Choose “OAuth 2.0.”
 - *Authentication Provider*—Choose the provider created for this data source by your administrator.
 - *Scope*—Leave blank.
 - *Start Authentication Flow on Save*— Select to immediately verify your login credentials with the external data source.

7. Click **Save**.

SEE ALSO:

[Find Your Personal Settings](#)

Access and Share External Files

After your administrator enables Files Connect, you can access files from external sources like SharePoint, or share them via the Files tab and feed.

Download or Share Files on the Files tab

If you want to download external files to your local system, or share them with a general set of people in your organization, use the Files tab.

1. At the top of the Salesforce window, click the Files tab.
2. In the left column, the External Files list shows available external data sources. Click one to access files it contains.

 **Note:** In the Recent list, Google Drive content is limited to the 24 most recently accessed documents from the last 30 days. Salesforce supports Google documents, spreadsheets, presentations, and drawings.

3. To the left of a file name, click the pop-up menu , and choose one of the following:
 - **Open** the file in the external data source, such as SharePoint.
 - **Download** the file to your local system. (From on-premises systems like SharePoint 2010, 2 GB is the maximum download size.)
 - **Share a copy** of the external file stored in Salesforce. If files are shared with a Chatter group, all group members can access the files, even if they lack access to the external system.
 - **Share a reference** to the external file stored outside Salesforce. No previews will appear in Chatter, and file downloads are available only for users with access to the external system. (Users must enter credentials for the system in the Authentication Settings for External Systems section of personal setup).

 **Note:** Your administrator determines whether shared files are copied or referenced—you will see only one option. Regardless of sharing mode, Chatter won't reflect file revisions in external systems. However, Reference mode will point to the latest versions in those systems.

Share Files in the Feed

If you want to include external files in a specific Chatter conversation, use the feed. All files shared in the feed are either copies or references, as determined by your administrator.

1. While authoring a post, click **File** above the feed, and then click **Select a file from Salesforce**.
2. In the left column, click the external source, such as SharePoint.
3. Next to the file you want to share, click **Attach**.

Search for External Files

Search an external data source like Google Drive or SharePoint right within Salesforce.

Search in a Specific External Data Source

1. In the left column of the Chatter or Files tab, click the data source name.
2. In the search box that appears for the data source, enter search terms such as document title or author. (The specific information you can search for depends on the configuration of the external data source.)

Search Globally for Salesforce and External Data

If your administrator enables global search for an external data source, you can conveniently search its contents along with your Salesforce data.

1. In the global search box at the top of the Salesforce window, enter your search terms.
2. To filter the results down to a specific external data source, click its name in the left column (for example, "SharePoint 2010").

Tip: If you often want to see content from a specific external data source, pin it to the top of global search results: In the left column, hover over the data source name, and click the pin icon. (If you don't see the data source listed, click Search All.)

Document Libraries

Document Library Overview

A document library is a place to store files without attaching them to accounts, contacts, opportunities, or other records. Each document in the document library resides in a folder. The folder's attributes determine the accessibility of the folder and the documents within it.

Displaying The Documents Tab

If your Documents tab is not visible, you can customize your display to show it.

Note: The Documents tab is not part of Salesforce CRM Content.

SEE ALSO:

[Differences between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments](#)

Documents Home

Clicking on the Documents tab displays the documents home page.

Note: If the Documents tab is not visible, you can customize your display to show it.

- Under **Find a Document**, enter keywords to search for a document.
- In the **Document Folders** section, select a folder to view all the documents contained in that folder.
- The **Recent Documents** section displays the last ten or twenty-five documents you viewed, with the most recently-viewed document listed first. This list is derived from your recent items and includes records owned by you and other users. Toggle the **Show 25 items** and **Show 10 items** links to change the number of items that display.
- In the **Recent Documents** section, click **New** to upload a new document.

Uploading and Replacing Documents

Uploading a New Document

To upload a document:

1. Click **New Document** from the Documents tab or click **New** next to **Recent Documents** on the documents home page. If you do not have a New Document option, check if you have the correct permissions.
2. On the Upload New Document page, specify a descriptive `Document Name`. If you want to use the file name, leave this field blank. The file name will appear automatically when you upload the file.
3. If you have the “Customize Application” permission, enter a unique name to be used by the API and managed packages.
4. You can check one of the following:
 - `Indicate Document is Internal`: When checked, a flag is added to the document indicating that document viewers should not share the file outside of the organization.

 **Note:** Checking this box does not expressly enforce any security rules.

 - `Externally Available Image` if the document is an image, such as a logo, that's not confidential. Check this box to:
 - Make the image available from HTML email templates without requiring a Salesforce username and password
 - Use the image as a custom tab icon or custom app logo, which do require a Salesforce username and password to view
 - Display the image as a custom logo in meeting requests

The `Indicate Document is Internal` and `Externally Available Image` checkboxes are mutually exclusive; you cannot select both.
5. Select a folder for the document.
6. Enter a description to use later as search criteria.
7. Enter keywords that you can use later as search criteria.
8. Select a document or path option.
 - To upload a document, click **Browse**, choose the file, and click **Open**.
 - To store a link to the document, enter the location of the document. Enter a path and file name or a URL such as:
`C:\Quotes\quote.doc`, `\\Server\Departments\Marketing\logo.doc`, or
`http://www.salesforce.com`.
9. Click **Save**.

Replacing a Document

To replace a document with an updated version:

1. Display the document you want to replace. For instructions on locating a document in the document library, see [Searching for Documents](#).
2. Click **Replace Document**.
3. Select a document or path option.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To upload new documents:

- “Create” on documents

To replace documents:

- “Edit” on documents

- To upload a replacement, click **Browse**, choose the file, and click **Open**.
- To store a link to the replacement, enter the location of the replacement. Enter a path and file name or a URL such as:
C:\Quotes\quote.doc, \\Server\Departments\Marketing\logo.doc, or
http://www.salesforce.com.

4. Click **Replace Document**.

Tips for Uploading or Replacing Documents

- Documents stored as links cannot be attached to emails, but they save space in your document library.
- If your administrator enables document content search, Salesforce also performs a full-text search of the document. When a new document is uploaded or an old one is replaced, its contents are available for searches.
- Salesforce stores the most recent upload date as the modified date.
- You can upload documents that have file names of up to 255 characters including the extension.
- The size limit for any document you upload is 5 MB. The maximum size for a custom-app logo is 20 KB.
- Your organization's used file storage includes all files stored in the document library.
- If the `Don't allow HTML uploads as attachments or document records` security setting is enabled for your organization, you cannot upload files with the following file extensions: `.htm`, `.html`, `.htt`, `.htx`, `.mhtm`, `.mhtml`, `.shtm`, `.shtml`, `.acgi`, `.svg`.

[Displaying and Editing Document Properties](#)

Searching for Documents

To find specific documents, use the **Find Document** button on the documents home page.

1. Click the Documents tab.
2. Enter your search terms. Salesforce searches the following fields:
 - Document Name
 - Keywords
 - Description
3. Click **Find Document**.

The search returns a list of documents that match all your search terms. The search results are listed in order of the closest matches. The `Keywords` and `Document Name` fields are used to determine the closest matches. The fields you see are predefined and cannot be changed.

 **Tip:** Use quotation marks around a phrase to search for the words in that sequence. For example, a search for *"my logos"* returns documents whose fields or content contains that exact phrase, as well as *my* and *logos*. Without quotation marks, your search returns any document whose fields or content includes any of the words in the search. For example, *my logos* returns documents whose fields or content contains *my* and *logos*.

4. Select any document to jump directly to the detail page for that document, or click **View** to open the document in a new window.

If your administrator enables document content search, Salesforce also performs a full-text search of the document. When a new document is uploaded or an old one is replaced, its contents are available for searches.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To view documents:

- "Read" on documents

-  **Note:** Salesforce automatically determines if the contents of a document can be searched. If the `Document Content Searchable` property is checked on a document, then its contents have been processed successfully and can be searched. If your document is large, it may take several minutes before Salesforce searches the contents of a document and marks the `Document Content Searchable` property.

You can also find documents using global search.

1. Enter your search terms in the header search box.
2. Select **Search Options...** from the drop-down and select `Documents` to narrow your search results.
3. Click **Search**.

The following file types are supported for a document content search.

-  **Note:** The contents of documents that exceed the maximum sizes are not searched; however, the document fields are still searched. Only the first 1,000,000 characters of text are searched. Text beyond this limit is not included in the search.

File Type	File Extensions	Maximum Size
HTML (only the text within a <code><body></code> tag)	<code>.htm</code> , <code>.html</code> , <code>.xhtml</code>	5 MB
PDF	<code>.pdf</code>	25 MB
PPT	<code>.pot</code> , <code>.pps</code> , <code>.ppt</code>	25 MB
RTF	<code>.rtf</code>	5 MB
Text	<code>.c</code> , <code>.cpp</code> , <code>.css</code> , <code>.csv</code> , <code>.ini</code> , <code>.java</code> , <code>.log</code> , <code>.sql</code> , <code>.txt</code>	5 MB
Word	<code>.doc</code> , <code>.dot</code>	25 MB
XLS	<code>.xls</code> , <code>.xlt</code>	5 MB, or a maximum cell limit of 100,000 cells
XML	<code>.xml</code>	5 MB

In some instances documents are not searched. These include:

- If a file extension is changed to a different format, it is not searched, even if both extensions are valid. For example, a `.txt` file that is renamed to `.rtf` is not searched.
- PDF and Word documents may have security restrictions that prevent them from being searched. To ensure that the content is searchable, the “content extraction” property on your file must be set to “Enabled” when creating your document.

SEE ALSO:

[Searching for Content](#)

[Search for Files](#)

Deleting Documents

To delete a document, click **Del** next to the document on the documents list page. Alternatively, click **Delete** on the documents detail page.

When you delete a document, Salesforce stores it in the Recycle Bin. You can restore the document to your document library within that time by clicking **Undelete** from the Recycle Bin.

Note:

- You can delete any document in your personal folder but you can only delete a document in a public folder if you have the "Manage Public Documents" permission.
- If you delete a document that's included in a letterhead or HTML email template, any emails using the letterhead or template display a broken link in its place. You can fix the broken link by removing the document from the Recycle Bin.
- You can't delete a document that's being used as a custom logo in meeting requests. To delete it, you must either select another document to use as a logo or uncheck the option to display a custom logo in meeting requests.

[Changing Document Authors](#)

Document Properties

Below is a description of the properties in alphabetical order that are stored for each document in the document library.

Field	Description
Author	The main point of contact for a document. Initially, the person uploading the document is the author. Thereafter, the author can be any selected user.
Created By	The name of the person who originally uploaded the file.
Modified By	The name of the person who last uploaded the file.
Folder	The name of the folder that contains the document.
Document Content Searchable	A checkbox that indicates if the content within a document can be searched via the Find Document button on the Documents tab. This checkbox is automatically set by Salesforce.
Document Name	The name of the document including its file extension.
Document Unique Name	A unique name used to refer to the document when using the Force.com API. In managed packages, this name prevents naming conflicts on package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With this field, a

[Changing Document Authors](#)

Changing Document Authors

Since documents are stored in folders that control user access, documents do not have owners like other types of records, but they do have authors. The author represents the user that originally uploaded the document file.

To change the author of a document:

1. View the document you want to modify.
2. Click **Change** next to the `Author` field.
The **Change** link displays only on the detail page, not the edit page. If you do not see the **Change** link, you may not have sufficient privileges to change a document author.
3. Enter a new author name. Alternatively, click the lookup icon to choose from a list of users.
4. Check the `Send Notification Email` box if you would like to alert the new author of this change.

 **Note:** When you change document authorship, Salesforce does not change the document's visibility.

Salesforce CRM Content

Salesforce CRM Content

Organize, share, search, and manage all types of files within your organization and throughout the Salesforce application.

With Salesforce CRM Content you can organize, share, search, and manage content within your organization and across key areas of the Salesforce application. Content can include all file types, from traditional business documents such as Microsoft® PowerPoint presentations to audio files, video files, Web pages, and Google® docs.

To learn the different ways files are used in Salesforce, see [Differences between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments](#).

Overview

Salesforce CRM Content simplifies content management by incorporating user-friendly features into the following tasks:

Organizing

Rather than keep files in folders that make content difficult to find, Salesforce CRM Content stores files in fully searchable file repositories known as libraries. Administrators can create multiple libraries based on any classification, such as department name, job function, or team, then configure user permissions within the library to balance content access with security. Authors assign descriptive labels called tags to help classify and organize content across libraries. You can view a list of all content that belongs to a particular tag or filter search results based on a tag or tags. Salesforce CRM Content also provides private libraries, which allow users to reduce the clutter on their desktops while using content-management benefits such as document search and version control.

Searching

The powerful Salesforce CRM Content search engine scans the entire body of the document as well as content properties such as the title, description, tags, categorization data, and author name. You can filter searches by featured content, file format, author, tags, libraries, or custom fields and then view the results with various levels of detail, providing an easy way to find relevant content quickly. If Chatter is enabled for your organization, you can also filter your search results by Chatter files. The “smart bar” graphic for downloads, comments, ratings, and subscribers allows you to compare documents within a search result set.

Subscribing

Once a file is located, subscribing to it ensures that you receive an email notification when new versions are published or changes are made to the file's properties. You can also subscribe to authors, tags, and libraries, thus reducing the time spent searching for new or updated content. Notification emails will arrive real-time or once daily, depending on your preferences.

Previewing

In Salesforce CRM Content you do not need to download a large document to determine if its content is relevant to you. The content details page provides document details at a glance, including document title, author, description, tags, libraries, comments, votes, versions, subscribers, and downloads. If the document is a Microsoft PowerPoint, Word, Excel, or Adobe® PDF file, you can preview the entire file in your browser without downloading it. Some aspects of files may not be displayed in previews. Copy-protected PDFs can't be previewed.

Contributing

Uploading new or revised files in Salesforce CRM Content is fast and easy. During the upload process you choose a library and record type for your file or Web link, write a description, assign one or more tags, and fill out any customized fields that help categorize and define your content. Version management does not require checking files in and out, rather, you simply upload a new version of the file and Salesforce CRM Content maintains a version list accessible from the content details page. You can download past versions of a file and read all reason-for-change comments that an author may have included with a new version.

Reviewing Usage and Providing Feedback

Salesforce CRM Content provides several methods for determining whether content is valuable to readers. Featuring a piece of content increases its visibility in search results. Voting thumbs up or thumbs down on a file, Web link, or Google doc and adding comments allow you to participate directly in content improvement. You can also see who has subscribed to a file, link, or doc and how many times files have been downloaded. The Reports tab allows you to create standard or custom reports on Salesforce CRM Content data. If the content delivery feature is enabled, you can send content to colleagues, leads, and contacts and then track how often the content has been previewed or downloaded.

Sharing Content in Salesforce

Salesforce CRM Content is also integrated with leads, accounts, contacts, opportunities, cases, products, and custom objects. If Salesforce CRM Content functionality is enabled on the Opportunity tab, for example, Salesforce CRM Content uses the fields on the opportunity detail page to search for files that may be relevant to that opportunity. You can drill down in the search results as needed or run your own search and then attach one or more files to the opportunity. The most current version of the file will be available on the detail page for the life of the opportunity.

Sharing Content in Salesforce Classic Mobile

Salesforce CRM Content is available in Salesforce Classic Mobile. Users can share content with customers and colleagues from the mobile application when they're away from their desks. Ask your administrator to set up mobile Content.

SEE ALSO:

[Differences between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments](#)

Contribute Content

Publish Files to Libraries

Publish files to libraries by uploading them from your computer, contributing them from your private library to a shared library, or sharing them from Chatter.

1. On the **Libraries** tab, do one of the following:

- To upload a file, click **Contribute** and choose a file from your local drive.
- To publish files from your private library, click the **My Private Files** tab, select one or multiple files, and click **Publish Selected**.

Or, to share files from Chatter with a library, see [Share Files with Libraries](#) on page 2877 (and skip the rest of these steps).

2. Enter a title for each file. Optionally, enter descriptions.

3. If you are adding a new file that you just uploaded, choose either **Save in my private library** or **Publish to a shared library**. If you choose the second option, select a library. This becomes the managing (home) library, meaning that the content can be shared with another library but only revised by a user with author permissions in the managing library.

4. Optionally, choose a language. The **Language** drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.

5. To publish the content on behalf of another author, choose that author from the drop-down list.

6. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:

- If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the **Tags** field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the **Tags** field automatically.
- If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the **Tags** field automatically.
- If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
- You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
- Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.

7. If multiple record types are available, choose one from the drop-down list. The record type determines which custom fields appear for you to categorize and define your content.

8. After completing the custom fields, click **Publish** or **Save**.

Note:

- Unique values in custom fields that are set for the first version of a file aren't included if you upload a new version. You can set the unique values in the new version as long as they aren't the same as a previous version.

EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To upload and publish files to a public library:

- **Manage Libraries** checked in your library permission definition

OR

Add Content checked in your library permission definition

To upload and save files to a private library:

- **None**

- Files published to a shared library are added to your Files tab and available to other Chatter users in your organization. Files published to your private library are added to your Files tab, but are private and not shared with anyone. For information about the different file tools and solutions in Salesforce, see [Differences between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments](#).
- Contact Manager, Group, Professional, Enterprise, Unlimited, and Performance Edition customers can publish a maximum of 36,000 new versions per 24-hour period. Developer Edition and trial users can publish a maximum of 2,500 new versions per 24-hour period.

Salesforce CRM Content File Size Limits

The following are maximum file size limits for files in Salesforce CRM Content:

- 2 GB
- 2 GB (including headers) when uploaded via Chatter REST API
- 2 GB (including headers) when uploaded via REST API
- 38 MB when uploaded via SOAP API
- 10 MB for Google Docs
- 10 MB when uploaded via Visualforce

SEE ALSO:

[File Size Limits in Salesforce](#)

Contributing Google Docs to Salesforce CRM Content

With Google Docs™, you can create and share on-demand documents, presentations, and spreadsheets (Google docs) and see your changes in real time as you collaborate with other users. Associating your Google docs with Salesforce CRM Content allows you to access all types of content from a single, fully-indexed location. It also ensures that your Google docs receive the feedback and tracking benefits provided by Salesforce CRM Content features such as votes, comments, and subscriptions.

 **Note:** The **Add Google Doc** drop-down list on the Libraries tab only displays if your administrator has enabled the Add Google Doc to Salesforce service.

For information about associating Google docs with Salesforce CRM Content from your Google Apps account, see [Installing the Add Google Doc to Salesforce Browser Button](#).

Adding New Google Docs to a Salesforce CRM Content Library

1. On the Libraries tab, choose **New Document**, **New Spreadsheet**, or **New Presentation** from the Add Google Doc drop-down button. You may be prompted to log in to Google Apps.
2. Enter a name for your document, spreadsheet, or presentation and click **Create Google Doc**. The blank Google doc opens and you can begin adding your text. The Save or Publish Content dialog in Salesforce CRM Content also opens.
3. In the Save or Publish Content dialog:
 - a. Optionally, provide a description of your Google doc. The description provides at-a-glance information for users who view the doc's content details page in Salesforce CRM Content.
 - b. Choose a library. If you do not want to put the doc in a public library, for example if the doc is still in progress, choose **Save in my private library**.
 - c. Optionally, choose a language. The Language drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.
 - d. To publish the content on behalf of another author, choose that author from the drop-down list.
 - e. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:

 - Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.
- f.** If multiple record types are available, choose one from the drop-down list. The record type determines which custom fields appear for you to categorize and define your content.
- g.** After completing any custom fields, click **Publish** to save the Google doc to its Salesforce CRM Content library, or click **Cancel** to save the doc to your private library. From there you can delete the doc from Salesforce CRM Content or publish it later. Once a Google doc is published in Salesforce CRM Content, all library members can search for the doc and provide feedback such as comments and votes.

Note: While you have your Google doc open, remember to share it with other Google Apps users in your organization. Only users with access to the Google doc in their Google Apps account can open the doc from Salesforce CRM Content.

Adding Existing Google Docs to a Salesforce CRM Content Library

If you have an existing Google doc, you can publish it into a library:

1. On the Libraries tab, choose **Add Existing** from the Add Google Doc drop-down button. A list of all the Google docs in your Google Apps account displays.
2. Optionally, limit your list of docs by entering a search term or choosing to view only documents, presentations, or spreadsheets.
3. Select the Google doc that you want to add to Salesforce CRM Content and click **Contribute**.
4. Optionally, edit the title of your Google doc and/or add a description.
5. Choose a library. If you do not want to add the doc to a public library, for example if the doc is still in progress, choose **Save in my private library**.
6. Optionally, choose a language. The `Language` drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.
7. To publish the content on behalf of another author, choose that author from the drop-down list.
8. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
 - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the `Tags` field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the `Tags` field automatically.
 - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the `Tags` field automatically.
 - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.

- You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
 - Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.
9. If multiple record types are available, choose one from the drop-down list. The record type determines which custom fields appear for you to categorize and define your content.
 10. After completing the custom fields, click **Publish** or **Save**.

SEE ALSO:

[Manage Libraries](#)

Contributing Web Links to Salesforce CRM Content

To classify and publish a Web link in Salesforce CRM Content:

1. Click the **Libraries** tab.
2. To add a new link, click **Contribute** > **Do you want to link to a website instead?**, then enter the URL, and click **Contribute**. To publish a link that is already in your private library, click the **My Private Files** tab, locate the link, and click **Publish**.
3. Assign a title and description to your Web link.
4. Choose a library. This becomes the managing (home) library, meaning that the Web link can be shared with another library but its content details page can only be edited by a user with relevant permissions in the managing library. If you do not want the link to be visible to other users in your organization, choose **Save in my private library**.
5. Optionally, choose a language. The **Language** drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.
6. To publish the content on behalf of another author, choose that author from the drop-down list.
7. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
 - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the **Tags** field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the **Tags** field automatically.
 - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the **Tags** field automatically.
 - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
 - You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
 - Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.

EDITIONS

Available in: Salesforce Classic

Updating Content Versions

Clicking a file name on any Salesforce CRM Content tab opens the content details page.

Publishing a New Version

To publish a new version of the file and update its properties:

1. Click **Edit** > **Upload New Version**. This option does not appear for Web links, content packs, or Google docs.

To add or remove files from a content pack, see [Create and Modify Content Packs in Salesforce CRM Content](#).
2. Click **Browse** to find and select the updated file.
3. As needed, update the **Title** and **Description** fields.
4. Fill out the **Reason for change** field. This text is included on the email notifications sent to subscribers and the version list located on the content details page.
5. To publish the content on behalf of another author, choose that author from the drop-down list.
6. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
 - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the **Tags** field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the **Tags** field automatically.
 - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the **Tags** field automatically.
 - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
 - You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
 - Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.
7. Update any custom fields as needed.
8. Click **Publish**.

Notes on Content Versions

Consider the following information when creating or modifying a new version:

EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To add a new version:

- **Add Content** checked in your library permission definition

- You cannot edit a file within Salesforce CRM Content. To edit a file, download it from Salesforce CRM Content to your computer, make your changes, then upload the updated version using the **Upload New Version** button.
- The Versions subtab on the content details page lists all content versions. The Recent Activity list on the Libraries tab also notifies users of new content versions.
- Contact Manager, Group, Professional, Enterprise, Unlimited, and Performance Edition customers can publish a maximum of 36,000 new versions per 24-hour period. Developer Edition and trial users can publish a maximum of 2,500 new versions per 24-hour period.

SEE ALSO:

[Uploading and Publishing Content](#)

Delete, Archive, and Restore Content

There are two methods for removing content from libraries: archiving and deleting.

Archiving lets you continue to store files in Salesforce without them being in a library or exposed in search results. Deleting files moves them to the **Recycle Bin**, where files remain for 15 days before being permanently, automatically deleted. Within 15 days of deleting a file, you can restore it from the **Recycle Bin**. You can also restore archived files.

Before you delete or archive content, it's important to know what's similar and different about these two methods:

Effects of Archiving or Deleting Content	Archived Content	Deleted Content
Counts towards file storage limits (storage size as well as number of documents)	✓	
Removed from libraries	✓	✓
New versions can no longer be uploaded	✓	✓
Content can no longer be downloaded (until restored)	✓	✓
Content no longer appears in search results	✓	✓
Content can be restored	✓	✓
Automatically removed from subscription lists (without notifying subscribers)	✓	✓
Permanently deleted by emptying recycle bin		✓

 **Note:** To delete files in content packs, you must first delete the content pack (container) itself.

To archive or delete content files:

1. On the **Libraries, Content**, or **Subscriptions** tab, click the name of the file you want to remove.
2. On the **Content Details** page, click **Edit > Archive Content** or **Edit > Delete Content**.

To restore archived content files:

EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To archive and restore any content in the library:

- **Archive Content** checked in your library permission definition

To archive and restore content that you published:

- **Add Content** checked in your library permission definition

To delete content:

- **Delete Content** checked in your library permission definition

1. Do one of the following to open the **Content Details** page for an archived file:
 - Follow a bookmark to the archived content.
 - On the **Libraries** tab, click a library name to open the **Library Details** page. Click the **View Archived Content** link to see a list of archived content on the **Content** tab. Click the name of the content file you want to restore.

 **Note:** The **View Archived Content** link only displays if you have the `Archive Content`, `Add Content`, or `Manage Libraries` privileges in your library permission. If you have the `Archive Content` or `Manage Libraries` privileges, you will see a list of all archived content in the library, regardless of author. If you do not have those privileges but have the `Add Content` privilege, you will only see archived content that you authored and archived.

2. On the **Content Details** page, click **Edit > Restore Content**.

To restore deleted content:

1. On either the **Libraries** or **Subscriptions** tab, or on the **Content Details** page, go to the **Recycle Bin**.
2. Select the checkbox for the content file you want to restore, and click **Undelete**.

 **Note:**

- Authors can always archive and restore their own content. Authors do not require the `Archive Content` library permission option.
- If a file is in Salesforce CRM Content and also posted in Chatter, archiving it doesn't remove the Chatter post.
- Deleting a Chatter file from the content details page deletes the file from Salesforce CRM Content and from Chatter.

SEE ALSO:

[Deleting a File from the File Detail Page](#)

Create and Modify Content Packs in Salesforce CRM Content

A *content pack* is a collection of related documents or files that are stored as a group in Salesforce CRM Content. For example, you may want to create a content pack with a product list, price quote, and contract to send to a particular customer. Any file in Salesforce CRM Content can be added to a content pack, from traditional business documents such as Microsoft® PowerPoint presentations and Adobe® PDF files, to audio files, video files, and Google docs. Using email or instant messaging, you can distribute the content pack to colleagues in your organization or leads and contacts outside your organization. The recipient of a *content delivery* can click a single URL to open a preview player with which he or she can preview and download the content. You can then view tracking information to see how often the content pack was viewed and which documents were downloaded. .

 **Note:** Content packs support all files types; however, the preview player launched by the content-delivery URL displays only PowerPoint, Word, Excel, and PDF files. The preview player does not display copy-protected PDFs. Also, working with content packs requires Adobe Flash® Player, version 9.0.11.5 or higher. If you do not have Flash installed, Salesforce provides a link to Adobe's website where you can download Flash for free.

To work with content packs:

1. Depending on whether you want to create, customize, or modify a content pack, use one of the following options:

 **Note:** The following options are available only if `Enable content pack creation` is selected on the Salesforce CRM Content page in Setup . If content pack creation is disabled after packs have been created, Salesforce doesn't delete the packs, but they can't be customized or modified.

- To create a new content pack, click the **Libraries** tab and then choose **Create New > Content Pack**.
 - To create a new content pack by copying an existing pack and adding, removing, or reordering files, open the content details page for the pack and click **Clone & Customize**.
 - To update a content pack and publish a new version, open the content details page for the pack and click **Edit > Edit Content Pack**.
2. Click **Search files** to display all the content in your libraries. To refine your results, select a specific library to search or enter a search term in the text box.

In addition to files and documents, search results also list content packs.

3. Drag the desired content from the search results into the assembly section in the lower half of the window. The following options help you assemble your content pack:
 - In the search results, click a document to preview it in the lower half of the window. Choose **Add to Content Pack** or **Hide preview** as needed.
 - In the search results, hover over a document and click the folder icon () to view the content packs that use the document.
 - In the search results, hover over a content pack and click the folder icon () to view all the documents in the pack.
 - In the assembly section, hover over a document and click the garbage can icon () to remove that document from the pack you are assembling.
 - Click **Clear** at any time to revert your changes; click **Cancel** to return to the Libraries tab.

 **Note:** The maximum number of files that can be included in a content pack is 50.

EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create or modify content packs in Salesforce CRM Content:

- `Manage Libraries` checked in your library permission definition
- OR

`Add Content` checked in your library permission definition

4. When you are done assembling or modifying your content pack, click **Save** and assign or change the content pack's name.
5. In the Save or Publish Content dialog:
 - a. Select a library. If you do not want the content pack to be visible to other users in your organization, for example if your work is still in progress, choose **Save in my personal library**.
 - b. Optionally, add or modify the content pack's description.
 - c. Optionally, choose a language. The `Language` drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.
 - d. If you are modifying the content pack, complete the `Reason for Change` field.
 - e. To publish the content on behalf of another author, choose that author from the drop-down list.
 - f. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
 - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the `Tags` field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the `Tags` field automatically.
 - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the `Tags` field automatically.
 - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
 - You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
 - Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.
 - g. If multiple record types are available, choose one from the drop-down list. The record type determines which custom fields appear for you to categorize and define your content.
 - h. Click **Publish**. You can then view the content details page, return to the Libraries tab, or publish another file.

Find Content

Find Salesforce CRM Content Related to Records

Quickly find content files that are related to leads, accounts, contacts, opportunities, products, cases, or custom objects by using the related lists on those records.

If your organization has Salesforce CRM Content enabled, you can take advantage of Salesforce CRM Content functionality on detail pages for leads, accounts, contacts, opportunities, products, cases, or custom objects. The Related Content related list allows you to search for files, content packs, Web links, or Google docs and attach them to the record. When you attach a file, the latest version will be available for the life of the record unless the file is removed.

 **Note:** The **Related Content** and **Content Deliveries** related lists are only available on a record if they have been added to the corresponding page layout by an administrator.

From the Related Content related list, you can:

- Click the content's title to view the content details page where you can perform several tasks, such as commenting and voting on content, downloading files, opening Web pages and Google docs, and subscribing to content, authors, tags, or libraries. For more information, see [Viewing and Editing Content Details](#).
- Click **Del** next to a piece of content to remove it from the record. This does not delete the content from the Salesforce CRM Content library.
- If content deliveries are enabled in your organization, click **Deliver Content** to create a content delivery. A *content delivery* allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. Content deliveries are available in Salesforce Classic only. However, Lightning Email generates delivery-based links as email attachments for Lightning Experience users who have access to the Content Deliveries feature. For more information, see [Creating Content Deliveries](#).
- Search for related content:
 1. Click **Find Content** or **Search All**. In both cases, Salesforce CRM Content searches within the libraries that you have access to. If you click **Search All**, the search results display all the content in your libraries. For the Find Content search, your search results contain content that is relevant to the record; Salesforce CRM Content searches for content with text or attributes that match the following fields:
 - On an opportunity, the `Opportunity Name`, `Account Name`, and all competitors and products.
 - On an account, the `Account Name` and `Industry`.
 - On a case, the `Case Reason`, `Subject`, `Account Name`, and `Industry`.
 - On a lead, the `Name`, `Company`, `Industry`, and `Title`.

 **Note:** On a custom object, clicking **Find Content** returns search results that contain the full custom object name in the document's text or attributes. If no content meets this criterion, the search results will be empty and a Search All search should be used instead.
 2. On the search results page, filter your results as needed by entering search terms or selecting filter criteria from the sidebar.
 3. Click **Attach** for any file that you want to attach to the record.
 4. Click the **Back** link to return to the detail page.

To access Salesforce CRM Content:

- Salesforce CRM Content User checked in your personal information AND Member of the library

Searching for Content

Clicking the Content tab displays files, content packs, Web links, and Google docs published in your Salesforce CRM Content libraries. If Chatter is enabled, and your administrator has enabled the setting to show Chatter files in Salesforce CRM Content, files posted to Chatter groups and other Chatter files that aren't private or privately shared, are also displayed on the Content tab. The top twenty most recently modified items are listed by default. You can filter the list using the Filter Your Results sidebar.

To search for specific content:

1. From the Search drop-down list, restrict your search to a specific library or choose to search in all libraries. If available, restrict your search to just Chatter files or just files in Chatter groups you're a member of.

 **Tip:** To display all the locations where the content appears, click **Display Options** and select **Display Locations**. The locations are listed under each title.

2. Enter your search term(s) and click **Go!**. Salesforce CRM Content performs a full-text search of the following document types: rich text format (RTF), UTF-8 encoded TXT, HTML, XML, Adobe® PDF, and Microsoft® Office 97 through Microsoft Office 2007 Word, Excel, and PowerPoint files.
3. If your administrator has enabled multi-language support, you can restrict your search to a specific language. By default, Salesforce CRM Content searches all the content in your libraries that is published in your default user language. Searching in all languages also searches the titles, author names, tags, file extensions, and custom fields of content in all languages.

 **Note:** Searching in all languages does not search the text or description of documents that were published in languages other than your default user language.

4. Optionally, in the Filter Your Results sidebar, filter your search results by file format, featured content, author, tag, libraries, language, custom field, or Chatter group (if available). The number in parentheses next to each filter type shows you how many matching files, content packs, Web links, and Google docs are in the search results.

The Content tab provides several options:

- Click **Display Options** to customize your view by adding sortable columns for various content criteria (such as Size and Publication Date), or choosing to display descriptions, tags and locations. **Display Locations** shows the libraries and Chatter groups where the content appears. **My Libraries: none** or **My Chatter Groups: none** means that the file is a Chatter file and is not part of any libraries or Chatter groups. The “smart bar” graphic for downloads, comments, ratings, and subscribers allows you to compare files, content packs, Google docs, and links within a search result set.

 **Note:** Chatter groups are only included in **Display Locations** if Chatter is enabled, and your administrator has enabled the setting to show Chatter files in Salesforce CRM Content.

- Select one or more files and click **Download** to create a zip file with your selected content. Web links and Google docs cannot be included in zip files.
- Hover over a file icon to see a snapshot of information about the specific file, content pack, Google doc, or Web link and options such as subscribing, voting, and downloading.
- Click the subscription icon next to the file name to toggle a subscription on or off. For more information, see [Viewing and Editing Content Subscriptions](#).
- Click the file name to view the content details page. The content details page provides all the available information about a file, content pack, Google doc, or link. For more information, see [Viewing and Editing Content Details](#).

To mark content as featured:	Feature Content checked in your library permission definition
To deliver content from a shared library:	Deliver Content checked in your library permission definition
To deliver content from a personal library:	Deliver Uploaded Files and Personal Content checked in your library permission definition
To post content from a library to a Chatter feed:	Post Content to Chatter Feeds checked in your library permission definition

Clicking a file name on the Libraries, Content, or Subscriptions tabs opens the content details page, which is a central access point to preview content and gather information about a particular file, Web link, content pack, or Google doc in Salesforce CRM Content. Starting with the Summer '10 release, if Chatter is enabled for your organization, files posted to Chatter are also listed.

The Preview tab displays if your file is one of the following types:

- Microsoft® Office 97 through Microsoft Office 2007 Word, Excel, and PowerPoint. Some Microsoft Office 2007 features don't display correctly in previews.
- Adobe® PDF. Copy-protected PDFs can't be previewed.
- JPG, BMP, GIF, and PNG.

The following options may be available on the Content Details page, depending on: the type of content you are viewing; your library permissions; and whether the content is in a public or private library, or from Chatter:

- Click the thumbs up or thumbs down icon to vote for the file, Web link, content pack, or Google doc. To change your vote, click the opposite icon. After you cast a vote, the Recent Activity list on the Libraries tab indicates whether you like or dislike the content.
 - Click **Deliver Content** to [create a content delivery](#). Click **Deliver Content > Show Content Deliveries** to [view a list of deliveries](#) associated with the content.
 - For Web links or Google docs, click the **Open** button to open the Web page in a separate window. For files, click the **Download** button to open or save the file.
 - Click **Subscribe** or **Subscribed** to toggle your subscription on or off.
 - For files, click the Content Packs subtab to see which content packs include this file.
 - Library administrators can click **Remove from all** to remove the file from all content packs that include the file.
 - Click the name of the content pack that includes the file to view the details of that content pack.
 - For content packs, click **Clone & Customize** to create a new pack by adding or removing files and slides. Salesforce CRM Content saves or publishes your customized pack as new content, not a version of the pack you copied.
 - Click **Edit > Edit Content Details** to modify standard and custom fields.
 - Click **Edit > Edit Content Pack** to [create a new version of a content pack](#) by adding or removing files.
 - For files, click **Edit > Upload New Version** to [replace the file](#) with a new version. The version option is not available for Web links, content packs, or Google docs.
-  **Note:** If the **Add New Version** button is grayed out, your organization has exceeded its file storage allowance and new content cannot be uploaded.
- Click **Edit > Archive Content** to [remove the file, Web link, content pack, or Google doc from the library](#). Authors can archive and restore their own content regardless of library permissions. If a file is in Salesforce CRM Content and also posted in Chatter, archiving it doesn't remove the Chatter post.

- Click **Edit** > **Delete Content** to [delete the file, Web link, content pack, or Google doc from Salesforce CRM Content](#) by moving it to the Recycle Bin. Authors can delete and undelete their own content regardless of library permissions. Deleting a Google doc removes the doc's association with Salesforce CRM Content but does not delete the doc in Google Apps. You cannot delete a file that is included in a content pack or content delivery. Deleting a Chatter file from the content details page deletes the file from Salesforce CRM Content and from Chatter.
- Click **Edit** > **Library Actions** and choose **Move to Another Library** to move the content to a different managing (or "home") library. Choose **Share to Another Library** to share content into additional libraries without changing the managing library. Sharing or linking content to other libraries enables members of those libraries to find your content. If the managing library and shared library have different tagging rules, the most restrictive tagging rule applies. If you want to remove content from a library where the content is shared, click **Remove from Libraries**. This option does not remove content from its managing library.
- Click the Comments subtab to view, add, edit, or delete comments.
- Click the Versions subtab to view a list of all file versions and the reason-for-change statements provided by the authors.
- Click the Downloads subtab to view a list of all Salesforce CRM Content users who have downloaded the file. Download data is not available for Web links or Google docs.
- Click the Subscribers subtab to [view a list](#) of all Salesforce CRM Content users subscribed to the file, Web link, or Google doc. To subscribe to an author, click the drop-down button next to the author's name. To subscribe to a library, click the drop-down button next to the library name.
- Click a tag name to view all the content associated with that tag. Click the arrow next to the tag to remove the tag or to subscribe to all content with that tag.
- To add a new tag, enter a tag name in the **Add Tags** field and click **Save**. As you type a tag, Salesforce CRM Content autosuggests tags based on the tags in your My Recent Tags list in the Save or Publish window and the Popular Tags section on the Libraries tab.
 -  **Note:** If your administrator applied a library tagging rule, you may not be able to enter new tags. If the guided tagging rule is applied, you can click **Add Tags** and choose from the list of suggested tags or enter new tags. If the restricted library tagging rule is applied, you can click **Add Tags** and choose from the list of suggested tags, but you cannot enter your own tags.
- Click the author's name to see a list of the author's published content. Click the arrow next to the author's name and choose **Subscribe to Author** to subscribe to all content published by that author.
- Click **Feature** or **Don't Feature** to toggle the "feature" designation on or off. Featured content receives a higher priority than similar content in search results; for example, if 100 files contain the search criteria term *sales asset*, any featured files with that term will appear at the top of the search results list. Featured content is also listed on the library overview and library detail pages for quick access.
- Click a library name to view details about the library. Click the arrow next to the library name and choose **Subscribe to Library** to subscribe to all content in the library or **Show Library Content** to view a list of all files, content packs, Web links, and Google docs published to the library.

Using the Content Related List

The Content related list on a record detail page includes links to all of the content that has been associated with that record in Salesforce CRM Content. Click the file name to open the content details page.

Only Salesforce CRM Content users who are members of the library where the content was published can see the published file in the Content related list. For example, if you select the “Big Deal” opportunity when publishing `BigDealStrategy.doc` into the Sales Collateral library, the Content related list on the “Big Deal” opportunity includes a link to `BigDealStrategy.doc` only for members of the Sales Collateral library. Users who are not members of that library do not see the link.

You can use the Related Content related list to access Salesforce CRM Content from leads, accounts, contacts, opportunities, products, cases, or custom objects. For more information, see [Find Salesforce CRM Content Related to Records](#) on page 2914.

[Salesforce CRM Content](#)

Viewing and Editing Content Subscriptions

Clicking the Subscriptions tab displays the Subscriptions home page, where you can view your Salesforce CRM Content subscriptions and toggle them off or on.

 **Note:** To subscribe to a file, content pack, Web link, or Google doc, [view its content details page](#) and click **Not Subscribed**. From the content details page you can also subscribe to a tag, author, or library by using the drop-down menus next to the tag, author, or library name.

On the Subscriptions tab, click the Content, Tags, Authors, or Libraries subtabs to view your subscriptions. Depending on your notification settings, you are notified of changes to your subscribed content via real-time emails or a once-daily email.

 **Tip:** To configure your notification settings, go to your personal information page, click **Edit**, and select `Receive Salesforce CRM Content email alerts`. If you want to receive a once-daily summary rather than real-time email alerts, also select `Receive Salesforce CRM Content emails as daily digest`.

Subscriptions generate the following notifications:

- If you subscribe to a file, you are notified when a viewer adds comments to the file or when a new version of the file is published. If you subscribe to a Web link or Google doc, you are notified when comments are added but not when the link is changed or the doc is edited.
- If you subscribe to a content pack you are notified when a new version of the pack is published. Unless you are subscribed to the individual files within a content pack, you are not notified when new versions of the files are published.

Viewing and Editing Libraries

Once you have located a Salesforce CRM Content library in the **My Libraries** area of the Libraries tab home page or on a content details page, click the library name to display detailed information. For details about the publishing options at the top of the page, see [Uploading and Publishing Content](#).

From the library title area, you can click the following quick links:

- **Browse** to [view search results](#) showing all the content in the library.
- **Edit** to change the library name or description.
- **Delete** to delete an empty library. If you want to delete a library that contains content, you must first move the content to another library or delete it and empty the Recycle Bin.
 -  **Note:** If your Recycle Bin is empty and you are unable to delete the library, another user's Recycle Bin may contain deleted content from the same library. A library cannot be deleted until all its content is permanently deleted or moved to another library.
- **Edit Members** to [add or remove library members](#) or change their library permission.
- **Tagging Rules** to [change the tagging method](#) permitted in the library.
- **Record Types** to [restrict the record types](#) available to library contributors.
- **View Archived Content** to [view a list of archived content](#) in the library. If you do not have the `Archive Content` or `Manage Libraries` privilege in your library permission, the archived content list only contains content that you authored and archived, not content that other authors archived.

The library detail page contains the following sections:

Members

This section lists all the Salesforce CRM Content users who are members of the library. To limit the member list, enter a username and click **Filter**. You can filter by the beginning of a username but not the last name.

To add new members to the library:

1. Click **Add Members**.
2. If the member you want to add isn't listed, start to enter their first name in the search box and click **Find**.

EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To edit a library:

- "Manage Salesforce CRM Content"

OR

`Manage Libraries` checked in your library permission definition

To add or remove library members:

- "Manage Salesforce CRM Content"

OR

`Manage Libraries` checked in your library permission definition

3. Select members from the Available Members box. Members can include individual Salesforce CRM Content users or public groups containing Salesforce CRM Content users.

Tip: If you have a large number of Salesforce CRM Content users, create a public group and add the group to a library rather than adding users to the library individually.

4. Click **Add** to add the members to the library.
5. Click **Next**.
6. Select a library permission for each user or public group and click **Save**.

To remove a member from the library, click **Remove**. To change a member's library permission, click **Edit** and choose a new library permission from the drop-down list.

Featured Content

This section lists the five pieces of content in the library most recently designated as “featured.” If no content has been featured, this section does not display. Featured content receives a higher priority than similar content in search results; for example, if 100 files contain the search criteria term *sales asset*, any featured files with that term will appear at the top of the search results list. To see all featured content, click **Show All**. To toggle the feature status on or off, go to its [content details page](#).

Top Content

This section includes lists that summarize content activity in your library. Within a list, click a file icon to download the content or click the title to open the associated content details page. In the Top Content section you can choose from the following categories:

- **Publication Date**—This content is sorted in descending order according to the most recent publication date. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the published files, Web links, and Google docs.
- **Num Downloads**—This content is sorted in descending order according to the highest number of downloads. The bar graphic indicates how one record compares to another. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the downloaded content.
- **Rating**—This content is sorted in descending order according to the highest number of thumbs-up votes. Green and red in the bar graphic represent positive and negative votes, respectively. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the content with votes.
- **Num Comments**—This content is sorted in descending order according to the highest number of viewer comments. The bar graphic indicates how one record compares to another. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the content with associated comments.

Popular Tags

This “tag cloud” shows you how the content in your library has been labeled. Tags are descriptive terms assigned during upload or revision that help classify and organize content. Click a tag name to view search results containing all the files, Web links, and Google docs with that tag. The tag names increase in size within the tag cloud according to popularity, meaning that the largest tags have been assigned to the most content. You can choose to sort the tags alphabetically or by popularity. The tag cloud contains the 30 most popular tags.

Recent Activity

This section is a snapshot of activity within your library. It shows the most recent files, Web links, and Google docs to receive comments, votes, or subscriptions. Featured content and newly published content are also included, but new versions of existing content, archived content, and deleted content do not appear in the Recent Activity section. Use the **Older** and **Newer** buttons to scroll through records. The Recent Activity section contains a maximum of 100 records.

Most Active Contributors

This section shows the authors who have uploaded content into your library most frequently. The names increase in size according to activity, so the largest names are the authors who have contributed the most content.

SEE ALSO:

[Updating Content Versions](#)

Manage Libraries

On the **Libraries** tab, access your private library, create new libraries, choose libraries to view or edit, and analyze library usage and activity. For details about the publishing options at the top of the page, see [Uploading and Publishing Content](#). The libraries home page has two tabs: Shared Content, which provides information about shared libraries, and My Private Files, which contains information about your private library.

Shared Content

The Shared Content tab on the libraries home page contains the following sections:

My Libraries

This section lists all the libraries to which you have access. Click a library name to view details about that library or click **Browse** to view a list of all the content in the library. Click the **New** button to create new libraries, add users to a library, or assign library permissions to users.

Featured Content

This section lists the five pieces of content in your libraries most recently designed as “featured.” Featured content receives a higher priority than similar content in search results; for example, if 100 files contain the search criteria term *sales asset*, any featured files with that term will appear at the top of the search results list. To see all featured content, click **Show All**. To toggle a piece of content's feature status on or off, go to its [content details page](#).

Top Content

This section includes lists that summarize content activity across all your libraries. Each list sorts content according to specific criteria. Within a list, click a file icon to download content or click a title to open the associated content details page. In the Top Content section you can choose from the following categories:

- **Publication Date**—This content is sorted in descending order according to the most recent publication date. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the published files, Web links, and Google docs.
- **Num Downloads**—This content is sorted in descending order according to the highest number of downloads. The bar graphic indicates how one record compares to another. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the downloaded content.
- **Rating**—This content is sorted in descending order according to the highest number of thumbs-up votes. Green and red in the bar graphic represent positive and negative votes, respectively. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the content with votes.

Popular Tags

This section, commonly referred to as a “tag cloud,” shows you how the content in your libraries has been labeled. Tags are descriptive terms assigned during upload or revision that help classify and organize content. Click a tag name to view search results containing all the files, Web links, and Google docs with that tag. The tag names increase in size within the tag cloud according to popularity, meaning that the largest tags have been assigned to the most content. You can choose to sort the tags alphabetically or by popularity. The tag cloud contains the 30 most popular tags.

Recent Activity

This section is a snapshot of activity within your libraries. It shows the most recent files, Web links, and Google docs to receive comments, votes, or subscriptions. Featured content and newly published content are also included, but new versions of existing content, archived content, and deleted content do not appear in the Recent Activity section. Use the **Older** and **Newer** buttons to scroll through records. The Recent Activity section contains a maximum of 100 records.

Most Active Contributors

This section shows the authors who have published content into your libraries most frequently. The names increase in size according to activity, so the largest names are the authors who have contributed the most content.

My Private Files

The My Private Files tab on the libraries home page is your private library. When you upload or create content and do not select a public library, your content is stored in your private library. You can publish content to a public library at any time or leave content in your private library indefinitely. Content in your private library can be assembled in content packs. It can also be sent to leads and contacts outside your organization using the content delivery feature. See [Set Up Content Deliveries](#) on page 3187 for more information. The My Private Files tab has the following sections:

Private Library

If you choose the **Save to my private library** option when publishing a file, Web link, content pack, or Google doc, your content is saved here. You can publish or delete files from this list or click the file's name to view its content details page. The following options that are available on the content details page for shared content are not available for private-library content: tagging, rating, subscribing, tracking downloads, tracking subscriptions, or using custom fields. If you publish a file from the Private Library list and click **Cancel** during the publishing process, your file is deleted.

Upload Interrupted

If an error occurs when you are uploading a new file, for example your browser crashes or your session times out, the file you were uploading is saved here. Click **Publish** to publish the file to a public library or save it to your private library. If you click **Cancel** on the Save or Publish Content dialog, your file will be deleted.

Revision Upload Interrupted

If an error occurs when you are uploading a new version of a file, the file you were uploading is saved here. Users can continue to access the original version. Click **Publish** to publish the file to a public library or save it to your private library. If you click **Cancel** on the Save or Publish Content dialog, your file will be deleted.

Google Apps

Google Apps Overview

Google Apps™ is a suite of on-demand communication and collaboration services hosted by Google and designed for business users. Salesforce integrates key Google Apps services and provides several AppExchange apps that enhance and customize Google-related functionality.

The following services for Google Apps are integrated with Salesforce and require a simple activation by a Salesforce administrator:

Add Google Docs to Salesforce

Google Docs™ allows you to create on-demand documents, spreadsheets, and presentations, edit them in your browser, and work together in real time with other collaborators. When the Add Google Docs to Salesforce service is activated, you can:

- Use the Google Docs, Notes, & Attachments or Google Docs & Attachments related list on any Salesforce record to create, edit, or view Google docs and associate them to a record.
- Share a Google doc with any Google Apps user in your organization.
- Associate Google docs with Salesforce records even when you are not working in Salesforce by using the **Add Google Doc to Salesforce** browser button.
- Add Google docs to Salesforce CRM Content, which allows you to manage all types of content in a centralized location.

Gmail to Salesforce

Gmail™ is a Web-based email application that operates on all standard browsers and can be used with your company's domain. Use Gmail to Salesforce to automatically log emails you send from your Gmail account as activities on lead and contact records in Salesforce.

Gmail Buttons and Links

Gmail Buttons and Links adds **Gmail** links next to email fields on all records and adds **Compose Gmail** buttons in Activity History related lists on leads and contacts. When you click a Gmail link or the **Compose Gmail** button, Salesforce automatically logs you into your Gmail account and automatically populates the **To** field. If Gmail to Salesforce is activated, Salesforce also populates the **BCC** field with your Email to Salesforce address.

Installing the Add Google Doc to Salesforce Browser Button

A browser button is an applet, or small computer application, that provides one-click functionality similar to a bookmark. The **Add Google Doc to Salesforce** browser button allows you to associate a Google doc with several Salesforce records at once, even when you are not working in Salesforce. To use this browser button, your administrator must enable the Add Google Doc to Salesforce and you must install the browser button in your browser.

You can access the **Add Google Doc to Salesforce** browser button on the Contribute tab in Salesforce CRM Content or on a record detail page:

1. Display any record in Salesforce that has a Google Docs, Notes, & Attachments or Google Docs & Attachments related list on the record detail page.
2. Choose **Add Existing** from the **Add Google Doc** drop-down button in the Google Docs, Notes, & Attachments or Google Docs & Attachments related list. If the related list contains a Google doc, you can also click **Edit** next to the Google doc.
3. Click **Get the browser button** at the bottom of the page.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

 **Note:** Because Customer Portal and partner portal users do not have access to the Google Docs, Notes, & Attachments or Google Docs & Attachments related list in the portal, portal users can only obtain the browser button from the Contribute tab in Salesforce CRM Content.

If you use more than one type of browser, for example Microsoft® Internet Explorer and Mozilla® Firefox, install the browser button in each browser. Google Chrome™ is not supported for the browser button. The instructions for installing the browser button depend on your browser. In Firefox, drag the browser button to your Bookmarks Toolbar. In Apple® Safari, drag the browser button to your Bookmark Bar. In Internet Explorer:

 **Note:** The instructions may vary slightly based on your version of Internet Explorer.

1. Right-click the browser button and choose **Add to Favorites...** from the Add Google Doc to Salesforce page.
2. Save the browser button in the Links folder and click **Add**.
3. In your browser menu bar, click **View > Toolbars** and ensure that the Links toolbar is visible.
4. Close and restart your browser. The browser button displays in your Links toolbar.

 **Note:** If you change your personal language setting in Salesforce and want to change the language on the browser button also, you must delete and reinstall the browser button.

[Associating Google Docs with Salesforce Records](#)

Using Google Docs in Salesforce

Use Google Docs™ to create and share on-demand documents, presentations, and spreadsheets ("Google docs") and see your changes in real time as you collaborate with other users. Because your content is stored within Google, there is no need to manage versions or send attachments by email—simply log in with your Google Apps account and view the current document or its revision history.

Salesforce and Google Apps allows you to integrate Google Docs with Salesforce. The Docs home page in your Google Apps account lists all the Google documents, presentations, and spreadsheets that you have created or that other Google Apps users have shared with you.

For information about Google Docs, refer to [Google's online help](#).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

Using Google Docs in Salesforce

- "Read" on the appropriate record type
- AND
- Google Apps account

Adding Google Docs to Salesforce

 **Note:** To use a Google Apps service in Salesforce, you must be logged in to your Google Apps business account. Business accounts use your organization's domain; for example, *john.doe@company.com*. If you are unsure of your Google Apps username and password, contact your administrator.

Salesforce offers three methods for creating new Google docs and associating them with Salesforce records:

- You can create a Google doc from any detail page. The doc is automatically associated with the record and is visible to anyone with access to both the record and the Google doc.
- You can create a Google doc from the Docs home page in your Google Apps account and associate the doc to one or more Salesforce records or Salesforce CRM Content libraries using the **Add Google Doc to Salesforce** browser button.
- If Salesforce CRM Content is enabled, you can create a Google doc from the Contribute tab to associate it with a Salesforce CRM Content library.

 **Tip:** For information about using Google Docs, refer to [Google's online help](#).

Adding New Google Docs to a Salesforce Record

1. Display the record you want linked to the new Google doc.
2. On the Google Docs, Notes, & Attachments related list or the Google Docs & Attachments related list, click **Add Google Doc** and choose **New Document**, **New Spreadsheet**, or **New Presentation**.
3. To create a blank Google doc:
 - a. After choosing a doc type from the Add Google Doc drop-down button, choose `Create as a blank document`, `Create as a blank spreadsheet`, or `Create as a blank presentation`. The name of the radio button depends on which type of Google doc you chose to create.
 - b. Enter a name for the document, spreadsheet, or presentation.
 - c. Click **Create Google Doc**. The blank document displays with the name you assigned. You can begin editing your doc; it is automatically associated with the selected record.

 **Tip:** While you have your Google doc open, remember to share it with other Google Apps users in your organization. Only users with access to the Google doc in their Google Apps account can view the doc from the record detail page.
4. To create a new Google doc by converting another file format to Google Docs:
 - a. After choosing a doc type from the Add Google Doc drop-down button, choose `Create using an existing file`.
 - b. Select the file you want to convert. Salesforce can convert the following file types to Google docs:
 - Microsoft Word® (.doc), text (.txt), rich text format (.rtf), OpenDocument text (.odt), or StarOffice® document (.swx) files up to 500 KB each
 - Microsoft Excel® (.xls), comma-separated value (.csv), or OpenDocument spreadsheet (.ots) files up to 1 MB each
 - Microsoft PowerPoint® (.ppt or .pps) files up to 10 MB each
 - c. Enter a name for the document, spreadsheet, or presentation.
 - d. Click **Create Google Doc**. The file you uploaded is converted to a Google document, presentation, or spreadsheet. You can begin editing your doc; it is automatically associated with the selected record.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

Creating a Google doc and linking it to Salesforce records:

- "Edit" on the appropriate record type
- AND
- Google Apps account

 **Tip:** While you have your Google doc open, remember to share it with other Google Apps users in your organization. Only users with access to the Google doc in their Google Apps account can view the doc from the record detail page.

To link an existing Google doc to a record, see [Editing Google Doc Links](#).

Creating Google Docs from the Docs Home Page

The Docs home page in your Google Apps account lists all the Google docs you have created with your Google Apps account or that other users have shared with your account. You can access the Docs home page by logging into your Google Apps account and navigating to the Docs home page. If the [Add Google Doc to Salesforce browser button is installed](#) in your browser, create a Google doc and click the browser button to associate the Google doc with Salesforce records or libraries. For more information, see [Associating Google Docs with Salesforce Records](#).

Adding New Google Docs to a Salesforce CRM Content Library

Create a new Google doc and publish it into a library, sharing that document with other members of that library.

1. On the Libraries tab, choose **New Document**, **New Spreadsheet**, or **New Presentation** from the Add Google Doc drop-down button. You may be prompted to log in to Google Apps.
2. Enter a name for your document, spreadsheet, or presentation and click **Create Google Doc**. The blank Google doc opens and you can begin adding your text. The Save or Publish Content dialog in Salesforce CRM Content also opens.
3. In the Save or Publish Content dialog:
 - a. Optionally, provide a description of your Google doc. The description provides at-a-glance information for users who view the doc's content details page in Salesforce CRM Content.
 - b. Choose a library. If you do not want to put the doc in a public library, for example if the doc is still in progress, choose **Save in my private library**.
 - c. Optionally, choose a language. The `Language` drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.
 - d. To publish the content on behalf of another author, choose that author from the drop-down list.
 - e. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
 - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the `Tags` field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the `Tags` field automatically.
 - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the `Tags` field automatically.
 - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
 - You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
 - Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.
 - f. If multiple record types are available, choose one from the drop-down list. The record type determines which custom fields appear for you to categorize and define your content.

- g. After completing any custom fields, click **Publish** to save the Google doc to its Salesforce CRM Content library, or click **Cancel** to save the doc to your private library. From there you can delete the doc from Salesforce CRM Content or publish it later. Once a Google doc is published in Salesforce CRM Content, all library members can search for the doc and provide feedback such as comments and votes.

 **Note:** While you have your Google doc open, remember to share it with other Google Apps users in your organization. Only users with access to the Google doc in their Google Apps account can open the doc from Salesforce CRM Content.

SEE ALSO:

[Using Google Docs in Salesforce](#)

[Installing the Add Google Doc to Salesforce Browser Button](#)

Associating Google Docs with Salesforce Records

When you create, edit, or view a Google doc from your online Docs home page in your Google Apps account, click the **Add Google Doc to Salesforce** browser button to associate the Google doc with one or more Salesforce records.

If Salesforce CRM Content is enabled in your organization, you can also add the Google doc to a Salesforce CRM Content library. Including Google docs in Salesforce CRM Content allows users to access all types of content from a single location and apply Salesforce CRM Content functionality, such as votes, comments, and subscriptions, to Google docs.

To associate a Google doc with Salesforce records from the Docs home page:

1. Open a Google doc.
2. Click the **Add Google Doc to Salesforce** browser button.
3. In the `Add Google Doc To` field, enter your search criteria for the Salesforce record.
4. Select an object type from the drop-down list and click **Search**.
5. Optionally, filter your search results with the `Limit to items I own` checkbox.
6. In the search results, select one or more records and click **Add Google Doc to Selected Records**. You can also click any of the fields in the search-results list to view more information about the record(s).

To associate a Google doc with Salesforce CRM Content from the Docs home page:

1. Open a Google doc.
2. Click the **Add Google Doc to Salesforce** browser button.
3. In the Salesforce CRM Content message window at the top of the page, click **Publish your Google Doc into Salesforce CRM Content**. The message only displays if you are a member of a Salesforce CRM Content library and have a library permission that allows you to contribute content.
4. In the Describe and Publish window, add a title for your Google doc and, optionally, a description.
5. Choose a library.
6. Optionally, choose a language. The `Language` drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.
7. To publish the content on behalf of another author, choose that author from the drop-down list.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

Associating a Google doc with a Salesforce record:

- "Read" on the appropriate record type
- AND
- Google Apps account

8. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
 - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the **Tags** field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the **Tags** field automatically.
 - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the **Tags** field automatically.
 - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
 - You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
 - Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.
9. If multiple record types are available, choose one from the drop-down list. The record type determines which custom fields appear for you to categorize and define your content.
10. After completing any custom fields, click **Publish**. All library members can now search for this doc and provide feedback such as comments and votes.

 **Note:** While your Google doc is open, remember to share it with other Google Apps users in your organization. Only Google Apps users with whom the doc is shared can view and edit the doc.

Editing Google Doc Links

 **Note:** To use a Google Apps service in Salesforce, you must be logged in to your Google Apps business account. Business accounts use your organization's domain; for example, *john.doe@company.com*. If you are unsure of your Google Apps username and password, contact your administrator.

You can associate an existing Google doc with a Salesforce record by adding the name and URL of that Google doc to the record. An existing Google doc is one that you already have access to on your Google Apps account but is not already associated with the record you are viewing.

 **Note:** To add an existing Google doc to a Salesforce CRM Content library, see [Contributing Google Docs to Salesforce CRM Content](#).

To add an existing Google doc to a record:

1. Display the record you want to associate with the Google doc.
2. On the Google Docs, Notes, & Attachments or Google Docs & Attachments related list, click **Add Google Doc** and choose **Add Existing**.
3. Enter a **Name** for the Google doc and its **URL**.
4. Click **Save**.

 **Tip:** You can find the URL by clicking **Take me to Google Docs**.

Collaborate with Partners and Customers

Chatter Customer Groups

About Chatter Customers in Private Groups

Chatter customers are users outside your company's email domains who can only see groups they're invited to and interact with members of those groups; they can't see any Salesforce information.

Chatter customers:

- Can only be added to Chatter if:
 - A manager or owner of a group that [allows customers](#) invites them to the group.
 - An administrator adds them in Setup by entering `Users` in the `Quick Find` box, then selecting **Users**.
- Can only see:
 - Groups they belong to.
 - People in groups they belong to. Customers only see limited profiles including photo, name, title, email, common group memberships, common files, and activity statistics and influence. They can't post to profiles.
 - Files shared to groups they belong to.
- Can't see:
 - Records or other Salesforce information, even in search results.
 - Topics, including topics in the feed, the topics list, topic detail pages, Recently Talked About, and Trending Topics. (Customers can see hashtag (#) topics.)
 - Recommendations and can't be recommended to others. Additionally, groups that allow customers can't be recommended.
- Are identified as a customer in profiles and groups they belong to. Customers and groups with customers are easily identified by the orange upper left corner of their photo.
- Have limited profiles, including name, photo, title, company, email, feed, group membership, file ownership, and activity statistics and influence.
- Can't be followed. Additionally, customers can't follow people or files.
- Can be group members and managers. If the customer is a manager, they will be able to see users who request to join the group, even if they aren't in other common groups, and approve requests.
- Can't own, create, delete, moderate, join, or ask to join groups.
- Can invite people that they're in common groups with to join groups that they manage.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Performance
- Unlimited
- Contact Manager
- Developer

- Can't invite people inside your company's domain whose profiles they can't see.
- Can't [chat](#) on page 2829 with other users.

 **Note:**

- When you invite someone as a customer to your group, they are given a unique username and password to log in to this group within your organization, even if they're already a member of another Salesforce organization. They will not be able to use other Salesforce logins to access your customer group.
- If a customer has an issue logging in to the group, verify that they are using the username and password from the welcome email they received after registering for the group. If the problem persists, ask your administrator for help.
- If a customer loses their password, they can use the Forgot Password option to reset it. If they don't have their username, they should contact the administrator of the organization in which they're a customer to recover it.

Considerations for Mobile Users

Chatter customers are able to log in and use the Salesforce1 apps and the Chatter Mobile for BlackBerry app. The same restrictions are applied to customer users as when using Chatter on the Web.

SEE ALSO:

[Chatter Groups](#)

[Adding or Removing Customers in Chatter Groups](#)

Adding or Removing Customers in Chatter Groups

If customer invitations are enabled for your organization, you can add, remove, and invite customers in private groups you own or manage that [allow customers](#).

1. Navigate to a group detail page.
2. To add people who aren't already customers in your company, click **Invite People**, or **Add/Remove Members** > **Invite them to Salesforce Chatter!**. Enter email addresses separated by commas, and an optional message, and click **Send**.

When someone accepts your invitation, they join Chatter and become a member of the group.

3. To add people who are already customers in your company, click **Add/Remove Members**, then:
 - Search using the **Find People** search box.
 - Toggle between **Members** of the group and **Everyone** in your company.
 - Use the **Next** and **Previous** links to see more of the list.
 - Click **Add** to add a customer, or **x** to remove a customer.
 - Click **Done** when you're finished.

 **Note:**

- When you invite someone as a customer to your group, they are given a unique username and password to log in to this group within your organization, even if they're already a member of another Salesforce organization. They will not be able to use other Salesforce logins to access your customer group.
- If a customer has an issue logging in to the group, verify that they are using the username and password from the welcome email they received after registering for the group. If the problem persists, ask your administrator for help.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Enterprise
- Professional
- Performance
- Unlimited
- Contact Manager
- Developer

- If a customer loses their password, they can use the Forgot Password option to reset it. If they don't have their username, they should contact the administrator of the organization in which they're a customer to recover it.

[View Chatter Group Members](#)

Sharing Files via Link

Share a file with anyone by creating a file link and sending it via email or IM. Creating a link generates an encrypted URL that you can send to any recipient, such as leads, customers, partners, and coworkers, inside or outside of your company. When your recipients click the link, they see a web-based version of the file that they can easily view and download. Sharing via link is on by default for most organizations that have Chatter. Administrators can enable sharing via link by enabling these permissions:

1. From Setup, enter *Content Deliveries* in the Quick Find box, then select **Content Deliveries**. Select **Enable content deliveries** and **Enable Creation of Content Deliveries for Chatter Files**.
2. From Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets**. Select a permission set, click **System Permissions**, and select **Create and Share Links to Chatter Files**.
3. From Setup, enter *Profiles* in the Quick Find box, then select **Profiles**. Select a profile, click **Edit**. In **General User Permissions**, select **Create and Share Links to Chatter Files**. You don't need this permission for files in a shared Salesforce CRM Content library. Instead, complete steps 1 and 2 and then ensure the user is a library member and that **Deliver Content** is checked in the library permission definition.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Group
- Enterprise
- Professional
- Performance
- Unlimited
- Contact Manager
- Developer

Create and share a file link:

1. Start by sharing the file from one of these locations:
 - On the Files page—Click **Upload a file**, click **Browse** and select a file from your computer, then click **Share via link > Upload**.
 - On the Home page—Click **Create New > File**, click **Browse** and select a file from your computer, then click **Share via link > Upload**.
 - On a file detail page—Click  **File Sharing Settings > Via link**.
 - On the Sharing Settings dialog box—Click **Anyone with link** from the Share with list.
 - Next to the file on the Files page, the Files Owned by list, or the Group Files list—Click  **> Share via link**.
 - Next to the file in a feed or on a file hover—Click **More Actions > File Sharing Settings**, then click **Anyone with link** from the Share with list.
 - In your Salesforce Files Sync folder on your desktop—Right-click on a file, hover on **Salesforce Files Sync**, then click **Share via link**.
2. Click **Copy** if available (or copy the link manually), and paste the link into an email or IM. File link recipients can only view and download files. They can't be collaborators.

Unless the file was already shared with your company, it's privately shared and displays the privately shared icon (). It's not posted anywhere and only the people you specifically shared it with can find and view it. If it was already shared with your company, it retains the your company icon () and all Chatter users in your company can find and view it.

On the Sharing Settings dialog box, click  next to a link to stop sharing it. Anyone with the link will no longer be able to access the file.

 **Note:**

- Documents from the Documents tab and attachments from the Notes and Attachments related list aren't listed on the Files tab and can't be shared in Chatter.
- The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

[Creating Content Deliveries](#)

Content Deliveries

Creating Content Deliveries

A *content delivery* allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. Content deliveries are available in Salesforce Classic only. However, Lightning Email generates delivery-based links as email attachments for Lightning Experience users who have access to the Content Deliveries feature.

A content delivery can be created from the Content Deliveries related list on most Salesforce objects. Salesforce CRM Content users can also create a content delivery from the content details page or the Related Content related list.

To create a new content delivery:

1. From the Content Deliveries related list, Related Content related list, or the content details page, click **Deliver Content**.
2. Upload a file or confirm the file name. If you are a Salesforce CRM Content user, search for the content in your libraries that you want to deliver. Salesforce CRM Content users can search for content in [shared libraries](#) or a [personal library](#).
3. Optionally, modify the `Delivery Name` field. This is the name that identifies your content delivery in Salesforce. We recommend using a name that will make the delivery easily distinguishable from other deliveries on the same record. The default delivery name includes the file name and today's date.
4. Select the delivery methods that determine how your content can be viewed. The options that appear depend on the file format you uploaded.
 - Choose `Allow Recipient to View in the Browser` to create an online version of the file that recipients can view in their browser.
 - Choose `Allow Recipient to Download as [file type] file` to allow the recipient of your content delivery to view the content in its original format. For example, if you uploaded a Microsoft® Word file, this field will be `Allow download as .doc file`.

 **Note:** If a preview of the file doesn't exist in Salesforce, users can download the delivered file regardless of whether or not downloading is allowed. File previews are made the first time they are requested in Salesforce, but not before. Viewing a file's detail page or posting it to a feed generate file previews.

 - Choose `Allow Recipient to Download as PDF` to allow recipients to download a .pdf version of the file. This option is only available for Microsoft® PowerPoint, Word, and Excel files.
5. Select `Notify Me of First View or Download` if you want to receive an email the first time your recipient clicks the content-delivery URL.
6. If the content you are delivering is time-sensitive, select the `Remove Access to Content` on checkbox and enter an expiration date. By default, the expiration date is 90 days from the current date. After creating your content delivery, you can change the expiration date at any time on the delivery detail page.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Salesforce CRM Content available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create content deliveries from a shared library in Salesforce CRM Content:

- Member of the library
- AND
- "Deliver Content" checked in your library permission definition

To create content deliveries from a personal library in Salesforce CRM Content:

- "Deliver Uploaded Files and Personal Content" checked in your general permission definition

To create content deliveries (non-Content user):

- "Deliver Uploaded Files and Personal Content" checked in your general permission definition

7. Optionally, select `Require a Password to Access Content`. When you create the content delivery you will receive a password to include with the delivery URL that you send to your recipients. The password is available for the life of the delivery on the delivery detail page.
8. Optionally, use the lookup to associate your content delivery with a Salesforce record. The record you were viewing when you clicked **Deliver Content** is selected by default.
9. Click **Save & Next**. Your delivery will usually be ready within a few moments, but you can click **Notify Me** to exit the content delivery wizard and be notified via email when your content delivery is ready.
10. If you did not exit the content delivery wizard, click **Preview** to verify that you are satisfied with the delivery.
 -  **Important:** Formatting in the original file may not display correctly in the online version. If you chose `Allow Recipient to View in the Browser`, preview your content delivery before sending its URL to your recipients. If you are not happy with the quality of the online version, click **Previous** and choose to make your content available in its original file format or a PDF only.
11. Copy and paste the delivery URL and, if applicable, its password into an email or instant message for delivery. The URL is available on the delivery detail page. For more information, see [Viewing and Editing Content Deliveries](#).

SEE ALSO:

[Sharing Files via Link](#)

Viewing and Editing Content Deliveries

On the Content Deliveries related list or the Content Deliveries list page, click the name of a content delivery to open the detail page.

Viewing Content Delivery Details

The delivery detail page provides all the information associated with a content delivery, including the number of times the delivery has been viewed, and the delivery settings. The URL providing access to the content delivery is visible only if you have access to the content or to a record associated with the content, or are the content delivery owner. For a description of each field, see [Content Delivery Fields](#).

Editing Content Delivery Details

Click **Expire Now** to immediately remove access to the content delivery. Click **Edit** to modify details such as the delivery methods, expiration date, or the record the delivery is associated with. For a description of each field, see [Content Delivery Fields](#).

Deleting Content Deliveries

Click **Delete** to remove access to the content delivery and delete the delivery record from Salesforce. Salesforce CRM Content users cannot delete files that are associated with a content delivery until the content delivery is deleted.

Tracking Content Deliveries

Each time a content delivery's URL is opened, Salesforce records the event as a *view*. The Views related list on the content delivery detail page lists every view associated with the delivery. Information about the view includes the date and time, whether the view was by an internal (Salesforce) user, and whether the view included a download. If the content delivery provided the ability to download the file in its original file format or as a PDF file, the `FileDownloaded` flag indicates that a download occurred, but you cannot distinguish between file types.

SET UP AND MANAGE SALESFORCE COMMUNITIES

Salesforce Communities Overview

Communities are branded spaces for your employees, customers, and partners to connect. You can customize and create communities to meet your business needs, then transition seamlessly between them.

Communities are a great way to share information and collaborate with people outside your company who are key to your business processes, such as customers or partners.

You can use Communities to:

- Drive more sales by connecting your employees with your distributors, resellers, and suppliers
- Deliver world-class service by giving your customers one place to get answers
- Manage social listening, content, engagement, and workflow all in one place

You can create multiple communities within your organization for different purposes. For example, you could create a customer support community to reduce support costs, or a channel sales community for partner deal support, or you could have a community specifically dedicated to an upcoming event.

Communities can be based on standard Salesforce functionality and tabs, or one of our preconfigured templates. Communities may contain a subset of features and data available in your internal Salesforce organization and can be customized to use your company branding. In addition, you can choose which members from your company and which customers, partners, or other people outside your company can join.

Communities live inside your organization and are easily accessed from a drop-down menu in the top left corner of Salesforce or in the Salesforce1 Mobile Browser App. Use this menu to switch between your communities and your internal Salesforce organization.

Plan Your Implementation

Planning Ahead

It helps to make a few key decisions well in advance of setting up your community and customizing it.

- Determine the business requirements of the community. What types of users are you creating the community for? You could start by identifying the main use cases you want to support, such as customer support, self-service, or marketing.
- Estimate the size of the community. This will help determine your licensing requirements.
- Decide if you want your community content to be publicly available to guest users without licenses

- Plan the look-and-feel of your community and then evaluate the available customization options. With Communities, you have the following choices:
 - **Use Visualforce to customize the out-of-the-box community tabs:** Communities comes with some out-of-the-box branding themes that you can use along with standard Salesforce tabs in your community. In addition, you can use Visualforce to extensively customize your community's appearance and leverage all the capabilities of the Force.com platform. This option requires programming capabilities.
 - **Use Community Builder with templates:** Community Builder comes with rich, stylized templates for communities targeted at customer support scenarios. Templates offer easy customization via an intuitive GUI and allow for a quick rollout of your community with minimal configuration in Site.com. This option doesn't require programming experience or knowledge of the Force.com platform.

For more information about these options, see [Choosing Between Community Builder and Force.com Sites](#)

- Determine if any of the [community limits](#) will affect your implementation.

Set Up and Maintain Your Community

Enable Salesforce Communities

Enabling Communities enables the new user interface theme, which updates the look and feel of Salesforce.

 **Note:** Once you enable Communities, you can't turn it off.

If your organization's access to Communities is suspended for non-payment of fees due, all of your communities are deactivated, including those in `Preview` status. When Communities is enabled again, all communities are in `Inactive` status. You can activate these communities, but can't return them to `Preview` status.

1. From Setup, enter `Communities Settings` in the `Quick Find` box, then select **Communities Settings**.

 **Note:** If you don't see this menu, Communities may not be enabled for your organization. Contact your Salesforce account executive.

2. Select **Enable communities**.
3. Select a domain name to use for your communities, then click **Check Availability** to make sure it's not already being used.

We suggest that you use something recognizable to your users, such as your company name. Although the domain name is the same for all communities, you create a unique URL for each community during the creation process. For example, if your domain is `UniversalTelco.force.com` and you're creating a customer community, you can designate the URL as `UniversalTelco.force.com/customers`.

 **Important:** Keep in mind that you can't change the domain name after you save it.

You can designate a completely custom domain by entering it in on the Domain Management page. From Setup, enter `Domains` in the `Quick Find` box, then select **Domains**.

4. Click **Save**.

You can now [create communities](#).

EDITIONS

USER PERMISSIONS

To enable Communities:

- "Customize Application"

The “Create and Set Up Communities” permission is required to create and customize communities. It also gives the user the ability to manage the Site.com site associated with the community.

After enabling Communities, we recommend that you give the “View Global Header” permission to internal users who need access to the community. The global header allows users to easily switch between their internal organization and any communities they’re a member of.

It also displays an extra menu in Community Management for administrators and community managers that they can use to switch between Community Management, Community Builder, Force.com, and Site.com Studio.

SEE ALSO:

[Getting Started With Salesforce Communities](#)

[Can I use the same domain name for my Force.com Sites and my Communities?](#)

[Who Can See What in Communities](#)

Update Org-Wide Community Settings

Set the Default Number of Community Roles

Set the default number of roles created when adding partner or customer accounts to communities.

If your community is set up with Partner Community or Customer Community Plus user licenses, these settings apply. By setting the number of roles, you can limit the number of unused roles. The limit is three roles; the system default is one.

For example, if three partner roles are currently created when an account is enabled for your community—Executive, Manager, and User—but you need only the User role for new accounts, you can reduce the number to one role. For better performance, we recommend setting this value to 1. You can then use Super User Access to grant specific users access to data owned by other users in their account.

To set the number of roles:

1. From Setup, enter *Communities Settings* in the Quick Find box, then select **Communities Settings**.
2. Select the number of roles per account.
 - a. If you're using Partner Community licenses, set the `Number of partner roles`.
 - b. If you're using Customer Community Plus licenses, set the `Number of customer roles`.
3. Click **Save**.

The number of roles for existing accounts isn't affected by this setting.

SEE ALSO:

[Portal Roles Limit](#)

[Create Communities Users](#)

Enable Super User Access in Communities

Enable super user access so that partner users in communities can access additional records and data.

If your community is set up with Partner Community user licenses, this setting applies. You can also grant super user access to users with Customer Community Plus licenses. For more information, see [Grant Super User Access to Customer Users in Your Community](#) on page 2951.

Granting super user access to external users in your community lets them access additional data and records, regardless of sharing rules and organization-wide defaults. Super users have access to data owned by other partner users belonging to the same account who have the same role or a role below them in the role hierarchy. Super user access applies to cases, leads, custom objects, and opportunities only, but external users have access to these objects only if you exposed them using profiles or sharing and added the tabs to the community during setup.

1. From Setup, enter *Communities Settings* in the Quick Find box, then select **Communities Settings**.
2. Select `Enable Partner Super User Access`.

3. Click **Save**.

You can now [assign super user access](#).

To disable super user access, deselect `Enable Partner Super User Access`. If you re-enable this feature, all users who were assigned super user access before the feature was disabled will automatically get super user access again.

SEE ALSO:

[Create Communities Users](#)

Enable Report Options for External Users

Allow external users with Partner Community or Customer Community Plus licenses with the “Run Reports” permission, to view and modify report options so that they can summarize and filter reports.

1. From Setup, enter `Communities Settings` in the `Quick Find` box, then select **Communities Settings**.
2. Select `Enable report options for external users`.
3. Click **Save**.

External users with Partner Community or Customer Community Plus licenses that have the “Run Reports” permission, now see report options on the run report page.

SEE ALSO:

[The Report Run Page](#)

Sharing Set Overview

Grant portal or community users access to records that are associated with their accounts or contacts using sharing sets, based on their user profiles.

Previously, a sharing set granted access to any record that has a lookup field to an account or contact that matches the user’s account or contact. With Spring ’14, you can also determine how access is granted using an access mapping in the sharing set, which supports indirect lookups from the user and target record to the account or contact. You can determine the objects to use in the access mapping, and they must both either point to an account or contact.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To enable report options for external users:

- “Customize Application”

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

For example, you might want to use a sharing set if you would like to:

- Grant users access to all cases related to their account or contact record.
- Grant users access to all cases related to a parent account or contact that is identified on the user's account or contact record.

You can use sharing sets to grant access to accounts, contacts, cases, service contracts, users, and custom objects. Sharing sets can be used with these user profiles:

- Authenticated Website
- Customer Community User
- Customer Community Login User
- High Volume Customer Portal
- High Volume Portal
- Overage Authenticated Website User
- Overage High Volume Customer Portal User

The following example shows an access mapping on a sharing set, which grants portal or community users access to all cases associated with the entitlements on their account, even if they are not directly associated with the case.

Example:

1. Account lookup on portal or community user
2. Related account on entitlement
3. Entitlement lookup on case

Note: Portal or community users gain access to all order entitlements and order items under an account to which they have access. To share records owned by high-volume portal users, use a share group instead.

- [Granting High-Volume Portal Users Access to Records](#)
- [Granting High-Volume Portal or Community Users Access to User Records](#)
- [About High-Volume Community Users](#)
- [Grant High-Volume Community Users Access to Records](#)
- [Share Records Owned By High-Volume Community Users](#)

About High-Volume Community Users

High-volume community users are limited-access users intended for organizations with many thousands to millions of communities users.

Unlike other community users, high-volume community users don't have roles, which eliminates performance issues associated with role hierarchy calculations. High-volume community users include the Customer Community, High Volume Customer Portal, and Authenticated Website license types.

Characteristics

High-volume community users:

- Are contacts enabled to access a community.
- Are assigned to the Customer Community, High Volume Customer Portal, or Authenticated Website license.
- Only share the records they own with Salesforce users in sharing groups.

Access to Records

High-volume community users can access records if any of the following conditions are met:

- They have "Update" access on the account they belong to.
- They own the record.
- They can access a record's parent, and the organization-wide sharing setting for that record is Controlled by Parent.
- The organization-wide sharing setting for the object is Public Read Only or Public Read/Write.

Administrators can create sharing sets to grant high-volume community users additional access to records; see [Grant High-Volume Community Users Access to Records](#).

Limitations

- High-volume community users can't manually share records they own or have access to.
- You can't transfer cases from non-high-volume community users to high-volume community users.
- High-volume community users can't own accounts.
- You can't add case teams to cases owned by high-volume community users.
- You can't include high-volume community users in:
 - Personal groups or public groups.
 - Sharing rules.
 - Account teams, opportunity teams, or case teams.
 - Salesforce CRM Content libraries.

These limitations also apply to records owned by high-volume community users.

- You can't assign high-volume community users to territories.

Grant High-Volume Community Users Access to Records

Grant high-volume community users access to records using sharing sets.

A sharing set grants high-volume users access to any record associated with an account or contact that matches the user's account or contact. You can also grant access to records via an access mapping in a sharing set, which supports indirect lookups from the user and target record to the account or contact. For example, grant users access to all cases related to another account that's identified on the users' contact records.

Sharing sets apply across all communities a high-volume community user is a member of. High-volume community users have either the Customer Community or High-Volume Portal User license. For more information, see "Sharing Set Overview" in the Salesforce Help.

To grant users access to selected users in the same community, you would typically create a sharing set if you deselected the `Community User Visibility` checkbox on the Sharing Settings page.

1. From Setup, enter *Communities Settings* in the `Quick Find` box, then select **Communities Settings**.
2. In the Sharing Sets related list, click **New** to create a sharing set, or click **Edit** next to an existing sharing set.
3. In the Sharing Set Edit page, fill in the **Label** and **Sharing Set Name** fields. **Label** is the sharing set label as it appears on the user interface. **Sharing Set Name** is the unique name used by the API.
4. Enter a description.
5. Select the profiles of the users to whom you want to provide access.
6. Select the objects you want to grant access to.

The Available Objects list excludes:

- Objects with an organization-wide sharing setting of Public Read/Write
- Custom objects that don't have an account or contact lookup field

7. In the Configure Access section, click **Set Up** or **Edit** next to an object name to configure access for the selected profiles, or click **Del** to remove access settings for an object.

 **Note:** Objects with **Set Up** in the Action column aren't configured for high-volume user access. Until you configure an object, high-volume users have limited or no access to its records.

8. Grant access based on an account or contact lookup:
 - Select a value in the User drop-down list to determine the account or contact lookup on the user.
 - Select the a value in the Target Object field to determine the account or contact lookup on the target object.

For example, to grant access to all cases associated with an account identified on the user's contact record, select `Contact.Account` and `Account` respectively.

 **Note:** Both selected fields must point to either an account or contact. For example, `Contact.Account` and `Entitlement.Account` both point to an account.

9. Choose an access level of Read Only or Read/Write. (If the object's organization-wide sharing setting is Public Read Only, then only Read/Write is available.)
10. Click **Update**, then click **Save**.

USER PERMISSIONS

To grant high-volume community users access to records:

- "Customize Application"

After creating a sharing set, [create share groups](#) to give other users access to records created by high-volume community users.

SEE ALSO:

[About High-Volume Community Users](#)

Share Records Owned By High-Volume Community Users

Share groups allow you to share records owned by high-volume community users with internal and external users in your communities.

High-volume users are limited-access users intended for organizations with many thousands to millions of external users. Unlike other external users, high-volume users don't have roles, which eliminates performance issues associated with role hierarchy calculations. Because high-volume community users are not in the role hierarchy while Salesforce users are, a *share group* allows you to specify the Salesforce other external users who can access records owned by high-volume community users.

Share groups apply across communities.

To set up share groups for your communities:

1. From Setup, enter *Communities Settings* in the **Quick Find** box, then select **Communities Settings**.
2. In the Sharing Settings for High-Volume Community Users related list, click **Edit** next to an existing sharing set.
3. Click the Share Group Settings tab.
4. Click **Activate** to turn on the share group.

Activating the share group can take a while. An email is sent to you when the process finishes.

 **Note:** Deactivating a share group removes *all* other users' access to records owned by high-volume community users. An email isn't sent to you when the deactivation process finishes.

5. Click **Edit** to add users to the share group. You can add both internal users from your organization as well as external users from the same parent account as the high-volume user.
 - a. From the **Search** drop-down list, select the type of member to add.
 - b. If you don't see the member you want to add, enter keywords in the search box and click **Find**.
 - c. Select members from the Available Members box, and click **Add** to add them to the group.
 - d. Click **Save**.

To share records owned by high-volume community users to other users:

- "Customize Application"

Community Setup Basics

Create Communities Users

To allow an external user to access your community, enable the user's contact record as a customer user or partner user, depending on the user's license type. Your community can contain users with Partner Community, Customer Community, and Customer Community Plus licenses.

If your organization has person accounts, you can't use them as partner accounts or create partner users that are associated with them. You can use only business accounts as partner accounts.

1. To create partner users:
 - a. View the external account you want to create a user for.
 - b. Create a contact. Click **New Contact** from the Contacts related list. Fill in the appropriate details, then click **Save**.

 **Note:** A non-partner account can't own a partner contact.

Person accounts can't own partner users.

- c. On the contact detail page, click **Manage External User**, then **Enable Partner User**.

 **Note:** If you don't see the **Enable Partner User** button, ask your administrator to check whether it's included in the Contact page layout.

- d. Edit the user record for this external user.

- Select the Partner Community user license.
- Select the appropriate profile. Remember that profiles give users access to tabs in your community, so be sure that you choose a profile that has the appropriate tabs exposed.

 **Note:** The available profiles for external users are limited to the Partner Community User profile or profiles cloned from it. Unlike a standard user, the partner user role is automatically assigned based on the account name. The partner user role is a subordinate of the account owner's role. Therefore, all data for the partner user role rolls up to the partner account owner's role. If you disable a partner user, the partner user role becomes obsolete, and the data no longer rolls up to the partner account role.

- Deselect **Generate new password and notify user immediately** so that users don't receive a password before the community is activated. When you activate the community, the user receives a welcome email with the login information, as long as the [Send welcome email](#) option is selected for the community.

 **Note:** If you select this option but your organization doesn't have `Active` communities that the user is a member of, Salesforce doesn't send the email.

If `Send welcome email` is disabled for your community, the user doesn't receive an email with the username and password. You must manually send the information.

- e. Click **Save**.

- Unlimited
- Developer

USER PERMISSIONS

To create partner users:

- "Manage External Users"

To create customer users:

- "Manage External Users"

OR

"Edit Self-Service Users"

 **Important:** When creating customer users, the account that the new contact is associated with must have an account owner that is assigned a role.

To log in as an external user:

- "Manage Users"

AND

"Edit" on Accounts

 **Note:** Creating an external user with a Customer Community Plus license is similar to creating a partner user. On the contact record, select **Manage External User**, then **Enable Partner User**. Also, when editing the user record, you select the Partner Community User profile or a profile cloned from it.

2. To create customer users:

a. Create a contact.

b. On the contact detail page, click **Manage External User**, then **Enable Customer User**.

 **Note:** If you don't see the **Enable Customer User** button, ask your administrator to check whether it's included in the Contact page layout.

c. Edit the user record for this external user.

- Select the appropriate profile. The available profiles are limited to the Customer Community User profile and any profiles cloned from it.

Remember that profiles give users access to tabs in your community, so be sure that you choose a profile that has the appropriate tabs exposed.

- Deselect **Generate new password and notify user immediately** so that users don't receive a password before the community is activated. When you activate the community, the user receives a welcome email with the login information, as long as the [Send welcome email](#) option is selected for the community.

 **Note:** If you select this option but your organization doesn't have `Active` communities that the user is a member of, Salesforce doesn't send the email.

If `Send welcome email` is disabled for your community, the user doesn't receive an email with the username and password. You must manually send the information.

d. Click **Save**.

 **Note:** Customer Users don't see the Notes & Attachments related list on accounts or contacts.

To troubleshoot issues or ensure that the community is configured appropriately, on the contact detail page, click **Manage External User** and choose **Log in As Partner User** or **Log in as Customer User**. You must have Edit permission on Accounts to log in as a Partner User or Customer User. A new browser window opens and you are logged in to the community on behalf of the external user.

When you log in as an external user, you see the behavior that the external user sees. For instance, external users only see the community drop-down menu if they have access to more than one `Active` community. Also, if an external user who is only a member of one `Active` community is given the URL for `Preview` community, the user doesn't see the drop-down menu when in the `Preview` community.

 **Note:** As a security measure, when administrators are logged in as another user, they can't authorize OAuth data access for that user. For example, admins can't authorize OAuth access to user accounts, including single sign-on to third-party applications.

Consider the following when creating external users.

- External users can't be deleted. If you no longer want an external user to have access to a community, deactivate the user.

SEE ALSO:

[Add Members to Your Community](#)

[How do external community members get login information?](#)

[Reset An External User's Password for Communities](#)

Delegate External User Administration

You can delegate user administration to external users so that they can decide who should access the community.

External users who are delegated administrators can:

- Create external users
- Edit external users
- Reset passwords for external users
- Deactivate existing external users

You can grant delegated external user administration rights to users with Partner Community, Customer Community Plus, Gold Partner, Enterprise Administration, and Customer Portal Manager licenses.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles** and click a custom profile.

You can't edit standard profiles.

You can add **Delegated External User Administrator** to a permission set that you assign to a standard profile.

2. Click **Edit**.
3. Select **Delegated External User Administrator**.
4. Click **Save**.
5. Click **Edit** in the Delegated External User Profiles related list.
6. Select the profiles you want users with this profile to be able to administer.
7. Click **Save**.

Consider the following when setting up delegated external user administration.

- You can also grant delegated administration rights using permission sets.
- On the profile you're granting delegated administration rights to:
 - Add the "Create" and "Edit" permissions on contacts so that delegated administrators can create and update contacts related to their account.
 - Set the Accounts and Contacts tab settings to Default On so that delegated administrators can view the Accounts and Contacts tabs and easily manage contacts related to their accounts.
- [Add the Accounts and Contacts tabs to your community.](#)

USER PERMISSIONS

To manage external users:

- "Manage External Users"

To create, edit, and delete profiles:

- "Manage Profiles and Permission Sets"

- Set field level security and page layouts so that delegated external user administrators can access only the account and contact fields you specify.

SEE ALSO:

[Create Communities Users](#)

[Grant Super User Access to Partner Users in Your Community](#)

Grant Super User Access to Partner Users in Your Community

Partner Super User Access must be enabled in your Communities Settings before you can grant access to users. Use this information to grant super user access to users with Partner Community licenses. You can also grant super user access to users in your community with Customer Community Plus licenses. To learn more, see [Grant Super User Access to Customer Users in Your Community](#).

Granting super user access to external users in your community lets them access additional data and records, regardless of sharing rules and organization-wide defaults. Super users have access to data owned by other partner users belonging to the same account who have the same role or a role below them in the role hierarchy. Super user access applies to cases, leads, custom objects, and opportunities only, but external users have access to these objects only if you exposed them using profiles or sharing and added the tabs to the community during setup.

1. View the contact record for the user.
2. Click **Manage External Account**, then choose **Enable Super User Access**.
3. Click **OK**.

Grant Super User Access to Customer Users in Your Community

Enable super user access so that external users in communities can access additional records and data.

You can only grant customer super user access to users with Customer Community Plus licenses.

To grant super user access to users with Partner Community licenses, see [Grant Super User Access to Partner Users in Your Community](#).

The “Portal Super User” permission lets delegated external user administrators do the following for their own account:

- View, edit, and transfer all cases
- Create cases for contacts
- View and edit all contacts, whether communities-related or not
- View account details when they’re the contact on a case
- Report on all contacts, whether portal enabled or not, if the Reports tab is added to your community and the user has the “Run Reports” permission

Add the “Portal Super User” permission to a permission set and assign it to Customer Community Plus users so that they have access to their account and can view and edit all of its cases and contacts without having the ability to manage other external users.

1. From Setup, enter *Permission Sets* in the *Quick Find* box, then select **Permission Sets**.
2. Either create or clone a permission set.
3. In the App Permissions section, add the “Portal Super User” permission.
4. Click **Save**.
5. Assign the permission set to your Customer Community Plus users by clicking **Manage Assignments** and then adding the appropriate users.

Create Communities

The number of communities you can create for your organization is listed on the Communities page in Setup. *Inactive* communities don't count against this limit. If you want to increase the number of communities in your organization, contact your Salesforce account executive.

1. To start creating communities, from Setup, enter *Communities* in the *Quick Find* box, select **All Communities**, then click **New Community**.
The template wizard appears, with different template options for you to choose from.
2. Hover over a template to see more information about it.

Kokua

A visually rich, responsive self-service template that lets users search for and view articles or contact support if they can't find what they're looking for. Supports Knowledge and Cases.

Koa

A text-based, responsive self-service template that lets users search for and view articles or contact support if they can't find what they're looking for. Supports Knowledge and Cases.

Napili

A powerful, responsive self-service template that lets users post questions to the community, search for and view articles, and contact support agents by creating cases. Supports Knowledge, Cases, and Questions & Answers.

Aloha

A configurable App Launcher template that lets users quickly find applications and access them using single sign-on authentication. For more information, see [Getting Started with Community Templates for Salesforce Identity](#).

Salesforce Tabs + Visualforce

Standard Salesforce structure and tabs that you can customize using Visualforce. Supports most standard objects, custom objects and Salesforce1.

3. Hover over the template you want to use, and then click **Choose**.
4. If you selected Koa or Kokua, specify the categories and Company Name for your template, then click **Next**.

Category Group Name

This is the unique name of the data category group that contains the data categories for your site. The name reflects the hierarchy of categories that you've set up for your community and is used throughout the site to organize articles.

Top Level Category

This is the highest-level category that you want to display. Only the children of this category appear in the community. You can have several nested layers of categories above this category, but the page will show this category as the parent and show its subcategories as children.

Company Name

This is the name of your company as you want it to appear in the community header.

5. Enter a community name.

 **Note:** If you're creating multiple communities, keep in mind that community names may be truncated in the global header drop-down menu. Users can see up to 32 characters of the name, and the *Preview* and *Inactive* status indicators count toward that number. Make sure that the visible part of the name is distinctive enough for users to distinguish between multiple communities.

EDITIONS

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

6. Enter a unique value at the end of the URL field.

This value is appended to the domain you entered when [enabling communities](#) to create a unique URL for this community. For example, if your domain is `UniversalTelco.force.com` and you're creating a customer community, you can designate the URL as `UniversalTelco.force.com/customers`.

 **Note:** You can create one community in your organization that doesn't have a custom URL.

You can change your community name and URL after the community is activated, but users won't be redirected to the new URL. If these changes are necessary, be sure to inform your community members before making the change.

7. Click **Create Community**.

The community is created in `Preview` status.

8. On the confirmation page, click **Go to Community Management** to customize your community. If you chose a template other than `Salesforce Tabs + Visualforce`, you can customize your community in `Community Builder`.

When you create a community, default pages for login, self-registration, change password, forgot password, and your home page are set based on your community template. You can customize or change these default pages at any time in `Community Management`.

 **Important:** When you create a community, your profile is automatically added to the list of profiles that have access. As a result, all users in your organization with this profile can log in to the community once it's `Active`. If you don't want all users with your profile to have access, you can remove the profile and give yourself access through a different profile or permission set.

Create Your Community Using a Preconfigured Template

Create a community and select a template to apply to your community. Define your template and community properties in one place, then use Community Builder to finish designing and organizing your community.

1. From Setup, enter *All Communities* in the **Quick Find** box, then select **All Communities**, and then click **New Community**.
The Community Creation wizard appears with different template options for you to choose from.

2. Hover over a template to see more information about it.

Kokua

A visually rich, responsive self-service template that lets users search for and view articles or contact support if they can't find what they're looking for. Supports Knowledge and Cases.

Koa

A text-based, responsive self-service template that lets users search for and view articles or contact support if they can't find what they're looking for. Supports Knowledge and Cases.

Napili

A powerful, responsive self-service template that lets users post questions to the community, search for and view articles, and contact support agents by creating cases. Supports Knowledge, Cases, and Questions & Answers.

Aloha

A configurable App Launcher template that lets users quickly find applications and access them using single sign-on authentication. For more information, see [Getting Started with Community Templates for Salesforce Identity](#).

Salesforce Tabs + Visualforce

Standard Salesforce structure and tabs that you can customize using Visualforce. Supports most standard objects, custom objects and Salesforce1. Keep in mind that the Salesforce Tabs + Visualforce template is based on the standard Salesforce tab structure and doesn't work with Community Builder.

3. Hover over the template you want to use, and then click **Choose**.
4. If you selected Koa or Kokua, specify the categories and Company Name for your template.

Category Group Name

This is the unique name of the data category group that contains the data categories for your site. The name reflects the hierarchy of categories that you've set up for your community and is used throughout the site to organize articles.

Top Level Category

This is the highest-level category that you want to display. Only the children of this category appear in the community. You can have several nested layers of categories above this category, but the page will show this category as the parent and show its subcategories as children.

Company Name

This is the name of your company as you want it to appear in the header.

5. Click **Next**.
6. Enter the name and optional URL for your community.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance

- Developer

USER PERMISSIONS

To create, customize, or publish a community:

- "Create and Manage Communities"

To create article types and article actions:

- "Manage Salesforce Knowledge"

To create data categories:

- "Manage Data Categories"

Selecting this option automatically updates your community's settings with the URL for the custom pages you create in this step. You can override this login page with another login page in your community's settings. For detailed instructions on creating custom login, logout, and self-registration pages for your community, see [Getting Started with Communities](#).

7. Click **Create Community.**

The community is created in preview status.

8. On the confirmation page, click **Go to Community Management to customize your community.**

If you selected the Napili template, use Community Management to set the topics that appear in the navigation menu or that feature prominently on your home page.

Use Community Management to configure community settings such as your default login and registration pages, header and footer, and email templates.

To try out a different template, go back to Community Management and change your template selection. But don't worry—you can always switch back to the first template you chose. To switch back, set the home page back to its original URL in Site Configuration in Site.com Studio.

Important: When you create a community, your profile is automatically added to the list of profiles that have access. As a result, all users in your organization with this profile can log in to the community once it's **Active**. If you don't want all users with your profile to have access, you can remove the profile and give yourself access through a different profile or permission set.

[Community Builder Overview](#)

Customize Communities

You can customize your community at any time, but if you plan on making major changes, we recommend deactivating the community first. You can access community customization options in Community Management under **Administration**.

1. Access Community Management in either of the following ways.

- From the community, click  in the global header.
- From Setup, enter *All Communities* in the **Quick Find** box, then select **All Communities**. Then click **Manage** next to the community name.

2. Click **Administration**, then select the part of the community you want to customize:

-  **Important:** The options available in Community Management are based on your community template selection, permissions, and preferences. For example, if your community does not use topics, you will not see the Topics node. Some of the options in the following list may not be applicable in your community. To display all nodes, go to **Administration > Preferences** and enable **Show all settings in Community Management**.

- **Members**
- **Tabs**
- **Branding**
- **Login & Registration**
- **Emails**
- **Pages**
- **Preferences**
- **Settings**

-  **Note:** To perform advanced customizations, such as adding custom pages or pages that don't require login, from Community Management click the Community Management menu in the global header, then click either **Go to Force.com** or **Go to Site.com Studio** to go to the site associated with this community. If you used the Aloha, Koa, Kokua, or Napili templates, select **Go to Community Builder** to customize the community.

3. To share the community with stakeholders while it's still in Preview status, copy the URL displayed on the **Administration > Settings** page and share it.

This allows you to get their feedback, and take advantage of having early members who can post, comment, and share records so that members enter an active community from their first login.

Keep in mind that you can only share the URL with users who you added as members of the community.

After you finish your customizations, activate the community to make it available to members. If **welcome emails are enabled** when you activate, a welcome email is sent to all members. If any of those users are new portal users, their welcome email includes their username and password.

EDITIONS

Available in: Salesforce Classic

USER PERMISSIONS

To access Community Management:

- "Manage Communities" OR "Create and Set Up Communities"
- AND is a member of the community whose Community Management page they're trying to access

To customize administration settings or use Community Builder:

- "Create and Set Up Communities"
- AND is a member of the community whose Community Management page they're trying to access

Add Members to Your Community

Use profiles and permission sets to manage community membership during the setup process.

Using profiles and permission sets, you can:

- Grant or remove access for groups of users. Once you add a profile or permission set, all users assigned to that profile or permission set become members of the community.
- Enforce a membership policy. New users added to a profile or permission set that is already associated with a community automatically gain access.

Permission sets allow added flexibility for adding members. You can grant community access to a subset of users from the same profile, without needing to clone the profile.

Standard, Chatter, and portal profiles can be added to communities; Chatter customers, from private groups with customers, can't be added to communities even if they're assigned permission sets that are associated with communities.

 **Note:** Profiles and permission sets associated with communities can't be deleted from Salesforce. You must remove the profiles or permission sets from the communities first.

1. Access Community Management in either of the following ways.

- From the community, click  in the global header.
- From Setup, enter *All Communities* in the Quick Find box, then select **All Communities**. Then click **Manage** next to the community name.

2. Click **Administration > Members**.

3. To add members using profiles:

- a. To filter profiles, select a profile type from the drop-down menu. To search for a specific profile, enter a search term and click **Find**.
Search returns profiles for the selected filter.

 **Note:** Search results include profiles that are already part of the community.

- b. Select the user profiles you want to allow access to your community. Press CTRL to select multiple profiles.

c. Click **Add**. To remove a profile, select it and click **Remove**.

If you remove a profile from a community, users with that profile lose access to the community, unless the users are assigned permission sets or other profiles that are still part of the community. Their posts and comments still appear.

 **Important:** If you're an administrator and accidentally remove yourself from a community, you won't be able to access the Administration settings in Community Management. To add yourself back to the community or make other membership updates, [use the API](#).

4. To add members using permission sets:

- a. To search for a specific permission set, enter a search term and click **Find**.
- b. Select the permission sets you want to allow access to your community. Press CTRL to select multiple permission sets.
- c. Click **Add**.

If you remove a permission set from a community, users with that permission set lose access to the community, unless the users are associated with profiles or other permission sets that are still part of the community. Their posts and comments still appear even after they lose access.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

5. Click Save.

If the community is **Active** and [welcome emails are enabled](#), users with the profiles or permission sets you added receive a welcome email. The welcome email includes a username and a change password link if it is sent to an external user who hasn't logged in to a portal or community yet.

When the community is **Active**, welcome emails are sent and the community is discoverable by members. When a community is in **Preview** status, only members with the login URL can view the community. If a community is **Inactive**, only users with the "Create and Set Up Communities" permission can access it through the Community menu, regardless of membership.

There are additional options for granting access to your community:

- Enable self-registration so that external users can register on their own
- Enable authentication providers, such as Facebook, so that external users can log into the community without creating an account

For more information about these additional options, see [Customize Login, Logout, and Self-Registration Pages in Your Community](#).

SEE ALSO:

[Customize Communities](#)

[Enable the Global Header for Communities](#)

How do I update community membership using the API?

If you aren't a member of a community, you can't access Community Management to update administration settings, including membership. As an alternative, you can use the API and Data Loader to add yourself and others to a community.

 **Tip:** You can also use other data loaders to update your community membership such as Workbench.

1. Get the `networkId` for your community.

From Setup, enter *All Communities* in the **Quick Find** box, select **All Communities**, and then right-click your community URL and select **Inspect**. The `data-networkId` property provides your `networkId`.

2. Get the `profileId` or `permissionsetId` you want to add.

From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles** or **Permission Sets**. Click on the profile or permission set that you want to add. The ID is the last part of the URL.

For example, at *mycompany.salesforce.com/00aa11bb22*, the ID is *00aa11bb22*.

3. Create a .csv file with columns for `networkId` and `parentId`. For `parentId`, list the `profileId` or `permissionsetId` you want to add.**4. Open Data Loader and select the **Network Member Group** object. Specify the location of the .csv file you created and complete the Data Loader steps.**

Once you have successfully added members using Data Loader, the members will be able to access Community Management from the **Manage** link on the **All Communities** page in Setup.

 **Note:** In order to access Community Management, the member must also have "Create and Set Up Communities" or "Manage Communities" permission.

SEE ALSO:

[Insert, Update, or Delete Data Using Data Loader](#)

Add Tabs to Your Community

If you are using the Salesforce Tabs + Visualforce template, you can add tabs to your community.

 **Note:** You can choose to hide tabs if you want to use completely custom pages in your community. Not sure which option works best for you? Check out [Tabs vs. Community Builder](#) on page 2960.

If you're using one of the preconfigured templates instead of Salesforce Tabs + Visualforce, the **Tabs** node is hidden by default. To display the node, click **Administration > Preferences**, then select **Show all settings in Community Management**.

After you identify the features you want your community members to see, you can expose those features by choosing the corresponding tabs during setup. The tabs that you select also determine community navigation in Salesforce1.

Remember that profiles control access to tabs, so some tabs you choose may be hidden for profiles associated with the community. In that case, you'll need to manually expose the tabs in the profile so that those users can see the tabs in the community.

 **Tip:** Keep in mind that the tabs you enable should be required for the type of activity you're performing in this community, whether it be sharing accounts and opportunities with your partners or sharing cases and solutions with customers who need support. You don't want to clutter your community with tabs that users don't really need.

 **Note:** Chatter Free users in your community won't see any tabs except the Chatter tab.

1. Access Community Management in either of the following ways.
 - From the community, click  in the global header.
 - From Setup, enter *All Communities* in the **Quick Find** box, then select **All Communities**. Then click **Manage** next to the community name.
2. Click **Administration > Tabs**.
3. Select the tabs to include in your community from the Available Tabs list. Press CTRL to select multiple tabs.
4. Click **Add** to add the tab. To remove a tab, select it in the Selected Tabs list and click **Remove**.
5. Click **Up** or **Down** to change the order that the tabs display.

The tab at the top of the list is the landing tab for the community. When users access the community, it will be the first tab they see.

 **Note:** If any user doesn't have access to the landing tab and Chatter is disabled, we show them the Home tab. If Chatter is enabled, we show the Chatter tab.

6. Click **Save**.

 **Important:** Changing from the Salesforce Tabs + Visualforce template to a Community Builder-based template removes all tabs from your community.

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Tabs vs. Community Builder

Not sure whether to use standard Salesforce tabs or the Community Builder when setting up your community? Here is some more information about each option to help you decide.

Tabs

Selecting the Salesforce Tabs + Visualforce template when creating your community means you will use out-of-the-box Salesforce tabs or Visualforce pages.

Pros

- Some theming options available out-of-the-box for tabs
- Support for all sales, service, marketing, and platform features
- Full Force.com platform capability

Cons

- Visualforce is the preferred approach for better customization, yet Visualforce requires coding capability
- Requires some knowledge of the Force.com platform

Community Builder

Selecting one of the preconfigured templates when creating your community means that you will use the WYSIWYG user interface of the Community Builder.

Pros

- Out-of-box app targeted at self-service communities
- More CSS styles available
- Great for a quick rollout of simple self-service community use case

Cons

- Limited to self-service functionality (cases, Salesforce Knowledge, and Chatter Questions)
- Doesn't support other sales, service, or platform use cases
- Doesn't have full platform capability

SEE ALSO:

[Add Tabs to Your Community](#)

[Community Builder Overview](#)

Rename the Chatter Tab

Most likely, many of your community members will use the Chatter tab as their home base. You can customize it to meet your company's branding.

The Chatter tab is the fastest way for your community members to see what's most important to them: activity feeds, groups, bookmarks, files, and more. Many of your community members will most likely use the Chatter tab as their home base. Customize the name of the Chatter tab in your community to match your company branding—for example, you can use your company's name or any other name that would be recognizable to your members.

1. From Setup, enter *Rename Tabs and Labels* in the *Quick Find* box, then select **Rename Tabs and Labels**.
2. Select your default language from the *Select Language* drop-down list at the top of the page.
3. Under Chatter Tabs in Communities, click **Edit** next to the community you want to edit.
4. Type the singular and plural versions of your preferred tab name, for example, Partner and Partners. Select *Starts with a vowel sound* if appropriate.
5. Click **Save**.

Brand Your Community

If you are using the Salesforce Tabs + Visualforce template, you can customize the look and feel of your community in Community Management by adding your company logo, colors, and copyright. This ensures that your community matches your company's branding and is instantly recognizable to your community members.

 **Important:** If you are using a self-service template or choose to use the Community Builder to create custom pages instead of using standard Salesforce tabs, you can use the Community Builder to design your community's branding too.

1. Access Community Management in either of the following ways.
 - From the community, click  in the global header.
 - From Setup, enter *All Communities* in the *Quick Find* box, then select **All Communities**. Then click **Manage** next to the community name.

2. Click **Administration > Branding**.

3. Use the lookups to choose a header and footer for the community.

The files you're choosing for header and footer must have been previously uploaded to the Documents tab and must be publicly available. The header can be .html, .gif, .jpg, or .png. The footer must be an .html file. The maximum file size for .html files is 100 KB combined. The maximum file size for .gif, .jpg, or .png files is 20 KB. So, if you have a header .html file that is 70 KB and you want to use an .html file for the footer as well, it can only be 30 KB.

The header you choose replaces the Salesforce logo below the global header. The footer you choose replaces the standard Salesforce copyright and privacy footer.

4. Click **Select Color Scheme** to select from predefined color schemes or click the text box next to the page section fields to select a color from the color picker.

Note that some of the selected colors impact your community login page and how your community looks in Salesforce1 as well.

Color Choice	Where it Appears
Header Background	Top of the page, under the black global header. If an HTML file is selected in the Header field, it overrides this color choice. Top of the login page. Login page in Salesforce1.
Page Background	Background color for all pages in your community, including the login page.
Primary	Tab that is selected.
Secondary	Top borders of lists and tables. Button on the login page.
Tertiary	Background color for section headers on edit and detail pages.

5. Click **Save**.

[Customize Communities](#)

Customize Email Sent from Communities

You can customize email sender information, Chatter email branding, and templates in your community emails. You can perform customizations in either the user interface or the Network object in Salesforce APIs.

1. Access Community Management in either of the following ways.

- From the community, click  in the global header.
- From Setup, enter *All Communities* in the **Quick Find** box, then select **All Communities**. Then click **Manage** next to the community name.

2. Click **Administration > Emails**.

3. Enter custom values for the email sender's name and address to replace the default values.

-  **Note:** If you change the sender's email address, we send a verification email to the new address. The change is pending, and we continue to use the existing address while we await verification. The requested address doesn't take effect until you click the confirmation link in the email. If verification is already pending for a new email address and you specify a different new address, we retain the latest value and use that for verification.

If you enter a custom value for the sender's address and you have enabled mail relay, your Chatter emails will use the relay.

4. Customize what displays in the footer of Chatter emails.

-  **Important:** Both a logo and email footer text are required. Keep in mind that:
- All Chatter emails display the Chatter logo and Salesforce information by default unless you replace them with your organization's own logo and information.
 - If you previously customized the logo or footer text and want to restore the default values, use the API to set these fields to `null`.

a. Choose a logo to replace the default Chatter logo.

The logo must be an existing document in the Documents tab and must be marked **Externally Available Image**. Images with a maximum size of 150 x 50 pixels on a transparent background work best.

b. Enter custom text to replace the default footer text, up to a maximum of 1,000 characters.

The default text includes Salesforce's name and physical address. We strongly recommend including your organization's physical address to comply with applicable anti-spam laws.

5. Select **Send welcome email** to send email to users when they're added to the community.

-  **Important:** Welcome emails contain login information for external members. If you don't select this option, you'll have to manually send external members their usernames and passwords.

The link provided in the welcome email is valid for 6 months.

Welcome emails are sent when:

- A community changes from **Preview** status to **Active** status. Emails are not sent when a community is in **Preview** or **Inactive** status.
- An administrator adds a new profile or permission set to a **Active** community.
- A user is assigned a profile or permission set that is part of a **Active** community.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

 **Note:** If a profile or permission set is part of multiple communities, users with that profile or permission set receive a welcome email from each community. The first email contains login credentials, but emails from subsequent communities simply contain a link to the community.

6. Use the default email templates or use the lookups to select different templates for welcome emails to new community members, forgotten password emails, and notification emails about reset passwords. If your organization uses email templates to submit case comments, you can select a template (none is provided by default).

User-initiated password reset links expire in 24 hours. Administrator-initiated password reset links don't expire. You can customize any default template.

 **Note:** If you customize the contents of an email template, we recommend that you use the `{!Community_Url}` merge field. This custom merge field populates the unique URL for a community, ensuring that emails to users contain URLs with the correct parameters and direct users to the appropriate community to log in or change a password.

7. Click **Save**.

Emails sent as a result of approvals, workflows, and case comments are sent based on community membership. For example, if a workflow triggers an email, all the recipients are grouped based on community membership and then one email is sent to each group. If the user is a member of multiple active communities, the email comes from the oldest active community.

Another way to customize community emails is to use these fields on the API Network object.

- `CaseCommentEmailTemplateId`—ID of the email template used when submitting a comment on a case.
- `ChangePasswordEmailTemplateId`—ID of the email template used when notifying a user that their password has been reset.
- `EmailFooterLogoId`—ID of the Document object that displays as an image in the footer of community Chatter emails.
- `EmailFooterText`—Text that displays in the footer of community Chatter emails.
- `EmailSenderAddress`—Read only. Email address from which community emails are sent.
- `EmailSenderName`—Name from which community emails are sent.
- `ForgotPasswordEmailTemplateId`—ID of the email template used when a user forgets their password.
- `NewSenderAddress`—Email address that has been entered as the new value for `EmailSenderAddress` but has not been verified yet. After a user has requested to change the sender email address and has successfully responded to the verification email, the `NewSenderAddress` value overwrites the value in `EmailSenderAddress`. This becomes the email address from which community emails are sent.
 - If verification is pending for a new email address and you set `NewSenderAddress` to null, this cancels the verification request.
 - `NewSenderAddress` is automatically set to null after `EmailSenderAddress` has been set to the new verified address.
 - If verification is pending for a new email address and you specify a different new address for this field, only the latest value is retained and used for verification.
- `OptionsSendWelcomeEmail`—Determines whether a welcome email is sent when a new user is added to the community.
- `WelcomeEmailTemplateId`—ID of the email template used when sending welcome emails to new community members.

[Customize Communities](#)

Merge Fields for Communities

You can add merge fields to Communities email templates.

When you enable Salesforce Communities in your organization, three text-based email templates are created:

- Communities: Changed Password Email
- Communities: Forgot Password Email
- Communities: New Member Welcome Email

These templates use unique merge fields. These merge fields are not available to select and copy when editing a template, but you can enter them manually. These merge fields will only work properly if used in a text or HTML template selected for a community.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Field Name	Description
<code>{!Community_Name}</code>	The name of the community, as entered during community creation.
<code>{!Community_Url}</code>	<p>The URL to the login page of a community. For instance, https://acme.force.com/partners/login.</p> <p>If this merge field is part of the welcome email being sent to a new external user, the URL is appended with a link to a reset password page.</p> <p>This field is populated only if:</p> <ul style="list-style-type: none"> • The template containing this field is selected as the Welcome New Member template for a community, and Send welcome email is selected, OR • The template containing this field is selected as either the Forgot Password or Change Password template and the user receiving the email is an external user who is a member of the community.
<code>{!Receiving_User.Username}</code>	The user name of the user who will receive the welcome email.

You can create custom email templates for communities using Visualforce, which allows you to use custom company branding in your email templates. For Visualforce email template, use the `$Network` global merge field type and its properties, as described in this table.

Field Name	Description
<code>\$Network.Name</code>	The name of the community, as entered during community creation.
<code>\$Network.NetworkUrlForUserEmails</code>	<p>The URL to the login page of a community. For instance, https://acme.force.com/partners/login.</p> <p>If this merge field is part of the welcome email being sent to a new external user, the URL is appended with a link to a reset password page.</p>

Field Name	Description
	This field is populated only if it is used in a Visualforce email template for one of three email types supported for Communities.

If your community is using cases, approvals, or workflows, emails created from an email template that use the `{!<any_object>.Link}` or `{!Case.Link}` merge fields include a link to the record in the community. If the user receiving the email is a member of multiple active communities, the link goes to the oldest active community. If the user is already logged in to a community and clicks the link in the email, the link goes to that community. If the user is not a member of any community, the link goes to the internal organization. If the user is a member of a portal and a community, the link goes to the community.

Field Name	Description
<code>{!Case.Link}</code>	Used in: <ul style="list-style-type: none"> • Case comment notifications to contacts and owners • Case creation and update notifications to contacts
<code>{!<any_object>.Link}</code>	Used in: <ul style="list-style-type: none"> • Approval requests sent to approvers and delegated approvers • Workflow email alerts

To find out if your email templates use these merge fields, from Setup, enter *Email Templates* in the **Quick Find** box, then select **Email Templates**, then click **Edit** next to any email template.

Enable Community Preferences

Customize Communities Preferences

Enable or disable nickname display, access to the community without login, Chatter private messages, content flagging, reputation levels, and knowledgeable people in your community.

To use these settings, you must enable Chatter in your organization.

1. Access Community Management in either of the following ways.
 - From the community, click  in the global header.
 - From Setup, enter *All Communities* in the **Quick Find** box, then select **All Communities**. Then click **Manage** next to the community name.
2. Click **Administration > Preferences**.
3. Change the desired settings.

General

- Display nicknames instead of full names in your community. Enabling nickname display in your community allows more privacy and protects member identities. This is especially helpful in a public community where unregistered visitors can access member profiles.
- Enable access to public content in your community so that guest users can access it without logging in. Allowing this access is a way to boost adoption and helps customers easily find information they need without having to login, register, or contact your company directly.
- Enable Chatter messages, which allow you to have secure private conversations with other Chatter users. To expose Chatter messages for external users, administrators must also enable the Chatter tab.
- Use custom Visualforce error pages, if you want authenticated users to see your custom branded Visualforce error pages.
- Show all settings available in Community Management that are hidden by default based on how you set up your community. Enabling this setting overrides the dynamic navigation provided in Community Management.

Community Management

- Allow members to flag posts, comments, or files for moderation within your community. Members may want to flag items that contain inappropriate language or sensitive information.
- Enable Reputation to allow community managers to set up a point system that rewards users who participate in the community. Administrators set up corresponding reputation levels that users see on their profile.
- Enable knowledgeable people so you can discover who's knowledgeable on topics and endorse people for their knowledge on a topic.

4. Click **Save**.

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Show Nicknames Instead of Full Names in the Community

Enabling nickname display in your community allows more privacy and protects member identities. This is especially helpful in a public community where unregistered visitors can access member profiles.

All users have nicknames by default, which they can modify by going to *Your Name* > **Edit Contact Info** in the global header or from their Chatter user profile.

1. Access Community Management in either of the following ways.
 - From the community, click  in the global header.
 - From Setup, enter *All Communities* in the **Quick Find** box, then select **All Communities**. Then click **Manage** next to the community name.
2. Click **Administration** > **Preferences**.
3. Select **Enable nickname display**, then click **Save**.

Nicknames are shown in place of first and last names in almost all locations in the community, including in feeds, list views, groups, search results, recommendations, and on user profiles and files. Additionally, Salesforce1 and any community sites activated using community templates show nicknames as well.

A few restrictions to keep in mind about nickname display:

- Private messages display full names. You can choose to turn off private messages to avoid this.
- Records and user lookups on records show full names. Keep in mind, though, that you can control record and user visibility with sharing rules.
- Mobile notifications in Salesforce1 show full names. You can turn off mobile notifications in Salesforce1 to avoid this.
- Searches by first, last, and full names aren't restricted and return matches, but the search results display only nicknames. The auto-complete recommendations in global search and the recent items list show any first, last, and full names that the user has already searched by or has accessed via a record or another location.

- Performance
- Unlimited
- Developer

USER PERMISSIONS

To enable nickname display:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Enable Public Access to Community Content

Enable access to community content for guest users (unlicensed users) without requiring them to log in or register with the community.

Public communities lend themselves well to business-to-consumer (B2C) type scenarios and allow you to reach a broader audience. Consider the example of a customer support community maintained by a sports equipment manufacturer. A community with public discussions, questions, known issues, and solutions posted by customer support would allow existing and potential customers to view this information without contacting the company directly.

1. Access Community Management in either of the following ways.
 - From the community, click  in the global header.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities**. Then click **Manage** next to the community name.
2. Click **Administration > Preferences**.
3. Select **Allow access without login**, then click **Save**.

Enabling public access allows you to expose groups, topics, user profiles, and feeds for guest users via Chatter in Apex, but it doesn't expose this data in the community. To allow guest users to view this information, do one of the following:

- Use a community template from the Community Builder that allows guest user access for one or more of these objects (Napili, for example). See the [Community Templates for Self-Service Implementation Guide](#) for detailed instructions.
- Use the Chatter in Apex methods and Visualforce pages to expose these objects to guest users. See "Methods Available to Communities Guest Users" in the [Force.com Apex Code Developer's Guide](#) and the [Visualforce Developer's Guide](#) for more information.

Note:

- If you have enabled profile-based rollout for Chatter in your organization, guest users won't be able to access your public community until you enable Chatter access on the guest user profile. For more information, see [Control Chatter Access through User Profiles](#) in the Salesforce Help.
- You can't attach files to questions in a public community from Internet Explorer 9.

SEE ALSO:

[Customize Communities Preferences](#)

EDITIONS

Available in: Salesforce Classic

Available in:

- Developer

USER PERMISSIONS

To enable public access to community content:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Use Custom Visualforce Error Pages for Authenticated Users

If you have customized Visualforce error pages, you can have those pages display for authenticated community users.

To assign or customize your Visualforce error pages, from Community Management, click the Community Management menu in the global header and select **Go to Force.com**. The **Error Pages** section lists your current page selections.

When **Use custom Visualforce error pages** is selected, users who are logged in to the community will see your custom Visualforce error pages. When **Use custom Visualforce error pages** isn't selected, users logged in to the community see the default Visualforce error pages. Guest users who aren't logged in to the community will always see the custom Visualforce error pages, regardless of whether or not you select the checkbox.

1. Access Community Management in either of the following ways.
 - From the community, click  in the global header.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities**. Then click **Manage** next to the community name.
2. Click **Administration > Preferences**.
3. Select **Use custom Visualforce error pages**, then click **Save**.

SEE ALSO:

[Assigning Force.com Site Error Pages](#)

Enable the Global Header for Communities

When Communities is enabled, the global header allows you to easily switch between your communities and your internal organization.

Communities must be enabled in your organization to use the global header.

The **View Global Header** permission is disabled by default for all standard profiles. To view the global header, users must be assigned the "View Global Header" permission either by selecting it on standard profiles, creating custom profiles, or by creating a permission set. Create permission sets to easily assign this permission to specific people.

1. From Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets**.
2. Click **New** and create a permission set that includes the System Permission **View Global Header**.
3. Assign the permission set to the appropriate users.

Users with this permission set see the global header at the top of all pages. They can use the menu on the left to switch between their internal organization and any communities they have access to.

- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create permission sets:

- "Manage Profiles and Permission Sets"

To assign a permission set to a user:

- "Assign Permission Sets"

The *Your Name* menu on the right side contains links to edit contact information and log out. For internal users, it also contains a link to Help & Training and may also contain links to Setup and other tools depending on user permissions and enabled features. If your organization is using Lightning Experience, users with the appropriate permission can switch between Salesforce Classic and the new interface using the Switcher. Look for the *Switch to Lightning Experience* link in the *Your Name* menu. Salesforce Communities isn't currently supported in Lightning Experience, so if a user switches over, they won't see the global header or communities. To access their communities, they'll have to switch back to Salesforce Classic.

When in a community, users with either the Manage Communities or the Create and Set Up Communities permission see a gear icon (⚙️) they can use to switch to Community Management. Within Community Management, they see an additional menu that they can use to preview the community or access the community settings via Community Builder, Site.com Studio, or Force.com.

Note: Within Community Management, users see the global header and the Community Management menu, even if they don't have the "View Global Header" permission. However, we recommend that you still assign the "View Global Header" permission to users who need to switch between your internal organization and communities.

SEE ALSO:

[Navigate to Your Communities](#)

Share a Link to Your Community

You can allow members to preview your community before making it active.

You can only share the link for a preview community with users who were added as members of the community.

Sharing a link to a community in *Preview* status allows you to easily gather stakeholder feedback. The community functions just as it will when you make it active, so stakeholders can try out all functionality and review your branding and customizations. Additionally, you can take advantage of having early members who can post, comment, and share records so that members enter an active community from their first login.

1. Access Community Management in either of the following ways.
 - From the community, click ⚙️ in the global header.
 - From Setup, enter *All Communities* in the *Quick Find* box, then select **All Communities**. Then click **Manage** next to the community name.
2. Click **Administration > Settings**.
3. Copy the URL displayed on the page and share it with your stakeholders.

Keep in mind that you can only share the URL with users who you added as members of the community.

Make Your Communities Active

Activating a community makes it visible to members. You can customize the community while it's active, or you can deactivate the community to make your changes. Keep in mind that once a community is active, everything in the community is visible to members. Be sure to finish all major customizations while in `Preview` status.

 **Note:** If welcome emails are enabled, an email with a link to the community is sent to each member when you first activate the community. For any members from outside the company who don't have a password or use single sign-on, the welcome email includes a link to set their password and security question.

An external user with access to multiple communities within one organization uses the same login credentials for all communities.

1. Access Community Management in either of the following ways.
 - From the community, click  in the global header.
 - From Setup, enter *All Communities* in the `Quick Find` box, then select **All Communities**. Then click **Manage** next to the community name.
2. Click **Administration > Settings**.
3. Click **Activate Community**.
Your community is active and online.

SEE ALSO:

- [Communities Statuses](#)
- [Customize Communities](#)
- [Deactivate a Community](#)

Communities Statuses

Communities can have one of the following statuses.

Status	Description
--------	-------------

<code>Preview</code>	Customization of the community isn't complete, and the community has never been activated. Once you activate a community, you can't go back to <code>Preview</code> status.
----------------------	---

Users with "Create and Set Up Communities" can access communities in `Preview` status if their profile or permission set is associated with the community. They can also share a link to these communities with users whose profiles or permission sets are associated with the community. The link for sharing a `Preview` community is located on the Community Management page.

No welcome emails are sent even if `Send welcome email` is selected.

 **Note:** If your organization's access to Communities is suspended for non-payment of fees due, all of your communities are deactivated, including those in `Preview` status. When Communities is enabled again, all

Update Your Community Settings

Manage your community name, description, URL, community status, and community template all from one spot.

You can change your community name and URL after the community is activated, but users won't be redirected to the new URL. If these changes are necessary, be sure to inform your community members before making the change.

1. Access Community Management in either of the following ways.
 - From the community, click  in the global header.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities**. Then click **Manage** next to the community name.
2. Click **Administration > Settings**.
3. Edit your community settings as needed:
 - Edit your community name, description, and URL, by clicking  next to your community name.
 - Manage the status of your community.
 - Change your community template.

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Deactivate a Community

You may want to deactivate a community if you need to:

- Add or remove members
 - Add, remove, or change the order of tabs
 - Change the color scheme
 - Change the community URL
1. Access Community Management in either of the following ways.
 - From the community, click  in the global header.
 - From Setup, enter *All Communities* in the **Quick Find** box, then select **All Communities**. Then click **Manage** next to the community name.
 2. Click **Administration > Settings**.
 3. Click **Deactivate**.

Your community is inactive and offline.

When a community is inactive, members still see it in the menu, but can't access it unless they have the "Create and Set Up Communities" permission.

Change Your Community Template

Change your community template if the requirements of your community evolve from when you first set it up.

 **Tip:** You won't lose any data when you change templates, but make sure to review [Considerations for Changing Your Community Template](#) before performing the steps below.

If your community is already active and you change templates from a Salesforce Tabs + Visualforce template to a Community Builder-based template, or from a Community Builder-based template to another Community Builder-based template, your template change is saved in a draft version that you can further customize in Community Builder. You must publish your changes in Community Builder before your active community is updated.

If your community is already active and you change templates from a Community Builder-based template to a Salesforce Tabs + Visualforce template, your active community is updated immediately. In this scenario, we recommend that you first deactivate your community. Once you have made all of your changes, you can then re-activate it.

If your template is listed as `None`, this means you're not using a predefined Community Builder-based template or you have modified a Community Builder-based template.

If you are using a Community Builder-based template and you customize your template, the **Settings** page shows the name of template you have in draft mode in Community Builder. A warning message reminds you to publish your changes in Community Builder.

1. Access Community Management in either of the following ways.
 - From the community, click  in the global header.
 - From Setup, enter *All Communities* in the `Quick Find` box, then select **All Communities**. Then click **Manage** next to the community name.

2. Click **Administration > Settings**.

3. Click **Change Template**.

4. Choose a template that meets your community's needs.

To learn more about using the Koa, Koa, and Napili templates, see the [Community Templates for Self-Service Implementation Guide](#).

To learn more about using the Aloha template, see the [Getting Started with the Aloha Community Template for Salesforce Identity](#).

5. When prompted, select **Change Template** to confirm your changes.

After you change the template, you are taken back to Community Management.

Check to make sure your community pages, such as the Login page or Community Home page, are still the best choice for your updated community template. For example, if you previously had a Salesforce Tabs + Visualforce template and switched to a Community Builder-based template, you might want to update your pages to use Community Builder pages instead of Visualforce pages. If required, customize your community in Community Builder and publish any changes you make.

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Considerations for Changing Your Community Template

Changing your community template affects the community navigation, branding, and customizations.

- Salesforce object data carries over, but all branding and component customizations do not. You'll need to redo all customizations.
- Switching between templates updates the navigation in Community Management. To view all available options in Community Management, regardless of template selection, select **Administration > Preferences > Show all settings in Community Management**.
- Your community URL changes when switching from a Salesforce Tabs + Visualforce template to a Community Builder template, or vice versus. For example, in Community Builder-based templates `/s` is appended to your URL. Be sure to update any links to your community with the new URL.

To learn more about using the Kokua, Koa, and Napili templates, see the [Community Templates for Self-Service Implementation Guide](#).

To learn more about using the Aloha template, see the [Getting Started with the Aloha Community Template for Salesforce Identity](#).

Administrating Communities Users

Reset An External User's Password for Communities

An external user's password can be reset either by the user or by the administrator of the organization hosting the community.

In either case, when someone initiates a reset of an external user's password, an email is sent to the user with a link to reset their password. User-initiated password reset links expire in 24 hours. Administrator-initiated password reset links don't expire. When the user clicks the link, they will be required to reset their password before proceeding.

If a user-initiated password reset request can't be processed, they receive an email telling them why. Password reset requests fail if a user's account is temporarily or permanently locked due to too many unsuccessful login attempts or if the request was sent outside approved login hours, IP ranges, or network locations.

SEE ALSO:

[Create Communities Users](#)

[How do external community members get login information?](#)

How do external community members get login information?

External users get their login credentials in welcome emails from a community.

When you enable a contact as a customer user or partner user, they don't receive their login credentials until you add them to a community with welcome emails enabled. If welcome emails are disabled for the community, the external user won't receive credentials and you must manually send them. To do so, from Setup, enter `Users` in the `Quick Find` box, select **Users**, select

EDITIONS

Optional Community Enhancements

Configure a Custom Domain for Your Community

Set up a custom domain so that your community URLs reflect your company brand.

 **Note:** Custom domains are supported only in non-sandbox instances. You can configure a custom domain in a sandbox instance and then migrate it to a production instance, but the custom domain is only active in production.

When you add a domain, you also have the option of attaching a certificate and key for connection security. If you're going to use a certificate, make sure you've already added it using Certificate and Key Management before you try to attach it to your domain. Only CA-signed certificates are supported, and they must be 2048 bits in length. To support all domains that are hosted by sites in your organization, use a wildcard or Subject Alternative Name certificate.

1. From Setup, enter *Domains* in the **Quick Find** box, then select **Domains**.
2. Click **Add a Domain**.
3. Enter the Domain Name.
4. Add a certificate if you have already set up a CA-signed certificate that supports this domain.
5. Click **Save**. Alternatively, click **Save & New** to add multiple domains.

If you plan to host more than one community on a domain, you'll need to set up custom URLs for each site. Custom URLs are the way to uniquely distinguish the communities within that domain. From Setup, enter *Custom URLs* in the **Quick Find** box, then select **Custom URLs**.

Before you switch the CNAME of your domain name to point to a new target name, ensure that the new target name exists in the DNS by using `dig` or `nslookup`. When you created your domain names affects the target of your CNAME:

- Domain names that were added before Summer '13, typically need to have their CNAME adjusted to point to the fully qualified domain followed by `.live.siteforce.com` instead of to the organization's `force.com` sub-domain. For example, if your pre-Summer '13 domain is `www.example.com`, then the target of its CNAME will need to be `www.example.com.live.siteforce.com` instead of `example.force.com` before HTTPS will work.
- Domain names that were added in or before Summer '13, don't have the 18-character organization ID in the CNAME target.
- Domain names that were added in or after Summer '13, already point to the proper place for setting up HTTPS in a custom domain.
- Domain names that were added in or after Winter '14, use a CNAME that points to the fully qualified domain followed by your organization's 18-character ID and `.live.siteforce.com`. For example, if your domain name is `www.example.com` and your 18-character organization ID is `00dxx000001ggxeay`, then the target of its CNAME will need to be `www.example.com.00dxx000001ggxeay.live.siteforce.com`.

USER PERMISSIONS

To view domains:

- "View Setup and Configuration"

To add domains:

- "Customize Application" or "View Setup and Configuration" plus either a Site.com Publisher license or "Create and Set Up Communities"

To edit or delete domains:

- "Customize Application"

To associate certificates with a domain:

- Contact Salesforce if you aren't using Communities. Organization with Communities can associate certificates with a domain.

Add the Global Search Box to Your Customized Community HTML Header

If you customize your Salesforce Communities with an HTML header, you hide the global search box. To take advantage of this search functionality, add a form to your custom header.

1. In your customized HTML header, embed a form similar to this one.

```
<form action="/<community name>/search/SmartSearch" method="get">
  <input id="phSearchInput" type="text" name="str"/>
  <input type="submit" value="Search"/>
</form>
```

2. Replace `<community name>` with the unique value you used for the URL when creating the community. For example, if you entered `customers` as the unique value for your community URL, the form would look like this example:

```
<form action="/customers/search/SmartSearch" method="get">
  <input id="phSearchInput" type="text" name="str"/>
  <input type="submit" value="Search"/>
</form>
```

Set Up Search Engine Optimization (SEO) for Your Community

Have popular search engines, such as the *Google*™ search engine and the *Bing*® search engine, index your community so that customers, partners, and guest users can easily discover community pages via online searches. SEO can significantly improve discovery for public communities.

There are a few standard files you should know about when setting up SEO for your community:

robots.txt

The `robots.txt` file, a standard file used across the Web for SEO, uses include and exclude rules to inform web spiders and robots about which areas of your community to index. This file gives you complete control over what users can discover via search engines. You can customize the rules to allow your entire community to be indexed, or you can choose specific areas. Once you specify your rules, search engines use the file to index your community pages.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create a Visualforce page, robots.txt file, and sitemap.xml file for your community:

- "Create and Set Up Communities"

For Salesforce Communities, you must create a Visualforce page to host this information. This file is placed at the root level of your community. Here's an example of a Visualforce page with indexing rules for a community:

```
<apex:page contentType="text/plain">
User-agent: *
Disallow: / # hides everything from ALL bots
Allow: /<path-prefix-1>/s # add path you want to open to bots
Allow: /<path-prefix-2>/s # add path you want to open to bots
Sitemap: http://community_URL/<sitemap_to_community1>
Sitemap: http://<community_URL>/<sitemap_to_community2>
</apex:page>
```

sitemap.xml

The `sitemap.xml` file contains a list of the URLs of your community. Search engines use this list to find out which pages of your community are available for crawling and indexing. The `robots.txt` file contains the path to your community's sitemap. The `sitemap.xml` should also be placed at the root level of your community. For more information about creating the `sitemap.xml` file for your community, see [this article](#).

Note: You may have more than one community, each with various sub-paths. Keep in mind that they all share the same file, so be sure your indexing rules account for the pages in all your communities. The Visualforce page with the `robots.txt` info will need to be within the community that has no sub-path name at all, so at the root level.

1. Create a list of include and exclude rules for the different areas of your community that you want to expose or hide from search engines. Save this information in a text file.
2. In Setup, enter *Visualforce Pages* in the **Quick Find** box, then select **Visualforce Pages** and click **New** to create a new Visualforce page. Give it any name; you can even call it `robots`.
3. Paste the list of indexing rules in the Visualforce page. The final contents should look similar to the example above, with more rules as required.
4. Click **Save**.
5. Back on the Community Management page for your community, click **Administration > Pages > Go to Force.com** and then **Edit** on the Site Details page.
6. In the **Site Robots.txt** field, enter the name of the Visualforce page you just created, or click  to search for the file.
7. Click **Save**.
8. Optionally, submit your `sitemap.xml` file directly to search engines. For example, submit the file to [Google™ Webmaster Tools](#) and [Bing® Webmaster Tools](#) to allow users of those search engines to discover content in your community.

To confirm that the `robots.txt` file is available for robots and spiders, navigate to your community and append `/robots.txt` to the landing page URL. You should see the contents you pasted into the Visualforce page you created earlier. Similarly, append `/sitemap.xml` to your community URL to test if your sitemap is available to search engine spiders and robots.

Login, Self-Registration, and Password Management In Your Community

Customize Login, Logout, and Self-Registration Pages in Your Community

Configure the standard login, logout, password management, and self-registration options for your community, or customize the behavior with Apex and Visualforce or Community Builder (Site.com Studio) pages.

By default, each community comes with default login, password management, and self-registration pages and associated Apex controllers that drive this functionality under the hood. You can use Visualforce, Apex, or Community Builder (Site.com Studio) to create custom branding and change the default behavior:

- [Customize the branding of the default login page.](#)
- [Customize the login experience](#) by modifying the default login page behavior, using a custom login page, and supporting other authentication providers.
- [Redirect users to a different URL on logout.](#)
- [Use custom Change Password and Forgot Password pages](#)
- [Set up self-registration](#) for unlicensed guest users in your community.

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Brand Your Community's Login Page

If you selected the Salesforce Tabs + Visualforce template, you can add your company logo and custom footer text to the standard login page that comes out-of-the-box with your community.

The header and page background colors used on the standard login page are inherited from the community's [branding color scheme](#).

1. Access Community Management in either of the following ways.
 - From the community, click  in the global header.
 - From Setup, enter *All Communities* in the **Quick Find** box, then select **All Communities**. Then click **Manage** next to the community name.
2. Click **Administration** > **Login & Registration** and make your changes in the Header and Footer section.
3. Upload a logo for the community login page header.

The file can be .gif, .jpg, or .png. The maximum file size is 100 KB. Images larger than 250 pixels wide or 125 pixels high aren't accepted. Uploading a logo automatically creates a Communities Shared Document Folder on the Documents tab and saves the logo there. Once created, you can't delete the folder.

The header logo displays at the top left of the standard login page. It is also used when you access the community in Salesforce1. The header logo doesn't appear on custom login pages.
4. Enter custom text for the community login page footer, up to a maximum of 120 characters.

The footer displays at the bottom of the login page. This footer text doesn't display on custom login pages.
5. Click **Save**.

The logo and custom footer text display to all users (internal, external, and unlicensed guest users) on the login page.

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Customize Your Community's Login Experience

Customize the default login process for external users in your community. You can also use a custom Community Builder, Site.com Studio, or Visualforce login page, support multiple authentication providers, and configure single sign-on with any template.

External users are users with Community, Customer Portal, or partner portal licenses.

- The login page you select in Community Management overrides other login page assignments in the Site.com or Force.com site settings.
 - If your community uses the Salesforce Tabs + Visualforce template, the login page assigned to the community by default is called `CommunitiesLogin`. Use Visualforce to customize the appearance of this page.
 - If your community uses the Napili template, the login page assigned to the community by default is called `Login`. Use Community Builder (Site.com Studio) to customize its appearance.
 - To update the login behavior for both Visualforce and Community Builder pages, update the `CommunitiesLoginController` Apex controller.
 - Custom Community Builder pages must be published before they can be assigned to they community. Remember to modify the `CommunitiesLoginController` Apex controller and the `Site.Login()` Apex method to use your custom login page.
 - The login options you configure here are valid only for external users. Users from your internal organization must use the link that directs employees to log in with their Salesforce username and password.
1. Access Community Management in either of the following ways.
 - From the community, click  in the global header.
 - From Setup, enter *All Communities* in the `Quick Find` box, then select **All Communities**. Then click **Manage** next to the community name.
 2. Click **Administration** > **Login & Registration** and make your changes under the Login section.
 3. Optionally, choose a custom login page for your community. Select the page type (**Community Builder** or **Visualforce**), enter the name of the page in the search field, and click . In the search results window, click the name of the page to select it.

 **Tip:** To revert to the default login page for your community's template, select **Default Page**.
 4. Select what credentials external users can log in or register with.

By default, users log in to the community using the default community username and password. If you want to allow them to log in with other credentials, such as their Facebook[®], Janrain[®], or Salesforce credentials from another organization, select those from the list.

 **Important:** Configure these [authentication provider options](#) in advance to be able to use them for community logins. From Setup, enter *Auth. Providers* in the `Quick Find` box, then select **Auth. Providers**.
 5. Optionally, allow external users to log in with their SAML single-sign on identity.

This option is available only if your organization has successfully [set up SAML for your community](#) on page 3014 including:

 - SAML settings for single sign-on, which enables login to Salesforce using your corporate identity provider. Note that you must enter an Identity Provider Login URL.
 - A custom domain name, which changes the application URLs for all of your pages, including login pages. Contact Support if you need to enable My Domain.

- Unlimited
- Developer

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

To offer multiple SAML single sign-on options, enter *Single Sign-On Settings* in the *Quick Find* box, select **Single Sign-On Settings**, and then click **Enable Multiple Configs**. If you already had SAML enabled and you then enable multiple SAML configurations, your existing SAML configuration is automatically converted to work with multiple additional configurations.

Users see the option to **Log In with Single Sign-On**. If you have enabled multiple SAML single sign-on options, each login button displays labeled with the SAML configuration's *Name* field.

6. Click **Save**.

 **Note:** Renaming or deleting the default login page can cause problems with the default community login flow.

SEE ALSO:

[Customize Login, Logout, and Self-Registration Pages in Your Community](#)

Customize the Login Process with Apex

You can provide community members outside your company with a completely custom login page that reflects your organization's style and branding. Use Visualforce and Apex to either customize the `CommunitiesLogin` page and `CommunitiesLoginController`, or create your own Visualforce page.

To redirect from the default community login page to your custom login page:

1. From Setup, enter *Apex Classes* in the *Quick Find* box, then select **Apex Classes**.
2. Click **Edit** next to `CommunitiesLoginController`.
3. Add the following code:

```
global PageReference forwardToCustomAuthPage() {
    String startUrl = System.currentPageReference().getParameters().get('startURL');

    return new PageReference(Site.getPathPrefix() + '/SiteLogin?startURL=' +
        EncodingUtil.urlEncode(startURL, 'UTF-8'));
}
```

4. If you created a completely custom login page, replace `SiteLogin` with the name of your Visualforce page.
5. Click **Save**.
6. Click **Edit** next to `CommunitiesLandingController`.
7. Add the following code:

```
public PageReference forwardToCustomAuthPage() {
    String startUrl = System.currentPageReference().getParameters().get('startURL');

    return new PageReference(Site.getPathPrefix() + '/SiteLogin?startURL=' +
        EncodingUtil.urlEncode(startURL, 'UTF-8'));
}
```

8. If you created a completely custom login page, replace `SiteLogin` with the name of your Visualforce page.
9. Click **Save**.
10. From Setup, enter *Visualforce Pages* in the *Quick Find* box, then select **Visualforce Pages**.

USER PERMISSIONS

To create and edit Visualforce pages:

- "Customize Application"

To edit Apex classes:

- "Author Apex"

AND

"Customize Application"

11. Click **Edit** next to `CommunitiesLogin`.

12. In the first line of code, add the following:

```
action="{!forwardToCustomAuthPage}"
```

13. Click **Save**.

14. Click **Edit** next to `CommunitiesLanding`.

15. In the first line of code, add the following:

```
action="{!forwardToCustomAuthPage}"
```

16. Click **Save**.

Redirect Community Members to a Custom URL on Logout

Specify the URL that community members should be redirected to when they log out from your community.

When community members log out, they are taken to the community login page by default. You can choose to point them to a different location, such as your company web site for example.

1. Access Community Management in either of the following ways.
 - From the community, click  in the global header.
 - From Setup, enter *All Communities* in the `Quick Find` box, then select **All Communities**. Then click **Manage** next to the community name.
2. Click **Administration > Login & Registration**.
3. In the Logout section, enter the URL you want to redirect community members to.
4. Click **Save**.

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Set Up Self-Registration for Your Community

Enable self-registration to allow unlicensed guest users to join your community. You can choose to save them as contacts under a business account or create a person account for each self-registering user.

When you enable self-registration, these Visualforce pages and Apex controllers are associated with your community.

- `CommunitiesSelfReg` page and `CommunitiesSelfRegController`—Provide the form for partners or customers so they can register with your community. You can [modify the `CommunitiesSelfRegController` Apex controller](#) to change the default self-registration process, but it is no longer required starting with the Spring '15 release.

 **Note:** Apex customizations for the self-registration process take precedence over the defaults specified in Community Management. In organizations created prior to the Spring '15 release, existing Apex customizations for self-registration remain in effect as before.

- `CommunitiesSelfRegConfirm` page and `CommunitiesSelfRegConfirmController`—If a user doesn't create a password during self-registration—either because they left the password field blank or your organization customized the self-registration form to omit the password field—this page confirms that a password reset email has been sent. Users landing on this page can't log in until they reset their password.

The default self-registration pages and controllers are shared by all of your organization's communities. If you enable self-registration for multiple communities, you must further customize the self-registration experience to direct users to different pages, assign different profiles or permission sets for different communities, and so on.

 **Note:** Renaming or deleting the default self-registration page can cause problems with the default self-registration flow.

1. Access Community Management in either of the following ways.
 - From the community, click  in the global header.
 - From Setup, enter *All Communities* in the *Quick Find* box, then select **All Communities**. Then click **Manage** next to the community name.
2. Click **Administration > Login & Registration**.
3. In the Registration section, select **Allow external users to self-register**.
4. Optionally, choose a custom self-registration page for your community. Select the page type (**Community Builder** or **Visualforce**), enter the name of the page in the search field, and click . In the search results window, click the name of the page to select it. To revert to the default self-registration page (`CommunitiesSelfReg`), select **Default Page**.
Community Builder pages must be published, else they aren't included in the page lookup search results. Remember to modify the self-registration `CommunitiesSelfRegController` and `CommunitiesSelfRegConfirmController` Apex controllers if you use a custom page.
5. Select the default **Profile** to assign to self-registering users.

 **Note:** You can only select portal profiles that are associated with the community. If a profile is selected as the default for users who self-register, and you remove it from the community, the self-registration `Profile` is automatically reset to `None`.
6. Select the business **Account** that you want to assign self-registering users to.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

The self-registering user is assigned as a contact of the account you specify. To [create a person account \(if enabled\) for each self-registering user](#), leave this field blank.

Ensure that the account you use is enabled as a partner. To do so, go to the account, click **Manage External Account**, then click **Enable as Partner**.

7. Click **Save**.

After you set up self-registration, a **Not a member?** link directs external users to the self-registration page from the login page. When a user self-registers to join your community:

- Salesforce creates a new user record with the information they provide on the self-registration page.
- The user is assigned the profile you specified when you set up self-registration.
- The user is associated with a business account or a person account, depending on how you set it up.
- Customer Community Plus and Partner Community licenses require user records to be associated with a role in your organization. If you don't specify a role in the default self-registration profile, Salesforce assigns them the `WORKER` role.

 **Note:** Keep in mind that each time a user self-registers, they consume one of your Communities licenses. When setting up your self-registration page, be sure to add some criteria to ensure that the right people are signing up. Additionally, to prevent unauthorized form submissions, we recommend using a security mechanism, such as CAPTCHA or a hidden field, on your self-registration page.

SEE ALSO:

[Customize Login, Logout, and Self-Registration Pages in Your Community](#)

[Customize the Community Self-Registration Process with Apex](#)

[Create Person Accounts for Self-Registering Users](#)

Create Person Accounts for Self-Registering Users

If your business deals mostly with individuals, instead of creating them as contacts under a single business account, you can assign each self-registering user to a person account.

 **Important:** You must have Person Accounts enabled in your organization. Only Customer Community and Customer Community Plus licenses support the creation of person accounts.

In Community Management, under **Administration > Login & Registration**, enable self-registration and leave the **Account** field blank. Note that you must specify a default profile to assign self-registering users to.

Salesforce creates separate person accounts for each self-registering user. Each user is assigned the default profile you specified while setting up self-registration, as well as a default role. If you don't specify a role, either on the profile or via the self-registration Apex controller, Salesforce assigns the `WORKER` role to the self-registering users. You can further customize this functionality by using the [self-registration Apex controller](#) (`CommunitiesSelfRegController`), but it's not required.

EDITIONS

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Customize the Community Self-Registration Process with Apex

Update the `CommunitiesSelfRegController` to customize the default self-registration process for your community. You can use the same controller for the default self-registration page (`CommunitiesSelfReg`) or a custom Visualforce or Community Builder self-registration page.

You can configure self-registration entirely in Community Management. This customization is recommended only if you want to modify the self-registration behavior beyond the defaults, if you have more than one community in your organization, or if you are using a custom self-registration page.

 **Note:** You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by Salesforce to support its users and partners, but are not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.

1. From Setup, enter `Apex Classes` in the `Quick Find` box, then select **Apex Classes**.

2. Click **Edit** next to `CommunitiesSelfRegController`.

3. Optionally, enter a value for `ProfileId` to define the type of profile the user should be assigned.

If you selected a default profile while setting up self-registration in Community Management, the value in the Apex code will override that default.

 **Note:** Note that regardless of which role you enter for the `roleEnum`, the role for new users will default to `None`. Once a user self-registers, you can update their role on the user detail page.

4. Enter the account ID for the partner or customer account that users who self register should be associated with.

If you selected a default account while setting up self-registration in Community Management, the value in the Apex code will override that default.

Ensure that the account you use is enabled as a partner. To do so, go to the account, click **Manage External Account**, then click **Enable as Partner**.

5. If you're enabling self-registration for multiple communities, add code to create appropriate types of users for each community, that is, assigning the correct profile, role, and account ID per community.

6. Click **Save**.

7. Enable access to accounts and contacts for the guest profile. The guest profile is automatically associated with your community's Force.com site.

a. From Setup, enter `All Communities` in the `Quick Find` box, then select **All Communities**. Then click **Manage** next to the community name.

b. From Community Management click **Administration > Pages > Go to Force.com..**

c. Click **Public Access Settings**.

d. Click **Edit**.

e. In the Standard Object Permissions section, select Read and Create next to Accounts and Contacts.

f. Click **Save**.

g. In the Enabled Apex Class Access related list, click **Edit**.

h. Add the `CommunitiesSelfRegController` and click **Save**.

i. In the Enabled Visualforce Page Access related list, click **Edit**.

j. Add the `CommunitiesSelfReg` and click **Save**.

8. Optionally, if you want to customize the contents of the default self-registration page, edit the `CommunitiesSelfReg` page.

a. From Setup, enter `Visualforce Pages` in the `Quick Find` box, then select **Visualforce Pages**.

b. Click **Edit** next to `CommunitiesSelfReg`.

- c. Add code to customize the fields required for self-registration or the page's look and feel.
In the default form, all fields except `Password` are required.
- d. Click **Save**.

Once setup is complete, external users who submit the completed self-registration form (including a password) are logged in to the community.

 **Note:** If a user self-registers for a community with Chatter Answers enabled, the Chatter Answers User permission is not automatically set for the user.

If you're using a custom Visualforce self-registration page instead of the default `CommunitiesSelfReg` page, add the following code to `CommunitiesSelfRegController`. Replace `CommunitiesCustomSelfRegPage` with the name of the custom self-registration page. Then add this to the first line of code in the `CommunitiesSelfReg` page.

Use Other Salesforce Features In Your Community

Enable Cases for Communities Users

Enable cases for external users so that they have access to and can create cases in your communities.

When you enable cases for external users in your community, you can assign cases to those members. Additionally, external members can edit cases, create new cases, add case comments, reassign cases, find case solutions, and create case teams. External users can't edit case comments, associate assets with cases, or delete cases.

 **Note:** Case comments added by external users in communities are public and can be viewed by any user that can view the case.

1. Add the Cases tab to the list of available tabs in your community.
2. Set tab visibility and "Read," "Create," and "Edit" object permissions. You can either set them on the profile or using a permission set. We recommend using a permission set if you plan to apply these permissions selectively.
 - a. If using a profile, such as the Partner Community profile, set the cases tab setting to `Default On` and enable the "Read," "Create," and "Edit" object permissions for cases.
 - b. If using a permission set, create a permission set with the following settings for cases:
 - In the Tab Settings, select Available and Visible.
 - In the Object Settings, select "Read," "Create," and "Edit".

If case comment notification to contacts is enabled, emails sent to external users include a link to the community. Emails sent to contacts for case creation and update notifications also include a link to the community.

To enable cases for Communities users:

- "Manage Profiles and Permission Sets"

Set Up the Community Case Feed

Community Case Feed

With the community case feed, agents and community users see the life cycle of a case from start to finish: all case interactions appear in a unified, chronological Chatter case feed. Community users benefit from the added functionalities of Chatter, while support-side features help agents provide efficient, personalized support.

The community case feed gives community users an intuitive, versatile environment where they can manage their cases. Internal and external users see the following interactions in the community case feed:

- Chatter text, file, and link posts
- Questions in Chatter that are associated with the case
- Case emails

Note: To learn more about case email visibility, see [Emails in the Community Case Feed](#).

If the Salesforce administrator exposes read-only social posts on cases, these also appear in the feed.

Community case feed in a community built on the Napili template:

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Using the publisher **(1)**, users create posts and attach files to the case. The feed **(2)** comes fully equipped with Chatter's collaboration tools: users can bookmark, like, and comment on posts, and mention other users. Images and comments appear inline, making it easy to scan the feed for details. The Attachments component **(3)** displays all case attachments.

When the community case feed is enabled, support agents can:

- Use the Community action in the console case feed to answer community questions and create private and public Chatter posts on cases
- Expose or hide a published post or email in the community case feed of external users

The community case feed is available in all communities that use the self-service community templates or Salesforce Tabs + Visualforce.

Known Issues

In communities built on the Koa or Kokua community templates, users' names in the community case feed look like links but don't lead anywhere.

SEE ALSO:

[Community Case Feed Considerations](#)

[Set Up the Community Case Feed](#)

[Expose or Hide a Published Post or Email in the Community Case Feed](#)

Set Up the Community Case Feed

The community case feed lets community users and support agents see all case interactions in a unified feed, and lets agents take more actions directly from the console. To set up the community case feed, enable it in your organization and make sure that the case page in your community is properly configured.

Important: Before setting up the community case feed, read [Community Case Feed Considerations](#).

1. Enable the community case feed:
 - a. From Setup, enter *Support Settings* in the Quick Find box, then select **Support Settings**.
 - b. Select **Enable Community Case Feed**.
 - c. Optionally, select **Enable Email Notifications for Case Posts** (recommended).
 - d. Click **Save**.
2. If your community was built using Salesforce Tabs + Visualforce, make sure that your case page includes a Chatter feed.
3. If your community uses the Koa, Kokua, or Napili template, confirm that your active case detail page supports the community case feed:
 - a.  In Community Builder, click  .
 - b. Click **Page Management**.
 - c. Find Case Detail in the Name column, and make sure that the active page assigned to it is either Chatter Case Detail (the default) or Record Detail.

If you change the active case detail page, publish your change.

Important: If the community case feed is enabled and you use Basic Case Detail as your active case detail page, external users only see case comments—not Chatter posts or emails—in their case feed. This gives external users far less visibility into their cases. To give users a full view of their case interactions, use Chatter Case Detail or Record Detail as your active case detail page.

Community Case Feed Considerations

Before setting up the community case feed, review this essential information.

If the community case feed is enabled:

- Agents can use the Community action in the console case feed to answer community questions and create private and public Chatter posts on cases.
- Agents can expose or hide published Chatter posts and emails in the case feed of external community users.
- External community users with access to a case see associated Chatter posts, questions, and emails in their case feed.

If email notifications for case posts are enabled:

- The case contact is notified by email when someone makes an externally visible post on their case. Users can comment on the post by replying to the email.
- If you're already using custom email notification settings, such as those triggered by workflows, selecting this preference may create duplicate email notifications.
- Users in communities built on the Napili template or Salesforce Tabs + Visualforce can turn off these notifications in their email notification settings by deselecting **Posts on one of my cases** under "Email me when someone...".

Emails in the Community Case Feed

When you enable the community case feed, external users with access to a case see case emails in their feed. Emails in the community case feed include the email's author, recipients, text, and time sent.

By default, if the case contact sends or receives a case email, that email appears in the feed of all users—both internal and external—with access to the case. For an external user to view the case, their profile must include access to cases in the community.

For example, suppose Rita, an external user, posts a question in a community. The question remains unresolved, and a community moderator creates a case from it using the Question-to-Case action. If the support agent assigned to the case emails Rita from the email publisher, Rita and all other users with access to the case see the email in their case feed. Users with access to a case typically include the assigned support agent and the case contact.

If the community case feed is enabled, you can write an Apex trigger or process to hide or expose all case emails in the feeds of external community users. The `IsExternallyVisible` field of the `EmailMessage` object controls the visibility of email messages in the community case feed. When the field is set to `true` emails sent or received by the case contact are visible to external users with access to the case.

 **Example:** The following trigger exposes all case emails in the feeds of external users with access to the case. This means that case emails between internal users will also be visible to external users with access to the case (for example, if the assigned support agent used the email publisher to email their shipping vendor). To *hide* all case emails from external users' case feeds, simply change `true` to `false`:

```
trigger makepublic on EmailMessage (before Insert) {
    for (EmailMessage oe:trigger.new) {
        oe.IsExternallyVisible=true;
    }
}
```

```
}
}
```

[Expose or Hide a Published Post or Email in the Community Case Feed](#)

Expose or Hide a Published Post or Email in the Community Case Feed

When necessary, support agents can expose or hide individual case emails and published Chatter posts in the case feed of community users.

To change the external visibility of a published Chatter post or email on a case:

1. Navigate to the post or email in the compact case feed.
2. In the post or email's drop-down menu:
 - Select **Make Public** to expose an internal Chatter post or email in the case feed of external users with access to the case
 - Select **Make Private** to remove a Chatter post or email from the case feed of external users with access to the case

Make Public option on a case Chatter post:

EDITIONS

Available in: Salesforce Classic

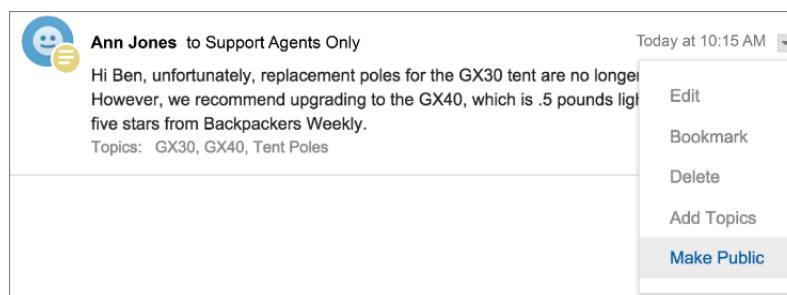

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

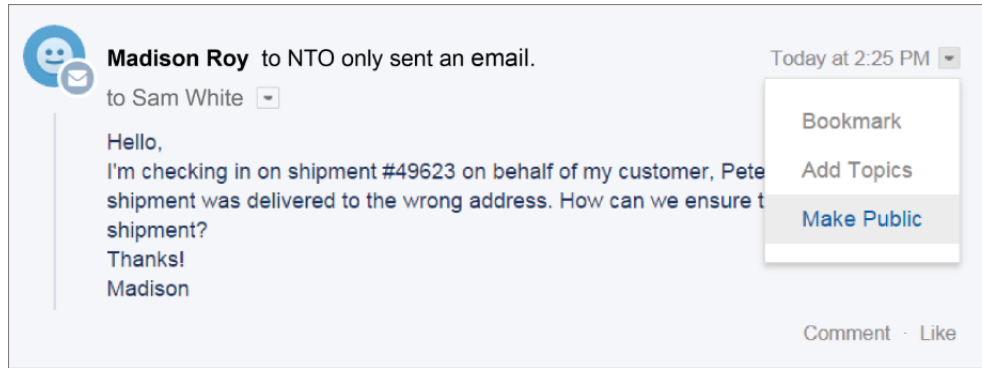

USER PERMISSIONS

To edit the external visibility of a published Chatter post or email on a case:

- "Edit My Own Posts"
- "Edit Posts on Records I Own"
- Compact case feed enabled in your organization
- Community case feed enabled in your organization

Make Public option on a case email:

The agent who owns the case and their superiors see the **Make Public** and **Make Private** options on all case emails and Chatter posts on the case. Internal users who don't own the case also see these options on case posts or emails that they authored.

Making Emails and Chatter Posts *Private*

Clicking **Make Private** on a case Chatter post or email means that the case contact and any other external users with access to the case no longer see the post or email in their case feed. (It still appears in the feeds of internal users with access to the case.) An agent might choose to make an email or post in the community case feed private if they want to hide their correspondence with the case contact from the case feed of other external users with access to the case.

 **Note:** Keep in mind that when you make an email private, the email recipient(s) already received the email. Similarly, when you make a Chatter post private, remember that external users with access to the case may have been notified by email when it was first posted.

Making Emails and Chatter Posts *Public*

Clicking **Make Public** on a case Chatter post or email means that the case contact and any other external users with access to the case now see the post or email in their case feed. An agent might choose to make an email or post in the community case feed public in order to keep the case contact updated about internal progress on the case.

 **Note:**

- The case feed offers handy visual cues to help agents quickly identify which case posts are externally visible. To learn about enabling these visual cues, see “Feed View Options” in [Settings for Feed Views in Case Feed](#).
- You can write an Apex trigger or process to hide or expose all case emails from the community case feed of external users. For more information, see [Emails in the Community Case Feed](#).

Enable Chatter Questions in Your Community

Chatter Questions helps you promote community engagement by giving users the ability to ask and answer questions in their Chatter feed, in groups, and in records. Members in your users' groups and communities can answer questions in Chatter just as they would comment on a Chatter post. Users in communities built on the Napili template can also attach files to questions.

To set up Chatter Questions in your community, simply add the Question action to the global publisher layout. In organizations created after Summer '14, the Question action is automatically added, but we recommend dragging it to the far left to increase its visibility.

 **Note:** Chatter Questions is not available in communities built on the Koa and Kokua community templates.

1. From Setup, enter *Publisher Layouts* in the Quick Find box, then select **Publisher Layouts**.
2. Click **Edit** next to the global publisher layout.

EDITIONS

Available in: **Salesforce Classic**

Chatter Questions is available in: **Group, Professional, Developer, Performance, Enterprise, and Unlimited Editions**.

USER PERMISSIONS

To edit the global publisher layout:

- "Customize Application"

3. Drag the Question action from the palette to the global publisher layout. If the Question action already appears in the layout, drag it to the location where you want it.
4. Click **Save**.

 **Note:** If you're using a customized publisher layout in groups or on records, make sure that the Question action is added to those layouts as well.

Enable Chatter Answers in Your Community

Chatter Answers is a self-service support community where users can post questions and receive answers and comments from other users or your support agents.

To set up Chatter Answers in Salesforce Communities, follow these high-level steps:

1. Enable Chatter Answers.
 - a. From Setup, enter *Chatter Answers Settings* in the **Quick Find** box, then select **Chatter Answers Settings**.
 - b. Select **Enable Chatter Answers**.
2. Ensure that your community members have access to the following objects within your organization:
 - Questions
 - Knowledge Articles
 - Data Categories
3. Create a zone for Chatter Answers.
 - a. Enable the zone for Chatter Answers.
 - b. Set the **Visible In** setting to the community that you want the zone shown in.
 - c. As a best practice, select a public group from your organization to designate as a Customer Support Agents Group.
4. Add the Q&A tab to your community.
 - a. From Setup, enter *All Communities* in the **Quick Find** box, then select **All Communities**. Then click **Manage** next to the community name.
 - b. Click **Administration > Tabs**.
 - c. Add the Q&A tab to the Selected Tabs list.
 - d. Click **Save**.
 - e. Click **Close**.
5. Make the Q&A tab visible on profiles that need access to it.
 - a. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
 - b. Click **Edit** for the profile that you want to make the Q&A tab visible for.
 - c. Under Standard Tab Settings, set the Q&A tab to Default On.

USER PERMISSIONS

To enable Chatter Answers in Salesforce Communities:

- "Customize Application"

d. Click **Save**.

After you have enabled Chatter Answers in your community, consider the following extra deployment options:

- A public-facing Force.com site with or without a portal.
- A Visualforce tab, which provides branding, a customized landing page, and custom access to Chatter Answers within your community.

If a user self-registers for a community with Chatter Answers enabled, the Chatter Answers User permission is not automatically set for the user. Set permissions for Chatter Answers on the community user.

Set Up Question-to-Case

Add Question-to-Case to your communities, your Salesforce organization, or both.

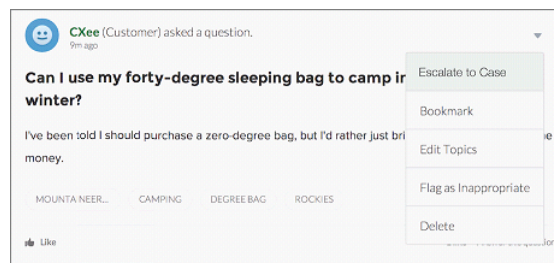

Question-to-Case lets moderators create cases from unresolved questions in Chatter, which makes it easier to track and resolve your customers' issues. Moderators can create cases from questions directly in the feed, or you can set up processes—similar to workflow rules—in the Lightning Process Builder to automatically create cases from questions that meet specified criteria. Cases from questions are added to a queue so support agents can claim them.

Customize the Escalate to Case Action Layout

Choose which fields appear on the Escalate to Case action, and in what order, based on the information you need to track for each case.

1. From Setup, enter *Actions* in the *Quick Find* box, then select **Feed Item Actions**.
2. Click **Layout** next to the Escalate to Case action.
3. Drag any fields you want to add to the action from the action layout editor palette, and reposition them if necessary.
4. Click **Save**.

 **Note:** In public communities, you can't look up a contact when the case is submitted, so we recommend that you remove the *Contact* field from the Case Action layout.

SEE ALSO:

[Automatically Assign Cases from Questions to a Queue](#)

Automatically Assign Cases from Questions to a Queue

Case assignment rules aren't supported in Question-to-Case, so by default, cases created from questions are assigned to the moderator who escalates the question. If you'd like, you can write a workflow rule or process that automatically adds questions that were created from cases to a queue so agents can claim them.

You can assign escalated questions to a queue in several ways. The basic approach is to write a process in the Lightning Process Builder that automatically assigns a case to a specified queue if the *Type* field on the case is equal to *Question*. You can also build the process to accommodate multiple queues. For example, have your process assign cases with a certain topic to a different queue.

The way you use queues in escalated questions will depend on your users, your goals, and more. Find an approach that best fits your business needs.

To learn how to create a queue, see [Creating Queues](#).

Automatically Create Cases from Unresolved Questions in Chatter

As your community or organization develops, ensure that users get speedy answers to their questions. Question-to-Case lets moderators escalate unresolved questions to cases in the feed, but you can make your case resolution process even more efficient by setting up processes—similar to workflow rules—in the Lightning Process Builder. Set up a process that automatically creates a case from questions that meet specified criteria.

 **Important:** These steps apply only to organizations and communities that use Chatter Questions. Not sure if that's you? See [Differences Between Q&A Features in Salesforce](#) on page 2846.

You can use Question-to-Case in processes in several ways. For example, consider setting up processes that:

- Create a case from a question if a week has passed, the question has received more than ten likes, and a best answer hasn't been selected.
- Create a case from a question immediately if the question contains the word "competitor."

Processes related to Question-to-Case act on the Feed Item object. The process includes a flow that evaluates whether question posts meet your escalation criteria. You can create flow variables based on several Feed Item fields, including:

- `BestCommentId`: The ID of the comment that was selected as the best answer. If no comment has been selected as the best answer, this field is null.
- `CommentCount`: The number of comments on a question.
- `LikeCount`: The number of likes on a question.

 **Tip:**

- Each flow variable's data type must match the feed item field's data type. `CommentCount` and `LikeCount` are number fields, while `BestCommentId` is a text field.
- The creation of a feed item can trigger a process, but updates to feed items (such as likes and comments) cannot. Depending on your process, you might need to specify how much time must pass before a related flow runs.

Beyond the Basics

Robert, a Salesforce administrator, wants questions to be automatically escalated to cases if they meet these criteria:

- 24 hours have passed
- The question received more than four comments
- A best answer wasn't selected

Step 1: Create a Process

First, Robert creates a process in the Process Builder on the Feed Item object. The process runs only when feed items are created.

EDITIONS

Available in: Salesforce Classic

Question-to-Case is available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

The Lightning Process Builder is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Choose Object and Specify When to Start the Process ?

Object*

Feed Item ▼

Start the process*

only when a record is created

when a record is created or edited

Allow process to evaluate a record multiple times in a single transaction? i

Yes

Step 2: Add Criteria

Robert adds criteria to his process that check whether newly created feed items are questions. He uses the following settings:

- Criteria Name = `Is Question`
- Criteria for Executing Actions = `Filter conditions are met`
- Filter Condition = `[FeedItem].Type Equals Question Post`
- All of the conditions are met (AND)

Define Criteria for this Action Group ?

Criteria Name* i

Is Question

Criteria for Executing Actions*

Filter conditions are met

Formula evaluates to true

No criteria—just execute the actions!

Set Filter Conditions

Field*	Operator*	Value*
1 [FeedItem].Type ▼	Equals ▼	Question Post ▼
<input type="button" value="+ Add Row"/>		

Filter Conditions*

All of the conditions are met (AND)

Any of the conditions are met (OR)

Customize the filter logic

Step 3: Add a Flow

Robert creates a simple flow named “Escalate Question to Case” in the Cloud Flow Designer. The flow includes three elements: a *record lookup*, a *decision*, and a *quick action*. It checks whether a question has received four or more comments, and whether a best answer has been selected.

The *record lookup* element retrieves the record ID of a question post. It uses the following settings:

- Name = Question ID
- Lookup = FeedItem
- Field = Id
- Operator = equals
- Value = {!QuestionID}

 **Note:** For the Value field, Robert creates a text variable named {!QuestionID} with an Input/Output type of Input and Output.

The *decision* element specifies whether the question should be escalated to a case. It uses the following settings:

- Name = Should be escalated
- Default Outcome = No
- Editable Outcome = Yes
- Flow Conditions = {!BestCommentId} is null {!\$GlobalConstant.True} AND
 {!CommentCount} greater than or equal to 4
- All conditions must be true (AND)

 **Note:** For the Flow Conditions, Robert creates two new variables: a text variable named {!BestCommentId} and a number variable named {!CommentCount}, both with an Input/Output type of Input and Output.

The **FeedItem.EscalateQFToCase** Quick Action escalates the question to a case if the conditions for the **Yes** outcome are met. It uses the follow settings:

- Name = Escalate to case
- In the Inputs section, Related Record ID = `{!QuestionId}`

 **Warning:** Do not edit the name of the **FeedItem.EscalateQFToCase** Quick Action. Editing the name of the action causes it to appear in the action drop-down menu of text, attachment, and link feed posts as well, leading to errors.

Step 4: Add the Flow to the Process

After completing the flow, Robert incorporates it into his process as a scheduled action. First, he specifies that the flow must run 24 hours after a feed item has been created.

Next, he adds the flow to the process with a variable that uses information from the feed item record. He uses the following settings:

- Action Name = Escalate to Case
- Flow = Escalate_Question_to_Case
- **Variable:**
 - Flow Variable = QuestionId
 - Value = `[FeedItem].Id`

Launch a Flow ?

Action Name* i

Escalate to Case

Flow* i

Escalate_Question_to_Case

Set Flow Variables

Flow Variable*	Value*
QuestionID	[FeedItem].Id

[+ Add Row](#)

Step 5: Save and Activate the Process

Take a look at Robert's completed process.

After Robert activates his process, it will run on all future questions that are posted in communities and in Salesforce.

Tip: Robert may want to create a similar process that escalates questions to cases after they receive ten or more likes. He can save time by cloning this process and associating it with a flow that checks the number of likes on questions.

Enable Salesforce Knowledge in Your Community

Enable Salesforce Knowledge to let community users view Knowledge articles.

You can use Communities to access your knowledge base articles if your Salesforce organization has a Salesforce Knowledge license. Once Salesforce Knowledge is enabled, complete the following steps to view articles in your communities.

1. Update profiles:
 - Clone the Customer Community User, Customer Community Plus User, or Partner Community User profiles and enable the "Read" permission for article types you want to share with community users.
 - Verify that the tab visibility for the Articles (or Knowledge) tab is Default On.
 - Remember to click **Edit Profiles**, at the bottom of the detail page, and activate the new profile.
2. Add the Knowledge tab to each community.

 **Note:** Community members without the Knowledge One permission cannot access Knowledge through Communities. They also can't access Knowledge in communities via the Salesforce1 mobile browser and downloadable apps.
3. If you want your community users to have different category group visibility settings, change the visibility settings by permission set, profile, or role. For example, you can prohibit users with the Customer Community User profile from seeing articles in a certain category group by changing the data category visibility for that profile.
4. Notify users who create articles that they must select **Customer** for users with Customer Community or Customer Community Plus licenses, or **Partner** for users with Partner Community licenses, as a channel option when creating or modifying an article. If the appropriate channel is not selected, the article is not published in the community.

SEE ALSO:

- [Salesforce Knowledge Overview](#)
- [Setting Up Salesforce Knowledge](#)

EDITIONS

Available in: Salesforce Classic

Communities is available in: **Enterprise, Performance, Unlimited, and Developer** Editions.

Salesforce Knowledge is available in: **Performance** Edition.

Salesforce Knowledge is available for an additional cost in: **Enterprise, Unlimited, and Developer** Editions.

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND is a member of the community they're trying to update

To set up Salesforce Knowledge, create article types and article actions, and modify category groups assignments:

- "Customize Application"

AND

"Manage Salesforce Knowledge"

To assign user licenses:

- "Manage Internal Users"

To create data categories:

- "Manage Data Categories"

Enable Ideas in Your Community

Ideas enable a group of users to post, vote for, and comment on ideas. Enabling Ideas in a community provides an online, transparent way for you to attract, manage, and showcase innovation.

To manage organization-wide settings for Ideas, follow these high-level steps:

1. From Setup, enter *Ideas Settings* in the Quick Find box, then select **Ideas Settings**

- a.** To enable Ideas for your organization, select the **Enable Ideas** checkbox.
- b.** Optionally, select **Enable Text-Formatting**, **Images and Links** to enable the Ideas HTML editor, which gives users WYSIWYG HTML editing and image referencing capabilities when they post or comment on ideas.

Once you enable the HTML editor, you can't disable it.

- c.** Ensure that the multi-select **Categories** field is enabled by clicking the **Enable** button located below the Categories message at the top of the page. This button is not displayed if your organization already has the **Categories** field enabled.
- d.** To let Ideas members associate more than one category with an idea, select **Enable Categories**. Once you enable multi-select categories, you can't disable it.
- e.** To let users earn points and ratings based on their activity in each zone, select **Enable Reputations**.
- f.** In the **Half-Life (in Days)** field, enter the number of days.

The half-life setting determines how quickly old ideas drop in ranking on the Popular Ideas subtab, to make room for ideas with more recent votes. A shorter half-life moves older ideas down the page faster than a longer half-life.

2. Define and customize fields for Ideas:

- a.** Define picklist values for the **Categories** and **Status** fields.

Make sure that you add the categories and statuses to the zones you'll be including in the community.

- b.** Set field-level security for standard and custom fields.
- c.** Create custom fields and set validation rules on them.

Custom fields appear in the Additional Information section on the Post Idea and Idea Detail pages.

- d.** Optionally, add the **Attachment** field to the layout and set field-level security to enable users to add files to their ideas.

- 3.** To enable experts within your zones, create a public group that includes these users.
- 4.** Optionally, enable Idea Themes in your organization.
- 5.** Create one or more zones to organize ideas into logical groups, and associate the zones with the community.
- 6.** Customize your Ideas page layouts to display the information you want to see.
- 7.** Create validation rules that prevent offensive language from being used in the zone
- 8.** Set up Apex triggers and validation rules for comments on ideas.
- 9.** Enable user profiles for community members and moderators and ensure the profiles can access Ideas.
- 10.** Add the Ideas tab and the Idea Themes tab to the community.

- "Customize Application"

Enable Leads for Partner Users

Enable leads for partner users so that they have access to and can create leads in your communities.

When you enable leads for partner users in your community, you can assign leads to those members. Additionally, partner users can edit leads, create leads, import leads, and also mass update leads in a list view.

1. In Community Management, click **Administration > Tabs**, and add the **Leads** tab to the list of available tabs in your community.
2. In Setup, set tab visibility and object permissions. You can either set them on the profile or using a permission set. We recommend using a permission set if you plan to apply these permissions selectively.
 - a. If using a permission set, use the following settings for leads:
 - In the Tab Settings, select Available and Visible.
 - In the Object Settings, select “Read,” “Create,” and “Edit.”
 - b. If using a profile, such as the Partner User profile, set the leads tab setting to `Default On` and enable the “Read,” “Create,” and “Edit” object permissions for leads.
3. Optionally, you can assign extra permissions that enable advanced features for your partners. If you plan to apply these permissions to only some of your partner users, we recommend creating separate permissions sets.

Note: Partner users with legacy portal licenses can use these advanced features in communities, but not in portals.

EDITIONS

Available in: **Salesforce Classic**

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To enable leads for partner users:

- “Manage Profiles and Permission Sets”

Feature	Partner User Permission Needed
To import leads using the Import Leads link on the Leads tab in your community.	“Import Leads”
If your partner user is importing leads, it might also make sense to allow them to import accounts and contacts using the Import My Organization’s Accounts & Contacts link on the Accounts and Contacts tabs in your community.	AND Optionally, “Import Personal Contacts”
To change the status of multiple leads via the Change Status button.	“Manage Leads”
To change the owner of multiple leads via the Change Owner button.	“Transfer Leads”

Set Up Approvals for External Users in Your Community

Customer and partner users in your community can be assigned as approvers on records or added directly to queues. They can see and take action through the My Approvals and Approval History related lists on the record. Approvals can also be triggered directly from the Chatter feed.

An approval process is an automated process your organization can use to approve records in Salesforce. An approval process specifies the steps necessary for a record to be approved and who must approve it at each step. A step can apply to all records included in the process, or just records that meet certain administrator-defined criteria. An approval process also specifies the actions to take when a record is approved, rejected, recalled, or first submitted for approval.

Note:

- Users with high-volume licenses, such as High Volume Customer Portal and Authenticated Website, can't approve records.
- External users with legacy portal licenses can approve records in communities, but not in portals.

When setting up approvals or queues, use the lookup fields to find customer and partner users.

For example, when setting up an approval, if you want to automatically assign a customer user as an approver use the lookup list to find and specify the user.

If you set up email notifications for your approval workflows, emails are sent based on community membership. If the user is a member of multiple active communities, the email comes from the oldest active community. Any links included in the email point users directly to the approval within the community.

In Salesforce1, users can see and take action from the Approval History related list, but they can't submit requests for approval. To submit requests for approvals, the user must do so from the full Salesforce site.

USER PERMISSIONS

To create, edit, delete, or clone approval processes:

- "Customize Application"

To create or change queues:

- "Customize Application"

AND

"Manage Public List Views"

Security and Authentication

Authentication Options

Here's an overview of the user authentication options available in Communities.

- Your organization's internal users who belong to a community are required to follow the employee login flow and use their Salesforce username and password.
- The default login option for external users is the username and password that Salesforce assigned for the community. External users are users with Community, Customer Portal, or partner portal licenses.
- If your organization uses single sign-on for identity management, you can use SAML for single sign-on. This allows external users to log in to Salesforce using your corporate identity provider. Communities supports multiple SAML configurations. See [Configure SAML for Communities](#) on page 3014.

 **Note:** All authentication options also work with custom HTTPS web addresses.

Your organization can allow authentication via an external service provider such as Facebook®, Janrain®, or Salesforce. See [Configure Authentication Providers](#) on page 3017.

If you want to integrate communities into custom branded apps such as mobile or desktop apps, you can [create branded authentication flows using OAUTH](#).

SEE ALSO:

[Customize Login, Logout, and Self-Registration Pages in Your Community](#)

Configure SAML for Communities

If your organization uses an existing single sign-on capability to simplify and standardize your user authentication, you can extend this capability to communities.

The following information assumes that you are already familiar with Security Assertion Markup Language (SAML) authentication protocols and know how to work with your identity provider to configure single sign-on for your organization. When implementing SAML for communities, the key is to use the community URL associated with login for the single sign-on flow. Also make sure that the community URL in the SAML assertion POST includes `/login`.

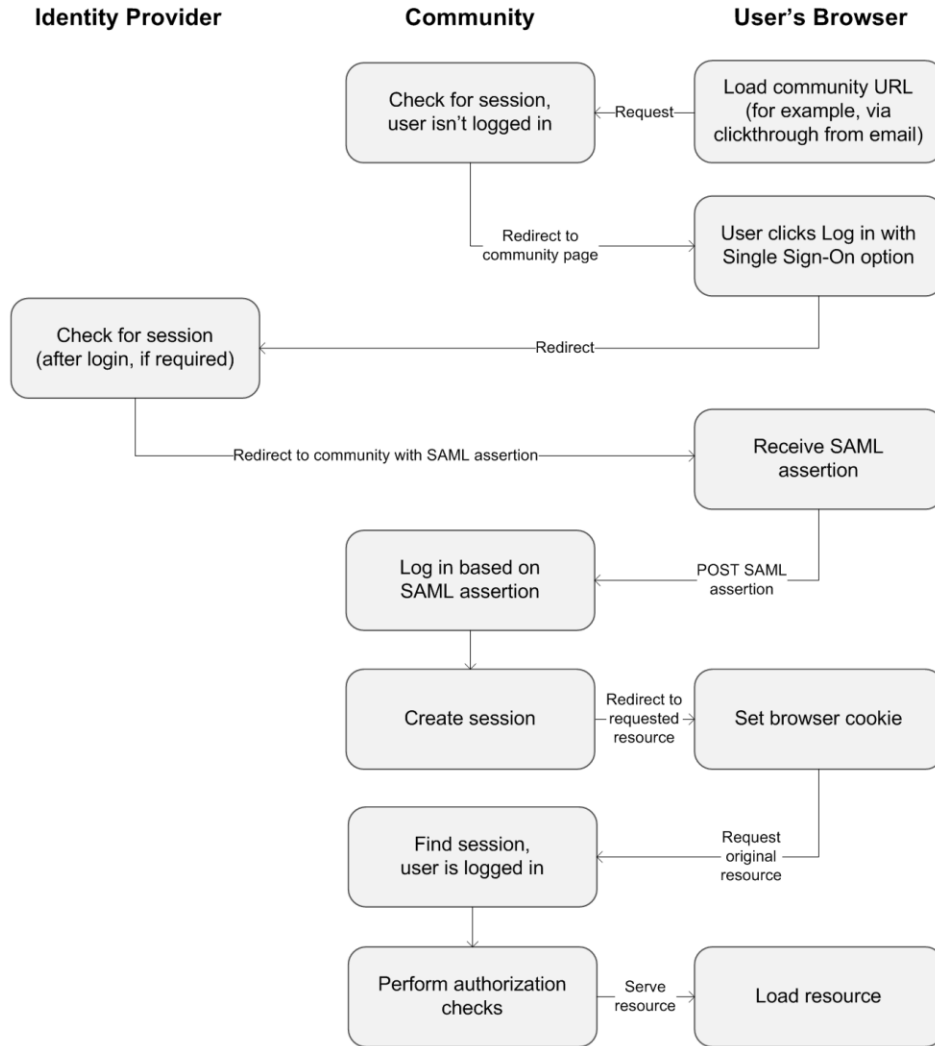

Here is a summary of how SAML requests and responses are processed between the user's browser, the community, and your identity provider.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

This table compares what's required for community SAML assertions to what's required for other types of Salesforce domains.

Requirement	Standard	Portal	Force.com Sites	Community
URL where SAML assertion POST is made.	login.salesforce.com	login.salesforce.com	login.salesforce.com	<i>community URL</i>
Are <code>organization_id</code> and <code>portal_id</code> required in assertion?	No	Yes—passed as an attribute	Yes—passed as an attribute	No  Note: Required if using Just-in-Time provisioning to create portal users in the community. Community-specific portal users can be provisioned with <code>portal_id</code> excluded.
Is <code>siteUrl</code> required in assertion?	No	No	Yes—passed as an attribute	No

The following sample SAML assertion shows the community URL specified as the Recipient, for a sample customer community in the Acme organization. This example applies to an organization that has a single SAML configuration.

```
<samlp:Response ID="_f97faa927f54ab2c1fef230eee27cba21245264205456"

        </saml:SubjectConfirmation>
      </saml:Subject>

      <saml:Conditions NotBefore="2009-06-17T18:43:25.456Z"
        NotOnOrAfter="2009-06-17T18:48:25.456Z">

        <saml:AudienceRestriction>
          <saml:Audience>https://saml.salesforce.com</saml:Audience>
        </saml:AudienceRestriction>
      </saml:Conditions>

      <saml:AuthnStatement AuthnInstant="2009-06-17T18:43:25.456Z">

        <saml:AuthnContext>
          <saml:AuthnContextClassRef>urn:oasis:names:tc:SAML:2.0:
            ac:classes:unspecified
          </saml:AuthnContextClassRef>
        </saml:AuthnContext>
      </saml:AuthnStatement>

    </saml:Assertion>
  </samlp:Response>
```

If your organization has multiple SAML configurations, the previous sample SAML assertion applies but note these differences in the Recipient.

- The trailing slash after `login` is not required

- The `so` parameter is required and must specify the organization ID

The Recipient would look like this:

```
Recipient="https://acme.force.com/customers/login?so=00DD000000JsCM"
```

When logging out of a community, external users authorized using SAML for single sign-on are redirected to the Identity Provider Logout URL, if one is set in the community's SAML settings. To access the SAML settings, from Setup, enter *Single Sign-On Settings* in the Quick Find box, then select **Single Sign-On Settings**.

SEE ALSO:

[Example SAML Assertions](#)

[Best Practices for Implementing Single Sign-On](#)

[Single Sign-On with SAML on Force.com](#)

Configure Authentication Providers

External users can log in using their credentials from Facebook[®], Janrain[®], or another Salesforce organization if you set up authentication providers on the Auth. Providers page in Setup and choose to display them on the community login page.

 **Note:** The following information assumes that you are familiar with the use of authentication providers for single sign-on.

If you're using a custom Visualforce login page instead of the default login page, use the `Single Sign-On Initialization URL` from an Auth. Provider detail page as the target URL of a custom login button. For example:

```
https://login.salesforce.com/services/auth/sso/orgID/URLsuffix?community=https://acme.force.com/support
```

If you're using Janrain as the authentication provider you can pass the following to the Janrain login widget that's deployed on your site.

```
janrain.settings.tokenUrl='https://login.salesforce.com/services/authcallback/orgID/URLsuffix'+ '?flowtype=sso&community='+encodeURIComponent('https://acme.force.com/customers');
```

SEE ALSO:

[About External Authentication Providers](#)

[Using Request Parameters with Client Configuration URLs](#)

[Customize Login, Logout, and Self-Registration Pages in Your Community](#)

Configure Authentication Flows with OAuth

If your organization wants to build integrations between communities and custom-branded apps, such as mobile or desktop apps, you can use OAuth to create a branded login page.

The following information assumes that you're familiar with OAuth protocols and authentication flows for remote access applications. Communities support all available authentication flows, except for the username-password OAuth authentication flow and the SAML assertion flow. When implementing branded OAuth flows for communities, you configure the authorize URL to use the community URL. The authentication flow then directs users to the application approval page.

 **Note:** As a security measure, when administrators are logged in as another user, they can't authorize OAuth data access for that user. For example, admins can't authorize OAuth access to user accounts, including single sign-on to third-party applications.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

For example, to authenticate a user using an authorize URL like the following:

```
https://login.salesforce.com/services/oauth2/authorize?
response_type=token&client_id=your_app_id&redirect_uri=your_redirect_uri
```

Replace the `login.salesforce.com` host name with the full path to the community URL:

```
https://acme.force.com/customers/services/oauth2/authorize?
response_type=token&client_id=your_app_id&redirect_uri=your_redirect_uri
```

When implemented successfully, this URL directs users to the community login page. After they authorize the app, you then set a user access token and refresh token for future authentication. In requests for the token endpoint, replace the host with the community, like this:

```
https://acme.force.com/customers/services/oauth2/token
```

 **Note:** After you acquire the `access_token` you can pass it as a Bearer token in the Authorization header request. Following is an example of a REST API call to communities: `https://acme.force.com/customers/services/data/v32.0/-H "Authorization: Bearer 00D50000000IehZ\!AQcAQH0dMHZfz972SzmPKb58urFRkgeBGsxL_QJWwYmFAbUeeG7c1E6LYUfiDUkWe6H34r1AAwOR8B8fLEz6n04NPGRrq0FM"`

Design and Page Management

Plan Your Community Design Strategy

If you chose to use custom pages in your community instead of out-of-box tabs and branding, you need to [decide whether to use Community Builder or Force.com](#). Once you make the decision, use the following sections to help you customize community pages:

- [Use Visualforce and Force.com Sites](#)
- [Using Community Builder With Templates](#)
- [Use Community Builder \(Site.com\) Without Templates](#)

You can also customize these other areas of your community:

- [Add the Global Search Box to Your Customized Community HTML Header](#) on page 2979
- [Configure a Custom Domain for Your Community](#)
- [Rename the Chatter Tab](#)

Choosing Between Community Builder and Force.com Sites

If you want to add new pages or customize existing pages in your community, you can use Force.com Sites or Community Builder. With either option, you can create branded, publicly available pages such as landing or marketing pages, and private custom pages that only community members can access.

So which option should you use to customize your community? Well, that depends on your skills and the needs of your organization. You can even use a mixture of Force.com pages and Community Builder pages for complete control over your customizations.

Community Builder

Community Builder is an intuitive, convenient tool for customizing your community. Community Builder lets you create a community based on a preconfigured template, and then apply branding, edit pages, update your template, and publish changes all from one user-friendly interface.

Here's what you can achieve with Community Builder:

- Use one of the self-service templates—Koa, Kokua, or Napili—to easily create a responsive self-service community.
- Use the Aloha template to create a configurable App Launcher.
- Design pixel-perfect, branded pages.
- Create public pages that anyone can access, or add private pages that you can add as a tab within your community.
- Build and iterate quickly using drag-and-drop reusable page elements.
- Use ready-made forms to create web-to-lead forms or gather customer feedback.
- Create data-driven pages, such as product catalogs or other listings, using your organization's data.
- Set a home page and set up multilingual support for your community in Site.com Studio, a Web content management system that provides extra configuration options. Site.com Studio is easily accessible from Community Management.

Force.com Sites

Suitable for developers with experience using Visualforce, Force.com Sites lets you build custom pages and Web applications by inheriting Force.com capabilities including analytics, workflow and approvals, and programmable logic. So if you are looking to create sites programmatically using Apex and APIs, Force.com Sites is the product for you. Here's what you can achieve with Force.com:

- Create public, branded pages that anyone can access.
- Leverage Visualforce to create private pages that you can add as a tab within your community.
- Write your own controllers, or extensions to controllers, using Apex code.
- Create custom login or self-registration pages.
- Build dynamic web applications, such as an event management application.

Features At a Glance

Still unsure which product to choose? Take a look at this table to learn more about each product's features.

Feature	Community Builder	Force.com Sites
Public pages		
Community templates (Koa, Kokua, Napili, Aloha)*		
Authenticated pages*		
Visualforce pages		
Out-of-the-box login, logout, self-registration, and error pages		
Drag-and-drop environment		

Feature	Community Builder	Force.com Sites
Reusable components	✓	
Pixel-perfect designs	✓	✓
IP restrictions	✓	✓
Access to data, such as cases, leads, and opportunities	✓	✓
Ready-made forms	✓	
CMS	✓	
Programmatic page creation (using Apex, APIs, and controllers)		✓
Web applications		✓
Analytics, reports, and workflows		✓
Full Force.com platform capability		✓

*Available in Community Builder for Communities users only.

To learn more about Community Builder, Force.com, and Site.com technologies, see:

- [Community Builder Overview](#) on page 3027
- [Force.com Sites Overview](#) on page 4497

- [Use Community Builder \(Site.com\) Without Templates](#)
- [Use Visualforce and Force.com Sites](#)

Use Community Builder With Templates

Community Builder in conjunction with community templates for self-service lets you create, brand, and publish a custom community that looks great on any mobile device! Choose a template to quickly start your community, and then style the pages to match your company's branding.

With Community Builder and templates you can:

- [Quickly style the community](#) to match your company's branding.
- [Edit community pages and components with the Community Builder](#) to customize their design and content.
- [Preview your community](#) to ensure that it appears correctly on different devices.
- [Publish your changes](#) to make them available to everyone in your community.
- [Apply template updates](#) to your community as soon as they become available.

You can use the Community Builder to customize communities created using these templates:

Kokua

A visually rich, responsive self-service template that lets users search for and view articles or contact support if they can't find what they're looking for. Supports Knowledge and Cases.

Koa

A text-based, responsive self-service template that lets users search for and view articles or contact support if they can't find what they're looking for. Supports Knowledge and Cases.

Napili

A powerful, responsive self-service template that lets users post questions to the community, search for and view articles, and contact support agents by creating cases. Supports Knowledge, Cases, and Questions & Answers.

Aloha

A configurable App Launcher template that lets users quickly find applications and access them using single sign-on authentication. For more information, see [Getting Started with Community Templates for Salesforce Identity](#).

To access Community Builder and continue customizing your community or update its template version:

1. From Setup, enter *All Communities* in the **Quick Find** box, then select **All Communities**.
2. Next to the community name, click **Manage**.
3. Click the Community Management menu in the global header, then click **Go to Community Builder**.
4. In Community Builder, you can:
 - [Brand your community](#) on page 3029
 - [Edit community pages and page components](#).
 - [Update your community template](#).

 **Note:** Community Builder doesn't support branding for sites that weren't created using one of the preconfigured templates. Instead, you must use Site.com Studio. To get there, click Site.com Studio from the Communities menu in the toolbar.

To learn more about using the Kokua, Koa, and Napili templates, see the [Community Templates for Self-Service Implementation Guide](#).

SEE ALSO:

[Choosing Between Community Builder and Force.com Sites](#)

Use Community Builder (Site.com) Without Templates

Each community has one associated Site.com site that lets you add custom, branded pages to your community. By default, Site.com pages are publicly available and don't require login, but you can also create private pages that only community members can access.

For more detailed information about using Site.com, check out the online help.

Before You Begin

Communities users with the "Create and Set Up Communities" permission automatically have full site administrator access to a community's Site.com site. To let Communities users without the permission edit the site, you must purchase and assign either a Site.com Publisher or a Site.com Contributor feature license, and assign a user role at the site level.

See [About Site.com User Roles](#) on page 4327.

Tips and Considerations

- Communities users with the “Create and Set Up Communities” permission are assigned the role of site administrator in a community’s Site.com site. However, they don’t appear in the User Roles section on the Overview tab of Site.com Studio.
- You can’t create, delete, or duplicate community sites in Site.com.
- When working with data-bound components, such as data repeaters and forms, keep in mind that the objects listed may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site’s guest user profile.
- When adding forms to authenticated community pages in Site.com, set the current user for Salesforce objects that require the Owner ID field. Setting the current user (as opposed to the default guest user) lets you identify the authenticated user when the form is submitted. To set the current user for the Owner ID field, select the field in the form, click **Configure** under Field Properties in the Properties pane, select `Global Property` as the source, and select `Current userID` as the value.
- The home page, 404 page, login page, and self-registration page that you specify for Site.com Community sites in Site Configuration set the default pages for the Site.com Community site. These default URLs are used unless you specify different URLs in Community Management under **Administration > Pages** and **Administration > Login & Registration**. Community error pages are specified in Force.com Setup, under Error Pages.
- When your Site.com Community site is inactive, users are redirected to the Service Not Available page defined in Community Management under Pages.
- The contributor’s view is not available by default for Site.com Community sites. However, you can use a Site.com Contributor license to grant contributor access to a specific user. See *About Feature Licenses* in the Site.com help for details. Alternatively, a user can preview the Site.com Community site as a contributor by appending `?iscontrib` to the site’s URL. For example:
`https://sitestudio.na1.force.com/?iscontrib`

SEE ALSO:

- [Choosing Between Community Builder and Force.com Sites](#)
- [Use Site.com to Customize Your Community](#)
- [Salesforce Communities Overview](#)

Use Visualforce and Force.com Sites

Each community has one associated Force.com site that lets you make advanced customizations to your community. For example, with Force.com Sites you can:

- Add public pages to your community that don’t require login.
- Use branded self-registration and login pages to enable users to register for or log into your community.
- Customize out-of-the-box error pages to reflect the branding of your community, including “Authorization Required (401)” and “Page Not Found (404)” pages.
- Leverage Visualforce pages to create private pages that only community members can access.

For detailed information about using Force.com Sites, refer to the online help.

Tips and Considerations

- Force.com Sites pages automatically include the branding styles you specify in the Create Community wizard. To disable these styles, set the `standardStylesheets` attribute on the `<apex:page>` tag to `false`.
- Consider these limitations when using Force.com Sites with Communities:
 - Out-of-the-box RSS feeds, analytics tracking, and custom portal profile pages aren’t available.

- Custom change-password pages aren't available.
- Login to custom domains is only available with HTTPS.
- Because Force.com sites are served directly from the Force.com organization, a site's availability is directly related to the organization's availability. During your organization's maintenance window for major releases, your sites will be unavailable; users who try to access a site will see a Force.com-branded maintenance page or your custom Service Not Available Page.
- You can redirect a community home page to its companion Site.com home page. To do this, set a URL Redirect on the Force.com site detail page. Set the Source URL to /, which represents the home page for the community, and set the Target URL to s, which represents the home page for the Site.com site.

Custom Community Pages

Override Default Pages in Your Community with Custom Pages

Use company-branded Community Home and Service Not Available pages by overriding the standard pages in your community.

- [Use a Custom Community Home Page](#)
- [Use a Custom Page for Service Unavailability](#)

You can override other default community pages in the Site.com or Force.com settings for the community. To do this, click the Community Management menu in the global header and then click **Go to Force.com** or **Go to Site.com Studio**. Page selections in Community Management automatically override any previously specified page selections in the Site.com or Force.com settings.

Use a Custom Page for Service Unavailability

On rare occasions, if your community is not available because of a service outage, Salesforce displays a generic Service Not Available page with Force.com branding. You can replace this page with a custom company-branded static resource page for a personalized user experience for your community members.

The Service Not Available static resource:

- Must be a public .zip file 1 MB or smaller.
- Must contain a page named `maintenance.html` at the root level of the .zip file. Other resources in the .zip file, such as images or CSS files, can follow any directory structure.
- Must contain only files that have file extensions.

For more information, refer to *Assigning Force.com Site Error Pages* in the Salesforce Help.

1. Access Community Management in either of the following ways.
 - From the community, click  in the global header.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities**. Then click **Manage** next to the community name.
2. Navigate to **Administration > Pages**.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

3. Click  next to **Service Not Available** to search for and select your custom page.
4. Click **Save**.

If there is a service outage at any time, your community displays your selected page. A couple things to keep in mind:

- This page selection doesn't affect communities that use Site.com Studio pages.
- The Service Not Available page, once customized, is available for all communities in the same domain. Depending on the needs of your organization, this might not be desirable. To avoid using the same page for all the communities in your domain, create and assign separate Service Not Available pages for each community.

For example, consider a scenario where you have two communities in your domain: a customer community (`universaltelco.force.com/customer`) and a partner community (`universaltelco.force.com/partner`). If you use a custom Service Not Available page for only the customer community, then the partner community will display the same page during a service outage, unless you create and assign a separate Service Not Available page to the partner community.

SEE ALSO:

[Override Default Pages in Your Community with Custom Pages](#)

Use a Custom Community Home Page

Personalize the standard community home page with company branding by using a custom Community Builder (Site.com Studio) or Visualforce page.

The community home page is shown to unauthenticated users in a public community and it allows you to specify a landing page for guest users without setting up redirects. This page is also known as your Active Site Home page.

1. Access Community Management in either of the following ways.
 - From the community, click  in the global header.
 - From Setup, enter *All Communities* in the **Quick Find** box, then select **All Communities**. Then click **Manage** next to the community name.
2. Click **Administration > Pages**.
3. For the Community Home page:
 - a. Select the page type: **Community Builder** or **Visualforce**.
 - b. Enter the name of the page or leave the field blank to get a list of available options.
 - c. Click , then click the name of the page in the search results to select it.

 **Note:** Only published Community Builder (Site.com Studio) pages are included in the search results.
4. Click **Save**.

Page selections in Community Management automatically override any previously specified page selections in the Site.com or Force.com site properties.

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Configure the Default Community Login Page to Use a Custom Home Page

If you're using external authentication providers and a custom home page, ensure that users are accessing the correct home page.

To do so, edit the `CommunitiesLandingController` so that it has the correct `startURL` for your community. The `CommunitiesLandingPage` is the Active Site Home Page for your community, meaning that it is shown when someone enters a direct URL to your community. For instance, if your domain is `universaltelco.force.com` and your community URL is `customers`, the `CommunitiesLandingPage` is shown when someone enters `http://universaltelco.force.com/customers`.

There are 2 methods for using a custom home page:

- Update the `CommunitiesLandingController` code to redirect to the new page:
 1. From Setup, enter `Apex Classes` in the `Quick Find` box, then select **Apex Classes**.
 2. Click **Edit** next to `CommunitiesLandingController`.
 3. Replace the code so that it reads:

```
public with sharing class CommunitiesLandingController {
    // Code we will invoke on page load.
    public PageReference forwardToStartPage() {
        String communityUrl = 'https://universaltelcom.force.com';
        String customHomePage = '/apex/hello';
        if (UserInfo.getUserType().equals('Guest')) {
            return new PageReference(communityUrl + '/login?startURL=' +
EncodingUtil.urlEncode(customHomePage, 'UTF-8'));
        }else {
            return new PageReference(communityUrl + customHomePage);
        }
    }
}
```

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To access Community Management:

- "Manage Communities" OR "Create and Set Up Communities"
- AND is a member of the community whose Community Management page they're trying to access

To customize administration settings:

- "Create and Set Up Communities"
- AND is a member of the community whose Community Management page they're trying to access

To edit Apex classes:

- "Author Apex"

```
public CommunitiesLandingController() {}
}
```

4. Replace `https://universaltelcom.force.com` with the URL for your community.
 5. Click **Save**.
- Alternatively, you can replace the Active Site Home Page with a custom Visualforce page.
 1. From Setup, enter *All Communities* in the Quick Find box, then select **All Communities**.
 2. Click the **Manage** button next to the community name.
 3. Click **Administration > Pages > Go to Force.com**.
 4. In the Site Detail section, click **Edit**.
 5. In the **Active Site Home Page** field, select your custom Visualforce page.
 6. Click **Save**.

When a user enters the community URL, they see the new Active Site Home Page.

SEE ALSO:

[Use a Custom Community Home Page](#)

Add Custom Pages That Don't Require Login

Within a community, you can have publicly available pages that are accessible without requiring login, making them ideal for landing or marketing pages.

Communities leverage Force.com Sites technology to set a custom domain for your organization and a URL prefix for each community created in your organization. If you want to further customize your communities beyond what's available in setup, you can use Force.com Sites or Site.com to create completely customized pages.

 **Tip:** Communities can have a combination of Visualforce and Site.com pages. By default, the pages you create don't require login, but you can add authenticated pages if needed.

1. Access Community Management in either of the following ways.
 - From the community, click  in the global header.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities**. Then click **Manage** next to the community name.
2. Click **Administration > Pages** and then in the Advanced Customizations area, click either:
 - **Go to Force.com** to create pages that don't require login or edit out-of-the-box error pages.
 - **Go to Site.com Studio** to open Site.com Studio, where you can create public, branded pages. (You can also create authenticated pages that require login.)
3. After you create a public page in Site.com Studio, you must publish the Site.com site to allow users to access the page.

For more information about creating pages, refer to these resources:

- [Creating Site.com Pages](#) on page 4380
- [Managing Force.com Site Visualforce Pages](#) on page 4518
- [Managing Force.com Site Standard Pages](#) on page 4519

Customize Templates with Community Builder

Community Builder Overview

Community Builder in conjunction with community templates for self-service lets you create, brand, and publish a custom community that looks great on any mobile device! Choose a template to quickly start your community, and then style the pages to match your company's branding.

With Community Builder, you can:

- [Quickly style the community](#) to match your company's branding.
- [Edit community pages and components with the Community Builder](#) to customize their design and content.
- [Preview your community](#) to ensure that it appears correctly on different devices.
- [Publish your changes](#) to make them available to everyone in your community.
- [Apply template updates](#) to your community as soon as they become available.

Community Builder works in conjunction with all of the preconfigured templates.

 **Note:** If you don't want to use the preconfigured templates, you can still create a custom community in Site.com Studio. However, you won't be able to use Community Builder for branding.

To try out a different template, go back to Community Management and change your template selection. But don't worry—you can always switch back to the first template you chose. To switch back, set the home page back to its original URL in Site Configuration in Site.com Studio.

Known Limitations

- Community Builder doesn't support branding for sites that weren't created by using one of the preconfigured templates.

Navigate Community Builder

Community Builder lets you quickly create and style your custom community to match your organization's branding.

From Community Management, click the Community Management menu in the global header, then click **Go to Community Builder** to brand and configure your community.

 **Note:** Remember, Community Builder doesn't support branding for communities that weren't created by using one of the preconfigured templates.

In Community Builder, you can customize the community to suit your needs.

- [Edit your community pages](#) (1) in the Page Editor to add, update, or remove page components.
- [Accept updates](#) (2) to your community's template and [manage your community pages](#).
- [Brand the community](#) (3) to match your organization's style and see your changes immediately appear on the page.
- Navigate (4) to the community page that you want to style by clicking links and navigation menu items.
- Use the Communities menu (5) to:
 - Access Community Management to manage community analytics, login, registration, reputation, topics, and other settings.
 - Go to Site.com Studio to add advanced community customizations.
- [Create a new page](#) (6) to include in your community.
- [See how your community appears on different devices](#) (7).
- [Preview the community](#) (8) in a new browser window.

Brand Your Community with Community Builder

Use Community Builder's enhanced Branding Editor to efficiently apply color and style to your community. Choose a color scheme with the color palette, which provides a wide range of colorized text elements for a personalized design. Match your colors precisely by uploading your own logo to automatically generate a custom color palette.

Each template includes predefined styles to control the appearance of the pages. These styles give you a head start with your community, and you can easily customize the styles further to suit your needs. After you've created a community, brand and style your pages with Community Builder's Branding Editor.

Depending on the template that you select, you can use Community Builder to:

- Apply a color scheme that's appropriate for your template with the color palette.
- Choose colors for text, borders, and button backgrounds.
- Upload your own company logo image to generate a custom color palette based on its main colors.
- Maintain your own color palettes by saving or removing them as needed.
- Specify font family, style, and weight.
- Change header and page background color, font family, font size, and font color.

EDITIONS

Available in: Salesforce Classic

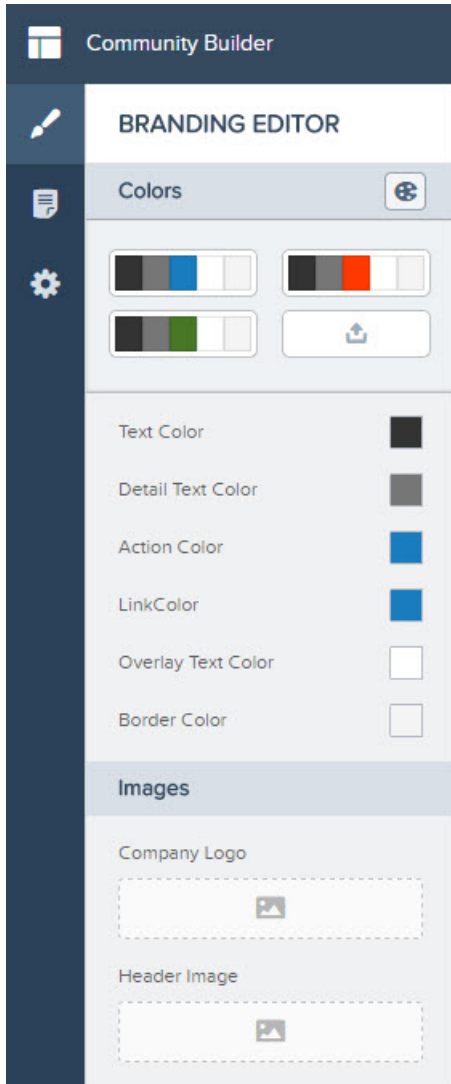

Available in:

- Enterprise
- Performance
- Unlimited

USER PERMISSIONS

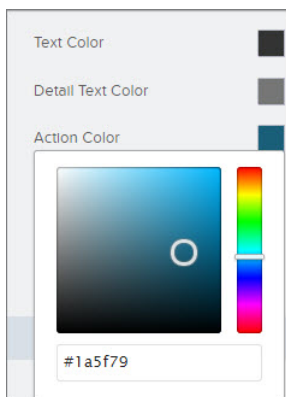

To create, customize, or publish a community:

- "Create and Manage Communities"

 **Note:** The available branding options vary depending on the template that you're using and the page that you've selected.

When you upload your own logo to the Branding Editor, Community Builder extracts its colors behind the scenes, and suggests a set of colors based on those. To modify a suggested color, click the color swatch and adjust the color by using the slider or by entering hex values.

To brand your community:

1. Navigate to the pages that you want to view as you brand by using the Page menu in the toolbar.
2. Define styles, such as:
 - The range of colors that are used by the entire site, by selecting a palette swatch.
 - A specific color, by using the relevant color picker or entering a hex value.
 - An image, by clicking the image area and uploading an image.
 - The font type, size, or weight, by selecting an option in the relevant drop-down list.

Your changes are saved automatically and appear instantly on the page canvas.

3. Use the Communities menu to:
 - Access Community Management to manage community analytics, reputation, and topics.

Create New Community Pages with Community Builder

Create pages for your community to add custom content or share additional Salesforce object data in Koa, Kokua, and Napili templates. This allows you to extend the community template functionality to meet your business requirements.

Important: This functionality is available only in communities using the Winter '16 version of the Koa, Kokua, and Napili templates.

1. From Community Management, click the Community Management menu in the global header, then click **Go to Community Builder**.
2. In Community Builder, click  on the left to display the Page Editor.
3. In the toolbar, click **New Page**.

4. Select the page type. Then, follow the prompts to specify more details about the content and layout.
 - Select **Standard Page** to use a page template or to create a blank page with columns. For example, you can start with the Home page template and customize it to your needs.
 - Select **Data Detail Page** to create a record detail page. When prompted, pick the object you want to associate the page with and then the page layout you want to use.

In Winter '16, we support data detail pages for accounts, contacts, cases, tasks, events, and custom objects.

You can create multiple data detail pages for the same object, but only one can be active at any time. To manage the active page for all objects in your community, go to [Page Management](#) in the Community Builder Settings.

EDITIONS

Available in: Salesforce Classic

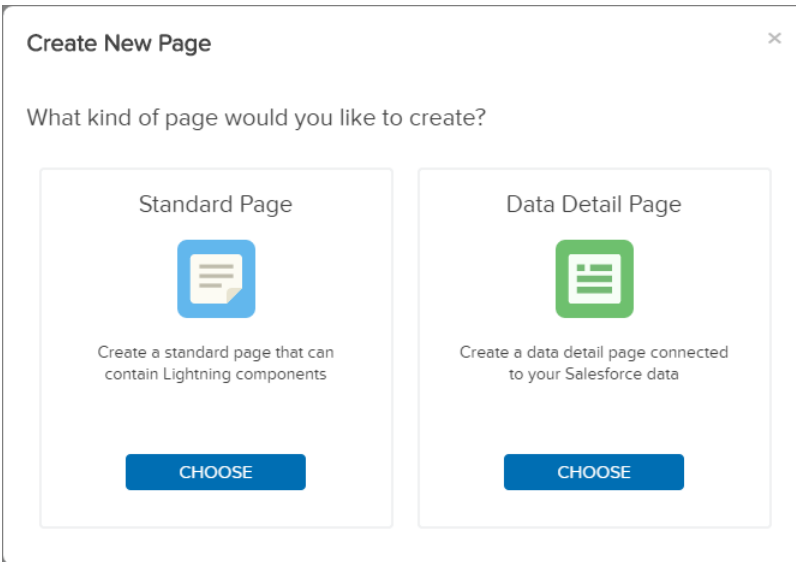

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

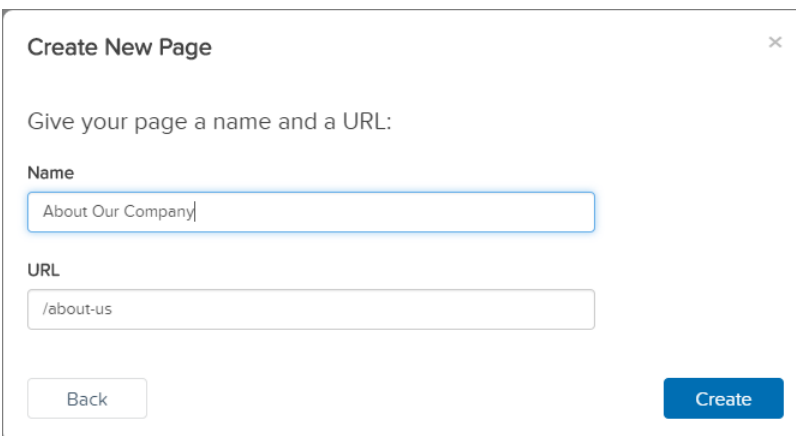

USER PERMISSIONS

To create pages in Community Builder:

- "Create and Manage Communities"

5. Give the page a unique name and URL. For standard pages, you can specify the static portion of the page's URL. For data-driven pages, you can specify the name. All new pages use the community's domain.
 - Page names can be changed. Select the page from the **Page** menu in the toolbar, and then modify its name in the Property Editor on the right.
 - All the data detail pages for an object use this URL format: `<object_name>/<placeholder_record_ID_variable>`. This URL format allows all records of that object to use the same page layout. We recommend that you don't change the record ID variable in the URL to a specific record ID, unless you want to display only a single record on that page.

6. Drag components from the Page Editor on the left to [add and configure page components](#) on the new page.
 - 💡 **Tip:** Spend some time planning the composition of your new page based on the goals for the page. For example, in Napili, you can use a combination of the Record Headline and Record Information components to create a custom record detail page. In Koa and Kokua, you can create custom Data Detail pages, but you first need to create custom Lightning components to display record data.

- Click  and then Page Management to [manage page assignments](#) by object or page type. The selections on this page determine what is displayed in the community.
- Preview and publish your community when you're done.

Tip: Use the Navigation Menu component to create custom navigation nodes for new pages. For more information about templates and components, see [Using Templates to Build Communities](#).

Edit Community Pages and Components in Community Builder

Drag and drop components on to the Community Builder page canvas to add them to your community's pages. Use the Page Editor and Property Editor to select and edit components, and then preview your changes before publishing them from Community Builder.

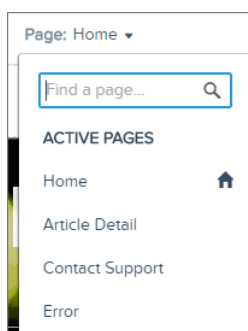

Note: The ability to drag and drop components is available only in the Winter '16 and later versions of the Koa, Kokua, and Napili templates, which have been converted to use Lightning components. When you upgrade to the the Lightning versions of these templates, you can customize pages and components entirely from Community Builder; you no longer need to use Site.com Studio for these communities.

Only the components that are supported on the selected page are available in the Page Editor. For example, you can't add the User Profile Detail component to the Home page. You can also create custom Lightning components and use them on community pages.

Note: For more information on creating custom Lightning components and enabling them for Community Builder, see the [Lightning Components Developer's Guide](#).

- From Community Management, click the Community Management menu in the global header, then click **Go to Community Builder**.
- In Community Builder, click  on the left to display the Page Editor.
- From the Page menu in the toolbar above, search for or select the page to edit. The Page Editor reloads with a list of components that are compatible with the selected page.

- Locate or search for a component from the Page Editor and drag it to the page in an editable area. To edit the properties for a component that already exists on the page, click to select it from the main page canvas. The ability to add a component by dragging it to the page canvas is available only in the Winter '16 version of the Koa, Kokua, and Napili templates. The blue box around the placed component indicates that it's selected for edit. The Property Editor on the right displays the editable properties of the selected component.
- Make your changes.

USER PERMISSIONS

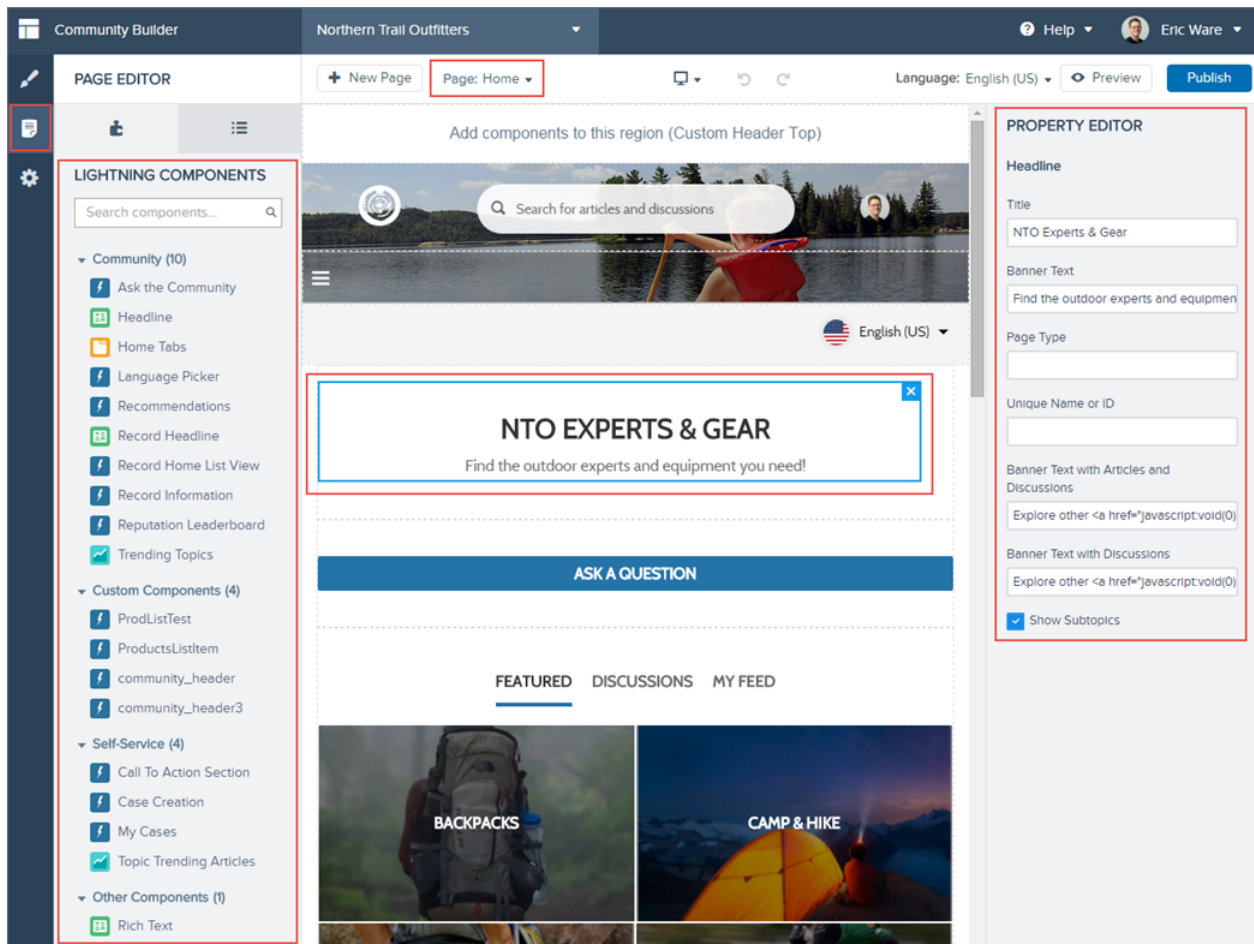

To customize or publish a community:

- "Create and Manage Communities"

- Update the component properties in the Page Editor.
- Click the **x** in the upper-right corner to remove it from the page.
- Undo or redo your changes by clicking  in the toolbar.

 **Note:** Component property fields don't support dynamic expressions. Use plain text only.

 **Example:** Here's a sample configuration of the Headline component on the Home page with the list of supported components and properties.

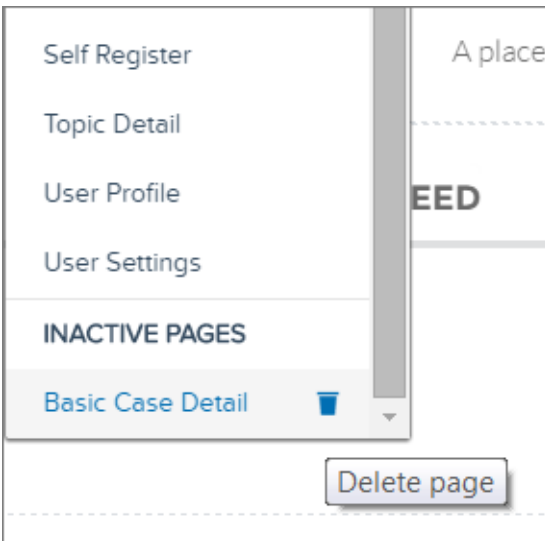

The screenshot displays the Salesforce Community Builder interface for editing the 'Home' page of the 'Northern Trail Outfitters' community. The interface is divided into three main sections:

- Left Sidebar (LIGHTNING COMPONENTS):** A list of components categorized into 'Community (10)', 'Custom Components (4)', 'Self-Service (4)', and 'Other Components (1)'. The 'Headline' component is selected.
- Central Preview Area:** Shows the live view of the page. A search bar is visible at the top. Below it, a headline component is highlighted with a red box, displaying the text 'NTO EXPERTS & GEAR' and 'Find the outdoor experts and equipment you need!'. Below the headline is an 'ASK A QUESTION' button and a 'FEATURED' section with two cards: 'BACKPACKS' and 'CAMP & HIKE'.
- Right Sidebar (PROPERTY EDITOR):** A panel for configuring the selected 'Headline' component. It includes fields for:
 - Title:** NTO Experts & Gear
 - Banner Text:** Find the outdoor experts and equipment
 - Page Type:** (empty field)
 - Unique Name or ID:** (empty field)
 - Banner Text with Articles and Discussions:** Explore other
 - Banner Text with Discussions:** Explore other
 - Show Subtopics:**

Delete a Community Page in Community Builder

Conveniently remove a community page you no longer need by deleting it from the Page menu in Community Builder.

- You can delete only inactive community pages. To see inactive pages, scroll to the bottom of the Pages menu.
 - You can't delete a Data Detail page if it's the only page associated with a given Salesforce object. If you have more than one Data Detail page for the same object, you can delete the inactive one.
- From Community Management, click the Community Management menu in the global header, then click **Go to Community Builder**.
 - In Community Builder, click  at the left to display the Page Editor.
 - Click the **Page** drop-down in the toolbar.
 - Hover over the page name and then click the trash icon to delete the page.

Share More Salesforce Object Data in Your Community

Napili allows you to share record data for accounts, cases, contacts, tasks, events, and custom objects with minimal configuration. Record data respects user permissions via licenses, profiles, permission sets, and sharing rules.

-  **Note:** You must update your community's template to the Winter '16 version to use this functionality.
- Create a [list of records and link to it](#).
 - [Display record details in your community](#) with the out-of-the-box Record Detail page or create a custom page.

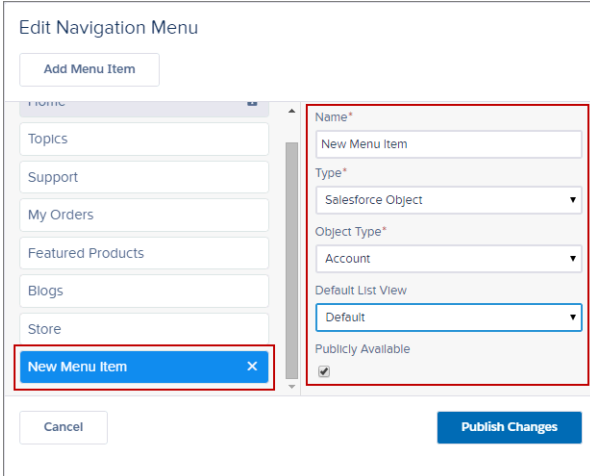

SEE ALSO:

[Using Templates to Build Communities](#)

Share a List of Records in Your Community

Create record list views for accounts, cases, contacts, and custom objects and link to them from the Napili navigation menu. Use an out-of-the-box or custom page layout to display the list of records.

-  **Note:** You must update your community's template to the Winter '16 version to use this functionality.
1. In Community Builder, drag and drop the Navigation Menu component to add it to the appropriate page in the template. We recommend adding it to the Home page.
 2. Create a navigation menu item pointing to a supported Salesforce object. Currently, Napili supports accounts, cases, contacts, and custom objects.

3. Publish your changes.

USER PERMISSIONS

To create, customize, or publish a community:

- "Create and Manage Communities"

 **Note:** If your community is active, your navigation menu item changes will immediately appear to your community members.

That's it! This creates a navigation menu item, which links to a list of the selected object's records. Under the hood, your data is retrieved from Salesforce and displayed using the generic Record List page. This page is available out-of-the-box in Napili and uses the Record Home List View Lightning component to display data in an appropriate layout.

 **Note:** The generic Record List page provides the default list view layout for objects that don't have a predefined or custom list view page assigned. For example, if you create a navigation menu item for another Salesforce object, it uses this same page. If you modify the Record List page, be sure to account for all the affected objects.

 **Example:** A list view page for a custom object called Featured Products.

- Creating a navigation menu item is the easiest way to link to a list of records for an object. If you prefer to use a custom list view page for an object, you can [create a new page](#) for your community using Community Builder. Choose the Standard page type with a single-column layout. Add the Record Home List View component to the page, configure the component properties to point to the object, and then publish the page. To link to the page, create a custom navigation menu item and use the internal page URL.
- Users can access only records they have access to via licenses, profiles, permissions, and sharing rules, same as in Salesforce. Users with the "Create" permission for the object can create records from the list view page. The ability to create records from this page isn't supported on mobile devices.
- You can hide a navigation menu item from guest users to block access to the associated record list view page.
- When users click a record on this page, the record details are displayed using the layout from the generic Record Detail page. If you create a custom record detail page and assign it to the object, we use that page instead.
- Clicking a record in the list view displays the record details, which are displayed using the Record Detail page that comes out of the box with the Napili template.
- The Record List page and the Record Home List View component are not available in the Koa and Kokua templates.

SEE ALSO:

[Using Templates to Build Communities](#)

Display Record Details in Your Community

Display record details using the generic Record Detail page or create custom record detail pages.

Note: You must update your community's template to the Winter '16 version to use this functionality.

Napili supports a record detail page that you can use out of the box with no configuration. All objects in your community without a preassigned record detail page use this generic page, called Record Detail, to display record data. For example, consider the scenario where a user lands on a case detail page (that uses a preassigned case detail layout) and clicks on a contact in the related records. If you haven't created a custom record detail page for contacts, the contact information is displayed using the generic Record Detail page. Under the hood, the Record Detail page uses the Record Headline and Record Information Lightning components to display record data.

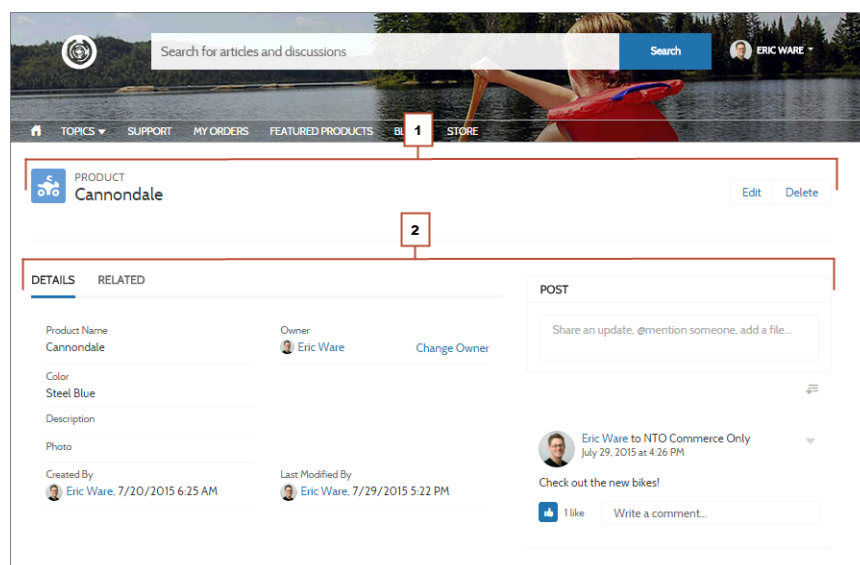

- **Record Headline:** Displays the record name and key record highlights along with buttons to edit and delete the record.
- **Record Information:** Displays all record details including related records and the record feed. It also allows users to create new related records and post to the record feed.

Optionally, you can create custom record detail pages for accounts, contacts, cases, tasks, events, and custom objects.

1. [Create a new Data Detail page](#) in Community Builder and pick a supported object.
2. Add the Record Headline and Record Information components to the page and configure the component properties from the Property Editor on the right.
3. Click  to access Page Management in the Community Builder settings, and then [select the custom page as the active page](#) for the object.
4. Publish your changes.

Note: If your community is active, your navigation menu item changes will immediately appear to your community members.

Example: The record detail page for a custom object with the Record Headline (1) and Record Information (2) components.

USER PERMISSIONS

To create, customize, or publish a community:

- "Create and Manage Communities"

- Some objects have preassigned, active record detail pages to display record data (such as cases). You can check the available pages and assignments for each object in Community Builder settings, under Page Management.
- We don't block unsupported objects (such as leads and opportunities) from related lists. When a user clicks on a record for an unsupported object, the generic Record Detail page is used to display record data. When a user expands a list of related records, the generic Related Record List page is used to display the list.
- Objects without preassigned record detail pages use the generic Record Detail page. If you modify the Record Detail page layout or configuration, be sure to account for all objects that use this page layout.
- Users without the necessary license, profile, and permissions can't access record data.
- Users with the necessary permissions can create records from the related lists, and edit and delete the record from the record headline. These actions aren't supported on mobile devices.
- Page layouts for each object in Salesforce determine what fields display in the Record Information component, and the fields in the Highlight Panel layout determines what displays in the Record Headline component. This feature includes support for record types.
- You must enable feeds on records in Salesforce to allow users to post on them in communities.
- The Record Detail page, the Record Headline component, and Record Information component are not available in the Koa and Kokua templates.

SEE ALSO:

[Using Templates to Build Communities](#)

Manage Active Community Pages in Templates

View and select active pages for each object and page type in communities built with the Koa, Kokua, and Napili templates.

 **Important:** This functionality is available only in communities using the Winter '16 version of the Koa, Kokua, and Napili templates.

You can create multiple custom pages for the same purpose, but only one can be active at a time in your community. For example, you can choose to create multiple Case Detail pages, and select the latest version as the active page in your community. This automatically deactivates the default Case Detail page defined in the template. You can change the active page selection at any time.

1. From Community Management, click the Community Management menu in the global header, then click **Go to Community Builder**.
2. Click  at the left, then click **Page Management**.
3. Use the drop-down menu in the Active Page column to select a different active page for the object or page type.

The list of pages contains both the default and custom pages.

Publish Your Customizations with Community Builder

Publish your changes in Community Builder to make the updates available to everyone in your community.

 **Note:** Your community must be active before you can publish the changes you've made in Community Builder.

- From Setup, enter *All Communities* in the **Quick Find** box, then select **All Communities**. Then click **Manage** next to the community name.
- From Community Management, click the Community Management menu in the global header, then click **Go to Community Builder**.
- Optionally, [preview your community](#) to make sure that your updates appear as expected.
- When you're happy with your changes, click **Publish** in the toolbar to publish your changes.

You'll receive an email notification when your changes go live.

Update Your Community's Template

Use Community Builder to learn about and apply a new version of your community's template. Updating your template keeps your current branding, while saving a copy of your community with the old template version applied. You get the latest styling and functionality, with the option to revert to your previous template version.

Here are some of the things you need to know about before you update your template:

- Any branding defined using the Branding Editor in Community Builder is retained.
- Most component customizations and properties do *not* carry over. For the Koa and Kokua self-service templates, general settings (such as Category Group Name, Top-Level Category, and Company Name) carry over. For Napili, topic definitions carry over.
- Template updates for communities using the Salesforce Tabs + Visualforce template not managed from Community Builder.
- Your community's home page URL is preserved automatically without any configuration on your part. Users are transparently directed to the new home page when they access the community.

USER PERMISSIONS

To update your template

- "Create and Manage Communities"

- When you update, the old version of your community is saved with a unique home page URL. To restore your community to the previous template version, manually set the home page to this URL in Site.com Studio under Site Configuration.

When a template update is available, a red notification icon appears over the Settings icon in Community Builder. You don't have to apply an update when it becomes available; you can wait until you're ready.

1. From Community Management, click the Community Management menu in the global header, then click **Go to Community Builder**.
2. Click the red notification icon that appears over the Settings icon.
3. Under Settings, click **Updates**.
4. Click **Update** to update your template to the new version, and then confirm the update when prompted.
5. Review all community pages to make sure that your branding and styles are as you expect.
6. [Publish your community](#) to apply the template updates.

[Community Builder Overview](#)

Considerations for Changing Your Community Template

Changing your community template affects the community navigation, branding, and customizations.

- Salesforce object data carries over, but all branding and component customizations do not. You'll need to redo all customizations.
- Switching between templates updates the navigation in Community Management. To view all available options in Community Management, regardless of template selection, select **Administration > Preferences > Show all settings in Community Management**.
- Your community URL changes when switching from a Salesforce Tabs + Visualforce template to a Community Builder template, or vice versa. For example, in Community Builder-based templates `/s` is appended to your URL. Be sure to update any links to your community with the new URL.

To learn more about using the Koa, Koa, and Napili templates, see the [Community Templates for Self-Service Implementation Guide](#).

To learn more about using the Aloha template, see the [Getting Started with the Aloha Community Template for Salesforce Identity](#).

Manage Your Community's General Settings

Use Community Builder's General settings page to keep track of which template you're using, your community's status, and which profile is assigned to guest users. If you're using the Napili template, easily access your navigational and featured topic settings.

You can manage these general settings for your community from within Community Builder when you use any of the preconfigured community templates provided by Salesforce.

To access general settings, click the Settings icon in Community Builder , and then click **General**.

EDITIONS

Available in: Salesforce Classic

- Developer

USER PERMISSIONS

To modify general settings

- "Create and Manage Communities"

The screenshot shows the 'General' settings page in Salesforce Community Builder. The left sidebar contains a 'SETTINGS' menu with options for General, Languages, Page Management, and Updates. The main content area is titled 'General' and includes the following sections:

- Community Template:** Napili Winter '16
- Site Status:** Site is not published
- Guest User Profile:** Acme Internal Profile
- Set Navigational Topics:** Create and edit the topics that appear in your community's navigation menu. Then select topic banner images.
- Set Featured Topics:** Choose navigational or member-created topics to feature prominently on your home page. Then select topic thumbnail images.
- Customize Template:**
 - Hide the header region and navigation

A 'Publish' button is located in the top right corner of the settings area. A tooltip for the 'Hide the header region and navigation' option states: "Selecting this option hides the community header image, the search box, and the community and user profile navigation menus in the template. You can replace some of this functionality with custom components, such as a custom community header and navigation menu."

General settings include:

- **Community Template**
Displays the name and version of the template that your community is using.
- **Site Status**
Indicates whether your community is published. If it's published, click the link to open the live community in a separate browser tab.
- **Guest User Profile**

Shows which user profile is assigned to guest users. Clicking the link takes you to the Profile page in Setup, where you can modify settings for this profile, like which tabs are visible and which permissions the guest user has. For more information about configuring the guest user profile, see [Configure the Guest User Profile for Unauthenticated Users in the *Community Templates for Self-Service Implementation Guide*](#).

- **Set Navigational Topics** (*Napili template only*)

Click the link to go to Community Management, where you can [define topics to be used for navigation](#).

- **Set Featured Topics** (*Napili template only*)

Click the link to go to Community Management and [define featured topics](#).

- **Hide the header region and navigation** (*Napili Winter'16 version only*)

Select this option to hide the default community header in your community and replace it with your own. Choosing this option hides the default header image, the search box, the community menu, and user profile navigation menu all the pages in your community.

Tip: If you choose to hide the header, consider replacing some of the hidden functionality with custom components. For example, you can create a custom navigation menu to replace the default community navigation and add it to the editable header regions above and below the default header.

Community Templates

Which Community Template Should I Use?

Community templates let you quickly and easily build a self-service community that gives customers the same visual and functional experience whether they use a tablet, a mobile device, or their desktop.

Your customers want an easy way to interact with your company whenever and wherever they are. A self-service community gives your customers an easy way access the information they need when they have questions. With communities built on the Koa and Kokua templates, customers can search for information using knowledge articles and contact support, if necessary. When they're in a community based on the Napili template, they can search for articles as well as ask questions and get crowd-sourced answers from the community. If they still can't find what they're looking for, they can contact support without having to log in. The self-service templates let you extend your community to various devices with a consistent user experience every time.

EDITIONS

Available in: Salesforce Classic

Available in:

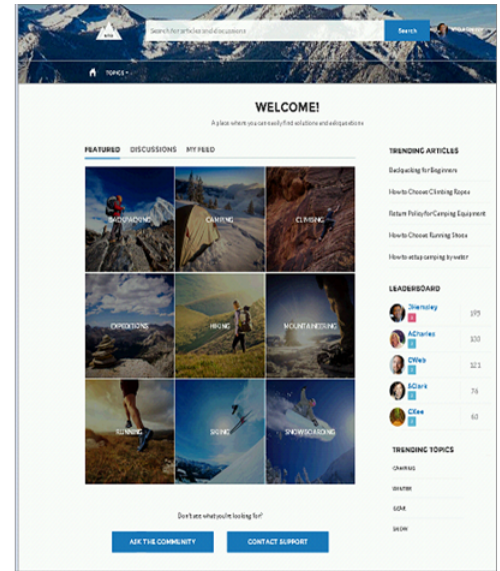

- Enterprise
- Performance
- Unlimited
- Developer

Kokua

Koa

Napili

A wizard guides you through selecting a template and then walks you through the initial setup for your data categories or topics—depending on which template you're using.

- Kokua is a visually rich self-service template that presents users with knowledge articles organized by data categories. Users can also submit cases to get help from agents.
- Koa is a text-based self-service template that's optimized for mobile devices. It lets users search for and view articles by text representations of data categories, and contact support if they can't find what they're looking for.
- Napili is a powerful support community template that lets your customers post questions to the community and search for and view articles. If they don't find what they're looking for, they can contact a support agent.

Community Builder makes it super easy to customize your community. Simply edit a few of the components to include information about your community, add a few images to extend your branding, and you're ready to go—without any coding! Additionally, if you want a more custom experience, you can create custom pages, add components to pages, use custom Lightning components, and expose additional Salesforce objects.

Communities are automatically displayed in a logged-in user's profile language, so you don't need to create and manage a separate community for each language. With Community Builder, you can extend the support for Guest users in communities so that if their language isn't supported, they can choose one from a language picker on each community page. And because all languages are maintained within the community, you don't need to create and manage a separate community for each language.

Community Management

Community Managers, Moderators, and Administrators Working Together

Manage Your Community

Community Management is your one-stop shop for setting up and monitoring your community. Administrators can manage basic setup information including membership and branding. Community managers can view dashboards about groups, members, feed activity, and license usage, and manage the community's reputation system. Moderators can see which items have been flagged for review.

You can customize your community at any time, but if you plan on making major changes, we recommend deactivating the community first.

! **Important:** The options available in Community Management are based on your community template selection, permissions, and preferences. For example, if your community does not use topics, you will not see the Topics node. Some of the options in the following list may not be applicable in your community. To display all nodes, go to **Administration** > **Preferences** and enable **Show all settings in Community Management**.

Home

- View your community's home page dashboard. If your home page still displays a message to install the Salesforce Communities Dashboards, your administrator hasn't mapped a dashboard yet.
- Preview the community or access your community's settings in the Community Builder, Force.com, or Site.com Studio from the Community Management menu in the global header.

Insights

Monitor recent activity and drill down to the source of that activity to take further action.

[Insights are set up by the administrator](#). If the Insights menu doesn't appear, the administrator hasn't mapped any Insights for your community.

Dashboards

View dashboards and monitor information about groups, members, feed activity, moderation, topics, and license usage for this community.

[Dashboards are set up by the administrator](#). If the Dashboards menu doesn't appear, the administrator hasn't mapped any dashboards for your community.

Moderation

View a list of posts, comments, and files that were flagged by community members for review. You can also set up moderation rules for your community.

[Moderation is set up by the administrator](#). If the Moderation menu doesn't appear, the administrator hasn't enabled members to flag content.

To moderate flagged posts or comments within Community Management, you need "Moderate Communities Feeds". To moderate flagged files, you need "Moderate Communities Files".

Topics

Create a navigation menu and showcase popular topics in your community.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To access Community Management:

- "Manage Communities" OR "Create and Set Up Communities"
- AND is a member of the community whose Community Management page they're trying to access

To customize administration settings or use Community Builder:

- "Create and Set Up Communities"
- AND is a member of the community whose Community Management page they're trying to access

[Navigational topics](#) and [featured topics](#) are set up by the administrator or in the case of self-service templates, they are enabled by default. If the Topics menu doesn't appear, your community is not using Topics.

Recommendations

Recommendations can help drive engagement in a community. They can be set up to encourage users to watch videos, take trainings, and more.

[Recommendations are set up by the administrator](#). If the Recommendations menu doesn't appear, the administrator hasn't set up any.

Reputation

Set up reputation levels and points to reward members for activity in the community feed.

[Reputation is set up by the administrator](#). If the Reputation menu doesn't appear, the administrator hasn't enabled it.

Administration

On the Administration page, you can update basic setup for the community, including:

- **Members**—Add or remove members based on profiles or permission sets.
- **Tabs**—Select the tabs you want community members to see. Tabs are also used to determine community navigation in Salesforce1. Tab settings aren't used if your community was created with one of the Self-Service templates.
- **Branding**—Select an out-of-box branding theme. This branding is only used if your community uses the Salesforce tabs + Visualforce template.
- **Login & Registration**—Select the default community login page and set up self-registration.
- **Emails**—You can customize email sender information, Chatter email branding, and templates in your community emails.
- **Pages**—Configure page assignments for your community and access the Force.com and Site.com settings for your community.
- **Preferences**—Update important settings such as flagging content, nickname display, and public access to Chatter.
- **Settings**—Edit your community name, description, and URL. You can also manage the status of your community and change your [community template](#).

Lookups in Community Management initially return the items you most recently viewed from within the community. If an object you're looking for isn't in the Recently Viewed Documents list, try typing all or part of the object name and searching again.

 **Important:** If you're an administrator and accidentally remove yourself from a community, you won't be able to access the Administration settings in Community Management. To add yourself back to the community or make other membership updates, [use the API](#).

[What is a Community Manager?](#)

[What is a Community Moderator?](#)

What is a Community Manager?

Every community needs someone to take an active role in making sure the community thrives. Community managers should spend time every day encouraging member participation, keeping conversations going, and recognizing members for contributing.

A community manager is a member of the community that takes on the extra responsibility of monitoring community engagement. Community managers need access to reports and dashboards that show trends in activity and membership. They also need to be aware if members aren't logging in as frequently as they should be. By monitoring community membership and activity, community managers can figure out how to engage community members and ensure that they participate.

A powerful tool for a community manager is the ability to recognize individual members for their participation, because community managers know that recognition and a little friendly competition usually lead to more active members. Community managers can set up a point system and reputation levels that reward members with points when they perform certain actions. Once the member reaches the top of the level's point threshold, they move up a level.

To assign a user as a community manager, simply give them the "Manage Communities" permission. With this permission, they can access the Community Management page. The user must be an employee of your organization; external community members can't be community managers.

SEE ALSO:

[Assign a Community Manager](#)

Assign a Community Manager

To assign a user as a community manager, simply give them the "Manage Communities" permission.

When you assign the "Manage Communities" permission to a user, they get access to all the community management features in the Community Management. Keep in mind that the user must be an employee of your organization; external users can't be community managers.

1. From Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**, then click **New**.
2. Create a permission set that includes the "Manage Communities" permissions.
3. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
4. Find the user you want to be a community manager and add the permission set to their Permission Set Assignments related list.

The user can now manage the community through the Community Management.

SEE ALSO:

[What is a Community Manager?](#)

What is a Community Moderator?

Moderators help ensure the success of your community by monitoring user activity and flagged items.

In a successful community, members are actively engaged and communicating with others. A community moderator facilitates knowledge sharing within a community to help members benefit and derive value from their participation. The moderator also helps to ensure that all communications and content in the community are appropriate.

EDITIONS

USER PERMISSIONS

To assign permission sets:

- "Assign Permission Sets"

The moderator must be an employee from your internal organization. This person should be accustomed to interfacing with customers, familiar with Salesforce and Chatter capabilities, and can spend time regularly monitoring the community.

A moderator can:

- Manage the list of flagged posts and comments in the community
- Manage flagged files
- Remove flags
- Delete inappropriate posts, comments, and files

A moderator can also help drive the success of a community in many other ways.

- Sharing relevant and useful information in community posts
- Encouraging members to post and comment on each other's posts
- Setting an example by their activity in the community
- Keeping discussions focused, spam-free, and non-controversial
- Redirecting email conversations to communities when it can benefit other community members
- Establishing the community as a reliable source of information and a forum for transparent discussions

You can choose to designate more than one moderator for a community, especially if the community has a large number of members.

 **Note:** Although they share some similar capabilities, a community moderator is different than a [Chatter moderator](#).

SEE ALSO:

[Assign a Community Moderator](#)

Which users can moderate?

There are multiple types of users who can moderate a community when flagging is enabled.

Moderators can be users from your internal organization or external users, but only internal users can moderate from within Community Management. External users who are moderators can moderate within context of the community, such as directly in the Chatter feed. Moderators can continue to flag items even if flagging is disabled for community members, although group owners and group managers can only moderate when flagging is enabled.

Who can moderate items in a community depends on permissions or if the user is a group manager or owner. This table shows who can moderate and what actions they can take in the user interface.

Action	User with "Moderate Communities Feeds"	User with "Moderate Communities Files"	Group Owner or Manager (on items in groups they own or manage)
Remove flags on a post or comment			
Delete a post or comment			
Remove flags on a file

Action	User with "Moderate Communities Feeds"	User with "Moderate Communities Files"	Group Owner or Manager (on items in groups they own or manage)
Delete a file			

SEE ALSO:

[What is a Community Moderator?](#)

[Assign a Community Moderator](#)

Assign a Community Moderator

Make one or more people moderators in your community so they can moderate content in the community.

Moderators can be users from your internal organization or external users, but only internal users can moderate from within Community Management. External users who are moderators can moderate within context of the community, such as directly in the Chatter feed.

You can assign moderators by assigning a permission set that includes one or both of the moderation permissions.

Permission	Allows Users To
Moderate Communities Feeds	Review flagged posts and comments and take action, such as removing flags or deleting the post or comment. Moderator options for feed content are available in the community feed as well as in Community Management.
Moderate Communities Files	Review flagged files they have access to and take action, such as removing flags or deleting the file. Moderator options for files are available on a file's detail page as well as in Community Management.
Manage Communities OR Create and Set Up Communities	Moderate flagged posts and files from Community Management and create moderation rules and criteria.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To assign permission sets:

- "Assign Permission Sets"

You can also add these permissions to a profile. These permissions are valid for all communities the user is a member of, but don't apply in your internal organization.

1. From Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**, then click **New**.
2. Create a permission set that includes the appropriate permissions.
3. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
4. Find the user you want to be a community moderator and add the permission set to their Permission Set Assignments related list.

Once you grant moderator permissions to a user, they can help curate flagged content in the community.

- The user can now moderate any items they have access to in all communities they're a member of. The user can flag items even if `Allow members to flag content` is disabled in a community.
- Moderators can receive an email notification when a post, comment, or file is flagged by selecting the `Flag an item as inappropriate` email notification.
- When `Allow members to flag content` is enabled for a community, group owners and managers can moderate posts, comments, and files in groups that they own or manage. They can view flags and flag counts, remove flags, and delete content.

Access to moderator functionality is slightly different depending on user permissions:

- **In the community feed:** Both internal and external users with the "Moderate Communities Feeds" permission can view flag indicators directly in the community feed for posts and comments and decide to either remove the flags or delete the content.
- **In Community Management:** An internal user with the "Moderate Communities Feeds" and "Manage Communities" permissions can review flagged content in the **Moderation > Flagged Posts** area in Community Management.

Access Community Management

Community administrators and managers use Community Management to monitor community activity, and set up other important management features.

To access Community Management, you must be logged in to the community.

1. From within the community, click  in the global header.

Members of the community who have the “Create and Set Up Communities” permission can also access Community Management from the All Communities page in organization setup.
 2. Choose the part of the community you want to manage:
 - Preview the community or access your community’s settings in the Community Builder, Force.com, or Site.com Studio from the Community Management menu in the global header.
 - In **Insights**, you can view Insights reports and take action on activity in your community.
 - In **Dashboards**, you can view community dashboards and reports.
 - In **Moderation**, you can set up moderation rules and monitor flagged feed items.
 - In **Topics**, you can manage navigational and featured topics.
 - In **Recommendations**, you can set up custom recommendations to appear in your community.
 - In **Reputation**, you can set up reputation levels and points.
 - In **Administration**, you can customize your community properties, such as name, description, URL, status, and template. You can also update your community settings, such as members, tabs, branding, login and registration, and emails.
-  **Important:** The options available in Community Management are based on your community template selection, permissions, and preferences. For example, if your community does not use topics, you will not see the Topics node. Some of the options in the following list may not be applicable in your community. To display all nodes, go to **Administration > Preferences** and enable **Show all settings in Community Management**.

Community Moderation Strategies and Tools

Communities Moderation Overview

Community moderation allows you to empower members of your community to monitor content and ensure that it is appropriate and relevant. You can also set up moderation rules and criteria to block, flag, and replace keywords in user-generated content, such as posts and comments.

Moderation is crucial for a community to thrive. You need active moderators who are willing to spend time ensuring that the members and content in your community are appropriate and helpful. You also need to empower members to speak up when they view something as inappropriate or offensive.

With Communities moderation, you can:

- Designate specific users as moderators so that they can closely monitor the community
- Allow members to flag posts, comments, files, and private messages that are inappropriate
- Allow moderators to review and act on flagged items, such as deleting a post, comment, or file
- Allow group owners and managers to moderate within their groups
- Create rules and criteria to automatically block, flag, or replace keywords in user-generated content, such as posts or comments
- Track flagging and moderation activity within your community

To report on moderation activity in your communities, either query the flagged content using the API or create a custom report type using `Networks` as the primary object and `Network Audits` as the secondary object. You can also install the [Salesforce Communities Dashboards](#) package to view Insights reports that help you track moderated content in your community.

If you want to create custom advanced moderation logic for your community, you can create triggers that flag content. Custom triggers run behind the scenes and don't require you to allow your users to flag content.

Enable Users to Flag Items in Your Community

Turn on flagging for your community to empower members to flag posts, comments, files, and private messages that they deem inappropriate.

Community moderation must be enabled for your organization before you can allow members to flag content in the user interface. If you don't see the option to allow flagged content, contact your administrator.

This setting isn't required to flag or moderate items using the API.

Once an item is flagged, your community moderator can review it and take action. Remember that moderators can continue to flag items even if flagging is disabled for community members.

1. Access Community Management in either of the following ways.
 - From the community, click  in the global header.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities**. Then click **Manage** next to the community name.
2. Click **Administration > Preferences**, then select `Allow members to flag content`.
3. Click **Save**.

With this setting enabled in a community:

- Members can flag posts, comments, and files using the `Flag as inappropriate` option.
- Members can flag private messages from within the community on their My Messages page in Chatter. If a member has turned on email notification for messages, they can also flag the message directly from their email. Members can only flag messages that are sent from communities they are members of.

 **Note:** Private messages can't be flagged in partner or customer portals, your internal organization, or from Salesforce1.

- Group owners and managers can moderate groups they own or manage.

If you want to create custom advanced moderation logic for your community, you can create triggers that flag content. Custom triggers run behind the scenes and don't require you to allow your users to flag content.

If your community uses a Community Builder-based template you won't see the **Flagged Files** node in Community Management even if `Allow members to flag content` is enabled. To show the **Flagged Files** node, select `Show all settings in Community Management` from the **Preferences** page.

- Developer

USER PERMISSIONS

To enable users in your community to flag items:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Create Moderation Criteria for Your Community

Create criteria that defines offensive language or inappropriate content that you don't want in your community. Criteria are used in rules to moderate user-generated content, such as posts and comments.

Some things to keep in mind:

- Your organization can have up to 10 keyword list criteria. This limit is per organization, not per community.
- A keyword list can have up to 2,000 keywords.
- Capitalization and trailing punctuation are ignored when matching your keywords to user-generated content. For example, if your criteria includes *BadWord*, it's matched when a user types *BADWORD* or *badword*.
- You can't use the API to set up moderation criteria.

Set up criteria to use in your moderation rules:

1. From within the community, click  in the global header.
Members of the community who have the "Create and Set Up Communities" permission can also access Community Management from the All Communities page in organization setup.
2. Click **Moderation > Criteria**.
3. Click **New**.
4. Enter a name, unique name, and description for your criteria.
5. Click **Save**.
6. Update the keywords in your criteria.

To add keywords, click **Add**.

- Keywords can be up to 100 characters and can only include letters, numbers, or ampersands (&).
- Wildcard characters aren't supported.
- Separate keywords with commas or line breaks.
- When adding keywords, you can copy and paste up to 32,000 characters at a time.

To delete keywords, select the keywords you want to remove, then click **Delete**.

A message indicates how many keywords were added or failed to add, and the number of duplicates that were ignored. If your entire entry failed to save, review the keyword requirements and then submit again. Don't worry about adding duplicates because they're ignored.

To delete criteria, click **Del** from the **Criteria** page. If criteria is being used by a rule, you can't delete it.

SEE ALSO:

[Communities Moderation Overview](#)

[Create Moderation Rules for Your Community](#)

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To view, create, edit, and delete criteria:

- "Manage Communities" OR "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Create Moderation Rules for Your Community

Create and modify rules for your community to moderate user-generated content. Each rule specifies the user-generated content the rule applies to, the criteria to enforce the rule on, and the moderation action to take. You can create rules that block, flag, or replace user-generated content that contains offensive language or inappropriate content.

If your community is using the Napili template, moderation rules apply to questions created by your community members.

Some things to keep in mind:

- Your organization can have up to 10 rules. This limit is per organization, not per community.
- Each rule can have up to three criteria.
- Rules that block content run first, followed by rules that replace content, then rules that flag content. If two or more rules perform the same action, the oldest rule runs first.
- You can't use the API to set up moderation rules.

 **Tip:** Before creating a rule, make sure you've created criteria to use in that rule.

1. From within the community, click  in the global header.

Members of the community who have the "Create and Set Up Communities" permission can also access Community Management from the All Communities page in organization setup.

2. Click **Moderation > Rules**.

3. Click **New**.

4. Complete the following fields:

- **Name**—Enter a name for your rule.
- **Unique Name**—Enter a unique name for your rule. The unique name used by the API and managed packages.
- **Description**—Optionally, enter a description.
- **Applies To**—Specify which types of user-generated content this rule applies to. Posts and comments only apply to content created in groups and user profiles.
- **Criteria**—Select the criteria to enforce this rule.

 **Important:** If you activate a rule without specifying criteria, the rule either flags all posts and comments or prevents users from creating posts and comments entirely. Yikes! Be careful.

- **Moderation Action**—Specify what you want to happen when the criteria is matched.
 - **Block** prevents the content from being published.
 - **Replace** publishes the content with the keywords replaced as asterisks. For example, *BadWord* becomes *******.
 - **Flag** publishes the content and then automatically flags the content as inappropriate.
- **Message for User**—Specify the message that your user sees when their content is blocked. If you don't specify a message, the user sees the standard message: "Looks like we found unacceptable content in your post or comment. Review your content and make sure it complies with community etiquette."
- **Activate Rule**—If selected, the rule is activated.

[Communities Moderation Overview](#)

[Create Moderation Criteria for Your Community](#)

[How and when do community moderation rules execute?](#)

How and when do community moderation rules execute?

Rules that block content run first, followed by rules that replace content, then rules that flag content. If two or more rules perform the same action, the oldest rule runs first. Community moderation rules work with existing triggers. On the server, Salesforce executes community rules within the standard order of execution.

Rules that block content execute during system validation. Rules that block content ignore changes made by `before` triggers. For example, if a `before` trigger changes a feed post, a moderation rule that blocks content isn't aware of the changed content and executes on the original content.

Rules that replace content execute before database saves.

Rules that flag content execute after workflow rules.

[Create Moderation Rules for Your Community](#)

[Triggers and Order of Execution](#)

Moderate Posts and Comments in Your Community

Community moderators can review the Flagged Posts feed which contains a list of posts and comments that members of the community have flagged as inappropriate and take action. If you're a group owner or group manager, you can view flags and take action on items in your groups.

Flagged posts and comments have a small orange flag next to the post or comment date. The number next to the flag indicates how many people have flagged the item. The moderator can review each item and decide whether to take action.

A few things to bear in mind about flagged items:

- Moderators can only view and act on items they have access to.
 - Within in group in a community, group owners or managers can moderate items in their groups, including viewing or removing flags and deleting posts, comments, or files if necessary. They can't see the Flagged Posts feed in Community Management.
 - If `Allow members to flag content` is disabled in a community, only moderators can flag items and view flagged items.
1. From within the community, click  in the global header.
Members of the community who have the "Create and Set Up Communities" permission can also access Community Management from the All Communities page in organization setup.
 2. Click **Moderation > Flagged Posts** to view a feed of flagged posts and comments.
 3. Click **Delete** or **Remove Flags**, depending on whether you agree that the post or comment is inappropriate and should be deleted or whether the post or comment was flagged in error.
 4. Click **OK**.

Alternatively, you can moderate directly within context of your community by removing flags or deleting content in the feed.

 **Tip:** If you want to receive an email each time an item in your community is flagged, select the **Flags an item as inappropriate** checkbox on the Chatter Email Notifications page.

USER PERMISSIONS

To view flagged items, remove flags, and delete posts or comments:

- "Moderate Communities Feeds"

To view flagged content in Community Management, remove flags, and delete posts or comments:

- "Moderate Communities Feeds"

AND

"Manage Communities"
OR "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Moderate Files in Your Community

Community moderators can review and take action on the Flagged Files list, which contains a list of files that members of the community have flagged as inappropriate. Group owners or group managers can view flags and take action on files in their groups.

Members of your community may post files that aren't appropriate because they contain sensitive information or content that may be offensive. Other members of the community can flag these files for review. Flagged files have a small orange flag. The number next to the flag indicates how many people have flagged the item.

Moderators can review and delete files in any community that they have access to.

Within a group in a community, group owners and managers can review and remove flags on files in the groups they own and manage if `Allow members to flag content` is enabled for their communities. If `Allow members to flag content` is disabled in a community, only moderators can flag items and view flagged items.

If your community uses a Community Builder-based template you won't see the **Flagged Files** node in Community Management even if `Allow members to flag content` is enabled. To show the **Flagged Files** node, select `Show all settings in Community Management` from the **Preferences** page.

1. From within the community, click  in the global header.
Members of the community who have the "Create and Set Up Communities" permission can also access Community Management from the All Communities page in organization setup.
2. Click **Moderation > Flagged Files** to view a list of flagged files.
3. From the Action column, select **Remove Flags** or **Delete** from the drop-down menu, depending on whether you agree that the file is inappropriate and should be deleted or whether the file was flagged in error.

You can click  to preview the file without leaving the page.

4. If prompted, click **OK**.

Alternatively, you can moderate directly within context of your community by removing flags or deleting content on the file detail page.

 **Tip:** If you want to receive an email each time an item in your community is flagged, select the **Flags an item as inappropriate** checkbox on the Chatter Email Notifications page.

"Manage Communities"
OR "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Moderate Private Messages in Your Community

Community moderators and managers can review and act on a list of private Chatter messages that members of the community have flagged as inappropriate or as spam.

 **Important:** Keep these limitations in mind:

- To view the content of a private message and delete it, you need the “Manage Chatter Messages” permission.
- To remove a flag from a private message, use the API.
- You can’t flag private messages sent from communities that you aren’t a member of or that haven’t turned on flagging for their users.
- You can’t flag private messages in your internal organization, in Salesforce 1, or in partner and customer portals.

There are a few ways you can monitor flagged messages in your communities:

- Get an out-of-the-box Insights report with the Salesforce Communities Dashboards package.

This Community Management Insights report will help you track trends and stay on top of private message spamming attacks in your community. You can view who sent the message, when it was sent, and who flagged the message. Remember that you can’t view the contents of the private message, delete it, or remove the flag from Community Management. For detailed information about this package, see [Report on Communities with the Dashboards and Insights Package](#).

- Create your own report.

First, create a custom report type using `Networks` as the primary object and `Network Audits` as the secondary object. Then create a report using your new custom report type and add a field filter for `Audited Object Type` set to equal `Chatter Message`.

- Query the flagged messages from the API.

 **Tip:** If you want to receive an email each time a private message in your community is flagged, select the **Flags an item as inappropriate** option on the Chatter Email Notifications page. To receive the email notifications, you also need the “Moderate Communities Feeds” and “Manage Chatter Messages” permissions.

Set Up Apex Triggers for Flagging Items

Use triggers to create custom advanced moderation logic that automatically flags items in your community.

-  **Tip:** Did you know you can do this in the UI? Most communities don't need custom moderation triggers. You can create moderation rules and criteria directly in Community Management. For more information, see [Create Moderation Rules for Your Community](#).

Using triggers to automatically flag items allows you to moderate your community behind the scenes. These flags are **only** visible to moderators. You can view flags on the Flagged Posts feed on the Community Management page, query for them in the API, or use custom report types to create reports on flagged items, people whose items are flagged most, and more.

Consider the following when creating triggers:

- Create Apex after insert triggers on either FeedItem, FeedComment, ChatterMessage, or ContentDocument.
- Define criteria that when met creates a NetworkModeration (flag) record, with the FeedComment, FeedItem, ChatterMessage, or ContentDocument as the parent.

-  **Example:** This trigger automatically flags posts in your community that contain *BadWord*.

```
trigger autoflagBadWord on FeedItem (after insert) {
    for (FeedItem rec : trigger.new) {
        if (!<CommunityId>.equals(rec.networkScope))
            continue;

        if (rec.body.indexOf('BadWord') >= 0) {
            NetworkModeration nm = new NetworkModeration(entityId=rec.id,
visibility='ModeratorsOnly');
            insert (nm);
        }
    }
}
```

A similar trigger on comments would look like this.

```
trigger autoflagBadWord on FeedComment (after insert) {
    for (FeedComment rec : trigger.new) {
        if (!<CommunityId>.equals(rec.networkScope))
            continue;

        if (rec.commentBody.indexOf('BadWord') >= 0) {
            NetworkModeration nm = new NetworkModeration(entityId=rec.id,
visibility='ModeratorsOnly');
            insert (nm);
        }
    }
}
```

Organize Self-Service Communities With Topics

Organize Self-Service Communities with Topics

Topics are available in all communities. But when you set up a self-service community with the Napili template, you can use the Community Management page to quickly guide members to key navigational and featured topics.

On the Community Management page, you choose navigational topics to provide a consistent map of your community, and featured topics to highlight current, popular conversations. In the community itself, member-created topics let users organize information for each other, creating a personalized experience that boosts community engagement.

In a self-service community, the Napili template specifies the layout and design of navigational, featured, and member-created topics. Below are visual examples of each type in an active community.

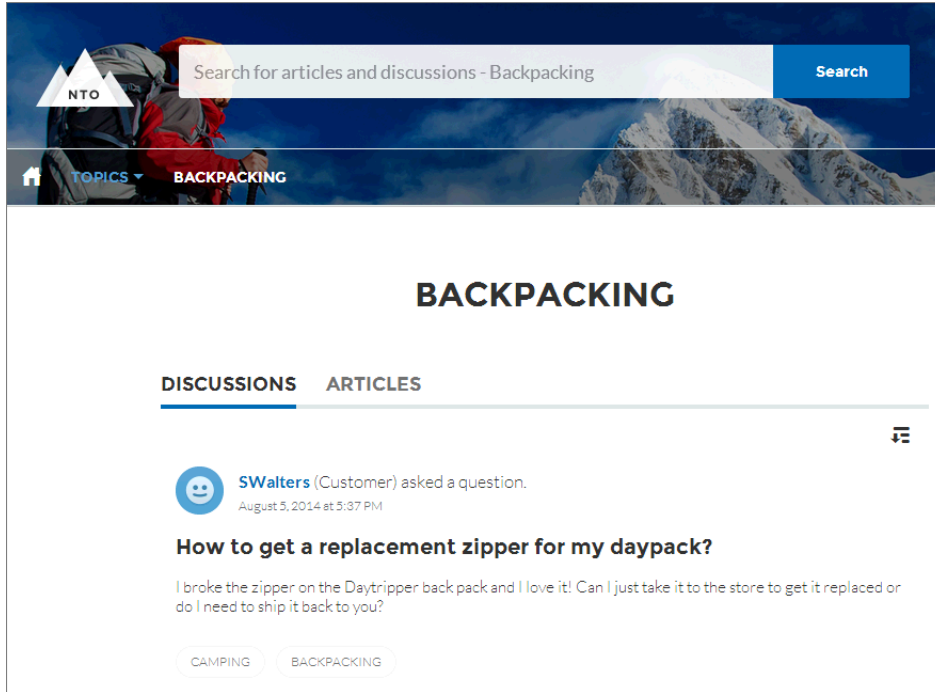

Tip: To add navigational and featured topics to other types of communities, Apex developers can use the [ConnectApi.ManagedTopics class](#) in a Visualforce page.

Navigational topics

On every page of a self-service community, navigational topics are available from the Topics menu at upper left.

When visitors choose a navigational topic, the banner image you selected for it appears at the top of the page.

Featured topics

Featured topics are accessible from the body of your community home page. Thumbnail images you select for featured topics uniquely identify them. (These unique thumbnails appear only on the home page; at the top of all featured topic pages, the default banner image specified in Community Builder appears.)

Member-created topics

When posting questions, community members create topics by using hashtags in body text, or typing in the topic suggestions box below. (In Setup, the "Assign Topics" and "Create Topics" permissions must be enabled for community users.)

Post To **Backpacking** ▾ ✕

What's the best backpack for a solo expedition?

I'm doing a solo hike of the Pacific Crest Trail next July. Any recommended packs for a #PCT trek like this?

Topics help get your questions seen by the right people

Camping, Expeditions ASK

If any suggested topics are poor matches for the post, members can simply click to delete them.

Tip: Member-created topics can be accessed via search, or highlighted as featured topics on the Community Management page.

[Manage Topics in Communities](#)

Set Up Navigational Topics

Navigational topics provide consistent entry points to key community areas that people often return to. If your organization uses data categories, community managers add current Salesforce Knowledge articles with those categories to each navigational topic page. (If data categories aren't enabled, administrators add articles to each topic using the Chatter REST API.)

1. From Setup, enter *Topics for Objects* in the **Quick Find** box, then select **Topics for Objects**, and enable topics for all the article types you want to include.

 **Note:** Enabling topics disables public tags on articles. Personal tags aren't affected.

2. From the community, click  in the global header.
3. Click **Topics > Navigational Topics**.
4. In the text box at right, enter a topic name, and click **Add**.
5. If your organization uses data categories, hover over the navigational topic name, and click . Select a Data Category Group, then select the categories you want to add to the topic, and click **Add Articles & Close Window**.

 **Important:** This process adds only current articles to a topic. To add new articles, return to Community Management and repeat the step above.

6. Hover over a topic name, and click . Then click **Upload banner image**, and select an image that appears across the top of the topic page.

(Banner images are scaled to 1400 x 180 pixels. To prevent distortion, create image files with those dimensions.)

7. Repeat steps 4-6 to create several navigational topics for your community, up to a maximum of 25. Then click **Save**.

 **Tip:** To quickly edit existing navigational topics, simply hover over a topic name, and do any of following:

- To move a topic up or down, click the arrows at left.
- To rename or remove a topic, change its banner image, or remove assigned articles, click .

AND

"Read" on related article types

Set Up Featured Topics

Featured topics highlight current, popular community conversations. Change them regularly to keep community members up-to-date and engaged.

1. From the community, click  in the global header.
2. Click **Topics > Featured Topics**.
3. From the pop-up menu at right, select a navigational or member-created topic you want to feature. Then click **Add**.

 **Tip:** Using the Chatter REST API, you can create unique featured topics, separate from navigational or member-created ones.

4. Hover over a topic name, and click . Then click **Upload thumbnail image**, and select an image that represents the featured topic on the community home page.

(Thumbnail images are scaled to 250 x 250 pixels. To prevent distortion, create image files with those dimensions.)

5. Repeat steps 3-4 to create several featured topics for your community, up to a maximum of 25. Then click **Save**.

To quickly edit existing featured topics, simply hover over a topic name, and do any of following:

- To move topics up or down, click the arrows at left.
- To rename or delete topics, or change their thumbnail images, click .

Customize Recommendations in Communities

Create recommendations to drive engagement for your community, encouraging users to watch videos, take trainings, and more. Edit these recommendations in Community Management, where they're supported in feeds in the Salesforce1 mobile browser app and in any community using the Summer '15 or later version of the Napili template.

1. Access Community Management in either of the following ways.
 - From the community, click  in the global header.
 - From Setup, enter *All Communities* in the *Quick Find* box, then select **All Communities**. Then click **Manage** next to the community name.
2. Click **Recommendations > Recommendations**.
3. Click **New**.
4. Complete the following fields:
 - **Name**—Enter a name for the recommendation in Community Management. This name doesn't appear in the community.
 - **Image**—Click **Upload Image** to include an image with your recommendation.
 - **Title**—Optionally, enter header text that appears above the image.
 - **Description**—Enter detailed text that suggests what users can do.
 - **Button text**—Enter a label for the button in the recommendation.
 - **https://**—Enter the URL that the button opens.
 - **Enabled**—If checked, this recommendation is active and appears in communities.

When disabled, recommendations that exist in feeds in the Salesforce1 mobile browser app are not removed, but no new recommendations appear. In communities using the Summer '15 or later version of the Napili template, disabled recommendations no longer appear.

In the Salesforce1 mobile browser app, recommendations appear directly in the feed. In communities using the Summer '15 or later version of the Napili template, recommendations appear by default on the right side of the home page. Recommendations don't appear in other communities.

 **Tip:** To remove an existing recommendation, in Community Management, click **Recommendations > Recommendations**, and click the recommendation name. At the bottom of the recommendation details, click **Delete**.

You can target audiences for your recommendations. To create and manage recommendation audiences in Winter '16, use Chatter REST API or ConnectApi.Recommendations in Apex.

Build Engagement With Reputation Levels

Reputation Overview

Your reputation in the community directly corresponds to how active you are. The more you post, comment, and share, the higher your reputation level will be.

Your reputation level appears on your profile page and when any user hovers over your name. It's visible to other community members so that they know how influential you are. When you start out in the community, you are at the lowest level. As you become more active in the community, you gain points and your reputation level increases. Increases in reputation levels are posted to your feed. In other words, as people see you participating and sharing your knowledge, your credibility and influence grows.

Your administrator defines the activities that help you gain points. They also set the number of points for each action.

These are the default actions that increase your reputation level:

You increase your reputation by:

- Posting
- Commenting
- Liking a post or comment
- Sharing a post
- People sharing your posts
- People commenting on your posts
- People liking your posts or comments
- Mentioning someone
- Being mentioned
- Asking a question
- Answering a question
- Receiving an answer
- Marking an answer as best
- People marking your answer as best
- Endorsing someone for knowledge on a topic
- Being endorsed for knowledge on a topic

Enable Reputation in Your Community

Enable reputation in your community so that members are recognized and rewarded for participating.

A powerful tool for a community manager is the ability to recognize individual members for their participation, because community managers know that recognition and a little friendly competition usually lead to more active members. Enabling reputation turns on a default point system and set of reputation levels in the community. A community manager can personalize labels and point values from the Community Management page.

Members start to accrue points by performing the actions that have assigned point values. Once the member exceeds the top of the level's point threshold, they move up a level. They, and other members of the community, see their reputation level on their profile and when hovering over their name. Total points also show on member's profiles.

Note: When you enable Reputation, Chatter influence is removed from the Contribution section on the profile page.

1. Access Community Management in either of the following ways.
 - From the community, click in the global header.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities**. Then click **Manage** next to the community name.
2. Click **Administration > Preferences**.
3. Select **Enable setup and display of reputation levels**, then click **Save**.

After you enabled reputation, a default point system and set of reputation levels is available on the Community Management page. The default reputation points are as follows:

Action	Points
Community Engagement	
Write a post	1
Write a comment	1
Receive a comment	5
Like something	1
Receive a like	5
Share a post	1

[Reputation Overview](#)

[Set Up Reputation Levels](#)

[Set Up Reputation Points](#)

[How is my community reputation calculated?](#)

Set Up Reputation Levels

Update the default reputation levels to meet your community's needs and help motivate your members.

When reputation is enabled for a community, 10 default levels are added. You can add or remove levels, give each level a name, and update the point range and image for each level.

 **Note:** A community must have at least three reputation levels and can have up to 50.

1. From within the community, click  in the global header.

Members of the community who have the "Create and Set Up Communities" permission can also access Community Management from the All Communities page in organization setup.

2. Click **Reputation > Reputation Levels**.

From here you can:

- Upload your own image for each reputation level. Click the default image to browse to an image file and upload a new image.

 **Note:** You can't revert to the default reputation level images from the Salesforce user interface. Use the Salesforce Chatter REST API to do this.

- Give each level a name, such as "Beginner," "Intermediate," and "Expert." If you don't assign a name, the default is used. For example, "Level 1," "Level 2," "Level 3."
- Edit the point range for a level.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To update reputation levels:

- "Manage Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

When you update the higher value of a level's point range, the lower value for the next level is automatically adjusted when you save.

- Add more levels by clicking **Add a level**, located underneath the list of levels.
- Remove a level by clicking  next to the level.

3. Click **Save** to apply your changes.

You can now update the point system for the community. The point system determines how many points a user gets when they perform certain actions or when others recognize their contributions by commenting, liking, or sharing their posts. Reputation level increases are posted to member feeds.

You can [translate](#) reputation level names so that international community members can view their reputation levels in the appropriate language. In Translation Workbench, select the `Reputation Level` setup component and then expand the node next to your community.

Questions and answers in the community feed are not to be confused with the Chatter Answers functionality.

 **Note:** In organizations with reputation enabled prior to the Winter '15 release, actions associated with questions and answers will be available at the time of the release and their default point values will be set to 0. Existing user reputation points will not be affected by the release, and users won't accrue points from these actions until you configure point values for them.

1. From within the community, click  in the global header.
Members of the community who have the "Create and Set Up Communities" permission can also access Community Management from the All Communities page in organization setup.
2. Click **Reputation > Reputation Points**.
3. Update the points for each action. If you don't want users to accrue points for a certain action, set the Points to 0.
4. Click **Save**.

Point totals show up on profile pages beneath the photo. Point totals are visible to anyone in the community.

 **Tip:** You can directly update reputation points for a community member via the Salesforce API. You can also use Apex triggers to send custom notifications based on changes to reputation points.

SEE ALSO:

[Reputation Overview](#)

[Enable Reputation in Your Community](#)

[Set Up Reputation Levels](#)

How is my community reputation calculated?

The reputation level on your profile is calculated based on your total points.

Points are accrued when you perform activities that your community manager has assigned point values. You could also potentially gain points if your posts or comments draw reaction from other community members. For example, your community manager may have decided that writing a post earns you 5 points. If someone else shares your post, your community manager may decide that you should earn 10 points because your post is influencing others to contribute.

 **Note:** Only active users accrue points. For example, if an active user likes the post of an inactive user, the active user gets 1 point, but the inactive user does not get points.

Default point values are as follows. Keep in mind that your community manager may have customized these values. For more information, contact your community manager.

One Stop Monitoring With Community Dashboards

Enable and Map Dashboards for Community Managers

Community managers can use dashboards to measure the success of their communities. To help community managers stay on top of things, you can even map a dashboard to the Community Management **Home** page. You can map custom dashboards or use ones provided in an AppExchange package. Each community can have their own dashboards.

You can choose to map any dashboard you have access to, but ensure that your community managers have access as well.

 **Tip:** Keep in mind that you can get preconfigured dashboards in the [Salesforce Communities Dashboards package](#) available for download on the AppExchange.

If the Salesforce Communities Dashboards package is installed in your organization, each of the dashboard pages has a default mapping to a dashboard from the package. You can overwrite these values as needed.

Use the following steps to map or update your dashboards in Community Management:

1. From within the community, click  in the global header.
Members of the community who have the “Create and Set Up Communities” permission can also access Community Management from the All Communities page in organization setup.
2. Click **Dashboards > Settings**.
3. For each of the pages, select the dashboard you want to show to community managers.
The dashboard you map to **Home** displays on your Community Management **Home** page.
4. Click **Save**.
Dashboards are visible to community managers when they expand the **Dashboards** section or visit the home page in Community Management.

Verify the dashboard mappings by clicking **Dashboards** and then clicking each page name. If you mapped a dashboard to the **Home** page, check that out too.

USER PERMISSIONS

To map dashboards in Community Management:

- “Create and Set Up Communities” OR “Manage Communities”

AND

“Manage Dashboards in Public Folders”

AND

Is a member of the community whose Community Management page they’re trying to access.

Create a Dashboard to Display in Community Management

You can show any dashboard in Community Management. However, we recommend creating them based on custom report types available for communities.

 **Tip:** Keep in mind that you can get preconfigured dashboards in the [Salesforce Communities Dashboards package](#) available for download on the AppExchange.

Use the following process to create dashboards to display in Community Management:

1. Create custom report types based on the Networks object.

Reports and dashboards that are based on the Networks object show community-specific information in Community Management.

 **Note:** You can create dashboards based on other objects and expose them in Community Management. Just keep in mind that they will show data from across your organization, not just for the community in which you're viewing the dashboard.

- Select Networks as the primary object.
- Select a child object:
 - Chatter Messages
 - Feed Revisions
 - Groups
 - Network Audits
 - Network Activity Daily Metrics
 - Network Members
 - Network Membership Daily Metrics
 - Network Public Usage Daily Metrics
 - Network Unique Contributor Daily Metrics
 - Topic Assignments
 - Topics

2. Use the custom report type to create a report.

Be sure not to filter the report by Network ID to ensure that the report dynamically displays data for the community you view it from. Adding a Network ID filter causes the report to only show data for the community with that Network ID, regardless of which community you view it in.

3. Create a dashboard with components. Select the report as your source type.

- Add a component for each report you want to include in your dashboard.
- Find your report on the Data Sources tab and add it to the component.

If you're creating a dashboard for your Community Management **Home** page, keep these things in mind:

- Use a two-column dashboard with only metric components in the first column and only charts in the second column.
- In the first column, use up to six metric components. Using more than six causes the row to wrap.
- In the second column, you can include any number of charts. However, keep the number of reports to a minimum.
- Your dashboard must have a title.

4. Share the folder that you save your dashboard in with your community managers.

EDITIONS

Available in: Salesforce Classic

Available in:

- Developer

USER PERMISSIONS

To create custom report types:

- "Manage Custom Report Types"

To create, edit, and delete reports:

- "Create and Customize Reports"

To create and share dashboards:

- "Manage Dashboards in Public Folders"

5. In **Community Management**, click **Dashboards** > **Settings** to map your dashboard.

When a community manager accesses Community Management, the dashboard appears under **Dashboards**. If you mapped a dashboard to the **Home** page, the dashboard appears there.

Dashboards in Community Management are automatically refreshed every day. To see the latest data, click **Refresh**. If you access the dashboard after it has been recently refreshed, the dashboard displays the globally cached data from the last refresh. If the dashboard has not been refreshed for 24 hours, it's refreshed automatically when you access it Community Management. External users with super user access can refresh dashboards set up with "Run as specified user" and "Run as logged-in user" up to 100 times daily per organization. Scheduled and automatic refreshes don't count against the limit. There is no refresh limit for internal users.

View Dashboards in Community Management

Use the dashboards in Community Management to monitor the health of your community.

1. From within the community, click  in the global header.

Members of the community who have the "Create and Set Up Communities" permission can also access Community Management from the All Communities page in organization setup.

2. Click **Dashboards**.

Note: Your administrator maps the dashboards. If the **Dashboards** section isn't visible, they haven't been mapped for your community.

Pages that have dashboards mapped to them appear in the **Dashboards** section or on the **Home** page.

3. Click the dashboard page you want to view.

The dashboard appears. For an immediate refresh of dashboard data, click **Refresh**.

4. Click on a dashboard to view the related report.

Be sure not to filter the report by Network ID to ensure that the report dynamically displays data for the community you view it from. Adding a Network ID filter causes the report to only show data for the community with that Network ID, regardless of which community you view it in.

Dashboards in Community Management are automatically refreshed every day. To see the latest data, click **Refresh**. If you access the dashboard after it has been recently refreshed, the dashboard displays the globally cached data from the last refresh. If the dashboard has not been refreshed for 24 hours, it's refreshed automatically when you access it Community Management. External users with super user access can refresh dashboards set up with "Run as specified user" and "Run as logged-in user" up to 100 times daily per organization. Insights for Community Managers

What are Insights?

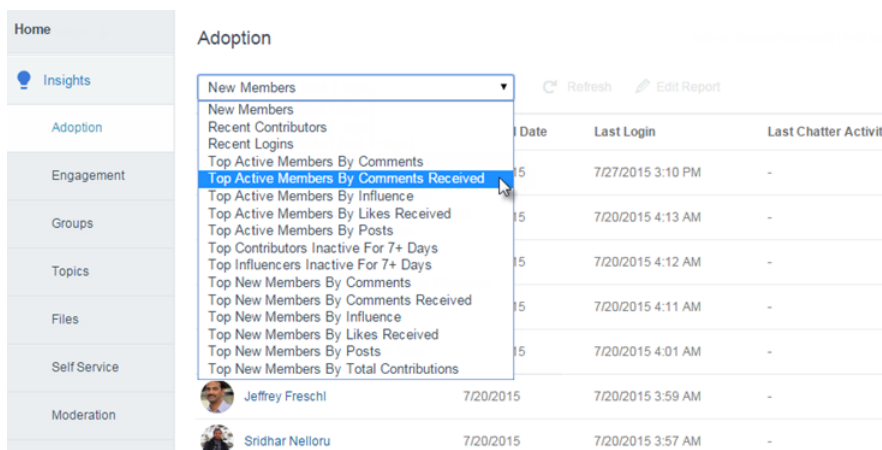

Insights are reports that help your community managers monitor activity and drill down to that activity to take further action. Insights make it easier to encourage community engagement and drive member adoption. You can set up Insights to monitor new members, unanswered questions, newly created groups, trending topics, and even recent Chatter contributions.

 **Example:** With an Insights report set up to track new members, community managers can quickly navigate to a new member's profile to send them a welcome message.

Member	Created Date	Last Login	Last Chatter Activity
John Luke	7/15/2015	7/27/2015 3:10 PM	-
Alok Par John Luke	7/20/2015	7/20/2015 4:13 AM	-
Mia Davis	7/20/2015	7/20/2015 4:12 AM	-
Aniket pal	7/20/2015	7/20/2015 4:11 AM	-

They can also access other reports about members directly from the Insights page using the drop-down menu.

Member	Date	Last Login	Last Chatter Activity
Jeffrey Freschl	7/20/2015	7/20/2015 3:59 AM	-
Sridhar Nelloru	7/20/2015	7/20/2015 3:57 AM	-

 **Note:** Let us do the setup work for you! Get out-of-the-box Insights in the [Salesforce Communities Dashboards package](#) available for download from the AppExchange. To use the preconfigured Insights reports, your community must use Chatter. This package will be available shortly after the Winter '16 release.

Insight reports provided in the package are 100% customizable. You can change the default Insights page names, report folder mappings, and even the Insights report

EDITIONS

[Create Insights to Display in Community Management](#)

[View and Customize Insights in Community Management](#)

Enable and Map Insights for Community Managers

Community managers can use Insights to monitor recent activity and drill down to the source of that activity to take further action. To get up and running quickly, use preconfigured Insights from an AppExchange package. You can also create and map your own. Each community can have their own Insights.

Insights pages map to report folders in your internal organization. All the reports included in that folder are displayed in the drop-down menu on the Insights page. Adding or removing an Insights report from the report folder in your internal organization updates the Insights page in Community Management. On the Insights page, entity links are automatically created for report fields such as `Created By` or `Group Name`.

Tip: Get out-of-the-box Insights in the [Salesforce Communities Dashboards package](#) available for download from the AppExchange. To use the preconfigured Insights reports, your community must use Chatter. This package will be available shortly after the Winter '16 release. When you install the package, report folders are automatically installed in your internal organization. If you have no previous Insights mapped, the package automatically maps them for you. You can change the default mapping at any time.

Use the following steps to map or update your Insights in Community Management:

1. From within the community, click  in the global header.
Members of the community who have the "Create and Set Up Communities" permission can also access Community Management from the All Communities page in organization setup.
2. Click **Insights > Settings**.
3. Provide a name for each Insights page and then select the report folder you want to map to the page.
You can have up to 10 Insights pages mapped in Community Management.
Make sure that you have shared the mapped report folder with your community managers or they won't be able to view the Insights reports.

4. Click **Save**.

Insights pages are visible to community managers when they expand the **Insights** section of Community Management.

EDITIONS

- [Share a Report or Dashboard Folder](#)

Create Insights to Display in Community Management

You can create your own Insights to display in Community Management. We recommend that you create your Insights reports based on custom report types available for communities.

 **Tip:** Get out-of-the-box Insights in the [Salesforce Communities Dashboards package](#) available for download from the AppExchange. To use the preconfigured Insights reports, your community must use Chatter. This package will be available shortly after the Winter '16 release.

Use the following process to create Insights to display in Community Management:

1. Create custom report types based on the Networks object.

Reports based on the Networks object show community-specific information in Community Management.

 **Note:** You can create reports based on other objects and expose them in Community Management. Just keep in mind that they will show data from across your organization, not just for the community in which you're viewing the report.

- Select Networks as the primary object.
- Select a child object:
 - Chatter Messages
 - Feed Revisions
 - Groups
 - Network Audits
 - Network Activity Daily Metrics
 - Network Members
 - Network Membership Daily Metrics
 - Network Public Usage Daily Metrics
 - Network Unique Contributor Daily Metrics
 - Topic Assignments
 - Topics

2. Use the custom report type to create an Insights report.

Insights reports are just like any other report, except they must also meet the following requirements:

- The report can only be a tabular-based report.
- The report must return 2,000 rows or less.
- The report can't include pagination.

EDITIONS

USER PERMISSIONS

To create custom report types:

- "Manage Custom Report Types"

To create, edit, and delete reports:

- "Create and Customize Reports"

To create and share report folders:

- "Manage Reports in Public Folders"

Be sure not to filter the report by Network ID to ensure that the report dynamically displays data for the community you view it from. Adding a Network ID filter causes the report to only show data for the community with that Network ID, regardless of which community you view it in.

3. Save the report to a new report folder that you'll use for mapping.

We recommend that you create a separate report folder for each of your Insights pages. For example, create one report folder called *Insights Members* and another called *Insights Moderation*.

Insights pages map to report folders in your internal organization. All the reports included in that folder are displayed in the drop-down menu on the Insights page. Adding or removing an Insights report from the report folder in your internal organization updates the Insights page in Community Management.

4. Share your Insights report folder with your community managers.
5. In [Community Management](#), click **Insights > Settings** to map Insights pages.

When a community manager accesses Community Management, the Insights reports appear in the drop-down menu on the mapped **Insights** page.

Reporting

Report on Communities with the Dashboards and Insights Package

The Salesforce Communities Dashboards package gives community managers an essential starter set of dashboards and reports to keep tabs on activity and engagement directly in Community Management.

Use the Salesforce Communities Dashboards package to:

- View the latest metrics and rapidly spot trends
- Determine how fast your community is growing
- Find out who your most engaged members are
- Discover which discussions people and groups are most excited about
- Identify areas in your community that need attention
- Drill down to the source of activity and take action with Insights reports

 **Note:** The updated Winter '16 version of the package, which includes preconfigured Insights, will be available shortly after the release. To use the preconfigured Insights reports, your community must use Chatter.

Install one of the following versions from the AppExchange:

- [Salesforce Communities Dashboards \(for Communities with Chatter\)](#)
- [Salesforce Communities Dashboards \(for Communities without Chatter\)](#)

 **Tip:** For installation instructions, detailed information about the reports, and upgrade instructions, see [Get Started with Communities Dashboards and Insights](#).

During installation, dashboard and report folders are automatically installed in your internal organization. You'll also have the option to give your community managers access to the package contents so you don't have to share the dashboard and report folders with them later. If you have no previous Insights or dashboards mapped in Community Management, they are automatically mapped for you during installation.

After the package is installed, you can access your new dashboards and reports alongside all your other Salesforce dashboards and reports. The dashboards and reports provided in the package are 100% customizable. Don't be afraid to customize and change what you get in the package. You won't hurt our feelings.

As newer versions of the package become available, you can upgrade your package by reinstalling it. If you customized any of the reports and dashboards, fear not; your customizations are retained during upgrade.

Navigation Node	Page Name	Description	Requires Chatter
Dashboards	Home	Stay informed about recent activity or membership. This dashboard is mapped to your Community Management home page.	
	Overview	See the overall state of your communities at a glance. 90-day trending reports show total membership, newly joined members, and member logins. If you have Chatter enabled, 90-day snapshots show post and comment metrics.	
	Activity	See metrics about posts, comments, daily unique contributors, and which types of members are contributing posts and comments.	

Navigation Node	Page Name	Description	Requires Chatter
	Chatter	In addition to tracking Chatter usage in your community, you can track Chatter usage in your internal organization. There are specific Chatter dashboards that report <i>only</i> on your internal organization's Chatter usage. You can find these dashboards and reports under the Chatter Dashboards and Chatter Reports folders.	✓
	Content	Track content uploads, downloads, engagement, and content creators.	✓
	Groups	Monitor membership and post and comment activity within groups, one of the top drivers of community success.	✓
	Licenses	Track license usage and login frequency by customer and partner licenses.	
	Members	Gauge membership growth and see login metrics for the last 30 days.	
	Moderation	Track flagged content in your community.	✓
	Q & A	Review metrics about questions, answers, and best answers posted in your groups.	✓
	Self-Service	See metrics about questions, answers, and best answers posted in your user profiles. This dashboard is great for communities using the Napili template.	✓
	Topics	See metrics about the navigational and featured topics in your community.	✓
Insights	Adoption	Monitor member activity and help drive adoption in your community.	✓
	Engagement	Track posts and comments in groups and see which members are truly engaged in your community.	✓
	Files	Monitor file uploads and downloads, including files receiving a lot of comments.	✓
	Groups	Helps you identify groups with deactivated or inactive owners and also groups that have been or will be archived soon.	✓
	Moderation	Track flagged posts, files, messages, and content flagged by moderation rules in your community.	✓
	Self-Service	Track questions and answers in user profiles, including questions escalated to cases. This Insights page is great for communities using the Napili template.	✓
	Topics	Keep an eye on recent topic activity in your community.	✓

Confused about the difference between Insights and Dashboards?

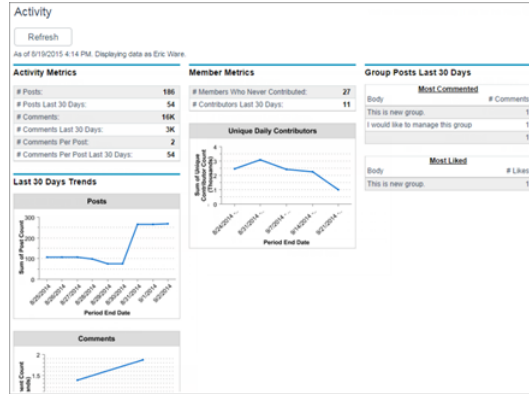

Use **Insights** to view, monitor, and act on your community's activity. Insights give you a super-focused look at a specific area of your community.

Use **Dashboards** to view your community's analytics, such as metrics and trends on activity. Dashboards give you mid-term to long-term views on adoption and engagement in your community. They help you monitor return on investment (ROI) and key performance indicators (KPI).

Set Up Report Management for External Users—Create and Edit Reports

Community partner and customer users can create and edit reports in their own personal folder or in a privately shared folder if they have sufficient permissions. You can grant partner and customer users permissions to create and edit reports through their profiles or by using permission sets. After you grant the required permissions, they can use the drag-and-drop Report Builder tool.

Important: If your organization existed before the Summer '13 release, you must first turn on enhanced sharing for reports and dashboards before granting external users permissions. See [Analytics Folder Sharing](#).

To create, customize, and delete reports, external users must use the Report Builder tool.

Data visibility is based on two main things: the user role the partner or customer belongs to and your organization's sharing rules. Your organization's field-level security is respected, meaning that if a field is not visible for external users, a partner or customer user won't see it in Report Builder.

1. To allow external users to create and edit reports, turn on the "Create and Customize Reports," "Report Builder," and "Edit My Reports" permissions through custom profiles or permission sets.

Optionally, if you want external users to export report data, grant them "Export Reports" permission.

In Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets** or **Profiles**. The permissions you need to assign are as follows:

External User Permissions Needed to Create and Edit Reports

To create, customize, and delete reports in a personal folder:	"Create and Customize Reports" AND "Report Builder"
--	---

To create, customize and delete their own reports in a privately shared folder with Viewer access:	"Edit My Reports" AND "Report Builder"
--	--

To export report data:	"Export Reports"
------------------------	------------------

You can give permission to create and edit reports to the following licenses:

- Customer Community Plus
- Customer Community Plus Login
- Partner Community
- Partner Community Login
- Customer Portal Manager
- Customer Portal Manager Custom (for Enterprise Administration users)
- Gold Partner
- Silver Partner ("Export Reports" permission isn't available to this license.)

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create permission sets or enable custom permissions in profiles:

- "Manage Profiles and Permission Sets"

To assign a permission set to a user:

- "Assign Permission Sets"

To share a report folder with external users:

- "Manager" folder access or "Manage Reports in Public Folders"

 **Note:**

- These permissions aren't available to the Customer Portal Manager Standard license or high-volume user licenses, such as Customer Community, High Volume Customer Portal, Service Cloud Portal, and Authenticated Website.
- External users with legacy portal licenses can create and edit reports in communities, but not in portals.

2. If you want your external users to create or edit reports in a privately shared folder, grant them "Viewer" access on the folder.

On the **Reports** tab in the Folders view, click  next to the folder you want to share, then select **Share**.

 **Note:** Partner and customer users can't create, edit, or view reports in the Unfiled Public Reports folder.

Depending on what objects, fields, and categories your external users have access to, they might see custom report types in the UI when creating a report. Custom report types are visible if a user has read access on any fields or objects included in the custom report type.

[Communities Report and Dashboard Limitations](#)

Track Community Activity

Create custom reports to track usage, moderation, and other community activity.

 **Tip:** Keep in mind that you can get preconfigured dashboards in the [Salesforce Communities Dashboards package](#) available for download on the AppExchange.

To monitor the health of your community, you can create custom report types and then create a report using that custom report type. Additionally, if you want your community managers to see your report on the Community Management page, you can create or edit a dashboard to include your report and then map the updated dashboard in Community Management by clicking, **Dashboards > Settings**.

 **Note:** Reports and dashboards that are based on the Networks object show community-specific information on the Community Management page. This means you can create one custom report and use it across all your communities.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Use the following table to get started with reporting for communities:

High-level usage	Primary Object > B (Child Object) > C (Child Object, If Applicable)	Description
Chatter Usage	Networks > Chatter Messages	Create reports on the private message activity in your community. ¹
Chatter Usage	Networks > Groups	Create reports on the groups in your community.
User Activity	Networks > Network Activity Daily Metrics	Create reports on the daily number of posts and comments by member type.
User Activity	Networks > Network Members > Login History	Create reports on the login activity in your community.
Moderation	Networks > Network Members > Network Activity Audit — User	Create reports on the users in your community whose items were flagged.
Moderation	Networks > Network Members > Network Activity Audit — Moderators	Create reports on users in your community who either flagged items or moderated a flagged item.
Moderation	Networks > Network Audits	Create reports on all moderation activity in your community. To report on moderation activity in private Chatter messages, filter the report by <code>Audited Object Type</code> for <code>Chatter Message</code> .
Public Activity	Networks > Network Public Usage Daily Metrics	Create reports on the daily public community page views and unique visitors.
Topic Activity	Networks > Topics	Create reports on the topic activity in your community.
Topic Activity	Networks > Topic Assignments	Create reports on the topic assignments in your community.
User Activity	Networks > Network Membership Daily Metrics	Create reports on the daily count of total active members, new members added, and external member logins by member type.
User Activity	Networks > Network Unique Contributor Daily Metrics	Create reports on the unique daily contributors in your community. A member is counted as a contributor if they posted or commented on a group or a user profile.

¹To report on Chatter Messages, you must have the “Manage All Data” or “Manage Communities” permissions.

 **Note:** You can create dashboards based on other objects and expose them in Community Management. Just keep in mind that they will show data from across your organization, not just for the community in which you're viewing the dashboard.

Educate Your Users About Communities

Share Personal Contact Information Within Communities

Users can specify which information from their profile is visible to external users, such as customers and partners, and guests viewing publicly accessible pages that don't require login.

When interacting with other community members, it's important to balance being visible and accessible with protecting your personal contact information. You may not want to show your job title, phone numbers, and other contact details outside of your internal organization. Your customers and partners may not want other customers and partners viewing all their contact information.

Use either the user interface or API to control visibility. You can choose to expose fields to employees only, members of the community from outside your company, or guest users who aren't required to log in. Some fields are always visible to everyone accessing the community. Some fields allow up to three levels of visibility, while others allow fewer.

- **Employees**—Only members from the internal organization can view.
- **External**—Members from the internal organization and external members, such as customers and partners, can view. External users are users with Community, Customer Portal, or partner portal licenses.
- **Public**—Anyone can view, including guest users viewing publicly accessible pages that don't require login. Guest users can access public pages in communities via the Guest User license associated with each site or community.

In the API, setting a field to `true` on the User object makes it visible to the type of user indicated in the field name (external or guest users).

Consider these tips about the visibility of your contact information.

- Your chosen settings apply to every community you're a member of.
- When a user is restricted from viewing a contact information field, there are differences in what's displayed in the user interface versus the API.
 - In the user interface, the restricted field is hidden from your profile everywhere that it usually displays in a community. If your organization displays your profile information on custom Visualforce pages, the field still displays, but with the value `#N/A`.
 - In the API, a field set to `false` returns the value `#N/A`.
- Information in hidden fields on a profile is not searchable by other partners and customers in the community, but is searchable by users in the company's internal organization.

Default Visibility Settings for Contact Information

This table summarizes the default visibility settings for contact information and your options for restricting visibility.

Contact Information	Default Visibility	Where to Set in User Interface	Options for Restricting Visibility	API Controls on User Object
First Name Last Name Nickname About Me	Public	Go to <i>Your Name</i> > Edit Contact Info , then click About	Everyone see these fields unless your administrator enables nickname display or creates a custom page that displays this information. If your administrator has enabled nickname display, your nickname displays in place of your first and last names in most locations.	N/A

Navigate to Your Communities

You can easily switch between working in your internal organization and collaborating with customers or partners in communities. The global header is not available by default, the administrator for your organization must enable it for community members.

 **Note:** Organizations who enabled Communities before Winter '14 see the new global header by default when they turn on Communities.

EDITIONS

Available in: Salesforce Classic

- Available in:
- Enterprise
 - Performance
 - Unlimited
 - Developer

The menu on the left side lets you switch between communities and your internal organization.

- To access communities from within your organization, click  next to *Organization Name* in the drop-down and select the community you want to switch to. The drop-down shows *Active* communities that you're a member of. If you have the "Create and Set Up Communities" permission, you also see *Preview* communities that you're a member of.
- To return to your internal organization, click  next to *Community Name* in the drop-down and select your organization name.

Internal users who aren't members of any community only see the company name. External users see the drop-down menu only if they belong to more than one active community.

 **Note:** If an external user who is only a member of one **Active** community is given the URL for a **Preview** community, they don't see the drop-down menu in the **Preview** community.

You can work in more than one community at a time if you open each one in a different browser tab.

Switching between your internal organization and your communities doesn't have to disrupt your workflow. We automatically return you to the page where you were last working, so you can pick up right where you left off.

 **Note:** If your organization is setting up My Domain but hasn't finished deployment of the new custom domain, switching from a community to your internal organization directs you to the Salesforce login page instead. This can happen when you've logged in using a My Domain URL that has been registered but not yet deployed. Once your domain is deployed, selecting your organization in the drop-down directs you to the internal organization as expected.

The *Your Name* menu on the right side contains links to edit contact information and log out. For internal users, it also contains a link to Help & Training and may also contain links to Setup and other tools depending on user permissions and enabled features. If your organization is using Lightning Experience, users with the appropriate permission can switch between Salesforce Classic and the new interface using the Switcher. Look for the **Switch to Lightning Experience** link in the *Your Name* menu. Salesforce Communities isn't currently supported in Lightning Experience, so if a user switches over, they won't see the global header or communities. To access their communities, they'll have to switch back to Salesforce Classic.

[Salesforce Communities Overview](#)

Search Behavior in Communities

In general, searches within a community return results specific to that community. Search behavior also depends on whether Chatter is enabled in your organization.

If Chatter is enabled in your organization, global search and contextual feed search are enabled by default in all communities.

- With global search, users can search for records, files, people, groups, topics, and feed posts and comments.
- Feed search () is helpful when users want to look for information in a specific feed context, such as in groups, on a user's profile, in a record feed, or in the community feed.

If Chatter isn't enabled, sidebar search is enabled in all communities.

- Sidebar search doesn't support searches for items specific to Chatter, such as feeds, groups, files, topics, and user profiles.

Search behavior in communities is different from searches in the internal organization:

- In general, searches within a community return matches from within the community. To find items from a different community, users must leave the current community and search from within the other community.
- In search results in a community, users can see what they have access to through their profiles or permission sets in addition to what is explicitly shared with them in the community. This may include internal company content and records not explicitly shared in the community. For example, if the user's profile allows access to account information, and the accounts tab isn't made visible in the community, the user is able to access account information from their search results.
- For user searches performed by external community members, global search and enhanced lookup search (with the **All Fields** option selected) query the following limited set of fields:
 - Name

EDITIONS

Available in: **Salesforce Classic**

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

- Username
- User ID
- Body
- Email
- Phone
- Custom fields

For example, if an external community member searches for a user, John Doe, by his alias, *jdoe*, and that term isn't contained in any of the searchable fields, the user John Doe isn't included in search results.

- Search results for records and files are not limited to data made visible within the community. Record search results include all the records a user has access to across all communities, including the internal organization's records if they have access. In file searches, users can see:
 - Files they own
 - Files shared with them directly
 - Files they have access to in a library
 - Files that are posted to a record they have access to
 - Files that are posted to groups or shared with that community
- To enable search result filters for an object in a community, the administrator must enable them for that object from within the internal organization.

Manage Your Community Email Notifications

Use email notifications to keep up with important updates in communities.

You can choose to receive email notifications whenever someone posts on your profile, comments after you on a post you've commented on, posts to a group you belong to, and more. Email notification preferences are set by community.

To set your email preferences, go to your profile page within a community, click the drop-down button () in the upper-right corner and select **My Settings**, then click **Email Settings**. You can turn individual notifications on or off.

Your chosen settings apply to the current community. If you don't belong to any groups yet, you won't see the option to set groups on this page until after you join your first group. You can also set your group email preferences using the **Email Me...** drop-down on each group's page. You can choose to receive a daily or weekly digest email or an email every time someone posts. This option is visible if you're a group member.

Your email options are similar to the Chatter email settings in your internal organization under your personal settings (*Your Name* > **My Settings** > **Email Settings** for Chatter Free users). Within communities, however, note the following differences.

- The default notification frequency for new groups you join can't be set via the user interface. It can be set only via Salesforce APIs (SOAP API and REST API).
- Personal digests aren't currently available.
- If your community has Chatter messages enabled, you're notified of file shares in a private message. If Chatter messages aren't enabled, you'll continue to be notified of file shares by email.
- The `Flags an item as inappropriate` option appears for all members of the community, but only sends notifications if:

SET UP AND MAINTAIN COLLABORATION TOOLS

Welcome, Collaboration Tool Administrators

This documentation contains everything you need to help your users collaborate with each other, or even with people outside your organization. Learn how to set up and extend Chatter, or enable users to create, package and send files outside your organization using Salesforce CRM Content. For help with basic Salesforce administration, see *Set Up Your Organization*.

Salesforce Chatter

Chatter

Chatter is a Salesforce collaboration application that connects, engages, and motivates users to work efficiently across the organization regardless of role or location. Chatter lets users collaborate on sales opportunities, service cases, campaigns, and projects with embedded apps and custom actions.

Salesforce organizations created after June 22, 2010 have Chatter already enabled for all users by default. However, if you only want certain parts of your organization to use Chatter, you can do a profile-based rollout of Chatter instead. With a profile-based rollout, only the users that have been assigned the required user profile or permission sets have access to Chatter. Profile-based rollout of Chatter is useful for larger companies and companies or government agencies with regulatory constraints. It allows them to plan a controlled rollout and deploy Chatter on a department-by-department basis.

We recommend rolling out Chatter for all users in your organization, unless your company doesn't want all users to have full access to Chatter. Chatter is secure and works in accordance with all the security and permission settings in your Salesforce organization.

SEE ALSO:

[Profile-Based Chatter Rollout Overview](#)

Profile-Based Chatter Rollout Overview

Profile-based rollout of Chatter enables Chatter for a subset of users instead of all users in the organization.

Profile-based rollout of Chatter makes Chatter available for a part of your organization, but not for all users. Once profile-based rollout of Chatter is enabled for your organization, you can turn on Chatter for the users with the required user profile or permission sets. All other users in your organization don't have access to Chatter.

 **Example:** Let's say you assign a profile or permission set that excludes Chatter access to a subset of users. These users still have access to Salesforce objects, but they don't see the record feed and they can't make posts.

IN THIS SECTION:

[Get Ready for Profile-Based Rollout of Chatter](#)

If you're rolling out Chatter to just a subset of your users, prepare your organization to control Chatter access with custom user profiles and permission sets.

[Control Chatter Access through User Profiles](#)

Modify existing custom user profiles to allow or deny access to Chatter.

[Control Chatter Access through Permission Sets](#)

Modify existing and create new permission sets to handle Chatter access.

[Profile-Based Rollout Considerations](#)

In organizations that use profile-based rollout of Chatter, certain limitations apply to user profiles, permissions sets, and the interaction between users with and users without Chatter access.

Get Ready for Profile-Based Rollout of Chatter

If you're rolling out Chatter to just a subset of your users, prepare your organization to control Chatter access with custom user profiles and permission sets.

From a high-level perspective, a profile-based rollout of Chatter consists of these steps:

1. Salesforce enables the profile-based rollout of Chatter feature for your organization.
2. You determine which users get access to Chatter.
3. You review and modify existing custom user profiles and permissions sets.
4. Verify that the Enable Chatter permission in a custom user profile or permission set has the desired setting.
5. To allow or restrict Chatter access, assign the associated profile or permission set to users.
6. You turn on Chatter for your organization.

Control Chatter Access through User Profiles

Modify existing custom user profiles to allow or deny access to Chatter.

When Salesforce turns on profile-based rollout of Chatter for your organization, the Enable Chatter permission is added to all of your existing user profiles and permissions sets. This permission is automatically enabled for all standard profiles. It is also automatically enabled for all custom profiles, if any of the following user-level permissions were already enabled, either manually or as part of a license:

- “Create and Own New Chatter Groups” (ChatterOwnGroups)
- “Create and Share Content Deliveries for Chatter Files” (ChatterFileLink)
- “Invite Customers To Chatter” (ChatterInviteExternalUsers)
- “Manage Chatter Messages” (ManageChatterMessages)
- “Moderate Chatter” (ModerateChatter)
- “Moderate Chatter Feeds” (ModerateNetworkFeeds)
- “Use Case Feed” (ViewCaseInteraction)
- “View All Data” (ViewAllData)

Modify your existing custom profiles with the desired permissions to control access to Chatter and create new custom profiles, if required.

1. Log in as a Salesforce administrator.
2. From Setup, enter *Profiles* in the Quick Find box, then select **Profiles**.

3. For each of your existing custom user profiles:
 - a. Click **Edit**.
 - b. In the Administrative Permissions section, select or deselect **Enable Chatter**, depending on whether you want users with this profile to have Chatter access or not.

- [Control Chatter Access through Permission Sets](#)
- [Chatter Settings](#)
- [Profile-Based Rollout Considerations](#)

Control Chatter Access through Permission Sets

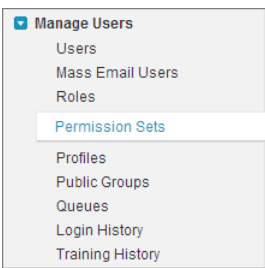

Modify existing and create new permission sets to handle Chatter access.

When you enable or disable Chatter through permission sets, consider that:

- Permission sets persist over user profile settings when you enable Chatter. All users with a Chatter-enabled permission set have access to Chatter, even if Chatter isn't enabled in their user profile.
- Permission sets don't persist over user profile settings when you disable Chatter. All users with a Chatter-enabled user profile have access to Chatter, even if Chatter is disabled in their permission set. To prevent that person from accessing Chatter, disable Chatter in both, the person's user profile and permission set.

For your existing permission sets, you need to verify that they include the correct and required Chatter permissions for the desired subset of users.

1. Log in as a Salesforce administrator.
2. From Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets**.

3. For each existing user-level permission set:
 - a. In the System section, click **System Permissions**.
 - b. Click **Edit** and select **Enable Chatter**. This permission is only available, if profile-based rollout of Chatter has been enabled for your organization.

USER PERMISSIONS

To enable Chatter:

- "Customize Application"

System Permissions		Edit
▼ System		
Permission Name	Enabled	Description
Access Custom Mobile Apps	<input type="checkbox"/>	Allow user to run custom mobile apps.
API Enabled	<input type="checkbox"/>	Access any Salesforce.com API.
Api Only User	<input type="checkbox"/>	Access Salesforce.com only through a Salesforce.com API.
Assign Topics	<input type="checkbox"/>	Assign existing topics to feed items. Remove topics from feed items.
Author Apex	<input type="checkbox"/>	Create Apex classes and triggers.
Bulk API Hard Delete	<input type="checkbox"/>	Delete records in the Bulk API without storing them in the Recycle Bin.
Chatter Internal User	<input type="checkbox"/>	Use all Chatter features.
Connect Organization to Environment Hub	<input type="checkbox"/>	Allows a user to connect this organization to an Environment Hub.
Edit Tasks	<input type="checkbox"/>	Create, edit, and delete tasks.
Edit Topics	<input type="checkbox"/>	Edit topic names and descriptions.
Email-Based Identity Confirmation Option	<input type="checkbox"/>	Provides an option to use email to confirm identity, even if the user has a verified phone number.
Enable Chatter	<input checked="" type="checkbox"/>	Use Chatter.
Enable Work.com	<input type="checkbox"/>	Allow Work.com only users to access Work.com functionality.
Export Reports	<input type="checkbox"/>	Use Export Details and Printable View to export reports.
Insert System Field Values for Chatter Feeds	<input type="checkbox"/>	Set the author or creation date for a Chatter post or comment.
Invite Customers To Chatter	<input type="checkbox"/>	Invite Customers To Chatter
Manage Analytic Snapshots	<input type="checkbox"/>	Create, edit, and delete analytic snapshots.

- c. Save your changes.
4. If applicable, create new permission sets with the desired permissions and assign them to users. By default, all permissions in a new permission set are disabled. The following Chatter permissions have to be enabled in a new permission set, if you want the users to whom you are assigning this permission set to have these permissions.
- “Create and Own New Chatter Groups” (ChatterOwnGroups)
 - “Create and Share Content Deliveries for Chatter Files” (ChatterFileLink)
 - “Invite Customers To Chatter” (ChatterInviteExternalUsers)
 - “Manage Chatter Messages” (ManageChatterMessages)
 - “Moderate Chatter” (ModerateChatter)
 - “Moderate Chatter Feeds” (ModerateNetworkFeeds)
 - “Use Case Feed” (ViewCaseInteraction)
 - “View All Data” (ViewAllData)

 **Note:** Selecting the Enable Chatter permission in a person's permission set doesn't automatically turn on Chatter for that person. People can't use Chatter until you actually [turn on Chatter](#) for your organization.

SEE ALSO:

[Control Chatter Access through User Profiles](#)

[Chatter Settings](#)

[Profile-Based Rollout Considerations](#)

Profile-Based Rollout Considerations

In organizations that use profile-based rollout of Chatter, certain limitations apply to user profiles, permission sets, and the interaction between users with and users without Chatter access.

- The Enable Chatter option isn't available unless profile-based rollout of Chatter has been enabled for the organization.
- Permission sets persist over user profile settings when you enable Chatter. All users with a Chatter-enabled permission set have access to Chatter, even if Chatter isn't enabled in their user profile.
- Permission sets don't persist over user profile settings when you disable Chatter. All users with a Chatter-enabled user profile have access to Chatter, even if Chatter is disabled in their permission set. To prevent that person from accessing Chatter, disable Chatter in both, the person's user profile and permission set.
- Selecting the Enable Chatter permission in a person's user profile or permission set doesn't automatically turn on Chatter for the organization. Turn on Chatter for your organization after you modified user profiles and permission sets.
- Standard Salesforce user profiles have Chatter enabled by default. You can't disable Chatter for these standard profiles.
- Don't deselect Enable Chatter permission on a cloned Chatter External user profile. The user sees an error message and can't log in.
- Don't deselect the Enable Chatter permission on a cloned Chatter Free or Chatter Moderator profile. You get an error message and can't save the profile.
- Enabling profile-based rollout of Chatter and Chatter for an organization also enables a set of dependent Chatter user permissions. If Chatter is disabled for the organization, these permissions are also disabled at the same time. However, if Chatter is then enabled again, these permissions aren't automatically re-enabled and the administrator must enable them explicitly.
- When profile-based rollout of Chatter is enabled for an organization, Chatter is automatically enabled for standard profiles. For all custom profiles and permission sets, Chatter is automatically enabled, if any of the following user-level permissions were already enabled, either manually or as part of a license:
 - "Create and Own New Chatter Groups" (ChatterOwnGroups)
 - "Create and Share Links to Chatter Files" (ChatterFileLink)
 - "Invite Customers To Chatter" (ChatterInviteExternalUsers)
 - "Manage Chatter Messages" (ManageChatterMessages)
 - "Moderate Chatter" (ModerateChatter)
 - "Moderate Chatter Feeds" (ModerateNetworkFeeds)
 - "Use Case Feed" (ViewCaseInteraction)
 - "View All Data" (ViewAllData)
- In organizations that have Work.com enabled, users with access to Chatter can't thank users who don't have access to Chatter.

- If your organization already has Chatter enabled and switches to profile-based rollout of Chatter, manually enable Chatter in all existing custom profiles and permission sets. Otherwise, users that are assigned these custom profiles and permission sets lose access to Chatter.

Chatter Settings

Chatter is enabled by default in Salesforce and the Salesforce1 app. Configure various Chatter features and customize the Chatter experience for your users on the Chatter Settings page in Setup.

- To access the Chatter Settings page, enter *Chatter* in the **Quick Find** box and select *Chatter Settings*.
- To disable Chatter for your entire organization, deselect **Enable** in the Chatter Settings section.

IN THIS SECTION:

[Chatter Group Settings](#)

Configure group features like group archiving, records in groups, and unlisted groups. Chatter groups are the main collaboration space in Chatter where people share information, post updates and ask questions.

[Enable Emoticons in the Feed](#)

Emoticons let your users add expressions like a smiley face to their posts and comments by typing a character combination.

[Customer Invitations](#)

Allow users to invite customers to private groups that they own or manage. Customers are users outside of your company's email domains. They have limited Chatter access and can only see groups they're invited to and interact with members of those groups.

[Coworker Invitations](#)

Allow Salesforce users to invite coworkers without Salesforce licenses to Chatter. Invited users can access Chatter people, profiles, groups, and files but can't see record data unless they have a Salesforce license.

[Enable Actions in the Publisher](#)

To add global actions to the publisher, you must first enable the Actions in the Publisher feature in Chatter Settings. Actions add functionality to the Chatter publisher and let your users do more in Salesforce and in Salesforce1.

[Feed Post and Comments Editing Overview](#)

With feed post editing, users can edit their own feed posts. Record owners can also edit any post on records they own, no matter who created the post.

Chatter Group Settings

Configure group features like group archiving, records in groups, and unlisted groups. Chatter groups are the main collaboration space in Chatter where people share information, post updates and ask questions.

IN THIS SECTION:

[Chatter Group Archiving](#)

Group archiving is enabled by default for your organization. If a group has no new feed posts or comments for 90 consecutive days, the group is archived automatically. When group archiving is enabled, feed activity in groups is reviewed on a weekly basis.

[Enable Records in Chatter Groups](#)

Records are allowed in groups by default. Customize the group publisher to include the Add Record action, so users can add records to groups.

[Enable Unlisted Chatter Groups](#)

Enable unlisted groups for your organization to allow users to collaborate more privately in Chatter.

[Unlisted Group Limitations](#)

Consider the limitations of unlisted groups before you decide to enable them in your organization.

Chatter Group Archiving

Group archiving is enabled by default for your organization. If a group has no new feed posts or comments for 90 consecutive days, the group is archived automatically. When group archiving is enabled, feed activity in groups is reviewed on a weekly basis.

Mentioning a group doesn't count as feed activity and doesn't delay group archiving. Archived groups count toward your organization's group limits (10,000), but not toward a user's group membership limits (100).

There are more group archiving settings on the group settings page. That's where group owners and managers can archive, activate, or edit the automatic archiving settings. To change the archiving settings for multiple groups at once, use the Salesforce API.

If your organization doesn't want to use group archiving, disable this feature in Setup. Enter *Chatter* in the **Quick Find** box, select **Chatter Settings**, and deselect **Allow Group Archiving** in the Groups section.

 **Note:** To allow group owners and managers to archive, activate, or disable automatic archiving in the Salesforce1 apps and in the Lightning Experience, customize the group layout and add the necessary fields.

Enable Records in Chatter Groups

Records are allowed in groups by default. Customize the group publisher to include the Add Record action, so users can add records to groups.

The Add Record action on the group publisher lets users add account, contact, lead, opportunity, contract, campaign, case, and custom object records to groups. The Add Record action isn't available by default, so you must configure the group publisher to include this action.

[Walk Through It: Allow Users to Add Records to Chatter Groups](#)

We recommend that you also customize object layouts to include the Groups related list on record detail pages. Customize the layout of all the standard and custom objects in your organization that support group-record relationships. The Groups related list shows users the list of groups associated with the record.

[Walk Through It: Add the Groups Related List to Records](#)

If you don't want to users to add records to groups, enter *Chatter* in the *Quick Find* box in Setup, then select *Chatter Settings*, and deselect **Allow records in groups in the Groups** section. Disabling the feature hides the Group Records list on the group detail page and the **Add Record** action in the group publisher.

SEE ALSO:

[Customize the Chatter Group Layout and Publisher](#)

Enable Unlisted Chatter Groups

Enable unlisted groups for your organization to allow users to collaborate more privately in Chatter.

Unlisted groups offer more privacy for compared to private groups. Only group members and users with the "Manage Unlisted Groups" permission can access unlisted groups in list views, feeds, and search results. By default, unlisted groups aren't enabled for your organization. Review the limitations of unlisted groups, before you enable this feature in your organization.

1. From Setup, enter *Chatter* in the *Quick Find* box, then select **Chatter Settings**.
2. Click **Edit**.
3. Select **Enable Unlisted Groups**.
A message displays with important information about enabling unlisted groups in your organization.
4. In the highlighted message, select the checkbox next to **I want to enable unlisted groups and understand that I may need to update Apex/Visualforce code in my organization**.
5. Click **Save**.

Any user can create an unlisted group. Unlike private groups, users with the "View All Data" or "Modify All Data permission" can't view or update unlisted groups unless they're members. To allow

non-members to view and modify unlisted groups, assign the “Manage Unlisted Groups” permission to them via their profile or a permission set.

SEE ALSO:

[Unlisted Group Limitations](#)

[Unlisted Groups Overview](#)

Unlisted Group Limitations

Consider the limitations of unlisted groups before you decide to enable them in your organization.

For Administrators

- Only users with the “Manage Unlisted Groups” permission can access or modify unlisted groups and its files and feed content without membership.
- Users with the “Modify All Data” permission can’t delete feed content from unlisted groups, unless they are group members.
- Users with the “Data Export” permission can export all Chatter data and view the exported posts and comments from any group, regardless of whether they have the “Manage Unlisted Groups” permission.
- You can’t grant the “Manage Unlisted Groups” permission to users with these profiles Chatter External, High Volume Portal, or High Volume Customer Portal.
- Unlisted groups count toward a user’s group limit, but they don’t appear in the Groups list on a user’s profile page unless the person who’s viewing the list is a member of those groups or has permission to manage unlisted groups. When unlisted groups are hidden, the count that’s shown next to the Groups list might not be accurate, depending on the permissions of the person viewing the list.

EDITIONS

For Developers

Apex code runs in system mode, which means that the permissions of the current user aren’t taken into account. This limitation has implications for pages that are written in Apex.

- Visualforce pages that display groups might expose unlisted groups to users who aren’t members.
- Because system mode disregards the user’s permissions, all users who are accessing a Visualforce page that’s showing an unlisted group can act as an owner of that group.
- AppExchange apps that are written in Apex and that access all groups will expose unlisted groups to users who aren’t members.

To limit and manage access to the unlisted groups in your organization:

- Explicitly filter out unlisted groups from SOQL queries in all Apex code.
- Use permission sets, profile-level permissions, and sharing checks in your code to further limit unlisted group access.
- Use Apex triggers on the CollaborationGroup object to monitor and manage the creation of unlisted groups. In Setup, enter *Group Triggers* in the Quick Find box, then select **Group Triggers** to add triggers.

SEE ALSO:

[Enable Unlisted Chatter Groups](#)

[Unlisted Groups Overview](#)

Enable Emoticons in the Feed

Emoticons let your users add expressions like a smiley face to their posts and comments by typing a character combination.

Emoticons aren't supported in Salesforce1.

1. From Setup, enter *Chatter Settings* in the Quick Find box, then select **Chatter Settings**.
2. In the Emoticons in Feed section, select **Allow Emoticons**.

Salesforce supports these character combinations in posts and comments.

Character Combinations	Emoticon
<ul style="list-style-type: none"> • :) <ul style="list-style-type: none"> • :-) 	 (smile)
<ul style="list-style-type: none"> • :P <ul style="list-style-type: none"> • :-P • :p • :-p 	 (tongue)
<ul style="list-style-type: none"> • :(<ul style="list-style-type: none"> • :-(- 	 (frown)
<ul style="list-style-type: none"> • >:(<ul style="list-style-type: none"> • >:-(- 	 (angry)
<ul style="list-style-type: none"> • :((<ul style="list-style-type: none"> • :!(• :!-( (crying)

- "Customize Application"

Customer Invitations

Allow users to invite customers to private groups that they own or manage. Customers are users outside of your company's email domains. They have limited Chatter access and can only see groups they're invited to and interact with members of those groups.

Customer invitations don't support custom domains created using My Domain, single sign-on, and IP restrictions. To allow customer invitations with these features enabled, we recommend one of the following approaches:

- Customize the single sign-on page for your organization with an extra link redirecting users to <https://login.salesforce.com>.
- Enable single sign-on for your customers.

Customer invitations are enabled by default. To disable customer invitations, enter *Chatter* in the **Quick Find** box in Setup, select *Chatter Settings*, and deselect **Allow Customer Invitations** in the Chatter Settings section. Disabling this feature doesn't delete existing customers or groups that allow customers.

SEE ALSO:

[Coworker Invitations](#)

[Can I connect multiple Salesforce organizations using Chatter?](#)

Coworker Invitations

Allow Salesforce users to invite coworkers without Salesforce licenses to Chatter. Invited users can access Chatter people, profiles, groups, and files but can't see record data unless they have a Salesforce license.

Coworker invitations are automatically enabled for new Salesforce organizations. The email domain of the first Salesforce user that is added to the organization is used as the company domain in the **Company Email Domains** field. Invitations aren't turned on if the user's domain is a free public email provider such as yahoo.com or gmail.com.

You can add up to 200 domains. Enter the domains that are used in email addresses for your company. We recommend that you don't enter public email domains such as hotmail.com, yahoo.com, or gmail.com. If invited, anyone with an email address in these domains can join and see user profiles, feeds, and Chatter groups.

To disable coworker invitations, enter *Chatter* in the **Quick Find** box in Setup, select *Chatter Settings*, and deselect **Allow Coworker Invitations** in the Coworker Invitations section. If you deselect this feature, users can't accept outstanding invitations. Similarly, if you remove an email domain, users can't accept outstanding invitations from that domain.

Feed Post and Comments Editing Overview

With feed post editing, users can edit their own feed posts. Record owners can also edit any post on records they own, no matter who created the post.

A Chatter Settings option and two user permissions control the feed post editing feature.

The *Allow users to edit posts and comments* option in Chatter Settings enables or disables the Edit Feed Post feature for your organization. This option is enabled by default in existing and new organizations. All users that are assigned a standard profile can edit their own posts and comments immediately, except for Chatter Free, Chatter External, and Customer Portal users. For users that are assigned custom profiles, administrators must specifically enable the permissions in the users' custom profiles or permission sets.

The "Edit My Own Posts" permission allows users to edit their own posts. This permission is available and automatically enabled on standard profiles, except Chatter External, Chatter Free, and Customer Portal User profiles. To allow Chatter External, Chatter Free, or Custom Portal users to edit their own posts, clone the profiles and enable the "Edit My Own Posts" permission in the cloned profiles. Assign the cloned profiles to the users.

The "Edit Posts on Records I Own" permission allows users to edit posts and comments on records they own, including other people's posts and comments. For example, a group owner or manager can edit all posts on the group's feed. A manager for a particular record type can edit all posts on the record. This permission is available on standard and custom profiles, but it is disabled by default.

This table summarizes the permissions and their default settings.

User Permission	Description	Available in	Default Setting
Edit My Own Posts	Allows users to edit their own posts	Standard profiles, except <ul style="list-style-type: none"> • Chatter External User • Chatter Free User • High Volume Customer Portal User • Partner Community User Profile 	Enabled in all new and existing organizations
		Custom profiles	Disabled in all new and existing organizations
Edit Posts on Records I Own	Allows record owners to modify their own posts and	Custom profiles	Disabled in all new and existing organizations.

USER PERMISSIONS

To enable actions:

- "Customize Application"

User Permission	Description	Available in	Default Setting
	posts other users made on groups and record detail pages.		However, Chatter moderators, community moderators, and users with “Modify All Data” permission can always edit all posts and comments.

The *Allow users to edit posts and comments* option in Chatter Settings is enabled by default. For users that have the required permissions, the Edit option is available from the drop-down menu on posts, comments, questions, and answers. It opens a separate Edit window, where users can modify the text.

After users saved their edited version of the post, it shows an Edited time stamp to indicate that the original post was modified.

If users edit a post or comment and mention new people or groups, those people and groups receive email notifications. People and groups who were mentioned in the original post or comment don't receive a new email notification. Email notifications for edited posts or comments show the Edited time stamp.

For community users, feed post editing is only available, if the community was created using Salesforce Tabs + Visualforce or the Napili template. The Edit option isn't available on system-generated posts like feed tracked record updates.

IN THIS SECTION:

[Enable Feed Post Editing in User Profiles or Permission Sets](#)

By default, feed post editing is disabled on all custom profiles. To make the feature available to your users, you can either modify your user profiles or assign the permissions to users via a permission set.

[Disable Feed Post Editing for All Users](#)

By default, all users who are assigned a profile that has the feed post editing permissions enabled can edit their posts and comments. If needed, you can disable feed post editing for all users in your organization, regardless of their assigned user profile.

Enable Feed Post Editing in User Profiles or Permission Sets

By default, feed post editing is disabled on all custom profiles. To make the feature available to your users, you can either modify your user profiles or assign the permissions to users via a permission set.

Here's how you enable the permissions in a permission set.

1. From Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**.
2. Click an existing permission set or create one.
3. In the System Permissions section, click **Edit**.
4. Select the edit feed post permissions you want to enable.
 - Select *Edit My Own Posts* to allow users that are assigned this custom profile to edit their own posts and comments.
 - Select *Edit Posts on Records I Own* to allow users that are assigned this custom profile to edit posts and comments on records they own, including posts and comments made by other users.
5. Click **Save**.
6. Assign the permission set to the users who need the permissions.

Example:  [Walk Through It: Assign a Permission Set](#)

USER PERMISSIONS

Disable Feed Post Editing for All Users

By default, all users who are assigned a profile that has the feed post editing permissions enabled can edit their posts and comments. If needed, you can disable feed post editing for all users in your organization, regardless of their assigned user profile.

1. From Setup, enter *Chatter Settings* in the **Quick Find** box, then select **Chatter Settings**.
2. Click **Edit**.
3. In the Post and Comment Modification section, deselect *Allow users to edit posts and comments*.

USER PERMISSIONS

To enable or disable features in Chatter Settings:

- “Customize Application”

Post and Comment Modification
The author of the post or comment, the record owner, a Chatter moderator, and a moderator in this community have permission to modify the text.
Allow users to edit posts and comments <input type="checkbox"/>

4. Click **Save**.

The feed post editing feature is disabled for your entire organization. Users can no longer edit posts and comments.

Publisher Actions and Layouts

Actions add functionality to the Chatter publisher and let your users do more in Salesforce and in Salesforce1.

Actions are all about productivity. Actions let users accomplish things with fewer clicks, fewer fields, and ultimately less time spent. Actions are especially useful in Salesforce1, because it makes it easy to create and edit records with a simple, mobile-optimized interface. By default, the Chatter publisher includes the standard actions Post, File, Link, Poll, and Question.

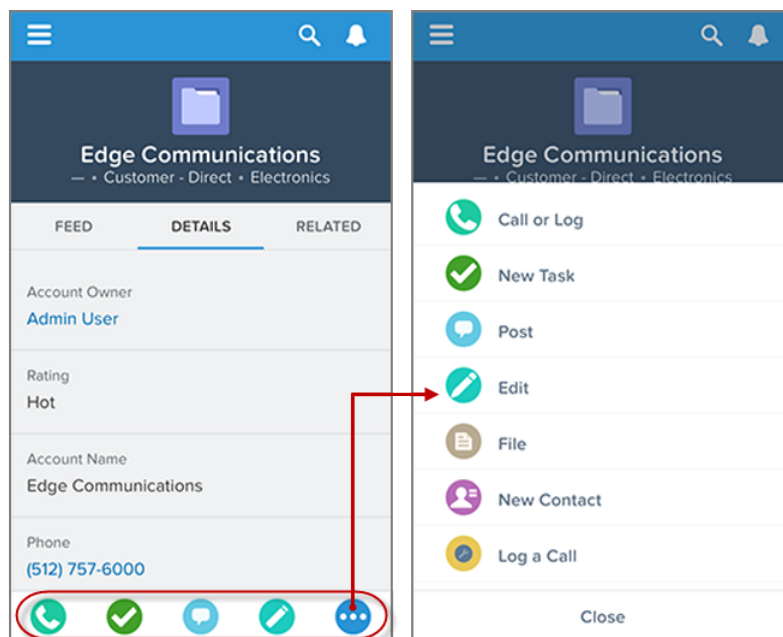

EDITIONS

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Contact Manager
- Developer
- Database.com

In Salesforce1, actions appear in the action bar, its associated action menu, and as list-item actions.

There are several categories of actions, like standard actions, nonstandard actions, default actions, mobile smart actions, custom actions, and productivity actions.

- **Standard actions:** Standard actions are actions that are automatically added to the publisher when Chatter is enabled—such as Post, File, Link, and Poll. You can customize the order in which these actions appear in the publisher, but you can't edit their properties.
- **Nonstandard actions:** Nonstandard actions are actions that you create and customize yourself.
- **Default actions:** Default actions are predefined actions provided by Salesforce. Add them to the publisher layout to make them available to your users.
- **Mobile smart actions:** Mobile smart actions are a set of preconfigured actions, just like default actions. In Salesforce1, mobile smart actions let users create records directly in the feed.

- **Custom actions:** Custom actions are Visualforce pages or canvas apps with functionality that you define. For example, you can create a custom action so that users can write comments that are longer than 5000 characters.
- **Productivity actions:** Productivity actions are predefined by Salesforce and are attached to account, contact, event, lead, user, and user profile objects. You can't edit or delete productivity actions.

To customize the publisher with more actions or change the order of the actions, first enable actions in the publisher on the Chatter Settings page in Setup.

IN THIS SECTION:

[Create Global Publisher Layouts](#)

Use global publisher layouts to customize the Chatter publisher on global pages such as the Home page and the Chatter page. These publisher layouts also drive the actions that users see in the action bar and action menu on the Feed and People pages in Salesforce1.

[Add Actions to Global Publisher Layouts](#)

Actions you add to the global publisher layouts appear on pages such as the Home and Chatter pages, and the action bar and action menu on the Feed and People pages in Salesforce1.

Create Global Publisher Layouts

Use global publisher layouts to customize the Chatter publisher on global pages such as the Home page and the Chatter page. These publisher layouts also drive the actions that users see in the action bar and action menu on the Feed and People pages in Salesforce1.

1. From Setup, enter *Publisher Layouts* in the **Quick Find** box, then select **Publisher Layouts**.
2. To create a new global publisher layout, click **New**.
3. To clone a publisher layout, select one from the Existing Global Publisher Layout drop-down list.
4. Enter a name for the new global publisher layout.
5. Click **Save**.

Add Actions to Global Publisher Layouts

Actions you add to the global publisher layouts appear on pages such as the Home and Chatter pages, and the action bar and action menu on the Feed and People pages in Salesforce1.

Arrange the actions so that the frequently used actions appear first in each list. All other actions appear in the publisher drop-down menu.

Walk Through It: Customizing Global Publisher Layouts

You can add actions to two sections on a page layout:

Quick Actions in the Salesforce Classic Publisher

This section can contain actions only from the Quick Actions category in the palette. Actions in this section appear in the Chatter publisher in the full Salesforce site.

Salesforce1 and Lightning Experience Actions

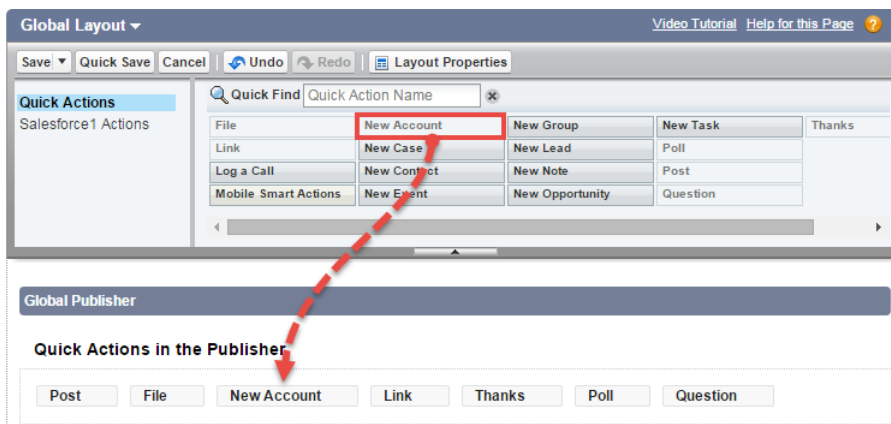

This section can contain actions only from the Salesforce1 Actions category in the palette. On object page layouts, the Salesforce1 Actions category contains all available types of actions for the object, including quick actions, productivity actions, and standard and custom buttons. Actions in this section appear in the action bar and action menu in Salesforce1 and in various areas of Lightning Experience.

1. From Setup, enter *Publisher Layouts* in the *Quick Find* box, then select **Publisher Layouts**.
2. To add or remove actions, drag them to and from the palette. To reorder actions, select an action and drag it to a new position.

In the Quick Actions in the Salesforce Classic Publisher section, the first three actions on the left appear in the Chatter publisher. All other actions appear in the More drop-down menu.
3. Click **Save** when you're done, or click **Quick Save** to save your changes and continue working on the layout.

If you navigate away without saving, you lose your changes.

 **Example:** Let's add the New Account action to the publisher, so users can create an account directly from the publisher. Just drag the New Account action to the Quick Actions in the Publisher section and save your changes.

Go to the Chatter tab. Now the New Account action shows up in the publisher.

Feed Tracking

Feed tracking tracks changes to objects and fields and posts them as updates in Chatter. Users who follow a record, see the feed updates in their Chatter feed.

Feed tracking is available for objects and fields. You can configure feed tracking for users, Chatter groups, topics, custom objects, external objects, and the following standard objects: accounts, article types, assets, campaigns, cases, contacts, contracts, dashboards, events, leads, opportunities, products, reports, solutions, and tasks.

Sharing rules and field-level security determine visibility of record changes in Chatter feeds. To see changes to that record in their feeds, users must have access to the record.

These objects and fields are tracked by default:

- Account: Account Name, Account Owner
- Case: Case Owner, Priority, Status
- ChatterGroup: Allow Customers, Description, Group Access, Information Body, Information Title, Name, Owner Name
- Contact: Account Name, Contact Owner, Name
- Lead: Lead Owner, Lead Status, Name
- Opportunity: Amount, Close Date, Opportunity Name, Opportunity Owner, Stage
- Topic: Description
- User: About Me, Address, Email, Manager, Phone, Title

Tracked feed updates that are older than 45 days and have no likes or comments are deleted automatically. The tracked feed updates no longer appear in the feed. However, if auditing is enabled for a tracked field, the tracking field audit history is still available.

IN THIS SECTION:

[Customize Chatter Feed Tracking](#)

Enable feed tracking for objects and records, so users see updates for the objects and records they follow in their Chatter feed. Many objects and fields are tracked by default, but you can further customize feed tracking to include or exclude specific objects and fields.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer,** and **Database.com** Editions

The Account, Case, Contact, Lead, Opportunity and User objects are not available in **Database.com**.

Lightning Connect external objects are available in: **Developer** Edition and for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

USER PERMISSIONS

To customize fields tracked in feeds:

- “Customize Application”

To view the field tracking setup page:

- “View Setup and Configuration”

[Enable Feed Updates for Related Records](#)

Show feed updates on a record's detail page whenever someone creates related records. Feed updates for related records give users a complete view of the account activity.

SEE ALSO:

Customize Chatter Feed Tracking

Enable feed tracking for objects and records, so users see updates for the objects and records they follow in their Chatter feed. Many objects and fields are tracked by default, but you can further customize feed tracking to include or exclude specific objects and fields.

You can configure feed tracking for users, Chatter groups, topics, custom objects, external objects, and the following standard objects: accounts, article types, assets, campaigns, cases, contacts, contracts, dashboards, events, leads, opportunities, products, reports, solutions, and tasks.

1. From Setup, enter *Feed Tracking* in the **Quick Find** box, then select **Feed Tracking**.
2. Select an object.
3. Select **Enable Feed Tracking**.

You must have the required user permissions to see this checkbox.

4. Select up to 20 fields to track.

You can't select fields for external objects or article types. The following standard field types can't be tracked:

- Auto-number, formula, and roll-up summary fields
- Encrypted and read-only system fields
- The **Expected Revenue** field on opportunities
- The **Solution Title** and **Solution Details** fields on solutions; these fields display only for translated solutions in organizations with multilingual solutions enabled

5. If you have actions in the publisher enabled, you see the **All Related Objects** option. Select this checkbox to show feed items when related objects are created.
6. Save your changes.

SEE ALSO:

[Feed Tracking](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer, and Database.com** Editions

The Account, Case, Contact, Lead, Opportunity and User objects are not available in **Database.com**.

Lightning Connect external objects are available in: **Developer** Edition and for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To customize fields tracked in feeds:

- "Customize Application"

To view the field tracking setup page:

- "View Setup and Configuration"

Enable Feed Updates for Related Records

Show feed updates on a record's detail page whenever someone creates related records. Feed updates for related records give users a complete view of the account activity.

1. From Setup, enter *Feed Tracking* in the **Quick Find** box, then select **Feed Tracking**.

2. Click the object for which you want to enable feed updates for related records.

3. Click **All Related Objects**.

If you don't see this option, make sure that actions in the publisher are enabled. The All Related Objects option is available only on these objects:

- Account
- Campaign
- Case
- Contact
- Custom objects
- Group
- Lead
- Opportunity

4. Save your changes.

Example: If you enable feed updates for related records on accounts, the account feed includes:

- Feed updates for all activity on the account
- Updates for related tasks, events, and contacts

Chatter Email Settings and Branding

Chatter email settings let you control whether users receive email notifications about new posts, comments, and other changes. You can also change the format of the emails, like add your company's logo and sender information.

If Chatter is enabled, email notifications are enabled by default. However, your users can configure their own email settings. They control whether they want to receive emails, for which changes, and how often. It is important that you teach your users how they can control the amount of email they receive. Too many email notifications are a pain point for many Chatter users and a common barrier to adoption.

Configure the general Chatter email settings and branding from Setup. Enter *Email Settings* in the **Quick Find** box, then select **Email Settings**. This table describes the settings.

Setting	Description
General Settings	
Allow Emails	Enables or disables email notifications for your entire company. If you deselect this option, all email notifications are disabled and your users don't receive any notifications.
Allow Email Replies	If selected, users can reply to email notifications about messages and comments via email instead of navigating to the comment or message in Chatter.
Allow Posts via Email	If selected, users can post to groups using email.
Allow Attachments via Email	If selected, users can include attachments in posts to groups using email.
Sender	
From Name	The name that appears as the sender's name in the email notification. For example, add your company's name.
Email Address	The email address of the sender. For example, add your company's email address.
Branding	
Logo	A logo that appears in the email notification. Upload a different logo to replace the default Chatter logo.
Footer Text	The text that appears in the footer of the notification email. We strongly recommend including your company's physical address to comply with applicable anti-spam laws.

IN THIS SECTION:

[Customize Branding for Email Notifications](#)

Customize your company's Chatter email notifications to display sender information, footer text, and a footer logo that is personalized for your organization.

Customize Branding for Email Notifications

Customize your company's Chatter email notifications to display sender information, footer text, and a footer logo that is personalized for your organization.

1. From Setup, enter *Email Settings* in the Quick Find box, then select **Email Settings**.
2. Enter custom values for the email sender's name and address to replace the default values.

 **Note:** If you change the sender's email address, we send a verification email to the new address. The change is pending, and we continue to use the existing address while we await verification. The requested address doesn't take effect until you click the confirmation link in the email. If verification is already pending for a new email address and you specify a different new address, we retain the latest value and use that for verification.

If you enter a custom value for the sender's address and you have enabled mail relay, your Chatter emails will use the relay.

3. Customize what displays in the footer of Chatter emails.

 **Note:**

- All Chatter emails display the Chatter logo and Salesforce information unless you replace them with your organization's own logo and information.
- If you previously customized the logo or footer text and want to restore the default values, use the API to set these fields to `null`.

- a. Choose a logo to replace the default Chatter logo.

The logo must be an existing document in the Documents tab and must be marked `Externally Available Image`. Images with a maximum size of 150 x 50 pixels on a transparent background work best.

- b. Enter custom text to replace the default footer text, up to a maximum of 1,000 characters.

The default text includes Salesforce's name and physical address. We strongly recommend including your organization's physical address to comply with applicable anti-spam laws.

4. Click **Save**.

Chatter Post Actions and Layouts

Actions on posts and comments appear in the drop-down menu on a post or comment. They let users edit, bookmark, and delete posts, add topics, and create tasks from posts.

The standard Bookmark, Delete, and Add Topic actions on posts are available by default and you can't modify them. However, you can add more actions like the Edit and Create New Task actions.

IN THIS SECTION:

[Enable Create New Tasks on Posts](#)

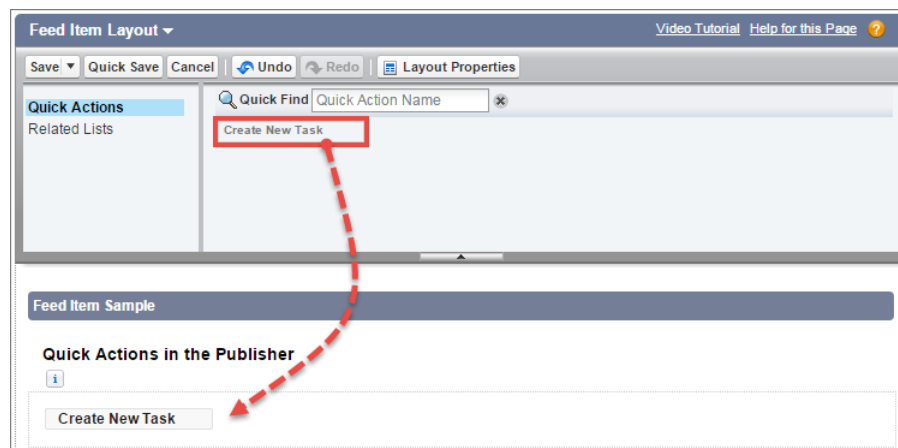

Enhance the feed with an action that lets users create tasks directly from a post.

Enable Create New Tasks on Posts

Enhance the feed with an action that lets users create tasks directly from a post.

[Actions in the Publisher](#) and [feed tracking](#) for task objects must be enabled.

1. From Setup, enter *Feed Item* in the *Quick Find* box, then select **Feed Item Layouts**.
2. Click **Edit** next to Feed Item Layout.
3. In the Feed Item Layout, click **Quick Actions**.
4. Select the **Create New Task** action and drag it to the Actions in the Publisher section.

If you don't see the Create New Task action, verify that the [Actions in the Publisher](#) feature is enabled in the Chatter Settings in Setup.

5. Save your changes.

The Create New Task action displays on the drop-down menu on text and content posts. When a user creates a task from a post, the task shows up in the My Task list on the user's Home page. The Create New Task action on posts

- Is available on text and content posts, but not on system-generated posts like tracked feed updates
- Can be partly customized. You can't change the fields, but you can change the layout of the fields.

Group Layouts

The group layout lets you customize which fields, buttons, actions, and lists appear in Chatter groups. Changes to the group layout affect all groups in your organization, but they only show up on the group pages in Salesforce1. Changes to the group publisher show up in the full Salesforce site and the Salesforce1 app.

Changes you make to the group layout and the publisher affect all groups in your organization. You can't customize the layout for an individual group.

IN THIS SECTION:

[Customize the Chatter Group Layout and Publisher](#)

Add and remove fields, buttons, lookups, and related lists to change the layout of groups.

[Add Actions to the Group Publisher](#)

Customize the group publisher with quick actions and Salesforce1 actions.

Customize the Chatter Group Layout and Publisher

Add and remove fields, buttons, lookups, and related lists to change the layout of groups.

1. From Setup, enter *Group Layouts* in the **Quick Find** box, then select **Group Layouts**.
2. Click **Edit** next to the group layout you want to customize, or click **New** to create a layout.
3. From the palette on the top of the page, drag and drop fields, buttons, and other user interface elements to the different sections to add them to the group layout. Drag and drop them back to the palette to remove them from the layout.

All group layout changes affect Salesforce1 and Lightning Experience. Group publisher changes appear everywhere. For example, if you delete the Files related list or a field in the Group Details section, those changes show up only in Salesforce1 and Lightning Experience, but not in Salesforce Classic.

4. Click **Save** to save the layout.

USER PERMISSIONS

To customize Chatter group layouts:

- "Customize Application"

 **Example:** To allow group owners and managers to archive and activate groups from Salesforce1 and Lightning Experience, drag the Archive field to the Group Detail section.

The screenshot shows the 'Group Layout' editor interface. At the top, there are tabs for 'Save', 'Quick Save', 'Cancel', 'Undo', and 'Redo', along with a 'Layout Properties' button. Below this is a 'Quick Find' search bar. The main area is divided into two panes. The left pane, titled 'Fields', contains a list of available fields: 'Section', 'Blank Space', 'Access Type', and 'Allow Customers'. The right pane, titled 'Group Detail', shows a grid of fields currently assigned to the layout: 'Information', 'Member Count', 'Description', 'Disable Automatic...', 'Name', and 'Group Email'. A red dashed arrow indicates the 'Archive' field being dragged from the 'Fields' pane to the 'Group Detail' section.

To assign group layouts by user profiles, click **Page Layout Assignment** on the group layout list view.

SEE ALSO:

[Customize Page Layouts with the Enhanced Page Layout Editor](#)

[Customize Actions with the Enhanced Page Layout Editor](#)

[Assigning Page Layouts](#)

[Add Actions to Global Publisher Layouts](#)

Add Actions to the Group Publisher

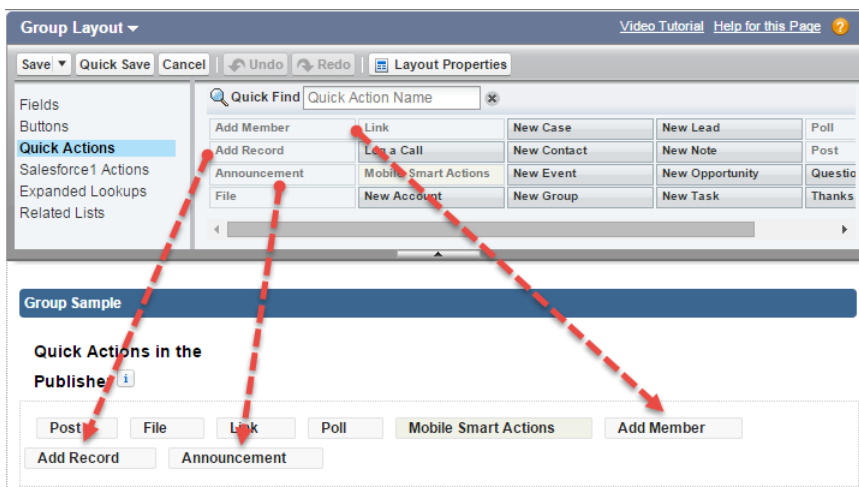

Customize the group publisher with quick actions and Salesforce1 actions.

By default, Chatter groups display standard actions that are part of the global publisher layout, like Post, File, Link, and Poll. Override the global publisher layout with a customized group publisher layout.

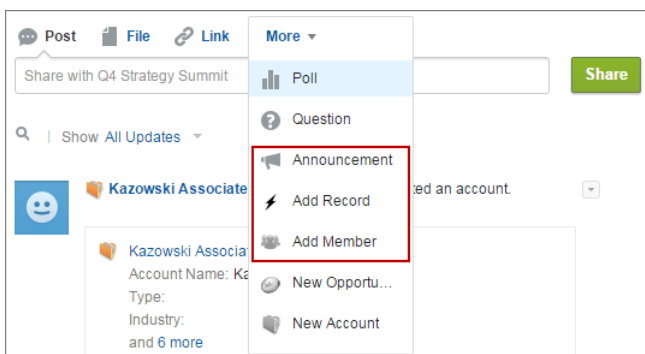

1. From Setup, enter *Groups* in the *Quick Find* box, then select *Group Layouts*.
2. Click **Edit** next to the group layout you want to customize, or click **New** to create a layout.
3. Click **override the global publisher layout** or  in the Quick Actions in the Publisher or Actions in the Salesforce1 Action Bar section. Drag and drop actions between the palette and the publisher layout to add, remove, and reorder actions.

Changes to the Quick Actions in the Publisher section appear in the full Salesforce site. Changes to the Actions in the Salesforce1 Action Bar section appear in Salesforce1. In groups that allow customers, the publisher only shows standard actions.

 **Example:** Add the Announcement, Add Record, and Add Member actions to the group publisher.

Now users can select these actions directly from the publisher.

Topics on Objects

Topics on objects is one of the most powerful ways to crowdsource your company's key themes and issues.

Your employees can attach topics to object records based on what they're seeing in the field and from working with customers, giving your business insight into the voice of your customer. And because topics can cross objects, they can provide connections across people, conversations, and records.

Users can also add topics to posts. Topics on posts help users organize posts and increase their visibility. Topics are great for discussing a particular issue, theme, or subject, that isn't limited to a particular group of people. For example, if your company has created a year-long goal around volunteering with local schools, create a topic to allow your entire company to share posts, photos, and updates related to the company goal. Groups, on the other hand, are good for conversation with a specific gathering of people. Collaboration within a group can cover any number of subjects, but always involves the same key team members. For example, if your company is planning a holiday party, a private group for the party committee lets them plan the event without the rest of the company learning the details in advance.

IN THIS SECTION:

[Enable and Configure Topics for Objects](#)

Enable topics for objects so users can add topics to records and organize them by common themes. This powerful feature is available with or without Chatter.

[Delete Topics](#)

People with appropriate permissions can delete topics directly from topic detail pages.

[Topics Privacy](#)

Topic names and descriptions are not private, even those that appear solely in private groups and on records. Posts and records with topics have the same security and privacy as those without topics.

EDITIONS

Available in: **Salesforce Classic**

Available in all editions

Enable and Configure Topics for Objects

Enable topics for objects so users can add topics to records and organize them by common themes. This powerful feature is available with or without Chatter.

Administrators can enable topics for accounts, assets, campaigns, cases, contacts, contracts, leads, opportunities, orders, solutions, custom objects, and English articles. For each object type, administrators specify which fields to use for topic suggestions.

 **Note:** Topics are only supported on English Knowledge articles.

 **Warning:** When topics are enabled for an object, public tags are disabled for records of that object type.

1. From Setup, enter *Topics for Objects* in the **Quick Find** box, then select **Topics for Objects**.
2. Select an object.
3. At the right, select **Enable Topics**.
4. Select the text fields that you want to use for topic suggestions. (From a combination of the selected fields, up to 3 suggestions are made from the first 2,000 characters.)
5. Click **Save** to save changes for all objects.

EDITIONS

Available in: **Salesforce Classic and Lightning Experience**

Available in all editions

USER PERMISSIONS

To enable topics for objects:

- "Customize Application"

Now, users with access to the enabled objects and appropriate topics permissions can:

- See topic assignments and suggestions on records of that object type
- Add and remove topics from records of that object type
- Use topics on records of that object type to filter their list views

Additionally, if your organization uses Chatter, users can click any topic assigned to a record to go directly to a topic page. There, they'll find other records on the topic, people who are knowledgeable about the topic, and other related information.

SEE ALSO:

[Topics on Records Overview](#)

[Add Topics to Records](#)

[Topics on Records Overview](#)

[Add Topics to Records](#)

[Enabling Topics for English Articles](#)

Delete Topics

People with appropriate permissions can delete topics directly from topic detail pages.

Because topic names and descriptions are not private, administrators might want to delete topics for compliance reasons or to remove inappropriate content. When deleting topics, consider these points.

- Topics are permanently deleted. They aren't sent to the Recycle Bin.
- Deleted topics are removed from search results, the topics list, all posts and records, Recently Talked About topics, Related Topics, and your users' favorites. Deleted topics are removed from Trending Topics after the next calculation.
- Users can reintroduce a topic after it's been deleted.

To delete a topic:

1. Navigate to the topic detail page.
2. In the upper-right, click , and choose **Delete**.

EDITIONS

Available in: Salesforce Classic

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Contact Manager
- Developer

USER PERMISSIONS

To delete standard topics:

- "Modify All Data"

OR

"Delete Topics"

To delete topics also used as navigational or featured items in a community:

- "Create and Set Up Communities"

OR

"Manage Communities"

Topics Privacy

Topic names and descriptions are not private, even those that appear solely in private groups and on records. Posts and records with topics have the same security and privacy as those without topics.

This table explains where you can see all topics and where you can't see topics used solely in private groups or on records.

User interface element	Shows all topics	Doesn't show topics used solely in private groups and on records
Topics list	✓	
Topic search results	✓	
Topic reports	✓	
Knowledgeable User reports		✓
Related Topics on the topic detail page	✓	
Recently Talked About topics on group detail pages	✓	
Recently Talked About topics on profiles		✓
Trending Topics on the Chatter page		✓
Topic suggestions when adding topics to a post		✓
People talking number in the topics list and in topic suggestions when adding topics to a post		✓

EDITIONS

Available in: Salesforce Classic

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Contact Manager
- Developer

 **Note:** You can't use topics in unlisted groups. You can add a hashtag topic when writing a post or comment in an unlisted group, and the topic will be formatted as a link after you post. However, a topic detail page isn't created, and the link won't work.

Customize Chatter Influence

Customize activity thresholds for posts, comments, and likes to improve the Chatter influence calculation.

Chatter activity statistics include how many posts and comments users made, how many comments they received, and how many people liked their posts and comments.

1. From Setup, enter *Influence* in the **Quick Find** box, then select **Influence**.
2. Change the minimum activity thresholds.
All minimum activity thresholds default to zero. If you set higher thresholds, users who don't meet all three minimums are considered observers who aren't counted when calculating influence rank. Users who do meet all three minimums but have relatively low activity are also considered observers, but they're counted when calculating influence.
3. Click **Save**.
Chatter influence is recalculated when you save these values.

 **Warning:** Use caution when setting new thresholds because users' influence levels can change immediately.

SEE ALSO:

[Chatter](#)

Guidelines for Deleting Your Users' Chatter Messages

Salesforce administrators with the "Manage Chatter Messages" permission can access all users' private messages via the SOAP API. You can view and delete any message (such as for compliance purposes).

When you delete private Chatter messages, consider these guidelines.

- Messages are hard deleted. They aren't sent to the recycle bin.
- Deleted messages aren't included in message search results.
- Deleting a message that resulted from sharing a file with someone does not delete the file itself.
- If all messages in a conversation are deleted, the conversation isn't shown in My Messages and can't be retrieved via the Chatter REST API.
- If replies via email are enabled and a user replies to a deleted message, Chatter returns an error notification and doesn't process the reply message.

Report on Chatter with the Dashboards Package

The Salesforce Chatter Dashboards package packs a punch! You get multiple dashboards, over 100 reports, and even custom report types that you can use to monitor and manage Chatter adoption and engagement in your organization.

Use the Salesforce Chatter Dashboards package to:

- View overall Chatter adoption with detailed metrics and monthly trends
- Monitor group adoption with membership and engagement metrics, such as the number of posts, comments, likes, and the top contributors

- Monitor content creation and user engagement, such as the top files, trending content, and the top contributors
- View topic taxonomy and monitor topic assignments, including the most assigned topics and the top assigners
- Create customized reports using out-of-the-box groupings such as department, country, role, or profile

You can install the [Salesforce Chatter Dashboards](#) from AppExchange.

 **Tip:** For installation instructions, detailed information about the reports, and upgrade instructions, see [Get Started with Chatter Dashboards](#).

Once the package is installed, you can access your new dashboards, reports, and custom report types alongside all your other Salesforce dashboards and reports.

As newer versions of the package become available, you can upgrade your package by reinstalling the package. If you customized any of the reports and dashboards, fear not; your customizations are retained during upgrade.

Dashboard	Description
Overview	See the overall state of Chatter at a glance.
Adoption by Department	Get an overview of department metrics for groups, user profiles, and topic adoption.
Files	Track file uploads, downloads, engagement, and content creators.
Groups	Monitor feed and member activity in Chatter groups.
Management	Track unanswered questions and posts, group growth rates, and the overall health of your groups.
Q&A	Track recent activity for questions, answers, and best answers posted in groups.
Topics	Track your Chatter topics activity.
User	Track recent activity for questions, answers, and best answers in user profiles.

 **Note:** The reports in this package return data for all Chatter. If your organization is using a community, we recommend that you install the [Salesforce Communities Dashboards \(for Communities with Chatter\)](#) package instead. This package allows you to report on Chatter usage in your internal organization and Chatter usage in your community.

Chatter Administration FAQs

Can I connect multiple Salesforce organizations using Chatter?

Chatter is only available on a per-organization basis. Only users within the same Salesforce organization can communicate with each other using Chatter. However, you can add people outside of your company's email domains to use Chatter in your organization as a customer in groups you own or manage.

Can portal users use Chatter?

Chatter is not available to portal users in partner portals or Customer Portals. Chatter is available to customer users and partner users in Communities.

Can I take control of the Chatter Expert user?

As an administrator, you can either deactivate or take over the Chatter Expert user and provide posts to your company. By default, the Chatter Expert posts when a new user chooses to start one of the groups suggested by Chatter on the Groups you can join page.

 **Note:** This only applies to organizations created after Summer '11.

To deactivate the Chatter Expert:

1. Click **People > Find People**.
2. Search for Chatter Expert.
3. Click **Manage User > Deactivate User**.

To take control of the Chatter Expert so that you can send and receive posts:

1. Click **People > Find People**.
2. Search for Chatter Expert.
3. Change the email address to your own.

Can I Stop a User From Creating Chatter Groups?

If there are users that shouldn't be able to create groups, you can prevent them from doing so.

The ability to create groups (public, private, or unlisted) is controlled by the permission "Create and Own New Chatter Groups." The permission is enabled by default and administrators can disable it on the appropriate users' profiles.

After an administrator disables this permission, a user can no longer create or be assigned as owner of new Chatter groups. If the user was already the owner of any groups, that ownership is not revoked.

SEE ALSO:

[Edit Profiles in the Original Profile Interface](#)

Can I change the location of Chatter feeds using the page layout editor?

Currently, you can't change the location of Chatter feeds. However, users can click the  **Hide Chatter** link in a Chatter feed to hide the feed, and the  **Show Chatter** link to show the feed.

Can I prevent certain words from being used in Chatter posts?

No, not using the standard Chatter interface. However, there are third-party apps like [Chatter Blacklist](#). This app lets you create a "blacklist" of words, phrases, or custom expressions (for example, credit card numbers) that are prohibited in Chatter posts and comments. These words can prevent a post, be substituted with approved words or phrases, or be recorded for audit purposes.

Salesforce Support doesn't provide troubleshooting for third-party applications/packages unless specifically stated in the provider information of the application.

Do Chatter posts and files count toward my storage use?

Chatter feed posts, tracked changes, and comments don't count toward your data storage. However, any files and photos you upload are counted against file storage. Files uploaded on the Files tab are also counted against file storage.

Salesforce Files

Add the Files Related List to Page Layouts

Add the Files related list to your page layouts for accounts, opportunities, leads, cases, and other objects so users can attach files to records while leveraging the rich features and flexibility of Salesforce Files. Use files instead of attachments to make the files available outside of the context of the individual record. The file owner or admin still decides sharing settings for the file.

You can customize page layouts to include the Files related list. This allows users to add files to a record and see a list of files associated with the record such as a lead or a case.

1. From Setup, enter *Object Manager* in the **Quick Find** box, then select the name of the object you want to add the Files related list to (such as Opportunity).
2. Click **Page Layouts**.
3. Click the page layout you want to customize.
4. In the list of available items in the left pane, click **Related Lists**.
5. Drag **Files** to the Related Lists section.
6. Click **Save**.

EDITIONS

Prevent Users from Attaching Salesforce Files

You can disable the **Select Files from Salesforce** administrative permission in user profiles. Disabling this permission prevents users with that profile from selecting Salesforce files when attaching files to feed posts, records, or other objects. Another option is to apply the permission in a permission set. Users who have this permission disabled are still able to upload files from their local drive.

Disable or enable the user permission in Setup. Enter *User Profiles* in the **Quick Find** box, then select **Profiles**. Click **Edit** next to the user profile you want. In the Administrative Permissions section, enable or disable the Select Files from Salesforce checkbox. Click **Save**.

To apply the permission in a permission set, from Setup enter *Permission Sets* in the **QuickFind** box, then select **Permission Sets**. Edit the permission set and apply the Select Files from Salesforce permission.

EDITIONS

Available in: All Editions

Salesforce Files Sync

Enable Salesforce Files Sync

Enable Salesforce Files Sync to allow users to sync files between their devices and Salesforce.

1. From Setup, enter *Salesforce Files Sync* in the **Quick Find** box, then select **Salesforce Files Sync**.
2. At the bottom of the Salesforce Files Sync Settings page, click **Edit**.
3. Select **Enable Files Sync**.
4. Click **Save**.

Salesforce Files Sync is now enabled for your organization.

Next, grant users access to Salesforce Files Sync.

Grant Users Access to Salesforce Files Sync

After enabling Salesforce Files Sync, grant your users access by either creating and assigning a permission set or by granting permission on profiles.

IN THIS SECTION:

[Grant Access to Salesforce Files Sync Using a Permission Set](#)

Permission sets are an easy way to enable Salesforce Files Sync for users.

[Enable Salesforce Files Sync for Profiles](#)

Enable Salesforce Files Sync for all users with particular standard profiles, or for custom profiles specific to your Salesforce organization.

Grant Access to Salesforce Files Sync Using a Permission Set

Permission sets are an easy way to enable Salesforce Files Sync for users.

1. From Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**.
2. Click **New**.
3. Fill out the required fields.

Label

The unique label for the permission set. For example, you might call this permission set "Salesforce Files Sync Enabled".

API Name

The unique name used by the Force.com API.

- "Customize Application"

Description

A description of this permission set. For example, “Enables Salesforce Files Sync for assigned users. Salesforce Files Sync allows users to automatically sync files across devices.”

4. Select a user license option.

Note: If you plan to assign this permission set to users with both Salesforce and Chatter Only licenses, select — *None* —.

5. Click **Save**.
The overview page for your new permission set appears.
6. Under System, click **System Permissions**.
7. At the top of the System Permissions list, click **Edit**.
8. Select **Sync Files**.
9. Click **Save**.

Assign the permission set to users who should have access to Salesforce Files Sync.

SEE ALSO:

[Permission Set Licenses](#)

Enable Salesforce Files Sync for Profiles

Enable Salesforce Files Sync for all users with particular standard profiles, or for custom profiles specific to your Salesforce organization.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Select the profile that will have the Salesforce Files Sync permission.
3. On the profile detail page, click **Edit**.
4. Under Administrative Permissions, select **Sync Files**.
5. Click **Save**.

SEE ALSO:

[Profiles](#)

USER PERMISSIONS

To enable Salesforce Files Sync for profiles:

- “Customize Application”

Install Salesforce Files Sync

To sync files between their computers and Salesforce, users must install the Salesforce Files Sync client, which is available for desktops and laptops. Users can also access synced files from Salesforce1.

To use Salesforce Files Sync, we recommend:

System Requirement	Windows	Mac
Supported operating systems	Microsoft® Windows® 7 and later	Apple® Mac OS X 10.8 Mountain Lion and later

System Requirement	Windows	Mac
Processors	2.33 GHz or faster x86-compatible processor, or Intel® Atom™ 1.6 GHz or faster processor for netbook devices	Intel® Core™ Duo 1.83 GHz or faster processor
Memory	512 MB of RAM (1 GB recommended)	512 MB of RAM (1 GB recommended)
Hard drive	4 GB of free space recommended for sync operations	4 GB of free space recommended for sync operations

Users can download Salesforce Files Sync from Chatter.

1. From your personal settings, enter *Files Sync* in the **Quick Find** box, then select **Salesforce Files Sync**. Multiple results? Select the one under Personal Setup.
2. Click the **Download** button.
3. Follow the installation instructions for your operating system.
4. Log in with your Salesforce credentials.

SEE ALSO:

[Find Your Personal Settings](#)

Configure File Upload and Download Security Settings

For security reasons, your organization may want to configure the way some file types are handled during upload and download.

To manage file upload and download settings:

1. From Setup, enter *File Upload and Download Security* in the **Quick Find** box, then select **File Upload and Download Security**.
2. Click **Edit**.
3. To prevent users from uploading files that may pose a security risk, select **Don't allow HTML uploads as attachments or document records**.
This setting blocks upload of these MIME file types: `.html`, `.htt`, `.mht`, `.svg`, `.swf`, `.thtml`, and `.xhtml`.

Warning: Keep the following in mind when selecting this option:

- If your organization uses the partner portal to give your partner users access to Salesforce, we don't recommend enabling this setting. Enabling this setting prevents your organization from customizing the appearance of your partner portal.
- HTML attachments are not permitted on solutions, regardless of whether this security setting is enabled. In addition, this setting does not affect attachments on email templates; HTML attachments on email templates are always permitted.
- After this setting is enabled, previously-uploaded HTML documents and attachments are unaffected. However, when users attempt to view an HTML attachment or document, their browser first prompts them to open the file in the browser, save it to their computer, or cancel the action.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

USER PERMISSIONS

To configure file upload and download settings:

- "Customize Application"

4. Set download behavior for each file type:
 - a. **Download** (recommended): The file, regardless of file type, is always downloaded.
 - b. **Execute in Browser**: The file, regardless of file type, is displayed and executed automatically when accessed in a browser or through an HTTP request.
 - c. **Hybrid**: The file uses the default browser execution behavior, but downloads Chatter and Salesforce CRM Content files.
5. Click **Save**.

Tips and Best Practices for Administering Salesforce Files Sync

After you've enabled Salesforce Files Sync for your users, you have access to administrator tools that help you monitor usage and access.

View When and How Salesforce Files Sync is Being Used

Once Salesforce Files Sync has been enabled for users, you may want to review how often the application is being accessed from the desktop, or how files are being shared.

- Logins to the Salesforce Files Sync desktop application are noted in the Login History page under the Application column as "Salesforce Files". To view these logins, you can either export your organization's login history to a CSV file, or create a custom list view with the Application column displayed prominently.
- An individual user's login history is available on their User detail page in the Login History related list.

Revoke Access to Salesforce Files Sync

Things happen—users have their laptops stolen, people leave the company. When these inconveniences arise, you have a few courses of action to revoke access to Salesforce Files Sync.

- On mobile devices, synced files are included in the Salesforce1 application, and therefore, if mobile security has been compromised, you should revoke that user's access to the Salesforce1 application.
- On desktop and laptop computers, Salesforce Files Sync is an installed application that syncs files in a folder called "Salesforce Files Sync" with Salesforce. When you disable the "Sync Files" permission for an individual user, the files in the user's Salesforce Files Sync folder will remain on their computer, but will no longer sync with Salesforce.

To make disabling Salesforce Files Sync for individual users easier, we recommend [enabling Salesforce Files Sync using a permission set](#) on the user record rather than [enabling the feature for profiles](#).

SEE ALSO:

[Monitor Login History](#)

Regenerate a Content or File Preview

If content or a file doesn't have a preview or the preview quality is poor, try to regenerate the preview.

The file is added to a queue while the regeneration is in progress. The existing preview is deleted immediately and users don't a preview while the file is in the queue.

You can't regenerate a preview for encrypted files, password-protected files, copy-protected PDFs, unknown file types, and any file larger than 25 MB.

1. From Setup, enter *Regenerate Previews* in the *Quick Find* box, then select **Regenerate Previews**.
2. Specify either the Content Document ID or the Content Version ID.
If you specify the Content Document ID but don't specify the Version Number, the latest version is used.

To see whether the preview regenerated successfully, navigate to the file's detail page.

Salesforce Files Connect

The Files Connect Setup Process

With Files Connect, Salesforce users can access, share, and search external data from systems like Google Drive or SharePoint. The setup process differs for cloud-based and on-premises external data sources.

 **Tip:** For detailed visuals, tips, and troubleshooting, see the Files Connect [Setup Guide](#) and [User Guide](#).

First, enable Files Connect, and let users access related external data sources

1. [Enable Salesforce Files Connect for Your Organization](#).
2. [Let Users and Administrators Access Files Connect Data Sources](#).

For cloud-based data sources, create an authentication provider, and then define the source

If you use Google Drive:

1. [Create an Authentication Provider for Google Drive](#).
2. [Define an External Data Source for Google Drive](#).

If you use Microsoft's cloud systems:

1. [Create an Authentication Provider for SharePoint Online or OneDrive for Business](#).
2. [Define an External Data Source for SharePoint Online or OneDrive for Business](#).

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, and Developer**

USER PERMISSIONS

To regenerate a preview:

- "Customize Application"

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

For on-premises data sources, set up a Secure Agent, and then define the source

 **Note:** This process requires a paid permission set license, “Files Connect for on-premises external data sources.” For information about permission set licenses, [see Salesforce Help](#).

1. [Set Up a Secure Agent for SharePoint 2010 or 2013](#) on a Linux or Windows server to securely connect Salesforce to data stored behind your firewall.
2. [Define an External Data Source for SharePoint 2010 or 2013](#).

Include the external data in global search

To let users access external data in global Salesforce searches, you’ll need to [create an external object and give users access to its fields](#). This is an optional step, but highly recommended to best integrate external data with Salesforce.

For per-user data sources, have users authenticate in Salesforce

If you specified per-user authentication for a data source and exposed it through profiles or permission sets, ask authorized users to [provide their data source credentials](#).

Start accessing, sharing, and searching external files!

Now users can [access and share external files](#) via the Files tab and feed, and [search for them](#) right alongside their Salesforce content.

Enable Salesforce Files Connect for Your Organization

Let users search and share files from external systems like Google Drive and SharePoint. To complete the process, Chatter must be enabled for both the organization and the profile of the administrator who performs these steps.

1. From Setup, enter *Files Connect Settings* in the Quick Find box, then select **Files Connect Settings**.
2. Click **Edit**, and then select **Enable Files Connect**.
3. For File Sharing, select one of the following:
 - **Copy** stores a copy of external files in Salesforce. If files are shared with a Chatter group, all group members can access the files, even if they lack access to the external system.
 - **Reference** points to external files stored outside Salesforce. No previews are available in Chatter, and file downloads require user access to the external system. (Users must enter credentials for the system in the Authentication Settings for External Systems section of personal setup).

 **Tip:** Choose the Copy mode if your organization shares files with external customers or partners. Choose the Reference mode to reflect access restrictions from the external system in Salesforce.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To enable Salesforce Files Connect:

- “Customize Application”

Regardless of sharing mode, Chatter doesn't reflect file revisions in external systems. However, Reference mode points to the latest versions in those systems.

[The Files Connect Setup Process](#)

[Let Users and Administrators Access Files Connect Data Sources](#)

Let Users and Administrators Access Files Connect Data Sources

After you enable Files Connect, give users and administrators permission to access specific external data sources from Salesforce.

 **Tip:** Though you can provide access to data sources via permission sets or profiles, permission sets let you more quickly adjust access for several types of users. Regardless of which method you choose, be sure to give administrators access so they can configure data sources.

1. From Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets** or enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Create a new permission set or profile, or click an existing one.
If you use a permission set, User License must be set to the default option, "None."
3. For a permission set, click **System Permissions**, then click **Edit**.
For a profile, click **Edit**, and scroll down to the Administrative Permissions section.
4. Do either of the following, and then click **Save**.
 - To access cloud-based data sources like SharePoint Online, select **Files Connect Cloud**.
 - To access on-premises data sources like SharePoint 2010 or 2013, select **Files Connect On-premises**.

 **Note:** The on-premises permission is available with a paid permission set license, "Files Connect for on-premises external data sources." To enable the license for your organization, [see these brief instructions](#) in Salesforce Help.

5. For a permission set, click **Manage Assignments** in the toolbar at the top of the page. Then click **Add Assignments**, select users for the permission set, and click **Assign**.

 **Important:** Include any administrators who need to configure external data sources.

6. If you haven't already, define the external data sources for your organization:
 - [Define an External Data Source for SharePoint Online or OneDrive for Business](#)
 - [Define an External Data Source for SharePoint 2010 or 2013](#)
 - [Define an External Data Source for Google Drive](#)

 **Note:** If you select an identity type of Named Principal for the data source, skip the steps below. But if you select Per User, read on.

7. In Setup, return to the detail page for the permission set or profile. Then do either of the following:
 - For a permission set, in the Apps section, click **External Data Source Access**.
 - For a profile, go to the Enabled External Data Source Access related list.
8. Click **Edit**, add specific data sources to the Enabled External Data Sources list, and click **Save**.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To set permissions:

- "Customize Application"

(Users enter their credentials when they first access external data sources, or from their personal settings on the Authentication Settings for External Systems page.)

Create an Authentication Provider for Google Drive

To use Google Drive as an external data source, you must create an authentication provider for it in Salesforce. The process begins with creating a related project in the Google Developers console.

Create a Project in the Google Developers Console

1. Using the credentials of your Google account, log in to <https://console.developers.google.com/project>
2. Click **Create Project**.
3. Enter a project name, and click **Create**.
4. Click the project name, and then navigate to **APIs & auth > APIs**.
5. At right, search for "Drive API" on the API Library tab.
6. Click the search result for Drive API, and then click **Enable API**.
7. Navigate to **APIs & auth > Credentials**.
8. At right, on the OAuth Consent Screen tab, enter a valid email address and product name.
9. On the Credentials tab, click **Add credentials**, and select **OAuth 2.0 client ID**.
10. Select **Web application**, and click **Create**.
11. Copy the client ID and client secret values to a text file. You'll use these values when creating an authentication provider in Salesforce.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance

- Developer

USER PERMISSIONS

To create authentication providers:

- "Customize Application"

AND

"Manage Auth. Providers"

Create an Authentication Provider in Salesforce

1. In Setup, enter *Auth. Providers* in the **Quick Find** box, then select **Auth. Providers**.
2. Click **New**.
3. For **Provider Type**, select **Open ID Connect**, and then set the following options:
 - **Name**—Enter the name you want to appear in Salesforce.
 - **URL Suffix**—Enter the suffix at the end of the URL path. For example, in the path, <https://login.salesforce.com/services/authcallback/00Dx000000000001/MyGoogleProvider>, the suffix is "MyGoogleProvider"
 - **Consumer Key**—Enter the client ID you copied when creating the Google project.
 - **Consumer Secret**—Enter the client secret you copied when creating the Google project.

- Authorize Endpoint URL—Enter `https://accounts.google.com/o/oauth2/auth?access_type=offline&approval_prompt=force`
 - Token Endpoint URL—Enter `https://accounts.google.com/o/oauth2/token`
 - Default Scopes—Enter `openid email profile https://www.googleapis.com/auth/drive`
4. Click **Save**. Then, at the bottom of the Auth. Provider detail page, copy the `Callback URL` entry to a text file. (You'll use this when editing the Google project.)

Edit the Project in the Google Developer Console

1. Navigate to **APIs & auth > Credentials**.
2. Under `Client ID for web application`, click **Edit Settings**.
3. In the `Authorized redirect URI` field, enter the Callback URL you copied when creating the authentication provider in Salesforce.
4. Click **Update**. Your authentication provider is now ready for use.

Define an External Data Source for Google Drive

Let Chatter users access their Google Drive content from the Files tab, feed posts, and search. Salesforce supports Google documents, spreadsheets, presentations, and drawings.

1. From Setup, enter *External Data Sources* in the `Quick Find` box, then select **External Data Sources**.
2. Click **New External Data Source**. Then set the following options.

Field	Description
Label	A user-friendly name for the data source displayed in the Salesforce user interface.
Name	A unique identifier used to refer to this external data source definition through the API. The Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Type	Choose Files Connect: Google Drive
Identity Type	The identity type used to authenticate to the external data source. Select Per User to require separate credentials for each user who accesses the data source. (Administrators must enable the data source for specific permission sets and profiles. Users then enter their credentials when first accessing the data source.)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To define an external data source:

- "Customize Application"

Field	Description
	Select Named Principal to use the same set of credentials for every user who accesses the data source from Salesforce.
Authentication Protocol	The protocol used to access Google Drive. Select OAuth 2.0 .
Authentication Provider	Enter the Google Drive authentication provider .
Scope	Leave blank.
Start Authentication Flow on Save	Select to immediately test the settings above.

Create an Authentication Provider for SharePoint Online or OneDrive for Business

To use one of Microsoft's cloud-based external data sources, you must create an authentication provider for it in Salesforce and register that provider in an Office 365 app.

To fully configure an authentication provider, complete these steps:

1. [Create an Authentication Provider Using Placeholder Values](#)
2. [Register an Office 365 app](#)
3. [Edit the Authentication Provider](#)

Create an Authentication Provider Using Placeholder Values

1. In Setup, enter *Auth. Providers* in the *Quick Find* box, then select **Auth. Providers**.
2. Click **New**.
3. For *Provider Type*, select **Microsoft Access Control Service**, and then set the following options:
 - *Name*—Enter the name you want to appear in Salesforce.
 - *URL Suffix*—Enter a suffix you want to appear at the end of the URL path. By default, the suffix reflects the *Name* entry.
 - *Consumer Key*—Enter a placeholder value.
 - *Consumer Secret*—Enter a placeholder value.
 - *Authorize Endpoint URL*—Enter a placeholder that begins with *https*.
 - *Token Endpoint URL*—Enter a placeholder that begins with *https*.
 - *Default Scopes*—Leave empty.
4. Click **Save**. Then, at the bottom of the Auth. Provider detail page, copy the *Callback URL* entry to a text file. (You'll use this when registering an Office 365 app.)

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create authentication providers:

- "Customize Application"
AND
"Manage Auth. Providers"

Register an Office 365 app

1. Log in to your Office365 account as an administrator, and go to one of the following URLs:

SharePoint Online

```
https://[your company name].sharepoint.com/[site collection path]/_layouts/15/appregnew.aspx
```

OneDrive for Business

```
https://[your company name]-my.sharepoint.com/_layouts/15/appregnew.aspx
```

2. Set the following options:

- **App Type**—Select **An app running on a web server**.
- **Client Id**—Click **Generate**, and copy the generated value to a text file.
- **Client Secret**—Click **Generate**, and copy the generated value to a text file.
- **Title**—Enter a name for the app.
- **App Domain**—Enter the domain name of your Salesforce organization.
- **Redirect URL**— Enter the Callback URL you copied when creating the Authentication Provider in Salesforce.

3. Click **Create**.

Now you'll configure the newly created app to access SharePoint resources.

4. Go to one of the following URLs:

SharePoint Online

```
https://[your company name].sharepoint.com/[site collection path]/_layouts/15/appinv.aspx
```

OneDrive for Business

```
https://[your company name]-my.sharepoint.com/_layouts/15/appinv.aspx
```

5. Set the following options:

- **App Id**—Enter the Client Id you copied to a text file, then click **Lookup**.
- **Title**—Keep the default value.
- **App Domain**—Keep the default value.
- **Redirect URL**—Keep the default value..
- **Permission Request XML**—Enter a string with this format:

SharePoint Online

```
<AppPermissionRequests>
  <AppPermissionRequest Scope="[SCOPE]" Right="[PLACEHOLDER]" />
</AppPermissionRequests>
```

OneDrive for Business

```
<AppPermissionRequests>
  <AppPermissionRequest Scope="http://sharepoint/content/tenant"
  Right="[PLACEHOLDER]" />
  <AppPermissionRequest Scope="http://sharepoint/social/tenant" Right="Read" />
</AppPermissionRequests>
```

- For SharePoint Online, replace [SCOPE] with one of these values:

 **Important:** Office 365 recognizes only these scope URLs; copy them exactly, without changes.

- `http://sharepoint/content/sitecollection/web` to let users access a single site (but not its subsites).
- `http://sharepoint/content/sitecollection` to let users access a single site collection (including all subsites).
- `http://sharepoint/content/tenant` to let users access all site collections.

- Replace [PLACEHOLDER] with one of these values:

- Read
- Write
- Manage
- Full Control

For details about the differences between permission levels above, [see the Microsoft website](#).

- Click **Create**.

Edit the Authentication Provider

In Salesforce, you'll now replace the original placeholder values with the correct ones from the Office 365 app.

- In Setup, enter *Auth. Providers* in the Quick Find box, then select **Auth. Providers**.
- Click **Edit** next to the authentication provider you created previously.
- Change the following values:
 - Consumer Key**—Enter the Client Id you copied to a text file.
 - Consumer Secret**—Enter the Client Secret you copied to a text file.
 - Authorize Endpoint URL**—Enter the URL of the OAuthAuthorize.aspx page in Office 365. The URL format is as follows:

SharePoint Online

```
https://[your company name].sharepoint.com/[site collection path]/_layouts/15/OauthAuthorize.aspx
```

OneDrive for Business

```
https://[your company name]-my.sharepoint.com/_layouts/15/OauthAuthorize.aspx
```

- Token Endpoint URL**— Enter a URL in the following format:

SharePoint Online

```
https://accounts.accesscontrol.windows.net/[your company name].onmicrosoft.com/tokens/OAuth/2?resource=00000003-0000-0ff1-ce00-000000000000/[your company name].sharepoint.com@[your company name].onmicrosoft.com
```

OneDrive for Business

```
https://accounts.accesscontrol.windows.net/[your company name].onmicrosoft.com/tokens/OAuth/2?resource=00000003-0000-0ff1-ce00-000000000000/[your company name]-my.sharepoint.com@[your company name].onmicrosoft.com
```

4. Click **Save**. Your authentication provider is now ready for use.

[The Files Connect Setup Process](#)

Define an External Data Source for SharePoint Online or OneDrive for Business

With Files Connect and Chatter, Salesforce can access content from Microsoft's cloud-based systems.

1. From Setup, enter *External Data Sources* in the Quick Find box, then select **External Data Sources**.
2. Click **New External Data Source**. Then set the following options.

Field	Description
Label	A user-friendly name for the data source displayed in the Salesforce user interface.
Name	A unique identifier used to refer to this external data source definition through the API. The Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Type	Choose Files Connect: Microsoft SharePoint Online or Files Connect: Microsoft OneDrive for Business .
Site URL	The URL of your SharePoint site, site collection, or web app.  Important: The URL must begin with <i>https</i> and end with the site name. (Don't copy the URL seen in the browser when accessing SharePoint.)
Exclude Other Site Collections	Accesses only the collection specified by the URL, ignoring any related collections.
Identity Type	The identity type used to authenticate to the external data source. Select Per User to require separate credentials for each user who accesses the data source. (Administrators must enable the data source for specific permission sets and profiles. Users then enter their credentials when first accessing the data source.)

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To define an external data source:

- "Customize Application"

Field	Description
	Select Named Principal to use the same set of credentials for every user who accesses the data source from Salesforce.
Authentication Protocol	The protocol used to access SharePoint Online. Select OAuth 2.0 .
Authentication Provider	Enter the SharePoint Online authentication provider .
Scope	Leave blank.
Start Authentication Flow on Save	Select to immediately test your settings.

[The Files Connect Setup Process](#)

Set Up a Secure Agent for SharePoint 2010 or 2013

A Secure Agent provides secure communication between Salesforce and on-premises data in SharePoint 2010 or 2013.

 **Note:** The Secure Agent setup process requires a paid permission set license, “Files Connect for on-premises external data sources.” For information about permission set licenses, [see Salesforce Help](#).

To fully configure a Secure Agent, complete these steps:

1. [Create a Connected App for the Secure Agent](#)
2. [Create a Profile and User Specific to the Secure Agent](#)
3. [Create the Agent in Salesforce, and Download the Installer to Your Server](#)
4. Install and Run the Agent on a [Windows Server](#) or a [Linux Server](#)
5. [Install Secure Agent Plug-ins for Your On-premises Data Source](#)
6. [Update Previously Installed Plug-ins](#)
7. [Import Any Required Certificates](#)
8. [Track and Troubleshoot Secure Agent Activity](#)

 **Tip:** For a visual walk-through, see this [video tutorial of Secure Agent setup](#).

Create a Connected App for the Secure Agent

1. In Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. In the Connected Apps section, click **New**.
3. In the Basic Information section, enter the following settings:
 - *Connected App Name*—Enter a distinctive name like “Secure Agent App.”

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available for an additional cost in: **Enterprise**, **Performance, Unlimited**, and **Developer** Editions

USER PERMISSIONS

To set up a Secure Agent:

- “Customize Application”

- `API Name`—Leave the default value.
 - `Contact Email`—Enter your administrator's address.
4. In the API section, select **Enable OAuth Settings**, and enter the following settings:
 - `Callback URL`—Enter `https://login.salesforce.com` for a production instance, or `https://test.salesforce.com` for a sandbox.
 - `Use Digital Signatures`—*Deselect* this option.
 - `Selected OAuth Scopes`—Add "Access and manage your data (api)" and "Perform requests on your behalf at any time (refresh_token, offline_access)."
 5. Click **Save**.
 6. In Setup, enter *Connected Apps* in the `Quick Find` box, then select the option for managing connected apps.
 7. Next to the new app, click **Edit**, and then enter the following settings:
 - `Permitted Users`—Select "Admin approved users are pre-authorized."
 - `IP Relaxation`—Select "Relax IP restrictions."
 8. Click **Save**.

Create a Profile and User Specific to the Secure Agent

1. In Setup, enter *Profiles* in the `Quick Find` box, then select **Profiles**.
2. Next to the Standard User profile, click **Clone**.
3. For `Profile Name`, enter a distinctive name like "Secure Agent profile."
4. Click **Save**.
5. Next to the new profile, click **Edit**.
6. In the Connected App Access section, select the connected app you created for the agent.
7. In the Administrative Permissions section, select **Modify Secure Agents**.
8. Click **Save**.
9. In Setup, enter *Users* in the `Quick Find` box, then select **Users**.
10. Click **New User**.
11. For `Profile`, select the profile you created for the agent. Then complete the remaining required fields, and click **Save**.

 **Important:** Be sure to *deselect* "Generate new password and notify user immediately."

Create the Agent in Salesforce, and Download the Installer to Your Server

1. In Setup, enter *Secure Agents* in the `Quick Find` box, then select **Secure Agents**.
2. Click **New Secure Agent**.
3. Enter a **Label** for the user interface and **Name** for the API.
 -  **Note:** Choose the label carefully, because you can't change it. Salesforce relies on a consistent label to remain connected to the agent.
4. For **Proxy User**, enter the user you created for the Secure Agent.

5. Click **Save**.
 6. On the details page, click **Download Installer**, and then choose **Linux Agent** or **Windows Agent**.
 7. In Setup, enter *Apps* in the *Quick Find* box, then select **Apps**, and click the name of the connected app you created. Then, in the API section, copy the Consumer Key value to a text file.
 8. To your server, copy the text file and the downloaded installer file (sfdc-agent.zip for Windows, or sfdc-agent.run for Linux).
-  **Important:** Make sure the server can access both Salesforce and your on-premises data source, and has Java 6.x or 7.x installed.

Install and Run the Agent on a Windows Server

1. Extract the files in sfdc-agent.zip. Then double-click SecureAgentInstaller.exe
2. Click **Next**, and enter an installation folder. Click **Next** again, and finish initial installation.
3. When the configuration window appears, enter proxy settings used to connect to Salesforce.
 -  **Tip:** To change proxy settings after installation (due to a new password for example), enter the `agent:proxyconfig` command in the agent interface.
4. For Login Server Type, choose **Production** or **Sandbox**.
 -  **Tip:** To later change this and following configuration settings, you must uninstall and reinstall the agent.
5. For OAuth Client Key, enter the Consumer Key value you copied to the text file.
6. For Encryption Settings, select one of the following:
 - **Generate** to randomly generate a 1,024-bit public/private key pair. See the [Re-use existing certificate](#) setting if you need another key size. Then note the displayed path to the generated *.509 certificate file. You reference this path in the Salesforce connected app.
 - **Re-use existing keystore** to reuse a key pair from a previous agent installation. The keystore is in this location: `[agent installation folder]\etc\auth.jks`.
 -  **Note:** If you select an existing keystore, skip to step 10.
 - **Re-use existing certificate** to select your own certificate and private key. This option enables you to use a different key size. Contact Salesforce for more information.
7. In Salesforce, from Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
8. Click **Edit** next to the connect app, and select **Use Digital Signatures**.
9. Click **Choose File**, and select the *.509 certificate. Then click **Save**.
10. Return to the agent installer, and click **Next** to complete the installation.
11. Click **Install Agent as Service** to start the “Salesforce Secure Agent” service on your server.
 -  **Tip:** To access services in Windows, choose **Start > Administrative Tools > Services**.

Install and Run the Agent on a Linux Server

1. Run the installer using one of these commands:

- Production instance:

```
./sfdc-agent.run
```

- Sandbox instance:

```
./sfdc-agent.run -l https://test.salesforce.com
```

- Production instance with your own public/private key pair:

```
./sfdc-agent.run -l https://login.salesforce.com -p [private key filename].PKCS8 -f [public key filename].X509
```

- Production instance with a keystore generated during a previous installation:

```
./sfdc-agent.run -l https://login.salesforce.com -j [path to *.jks file]
```

You'll find the *.jks file here: `[agent installation folder]/etc/auth.jks`

2. Follow the on-screen instructions to enter an installation folder and proxy settings.

 **Tip:** To change proxy settings after installation, enter the `agent:proxyconfig` command in the agent interface.

3. When the installer prompts you for an OAuth Client Key, enter the Consumer Key value you copied to the text file.

 **Note:** If you specified a keystore generated during a previous installation, skip to step 8.

4. If prompted, generate a random 1,024-bit public/private key pair. Then note the displayed path to the generated *.509 certificate file. You reference this path in the Salesforce connected app.

 **Note:** Contact Salesforce if you need to use a different key size.

5. In Salesforce, from Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.

6. Click **Edit** next to the connect app, and select **Use Digital Signatures**.

7. Click **Choose File**, and select the *.509 certificate. Then click **Save**.

8. Return to the agent installer, and press Enter to complete the installation.

9. Start the agent with this command: `[agent installation folder]/bin/start`

Install Secure Agent Plug-ins for Your On-premises Data Source

To connect a Secure Agent to an external data source in Salesforce, you need to install the necessary plug-ins.

1. In Setup, enter *Secure Agents* in the *Quick Find* box, then select **Secure Agents**.

2. Click an agent name to access its details page.

3. In the Secure Agent Plugins list, click **New**.

For SharePoint 2010 or 2013, you'll need to install the following plug-ins:

- Files Connect SharePoint
- Files Connect Remote Connector Service
- Secure Transport Client Service

4. To install a plug-in, select it from the Type menu, enter a distinctive name, and click **Save**. Repeat the process for each required plug-in.

Update Previously Installed Plug-ins

When plug-in updates are available, administrators receive weekly email notifications.

1. In Setup, enter *Secure Agents* in the Quick Find box, then select **Secure Agents**.
2. In the Secure Agent Plugins list, if the Update Available column states “Yes,” click **Edit** for that plug-in.
3. Select **Update to the recommended version on save**, and click **Save**.

Import Any Required Certificates

In the agent interface, you can press the TAB key to access a variety of commands. If your SharePoint server requires a self-signed certificate, or a certificated signed by an unofficial authority, you must use the `rsc:importcert` command. Then enter the path to import the self-signed certificate, or the root certificate of the authority, into the Secure Agent trust store.

The `rsc:listcert` command lists all certificates currently in the trust store, while `rsc:deletecert` deletes the specified certificate from the store.

Track and Troubleshoot Secure Agent Activity

Download log files to precisely monitor agent events.

1. In Setup, enter *Secure Agents* in the Quick Find box, then select **Secure Agents**.
2. Click the name of a previously created Secure Agent to open its detail page.
3. Click either of the following:
 - **Download Logs** to download a compressed .zip file containing text logs.
 - **Download Diagnostics** to see the current agent state, including the list of installed plug-ins and Java virtual machine status.

Ensure Access with Secure Agent Clusters

Secure Agent clusters provide failover protection, ensuring that Salesforce users can always access on-premises external data sources like SharePoint 2010 or 2013.

 **Note:** The Secure Agent setup process requires a paid permission set license, “Files Connect for on-premises external data sources.” For information about permission set licenses, [see Salesforce Help](#).

Create the Secure Agent Cluster

1. Create multiple Secure Agents on different servers by repeating this process: [Set Up a Secure Agent](#).
2. From Setup, enter *Secure Agent Clusters* in the Quick Find box, then select **Secure Agent Clusters**.
3. Click **New Secure Agent Cluster**.
4. Enter a **Label** for the user interface and **Name** for the API.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available for an additional cost in: **Enterprise**, **Performance, Unlimited**, and **Developer** Editions

USER PERMISSIONS

To set up Secure Agent clusters:

- “Customize Application”

- To add available agents to the cluster, select them, and click **Add**.

Change the priority order in which agents are used by moving them up or down in the Selected Secure Agents list. The accessible agent with highest priority is used first.

- Click **Save**.

Check Cluster Status

- From Setup, enter *Secure Agent Clusters* in the *Quick Find* box, then select **Secure Agents Clusters**.
- Click a cluster name to access its details page.
- Note the overall status for the cluster. Green indicates that all agents are accessible, yellow that some are, and red that none are.
- Note the status of individual agents and these additional details:
 - The Priority column shows the order in which agents are used. To change priority, click **Edit**, and move agents up or down in the Selected Secure Agents list.
 - The Active column indicates which agent is currently in use.

Define an External Data Source for SharePoint 2010 or 2013

Let Salesforce access data in your on-premises system. Files Connect and Chatter make it possible.

 **Note:** This setup process requires a paid permission set license, “Files Connect for on-premises external data sources.” For information about permission set licenses, [see Salesforce Help](#).

- From Setup, enter *External Data Sources* in the *Quick Find* box, then select **External Data Sources**.
- Click **New External Data Source**. Then set the following options.

Field	Description
Label	A user-friendly name for the data source displayed in the Salesforce user interface.
Name	A unique identifier used to refer to this external data source definition through the API. The Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Type	Choose Files Connect: Microsoft SharePoint
Secure Agent	A service running on a Linux or Windows server on your intranet that lets you securely connect Salesforce to your on-premises SharePoint server. See Set Up a Secure Agent for SharePoint 2010 or 2013 .

EDITIONS

Available in: Salesforce Classic

Available for an additional cost in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To define an external data source:

- “Customize Application”

Field	Description
Site URL	<p>The URL of your SharePoint site, site collection, or web app.</p> <p> Important: The URL must begin with <i>https</i> and end with the site name. (Don't copy the URL seen in the browser when accessing SharePoint.)</p>
Identity Type	<p>The identity type used to authenticate to the external data source.</p> <p>Select Per User to require separate credentials for each user who accesses the data source. (Administrators must enable the data source for specific permission sets and profiles. Users then enter their credentials when first accessing the data source.)</p> <p>Select Named Principal to use the same set of credentials for every user who accesses the data source from Salesforce.</p>
Authentication Protocol	<p>The protocol required to access SharePoint.</p> <p>Select Password Authentication.</p> <p>(This option supports HTTP Basic and NTLM authentication.)</p>
Administration Username	<p>The username Salesforce uses to test the connection to SharePoint. You don't need to enter a SharePoint administrator's username. However, ensure that the credentials you use have adequate privileges to access the data source, perform searches, and return information.</p>
Administration Password	<p>The password Salesforce uses to test the connection to SharePoint.</p>

 **Note:** Salesforce users can't access SharePoint 2010 if anonymous access is enabled for the web application.

[The Files Connect Setup Process](#)

Include a Files Connect Data Source in Global Search

Combine searches for Salesforce data with external data from Google Drive, SharePoint, or OneDrive for Business. Via the API, developers can automate the process with supported SOQL or SOSL queries.

To include external data in global searches or API queries, first create a related external object. External objects behave similarly to custom objects, but map to data stored outside Salesforce in an external system like SharePoint. Each external object maps to a data table, and the object fields map to accessible table columns.

Tip: External objects support lookup relationships similar to custom objects, letting you integrate external data into related lists and other areas throughout Salesforce. For details, see [External Object Relationships](#).

To fully configure global search, complete these steps:

1. [Choose the Layout for Global Search Results](#)
2. [Create an External Object from an External Data Source](#)
3. [Give Users Access to the External Object Fields](#)

To automate search with SOQL or SOSL, review the supported queries for your data source:

- [SOQL and SOSL Support for SharePoint and OneDrive External Objects](#)
- [SOQL and SOSL Support for Google Drive External Objects](#)

Choose the Layout for Global Search Results

By default, Files Connect external objects use the standard search results layout for Chatter and the Files tab. If you want to display customized search layouts for these objects, complete these quick steps.

1. From Setup, enter *Files Connect Settings* in the Quick Find box, then select **Files Connect Settings**.
2. Select **Use External Object Search Layout**.

Create an External Object from an External Data Source

1. Define an external data source that supports search:
 - [SharePoint Online or OneDrive for Business](#)
 - [SharePoint 2010 or 2013](#)
 - [Google Drive](#)
2. In Setup, enter *External Data Sources* in the Quick Find box, then select **External Data Sources**.
3. Click the data source name to access the details page.
4. Click **Validate and Sync**.
5. Select the table named "items_[data source]." Then click **Sync** to create an external object that maps to the entire source.

Now you'll deploy the object to make the data it contains available to users.
6. Choose **Build > Develop > External Objects**.
7. Click **Edit** next to the new external object.
8. At the bottom of the page, click **Deployed**, and then click **Save**.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create an external object and provide access to its fields:

- "Customize Application"

Give Users Access to the External Object Fields

1. In Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets**.
2. Click [a permission set in which you enabled Files Connect](#).
3. In the Apps section, click **Object Settings**.
4. Click the name of the external object.
5. Click **Edit**, and enable the necessary Read permissions (for the object itself, and all fields you want to reveal in Salesforce).
6. Click **Save**.

SOQL and SOSL Support for SharePoint and OneDrive External Objects

SharePoint and OneDrive external objects support the standard fields identified below, as well as any custom fields you enable.

 **Note:** Queries on specific fields return only documents that have been indexed by the external data source.

Field Name	Queryable	Sortable
Author	Yes	Yes
Comment	No	Yes
ContentLength	Yes	Yes
CreationDate	Yes	Yes
DisplayUrl	No	Yes
DownloadUrl	No	No
ExternalId	Yes	Yes
IsFolder	Yes	Yes
	 Note: Not supported for SharePoint 2010 or 2013.	
MimeType	Yes	Yes
Name	Yes	Yes
UpdateDate	Yes	Yes
UpdatedBy	Yes	Yes

 **Note:** You can also use `ParentId__c` as query criteria to retrieve the list of documents in a folder. However, that field isn't displayed in query results unless your query specifies a `ParentId__c` value.

SOQL and SOSL Support for Google Drive External Objects

Files Connect supports all standard Google Drive properties, but not custom properties. The following properties have different field names in Salesforce external objects:

Google Property	Salesforce Field
alternateLink	DisplayUrl
createDate	CreationDate
description	Comment
downloadURL	contentStreamUri
editable	readOnly
fileSize	ContentLength
id	ExternalId
lastModifyingUserName	UpdatedBy
mimeType	MimeType
modifiedDate	UpdateDate
ownerNames	Author
originalFilename	contentStreamFileName
title	Name

This subset of fields supports SOQL and SOSL queries. (None are sortable, reflecting limitations in the Google Drive API.)

- CreationDate
- lastViewedByMeDate
- MimeType
- Name

Note: Google Drive queries on the `Name` field support only one wildcard, `%`. Searches using this wildcard match only name prefixes. For example, the title "HelloWorld" would be returned with the query `Name LIKE "Hello%"` but not `Name LIKE "%Word"`.

- sharedWithMe

Note: Queries on the `sharedWithMe` field with a value of "false" are not supported, protecting confidential data.

- starred
- UpdateDate

SEE ALSO:

[The Files Connect Setup Process](#)

[Include SharePoint Custom Properties in Search, SOQL, and SOSL Queries](#)

Include SharePoint Custom Properties in Search, SOQL, and Sosl Queries

After you create an external object for a SharePoint data source, some special steps are needed to search or query any custom properties it contains.

Configuring Custom Properties in SharePoint

External objects in Salesforce let you select and filter on these custom properties from SharePoint:

- Custom columns defined in a Custom Content Type
- Metadata from Microsoft Word, Excel, and other Office documents

To search on these custom properties in Salesforce, a corresponding Managed Property must be created by a Sharepoint administrator.

- To display these properties in external object fields, or use them in SOQL or Sosl `SELECT` queries, set the corresponding Managed Property to `Retrievable`. (In Sharepoint 2010, this option is labeled, "Allow this property to be used in scopes.")
- To filter on these properties in external objects, or use them as query criteria in a SOQL or Sosl `WHERE` clause, set the corresponding Managed Property to `Queryable`.

EDITIONS

Available in: Salesforce Classic

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create an external object and provide access to its fields:

- "Customize Application"

Querying Resulting Fields in Salesforce

In the examples below, `CustomProperty` stands for the Custom column name defined in the Custom Content Type, or the Office document metadata name. `ManagedCustomProperty` stands for the corresponding Managed Property name.

SharePoint 2010

Use `CustomProperty` in the `SELECT` clause and `ManagedCustomProperty` in the `WHERE` clause. Two corresponding fields must exist for the external object in Salesforce: one for selecting, the other for filtering.

Here's a SOQL example:

```
SELECT CustomProperty FROM items_sp2010_x WHERE ManagedCustomProperty=...
```

SharePoint 2013 and Online

In most cases, `ManagedCustomProperty` can be used for both the `SELECT` and `WHERE` clause.

Here's a SOQL example:

```
SELECT ManagedCustomProperty FROM items_sp2013_x WHERE ManagedCustomProperty=...
```

However, for file types SharePoint doesn't index for search, such as .jpg, .png, and .pdf files, you must use `CustomProperty` in the `SELECT` clause and `ManagedCustomProperty` in the `WHERE` clause. As a workaround, you can define an alias on the Managed Property in SharePoint and format queries like this:

```
SELECT Alias FROM items_sp2013/Online WHERE Alias=...
```

 **Tip:** Normally, custom properties aren't displayed on external object detail pages—defining an alias also addresses this issue.

Boolean Custom Properties

When using boolean (Yes/No) custom properties with a corresponding Managed Property set to the Text type, the corresponding external object field must be set to the Text type as well. In filters, the values "0" and "1" equal false and true, respectively. For example:

```
WHERE customBooleanWithTextManagedProperty="1"
```

"0" and "1" are also displayed as results, however, so ideally boolean custom properties correctly use a Managed Property type of YesNo. In that scenario, set the corresponding external object field to Checkbox to query it with standard `true` or `false` values. For example:

```
WHERE customBooleanWithYesNoManagedProperty=true
```

Metadata in Microsoft Office Documents

The Sharepoint Search service returns all metadata from Office documents as strings, so corresponding external object fields must be set to the Text type.

Dates are returned in the format, MM/DD/YYYY hh:mm:ss AM/PM, (for example, "3/31/2015 9:59:00 PM"). To query on fields using the Date type, the external object must include a corresponding Date field for filtering, and a Text field for selecting.

Limitations for Specific SharePoint Property Types in Salesforce

All versions

- Number, Currency, and Choice Dropdown properties can't be selected for file types SharePoint doesn't index for search, such as .jpg, .png, and .pdf files.

SharePoint 2010

- Numbers and Choice + Checkboxes properties can't be selected.
- Date properties can be selected but won't likely be returned in UTC (Coordinated Universal Time), so values may reflect a different time zone than expected.

SharePoint 2013

- Multiple Line of Text, URL, Date, and Choice Dropdown properties aren't queryable.
- Choice Dropdown can't be selected.

SharePoint Online

- Multiple Line of Text, URL, and Date properties aren't queryable.

SEE ALSO:

[Include a Files Connect Data Source in Global Search](#)

Define a Simple URL External Data Source

If Chatter is enabled for your organization, Salesforce can access data hosted on another Web domain for use in the Files tab and feed.

1. From Setup, enter *External Data Sources* in the *Quick Find* box, then select **External Data Sources**.
2. Click **New External Data Source**. Then set the following options.

Field	Description
Label	A user-friendly name for the data source displayed in the Salesforce user interface.
Name	A unique identifier used to refer to this external data source definition through the API. The Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Type	Choose Simple URL .
URL	The URL of the server hosting data outside of Salesforce, which must begin with <i>http://</i> or <i>https://</i> .
Default External Repository	Used for SharePoint® Online®. If metadata is not accessible, use this field to create tables and default table fields.
Large Icon	Specify an icon to easily identify the data source in the Salesforce user interface. First define the icon as a static resource in Salesforce. For more information, see Defining Static Resources .
Small Icon	Specify an icon to easily identify the data source in the Salesforce user interface. First define the icon as a static resource in Salesforce. For more information, see Defining Static Resources .
Identity Type	The identity type used to authenticate to the external data source. Select Anonymous , which doesn't require users to provide credentials when accessing the data source.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To define an external data source:

- "Customize Application"

Field	Description
Authentication Protocol	The protocol required to access the data source. Select No Authentication .

 **Note:** Simple URL data sources can't be included in global search, so the "Validate and Sync" option isn't supported.

Chatter Desktop

Control Access to Chatter Desktop

Chatter Desktop is enabled for most organizations, but administrators can control access to Chatter Desktop.

1. From Setup, enter *Chatter Desktop Settings* in the **Quick Find** box, then select **Chatter Desktop Settings**.
2. Select **Enable Chatter Desktop** to allow users to access Chatter data from Chatter Desktop.
Deselect this option to block access to the Chatter Desktop self-installation page and prevent all instances of Chatter Desktop from accessing Chatter data.
3. Select **Allow Chatter Desktop Managed Installations Only** to prevent non-administrators from installing Chatter Desktop.
For example, select this option if your IT department plans to deploy Chatter Desktop to your organization.
4. Save your changes.

[Chatter](#)

[Install Chatter Desktop Managed Version](#)

[Configure Chatter Desktop Managed Version](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer,** and **Database.com** Editions

Salesforce CRM, Approvals, Chatter email notifications, Chatter Invitations, and customer invitations are not available in **Database.com**.

Install Chatter Desktop Managed Version

Salesforce provides two Chatter Desktop installers: a standard version for individual installations and a managed version for enterprise deployments.

The following are the minimum requirements for using Chatter Desktop:

- Windows
 - 2.33GHz or faster x86-compatible processor, or Intel Atom™ 1.6GHz or faster processor for netbook devices
 - Microsoft® Windows® XP, Windows Server® 2003, Windows Server 2008, Windows Vista® Home Premium, Business, Ultimate, or Enterprise (including 64 bit editions) with Service Pack 2, or Windows 7
 - 512MB of RAM (1GB recommended)
- Mac
 - Intel® Core™ Duo 1.83GHz or faster processor
 - Mac OS X v 10.5, 10.6, or v10.7
 - 512MB of RAM (1GB recommended)

 **Important:** Chatter Desktop uses Adobe® Integrated Runtime (AIR®), Adobe's cross-platform runtime environment for desktop applications, and only runs on operating systems that Adobe AIR supports. Chatter Desktop does not run on operating systems that Adobe AIR does not support, such as 64-bit Linux. See the Adobe website for information on Adobe AIR.

The managed version of Chatter Desktop is ideal for enterprises deploying Chatter Desktop to users who don't have administrator privileges on their machines. The managed version:

- Doesn't automatically install AIR—your IT department must obtain a redistribution agreement from Adobe Systems Incorporated and deploy the required version of AIR before deploying Chatter Desktop
- Requires your IT department to accept the Chatter Desktop managed version end user license agreement on behalf of the users to which Chatter Desktop is deployed
- Doesn't automatically post to Chatter the first time Chatter Desktop launches
- Doesn't regularly check Salesforce for new versions

To install the managed version:

1. Deploy Adobe® Integrated Runtime (AIR®) version 2.6 or later (the latest version is recommended) to the machines on which you plan to deploy Chatter Desktop.

AIR is Adobe's cross-platform runtime environment for desktop applications, and is a prerequisite for Chatter Desktop.

 **Tip:** Visit these links before deploying AIR:

- AIR® overview:
http://www.adobe.com/devnet/air/articles/distributing_air_in_enterprise.html
- Information on obtaining an AIR® redistribution license from Adobe Systems Incorporated:
http://www.adobe.com/products/air/runtime_distribution1.html
- Installation information:
http://help.adobe.com/en_US/air/redist/WS485a42d56cd19641-70d979a8124ef20a34b-8000.html
- Administration information:
http://help.adobe.com/en_US/air/admin/WS485a42d56cd1964167ea49bd124ef17d52a-8000.html

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer,** and **Database.com** Editions

Salesforce CRM, Approvals, Chatter email notifications, Chatter Invitations, and customer invitations are not available in **Database.com**.

- From Setup, enter *Chatter Desktop Settings* in the *Quick Find* box, then select **Chatter Desktop Settings**.
- Click the link to download the managed version.

Important: Chatter Desktop uses Adobe® Acrobat® Reader to preview PDF files. Before previewing files with Chatter Desktop, download Adobe Acrobat from [Adobe's website](#), install it, and open it at least once to complete the installation.

SEE ALSO:

[Control Access to Chatter Desktop](#)

[Configure Chatter Desktop Managed Version](#)

Configure Chatter Desktop Managed Version

Control Chatter Desktop settings by deploying an XML-based configuration file to each user's machine. The configuration in the file overrides the user's settings.

- Create a file named `.chatterdesktop`, add a `chatterdesktop` parent element with two child elements, `config` and `servers`.
- Inside the `config` element, create the child elements listed in this table and add an `default` and an `editable` attribute. Both attributes can have the value `true` or `false`.

To make a child element the default setting, set the element's `default` attribute to `true`. To allow users to change a default setting through the user interface, set the element's `editable` attribute to `true`.

Child Element	Description
<code>launchOnStartup</code>	Launches the application on startup.
<code>minimizeOnClose</code>	Minimizes the application on close.
<code>notifications</code>	Enables popup notifications.
<code>criticalAlerts</code>	Enables alerts for new feed posts and comments by highlighting the taskbar icon (Windows) or causing the dock icon to bounce (Mac OS).
<code>bringToFront</code>	Brings Chatter Desktop to the foreground for new feed posts and comments.
<code>alwaysOnTop</code>	Enables Chatter Desktop to always display in the foreground.
<code>chatWindowToFront</code>	Enables the chat window to display in the foreground when a new chat is received (Mac only).
<code>chatSoundEnabled</code>	Enables sounds for new chats received.
<code>playSoundForEveryMessage</code>	Enables sounds for all chats received.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer,** and **Database.com** Editions

Salesforce CRM, Approvals, Chatter email notifications, Chatter Invitations, and customer invitations are not available in **Database.com**.

 **Note:** If the `default` attribute is set to `true` for `chatSoundEnabled` and `false` for `playSoundForEveryMessage`, a sound plays only for new chats received. If both are set to `true`, a sound plays for every chat received. If both are set to `false`, chat sounds are disabled.

3. If your organization uses instances of Salesforce other than Production and Sandbox, specify the servers that host those instances in separate `server` elements inside the `servers` element.

Inside each `server` element, include the following attributes:

- `label`—The name of the connection as you want it to appear in the user interface.
- `serverUrl`—The URL you use to log in to the instance. The URL must begin with `https://` and end with `salesforce.com` or `chatter.com`. For example, if your organization has a European division that you log into from `https://emea.salesforce.com`, enter that URL and name the connection `Europe`.
- `defaultServer`—Set to `TRUE` to make this server the default instance to which Chatter Desktop connects.

4. Test the `.chatterdesktop` configuration file.

a. Copy the `.chatterdesktop` configuration file to the user directory on your machine. The user directories are:

- Windows—`c:\Documents and Settings\` (Windows XP) or `C:\Users\` (Windows 7)
- Mac OS—`/Users/`
- Linux—`/home/`

b. Launch Chatter Desktop and verify that it functions correctly. See [Chatter Desktop Troubleshooting Tips](#) if there are problems.

5. Copy the `.chatterdesktop` file to the user directory on every machine running Chatter Desktop in your organization.

 **Example:** The following is a sample configuration file:

```
<chatterdesktop>
  <config>
    <launchOnStartup default="false"
      editable="false"/>
    <minimizeOnClose default="false"
      editable="true"/>
    <notifications default="true"
      editable="true"/>
    <criticalAlerts default="false"
      editable="true"/>
    <bringToForeground default="false"
      editable="true"/>
    <alwaysOnTop default="false"
      editable="false"/>
    <chatWindowToForeground default="false"
      editable="false"/>
    <chatSoundEnabled default="true"
      editable="true"/>
    <playSoundForEveryMessage default="true"
      editable="true"/>
  </config>
</chatterdesktop>
```

```

</config>

<servers>
  <server label="Europe"
    serverUrl="https://emea.salesforce.com"
    defaultServer="true"/>
  <server label="Production"
    serverUrl="https://login.salesforce.com"
    defaultServer="false"/>
</servers>
</chatterdesktop>

```

SEE ALSO:[Control Access to Chatter Desktop](#)[Install Chatter Desktop Managed Version](#)

Chatter Licenses

Chatter User Licenses

All standard Salesforce licenses allow free Chatter access for everyone in your organization. Salesforce also offers Chatter-specific licenses: Chatter External, Chatter Free, and Chatter Only (also known as Chatter Plus).

Chatter External

This license is for users who are outside of your company's email domain. These external users, also called customers, can be invited to Chatter groups that allow customers. Customers can access information and interact with users only in the groups they're invited to. They have no access to Chatter objects or data.

Chatter Free

The Chatter Free license is for users who don't have Salesforce licenses but need access to Chatter. These users can access standard Chatter items such as people, profiles, groups, and files, but they can't access any Salesforce objects or data. Chatter Free users can also be Chatter moderators.

Chatter Free users don't see tabs like other Salesforce users. Chatter Free users access feeds, people, groups, and files using the links in the sidebar of the page.

Salesforce administrators can upgrade a Chatter Free license to a standard Salesforce or Chatter Only license at any time. You can't convert a standard Salesforce or Chatter Only license to a Chatter Free license.

EDITIONS

Available in: Salesforce Classic

Chatter External and Chatter Free licenses are available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, and Developer** Editions

Chatter Only (also known as Chatter Plus) licenses are available in: **Professional, Enterprise Unlimited, and Performance** Editions

Chatter Only (Chatter Plus)

The Chatter Only license is also known as the Chatter Plus license. It is for users that don't have Salesforce licenses but need access to some Salesforce objects in addition to Chatter. Chatter Plus users can be Chatter moderators and have access to standard Chatter people, profiles, groups, and files pages. They also can

- View Salesforce accounts and contacts
- Use Salesforce CRM Content, Ideas, and Answers
- Access dashboards and reports
- Use and approve workflows
- Use the calendar to create and track activities
- View and modify up to ten custom objects
- Add records to groups

By default, the tabs for standard Salesforce objects are hidden from Chatter Plus users. Expose these tabs, if you want to make them available to Chatter Plus users. For more information on Chatter Plus users, see [Chatter Plus Frequently Asked Questions](#)

Chatter License Overview

This table shows the list of features that are available for Chatter External, Chatter Free, and Chatter Only licenses.

Feature	Chatter External (Access limited to items and people in the groups customers are invited to)	Chatter Free	Chatter Only (a.k.a. Chatter Plus)
Chatter Desktop client	✓	✓	✓
Use the Salesforce1 mobile app (Downloadable apps require the "API Enabled" profile permission)	✓ Downloadable app users can't access Groups or People list views.	✓	✓
Feeds	✓	✓	✓
File sharing	✓	✓	✓
Groups	✓	✓	✓
Invitations to join groups	✓ Only customers who are also group managers can invite Chatter users from groups they have access to or people outside Chatter.	✓	✓
Profiles	✓	✓	✓

Salesforce CRM Content

Set Up Salesforce CRM Content

USER PERMISSIONS

To create, edit, or delete library permissions:	"Manage Content Permissions" OR "Manage Salesforce CRM Content"
To create, edit, or delete page layouts and record types:	"Manage record types and layouts for Files" OR "Manage Salesforce CRM Content"
To create content fields:	"Manage Content Properties" OR "Manage Salesforce CRM Content"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

To create libraries:	“Create Libraries” OR “Manage Salesforce CRM Content”
To edit or delete libraries:	“Manage Salesforce CRM Content”

Set up Salesforce CRM Content to enable the use of content libraries in your org. Salesforce CRM Content is only available in Salesforce Classic, but files from content libraries are available in Lightning Experience if Salesforce CRM Content is enabled for your org.

 **Tip:** For more detailed information about setting up Salesforce CRM Content, refer to the [Salesforce CRM Content Implementation Guide](#).

You can also enable Salesforce CRM Content in the Salesforce Classic Mobile app by adding the Content tab to the desired mobile configuration data sets.

To set up Salesforce CRM Content for your organization:

1. Enable Salesforce CRM Content from Setup by entering *Salesforce CRM Content* in the Quick Find box, selecting **Salesforce CRM Content**, and then selecting *Enable Salesforce CRM Content*.
2. Give users access to Salesforce CRM Content by assigning feature licenses in one of the following ways:
 - To assign feature licenses to users automatically, from Setup, enter *Salesforce CRM Content* in the Quick Find box, select **Salesforce CRM Content**, and then select *Autoassign feature licenses to existing and new users*.
 - To assign feature licenses to users manually, from Setup, enter *Users* in the Quick Find box, then select **Users** and click **Edit** next to the user's name. Select the *Salesforce CRM Content User* checkbox and click **Save**.
3. Verify that the Salesforce CRM Content users have the Salesforce CRM Content user permissions enabled. The user permissions include “Manage Salesforce CRM Content,” “Create Libraries,” “Manage Content Permissions,” “Manage Content Properties,” “Manage record types and layouts for Files”, and “Deliver Uploaded Files and Personal Content.”

 **Note:** Users with the “Deliver Uploaded Files and Personal Content” user permission can create content deliveries from personal libraries. This user permission does not affect the ability to deliver content from shared libraries.

4. Optionally, create a public group with a set of Salesforce CRM Content users. You can save time later by assigning the group to a library rather than assigning several users to the same library individually.
5. Optionally, create one or more library permissions. Library permissions are the groups of privileges that determine user access within a library. Every user must be assigned a library permission before he or she can use a library. All new organizations contain three library permissions: library administrator, author, and viewer.
6. Use the New Library Wizard to create a library, add members to the library, and assign library permissions to the members.
7. Categorize and define your content:
 - a. Create content fields. These are custom fields that you assign to page layouts. The default fields are *Description*, *Tags*, and *Title*. If you want to create a field named, for example, *Reviewed By*, your custom content field would be a picklist with the names of possible reviewers.
 - b. Create a custom page layout or modify the default page layout. Page layouts are the containers for custom fields; they determine which fields are available during the publishing process and how the fields display on the content details page. You can create multiple page layouts and record types and assign a content field to any or all page layouts. For example, if sales and marketing users need to record different information about their content, you can create Sales and Marketing page layouts and record

types. If you create a `Related Campaign` lookup field and add it to the Marketing page layout and record type only, users who select the Sales record type during the upload process will not have the option to choose a campaign.

8. Optionally, enable the Add Google Doc to Salesforce service so library members can contribute Google docs to Salesforce CRM Content.

Implementation Tips

- Before creating libraries, review the files you plan to store in Salesforce CRM Content to determine how many libraries you need and what content belongs in each library. Users are given access to content based on library.
- If you have a large number of Salesforce CRM Content users, create a public group and add the group to a library rather than adding users to the library individually.
- To enable Salesforce CRM Content functionality for leads, accounts, contacts, opportunities, cases, products, or custom objects, add the Related Content related list to the appropriate page layout.
- To send web-formatted content to colleagues, leads, or contacts and associate it with Salesforce records, add the Content Deliveries related list to the page layout for leads, accounts, contacts, opportunities, cases, campaigns, or custom objects.
- To allow users to publish, edit, and search in any of the Salesforce-supported languages, from Setup, enter `Salesforce CRM Content` in the `Quick Find` box, select **Salesforce CRM Content**, and then click **Enable multilanguage search and contribute**.
- To associate Google docs with a library, the Add Google Doc to Salesforce service must be activated for your organization.
- Salesforce CRM Content is available via the Customer Portal and partner portal.
- All Salesforce CRM Content items display as primary tabs in the Salesforce Console.

Best Practices

- If you are using the Related Content related list on Salesforce objects, align your custom content fields with the standard and custom fields on the object to increase the accuracy of a “Find Content” search. Clicking the **Find Content** button on the related list matches content to the fields on the record and displays search results containing the related content.
- To ensure that content is classified consistently, define consistent tag names with your contributors. For example, by establishing tag names at the outset, you can avoid having tags such as “channel” and “channels” in the same library.
- Avoid using too many tags. The search engine helps users find specific content, whereas tags enable users to browse and subscribe. Therefore, excessive tagging creates unnecessary clutter.
- You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
- Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.
- To highlight valuable content and make it easier to find, mark it as “featured” on the content details page. Featured content receives a higher priority than similar content in search results, and appears on the Libraries tab for easy access. To feature content, users must have the `Feature Content` option checked in their library permission.

- If your organization uses Google Docs, encourage library members to add their Google docs to a library. Including Google docs in Salesforce CRM Content allows users to access all types of content from a single location and apply Salesforce CRM Content functionality, such as votes, comments, and subscriptions, to Google docs.

Content Customization

Customize Salesforce CRM Content

From Setup, enter *Salesforce CRM Content* in the **Quick Find** box, then select **Salesforce CRM Content** to access the following options for customizing Salesforce CRM Content:

-  **Tip:** To perform the initial set up of Salesforce CRM Content for your organization, see [Set Up Salesforce CRM Content](#) on page 3170.
- **Content Fields**—[Create, edit, or delete custom content fields](#). Custom fields allow users to categorize and define content during the publishing process.
- **Validation Rules**—Create, edit, or delete validation rules. Validation rules verify that the data a user enters when publishing content meets the standards you specify before the user can save the content.
- **Library Permissions**—[Create, edit, or delete library permissions](#). A library permission determines user privileges within a library.
- **Settings**—[Modify Salesforce CRM Content default settings](#) for multi-language support, PDF downloads, content pack creation, or the enhanced document viewer.

Customizing Content Fields

To create, modify, and delete Salesforce CRM Content custom fields for categorizing and defining your content, go to the object management settings for content. If you're using Lightning Experience, go to the Object Manager, select **Content Version**, then scroll to the fields area. If you're using Salesforce Classic, enter *Salesforce Files* in the *Quick Find* box, then select **Fields**. The data assigned to these fields during upload is available on the content details page for the life of the file. After creating custom content fields, you must assign them to a page layout. The page layout determines which fields appear when a user uploads or revises files in Salesforce CRM Content.

To create a custom content field:

1. Click **New**.
2. Choose the type of field to create, and click **Next**.
3. For relationship fields, associate an object with the field and click **Next**.
4. Enter a field label. The field name is automatically populated based on the field label you enter. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Ensure the custom field name is not identical to any standard field name for that object.
5. Choose the page layout that should display the field as an editable field.

Click **Edit** or **Del** in the Content Custom Fields & Relationships related list to edit or delete a custom content field. You cannot edit or delete the standard content fields. Deleted custom fields and their data are stored until your organization permanently deletes them or 15 days has elapsed, whichever happens first. Until that time, you can restore the field and its data.

Libraries

Create Libraries

Store, share, and manage your files in content libraries so you can decide who has access to files in each library and what permissions they have.

Adding a new library in Salesforce CRM Content includes creating the library name and description, adding members to the library, and assigning library permissions that determine each member's privileges within the library. The maximum number of libraries allowed in a single organization is 2,000.

Step 1: Create a New Library

1. Click **New** in the My Libraries section of the Libraries tab home page.
2. Enter a name for the library. Each library in your organization must have a unique name.
3. Optionally, enter a description for the library.
4. Click the **Save and Add Members** button or, if you want to add members later, click the **Save and Close** button.

Step 2: Add Library Members

1. If the member you want to add isn't listed, start to enter their first name in the search box and click **Find**.
2. Select members from the Available Members box. Members can include individual Salesforce CRM Content users or public groups containing Salesforce CRM Content users.

Tip: If you have a large number of Salesforce CRM Content users, create a public group and add the group to a library rather than adding users to the library individually.

3. Click **Add** to add the members to the library.
4. Click **Next**.

Step 3: Assigning Library Permissions to Members

Select a library permission for each user or public group and click **Save**. For more information, see [Manage Library Permissions](#) on page 3177.

Manage Library checked in your library permission definition

To assign library permissions to members:

- "Manage Salesforce CRM Content"

OR

Manage Library checked in your library permission definition

Manage Library Permissions

To manage library permissions, from Setup, enter *Content Permissions* in the Quick Find box, then select **Content Permissions**. A library permission is a group of privileges assigned to each Salesforce CRM Content library member. It determines which tasks a member can perform in a particular library. The same user can have a different library permission in each of his or her libraries.

 **Note:** If your Salesforce CRM Content organization was created after the Spring '09 release, your organization already has three library permissions: Library Administrator, Author, and Viewer.

To [create a custom library permission](#), click the **Add Library Permissions** button. To [edit a library permission](#), click **Edit** next to the library permission name. To [delete a library permission](#), click **Del** next to the library permission name.

 **Note:** Library permissions do not apply to personal libraries. All Salesforce CRM Content users can save files in their personal libraries.

OR

"Manage Content Permissions"

Creating Library Permissions

To create a library permission in Salesforce CRM Content, from Setup, enter *Content Permissions* in the *Quick Find* box, then select **Content Permissions**. Next, click **Add Library Permissions**.

 **Tip:** If your Salesforce CRM Content organization was created after the Spring '09 release, your organization already has Viewer, Author, and Library Administrator library permissions. If not, consider creating them. These three library permissions provide the different levels of library access required for most organizations. For the “Viewer” library permission, select the *View Comments* and *Add Comments* library privileges. For the “Author” library permission, select the *Add Content*, *Add Content on Behalf of Others*, *Archive Content*, *Add Comment*, and *Tag Content* library privileges. For the “Library Administrator” permission, select the *Manage Library* privilege.

1. Assign a name to the library permission.
2. Optionally, enter a description of the library permission. If your organization has several library permissions, consider describing each by its function or with a summary of its privileges. For example, for a “Marketing Reviewer” permission you might include a description that reads, “Reviews all content used in outbound marketing campaigns” or “This user can view and comment on documents.”
3. In the Permissions section, select the checkboxes that correspond to the privileges you want to grant to users with this library permission.

Library Privilege	Description
Manage Library	Perform any action in the library. This privilege is required to edit the libraries' name and description, add or remove library members, or delete a library. Creating a new library requires the “Manage Salesforce CRM Content” or “Create Libraries” user permissions.
Add Content	Publish new content to the library, upload new content versions, or restore archived (deleted) content. Content authors can also change any tags associated with their content and archive or delete their own content.
Add Content on Behalf of Others	Choose an author when publishing content in the library.
Archive Content	Archive and restore any content in the library.
Delete Content	Delete any content in the library. Authors can undelete their own content from the Recycle Bin.
Feature Content	Identify any content in the library as “featured.”

Assigning Library Tagging Rules

In Salesforce CRM Content, tags are descriptive labels that help classify and organize content. Contributors can assign tags to their files, content packs, Google docs, or Web links, thus enabling all library members to browse for content by tag. The tagging rule in a library determines how contributors can tag content; for example, the restricted-tagging rule does not allow contributors to create new tags. Library tagging rules are optional. By default, library contributors can enter any tag.

To assign a tagging rule to a library:

1. On the Libraries tab, select a library from the **My Libraries** area.
2. Click **Tagging Rules** and choose one of the following options:

Library Tagging Rule	Description
Open Tagging	This rule places no restrictions on tagging. Contributors can enter any tag when publishing or editing content. While a tag is typed, Salesforce CRM Content autosuggests tags based on the contributor's recently used tags and the Popular Tags list.
Guided Tagging	This rule also enables contributors to enter any tag when publishing or editing content, but contributors are also offered a list of suggested tags. If you select Guided Tagging, the next step prompts you to enter the suggested tags that you want to recommend to library contributors.
Restricted Tagging	This rule requires contributors to choose from the list of suggested tags. If you select Restricted Tagging, the next step prompts you to enter the list of suggested tags.

3. If you chose **Guided Tagging** or **Restricted Tagging**, click the link for auto-populating the `Suggested Tags` field and then edit, add, or remove tags as needed. If you do not auto-populate the `Suggested Tags` field, any new tags you enter in the field are added to the existing list of suggested tags in the library.
4. Click **Save**.

Notes on Library Tagging Rules

- `Open Tagging` is the default tagging rule.
- If you publish, share, or move content to a library that uses restricted tags, you will receive an error if your content contains unsupported tags.
- When you share content from one library to another, the most restrictive tagging rule applies. For example:
 - When content is shared between a restricted-tagging library and a guided- or restricted-tagging library, you can only choose tags that are common to both libraries.

EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To assign a tagging rule to a library:

- "Manage Salesforce CRM Content"

OR

Manage Libraries checked in your library permission definition

- When content is shared between an open tagging library and a restricted-tagging library, you can only choose tags suggested in the restricted-tagging library.
- If a restricted tagging rule is applied after content has already been published in the library and the existing content contains tags that are no longer permitted by the rule, the tags remain assigned to the content until it is edited or revised. For example, if the `Q3Forecast` document has a `market indicators` tag and `market indicators` is not a suggested tag according to the new restricted-tagging rule, `market indicators` is removed from `Q3Forecast` only when a user publishes a new version of the file or edits the file's tags on the content details page.
- Avoid using too many tags. The search engine helps users find specific content, whereas tags enable users to browse and subscribe. Therefore, excessive tagging creates unnecessary clutter.
- You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
- Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.

SEE ALSO:

[Create Libraries](#)

Restrict Record Types in a Library

Library administrators can choose which record types are available in a library. They can also set the default record type for publishing content to the library.

To restrict the record types allowed in a library:

1. On the Libraries tab, select a library from the **My Libraries** area.
2. Click **Record Types**.
3. Optionally, change the default record type for the library.
4. Select the `Restrict the record types available in the library` checkbox.
5. Select one or both of the following options:
 - `Allow content with any record type to be linked to this library`—Select this option if you want to enable content published in other libraries to be shared to the library where you have restricted record types. The content in other libraries can be shared regardless of the record types used.
 - `Do not apply record type restrictions to existing content`—Select this option if you do not want to receive warnings regarding existing content in the library. You will not be alerted if existing content uses record types that you exclude from the library. This option refers to notifications only; existing content is not affected by restricted record types.
6. For each record type that you want to allow in the library, move it from the Available Record Types list to the Selected Record Types list.
7. Click **Save**.

Notes on Restricting Record Types

- If the library already contains published content, selecting the `Restrict the record types available in the library` option automatically moves all the record types used by the published content to the Selected Record Types list.

EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group

- Performance
- Unlimited
- Developer

USER PERMISSIONS

To restrict record types:

- "Manage record types and layouts for Files"

OR

"Manage Salesforce CRM Content"

- Deselecting the `Restrict the record types available in the library` option automatically moves any record types in the Selected Record Types list to the Available record Types list.
- When changing a file's managing library, the file's record type must be permitted in the new managing library.
- When sharing a file with a library, the file's record type must be permitted in the shared library unless the `Allow content with any record type to be linked to this library` option is selected for the shared library.
- When the default record type for a user's profile differs from the default record type for a library, the user profile default takes priority when a user with that profile shares a file with the library. `General` is used as the default record type when no default is set for the user profile.
- When there are no record types in common between a user profile and a library, the default record type for a library is available to users with that user profile who are sharing files with the library.

Content Settings

Customize Content Settings

From Setup, enter `Salesforce CRM Content` in the Quick Find box, then select **Salesforce CRM Content** to modify the defaults for your Salesforce CRM Content organization:

Enable Salesforce CRM Content

If this option is checked, Salesforce CRM Content is enabled for your organization.

Autoassign feature licenses to existing and new users

If this option is checked, Salesforce automatically attempts to assign Salesforce CRM Content feature licenses to all existing users. If there aren't enough licenses available, no licenses are assigned. Contact Salesforce to request additional feature licenses. When a new user is created, a Salesforce CRM Content feature license is automatically assigned as long as licenses are available. A feature license corresponds to the `Salesforce CRM Content User` checkbox on the user detail page.

Enable multilanguage search and contribute

If this option is checked, a `Language` drop-down list is available when users publish, edit, or search for content. The `Language` drop-down list contains all languages that Salesforce supports.

If a user does not choose a language when publishing content, that content is associated with the user's personal language by default. If the user's personal language setting is different from the organization's language, content published by that user is associated with the user's language, not the organization's language.

Enable content pack creation

If this option is checked, the **Create New > Content Pack** option displays on the Libraries tab and users can create content packs from any documents or files in their Salesforce CRM Content private or public libraries.

If this option is not checked after users in your organization have already created content packs, those packs are not deleted and users can continue to modify metadata such as description, title, and custom fields. However, once content pack creation is no longer enabled, users cannot customize or modify existing packs. Specifically, the **Clone & Customize** button and the **Edit > Edit Content Pack** option on the content details page are unavailable.

Enable enhanced document viewer

If this option is checked, an enhanced set of navigation and customization options are available for the document viewer. The document viewer allows users to preview a document without downloading, whether the document be a content delivery sent to a lead, prospect, or colleague, a document viewed internally in Salesforce CRM Content, or a file in Chatter. The document viewer

has three modes: the Preview tab on the content details page (preview mode), the content delivery URL (delivery mode), and full screen mode, which displays when you click the full-screen option on the content details page or in a content delivery. In Chatter, users can preview files in feeds, on file lists, and on the Files tab. The `Enhanced document viewer` setting provides the following capabilities to users who are viewing documents:

- In addition to using the next page () , previous page () , first page () , and last page () icons on the document toolbar, you can navigate page-by-page through a document by right-clicking and choosing **Next Page** and **Previous Page**. The right-click menu is not available in preview mode.
- You can jump directly to a page by entering the page number and clicking Enter. This option is not available in full-screen mode.
- From the right-click menu you can choose the **Fit Width** option to expand the width of the document or the **Fit Full Page** option to view the whole page of the document. The fit width icon () and fit full page icon () are also available on the toolbar.
- From the right-click menu you can choose the **Full Screen** option to view the document in full screen mode or the **Exit** option to exit full screen mode. The full screen icon () and exit icon () are also available on the toolbar.
- From the right-click menu you can **Zoom In** or **Zoom Out**. The zoom-in icon () and zoom-out icon () are also available on the toolbar.
- You can use the scroll bar to move continuously through a document without needing to click the **Next Page** and **Previous Page** icons. Continuous scrolling is not available in preview mode or for PowerPoint documents in any mode.
- You can use the keyboard arrow keys to navigate page-by-page through a document. Click on the document viewer and use the keys as follows:
 - Right-arrow key: moves a PowerPoint document forward one slide and moves a PDF, Word, or Excel document forward one page.
 - Left-arrow key: moves a PowerPoint document backward one slide and moves a PDF, Word, or Excel document backward one page.
 - Up-arrow key: moves a PowerPoint document forward one slide and scrolls a PDF, Word, or Excel document up the page.
 - Down-arrow key: moves a PowerPoint document backward one slide and scrolls a PDF, Word, or Excel document down the page.

Navigating with keyboard-arrow keys is not available in preview mode.

Enable Office 2007 previews in Content—Pilot

If this option is checked, Microsoft Office 2007 files, including PowerPoint, Word, and Excel can be previewed in their entirety in Salesforce CRM Content and Chatter. In Salesforce CRM Content you do not need to download a large document to determine if its content is relevant to you. The content details page provides document details at a glance, including document title, author, description, tags, libraries, comments, votes, versions, subscribers, and downloads. If the document is a Microsoft PowerPoint, Word, Excel, or Adobe® PDF file, you can preview the entire file in your browser without downloading it. Some aspects of files may not be displayed in previews. Copy-protected PDFs can't be previewed.

You can also preview files in Chatter feeds, from the Files tab, from a file detail page, and from group and profile file lists.

 **Note:** If this option is unchecked after Office 2007 previews have been generated, those previews will no longer be available.

Show Chatter files in Salesforce CRM Content

If this option is checked, searches in Salesforce CRM Content include files from Chatter. The search drop-down list on the Content and Libraries tabs, and the filters on the Content tab include **All Files**, **Chatter Files**, and **My Chatter Groups**.

If this option is not checked, searches in Salesforce CRM Content don't include files from Chatter. The search drop-down list on the Content and Libraries tabs, and the filters on the Content tab include **All Libraries**, **Personal Library**, and any shared libraries the user is a member of.

Posts that contain rich media links are converted into embedded videos, images, and rich article previews.

You must enable Chatter before you can enable link previews.

The rich media content is provided by Embed.ly, a third-party service. We don't share any content, user, organization, or account data with Embed.ly. We only share the URLs that are on the domain whitelist. Additionally all of our URL requests pass through a Salesforce proxy, meaning Embed.ly never receives calls directly from the client and therefore doesn't have information about who's making the URL request.

1. From Setup, enter *Chatter Settings* in the Quick Find box, then select **Chatter Settings**.
2. Click **Edit**.
3. Select **Allow Rich Link Previews**.
4. Click **Save**.

Post with links to rich media content are rendered as a preview, including thumbnails, descriptions and video players for video URLs. If a post doesn't render a link as a rich preview in the feed, the URL domain for that link either isn't supported or Embed.ly was unable to return the preview content for the URL.

Rich media previews are enabled by default. If you disable rich media previews, users can only preview videos from the YouTube community.

Content Deliveries

Set Up Content Deliveries

A *content delivery* allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. Content deliveries are available in Salesforce Classic only. However, Lightning Email generates delivery-based links as email attachments for Lightning Experience users who have access to the Content Deliveries feature.

In addition to tracking, content deliveries provide several benefits over sending files as attachments, such as giving you control over how long the delivery is available to viewers and whether a viewer can download a file or see it online only. By default, a content delivery shows the most recent version of the file being delivered.

Create content deliveries from the Content Deliveries related list on most Salesforce objects. Salesforce CRM Content users can also create a content delivery from the content details page or the Related Content related list.

To enable or disable content deliveries for your organization:

1. From Setup, enter *Content Deliveries* in the Quick Find box, then select **Content Deliveries** and select or deselect the *Enable Creation of Content Deliveries for Chatter Files* checkbox. If you don't have access to the Content Deliveries feature, contact Salesforce Customer Support to activate it.
2. To let users create and share links to Chatter files, click *Enable Creation of Content Deliveries for Chatter Files*.
3. Choose a default option for content-delivery passwords. Because content-delivery URLs can be sent to leads, customers, or any unauthenticated user, Salesforce recommends requiring password protection if your users will send confidential documents via content delivery. The options below allow you to select an organization-wide default for content-delivery password protection.
 - **Password protection is optional and defaults to OFF**—If this option is selected, users can choose to require a password when they create a content delivery, but the *Require Password to Access Content* field on the create-delivery wizard is not checked by default.
 - **Password protection is optional and defaults to ON**—If this option is selected, the *Require Password to Access Content* field on the create delivery wizard is checked by default. Users can uncheck the option if they do not want to require a password.
 - **Password protection is required**—If this option is selected, a password is generated each time a content delivery is created. Users cannot opt out of the password requirement.

Note:

- If you choose to require a password, users who create a content delivery will receive a password when the delivery is generated; users must send the password and the delivery URL to delivery recipients. Delivery recipients are prompted for the password when they click the content delivery URL.
- Content delivery passwords display with the content-delivery URL when the delivery is created. You can also access the password on the delivery detail page for the life of the content delivery.

When content delivery is enabled, all users should add the Content Deliveries related list to their page layouts for leads, business accounts, contacts, opportunities, cases, campaigns, or custom objects. All Salesforce CRM Content users will see a **Deliver Content** option on each content details page.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To enable or disable content deliveries:

- “Customize Application”

Implementation Tips

- To ensure quality of service, the total number of content-delivery views allowed within a 24-hour period is limited to 20,000. Also, the amount of bandwidth allocated to content deliveries is limited to 10 GB within a 24-hour period. If a recipient tries to view a delivery when a rate limit has been exceeded, a notification displays that asks the viewer to try again later. Salesforce may be able to increase rate limits on an exception basis. For more information, contact your sales representative.
- When you create a content delivery, Salesforce copies the original file and creates a new version of that file specifically for online viewing. Note the following information concerning supported file types:
 - Microsoft® Office 97 through Microsoft Office 2007 Word, Excel, and PowerPoint files are supported for online views.
 - Adobe® PDF files are supported for online views, but copy-protected PDFs are not.
 - JPG, BMP, GIF, and PNG are supported for online views.
 - Any document over 25 MB is not supported for online views.

You can create a content delivery with any file type, but if the file type is not supported for online viewing, your recipient can only download the document in its original file format.

- Always preview your content delivery before sending the URL to recipients. In some cases, formatting in the original file, such as colors and non-standard fonts, may not display properly in the online version. If you are not happy with the quality of the online version, the content delivery wizard gives you the option of making your content available for download in its original file format.
- Content deliveries require Adobe Flash version 9.0.115. If a recipient does not have Flash installed, a download option displays.
- Customer Portal and partner portal users cannot create content deliveries.
- Only the creator of a content delivery can delete the delivery record or edit details such as the expiration date.
- Each time a content delivery's URL is clicked, Salesforce records the click as one view and distinguishes between internal and external views. An internal view is a view by a Salesforce user, for example, clicking the delivery URL on the delivery detail page or the View option on the Content Deliveries related list is an internal view. The Content Deliveries related list provides a count of all views for each delivery. Open the delivery details page to see information about a specific view.

Note: For password-protected content deliveries, a view is recorded when the recipient clicks on the delivery URL regardless of whether he or she enters the password and views the delivery.

- Salesforce CRM Content users can deliver content from shared libraries or a personal library.

Best Practices

- After creating a content delivery, always preview it before sending the URL to your recipients to ensure that the formatting in the original file displays properly in the online version. For example, colors and non-standard fonts may not display properly in the preview player. If you are not happy with the quality of the online version, click **Previous** and choose to make your content available in its original file format or as a PDF file only. Your recipients will be able to download the file, and you can track whether the file was downloaded on the delivery detail page.
- Animation and timings in PowerPoint files are not supported in the content delivery's online version. Hyperlinks in all file types are also unsupported. See the [implementation tips](#) for a complete list of supported file types.
- If you are a Salesforce CRM Content user and want recipients of your content delivery to always see the latest version of a file rather than the version available on the delivery-creation date, open the delivery detail page and click **Edit**. Select the `Content Delivery Opens Latest Version` checkbox.
- If you select `Notify Me of First View` or `Download`, you will receive an email when the content delivery is viewed for the first time.

Storage Implications

In Salesforce CRM Content, file storage is consumed when content is published to shared libraries or saved to a private library. Creating content deliveries does not have an additional affect on storage limits, but users who frequently upload files to their personal libraries for the purpose of content delivery should consider their organization's file-storage limits. Administrators can use reporting to identify which users are consuming the most storage and which files are largest in size.

For non-Salesforce CRM Content users, file storage is consumed each time a content delivery is created. Once uploaded to Salesforce, a file cannot be reused for multiple content deliveries. Creating multiple content deliveries with the same file requires uploading the file each time. Deleting a content delivery deletes the source file in Salesforce, thus increasing file-storage space.

[Set Up Salesforce CRM Content Content Delivery Fields](#)

Content Delivery Fields

The following table provides a description of the fields (in alphabetical order) that make up a content delivery. These fields are located on the create-delivery wizard, the Content Deliveries related list, or the delivery details page.

Field	Description
Allow Recipient to View in the Browser	If checked, the content delivery can be viewed online in a custom Web page. On the delivery details page, this field is labeled <code>Allow View in the Browser</code> .
Allow Recipient to Download as PDF	If checked, the content delivery converts Microsoft® Word, Excel, and PowerPoint files into PDF files and gives the recipient the option of downloading the PDF. If the file you uploaded was not a PDF, Word, Excel, or PowerPoint file, this option does not appear in the create-delivery wizard. On the delivery details page, this field is labeled <code>Allow Download as PDF</code> .
Allow Download in Original Format	If checked, the content delivery allows recipients to download the original file. In the create-delivery wizard, this field is called <code>Allow Recipient to Download as [file type]</code> where <code>[file type]</code> is the original file's file type, such as <code>.ppt</code> , <code>.pdf</code> , or <code>.doc</code> .
Author	For Salesforce CRM Content files, the user who published the file. (Read only)

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Salesforce CRM Content available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Field	Description
Content Delivery Name	The name assigned to the content delivery. By default, the <code>Content Delivery Name</code> includes the file name and the creation date.
Content Delivery Opens Latest Version	For Salesforce CRM Content files, this flag indicates that the recipient of a content delivery sees the most current version of a file. For example, if a file is updated between the delivery-creation date and today's date, a recipient who views the delivery today sees the newest version.
Content Delivery Expires	A flag that indicates whether access to the content delivery will expire on the expiration date. In the create-delivery wizard, this flag corresponds to the checkbox next to the <code>Remove access to content on</code> field.
Created By	The user who created the content delivery, including creation date and time. (Read only)
Description	For Salesforce CRM Content files, the description provided when the file was published. (Read only)
Expiration Date	The date on which the content delivery can no longer be viewed. In the create-delivery wizard, this is the date entered in the <code>Remove Access to Content on</code> field.
File Downloaded	A flag that indicates whether a file in the content delivery was downloaded. For example, if a content delivery includes options to view the content in the browser, download the content in its original file format, and download the content as a PDF file, this flag is checked if the recipient downloads the original file or the PDF file. (Read only)
Internal View	A flag that indicates whether a Salesforce user viewed the content delivery. A view is considered internal if the user opens the delivery URL from within Salesforce, for example by clicking View on the Content Deliveries related list or clicking the delivery URL on the delivery detail page. If the user copies the URL and pastes it into his or her browser, the view is considered external. (Read only)
Last Modified By	The user who last modified the content delivery, including modification date and time. (Read only)
Last Viewed	The date and time on which the content delivery was last viewed. A view is one click of the content-delivery URL. (Read only)
Notify Me of First View or Download	If checked, the user who created the content delivery receives an email notification the first time the content delivery URL is clicked.
Owner Name	The user who owns the content delivery. (Read only)

Field	Description
Related To	The record that the content delivery is associated with, such as an account, opportunity, or custom object. Users with sharing access to the record can click it to view more details.
Require Password to Access Content	If checked, the recipient must enter the provided password before viewing the content delivery. The password appears when the content delivery is generated and for the life of the delivery on the delivery detail page.
Title	For Salesforce CRM Content files, the title of the file included in the content delivery. (Read only)
View Count	Total number of views for the content delivery, including internal and external. (Read only)

Setting Up Salesforce CRM Content for Salesforce Classic Mobile

Note the following about how Salesforce CRM Content is implemented in Salesforce Classic Mobile:

- Content record information is synchronized to the device; however, the files associated with the content records are not. This allows users to deliver content from the app even when a file is too large to be downloaded to a mobile device.
- Users can't search for a specific piece of content in the app. They can only share the content available on the Content tab, which is automatically synchronized to their device based on the filters in their assigned mobile configuration.
- Users can't view a list of their subscribed content in the app. They also can't filter the list of records on the Content tab based on a particular library.
- While users can preview and share content from the app, they can't update the file associated with a content record. If they have the required permissions, they can edit the fields on the content detail page.
- Users must have a data connection to preview and deliver content. Without a data connection, they can only view the content detail page.
- Content in Salesforce Classic Mobile is only supported on BlackBerry and iPhone devices.
- Content is not available in the free version of Salesforce Classic Mobile.
- You can't block mobile permissions for the content object. Currently, the content object in Salesforce Classic Mobile is read-only.
- You can't edit the mobile page layout for the content object. The content detail page in the app is hard-coded to display only a few fields.

To set up Content for a Salesforce Classic Mobile configuration:

1. From Setup, enter *Salesforce Classic Configurations* in the Quick Find box, then select **Salesforce Classic Configurations**, and then click the name of a mobile configuration.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Free version available in: **All** editions except **Database.com**

Full version available in: **Performance, Unlimited, and Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

USER PERMISSIONS

To view Salesforce Classic Mobile configurations:

- "View Setup and Configuration"

To create, change, or delete Salesforce Classic Mobile data sets:

- "Manage Mobile Configurations"

2. In the Data Sets related list, click **Edit**.
3. Click **Add...**
4. In the popup window, select Content, then click **OK**.
5. Use field filters to specify which content records are synchronized.

Because users can't search for content in the Salesforce Classic Mobile app, it's essential to set up filters that make important content available on the device. You can't create filters based on libraries or subscriptions, but here are a few options for setting up useful filter conditions:

- **Date:** Filter on the `Last Modified Date`, `Content Modified Date`, or `Created Date` fields. Use special date values like LAST 90 DAYS or LAST 180 DAYS to ensure that recently updated content records are synchronized.
 - **Owner:** Filter on the author if certain people in your organization are responsible for publishing content.
 - **File Type:** Filter on certain types of documents. For example, your opportunity team might generally be interested in presentations or PDF documents.
 - **Custom Fields:** If you created custom content fields that help you categorize your content, filter on the custom fields. For example, if you built a `Functional Use` field with picklist values, you could set up a filter condition where `Functional Use` equals `Sales`.
6. Optionally, prevent content records from consuming all the memory on a mobile device by selecting the second radio button under Set Max Record Limit and entering the maximum number of content records this configuration can transfer to mobile devices. Use the Order By and Sort drop-down lists to specify which records are synchronized if the data size limit for your mobile configuration is exceeded.
 7. Click **Done**.

Google Apps

Getting Started with Salesforce and Google Apps

Google Apps is a suite of on-demand communication and collaboration services hosted by Google and designed for business users. If your organization has a Google Apps account, Salesforce administrators can enable Google Docs, Gmail, and a host of Google-related AppExchange apps—customized for use within Salesforce.

Step 1: Creating a Google Apps Account

Create a Google Apps account for your organization using one of the following methods:

- From Setup, enter *Google Apps* in the **Quick Find** box, select **Google Apps Settings**, and click **Sign Up** to launch the account-creation page on the Google website. You are prompted to register your organization's domain name or purchase a new domain name from Google. A domain is the portion of a website's URL that follows the "www." Follow Google's steps to configure your new or existing domain and set up your Google Apps account.
- If your organization purchased the Salesforce and Google Apps Supported feature, from Setup, enter *Premier Setup* in the **Quick Find** box, then select **Premier Setup** to create a new Google Apps Premier Edition account or upgrade your existing Standard Edition account to Premier Edition. For details, see [Getting Started With Salesforce and Google Apps Supported](#).

 **Note:** Google Apps in Salesforce supports Google Apps business accounts but not consumer accounts. You can identify a consumer account by the "gmail.com" domain in an email address; for example, *myname@gmail.com* is a consumer account. The Google Apps domain you set up in Salesforce must be the domain you registered with Google for your organization; for example, *mycompany.com* is a business rather than consumer account.

Step 2: Configuring Google Apps Domain Settings

1. On the Google Apps Settings page in Salesforce, click **Edit**.
2. Choose a user for the **Google Apps Administrative Contact** field. This person is the point of contact for Google Apps users in your organization; specifically, if a user cannot access a Google Apps service, he or she is directed to contact the Google Apps Administrative Contact. The Google Apps Administrative Contact does not need to be the same person who is registered as your organization's Google Apps administrator with Google, but only the Google Apps administrator can create new Google Apps users on your domain.
3. Enter the **Google Apps Domain** that you registered with Google. For example, if your company's URL is `http://www.acme.com` and you created a Google Apps account for the `acme.com` domain, enter `acme.com` in the **Google Apps Domain** field.
4. Click **Save**.

Step 3: Activating Google Apps Services

1. In the **Activate Google Apps Services** section on the Google Apps Settings page, locate the Google Apps service(s) that you want to activate.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To view and modify Google Apps domain settings:

- "Customize Application"

To activate or deactivate Google Apps services:

- "Customize Application"

To install or uninstall Force.com AppExchange packages:

- "Download AppExchange packages"

To export a list of users to Google to create Google Apps accounts:

- "Customize Application"

2. Click **Edit** or **Install** to activate a service. In the Action column, **Edit** corresponds to Google Apps services that are already integrated in Salesforce, and **Install** corresponds to uninstalled Force.com AppExchange apps. Integrated Google Apps services include:
 - [Add Google Docs to Salesforce](#)
 - [Gmail to Salesforce](#)
 - [Gmail Buttons and Links](#)
 - [Google Talk Sidebar Component](#)

 **Important:** Google Talk within Salesforce is no longer available. For alternative ways to use Google Talk, see [the Google Talk online help](#).

For descriptions of the Google-related AppExchange apps, visit <http://sites.force.com/appexchange>.

Step 4: Creating Google Apps Users

Activating Google Apps services in Salesforce makes the services visible to all users in your organization, but a user cannot access a service unless he or she has a Google Apps account on your organization's domain. The Google Apps administrator registered with Google can create these additional accounts. For more information, see [Creating Google Apps Accounts](#).

SEE ALSO:

[Getting Started With Salesforce and Google Apps Supported](#)

[Set Up Google Apps in Salesforce](#)

[Activate Google Docs in Salesforce](#)

[Using Gmail in Salesforce](#)

Getting Started With Salesforce and Google Apps Supported

The Salesforce and Google Apps Supported feature includes a Google Apps Premier Edition account for your organization. In Salesforce, you can create that account or upgrade from an existing Google Apps Standard Edition account to Google Apps Premier Edition.

After you create a new Google Apps Premier Edition account or upgrade your existing Google Apps Standard Edition account in Salesforce, the Premier Setup page displays your organization's domain name, the number of Google Apps Premier Edition licenses available to your organization, and, if applicable, the status of your upgrade.

Creating a New Google Apps Premier Edition Account

If your organization does not have a Google Apps account, complete the following steps to register a Google Apps Premier Edition account and enable Salesforce and Google Apps:

1. From Setup, enter *Premier Setup* in the **Quick Find** box, then select **Premier Setup**.
2. Complete the fields in Column A:

Field	Description
Domain Name	Enter the domain that you want to register as your organization's Google Apps account. For example, if your company's URL is <code>http://www.acme.com</code> , enter <code>acme.com</code> as your Domain Name.
User Name	This value is used to create the Google Apps administrator for your organization's account. For example, if your Google Apps administrator will be <code>jsmith@acme.com</code> , enter <code>jsmith</code> . After your Google Apps account is created, you can log in with the User Name and Password and change this value if necessary.
First Name	This value is used to create the Google Apps administrator for your organization's account. After your Google Apps account is created, you can log in with the User Name and Password and change this value if necessary.
Last Name	This value is used to create the Google Apps administrator for your organization's account. After your Google Apps account is created, you can log in with the User Name and Password and change this value if necessary.
Email Address	This email address receives a confirmation notice when your Google Apps Premier

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To create a new Google Apps Premier Edition account in Salesforce:

- "Customize Application"

OR

Google Apps
Administrative Contact

To upgrade Google Apps Standard Edition to Google Apps Premier Edition in Salesforce:

- "Customize Application"

OR

Google Apps
Administrative Contact

Field	Description
	Edition account is created. Google does not store this value for any other purpose.
Password	The Google Apps administrator can log in to Google Apps with this password.
Confirm Password	The Google Apps administrator can log in to Google Apps with this password.

3. Click `Create New Premier Account`.

- To enable Salesforce and Google Apps, from Setup, enter `Google Apps Settings` in the `Quick Find` box, then select **Google Apps Settings**.
- Choose a user for the `Google Apps Administrative Contact` field. This person is the point of contact for Google Apps users in your organization; specifically, if a user cannot access a Google Apps service, he or she is directed to contact the Google Apps Administrative Contact. The Google Apps Administrative Contact does not need to be the same person who is registered as your organization's Google Apps administrator with Google, but only the Google Apps administrator can create new Google Apps users on your domain.
- Verify that the `Google Apps Domain` field contains the domain name you registered with Google.
- Activate Google Apps services in Salesforce. For more information, see [Activating Google Apps Services](#).
- Create users for your organization's Google Apps account. For more information, see [Creating Google Apps Accounts](#).

 **Note:** The number of Google Apps Premier Edition accounts you can create is limited to the number of licenses your organization purchased with the Salesforce and Google Apps Supported feature.

Upgrading to a Google Apps Premier Edition Account

Complete the following steps to upgrade your organization's existing Google Apps Standard Edition account to a Google Apps Premier Edition account.

- From Setup, enter `Premier Setup` in the `Quick Find` box, then select **Premier Setup**.
- Complete the fields in Column B:

Field	Description
Domain Name	The domain that you want to register as your organization's Google Apps Premier Edition account. If you already enabled Salesforce and Google Apps, this field is prepopulated with your organization's domain name.
Google Apps Token	The 16-digit token required to upgrade from Google Apps Standard Edition to Google Apps Premier Edition. Your organization's Google Apps administrator can access this information on the Google website. For more information, click Retrieve Google Apps Token in Column B.

3. Click **Upgrade Existing Account to Premier**.
 4. To enable Salesforce and Google Apps, from Setup, enter *Google Apps Settings* in the **Quick Find** box, then select **Google Apps Settings**.
 5. As needed, edit the *Google Apps Administrative Contact* field. This person is the point of contact for Google Apps users in your organization; specifically, if a user cannot access a Google Apps service, he or she is directed to contact the Google Apps Administrative Contact. The Google Apps Administrative Contact does not need to be the same person who is registered as your organization's Google Apps administrator with Google, but only the Google Apps administrator can create new Google Apps users on your domain.
 6. Verify that the *Google Apps Domain* field contains the domain name you registered with Google.
 7. As necessary, activate Google Apps services in Salesforce. For more information, see [Activating Google Apps Services](#).
 8. As necessary, create users for your organization's Google Apps account. For more information, see [Creating Google Apps Accounts](#).
-  **Note:** The number of Google Apps Premier Edition accounts you can create is limited to the number of licenses your organization purchased with the Salesforce and Google Apps Supported feature.

[Getting Started with Salesforce and Google Apps](#)

Set Up Google Apps in Salesforce

From Setup, enter *Google Apps Settings* in the **Quick Find** box, then select **Google Apps Settings** to edit your Google Apps domain settings, activate or deactivate Google Apps services in Salesforce, or install or uninstall Google-related Force.com AppExchange packages..

 **Important:** You cannot use Salesforce and Google Apps until a Google Apps account has been created for your organization and your Google Apps domain settings are configured in Salesforce. For instructions on creating an account and configuring your domain settings, see [Getting Started with Salesforce and Google Apps](#) on page 3193.

Editing Google Apps Domain Settings

Domain settings consist of two values: the user chosen to administer your organization's Google Apps account and the domain your organization registered with Google. Both fields are required to enable Google Apps in Salesforce. To edit your domain settings:

1. In the Configure Google Apps Domain section, click **Edit**.
2. Optionally, choose a new user for the *Google Apps Administrative Contact* field. This person is the point of contact for Google Apps users in your organization; specifically, if a user cannot access a Google Apps service, he or she is directed to contact the Google Apps Administrative Contact. The Google Apps Administrative Contact does not need to be the same person who is registered as your organization's Google Apps administrator with Google, but only the Google Apps administrator can create new Google Apps users on your domain.
3. Optionally, modify the *Google Apps Domain* that is registered with Google for your organization's Google Apps account. Your *Google Apps Domain* is typically your company's domain; for example, acme.com.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To edit Google Apps domain settings and activate or deactivate services:

- "Customize Application"

To install or uninstall AppExchange packages:

- "Download AppExchange packages"

Modifying Google Apps Services

This section lists Google Apps services that are integrated with Salesforce and also provides links to several Google-related Force.com AppExchange apps that can be easily installed from AppExchange.

To activate or deactivate an integrated service, click **Edit** next to the service name. These services include:

- [Add Google Docs to Salesforce](#)
- [Gmail to Salesforce](#)
- [Gmail Buttons and Links](#)
- [Google Talk Sidebar Component](#)

 **Important:** Google Talk within Salesforce is no longer available. For alternative ways to use Google Talk, see [the Google Talk online help](#).

To install or uninstall an AppExchange app, click **Install** or **Uninstall** next to the appropriate name. To view all Google-related AppExchange offerings, visit <http://sites.force.com/appexchange>.

Implementation Tips

- For detailed information about Google Apps, refer to [Google's online help](#).
- Google Apps in Salesforce is available for Google business accounts but not consumer accounts. You can identify a consumer account by the "gmail.com" domain in an email address; for example, *myname@gmail.com* is a consumer account. The Google Apps domain you set up in Salesforce must be the domain you registered with Google for your organization; for example, *mycompany.com* is a business rather than consumer account.
- After creating a Google Apps account for your organization, create Google Apps accounts for your Salesforce users. From Setup, enter *Users* in the **Quick Find** box, select **Users**, and then click **Export to Google Apps**.
- Notify users of their Google Apps usernames and passwords.
- Notify users about the changes they will see in Salesforce when Google Apps services are activated.
- To view all the Google apps available on Force.com AppExchange, visit <http://sites.force.com/appexchange>.
- By default, Google Apps users on your organization's domain can share Google docs with Google Apps accounts outside your domain. The control panel for your Google Apps account contains sharing settings that enable you to restrict document sharing to within your domain.
- When the Add Google Docs to Salesforce service is deactivated, Google docs cannot be accessed from Salesforce records, and any Google docs in users' Recycle Bins that were deleted from a record are permanently removed from Salesforce. If the Add Google Docs to Salesforce service is reactivated within 30 days, Google docs that were associated with Salesforce records before the deactivation are restored to their previous location. Deactivating the Add Google Docs to Salesforce service does not affect Google docs in Salesforce CRM Content libraries; deactivation does not remove Google docs associations in libraries and does not permanently delete Google docs in Recycle Bins.
- Customer Portal and partner portal users with access to the **Contribute** tab in Salesforce CRM Content can create new Google docs and associate existing Google docs to a Salesforce library. Portal users without access to Salesforce CRM Content can associate an existing Google doc to a record, but they cannot create new Google docs from within a record because they do not have access to the Google Docs, Notes, and Attachments related list in the portal. Portal users cannot use the **Add Google Doc to Salesforce** browser button.
- Customer Portal and partner portal users cannot access Gmail Buttons and Links.
- If your organization purchased the Salesforce for Google Apps Supported feature, see [Getting Started With Salesforce and Google Apps Supported](#) on page 3195.

Best Practices

- Test your Google Apps integration using a sandbox or Developer Edition organization.
- Manage Google Apps users as you would Salesforce users. For example, if you deactivate a Salesforce user, also deactivate his or her Google Apps account in the control panel for your organization's Google Apps account. For information about administering your organization's Google Apps account, refer to [Google's online help](#).
- To locate a Google doc quickly in Salesforce, search for the doc using search.

SEE ALSO:

[Getting Started with Salesforce and Google Apps](#)

Creating Google Apps Accounts

After [creating a Google Apps account for your organization](#) and [enabling Google Apps in Salesforce](#), you can create Google Apps accounts for individual users. To access the Google Apps services that are enabled in Salesforce, each user needs a Google Apps account on the domain your organization registered with Google. An account includes a username and password that allow the user to log into all Google Apps services.

 **Note:** If your organization purchased Salesforce and Google Apps Supported, the number of Google Apps Premier Edition accounts you can create is limited to the number of licenses your organization purchased.

To export a list of users to Google and create Google Apps accounts for each user:

1. From Setup, enter `users` in the `Quick Find` box, then select **Users**.
2. In the View drop-down list, choose a list of users.
3. Click **Export to Google Apps** to export all the users in the list. To export certain users only, select those users in the Action column.

 **Note:** If Google Apps is not enabled for your organization, the **Export to Google Apps** button does not display. To enable Google Apps in Salesforce, see [Getting Started with Salesforce and Google Apps](#) on page 3193.

4. On the Export Users to Google Apps page, click the export file link that is labeled as Step 1. The name of the link depends on the list view you chose to export; for example, if you were viewing the All Users list, the link on the Export Users to Google Apps page is **All Users Export File**.
5. In the CSV spreadsheet that displays when click you the export link, provide a temporary password for each user. You can modify the `username`, `last name`, and `first name` fields for any user as needed. Google creates account names by adding your domain to the usernames in the spreadsheet; for example, if your domain is `acme.com` and the spreadsheet contains `john.doe` and `jane.doe` usernames, the Google Apps usernames are `john.doe@acme.com` and `jane.doe@acme.com`.
6. Save the spreadsheet to your computer.
7. Click the **Google Apps Bulk User Import Tool** link to launch the Bulk Account Update page for your organization's Google Apps account. If prompted, log in with your Google Apps administrator username. Only the user who is registered with Google as the administrator of your organization's account can create additional Google Apps accounts on your organization's domain.
8. Follow Google's instructions to import the data in the spreadsheet. The Google Apps administrator receives a confirmation report, and the user for each successfully created account receives a notification email at his or her new Gmail account..

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

Export users to Google:

- "Customize Application"

Create new Google Apps accounts:

- Google Apps administrator

9. Notify users of their usernames and passwords. They will need this information to use any Google Apps service that is enabled in Salesforce.

SEE ALSO:

[Getting Started with Salesforce and Google Apps](#)

Activate Google Docs in Salesforce

Important: Once you activate a Google Apps service in Salesforce, it is visible to all users in your organization. To use these services, your users must have Google Apps accounts on your domain. For more information, see [Getting Started with Salesforce and Google Apps](#).

Google Docs™ allows you to create on-demand documents, spreadsheets, and presentations, edit them in your browser, and work together in real time with other collaborators.

To activate or deactivate the Add Google Docs to Salesforce service:

1. From Setup, enter *Google Apps Settings* in the **Quick Find** box, then select **Google Apps Settings**.
2. Click **Edit** next to the Add Google Docs to Salesforce option in the Activate Google Apps Services list.
3. Select or deselect the **Activate** checkbox.
4. If you are activating the Add Google Docs to Salesforce service, read the Terms of Use and select the checkbox indicating you agree to the Terms of Use.
5. Click **Save**.

When the Add Google Docs to Salesforce service is enabled, the following changes allow users to create, edit, or view Google docs and associate them with Salesforce records:

- The Notes & Attachments related list on accounts, assets, contacts, contracts, leads, opportunities, products, and custom objects is renamed to Google Docs, Notes, & Attachments.
- The Attachments related list on cases, solutions, and campaigns is renamed to Google Docs & Attachments.
- If Salesforce CRM Content is enabled, the Libraries tab has an **Add Google Doc** drop-down list.

Users can also install the **Add Google Doc to Salesforce** browser button, which allows them to associate a Google doc to several Salesforce records or a Salesforce CRM Content library without being logged into Salesforce.

Implementation Tips

- For information about Google Docs, refer to [Google's online help](#).
- By default, Google Docs users on your domain can share their Google docs with Google Apps accounts outside your domain. The control panel in your Google Apps account contains sharing settings that enable you to restrict document sharing to users within your organization's domain.
- Customer Portal and partner portal users with access to the Contribute tab in Salesforce CRM Content can create new Google docs and associate existing Google docs to a Salesforce library. Portal users without access to Salesforce CRM Content can associate an existing Google doc to a record, but they cannot create new Google docs from within a record because they do not have access to the Google Docs, Notes, and Attachments related list in the portal. Portal users cannot use the **Add Google Doc to Salesforce** browser button.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

Activating the Add Google Docs to Salesforce service:

- "Customize Application"

- When the Add Google Docs to Salesforce service is deactivated, Google docs cannot be accessed from Salesforce records, and any Google docs in users' Recycle Bins that were deleted from a record are permanently removed from Salesforce. If the Add Google Docs to Salesforce service is reactivated within 30 days, Google docs that were associated with Salesforce records before the deactivation are restored to their previous location. Deactivating the Add Google Docs to Salesforce service does not affect Google docs in Salesforce CRM Content libraries; deactivation does not remove Google docs associations in libraries and does not permanently delete Google docs in Recycle Bins.
- The Add Google Docs to Salesforce service cannot be disabled for your organization if Google docs are referenced in Apex.
- Google docs count against data storage. For each Google doc associated with a record or library in Salesforce, two Kb of storage is used.

SEE ALSO:

[Getting Started with Salesforce and Google Apps](#)

Using Gmail in Salesforce

 **Important:** Once you activate a Google Apps service in Salesforce, it is visible to all users in your organization. To use these services, your users must have Google Apps accounts on your domain. For more information, see [Getting Started with Salesforce and Google Apps](#).

Gmail™ (also called Google Mail) is a free Web-based email service from Google that operates on all standard browsers and can be used with your company's domain. You can integrate Gmail with Salesforce in two ways:

- [Gmail to Salesforce](#)
- [Gmail Buttons and Links](#)

Gmail to Salesforce

Gmail to Salesforce allows you to automatically log emails and chats you send from your Gmail account as activities on lead, contact, opportunity, and other records that support activity history in Salesforce.

Gmail to Salesforce is based on the Email to Salesforce feature. To activate Gmail to Salesforce for your organization, from Setup, enter *Email to Salesforce* in the Quick Find box, then select **Email to Salesforce**. To configure your personal Gmail to Salesforce setup, from your personal settings, enter *My Email to Salesforce* in the Quick Find box, then select **My Email to Salesforce**.

Gmail Buttons and Links

Gmail Buttons and Links adds **Gmail** links next to email fields on all records and adds **Compose Gmail** buttons in Activity History related lists on leads and contacts. When you click a Gmail link or the **Compose Gmail** button, Salesforce automatically logs you into your Gmail account and automatically populates the **To** field. If Gmail to Salesforce is activated, Salesforce also populates the **BCC** field with your Email to Salesforce address.

To activate Gmail Buttons and Links:

1. From Setup, enter *Google Apps* in the Quick Find box, then select **Google Apps Settings**.
2. In the Activate Google Apps Services list, click **Edit** next to Gmail Buttons and Links.
3. Select the **Active** checkbox to activate Gmail Buttons and Links for your organization.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

Activating Gmail in Salesforce:

- "Customize Application"

4. Select the `Gmail Links` checkbox to add **Gmail** links next to all email fields (except email fields on pages under Setup).
5. Select the `Gmail Buttons` checkbox to add **Compose Gmail** buttons in Activity History related lists on leads and contacts.
6. Read the Terms of Use, and select the checkbox indicating you have read and agree to them.
7. Click **Save**.

Implementation Notes

- If your organization enables Gmail Buttons and Links but does not enable Gmail to Salesforce, you can still use the Gmail links on contact and lead records; however, Salesforce does not log emails you send from your Gmail account, or automatically populate the **BCC** field on the **Compose Mail** screen with an Email to Salesforce address.

[Find Your Personal Settings](#)

Using Google Talk in Salesforce

 **Important:** Google Talk within Salesforce is no longer available. For alternative ways to use Google Talk, see [the Google Talk online help](#).

Deactivating Google Talk

To deactivate Google Talk in Salesforce:

1. From Setup, enter `Google Apps` in the `Quick Find` box, then select **Google Apps Settings**.
2. Click **Edit** next to the Google Talk Sidebar Component option in the Activate Google Apps Services list.
3. Deselect the `Active` checkbox.
4. Click **Save**.

ANALYTICS

Salesforce Wave Analytics

Wave Analytics Library

Salesforce Wave Analytics is a cloud-based platform for connecting data from multiple sources, creating interactive views of that data, and sharing those views in dashboards. It's a better way to distribute insight to business users so they can understand and take action on changing information.

Learn Wave Analytics with Trailhead

Trailhead is the fun and free way to learn Salesforce. Now you can get acquainted with Wave Analytics through Trailhead, using a special Wave-enabled Developer Edition org.

For the Wave Analytics trails, you can't use an old Developer Edition org. You must sign up for the special Developer Edition that comes with a limited Analytics Cloud Wave Platform license and contains sample data required for the Wave trails.

To access all of the Wave Analytics trails, start here: https://developer.salesforce.com/trailhead/trail/wave_analytics_explorer. You'll find the sign up for the special Developer Edition org in the Wave Analytics Basics trail.

[Wave Analytics Limits](#)

Wave Analytics Glossary

Familiarize yourself with common Wave Analytics terminology.

App

An *app* contains dashboards, lenses, and datasets in any combination that makes sense for sharing your data analyses with colleagues. Apps are like folders. They allow users to organize their data projects—private and shared—and to control sharing.

Dashboard

A *dashboard* is a curated set of charts, metrics, and tables based on the data in one or more lenses.

Dashboard JSON file

A *dashboard JSON file* defines the components that a dashboard contains and describes how they're connected.

Data monitor

The *data monitor* tool allows you to monitor dataflow and system jobs. You can also use it to start, stop, reschedule, download, and upload dataflows.

Dataflow

A *dataflow* is a set of instructions that specifies what data to extract from Salesforce objects or datasets, how to transform the datasets, and which datasets to make available for querying.

Dataflow definition file

A *dataflow definition file* is a JSON file that contains transformations that represent the dataflow logic.

Dataflow job

A *dataflow job* processes the logic in a dataflow.

Dataset

A *dataset* contains a set of source data, specially formatted and optimized for interactive exploration.

Dataset builder

The *dataset builder* is a point-and-click user interface that allows you to easily select and extract data from related Salesforce objects to create a single dataset.

Date

A *date* can be represented as a day, month, year, and, optionally, time. You can group, filter, and perform math on dates.

Designer

Designer is the interface where you create dashboards.

Dimension

A *dimension* is a qualitative value, like region, product name, and model number. Dimensions are handy for grouping and filtering your data. Unlike measures, you can't perform math on dimensions.

Explorer

Explorer is the interface where you explore datasets and lenses.

Extended metadata (XMD)

Extended metadata (XMD) allows you to customize the formatting of many dashboard elements in Wave Analytics.

External data

External data is data that resides outside of Salesforce, such as data from outside applications and spreadsheets.

External Data API

Use *External Data API* to upload external data files to Wave Analytics to create datasets.

Lens

A *lens* is a particular view into a dataset's data. It's where you do exploratory analysis and visualization.

Measure

A *measure* is a quantitative value, like revenue and exchange rate. You can do math on measures, such as calculating the total revenue and minimum exchange rate.

Metadata file

A *metadata file* is a JSON file that describes the structure of an external data file.

Predicate

A *predicate* is a filter condition that defines row-level access to records in a dataset.

Salesforce Analytics Query Language (SAQL)

Use *SAQL* to access and analyze data in Wave Analytics datasets.

Transformation

A *transformation* refers to the manipulation of data. You can add transformations to a dataflow to extract data from Salesforce objects or datasets, transform datasets that contain Salesforce or external data, and register datasets.

Visualization

A *visualization* is commonly a chart or graph, such as a bar chart, donut chart, timeline, or heat map. It can also be data in tabular form, such as a comparison table or pivot table. Every visualization has an underlying query, which is how Wave Analytics retrieves information from the source data.

Set Up Wave Analytics

Wave Analytics Setup Guide

Licenses for Wave Analytics

Before using Wave Analytics, you need provisioned licenses for Wave Analytics. You need at least one Analytics Cloud Wave Platform license to enable Wave Analytics and one Analytics Cloud Builder permission set license to enable a user to perform all tasks in Wave Analytics.

The Analytics Cloud Wave Platform License

The Analytics Cloud Wave Platform license enables you to turn on Wave Analytics for your organization. Each Wave Platform license is contractually limited to a maximum of 400 users. If you need more than 400 users, you can purchase additional Wave Platform licenses.

Each Wave Platform license enables you to:

- Store up to 250,000,000 rows in your final registered datasets.
- Run up to 50 concurrent queries in Wave Analytics.

The Analytics Cloud Permission Set Licenses

Each user needs an Analytics Cloud permission set license to use the product. The permission set license defines what user permissions can be assigned to the user. The administrator assigns permission set licenses to users.

Salesforce provides the following permission set licenses for Wave Analytics.

- Analytics Cloud Builder permission set license enables users to access all Wave Analytics features.
- Analytics Cloud Explorer permission set license enables users to upload external data to Wave Analytics and explore data.

The following table lists the Wave Analytics user permissions that are included with each permission set license:

User Permission	Analytics Cloud Explorer Permission Set License	Analytics Cloud Builder Permission Set License
"Create and Edit Wave Analytics Dashboards"		✓
"Create Wave Analytics Apps"		✓
"Edit Wave Analytics Dataflows"		✓
"Manage Wave Analytics"		✓
"Upload External Data to Wave Analytics"	✓	✓
"Use Wave Analytics"	✓	✓

You can assign a Wave Analytics permission set license on top of any of the following user licenses.

- Force.com (app subscription)
- Force.com (one app)
- Full CRM
- Salesforce Platform
- Salesforce Platform One

User Permissions for Wave Analytics

You can assign Wave Analytics user permissions to specify what tasks users can perform and what features they can access. You can assign only user permissions that are included in the permission set license that's assigned to the user's profile.

The following table describes all Wave Analytics user permissions:

User Permission	What It Enables
"Use Wave Analytics"	Using Wave Analytics, and viewing the datasets, lenses, and dashboards that the user has permission to view.
"Create and Edit Wave Analytics Dashboards"	Creating and editing Wave Analytics dashboards. Requires the "Use Wave Analytics" user permission.
"Create Wave Analytics Apps"	Creating and sharing Wave Analytics applications. Requires the "Use Wave Analytics" user permission.
"Upload External Data to Wave Analytics"	Uploading external data to Wave Analytics to create a dataset. Viewing dataflow and system jobs in the data monitor. Requires the "Use Wave Analytics" user permission.
"Edit Wave Analytics Dataflows"	Downloading, uploading, starting, stopping, and rescheduling the dataflow. Viewing dataflow and system jobs in the data monitor. Requires the "Use Wave Analytics" user permission.
"Manage Wave Analytics"	Accessing all Wave Analytics features. Requires the "Use Wave Analytics" user permission.

"Use Wave Analytics Templated Apps"	Using Wave Analytics templated apps (pilot) and viewing the datasets, lenses, and dashboards that the user has permission to view..
"Access Sales Cloud Analytics Templates and Apps"	Using the Sales Wave Analytics app (pilot) and viewing the datasets, lenses, and dashboards that the user has permission to view.
"Manage Wave Analytics Templated Apps"	Accessing all Wave Analytics templated apps (pilot) features, including creating and sharing apps.

Wave Analytics Setup

To set up Wave Analytics, enable it, and then assign user permissions to users.

You assign a permission set license to each user to identify which Wave Analytics user permissions can be assigned to the user. If a user permission isn't included in the permission set license that's assigned to a user, you can't assign that user permission to the user.

Each permission set license can be assigned to only one user. Also, the user license that's associated with the user profile must support the Wave Analytics permission set license that you assign to the user. Not all user licenses support Wave Analytics permission set licenses.

Create permission sets to group related user permissions. When you select the user license option for a new permission set leave the default value `--None--` in the User License drop-down menu.

Warning: If you select anything other than `--None--` from the drop-down menu, some users in your organization will not be able to access Wave Analytics.

Next, assign the permission set to users, which lets you assign multiple user permissions to users quickly. For example, you can group user permissions in two groups, one for loading data and another for using dashboards. Each Wave Analytics permission set can include user permissions from one Wave Analytics permission set license.

After you create the Wave Analytics permission sets, assign them to users. Although you can assign a permission set to an individual user, for efficiency, assign them to groups of users. You can assign multiple permission sets to a user.

Note: If you disable Wave Analytics, user permissions are removed from each defined permission set. If you enable Wave Analytics later, you must define the permission sets again.

1. Enable Wave Analytics.
 - a. From Setup, enter *Wave Analytics* in the **Quick Find** box, then select **Settings**.
 - b. Select **Enable Wave Analytics**.
 - c. Click **Save**.
2. Assign a permission set license to each Wave Analytics user.
3. Create permission sets based on Wave Analytics user permissions. Then assign those permission sets to Wave Analytics users based on the tasks that they need to perform.

[Walk Through It: create, edit, and assign a permission set](#)

EDITIONS

Available in: **Salesforce Classic and Lightning Experience**

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

- Optionally, enable the setting that shows thumbnail previews of lenses and dashboards on the home page.

SEE ALSO:

- [Licenses for Wave Analytics](#)
- [User Permissions for Wave Analytics](#)
- [Assign a Permission Set License to a User](#)
- [Enable Preview Thumbnails for All Lenses and Dashboards](#)

Enable Preview Thumbnails for All Lenses and Dashboards

Make it easier for users to find their lenses and dashboards on the home page and on app pages. Replace the generic icons with preview thumbnails of the contents of all lenses and dashboards, including those that have row-level security restrictions.

 **Important:** Even if row-level security applies to the dataset used by a lens or dashboard, the preview thumbnail could expose data from restricted rows. Row-level security restrictions take effect only after users have clicked through to the lens or dashboard.

- From Setup, enter *Wave Analytics* in the Quick Find box, then select **Settings**.
- Select `Show preview thumbnails for lenses and dashboards with row level-security enabled`.
- Click **Save**.

Enable Wave Analytics for Communities

Securely share Wave Analytics apps with customers and partners. With Wave Analytics for Communities, portal users can view apps that have been shared with them, via Wave Analytics dashboards embedded in Visualforce pages on the Community website.

 **Note:** Community users can view embedded Wave dashboards when their org has the Wave Community permission and the Wave Community preference enabled. Access to apps is then given by selecting Share from a Wave app or dashboard.

- From Setup, enter *Wave Analytics* in the Quick Find box, then select **Settings**.
- Select `Enable Wave Analytics for Communities`.
- Click **Save**.

Connected App for Wave Analytics for iOS

Install the Analytics for iOS Connected App to allow your mobile clients to easily connect to your org. The Connected App gives you control over who's logging in and how your mobile clients share images and links.

1. While logged in as an admin, navigate to <https://login.salesforce.com/packaging/installPackage.apexp?p0=04tB0000000DKTA>.
2. Select **Install for All Users**.
If you install the Connected App only for certain roles, then only those clients are subject to your policies.
3. After clicking **Done**, open the Salesforce Insights for iOS package.
4. To configure policies and other settings, click **Edit**. When you are finished, save your changes. For more information about Connected App settings, see [Edit a Connected App](#).
5. If you want to disable sharing options for mobile users, click **New** in the Custom Attributes section.

All sharing options are enabled by default. To disable an option, add its attribute key and enter "false" for the attribute value. See the table for the supported attribute keys.

Attribute Key	Mobile clients can share
SHARE_IMAGE_AIRDROP	Images via AirDrop
SHARE_IMAGE_CAMERAROLL	Images from Camera Roll
SHARE_IMAGE_OPEN	The image that's currently open on the mobile device
SHARE_IMAGE_S1	Images in Salesforce1
SHARE_IMAGE_EMAIL	Images via email
SHARE_LINK_AIRDROP	Links via AirDrop
SHARE_LINK_CLIPBOARD	The link that's currently in the clipboard of the mobile device
SHARE_LINK_S1	Links in Salesforce1
SHARE_LINK_EMAIL	Links via email

 **Note:** To apply custom attributes to connected users, you can revoke them and ask them to reconnect.

6. To view and control how mobile clients connect to your Wave-enabled org, from Setup, enter *Connected Apps* in the *Quick Find* box, then select **Connect Apps OAuth Usage**.
You can block user sessions, revoke individual users, and drill in to user details. For more information, see [Monitoring Usage for a Connected App](#).

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To install and configure Connected App:

- "Manage Wave Analytics"

Wave Analytics Security Implementation Guide

Wave Analytics has different levels of security that your organization can implement to ensure that the right user has access to the right data.

- The administrator can implement object-level and field-level security to control access to Salesforce data. For example, the administrator can restrict access to prevent the dataflow from loading sensitive Salesforce data into datasets. This document describes how Wave Analytics uses object-level and field-level security on Salesforce data and how to configure permissions on Salesforce objects and fields.
 - Dataset owners can implement row-level security on each dataset that they create to restrict access to its records. If a dataset does not have row-level security, users who have access to the dataset can view all records. This document describes how to configure row-level security on datasets and provides some sample implementations based on datasets created from Salesforce data and external data.
 - App owners, administrators, and users granted manager access to an app control access to datasets, lenses, and dashboards within apps. This document describes the different levels of access for apps and how to share datasets, lenses, dashboards in an app with other users.
-  **Note:** Wave Analytics doesn't synchronize with sharing that's configured in Salesforce. Instead, you configure security separately in Wave Analytics. Wave Analytics provides a robust row-level security feature that enables you to model many different types of access controls on datasets.

For complete information about implementing Wave Analytics security, see [Wave Analytics Security Implementation Guide](#).

Salesforce Data Access

Wave Analytics requires access to Salesforce data when extracting the data and also when the data is used as part of row-level security. Wave Analytics gains access to Salesforce data based on permissions of two internal Wave Analytics users: Integration User and Security User.

Wave Analytics uses the permissions of the Integration User to extract data from Salesforce objects and fields when a dataflow job runs. Because the Integration User has View All Data access, you might choose to restrict access to particular objects and fields that contain sensitive data. If the dataflow is configured to extract data from an object or field on which the Integration User does not have permission, the dataflow job fails.

Wave Analytics uses the permissions of the Security User to access the User object and its fields when a user queries a dataset that has row-level security based on the User object. The Security User must have at least read permission on each User object field included in a predicate. A predicate is a filter condition that defines row-level security for a dataset. By default, the Security User has read permission on all standard fields of the User object. If the predicate is based on a custom field, then you must grant the Security User read access

on the field. If the Security User does not have read access on all User object fields included in a predicate expression, an error appears when a user tries to query the dataset on which the predicate is applied.

SEE ALSO:

[Control Access to Salesforce Objects and Fields](#)

[Platform Encryption Considerations](#)

Control Access to Salesforce Objects and Fields

Wave Analytics requires access to Salesforce data when extracting the data and also when the data is used as part of row-level security. Configure the permissions of the Integration User on Salesforce objects and fields to control the dataflow's access to Salesforce data. Configure the permissions of the Security User to enable row-level security based on custom fields of the User object.

When configuring permissions for the Integration User or Security User, make changes to a cloned version of the user profile.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**, and then select the user profile.
For the Integration User, select the Analytics Cloud Integration User profile. For the Security User, select the Analytics Cloud Security User profile.
2. Click **Clone** to clone the user profile.
3. Name and save the cloned user profile.
4. Click **Object Settings**.
5. Click the name of the Salesforce object.
6. Click **Edit**.
 - a. To enable permission on the object, select **Read** in the Object Permissions section.
 - b. To enable permission on a field of the object, select **Read** for the field in the Field Permissions section.

 **Note:** You can't change the permissions on standard fields of the User object.
7. Save the object settings.
8. Assign the cloned user profile to the Integration User or Security User.
 - a. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
 - b. Select the user to which you want to assign the user profile.
 - c. Click **Edit**.
 - d. In the Profile field, select the user profile.
 - e. Click **Save**.
9. Verify that the Integration User or Security User has the right permissions on fields of the objects.

USER PERMISSIONS

To clone a user profile:

- "Manage Profiles and Permission Sets"

To edit object permissions:

- "Manage Profiles and Permission Sets"
- AND
- "Customize Application"

Wave Analytics Limits

This section describes Wave Analytics limits.

The following limits apply to all supported editions. Contact salesforce.com to extend the limits.

API Call Limits

Limit	Value
Maximum concurrent Wave Analytics API calls per organization	100
Maximum Wave Analytics API calls per user per hour	5,000

Data Storage Limits

Limit	Value
Maximum number of rows in all datasets	250 million per platform license, excluding rows in datasets that aren't registered. This is not representative of the maximum size of a given dataset.
Maximum number of fields in a dataset	5,000 (including up to 1,000 date fields)
Maximum value for each numeric field in a dataset	36,028,797,018,963,967
Minimum value for each numeric field in a dataset	-36,028,797,018,963,968

Dataflow Limits

Limit	Value
Maximum number of dataflow runs in a rolling 24-hour period	24

External Data Limits

Limit	Value
Maximum file size per external data upload	If you use the External Data API: 40 GB. If you use the user interface: 512 MB.
Maximum file size for all external data uploads in a rolling 24-hour period	50 GB
Maximum number of external data files that can be uploaded in a rolling 24-hour period	50
Maximum number of characters in a field	32,000
Maximum number of fields in a record	5,000 (including up to 1,000 date fields)
Maximum number of characters for all fields in a record	400,000

Query Limits

Limit	Value
Maximum concurrent queries per organization	50 per platform license
Maximum concurrent queries per user	10
Maximum number of rows returned per query 10,000 is the default value. To set a different value, use the SAQL <code>limit</code> statement.	10,000
Query timeout	2 minutes

The following limits apply to the Wave-enabled Developer Edition.

Developer Edition Limits

Limit	Value
Maximum number of data rows	250,000
Maximum concurrent queries	5

Wave Analytics Limitations

Wave Analytics differs from other Salesforce features in some ways.

Releases Aren't Staggered

All customers receive Wave Analytics updates on the same schedule, regardless of instance. Related core updates happen by instance on a staggered schedule.

Localization

Wave Analytics has been localized with the following exceptions.

- We do not support right-to-left languages, such as Arabic and Hebrew.
- A subset of error messages may only be available in English.
- The mobile iOS app includes only English versions of sample datasets and dashboards.

Limited Internationalization Support

Wave Analytics provides internationalization support with the following limitations.

- You must set both locale and language to see translated labels.
- Data within datasets is not localized.
- Sorting data within datasets may not work as expected.
- Each dataset may have a single locale specified in the metadata. Everyone viewing that dataset will see the the same date, time, and number formats, as well as dimension names, regardless of their own locale and language settings.

- Search in filters is both case-sensitive and accent-sensitive. For example, using the filter “Andre” does not return “André” in the results.
- Multicurrency is not supported. When Wave Analytics extracts your organization’s default currency, it uses the currency for monetary values and doesn’t convert to another currency.

Accessibility Features Aren’t Supported

Accessibility features haven’t been incorporated into Wave Analytics.

Packaging and Metadata API Are Not Supported

The use of the Metadata API isn’t supported for Wave Analytics. You can’t package or version Wave Analytics applications. Migrating Wave Analytics data, objects, and applications from sandbox to production orgs requires manual effort. The Default Org Template (DOT) isn’t supported for org duplication.

Limited Field-Level Security

Field-Level security isn’t available for external data that’s uploaded via files. Field-level security that was implemented in the original database or Salesforce object isn’t preserved when the data is loaded into a Wave Analytics dataset. For more information, see the [Wave Analytics Security Implementation Guide](#).

Sales Wave App Support for Salesforce Objects and Fields

Sales Wave supports all Salesforce objects and data. However, when you first create the app by default it includes only a predefined set of objects and fields.

Sales Wave initially provides the following standard Salesforce objects:

- Accounts
- Users
- Roles
- Opportunities
- Products (Opportunities line item)
- Tasks
- Events

Sales Wave supports standard and custom fields on standard Salesforce objects. The fields provided are determined by the answers you provide when you create the app using the built-in [configuration wizard](#).

To add custom objects or additional fields not included when you first create the app, you need to update the Sales Wave dataflow. For details see [Create Datasets with a Dataflow](#).

Sales Wave App Support for Non-Salesforce Data

Sales Wave does not support external data sources [except a CSV file](#) that contains quota data at the user level. Importing other external data requires an additional license. See your Salesforce representative for details.

Note: To include data about quotas in Sales Wave, you need to upload a CSV file with the details. For more information, see [Update the Sales Wave App Quota \(Target\) Dataset](#).

Actions Menu Support for Objects and Actions

The current actions menu implementation provides limited support for Salesforce objects and actions.

You can currently create Wave quick actions menus for the following Salesforce objects:

- Account
- Cases
- Lead
- Opportunity

Actions on Contacts, User, or User Profile page layouts are not supported.

The current implementation of action menus supports [object-specific actions](#) and [global actions](#). It does not support Chatter actions (Post, Thanks, Poll) or Salesforce1 actions.

Other objects and actions will be supported in future releases.

SEE ALSO:

[Platform Encryption Considerations](#)

Update the Sales Wave App Quota (Target) Dataset

If you answer “yes” to the configuration wizard question about whether your business tracks quotas at the user level, to include quota information in dashboards, you need to update the Sales Wave Quota dataset to have it reflected in the app’s dashboards.

When you create the Sales Wave app, a Quota (Target) dataset is created along with the app. To explore how team members are tracking to their monthly, quarterly, or annual quotas in Sales Wave, you need to update the Quota dataset by completing the following steps. You can also watch the

video  [Create the Sales Wave App, Part 2: Upload the Quota CSV File and Schedule a Dataflow](#), which covers the steps described here.

 **Note:** When you work with .CSV files you want to import to Sales Wave, open them in a text editor. Opening them in Microsoft Excel or other spreadsheet software typically reformats .CSV files and makes them unusable in Sales Wave

 **Note:** If your business doesn’t track quotas at the user level, you can skip this step. You only need to complete this if you answer “yes” to the [configuration wizard](#) question about whether your business tracks quotas at the user level.

1. Create a .CSV file to include the following fields, in this order: QuotaAmount, StartDate (in yyyy-mm-dd format), OwnerName, and Username. For an example, see [Sales Wave App Example .CSV File](#).
2. Save the file to a location that you can easily remember.
3. In Salesforce, go to the Wave Analytics home page and find the Quota (Target) dataset.
4. Hover over the dataset, then click **Edit**.
5. Salesforce displays the Update Data section. Select **Select file or drag file here...**
6. Click **Update Dataset**.
7. Navigate to the .CSV file you created in Step 1, and double-click it.

USER PERMISSIONS

To create and manage Wave apps:

- “Manage Wave Analytics Templated Apps”
- “Edit Wave Analytics Dataflows”

Sales Wave App Example .CSV File

Here's an example of the .CSV file you create to update the Sales Wave app Quota (Target) dataset.

 **Note:** This file is for example purposes only. You need to create a unique .CSV file based on your own Sales Cloud data including the following fields:

- QuotaAmount
- StartDate
- OwnerName
- Username

See [Update the Sales Wave App Quota \(Target\) Dataset](#) on page 3374.

 **Example:**

```
QuotaAmount,StartDate,OwnerName,Username

Integrate Your Salesforce Data and External Data

Data Integration Guide

Data Integration

You can integrate Salesforce data and external data into Wave Analytics to enable users to explore and visualize the data with explorer and designer. *External data* is data that resides outside of Salesforce, such as data from outside applications and spreadsheets.

When you load data into Wave Analytics, you load it into datasets. A dataset is a collection of related data that is stored in a denormalized, yet highly compressed form.

You can use the following methods to create datasets in Wave Analytics.

	Dataflow JSON	Dataset Builder	Upload User Interface	External Data API	Wave Connector
Data source	Salesforce objects; existing datasets	Salesforce objects	External data	External data	Microsoft Excel
Can join external and Salesforce data?	Yes	No	No	No	No
Graphical user interface?	No (JSON)	Yes	Yes	No (programmatic access)	Yes
Can create multiple datasets at once?	Yes	No	No	No	No
Supports incremental extraction?	Yes	No	No	Yes	No
Data refresh method	Automatic	Automatic	Manual	Manual	Manual
Can filter records?	Yes	No	No	No	No
Can generate new columns when creating datasets?	Yes (delta and dimension columns)	No	No	No	No
Can override metadata?	Yes	No	Yes	Yes	No

IN THIS SECTION:

[Datasets](#)

A dataset is a collection of related data that is stored in a denormalized, yet highly compressed form. For each platform license, your organization can have a maximum of 250 million rows of data stored for all registered datasets combined.

Dataflow JSON

You can use the dataflow to create one or more datasets based on data from Salesforce objects or existing datasets. A *dataflow* is a set of instructions that specifies what data to extract from Salesforce objects or datasets, how to transform the datasets, and which datasets to make available for querying. With a dataflow, you can manipulate the extracted data and override the metadata before you load it into a dataset. The dataflow runs on a daily schedule to continually refresh the data.

Dataset Builder

Use the dataset builder to create a single dataset based on data from one or more related Salesforce objects. With the dataset builder you simply point and click to identify and select related Salesforce objects.

Wave Connector for Excel Data

The Salesforce Wave Connector makes it easy to import data from Microsoft Excel 2013 to Wave Analytics.

Upload User Interface for External Data

You can use the upload user interface to create a single dataset based on external data. You can upload an external data file in a .csv, .gz, or .zip format. To refresh the data, you can overwrite the data in the dataset by uploading a new external data file.

External Data API

You can use the External Data API to create a single dataset based on external data in the .csv format. You can also use the API to edit the dataset by uploading a new .csv file. When you edit the dataset, you can choose to overwrite all records, append records, update records, or delete records.

Datasets

A dataset is a collection of related data that is stored in a denormalized, yet highly compressed form. For each platform license, your organization can have a maximum of 250 million rows of data stored for all registered datasets combined.

Wave Analytics applies one of the following types to each dataset field:

Date

A *date* can be represented as a day, month, year, and, optionally, time. You can group, filter, and perform math on dates.

Dimension

A *dimension* is a qualitative value, like region, product name, and model number. Dimensions are handy for grouping and filtering your data. Unlike measures, you can't perform math on dimensions. To increase query performance, Wave Analytics indexes all dimension fields in datasets.

Measure

A *measure* is a quantitative value, like revenue and exchange rate. You can do math on measures, such as calculating the total revenue and minimum exchange rate.

For each dataset that you create, you can apply row-level security to restrict access to records in the dataset.

Attention: Before you create a dataset, verify that the source data contains at least one value in each column. Columns with all null values won't be created in datasets and can't be referenced in dataflows, lenses, or dashboards. Consider providing a default value for null values, like "n/a" or "empty."

IN THIS SECTION:

Numeric-Value Handling in Datasets

Wave Analytics internally stores numeric values in datasets as long values. For example, it stores the number "3,200.99" with a scale of "2" as "320099". The user interface converts the stored value back to decimal notation to display the number as "3200.99."

Date Handling in Datasets

When Wave Analytics loads dates into a dataset, it breaks up each date into multiple fields, such as day, week, month, quarter, and year, based on the calendar year. For example, if you extract dates from a `CreateDate` field, Wave Analytics generates date fields such as `CreateDate_Day` and `CreateDate_Week`. If your fiscal year differs from the calendar year, you can enable Wave Analytics to generate fiscal date fields as well.

Numeric-Value Handling in Datasets

Wave Analytics internally stores numeric values in datasets as long values. For example, it stores the number “3,200.99” with a scale of “2” as “320099”. The user interface converts the stored value back to decimal notation to display the number as “3200.99.”

The maximum numeric value that can be stored in a dataset is 36,028,797,018,963,967 and the minimum numeric value is -36,028,797,018,963,968.

Warning: If a numeric value is not within this range, you might receive unexpected results. For example, if you try to load the value 3.7E-16 with a scale of 16 into a dataset, Wave Analytics tries to store the value as 3700000000000000. However, because this value exceeds the maximum, Wave Analytics fails to load the entire record. In addition, if you perform a query that aggregates measures—like sum or group by—and the resulting value exceeds the maximum, the value overflows and Wave Analytics returns an incorrect result.

Date Handling in Datasets

When Wave Analytics loads dates into a dataset, it breaks up each date into multiple fields, such as day, week, month, quarter, and year, based on the calendar year. For example, if you extract dates from a `CreateDate` field, Wave Analytics generates date fields such as `CreateDate_Day` and `CreateDate_Week`. If your fiscal year differs from the calendar year, you can enable Wave Analytics to generate fiscal date fields as well.

Wave Analytics generates the following date fields.

Field Name	Field Type	Description
<date field name>_Second	Text	Number of seconds. If the date contains no seconds, value is '0.'
<date field name>_Minute	Text	Number of minutes. If the date contains no minutes, value is '0.'
<date field name>_Hour	Text	Number of hours. If the date contains no hours, value is '0.'
<date field name>_Day	Text	Day of the month.
<date field name>_Week	Text	Week number in calendar year.
<date field name>_Month	Text	Month number in calendar year.
<date field name>_Quarter	Text	Quarter number in calendar year.
<date field name>_Year	Text	Calendar year.
<date field name>_Week_Fiscal	Text	Week number in fiscal year.
<date field name>_Month_Fiscal	Text	Month number in fiscal year.
<date field name>_Quarter_Fiscal	Text	Quarter number in fiscal year.

Field Name	Field Type	Description
<date field name>_Year_Fiscal	Text	Fiscal year.
<date field name>_sec_epoch	Numeric	Number of seconds that have elapsed since January 1, 1970 (midnight UTC/GMT).
<date field name>_day_epoch	Numeric	Number of days that have elapsed since January 1, 1970 (midnight UTC/GMT).

You can set metadata attributes to control how dates are loaded into datasets and to enable Wave Analytics to generate fiscal date fields. You set the metadata attributes in the [sfcdigest transformation parameters](#) for Salesforce data or in the [metadata file](#) for external data.

 **Note:** Before loading dates from an external data file, ensure that you review the date format requirements [here](#). Also, ensure that the column names in the external data file do not conflict with the generated date field names. For example, if you load a CSV with column `Create_Date`, Wave Analytics generates the `Create_Date_Year` field in the dataset. If the CSV also had a field named `Create_Date_Year`, Wave Analytics would throw an error because the names conflict.

Fiscal Periods in Wave Analytics

If the calendar and fiscal year differ, you can enable Wave Analytics to generate the fiscal date fields in the dataset in addition to calendar date fields. To enable Wave Analytics to generate fiscal date fields, set the `fiscalMonthOffset` attribute to a value other than '0'. You set this attribute for each date column for which you want to generate fiscal date fields. If you set the offset to '0' or you do not specify a value, Wave Analytics does not generate any fiscal date fields.

Additionally, to configure the fiscal periods, set the following metadata attributes for each date column:

fiscalMonthOffset

In addition to enabling the generation of fiscal date fields, this attribute also determines the first month of the fiscal year. You specify the difference between the first month of the fiscal year and first month of the calendar year (January) in `fiscalMonthOffset`. For example, if your fiscal year begins in April, set `fiscalMonthOffset` to '3'.

isYearEndFiscalYear

Because the fiscal year can start in one calendar year and end in another, you must specify which year to use for the fiscal year. The `isYearEndFiscalYear` attribute indicates whether the fiscal year is the year in which the fiscal year ends or begins.

To see how this works, let's look at a couple of examples. If `isYearEndFiscalYear` = true (or you do not specify this attribute), then the fiscal year is the year in which the fiscal year ends. As shown in the following diagram, any dates between 4/1/2015 and 3/31/2016 are part of the fiscal year 2016 because the fiscal year ends in 2016.

If `isYearEndFiscalYear` = false, then the fiscal year is the year in which the fiscal year begins. As shown in the following diagram, any dates between 4/1/2015 and 3/31/2016 are part of the fiscal year 2015 because the fiscal year begins in 2015.

Week Numbering in Wave Analytics

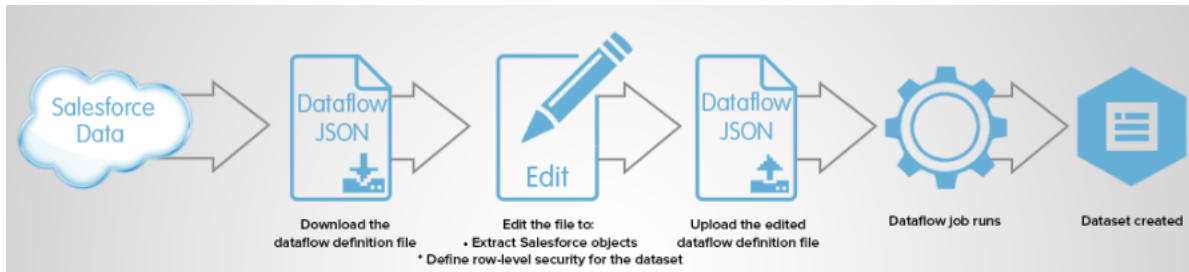

For each date loaded into a dataset, Wave Analytics generates the corresponding week number for the calendar year and, if applicable, fiscal year. Similar to the SOQL function `WEEK_IN_YEAR`, week 1 in Wave Analytics is January 1 - January 7. (This is different from the UTC `week()` calculation.)

If needed, you can configure the week to start on a particular day of the week by setting the `firstDayOfWeek` attribute. For example, if January 1 is a Saturday and you configure the week to start on a Monday, then week 1 is January 1 - 2. Week 2 starts on Monday, January 3. Week 3 starts January 10, the following Monday. Notice that week 1 can be a short week to ensure that the subsequent weeks start on the specified day of the week.

Dataflow JSON

You can use the dataflow to create one or more datasets based on data from Salesforce objects or existing datasets. A *dataflow* is a set of instructions that specifies what data to extract from Salesforce objects or datasets, how to transform the datasets, and which datasets to make available for querying. With a dataflow, you can manipulate the extracted data and override the metadata before you load it into a dataset. The dataflow runs on a daily schedule to continually refresh the data.

Wave Analytics provides a default dataflow that contains some sample transformation logic. This dataflow is just a sample that you must configure before running it.

To configure the dataflow, you add transformations to the dataflow definition file. A *dataflow definition file* is a JSON file that contains transformations that represent the dataflow logic. You can add transformations to determine what data to extract, how to transform datasets, and which datasets to register to make available for queries.

After you configure the dataflow, you upload the new dataflow definition file to Wave Analytics.

By default, the dataflow doesn't run automatically. To start running the dataflow on the schedule, you must manually start the dataflow first. After the first job runs, the dataflow job runs on the daily schedule. The dataflow runs on a daily schedule to capture the latest changes to Salesforce data and changes in the dataflow logic.

You can also stop, reschedule, and monitor dataflow jobs.

SEE ALSO:

[Create Datasets with a Dataflow](#)

Dataset Builder

Use the dataset builder to create a single dataset based on data from one or more related Salesforce objects. With the dataset builder you simply point and click to identify and select related Salesforce objects.

After you select the data to include in the dataset, the dataset builder generates and appends the associated JSON to the dataflow definition file. The dataset is created the next time the dataflow runs. The data in the dataset refreshes each time the dataflow runs.

SEE ALSO:

[Create a Dataset with the Dataset Builder](#)

Wave Connector for Excel Data

The Salesforce Wave Connector makes it easy to import data from Microsoft Excel 2013 to Wave Analytics.

The Wave Connector is available as an app for Excel 2013 on the desktop and Excel Online in Office 365. The Connector is available as an app from the Microsoft Apps for Office store or your organization's private app catalog. After you install the Connector just point and click to import data from Excel to Salesforce.

SEE ALSO:

[Install the Wave Connector Excel App](#)

Upload User Interface for External Data

You can use the upload user interface to create a single dataset based on external data. You can upload an external data file in a .csv, .gz, or .zip format. To refresh the data, you can overwrite the data in the dataset by uploading a new external data file.

When Wave Analytics loads any data into a dataset, it also adds metadata about each column of data. For example, metadata can include the field type, precision, scale, and default value.

For external data, Wave Analytics infers metadata about each column of data in the external data file unless specify different metadata attributes in a metadata file. A *metadata file* is a JSON file that describes the structure of an external data file. For example, you can use a metadata file to explicitly set the field type and default value for a specific column of external data. If no metadata file is provided when you upload external data, Wave Analytics treats every column as a dimension and sets the field type to 'Text.' This impacts the type of queries that can be placed on the dataset because you can't perform mathematical calculations on dataset columns with a Text field type. You can only perform mathematical calculations on dataset columns with a Numeric field type.

After you create a dataset based on an external data file, you can edit the dataset to apply a new metadata file. This enables you to change the metadata attributes of each column.

SEE ALSO:

[Create a Dataset with External Data](#)

External Data API

You can use the External Data API to create a single dataset based on external data in the .csv format. You can also use the API to edit the dataset by uploading a new .csv file. When you edit the dataset, you can choose to overwrite all records, append records, update records, or delete records.

For more information about the External Data API, see the [Analytics Cloud External Data API Developer's Guide](#).

Create Datasets with a Dataflow

You can use a dataflow to create one or more datasets based on data from Salesforce objects or existing datasets.

IN THIS SECTION:

1. [Design the Dataflow](#)

Before you start creating the dataflow definition file in the .json format, think about the dataflow design. Consider what data to make available for queries, where to extract the data from, and whether you need to transform the extracted data to get the data you want.

2. [Configure the Dataflow](#)

Configure the dataflow based on your dataflow design. You can configure the dataflow to extract data, transform datasets based on your business requirements, and register datasets that you want to make available for queries. To configure the dataflow, add transformations to the dataflow definition file.

3. [Start the Dataflow](#)

You can manually start a dataflow job to load the data into datasets immediately. You can also stop the job while it's running. You can run a maximum of 24 dataflow jobs during a rolling 24-hour period.

4. [Monitor a Dataflow Job](#)

Use the data monitor to monitor dataflow jobs to ensure that they complete successfully or to troubleshoot them if they fail.

5. [Reschedule the Dataflow](#)

The dataflow job runs on a daily schedule. You can change the time that the dataflow job runs. You might change the time to ensure that the data is available by a particular time or to run the job during non-business hours.

Design the Dataflow

Before you start creating the dataflow definition file in the .json format, think about the dataflow design. Consider what data to make available for queries, where to extract the data from, and whether you need to transform the extracted data to get the data you want.

To illustrate some key design decisions, let's consider an example. In this example, the goal is to create a dataset called "Won Opportunities." The dataset will contain opportunity details, including the account name for each opportunity.

To create this dataset, you design the following dataflow:

The dataflow extracts opportunity data from the Opportunity object and extracts the account name from the Account object. For each extracted object, the dataflow creates a new dataset.

The dataflow then transforms the datasets created from the extracted data. First, the dataflow joins the opportunity and account data into a new dataset. Next, the dataflow filters the records based on the opportunity stage so that the dataset contains only won opportunities. Each time the dataflow transforms a dataset, it creates a new dataset.

Finally, because you want users to be able to query won opportunities only, you configure the dataflow to register the final dataset only. However, if you wanted, you could register any dataset created by the dataflow and register as many datasets as you like.

Carefully choose which datasets to register because:

- The total number of rows in all registered datasets cannot exceed 250 million per platform license.
- Users that have access to registered datasets can query their data. Although, you can apply row-level security on a dataset to restrict access to records.

Configure the Dataflow

Configure the dataflow based on your dataflow design. You can configure the dataflow to extract data, transform datasets based on your business requirements, and register datasets that you want to make available for queries. To configure the dataflow, add transformations to the dataflow definition file.

A *dataflow definition file* is a JSON file that contains transformations that represent the dataflow logic. The dataflow definition file must be saved with UTF-8 encoding.

Before you can configure a dataflow to process external data, you must [upload the external data to Wave Analytics](#).

1. In Wave Analytics, click the gear icon (⚙️) and then click **Data Monitor** to open the data monitor.
The Jobs view of the data monitor appears by default.
2. Select **Dataflow View**.
3. To download the dataflow definition file, click **Download** in the actions list (1).

EDITIONS

Available in: Salesforce Classic and Lightning Experience

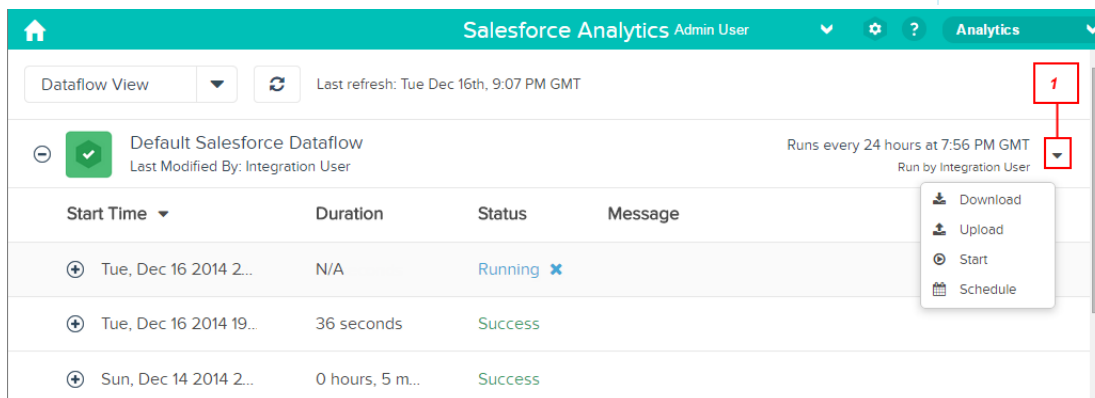

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

USER PERMISSIONS

To edit the dataflow definition file:

- "Edit Wave Analytics Dataflows"

4. Make a backup copy of the dataflow definition file before you modify it.
Wave Analytics doesn't retain previous versions of the file. If you make a mistake, you can upload the previous version to roll back your changes.

5. Add transformations to the dataflow definition file.

For example, based on the design in the [previous step](#), you can add the following transformations:

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Extract_AccountDetails": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Account",
      "fields": [
        { "name": "Id" },
        { "name": "Name" }
      ]
    }
  },
  "Transform_Augment_OpportunitiesWithAccountDetails": {
    "action": "augment",
    "parameters": {
      "left": "Extract_Opportunities",
      "left_key": [ "AccountId" ],
      "relationship": "OpptyAcct",
      "right": "Extract_AccountDetails",
      "right_key": [ "Id" ],
      "right_select": [
        "Name"
      ]
    }
  },
  "Transform_Filter_Opportunities": {
    "action": "filter",
    "parameters": {
      "filter": "StageName:EQ:Closed Won",
      "source": "Transform_Augment_OpportunitiesWithAccountDetails"
    }
  },
  "Register_Dataset_WonOpportunities": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "WonOpportunities",
      "name": "WonOpportunities",

```

```

    "source": "Transform_Filter_Opportunities"
  }
}

```

 **Note:** The JSON keys and values are case-sensitive. Each bolded key in the previous example JSON contains one action, which identifies the transformation type. The order in which you add the transformations to the dataflow definition file doesn't matter. Wave Analytics determines the order in which to process the transformations by traversing the dataflow to determine the dependencies among them.

6. Before you save the dataflow definition file, use a JSON validation tool to verify that the JSON is valid. An error occurs if you try to upload the dataflow definition file with invalid JSON. You can find JSON validation tool on the internet.
7. Save the dataflow definition file with UTF-8 encoding, and then close the file.
8. In the Dataflow view of the data monitor, click **Upload** from the action list (1) to upload the updated dataflow definition file.

 **Note:** Uploading the dataflow definition file does not affect any running dataflow jobs and does not automatically start the dataflow job.

You can now start the dataflow on demand or wait for it to run on the schedule. Users cannot query the registered datasets until the dataflow runs.

Start the Dataflow

You can manually start a dataflow job to load the data into datasets immediately. You can also stop the job while it's running. You can run a maximum of 24 dataflow jobs during a rolling 24-hour period.

 **Note:** By default, the dataflow doesn't run automatically. To start running the dataflow on the schedule, you must manually start the dataflow first. After the first job runs, the dataflow job runs on the daily schedule.

1. In Wave Analytics, click the gear icon () and then click **Data Monitor** to open the data monitor. The Jobs view of the data monitor appears by default.
2. Select **Dataflow View**.

To start a dataflow job:

- "Edit Wave Analytics Dataflows"

The screenshot shows the Salesforce Analytics interface. At the top, there's a header with 'Salesforce Analytics Admin User' and 'Analytics'. Below the header, there's a 'Dataflow View' dropdown and a refresh button. A table lists dataflow jobs with columns for Start Time, Duration, Status, and Message. A dropdown menu is open over the 'Start' button of the first job, showing options: Download, Upload, Start, and Schedule. A red box labeled '1' highlights the 'Start' button in the menu.

3. Click **Start** in the actions list (1) to start the dataflow job.
The dataflow job is added to the job queue. The **Start** button is greyed out while the dataflow job runs.
4. After the job completes, Wave Analytics sends an email notification to the user who last modified the dataflow definition file.
The email notification indicates whether the job completed successfully. It also shows job details like start time, end time, duration, and number of processed rows. If the job failed, the notification shows the reason for the failure.

You can monitor the dataflow job in the data monitor to determine when dataflow completes. After the dataflow completes successfully, refresh the Home page to view the registered datasets.

Monitor a Dataflow Job

Use the data monitor to monitor dataflow jobs to ensure that they complete successfully or to troubleshoot them if they fail.

The Dataflow view of the data monitor shows the status, start time, and duration of the last 10 dataflow jobs and retains the last 7 days of history. To help you troubleshoot a failed job, you can view error messages about the job and view the run-time details about every transformation that is processed.

EDITIONS

Available in: **Salesforce Classic and Lightning Experience**

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

USER PERMISSIONS

To access the data monitor:

- "Edit Wave Analytics Dataflows," "Upload External Data to Wave Analytics," or "Manage Wave Analytics"

1. In Wave Analytics, click the gear button (), and then click **Data Monitor** to open the data monitor. The Jobs view shows by default.
2. Select **Dataflow View** (1).
3. Click the Refresh Jobs button () to see the latest status of a job. Each job can have one of the following statuses:.

Status	Description
Running	The job is running.
Failed	The job failed.
Successful	The job completed successfully.

4. If the dataflow job fails, expand the job node (3) and review the run-time details for every transformation that was processed.
5. If there's a problem with the dataflow logic, edit the dataflow definition file, upload it, and then run the dataflow again.

Reschedule the Dataflow

The dataflow job runs on a daily schedule. You can change the time that the dataflow job runs. You might change the time to ensure that the data is available by a particular time or to run the job during non-business hours.

1. In Wave Analytics, click the gear icon (⚙️) and then click **Data Monitor** to open the data monitor.
The Jobs view shows by default.
2. Select **Dataflow View**.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

USER PERMISSIONS

To start a dataflow job:

- "Edit Wave Analytics Dataflows"

3. Click **Schedule** in the actions list (1) to reschedule the dataflow job.
The Dataflow Schedule dialog box appears.
4. Select the time that you want the dataflow to run.
5. Click **Save**.
6. Click **Done**.

Dataflow Transformation Reference

Transformations

A *transformation* refers to the manipulation of data. You can add transformations to a dataflow to extract data from Salesforce objects or datasets, transform datasets that contain Salesforce or external data, and register datasets.

For example, you can use transformations to join data from two related datasets and then register the resulting dataset to make it available for queries.

IN THIS SECTION:

[append Transformation](#)

The append transformation combines records from multiple datasets into a single dataset.

[augment Transformation](#)

The augment transformation augments an input dataset by combining columns from another related dataset. The resulting, augmented dataset enables queries across both related input datasets. For example, you can augment the Account dataset with the User dataset to enable a query to return account records and the full names of the account owners.

[delta Transformation](#)

The delta transformation calculates changes in the value of a measure column in a dataset over a period of time. The delta transformation generates an output column in the dataset to store the delta for each record. Create deltas to make it easier for business analysts to include them in queries.

[dim2mea Transformation](#)

The dim2mea transformation creates a new measure based on a dimension. The transformation adds the new measure column to the dataset. The transformation also preserves the dimension to ensure that existing lenses and dashboards don't break if they use the dimension.

[edgemart Transformation](#)

The edgemart transformation gives the dataflow access to an existing, registered dataset, which can contain Salesforce data, external data, or a combination of the two. Use this transformation to reference a dataset so that its data can be used in subsequent transformations in the dataflow. You can use this transformation and the Augment transformation together to join an existing dataset with a new dataset.

[filter Transformation](#)

The filter transformation removes records from an existing dataset. You define a filter condition that specifies which records to retain in the dataset.

[flatten Transformation](#)

The flatten transformation flattens hierarchical data. For example, you can flatten the Salesforce role hierarchy to implement row-level security on a dataset based on the role hierarchy.

[sfdcDigest Transformation](#)

The sfdcDigest transformation generates a dataset based on data that it extracts from a Salesforce object. You specify the Salesforce object and fields from which to extract data. You might choose to exclude particular fields that contain sensitive information or that aren't relevant for analysis.

[sfdcRegister Transformation](#)

The sfdcRegister transformation registers a dataset to make it available for queries. Users cannot view or run queries against unregistered datasets.

[update Transformation](#)

The update transformation updates the specified field values in an existing dataset based on data from another dataset, which we'll call the lookup dataset. The transformation looks up the new values from corresponding fields in the lookup dataset. The transformation stores the results in a new dataset.

SEE ALSO:

[Create Datasets with a Dataflow](#)

append Transformation

The append transformation combines records from multiple datasets into a single dataset.

Consider the following rules when using this transformation.

- This transformation does not remove duplicate records.
- All input datasets must have the same structure—the corresponding columns must be in the same order and have the same name and field type.

 **Example:** Let's look at an example. Each month, you create a dataset that contains the month's sales targets. Now, you want a holistic view of sales targets for all months. To do that, you create the following dataflow definition file to merge the existing datasets into a single dataset.

```
{
  "Extract_SalesTargets_2014Jan": {
    "action": "edgemart",
    "parameters": { "alias": "SalesTargets_2014Jan" }
  },
  "Extract_SalesTargets_2014Feb": {
    "action": "edgemart",
    "parameters": { "alias": "SalesTargets_2014Feb" }
  },
  "Extract_SalesTargets_2014Mar": {
    "action": "edgemart",
    "parameters": { "alias": "SalesTargets_2014Mar" }
  },
  "Append_SalesTargets_2014Quarter1": {
    "action": "append",
    "parameters": {
      "sources": [
        "Extract_SalesTargets_2014Jan",
        "Extract_SalesTargets_2014Feb",
        "Extract_SalesTargets_2014Mar"
      ]
    }
  },
  "Register_AllSalesTargets": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "AllSalesTargets",
      "name": "AllSalesTargets",
      "source": "Append_SalesTargets_2014Quarter1"
    }
  }
}
```

After you create the single dataset, you can use date filters to analyze the sales targets by month, quarter, or year.

IN THIS SECTION:

[append Parameters](#)

When you define an append transformation, you set the action attribute to `append` and specify the parameters.

append Parameters

When you define an append transformation, you set the action attribute to `append` and specify the parameters.

The following table describes the input parameters.

Parameter	Required?	Value
<code>sources</code>	True	Nodes in the dataflow definition file that identify the datasets that you want to merge.

SEE ALSO:

[append Transformation](#)

augment Transformation

The augment transformation augments an input dataset by combining columns from another related dataset. The resulting, augmented dataset enables queries across both related input datasets. For example, you can augment the Account dataset with the User dataset to enable a query to return account records and the full names of the account owners.

When you create the transformation, you identify each input dataset as the left or right dataset and specify the relationship between them. Wave Analytics combines all the columns of the left dataset with only the specified columns from the right dataset. (Keep in mind that each dataset can't have more than 5,000 columns.) Wave Analytics adds the relationship to column names from the right dataset, which is useful when the left and right datasets have columns with the same names.

For each record in the left dataset, the augment transformation performs a lookup to find a matching record in the right dataset. To match related records, the augment transformation uses a match condition. You specify the match condition based on a key from each dataset. For example:

```
"left_key": [ " Id " ], "right_key": [ " Prod_ID " ]
```

A key can be a single-column key or a composite key. For a match condition based on a composite key, the keys for both datasets must have the same number of columns, specified in the same order.

 **Tip:** To augment more than two datasets, augment two datasets at a time. For example, to augment three datasets, augment the first two datasets, and then augment the resulting dataset with the third dataset.

 **Example:** Let's look at an example of the augment transformation. In this example, you want to extract data from the Opportunity and Accounts objects, and then match the data based on the account ID field.

You create the following dataflow definition file.

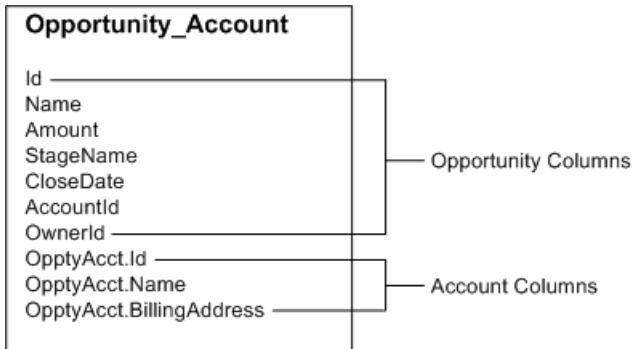

```
{
  "Extract_Opportunity": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Extract_AccountDetails": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Account",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "BillingAddress" }
      ]
    }
  },
  "Augment_OpportunitiesWithAccountDetails": {
    "action": "augment",
    "parameters": {
      "operation": "LookupSingleValue",
      "left": "Extract_Opportunity",
      "left_key": [
        "AccountId"
      ],
      "relationship": "OpptyAcct",
      "right": "Extract_AccountDetails",
      "right_key": [
        "Id"
      ],
      "right_select": [
        "Name",
        "BillingAddress"
      ]
    }
  },
  "Register_OpportunityDetails": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "Opportunity_Account",
      "name": "Opportunity_Account",
    }
  }
}
```

```

    "source": "Augment_OpportunitiesWithAccountDetails" }
  }
}

```

After you run the dataflow, Wave Analytics creates and registers the Opportunity_Account dataset. It also adds the relationship as a prefix to all columns from the right dataset.

IN THIS SECTION:

[Special Cases for Matching Records with the augment Transformation](#)

For each record in the left dataset, the augment transformation performs a lookup to find a matching record in the right dataset. However, it's critical that you understand how the augment transformation handles special cases when matching records.

[augment Parameters](#)

When you define an augment transformation, you set the action attribute to `augment` and specify the parameters.

Special Cases for Matching Records with the augment Transformation

For each record in the left dataset, the augment transformation performs a lookup to find a matching record in the right dataset. However, it's critical that you understand how the augment transformation handles special cases when matching records.

Let's look at some examples that illustrate some special cases.

Handling Null Keys

When a record in the left dataset contains a null key, Wave Analytics doesn't perform a lookup to match the record. Instead, Wave Analytics appends the right columns and inserts null for dimensions (including dates) and '0' for measures.

Let's look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price,", and match the records based on the `Id` and `ProdId` fields.

Product	
Id	Name
Prod1	Table
Prod2	Chair
null	Bench

Price		
ProdId	Pricebook	UnitPrice
Prod1	Standard	1000
Prod2	Standard	450
null	Custom	800
Prod3	Standard	700

Wave Analytics doesn't match the last record because the product ID is null. Instead, Wave Analytics inserts a null for the `Price.Pricebook` dimension and '0' for the `Price.UnitPrice` measure. Here's the resulting dataset after the augment.

```
{ "id": "Prod1", "Name": "Table", "Price.Pricebook": "Standard", "Price.UnitPrice": 1000 },
{ "id": "Prod2", "Name": "Chair", "Price.Pricebook": "Standard", "Price.UnitPrice": 450 },
{ "id": null, "Name": "Bench", "Price.Pricebook": null, "Price.UnitPrice": 0 }
```

Handling Empty Keys

Wave Analytics matches empty-value left keys and empty-value right keys.

Let's look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," and match the records based on the Id and ProdId fields.

Product		Price		
Id	Name	ProdId	Pricebook	UnitPrice
Prod1	Table	Prod1	Standard	1000
Prod2	Chair	Prod2	Standard	450
""	Bench	""	Custom	800
		null	Standard	700

Wave Analytics matches the last record in the Product dataset with the third record in the Price dataset because they both have empty values (""). Here's the resulting dataset after the augment.

```
{ "id": "Prod1", "Name": "Table", "Price.Pricebook": "Standard", "Price.UnitPrice": 1000 },
{ "id": "Prod2", "Name": "Chair", "Price.Pricebook": "Standard", "Price.UnitPrice": 450 },
{ "id": "", "Name": "Bench", "Price.Pricebook": "Custom", "Price.UnitPrice": 800 }
```

Handling Multiple Matches

If the left dataset has a one-to-many relationship with the right dataset, Wave Analytics might find multiple matches for a left record. What Wave Analytics does with multiple matches depends on the specified augment operation. You can specify one of the following operations to handle the multiple-match case:

LookupSingleValue

The augment transformation returns results from a single row. Wave Analytics randomly selects one row from the list of matched rows.

 **Note:** Each time you run the dataflow, Wave Analytics can return different results depending on the returned row.

Let's look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," set the operation to `LookupSingleValue`, and match the records based on the Id and ProdId fields.

Product		Price		
Id	Name	ProdId	Pricebook	UnitPrice
Prod1	Table	Prod1	Standard	1000
Prod2	Chair	Prod2	Standard	450
Prod3	Bench	Prod3	Custom	800
		Prod3	Standard	700

Although there are multiple rows for Prod3 in the Price dataset, Wave Analytics randomly chooses one matching row and returns values based on that row. Here's the resulting dataset after the augment if Wave Analytics chooses the first Prod3 row.

```
{ "id":"Prod1", "Name":"Table", "Price.Pricebook":"Standard", "Price.UnitPrice":1000 },
{ "id":"Prod2", "Name":"Chair", "Price.Pricebook":"Standard", "Price.UnitPrice":450 },
{ "id":"Prod3", "Name":"Bench", "Price.Pricebook":"Custom", "Price.UnitPrice":800 }
```

LookupMultiValue

Wave Analytics returns results from all matched rows.

Let's look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," set the operation to `LookupMultiValue`, and match the records based on the `Id` and `ProdId` fields.

Product		Price		
Id	Name	ProdId	Pricebook	UnitPrice
Prod1	Table	Prod1	Standard	1000
Prod2	Chair	Prod2	Standard	450
Prod3	Bench	Prod3	Custom	800
		Prod3	Standard	700

Because the lookup returns multiple rows for Prod3, the dimension `Price.Pricebook` field in the resulting dataset appears twice, once for each match. The measure field `Price.UnitPrice` contains 1500, which is the sum of 800 and 700. Here's the resulting dataset after the augment.

```
{ "id":"Prod1", "Name":"Table", "Price.Pricebook":"Standard", "Price.UnitPrice":1000 },
{ "id":"Prod2", "Name":"Chair", "Price.Pricebook":"Standard", "Price.UnitPrice":450 },
{ "id":"Prod3", "Name":"Bench", "Price.Pricebook":"Custom", "Price.Pricebook":"Standard", "Price.UnitPrice":1500 }
```

[augment Transformation](#)

augment Parameters

When you define an augment transformation, you set the action attribute to `augment` and specify the parameters.

The following table describes the input parameters.

Parameter	Required?	Value
<code>operation</code>	False	Indicates what the transformation does if it matches multiple rows in the right dataset with a row in the left. Valid values: <ul style="list-style-type: none"> <code>LookupSingleValue</code>. Returns values from one of the matched rows. If you don't specify the <code>operation</code> parameter, the transformation uses this operation.

Parameter	Required?	Value
		<ul style="list-style-type: none"> LookupMultiValue. Returns values from all matched rows. <p>For more information about each operation, see Special Cases for Matching Records with the augment Transformation.</p>
left	True	Node in the dataflow definition file that identifies the left dataset. This is one of two input sources for this transformation.
left_key	True	Key column in the left dataset used to augment the datasets. If you use a composite key, the left and right keys must have the same number of columns in the same order. For a composite key, use the following syntax: <pre>["Key Column1", "Key Column2", ..., "Key ColumnN"]</pre>
right	True	Node in the dataflow definition file that identifies the right dataset. This is one of two input sources for this transformation.
relationship	True	Relationship between the left and right datasets. The dataflow adds the relationship to the beginning of the right column names in the output dataset to make the column names unique and descriptive.
right_select	True	An array of column names from the right dataset that you want to include in the output dataset. The dataflow adds the relationship as a prefix to the column name to determine the name of the right column in the output dataset.
right_key	True	Key column in the right dataset used to augment the datasets. If you use a composite key, the left and right keys must have the same number of columns in the same order.

SEE ALSO:

[augment Transformation](#)

delta Transformation

The delta transformation calculates changes in the value of a measure column in a dataset over a period of time. The delta transformation generates an output column in the dataset to store the delta for each record. Create deltas to make it easier for business analysts to include them in queries.

The delta transformation calculates each delta value by comparing the value in each record with the value in the previous record. Because records might not be sorted, the delta transformation orders the records before computing the delta values. To do this, the transformation sorts the data by the specified dimension, and then by the specified epoch date column.

 **Note:** When Wave Analytics processes dates, it creates the following epoch date columns for each date processed:

Epoch Time Column	Description
<date_column_name>_sec_epoch	For example, if the date column is CloseDate, the generated epoch second column is CloseDate_sec_epoch. This column provides the number of seconds that have elapsed since January 1, 1970 (midnight UTC/GMT).
<date_column_name>_day_epoch	For example, if the date column is CloseDate, the generated epoch day column is CloseDate_day_epoch. This column provides the number of days that have elapsed since January 1, 1970 (midnight UTC/GMT).

 **Example:** Let's look at an example. You want to create an OppHistoryDelta dataset that contains opportunity history from the OpportunityHistory object and also calculates the deltas for opportunity amounts.

The OpportunityHistory object contains the following data.

OpportunityId	CloseDate	StageName	Amount
1	1/1/2014	New	100
2	1/1/2014	New	100
2	2/1/2014	ClosedWon	200
1	3/1/2014	ClosedWon	100

You create the following dataflow definition.

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "OpportunityHistory",
      "fields": [
        { "name": "OpportunityId" },
        { "name": "CloseDate" },
        { "name": "StageName" },
        { "name": "Amount" }
      ]
    }
  }
}
```

```

    },
    "Calculate_Delta": {
      "action": "delta",
      "parameters": {
        "dimension": "OpportunityId",
        "epoch": "CloseDate_day_epoch",
        "inputMeasure": "Amount",
        "outputMeasure": "DeltaAmount",
        "source": "Extract_Opportunities"
      }
    },
    "Register_Dataset": {
      "action": "sfdcRegister",
      "parameters": {
        "alias": "OppHistoryDelta",
        "name": "OppHistoryDelta",
        "source": "Calculate_Delta"
      }
    }
  }
}

```

To calculate the delta values for each opportunity amount, the delta transformation sorts the records by the dimension (OpportunityId) first, and then by time (CloseDate_day_epoch) as shown here.

OpportunityID	CloseDate	StageName	Amount
1	1/1/2014	New	100
1	3/1/2014	ClosedWon	100
2	1/1/2014	New	100
2	2/1/2014	ClosedWon	200

After the records are sorted, for each dimension (OpportunityId), the transformation compares the previous value to the next value to determine the delta for each record. The transformation creates the following dataset.

OpportunityId	CloseDate	StageName	Amount	DeltaAmount
1	1/1/2014	New	100	0
1	3/1/2014	ClosedWon	100	0
2	1/1/2014	New	100	0
2	2/1/2014	ClosedWon	200	100

For the first record of each dimension, the transformation inserts '0' for the delta value.

 **Note:** If an opportunity contains multiple changes on the same day, you must sort the records on a shorter time interval. In this case, sort on CloseDate_sec_epoch column. Otherwise, records might not be sorted correctly, which means delta values will be incorrect.

IN THIS SECTION:

[delta Parameters](#)

When you define a delta transformation, you set the action attribute to `delta` and specify the parameters.

delta Parameters

When you define a delta transformation, you set the action attribute to `delta` and specify the parameters.

The following table describes the input parameters:

Parameter	Required?	Value
dimension	True	Dimension column in the dataset used to sort records when calculating the delta values.
epoch	True	Epoch date column in the dataset used to sort records within each dimension when calculating delta values.
inputMeasure	True	Measure column on which you want to calculate the delta.
outputMeasure	True	Name of the output column that contains the delta value.
source	True	Node in the dataflow definition file that contains the dataset to which you want to add the delta column.

SEE ALSO:

[delta Transformation](#)

dim2mea Transformation

The `dim2mea` transformation creates a new measure based on a dimension. The transformation adds the new measure column to the dataset. The transformation also preserves the dimension to ensure that existing lenses and dashboards don't break if they use the dimension.

If the transformation cannot create a measure from a dimension, the transformation populates the measure with the specified default value. If no default value is provided, the transformation inserts '0.'

 **Example:** Let's look at an example. Your Opportunity object contains a custom text field called `StageVal__c`, which contains the opportunity amount at a particular stage. Because this is a text field, Wave Analytics loads this data as a dimension. However, you'd like to create a measure from this dimension to enable users to perform calculations on stage amount.

You create the following dataflow definition.

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
```

```

    "fields": [
      { "name": "Id" },
      { "name": "Name" },
      { "name": "Amount" },
      { "name": "StageName" },
      { "name": "CloseDate" },
      { "name": "AccountId" },
      { "name": "StageVal__c" }
    ]
  },
  "Create_Measure_From_Dimension": {
    "action": "dim2mea",
    "parameters": {
      "dimension": "StageVal__c",
      "measure": "StageValue",
      "measureDefault": "0",
      "measureType": "long",
      "source": "Extract_Opportunities"
    }
  },
  "Register_The_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "OpportunitiesWithConvertedMeasure",
      "name": "OpportunitiesWithConvertedMeasure",
      "source": "Create_Measure_From_Dimension"
    }
  }
}

```

IN THIS SECTION:

[dim2mea Parameters](#)

When you define a `dim2mea` transformation, you set the `action` attribute to `dim2mea` and specify the parameters.

dim2mea Parameters

When you define a `dim2mea` transformation, you set the `action` attribute to `dim2mea` and specify the parameters.

The following table describes the input parameters:

Parameter	Required?	Value
dimension	True	Dimension column in the dataset from which you want to create the measure.
measure	True	Name of the output measure. This column name must be unique within the dataset. Do not use the same name as the dimension because the transformation preserves the dimension in the dataset.

Parameter	Required?	Value
measureDefault	True	Default value for the measure if the transformation is unable to create a measure from a dimension.
measureType	True	Type of measure. Valid value: "long"
source	True	Node in the dataflow definition file that contains the dataset to which you want to add the measure.

SEE ALSO:

[dim2mea Transformation](#)

edgemart Transformation

The edgemart transformation gives the dataflow access to an existing, registered dataset, which can contain Salesforce data, external data, or a combination of the two. Use this transformation to reference a dataset so that its data can be used in subsequent transformations in the dataflow. You can use this transformation and the Augment transformation together to join an existing dataset with a new dataset.

Example: Let's look at an example. You would like to compare the final sales amount against the opportunity amount to determine if heavy discounts were offered to close deals. You previously created and registered the FinalSales dataset. The FinalSales dataset contains the final sale amount of each opportunity that was closed and won.

Table 40: FinalSales Dataset

OppID	UpdateDate	StageName	SaleAmount
1	1/1/2014	ClosedWon	100,000
2	11/1/2013	ClosedWon	150,000
3	2/1/2014	ClosedWon	200,000

You would now like to create a dataset that contains opportunity information from the Opportunity object. Then, you would like to join the data from the existing FinalSales dataset with the Opportunity dataset.

You create the following dataflow definition.

```
{
  "Extract_Opportunities": {
    "action": "sfcdigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" }
      ]
    }
  },
  "Extract_Final_Sales_Data": {
```

```

    "action": "edgemart",
    "parameters": { "alias": "FinalSales" }
  },
  "Combine_Opportunities_FinalSales": {
    "action": "augment",
    "parameters": {
      "left": "Extract_Opportunities",
      "left_key": [ "Id" ],
      "relationship": "Opportunity",
      "right": "Extract_Final_Sales_Data",
      "right_key": [ "OppID" ],
      "right_select": [ "SaleAmount" ]
    }
  },
  "Register_Opportunity_FinalSales_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "OpportunityVersusFinalSales",
      "name": "OpporunityVersusFinalSales",
      "source": "Combine_Opportunities_FinalSales"
    }
  }
}

```

IN THIS SECTION:

[edgemart Parameters](#)

When you define an edgemart transformation, you set the action attribute to `edgemart` and specify the parameters.

edgemart Parameters

When you define an edgemart transformation, you set the action attribute to `edgemart` and specify the parameters.

The following table describes the input parameter:

Parameter	Required?	Value
alias	True	API name of the dataset from which you want to extract data. To determine the API name of a dataset, edit the dataset and view the system name.

SEE ALSO:

[edgemart Transformation](#)

filter Transformation

The filter transformation removes records from an existing dataset. You define a filter condition that specifies which records to retain in the dataset.

Example: Let's look at an example. You would like to create a dataset that contains only opportunities that were Closed Won. First, you extract all opportunities from the Opportunity object. Next, you filter the records so that you only include opportunities with a Closed Won stage name.

You create the following dataflow definition.

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Filter_Opportunities": {
    "action": "filter",
    "parameters": {
      "filter": "StageName:EQ:Closed Won",
      "source": "Extract_Opportunities"
    }
  },
  "Register_My_Won_Opportunities_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "MyWonOpportunities",
      "name": "MyWonOpportunities",
      "source": "Filter_Opportunities"
    }
  }
}
```

IN THIS SECTION:

[filter Parameters](#)

When you define a filter transformation, you set the action attribute to `filter` and specify the parameters.

[filter Expression Syntax](#)

You create a filter expression in the filter transformation based on one or more dimensions in a dataset.

filter Parameters

When you define a filter transformation, you set the action attribute to `filter` and specify the parameters.

The following table describes the input parameters:

Parameter	Required?	Value
filter	True	Filter expression that specifies which records to include in the new dataset. See filter Expression Syntax .
source	True	Node in the dataflow definition file that contains the dataset that you want to filter.

SEE ALSO:

[filter Transformation](#)

filter Expression Syntax

You create a filter expression in the filter transformation based on one or more dimensions in a dataset.

 **Note:** String comparisons in a filter expression are case-sensitive.

You can use the following types of filter expressions:

Filter Expression Syntax	Description
dim:EQ:value	True if the dimension and value are equal. Example: <code>"filter": "StageName:EQ:Closed Won"</code>
dim:R:val0:val1	True if the left dimension falls within the specified range between val0 and val1. Example: <code>"filter": "EmployeeId:R:100:1000"</code>
dim:R:val	True if the dimension is greater than or equal to the value based on binary sort order. For example, this is true when the dimension is 'City' and the value is 'Anderson' because 'City' > 'Anderson'). Example: <code>"filter": "LastName:R:Li"</code>
dim:R::val	True if the dimension is less than or equal to the value based on binary sort order. Example: <code>"filter": "LastName:R::Levy"</code>
dim:N:val	True if the dimension and value are not equal. Example: <code>"filter": "RoleName:N:Manager"</code>
dim:EQ:val1 val2	True if the dimension equals values val1 or val2. This filter expression uses the logical OR operator (). You can compare the dimension value against more than two values. For example, to compare against three values, use the following syntax: <code>dim1:EQ:val1 val2 val3.</code>

Filter Expression Syntax	Description
	Example: <code>"filter": "Lead Status:EQ:Open Contacted"</code>
<code>dim1:EQ:val1,dim2:EQ:val2</code>	<p>True if dimension dim1 equals value val1 and dimension dim2 equals value val2. This filter expression uses the logical AND operator (,). You can compare more than two dimensions. For example, to compare three dimensions, use the following syntax: <code>dim1:EQ:val1,dim2:EQ:val2,dim3:EQ:val3</code>.</p> <p>Example: <code>"filter": "Lead Status:EQ:Qualified,Rating:EQ:Hot"</code></p>

SEE ALSO:

[filter Transformation](#)

flatten Transformation

The flatten transformation flattens hierarchical data. For example, you can flatten the Salesforce role hierarchy to implement row-level security on a dataset based on the role hierarchy.

When you configure the flatten transformation to flatten a hierarchy, you specify the field that contains every node in the hierarchy and the field that contains their corresponding parent based on the hierarchy. The flatten transformation generates one record for each node in the hierarchy. Each record contains all ancestors up the hierarchy chain for each node.

The flatten transformation stores the list of ancestors in two formats in the resulting dataset. One column contains a comma-separated list of all ancestors for each node in the hierarchy. The other column contains the hierarchy path.

See the Roles and RolePath columns in the following flattened dataset to see how ancestors are stored.

Role ID	Role Name	Parent Role ID	Roles	RolePath
1	Salesperson 1	10	10, 20, 30	\10\20\30
2	Salesperson 2	10	10, 20, 30	\10\20\30
3	Salesperson 3	11	11, 20, 30	\11\20\30
10	Regional Manager 1	20	20, 30	\20\30
11	Regional Manager 2	20	20, 30	\20\30
20	Vice President 1	30	30	\30
21	Vice President 2	30	30	\30
30	CEO	Not applicable	Not applicable	Not applicable

Example: Let's look at an example. In this example, you want to create a dataset that contains all opportunities. For each opportunity, you want to include user and role information about the opportunity owner. Also, to implement row-level security

based on the role hierarchy, each opportunity record must also contain a list of all ancestors above each opportunity owner based on the role hierarchy. To generate the list of ancestors, you will use the flatten transformation to flatten the role hierarchy.

You create the following dataflow definition file:

```
{
  "Extract_Opportunity": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Extract_User": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "User",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Department" },
        { "name": "UserRoleId" }
      ]
    }
  },
  "Extract_UserRole": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "UserRole",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "ParentRoleId" }
      ]
    }
  },
  "Flatten_UserRole": {
    "action": "flatten",
    "parameters": {
      "source": "Extract_UserRole",
      "self_field": "Id",
      "parent_field": "ParentRoleId",
      "multi_field": "Roles",
      "path_field": "RolePath"
    }
  },
  "Augment_User_FlattenUserRole": {
```

```

"action": "augment",
"parameters": {
  "left": "Extract_User",
  "left_key": [ "UserRoleId" ],
  "relationship": "Role",
  "right": "Flatten_UserRole",
  "right_key": [ "Id" ],
  "right_select": [
    "Id",
    "Name",
    "Roles",
    "RolePath"
  ]
}
},
"Augment_Opportunity_UserWithRoles": {
  "action": "augment",
  "parameters": {
    "left": "Extract_Opportunity",
    "left_key": [ "OwnerId" ],
    "right": "Augment_User_FlattenUserRole",
    "relationship": "Owner",
    "right_select": [
      "Name",
      "Department",
      "Role.Id",
      "Role.Name",
      "Role.Roles",
      "Role.RolePath"
    ],
    "right_key": [ "Id" ]
  }
},
"Register_OpportunityWithRoles_Dataset": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "OppRoles",
    "name": "OppRoles",
    "source": "Augment_Opportunity_UserWithRoles",
    "rowLevelSecurityFilter": "'Owner.Role.Roles' == \"\$User.UserRoleId\" || 'OwnerId'
== \"\$User.Id\""
  }
}
}
}

```

To flatten the Salesforce role hierarchy, the flatten transformation uses the following input fields from the UserRole object.

Id

Id identifies each node in the Salesforce role hierarchy.

ParentRoleId

ParentRoleId identifies the parent as defined in the role hierarchy.

After traversing through each parent-child relationship in the UserRole object, the flatten transformation generates one record for each role ID. Each record contains all ancestor roles for each role in the hierarchy. The flatten transformation generates two output columns—Roles and RolePath—to store all ancestor roles for each role.

IN THIS SECTION:

[flatten Parameters](#)

When you define a flatten transformation, you set the action attribute to `flatten` and specify the parameters.

flatten Parameters

When you define a flatten transformation, you set the action attribute to `flatten` and specify the parameters.

The following table describes the input parameters:

Parameter	Required?	Value
<code>self_field</code>	True	Name of the input field that identifies each node in the hierarchy.
<code>parent_field</code>	True	Name of the input field that identifies the direct parent of each node in the hierarchy. For example, the Regional Manager 1 role is the parent of the Salesperson 1 role in a role hierarchy.
<code>multi_field</code>	True	Name of the multi-value output field that contains a list of all ancestors in the hierarchy, in order from the lowest to the highest level. The flatten transformation creates this field and generates the list of ancestors for each node in the hierarchy. For example, for Salesperson 1 role, the hierarchy of ancestors is: <code>Sales Manager 1, Regional Manager 1, Vice President 1, CEO</code> .
<code>path_field</code>	True	A string representation of the multi-field field, separated by backslashes. This output field contains the hierarchical path of all ancestors in the hierarchy, in order from the lowest to the highest level. The flatten transformation creates this field and generates the ancestry path for each node in the hierarchy. For example, for a salesperson role in a role hierarchy, the value is: <code>Sales Manager 1\Regional Manager 1\Vice President 1\CEO</code> .
<code>source</code>	True	Node in the dataflow definition file that contains the hierarchical data that you want to flatten. This node is the input source for this transformation and it must contain the input fields mapped to <code>self_field</code> and <code>parent_field</code> .

Note: By default, the `multi_field` and `path_field` fields are created as system fields, which aren't visible in the user interface. To make the fields appear in the user interface, set the `IsSystemField` metadata attribute to `false` for each field in the flatten transformation. For more information about metadata attributes, see [Overriding Metadata Generated by a Transformation](#).

SEE ALSO:

[flatten Transformation](#)

sfdcDigest Transformation

The sfdcDigest transformation generates a dataset based on data that it extracts from a Salesforce object. You specify the Salesforce object and fields from which to extract data. You might choose to exclude particular fields that contain sensitive information or that aren't relevant for analysis.

When you upload the dataflow definition file, Wave Analytics validates access to Salesforce objects and fields based on the user profile of the user who uploads the file. If the user profile does not have read access to a field or object, the upload fails.

At run time, Wave Analytics runs the dataflow as the Integration User. Wave Analytics validates access to Salesforce objects and fields based on the user profile of the Integration User. For example, if the dataflow tries to extract data from a custom field on which the Integration User does not have read access, the dataflow job fails.

 **Note:** The Integration User is a preconfigured user that is created when Wave Analytics is enabled in your organization. If you or the Integration User need permission on a Salesforce object or field, ask the administrator to grant access.

For more information about preconfigured users in Wave Analytics, see the *Wave Analytics Security Implementation Guide*.

 **Example:** Let's look at an example. You would like to create a dataset that contains all opportunities from the Opportunity object.

You create the following dataflow definition.

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" },
        { "name": "OpportunitySupportTeamMembers__c" }
      ]
    }
  },
  "Register_Opportunities_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "Opportunities",
      "name": "Opportunities",
      "source": "Extract_Opportunities"
    }
  }
}
```

Tips for Using the sfdcDigest Transformation

- Be selective when choosing fields because a dataset can contain a maximum of 5,000 fields.
- To extract data from a Salesforce object, the sfdcDigest transformation runs a SOQL query. The length of the SOQL query cannot exceed 20,000 characters. No results are returned if the SOQL query exceeds the maximum. To reduce the SOQL query length, break up the extract into two or more sfdcDigest transformations and then use theaugment transformation to combine the results. For

example, you might create one `sfdcDigest` transformation to extract the half of the fields and create another `sfdcDigest` transformation to extract the remaining fields.

IN THIS SECTION:

[Extracting Incremental Changes to Data \(Pilot\)](#)

You can configure the `sfdcDigest` transformation to extract only records that changed in a Salesforce object since the last dataflow run. Use incremental extraction to decrease the time required to extract the data.

[Filtering Records Extracted from a Salesforce Object](#)

Add a filter to the `sfdcDigest` transformation to extract a subset of all records from a Salesforce object. You can filter records to reduce the number of extracted and processed records, exclude records that contain irrelevant or sensitive data, and increase dataflow performance.

[Overriding Salesforce Field Metadata](#)

You can override the field metadata that the `sfdcDigest` transformation extracts from a Salesforce object to make the data appear differently in a dataset. For example, Wave Analytics can add a default value to records that have missing values for a field.

[Unsupported Salesforce Objects and Fields](#)

The `sfdcDigest` transformation can't extract data from all Salesforce objects and fields. Consider these limitations before configuring the extraction of Salesforce objects.

[sfdcDigest Parameters](#)

When you define an `sfdcDigest` transformation, you set the action attribute to `sfdcDigest` and specify the parameters for the object and fields that you want to extract. Optionally, you can also specify parameters to filter the records extracted from the Salesforce object.

Extracting Incremental Changes to Data (Pilot)

You can configure the `sfdcDigest` transformation to extract only records that changed in a Salesforce object since the last dataflow run. Use incremental extraction to decrease the time required to extract the data.

 **Note:** Incremental extraction with the `sfdcDigest` transformation is currently available through a pilot program. Any unreleased services or features referenced in this or other press releases or public statements are not currently available and may not be delivered on time or at all. Customers who purchase our services should make their purchase decisions based upon features that are currently available.

There are two types of extractions: full and incremental. With a full extraction, the `sfdcDigest` transformation extracts all records from the Salesforce object. With incremental extraction, the transformation extracts only records that have changed since the last dataflow run. Unless configured otherwise, the `sfdcDigest` transformation runs full extractions.

When you enable incremental extraction, the `sfdcDigest` transformation performs different actions on the dataset based the types of record changes in the Salesforce object since the last dataflow run:

Record Change in Salesforce Object	Change to Dataset
Deleted record	Deletes corresponding record in the dataset.
New record	Inserts the new record into the dataset.
Updated record	Updates the corresponding record in the dataset.

Consider the following guidelines when enabling incremental extraction for an `sfdcDigest` transformation:

- Use incremental extraction for all instances of the `sfdcDigest` transformation in the dataflow.

- If necessary, when the `sfdcDigest` transformation is configured to run an incremental extraction, you can use the `fullRefreshToken` parameter to run a one-time, full extraction. You might use this option if the data in the Salesforce object and dataset become out of sync.
- The `sfdcDigest` transformation extracts all records from the object if you enable incremental extraction and it's the first time running the dataflow.
- You must use a full extraction in the following cases because incremental extraction is not supported:
 - The Salesforce object contains a formula field that references an external data object.
 - The Salesforce object fields or field types changed since the last dataflow run.
 - The filter in the `sfdcDigest` transformation changed since the last dataflow run.

 **Example:** Let's consider an example. You'd like to incrementally extract data from the Opportunity object. As a result, you configure the following dataflow definition:

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "incremental": true,
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Register_Opportunities_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "Opportunities",
      "name": "Opportunities",
      "source": "Extract_Opportunities"
    }
  }
}
```

Later, you realize that one of the opportunity records is missing. You decide to run a one-time full extraction by adding the `fullRefreshToken` parameter as shown in the following dataflow definition.

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "incremental": true,
      "fullRefreshToken": "bb",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "StageName" },

```

```

        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    },
    "Register_Opportunities_Dataset": {
      "action": "sfdcRegister",
      "parameters": {
        "alias": "Opportunities",
        "name": "Opportunities",
        "source": "Extract_Opportunities"
      }
    }
  }
}

```

After the full extraction, the dataflow performs an incremental extraction each time thereafter even though the `fullRefreshToken` parameter is included in the dataflow definition. To run a full extraction again, change the value of the `fullRefreshToken` parameter to a different value.

SEE ALSO:

[sfdcDigest Transformation](#)

Filtering Records Extracted from a Salesforce Object

Add a filter to the `sfdcDigest` transformation to extract a subset of all records from a Salesforce object. You can filter records to reduce the number of extracted and processed records, exclude records that contain irrelevant or sensitive data, and increase dataflow performance.

A filter consists of one or more filter conditions, where each filter condition compares a field value to a value. For example, `Amount >= 1000000`. You can also apply SOQL functions on the field value in a filter condition, like `CALENDAR_YEAR (CreatedDate) = 2011`. You can add multiple filter conditions using logical operators AND, OR, and NOT. You can also use a backslash (`\`) to escape double quotes included in strings.

The `sfdcDigest` transformation extracts all records for which the filter is true. If you configured the `sfdcDigest` transformation for incremental extraction, the filter applies to data extracted during the incremental run only—Wave Analytics doesn't apply the filter to records that were previously loaded into the dataset. If you add an invalid filter, the dataflow fails at run time.

For each instance of `sfdcDigest`, you can use one of the following types of filters:

- Structured filter
- Advanced filter

Tip: Are you trying to decide whether to use a filter in the `sfdcDigest` transformation or use a filter transformation? Use a filter transformation to filter records at any point in the dataflow. For example, you can add it after the dataflow joins two datasets. However, to reduce the number of rows processed in the dataflow and optimize dataflow performance, add the filter closest to the point at which records are extracted—when possible, add the filter in the `sfdcDigest` transformation.

IN THIS SECTION:

[Structured Filter in sfdcDigest Transformation](#)

You define a structured filter using JSON syntax.

Advanced Filter in sfdcDigest Transformation

You define an advanced filter using a Salesforce Object Query Language (SOQL) WHERE clause expression. Use an advanced filter only if you are familiar with SOQL.

SEE ALSO:

[sfdcDigest Transformation](#)

Structured Filter in sfdcDigest Transformation

You define a structured filter using JSON syntax.

A structured filter uses the following JSON syntax for each filter condition.

```
{
  "field": "<field name>",
  "operator": "<operator>",
  "value": "<value>"|["<value 1>", "<value 2>"],
  "isQuoted": true|false}
```

The value can be a number, date, string, list of strings, or [date literal](#). Wave Analytics automatically quotes strings unless you set `isQuoted` to true, which indicates that the string is already quoted.

You can use one of the following operators in a filter condition.

Operator	Comment
=	<p>Filter condition is true if the value in the field equals the specified value. String comparisons using the equals operator are case-insensitive.</p> <p>Example:</p> <pre>"filterConditions": [{ "field": "OwnerId", "operator": "=", "value": "a07B00000012HYu" }]</pre>
!=	<p>Filter condition is true if the value in the field does not equal the specified value.</p> <p>Example (using backslashes to escape double quotes in a string value):</p> <pre>"filterConditions": [{ "field": "Nickname__c", "operator": "!=", "value": "\"Sammy\"" }]</pre>

Operator	Comment
>	<p>Filter condition is true if the value in the field is greater than the specified value.</p> <p>Example:</p> <pre data-bbox="821 394 1438 625">"filterConditions": [{ "field": "Amount", "operator": ">", "value": "100000" }]</pre>
<	<p>Filter condition is true if the value in the field is less than the specified value.</p> <p>Example (using a date literal):</p> <pre data-bbox="821 802 1438 1062">"filterConditions": [{ "field": "CloseDate", "operator": "<", "value": "THIS_MONTH", "isQuoted": false }]</pre>
>=	<p>Filter condition is true if the value in the field is greater than or equal to the specified value.</p> <p>Example:</p> <pre data-bbox="821 1243 1438 1474">"filterConditions": [{ "field": "Amount", "operator": ">=", "value": "100000" }]</pre>
<=	<p>Filter condition is true if the value in the field is less than or equal to the specified value.</p> <p>Example (using a SOQL function):</p> <pre data-bbox="821 1650 1438 1831">"filterConditions": [{ "field": "CALENDAR_YEAR (CreatedDate)", "operator": "<=", "value": "2015", "isQuoted": true }]</pre>

Operator	Comment
	<pre data-bbox="821 256 1440 331"> }]</pre>
LIKE	<p data-bbox="821 382 1446 512">Filter condition is true if the value in the field matches the specified value. The LIKE operator is similar to the LIKE operator in SQL; it provides a mechanism for matching partial text strings and supports wildcards.</p> <ul data-bbox="821 529 1446 810" style="list-style-type: none"> • The % and _ wildcards are supported for the LIKE operator. • The % wildcard matches zero or more characters. • The _ wildcard matches exactly one character. • The LIKE operator is supported for string fields only. • The LIKE operator performs a case-insensitive match. • The LIKE operator supports escaping of special characters % or _. Use a backslash (\) to escape special characters. <p data-bbox="821 827 911 852">Example:</p> <pre data-bbox="821 869 1440 1104"> "filterConditions": [{ "field": "FirstName", "operator": "LIKE", "value": "Chris%" }]</pre>
IN	<p data-bbox="821 1150 1446 1247">Filter condition is true if the value in the field equals any one of the values in the specified list. You can specify a quoted or non-quoted list of values. If the list is quoted, set <code>isQuoted</code> to true.</p> <p data-bbox="821 1264 911 1289">Example:</p> <pre data-bbox="821 1306 1440 1541"> "filterConditions": [{ "field": "StageName", "operator": "IN", "value": ["Closed Won", "Closed Lost"] }]</pre>
NOT IN	<p data-bbox="821 1591 1446 1654">Filter condition is true if the value in the field does not equal any of the values in the specified list.</p> <p data-bbox="821 1671 911 1696">Example:</p> <pre data-bbox="821 1713 1440 1885"> "filterConditions": [{ "field": "BillingState", "operator": "NOT IN", "value": ["California", "New York"] }]</pre>

Operator	Comment
	<pre data-bbox="821 256 1440 331"> }]</pre>
INCLUDES	<p data-bbox="821 382 1440 445">For picklist or multi-select picklist fields only. Filter condition is true if the value in the picklist field includes the specified value.</p> <p data-bbox="821 466 911 487">Example:</p> <pre data-bbox="821 508 1440 739"> "filterConditions": [{ "field": "BillingState", "operator": "INCLUDES", "value": ["California"] }]</pre>
EXCLUDES	<p data-bbox="821 789 1440 852">For picklist or multi-select picklist fields only. Filter condition is true if the value in the picklist field excludes the specified value.</p> <p data-bbox="821 873 911 894">Example:</p> <pre data-bbox="821 915 1440 1146"> "filterConditions": [{ "field": "BillingState", "operator": "EXCLUDES", "value": ["California", "New York"] }]</pre>

Let's look at a few examples of structured filters.

Example: Let's look at an example with a basic structured filter. To perform pipeline analysis on opportunities in fiscal quarter 2 of fiscal year 2015, you create this dataflow definition file to create the relevant dataset.

```

{
  "Extract_Filtered_Opportunities": {
    "action": "sfcdigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "AccountId" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "OwnerId" },
        { "name": "FiscalYear" },
        { "name": "FiscalQuarter" },
        { "name": "SystemModstamp" }
      ]
    }
  }
}
```

```

    ],
    "filterConditions": [
      {
        "field": "FiscalYear",
        "operator": "=",
        "value": "2015"
      },
      {
        "field": "FiscalQuarter",
        "operator": "=",
        "value": "2"
      }
    ]
  },
  "Register_Opportunities_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "Opportunities_2015Q2",
      "name": "Opportunities_2015Q2",
      "source": "Extract_Filtered_Opportunities"
    }
  }
}

```

 **Note:** If you do not specify a logical operator for multiple filter conditions—as is the case in this example—Wave Analytics applies AND between the conditions.

 **Example:** Let's look at an example of a structured filter with a logical operator. To help forecast expected revenue, you create this dataflow to view all opportunities that have either closed or have greater than 90% probability of closing.

```

{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "AccountId" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "OwnerId" },
        { "name": "Probability" },
        { "name": "FiscalYear" },
        { "name": "FiscalQuarter" }
      ],
      "filterConditions": [
        {
          "operator": "OR",
          "conditions": [
            {
              "field": "StageName",

```

```

        "operator": "=",
        "value": "Closed Won"
      },
      {
        "field": "Probability",
        "operator": ">=",
        "value": "90"
      }
    ]
  }
}
],
},
"Register_Opportunities_Dataset": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "OpportunitiesExpectedToWin",
    "name": "OpportunitiesExpectedToWin",
    "source": "Extract_Opportunities"
  }
}
}
}

```

Example: Finally, let's look at an example of a structured filter with nested logical operators. You create this dataflow to view all opportunities that closed in the current fiscal quarter and are owned by either one of your two direct reports.

```

{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "AccountId" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "OwnerId" },
        { "name": "FiscalYear" },
        { "name": "FiscalQuarter" }
      ],
      "filterConditions": [
        {
          "operator": "AND",
          "conditions": [
            {
              "field": "CloseDate",
              "operator": "=",
              "value": "THIS_FISCAL_QUARTER",
              "isQuoted": false
            },
            {
              "operator": "OR",

```

```

        "conditions": [
          {
            "field": "OwnerId",
            "operator": "=",
            "value": "00540000000HfUz"
          },
          {
            "field": "OwnerId",
            "operator": "=",
            "value": "00540000000HfV4"
          }
        ]
      }
    ]
  },
  "Register_Opportunities_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "DirectReport_Opportunities",
      "name": "DirectReport_Opportunities",
      "source": "Extract_Opportunities"
    }
  }
}

```

Advanced Filter in sfdcDigest Transformation

You define an advanced filter using a Salesforce Object Query Language (SOQL) WHERE clause expression. Use an advanced filter only if you are familiar with SOQL.

Example: Let's look at an example of an advanced filter. You want to extract only opportunity records that are owned by a specific user and that have either high value or a high probability of closing. You create this dataflow.

```

{
  "Extract_Filtered_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "AccountId" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "Probability" },
        { "name": "OwnerId" }
      ],
      "complexFilterConditions": "OwnerId = '00540000000HfUz' AND (Amount > 100000 OR Probability > 75)"
    }
  },
}

```

```

"Register_Opportunities_Dataset": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "FilteredOpportunities",
    "name": "FilteredOpportunities",
    "source": "Extract_Filtered_Opportunities"
  }
}
}

```

Overriding Salesforce Field Metadata

You can override the field metadata that the sfdcDigest transformation extracts from a Salesforce object to make the data appear differently in a dataset. For example, Wave Analytics can add a default value to records that have missing values for a field.

You can add the following field parameters to the sfdcDigest transformation to override the field metadata:

- defaultValue
- type
- fiscalMonthOffset
- isYearEndFiscalYear
- firstDayOfWeek
- isMultiValue
- multiValueSeparator
- precision
- scale

For a description of each of these field parameters, see [Field Parameters](#). For information about using metadata attributes to configure dates, see [Date Handling in Datasets](#).

 **Example:** Let's look at an example. You would like to override metadata extracted from the Opportunity object.

You add the bold text in the following dataflow definition to override field metadata from the Opportunity object.

```

{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        {
          "name": "Amount",
          "defaultValue": 0
          "precision": 18
          "scale": 2
        },
        { "name": "StageName" },
        {
          "name": "CloseDate",
          "fiscalMonthOffset": 9,
          "firstDayOfWeek": "2",

```

```

        "isYearEndFiscalYear": true
    },
    { "name": "AccountId" },
    { "name": "OwnerId" },
    {
        "name": "OpportunitySupportTeamMembers__c",
        "type": "Text",
        "isMultiValue": "True",
        "multiValueSeparator": ",",
        "precision": 255
    }
]
},
"Register_Opportunities_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
        "alias": "Opportunities",
        "name": "Opportunities",
        "source": "Extract_Opportunities"
    }
}
}
}

```

Unsupported Salesforce Objects and Fields

The sfdcDigest transformation can't extract data from all Salesforce objects and fields. Consider these limitations before configuring the extraction of Salesforce objects.

For information about all Salesforce objects and fields, see the [Object Reference for Salesforce and Force.com](#).

Unsupported Objects

The sfdcDigest transformation can't extract data from these Salesforce objects.

The sfdcDigest transformation cannot extract data from external objects created in Salesforce. External objects are similar to custom objects, except that they map to data located outside Salesforce.

If you include an unsupported or inaccessible object in the sfdcDigest transformation, the dataflow fails at run time with an error message.

Unsupported Fields

The sfdcDigest transformation cannot extract data from these fields:

Object	Unsupported Fields
Account	CleanStatus
ActionPlanItem	ItemId
CaseArticle	KnowledgeArticleId
Contact	<ul style="list-style-type: none"> • CleanStatus • CanAllowPortalSelfReg
ContentFolderLink	ParentEntityId
ExternalEventMapping	EventId
Lead	CleanStatus
Network	<ul style="list-style-type: none"> • CaseCommentEmailTemplateId • ChangePasswordEmailTemplateId • WelcomeEmailTemplateId • ForgotPasswordEmailTemplateId

If you include a field with an unsupported field in the sfdcDigest transformation, the dataflow ignores the field.

In addition, Salesforce recommends that you do not extract data from the MayEdit field of the Account object. Extracting data from this field significantly decreases performance and can cause the dataflow to fail.

Unsupported Field Types

The `sfdcDigest` transformation can't extract data from fields with these field types.

- address
- base64
- data category group reference
- encrypted string
- location

If you include a field with an unsupported field type in the `sfdcDigest` transformation, the dataflow ignores the field.

SEE ALSO:

[sfdcDigest Transformation](#)

sfdcDigest Parameters

When you define an `sfdcDigest` transformation, you set the action attribute to `sfdcDigest` and specify the parameters for the object and fields that you want to extract. Optionally, you can also specify parameters to filter the records extracted from the Salesforce object.

You can specify parameters in the following sections of the `sfdcDigest` node: parameters, fields, and filterConditions.

Parameters

The following table describes the parameters in the `parameters` section.

Parameter	Required?	Value
object	True	API name of the Salesforce object from which you want to extract data. This object is the input source for this transformation. The <code>sfdcDigest</code> transformation doesn't support extraction from all Salesforce objects.
incremental	False	Performs an incremental extraction, which extracts only changes to the Salesforce object since the last dataflow run. Valid values: true or false.
fullRefreshToken	False	Performs a one-time full extraction to synchronize the data in the dataset with data in the Salesforce object. Specify any value for this parameter. After the full extraction, the dataflow performs an incremental extraction each time thereafter even though the <code>fullRefreshToken</code> parameter is included in the dataflow definition. To run a full extraction again, change the value of the <code>fullRefreshToken</code> parameter to a different value.

Parameter	Required?	Value
fields	True	An array of names of all fields from which you want to extract data from the specified Salesforce object. The sfdcDigest transformation doesn't support extraction from all field types.
filterConditions	False	A filter that restricts the records extracted from the specified Salesforce object. The sfdcDigest transformation extracts all records from the Salesforce object for which the filter is true. You can specify a structured or advanced filter.
complexFilterConditions	False	For advanced filters only. A SOQL WHERE clause used to filter records extracted from the specified Salesforce object.

Field Attributes

The following table describes the attributes in the `fields` section. It also describes optional attributes that you can provide to override the field metadata. You can override the metadata that the sfdcDigest transformation extracts from a Salesforce object to make the data appear differently in a dataset. For example, Wave Analytics can add a default value to records that have missing values for a field. If you don't override the values, Wave Analytics gets the values from Salesforce.

Attribute	Required?	Value
name	True	API name of the field in the Salesforce object that you want to include in the dataset. You can specify multiple fields.
defaultValue	False	For text and numeric fields that can be null. Default value that replaces a null value for the specified field.
type	False	Wave Analytics field type associated with the specified field. Valid types are Text, Numeric, or Date. Any value, including numeric values, can be Text. For example, by default, fiscal quarter from Salesforce objects is Number. However, you can change it to Text. Specify a type to override the type determined by Wave Analytics. Example: <pre>"type": "Text"</pre>

Attribute	Required?	Value
fiscalMonthOffset	False	<p>For date fields only. The difference, in months, between the first month of the fiscal year and the first month of the calendar year (January). For example, if the fiscal year starts in January, the offset is 0. If the fiscal year starts in October, the offset is 9.</p> <p>Example:</p> <pre>"fiscalMonthOffset": 9</pre> <p> Note: This attribute also controls whether Wave Analytics generates fiscal date fields. To generate fiscal date fields, set <code>fiscalMonthOffset</code> to a value other than '0'.</p> <p>For more information, see Date Handling in Datasets.</p>
isYearEndFiscalYear	False	<p>For date fields only. Indicates whether the fiscal year is the year in which the fiscal year ends or begins. Because the fiscal year can start in one calendar year and end in another, you must specify which year to use for the fiscal year.</p> <ul style="list-style-type: none"> • If true, then the fiscal year is the year in which the fiscal year ends. The default is true. • If false, then the fiscal year is the year in which the fiscal year begins. <p>Example:</p> <pre>"isYearEndFiscalYear": true</pre> <p>This field is relevant only when <code>fiscalMonthOffset</code> is greater than 0.</p> <p>For more information, see Date Handling in Datasets.</p>
firstDayOfWeek	False	<p>For date fields only. The first day of the week for the calendar year and, if applicable, fiscal year. Use 0 to set the first day to be Sunday, 1 to set the first day to be Monday, and so on. Use -1 to set the first day to be on January 1. The default is -1.</p>

Attribute	Required?	Value
		Example: <pre>"firstDayOfWeek": "0"</pre> For more information, see Date Handling in Datasets .
isMultiValue	False	For text fields only. Indicates whether the specified field has multiple values. Example: <pre>"isMultiValue": false</pre>
multiValueSeparator	False	For text fields only. Character used to separate multiple values in the specified field when isMultiValue equals true. This value defaults to a semicolon (;) if you do not specify a value and isMultiValue equals true. Set to null when isMultiValue equals false. Example: <pre>"multiValueSeparator": ";"</pre>
precision	False	The maximum number of digits in a numeric value, or the length of a text value. For numeric values: Includes all numbers to the left and to the right of the decimal point (but excludes the decimal point character). Value must be between 1 and 18, inclusive. For text values: Value defaults to 255 characters, and must be between 1 and 32,000 characters, inclusive. Example: <pre>"precision": 10</pre>
scale	False	The number of digits to the right of the decimal point in a numeric value. Must be less than the precision value. Value must be between 0 and 17 characters, inclusive. Example: <pre>"scale": 2</pre>

Filter Conditions Parameters

The following table describes the structured filter parameters in the `filterConditions` section. These parameters do not apply to advanced filters.

Parameter	Required?	Value
field	False	<p>The field in the Salesforce object on which you want to apply a filter condition. Each filter condition in a structured filter uses the following syntax:</p> <pre>{ "field": "<field name>", "operator": "<operator>", "value": "<value>", "isQuoted": true false}</pre>
operator	False	<p>The purpose depends on the context.</p> <ul style="list-style-type: none"> • <code>operator</code> can be used as a comparison operator—like <code>=</code>, <code><</code>, and <code>IN</code>—that compares the field value against a constant value. • <code>operator</code> can also be used as a logical operator (AND, OR, or NOT) that links multiple filter conditions together. <p>In the example below, the bold <code>operator</code> is the logical operator. The other instances of <code>operator</code> are comparison operators.</p> <pre>"filterConditions": [{ "operator": "OR", "conditions": [{ "field": "StageName", "operator": "=", "value": "Closed Won" }, { "field": "Probability", "operator": ">=", "value": "90" }] }]</pre>

Parameter	Required?	Value
		<pre> }] </pre>
value	False	The value used in a filter condition.
isQuoted	False	<p>Indicates whether you quoted the string value in a filter condition.</p> <p>Example with quoted values:</p> <pre> "filterConditions": [{ "field": "StageName", "operator": "IN", "value": "('Closed Won', 'Closed Lost')", "isQuoted": true }] </pre> <p>Example with non-quoted values:</p> <pre> "filterConditions": [{ "field": "StageName", "operator": "IN", "value": ["Closed Won", "Closed Lost"], "isQuoted": false }] </pre> <p>If you don't include isQuoted for a filter on a string value, Wave Analytics assumes that the string value is not quoted and adds the quotes for you.</p>
conditions	False	Use to specify a logical operator to link multiple filter conditions together.

- [Extracting Incremental Changes to Data \(Pilot\)](#)

sfdcRegister Transformation

The sfdcRegister transformation registers a dataset to make it available for queries. Users cannot view or run queries against unregistered datasets.

You don't need to register all datasets. For example, you don't need to register an intermediate dataset that is used to build another dataset and does not need to be queried. In addition, you don't need to register datasets that are created when you upload external data because Wave Analytics automatically registers these datasets for you.

Carefully choose which datasets to register because:

- The total number of rows in all registered datasets cannot exceed 250 million per platform license.
- Users that have access to registered datasets can query their data. Although, you can apply row-level security on a dataset to restrict access to records.

 **Example:** Let's look at an example. You create a dataflow that extracts opportunities from the Opportunity object. To register the dataset, name it "Opportunities," and apply row-level security on it, you add the `sfdcRegister` transformation as shown in the following dataflow definition file.

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Register_Oppportunities_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "Opportunities",
      "name": "Opportunities",
      "source": "Extract_Opportunities",
      "rowLevelSecurityFilter": "'OwnerId' == \"\$User.Id\""
    }
  }
}
```

IN THIS SECTION:

[sfdcRegister Parameters](#)

When you define an `sfdcRegister` transformation, you set the action attribute to `sfdcRegister` and specify the parameters.

sfdcRegister Parameters

When you define an `sfdcRegister` transformation, you set the action attribute to `sfdcRegister` and specify the parameters.

The following table describes the input parameters:

Parameter	Required?	Value
alias	True	API name of the registered dataset. This name can contain only underscores and alphanumeric characters, and must be unique among other dataset aliases in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. It also cannot exceed 80 characters.
name	True	Display name of the registered dataset. The name cannot exceed 80 characters.  Note: To change the name after you create the dataset, you must edit the dataset.
source	True	Node in the dataflow definition file that identifies the dataset that you want to register. This is the input source for this transformation.
rowLevelSecurityFilter	False	The predicate used to apply row-level security on the dataset when the dataset is first created. Example: "rowLevelSecurityFilter": "OwnerId" == "\$User.Id"  Note: To change the predicate after you create the dataset, you must edit the dataset. When entering the predicate in the Register transformation of the dataflow JSON, you must escape the double quotes around string values. After the dataset is created, Wave Analytics ignores its security predicate setting in the dataflow. To change the security predicate for an existing dataset, edit the dataset in the user interface.

[sfdcRegister Transformation](#)

update Transformation

The update transformation updates the specified field values in an existing dataset based on data from another dataset, which we'll call the lookup dataset. The transformation looks up the new values from corresponding fields in the lookup dataset. The transformation stores the results in a new dataset.

When you create the transformation, you specify the keys that are used to match records between the two datasets. To dictate which field in the lookup dataset updates the field in the source dataset, you also map the corresponding fields from both datasets.

 **Example:** Let's look at an example. You have an existing Accounts dataset that contains account information—Id, Name, and AnnualRevenue. Unfortunately, some of the account names in the dataset are now incorrect because of a series of mergers and acquisitions. To quickly update the account names in the dataset, you perform the following tasks.

1. Create a .csv file that contains the new account names and associated account IDs for accounts that have name changes.
2. Upload the .csv file to create a dataset called UpdatedAccountNames.
3. Create a dataflow definition file to update account names in the Accounts dataset by looking up the new account names in the UpdatedAccountNames dataset.

You create the following dataflow definition file.

```
{
  "Extract_AccountDetails": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Account",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "AnnualRevenue" }
      ]
    }
  },
  "Extract_UpdatedAccountNames": {
    "action": "edgemart",
    "parameters": { "alias": "UpdatedAccountNames" }
  },
  "Update_AccountRecords": {
    "action": "update",
    "parameters": {
      "left": "Extract_AccountDetails",
      "right": "Extract_UpdatedAccountNames",
      "left_key": [ "Id" ],
      "right_key": [ "AccountID" ],
      "update_columns": { "Name": "NewAccountName" }
    }
  }
}
```

```

    },
    "Register_UpdatedAccountRecords": {
      "action": "sfcdRegister",
      "parameters": {
        "alias": "Accounts",
        "name": "Accounts",
        "source": "Update_AccountRecords"
      }
    }
  }
}

```

Example: Let's look at another example, where a composite key is used to match records between both datasets. In this case, you match records using the account ID and account name fields.

You create the following dataflow definition file.

```

{
  "Extract_AccountDetails": {
    "action": "sfcdDigest",
    "parameters": {
      "object": "Account",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "AnnualRevenue" }
      ]
    }
  },
  "Extract_UpdatedAccountNames": {
    "action": "edgemart",
    "parameters": { "alias": "UpdatedAccountNames" }
  },
  "Update_AccountRecords": {
    "action": "update",
    "parameters": {
      "left": "Extract_AccountDetails",
      "right": "Extract_UpdatedAccountNames",
      "left_key": ["Id", "Name"],
      "right_key": ["AccountId", "NewAccountName"],
      "update_columns": {
        "Name": "NewAccountName",
        "CreatedDate": "NewCreatedDate",
        "AnnualRevenue": "NewAnnualRevenue"
      }
    }
  },
  "Register_UpdatedAccountRecords": {
    "action": "sfcdRegister",
    "parameters": {
      "alias": "Accounts",
      "name": "Accounts",
      "source": "Update_AccountRecords"
    }
  }
}

```

IN THIS SECTION:

[update Parameters](#)

When you define an update transformation, you set the action attribute to `update` and specify the parameters.

update Parameters

When you define an update transformation, you set the action attribute to `update` and specify the parameters.

The following table describes the input parameters.

Parameter	Required?	Value
left	True	Node in the dataflow definition file that identifies the dataset that contains the records that you want to update.
right	True	Node in the dataflow definition file that identifies the lookup dataset that contains the new values.
left_key	True	Key column in the left dataset used to match records in the other dataset. If you use a composite key, the left and right keys must have the same number of columns in the same order. For an example, see update Transformation on page 3275.
right_key	True	Key column in the right dataset used to match records in the other dataset. If you use a composite key, the left and right keys must have the same number of columns in the same order.
update_columns	False	<p>An array of corresponding columns between the left and right datasets. Use the following syntax: <code>"update_columns": { "LeftColumn1": "RightColumn1", "LeftColumn2": "RightColumn2", ... "LeftColumnN": "RightColumnN" }</code>. The value from right column replaces the value from the corresponding left column. The field types of the left and right column must match.</p> <p> Note: If you specify a column name that does not exist, the dataflow fails.</p> <p>If you do not specify this parameter, the transformation updates the left dataset</p>

Parameter	Required?	Value
		by matching all columns in the right dataset with those in the left. In this case, the right column names must match exactly with the left column names. Otherwise, an error might occur.

SEE ALSO:

[update Transformation](#)

Overriding Metadata Generated by a Transformation

Optionally, you can override the metadata that is generated by a transformation. You can override object and field attributes. For example, you can change the name and format of a date field that is extracted from a Salesforce object so that it appears differently in the dataset. To override the metadata, add the overrides to the Schema section of the transformation in the dataflow definition file.

In the Schema section, you can override the metadata attributes for one object only.

The Schema section in this sample `sfdcDigest` transformation contains metadata overrides:

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available for an additional cost in: **Enterprise**, **Performance**, and **Unlimited** Editions

```
"Extract_Opportunities": {
  "action": "sfdcDigest",
  "parameters": {
    "object": "Opportunity",
    "fields": [
      { "name": "Name" },
      { "name": "Amount" }
    ]
  },
  "schema": {
    "objects": [
      {
        "label": "Sales Opportunities",
        "fields": [
          {
            "name": "Amount",
            "label": "Opportunity Amount"
          }
        ]
      }
    ]
  }
}
```

Object Attributes

You can override the following object attributes.

Object Attribute	Type	Description
label	String	The display name for the object. Can be up to 40 characters. Example: <code>"label": "Sales Data"</code>
description	String	The description of the object. Must be less than 1,000 characters. Add a description to annotate an object in the dataflow definition file. This description is not visible to users in the Wave Analytics user interface. Example: <code>"description": "The SalesData object tracks basic sales data."</code>
fields	Array	The array of fields for this object.

Field Attributes

You can override attributes of each specified dataset field.

Field Attribute	Type	Description
name	String	Name of the field in the dataset. Identifies the field that you want to override. Examples: <code>"name": "Amount"</code> <code>"name": "Role.Name"</code>
label	String	The display name for the field. Can be up to 255 characters. Example: <code>"label": "Opportunity Amount"</code>
description	String	The description of the field. Must be less than 1,000 characters. Add a description to annotate a field in the dataflow definition file. This description is not visible to users in the Wave Analytics user interface. Example: <code>"description": "The Amount field contains the opportunity amount."</code>
isSystemField	Boolean	Indicates whether this field is a system field to be excluded from query results. Example: <code>"isSystemField": false</code>

Field Attribute	Type	Description
format	String	<p>The display format of the numeric or date value.</p> <p>Examples:</p> <p>"format": "\$#,##0.00" (Numeric)</p> <p>"format": "MM/DD/YYYY" (Date)</p> <p>For more information about valid formats, see Numeric Formats and Date Formats.</p>

Numeric Formats

An example of a typical numeric value is \$1,000,000.99, which is represented as \$#,##0.00. You are required to specify the precision and scale of the number. The format is specified by using the following symbols:

Symbol	Meaning
0	One digit
#	Zero or one digit
.	This symbol is the default decimal separator. Use the <code>decimalSeparator</code> field to set the decimal separator to a different symbol.
-	Minus sign
,	Grouping separator
\$	Currency sign

 **Note:** The format for numeric values isn't used in data ingestion. It is used only to specify how numeric values are formatted when displayed in the UI.

Date Formats

For Date fields, specify the format of the date by using one of the following formats.

Format	Sample Value
yyyy-MM-dd'T'HH:mm:ss.SSS'Z'	2014-04-29T16:53:34.000Z
yy-MM-dd'T'HH:mm:ss.SSS'Z'	14-04-29T16:53:34.000Z
yyyy-MM-dd'T'HH:mm:ss'Z'	2014-04-29T16:53:34Z
yy-MM-dd'T'HH:mm:ss'Z'	14-04-29T16:53:34Z
yyyy-MM-dd HH:mm:ss	2014-06-03 11:31:45
yy-MM-dd HH:mm:ss	14-06-03 11:31:45
dd.MM.yyyy HH:mm:ss	03.06.2014 11:31:45
dd.MM.yy HH:mm:ss	03.06.14 11:31:45

Format	Sample Value
dd/MM/yyyy HH:mm:ss	03/06/2014 11:31:45
dd/MM/yy HH:mm:ss	03/06/14 11:31:45
dd/MM/yyyy hh:mm:ss a	03/06/2014 11:31:45 AM
dd/MM/yy hh:mm:ss a	03/06/14 11:31:45 AM
dd-MM-yyyy HH:mm:ss	03-06-2014 11:31:45
dd-MM-yy HH:mm:ss	03-06-14 11:31:45
dd-MM-yyyy hh:mm:ss a	03-06-2014 11:31:45 AM
dd-MM-yy hh:mm:ss a	03-06-14 11:31:45 AM
MM/dd/yyyy hh:mm:ss a	06/03/2014 11:31:45 AM
MM/dd/yy hh:mm:ss a	06/03/14 11:31:45 AM
MM-dd-yyyy hh:mm:ss a	06-03-2014 11:31:45 AM
MM-dd-yy hh:mm:ss a	06-03-14 11:31:45 AM
HH:mm:ss dd/MM/yyyy	11:31:45 03/06/2014
HH:mm:ss dd/MM/yy	11:31:45 03/06/14

 **Note:** Only the preceding formats are supported.

These formats use the following symbols:

Symbol	Meaning
yyyy or yy	Four-digit year (yyyy) or two-digit year (yy)
MM	Two-digit month (01–12)
dd	Two-digit day (01–31)
'T'	A separator that indicates that time of day follows
HH	Two-digit hour (00–23)
mm	Two-digit minute (00–59)
ss	Two-digit seconds (00–59)
SSS	Optional three-digit milliseconds (000–999)
'Z'	The reference UTC time zone

Example: Let's consider an example where you want to override the following object and field attributes that the sfdcDigest transformation extracts from the Opportunity object.

Object/Field	Attribute Changes
Opportunity object	<ul style="list-style-type: none"> Change the object label to "Sales Opportunities" Add an object description
Id field	<ul style="list-style-type: none"> Change the field label to "Opportunity Id" Hide the field from queries
Amount field	<ul style="list-style-type: none"> Change the field label to "Opportunity Amount" Change the format to \$#,##0.00
CloseDate field	<ul style="list-style-type: none"> Change the field label to "Closing Date" Change the format to MM/dd/yyyy

To override the attributes, you add the Schema section with the override values to sfdcDigest in the dataflow definition file.

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    },
    "schema": {
      "objects": [
        {
          "label": "Sales Opportunities",
          "description": "These are all sales opportunities.",
          "fields": [
            {
              "name": "Id",
              "label": "OpportunityId",
              "isSystemField": true
            },
            {
              "name": "Amount",
              "label": "Opportunity Amount",
              "format": "$#,##0.00"
            }
          ]
        }
      ]
    }
  }
}
```

```

    },
    {
      "name": "CloseDate",
      "label": "Closing Date",
      "format": "MM/dd/yyyy"
    }
  ]
}
},
"Register_Dataset_Opportunities": {
  "action": "sfdcRegister",
  "parameters": {
    "source": "Extract_Opportunities",
    "alias": "Opportunities",
    "name": "Opportunities"
  }
}
}
}

```

Create a Dataset with the Dataset Builder

You can use the dataset builder to create a single dataset based on data from one or more Salesforce objects. The dataset builder generates and appends the associated JSON to the dataflow definition file. The dataset is created the next time the dataflow runs. The data in the dataset refreshes each time the dataflow runs. You can also edit the dataflow definition file to add transformations that manipulate the dataset.

1. On the home page or on an app page, click **Create > Dataset**.
2. Click **Salesforce**.

The dataset builder opens on the Dataset Builder tab.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available for an additional cost in: **Enterprise**, **Performance**, and **Unlimited** Editions

USER PERMISSIONS

To access the dataset builder:

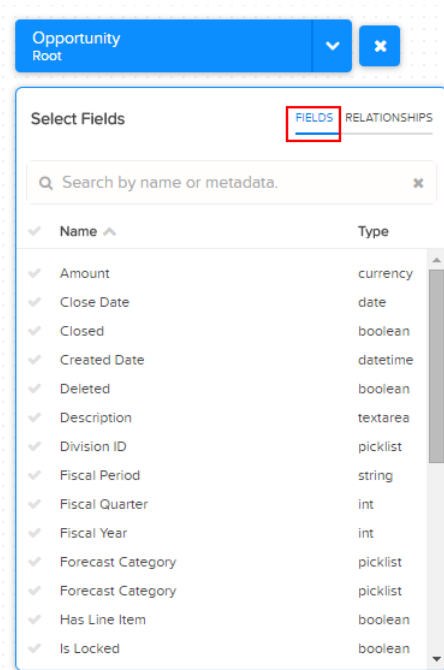

- "Edit Wave Analytics Dataflows"

3. Select the root object.

The root object is the lowest level child object that you can add to the canvas. After you select the root object, you can add only parent objects of the root object—you can't add its children objects. To change the root object, refresh the page and start over.

4. Hover over the root object, and then click .

The Select Fields dialog box appears. By default, the Fields tab appears and shows all available object fields from which you can extract data.

 **Note:** You can view this dialog box for any object included in the canvas.

5. In the Fields tab, select the fields from which you want to extract data.

To locate fields more quickly, you can search for them or sort them by name or type.

 **Important:** You must select at least one field for each object that you add to the canvas. If you add an object and don't add any of its fields, the dataflow fails at run time.

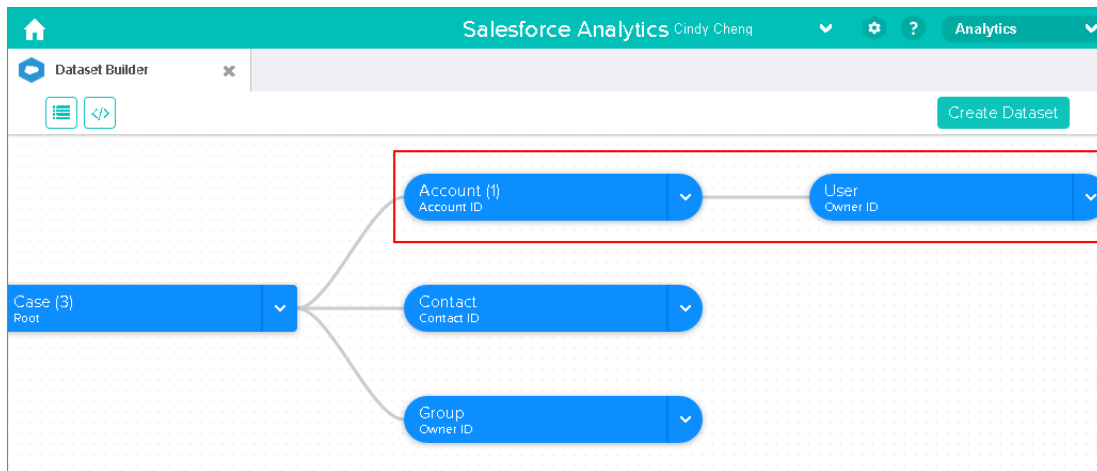

6. In the Relationships tab, click **Join** to add the related objects to the canvas.

When you add a related object, the related object appears in the canvas.

7. To remove a related object, click **Delete**.

 **Warning:** When you delete a related object, you also delete all objects that descend from the related object in the diagram. For example, if you delete Account shown below, you delete the branch that contains Account and User.

8. For each related object, select the fields from which you want to extract data.

9. To move the entire diagram, select a white space in the canvas and drag it. You might need to move the diagram to view a different section of the diagram.

10. To view all objects included in the canvas, click . The Selected Objects dialog box shows a tree structure of all objects included in the canvas. The root object appears at the top of the tree.

If you select one of the objects, the dataset builder focuses on the object by placing the object in the center of the canvas.

11. To view the associated JSON, click .

When you create the dataset, the dataset builder appends the JSON to the dataflow definition file.

12. Click **Create Dataset**.

13. Enter the name of the dataset, and select the app that will contain the dataset if it's not already selected.

 **Note:** If you enter a dataset name that is already used, when you create the dataset, the dataset builder appends a number to the dataset name. For example, if you entered MyOpportunities, the dataset builder creates MyOpportunities1. The dataset name cannot exceed 80 characters.

14. Click **Create**.

The dataset builder appends the underlying JSON to the dataflow definition file. The dataset is created the next time the dataflow runs. You can manually run the dataflow to immediately create the dataset.

Wave Connector for Excel Data

The Salesforce Wave Connector makes it easy to import data from Microsoft Excel 2013 to Wave Analytics.

The Wave Connector is available as an app for Excel 2013 on the desktop and Excel Online in Office 365. The Connector is available as an app from the Microsoft Apps for Office store or your organization's private app catalog. After you install the Connector just point and click to import data from Excel to Salesforce.

SEE ALSO:

[Install the Wave Connector Excel App](#)

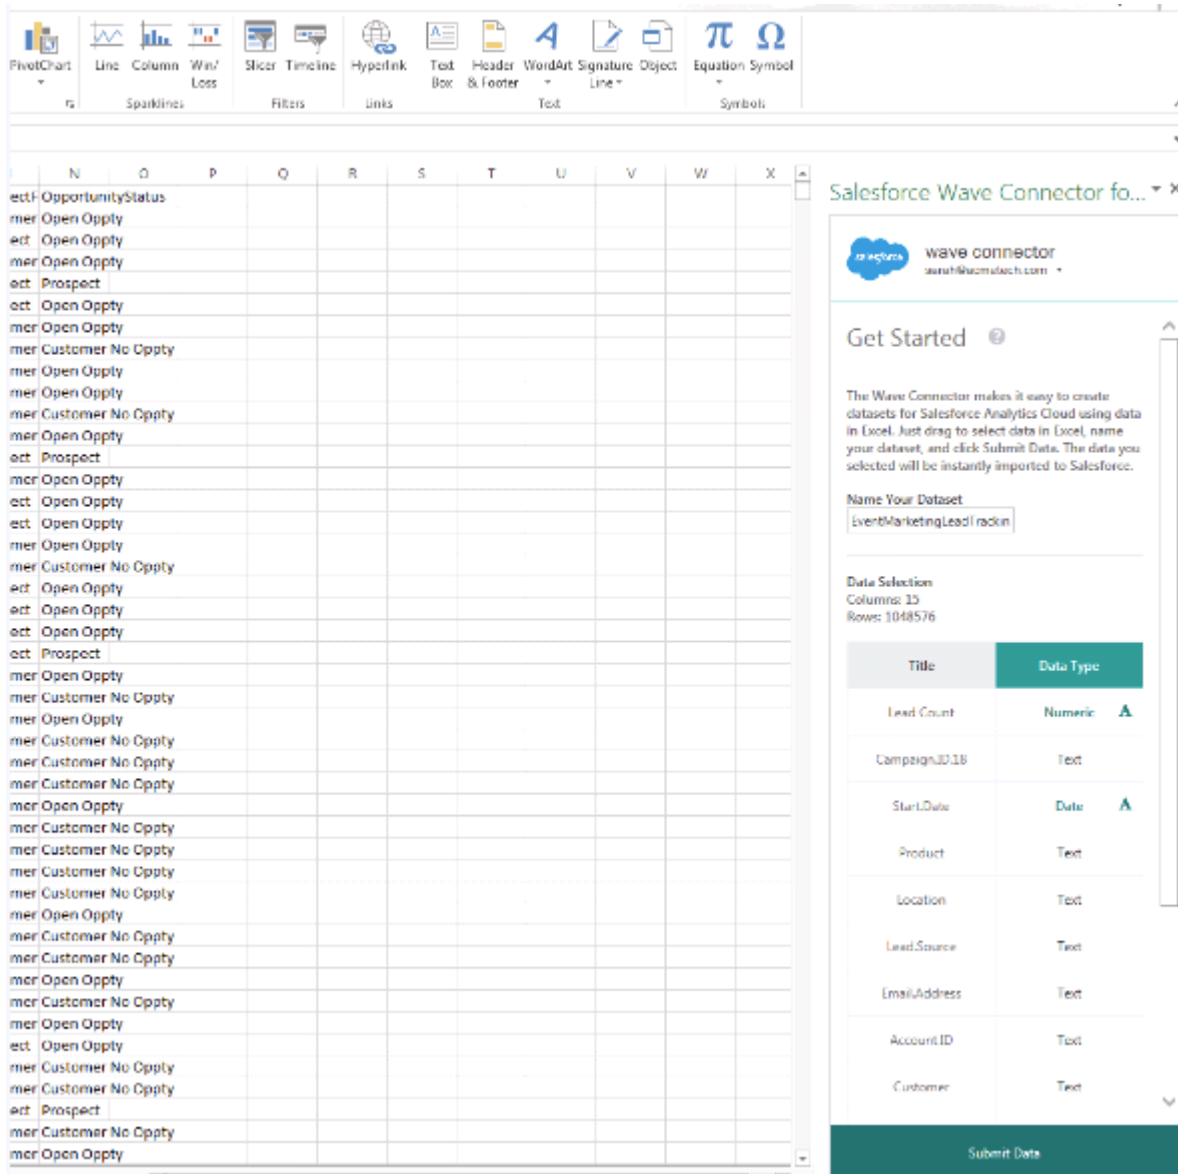

Install the Wave Connector Excel App

The Wave Connector app gives users a fast, easy way to import data from Excel 2013 into Salesforce Wave Analytics..

USER PERMISSIONS

To import data from Excel 2013 to Wave Analytics :

- Upload External Data to Wave Analytics

If you use Excel 2013 on the desktop or Office 365, the Office Online version of Excel, the Wave Connector gives you a great way to get your data into Salesforce Wave Analytics. After installing the Connector, you just select data from Excel, click Submit, and the Connector does the work for you, importing the data to Wave Analytics and creating a dataset.

Note: Excel Online in Office 365 users: Your administrator has to change Salesforce security settings to give you access to the Connector. Administrators can go to [Wave Connector Setup for Administrators](#) on page 3288 to learn how.

Here's how to install the Connector:

1. Open Excel, either on your desktop or in Office Online.
2. Open the Insert tab.
3. Click Apps for Office.
4. Search for the Wave Connector, and click to install it.
5. Enter your Salesforce credentials to open the Connector.

If the Connector doesn't open, check with your Salesforce administrator. Your organization may use a custom domain, which an administrator needs to configure for the Connector following instructions in [Wave Connector Setup for Administrators](#) on page 3288. Once you've installed the Connector, follow the instructions in the Connector window to create datasets based on Excel data. Opening the Connector automatically logs you in to Salesforce Wave Analytics. Click the Connector Help icon for complete information about using the app.

SEE ALSO:

[Wave Connector Setup for Administrators](#)

Wave Connector Setup for Administrators

In some cases, administrators need to change Salesforce security settings so users can connect to the Wave Connector app.

The Wave Connector app gives users a fast, easy way to import data from Excel 2013 into Salesforce Wave Analytics. Users of Excel 2013 on the desktop in a standard Salesforce domain access the Connector through the Microsoft Apps for Office store without requiring any additional setup work by administrators.

 **Note: Wave Connector users:** The steps described here can only be done by your Salesforce administrator. Users should go to [Install the Wave Connector Excel App](#) on page 3286.

There are two circumstances that require administrators to change Salesforce security settings so users can access the Connector:

- **If your organization includes users of Excel Online, available in Office 365:** Administrators need to add a URL to the CORS whitelist so users can connect to the app.
- **If your organization created a custom Salesforce domain using the [My Domain](#) feature:** Administrators need to download the custom Wave Connector manifest and create a network share catalog using Microsoft Sharepoint. This lets users access the Connector through a private app catalog available only to your organization.

Add Wave Connector URL to CORS Whitelist

Users of the Office 365 version of Excel, Excel Online, require you to change Salesforce settings to enable them to access the Wave Connector. Otherwise they see an error message if they try to launch the app. To give Excel Online users in your organization access to the Connector, add the Connector URL to the CORS whitelist in Security settings.

1. From Setup, choose Security Controls | CORS.
2. Choose New.
3. Enter `https://waveconnector.force.com` as an origin URL pattern.

Whitelist an Origin

To add an origin to the CORS whitelist, enter a URL pattern that identifies the origin.
 The URL pattern must include https:// and a domain name, and may include a port.
 The wildcard character (*) is supported and must be in front of a second-level domain name, for example, https://*.

CORS Whitelist Origin Edit Save Save & New Cancel

Origin URL Pattern

Save Save & New Cancel

Complete URL:
 https://waveconnector.force.com

Add Access to a Wave Connector Manifest for Custom Salesforce Domains

Wave Connector users in a custom Salesforce domain require you to set up a private app catalog to give them access to the Connector

1. Download the Wave Connector custom manifest from <https://waveconnector.force.com/analytics-excel-connector/manifest/MyManifest.apexp>. It should download automatically.
2. Follow the instructions at [MSDN](#) for creating a network share catalog to set up a private Sharepoint app catalog for your organization.

Create a Dataset with External Data

Create a Dataset with External Data

You can either upload external data through the user interface or through the External Data API to create a dataset. When you upload an external data file (in .csv, .gz, or .zip format), you can also provide a metadata file. A metadata file contains metadata attributes that describe the structure of the data in the external data file. If you do not provide a metadata file, Wave Analytics imports all external data file columns as dimensions.

If you upload a .csv from the user interface, Wave Analytics automatically generates the metadata file. You can preview the data to make further changes to the metadata attributes.

Before uploading external data files, review the format requirements and examples of the .csv and metadata files in the [External Data Format Reference](#).

 **Note:** You can also use the the External Data API to upload external data files. Use the API to take advantage of additional features, like performing incremental extracts and performing append, delete, and upsert operations. For more information about the External Data API, see the [External Data API Developer's Guide](#).

1. On the home or app page, click **Create > Dataset**.

2. Type the name of your dataset in the Dataset Name field.
The name cannot exceed 80 characters.
3. If you want to create the dataset in a different app, change the app in the App drop-down list.
4. Click **CSV**.
5. Add the .csv file.
After you add the .csv file, Wave Analytics automatically generates and adds the corresponding metadata file.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To upload external data:

- "Upload External Data to Wave Analytics"

 **Note:** Instead of using the generated metadata file, if you want, you can upload a different metadata file that you created from scratch. If you upload your own metadata file, the **Preview Data** button is disabled.

6. Perform the following tasks to change the metadata attributes in the generated metadata file.
 - a. Click **Preview Data** to view and change the required metadata attributes.

AccountOwner	Region	Target	TargetDate
Tony Santos	Midwest	10000	1/1/2011
Lucy Timmer	Northeast	50000	1/1/2011
Lucy Timmer	Northeast	0	12/1/2013
Bill Rolley	Midwest	15000	1/1/2011
Keith Laz	Southwest	35000	1/1/2011
Lucy Timmer	Southeast	40000	1/1/2011

- b. Click a column name to change it. The column name is the display name in the dataset. The column name cannot exceed 40 characters.

- c. Click the column header to change other attributes for the column.

You can change the attributes for measure and date columns only.

- d. To apply the changes to all other columns of the same data type, click **Apply to All <data type> Columns**.
- e. Click **Submit** to save the metadata changes to the metadata file.
-  **Note:** If there are errors, the **Submit** button is grayed out.
- f. Click **OK** to close the confirmation message.
- g. To change optional metadata attributes, click  to download the metadata file, edit the file, and then upload it.

7. Click Create Dataset.

Your data files are scheduled for upload. It might take some time to process the data upload job; you can monitor its status in the data monitor. If upload is successful, the new dataset is available from the home or app page.

- 8. Click Continue** to dismiss the confirmation message.

IN THIS SECTION:

[Rules for Automatic Generation of a Metadata File](#)

When you upload a CSV file from the user interface, Wave Analytics automatically generates the metadata file as long as the CSV file meets certain requirements.

Rules for Automatic Generation of a Metadata File

When you upload a CSV file from the user interface, Wave Analytics automatically generates the metadata file as long as the CSV file meets certain requirements.

To enable Wave Analytics to generate the metadata file, a CSV file must meet the following requirements.

- The file type must be .csv, not .gz or .zip.
- The file must contain one row for the column header and at least one record.
- The CSV file must meet all Wave Analytics requirements as mentioned in the [External Data Format Reference](#).

Wave Analytics generates the metadata attributes for each CSV column based on the first 100 rows in the CSV file. Wave Analytics uses the following rules to convert the CSV column names to field labels.

- Replaces special characters and spaces with underscores. For example, "Stage Name" becomes "Stage_Name."
- Replaces consecutive underscores with one underscore, except when column name ends with "___c." For example, "stage*&name" becomes "stage_name."
- Prefixes the field label with "X" when the first character of the column name is numeric. For example, "30Day" becomes "X30Day."
- Replaces the field name with "Column" + column number when all characters in the column name are not alphanumeric. For example, the fourth column name "&^*(&*(%" becomes "Column4."
- Deletes underscores at the beginning and end of the field label to ensure that it doesn't start or end with an underscore.
- Increments the derived field label if the label is the same as an existing label. For example, if "X2" already exists, uses "X21," "X22," "X23."

 **Tip:** You can download the generated metadata file to change the metadata settings, and then upload it to apply the changes. You can download the metadata file when you create or edit a dataset.

Monitor an External Data Upload

When you upload an external data file, Wave Analytics kicks off a job that uploads the data into the specified dataset. You can use the data monitor to monitor and troubleshoot the upload job.

The Jobs view (1) of the data monitor shows the status, start time, and duration of each dataflow job and external data upload job.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To access the data monitor:

- “Edit Wave Analytics Dataflows,” “Upload External Data to Wave Analytics,” or “Manage Wave Analytics”

Dataflow	Start Time	Duration	Status	Message
Default Salesf...	Today at 7:39 AM	24 seconds	Successful	
Default Salesf...	Yesterday at 7:39 AM	0 hours, 10...	Failed	Queue wait time exceeded limit
Sales_Targets...	2 Days Ago at 9:34 AM	0 hours, 1 ...	Failed	Error executing node load [root]

Node Name	Start Time	Duration	Node Type	Status
load	2 Days Ago at 9:34 AM	0 hours, 1 minute	sfdcFetch	error
digest	N/A	N/A	csvDigest	pending
optimize-register	N/A	N/A	optimizer	pending
register	N/A	N/A	sfdcRegister	pending

1. In Wave Analytics, click the gear button (⚙️) and then click **Data Monitor** to open the data monitor. The Jobs view appears by default. The Jobs view displays dataflow and upload jobs. The Jobs view displays each upload job name as `<dataset_name upload_flow>`. You can hover a job to view the entire name.

 **Note:** To view external data upload jobs in the Jobs view, **Show** in the File Uploads field (2) must be selected. It's selected by default.

- Click the Refresh Jobs button () to see the latest status of a job.
Each job can have one of the following statuses:.

Status	Description
Queued	The job is in queue to start.
Running	The job is running.
Failed	The job failed.
Successful	The job completed successfully.
Warning	The job completed successfully, but some rows failed.

- To view the run-time details for a job, expand the job node (3).
The run-time details display under the job. In the run-time details section, scroll to the right to view information about the rows that were processed.
- To troubleshoot a job that has failed rows, view the error message. Also, click the download button (1) in the run-time details section to download the error log.

Output Rows Processed	Output Rows Failed
N/A	
7	3 
N/A	

The error log contains a list of failed rows.

```
error: Field1_Number,Field2_Text,Field3_Field4 Columns
"(column: Field1_Number) strconv.ParseFloat: parsing "wrongvalue": invalid syntax" wrongvalue,value2,value3,value4
"(column: Field1_Number) strconv.ParseFloat: parsing "wrongvalueAgain": invalid syntax" wrongvalueAgain,value5,value6,value7
```

Row error
Row

- To troubleshoot a failed job, view the error message and the run-time details.

Edit a Dataset

You can edit a dataset to change the dataset name, app, security predicate, or extended metadata (XMD) file associated with the dataset. For datasets created from an external data file, you can also upload a new external data file or metadata file to update the data or metadata.

If you add an external data file, Wave Analytics generates and adds the corresponding metadata file. To make further changes to the metadata, you can click **Preview Data** or download and edit the generated metadata file. You can also upload your own metadata file to overwrite the generated file.

1. On the home or app page, click the **Datasets** tab.
2. Hover over the dataset that you want to edit, and then click **Edit**.
3. Configure the following options if applicable.

Option	Description
Dataset Name	Enter a new name if you'd like to change the name of the dataset. The name cannot exceed 80 characters.
App	Select a new app if you'd like to move the dataset to a different app.
Add Extended Metadata File (JSON)	Specify an extended metadata file if you'd like to customize the formatting of dashboards associated with the dataset. Refer to <i>Extended Metadata (XMD) Reference</i> for information about extended metadata files.
Add External Data File (CSV)	Specify an external data file if you'd like to replace the existing data in the dataset with data from the external data file. Maximum file size is 500 MB. You can upload a .CSV, .GZ, or .ZIP file. Refer to <i>External Data Format Reference</i> for information about external data files and metadata files.
Add Metadata File (JSON)	Specify a metadata file if you'd like to redefine the structure of the external data file. If you upload a new metadata file, you must also upload the corresponding external data file. Refer to <i>External Data Format Reference</i> for information about metadata files.
Security Predicate	Add a security predicate if you'd like to apply row-level security on the dataset.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To edit a dataset:

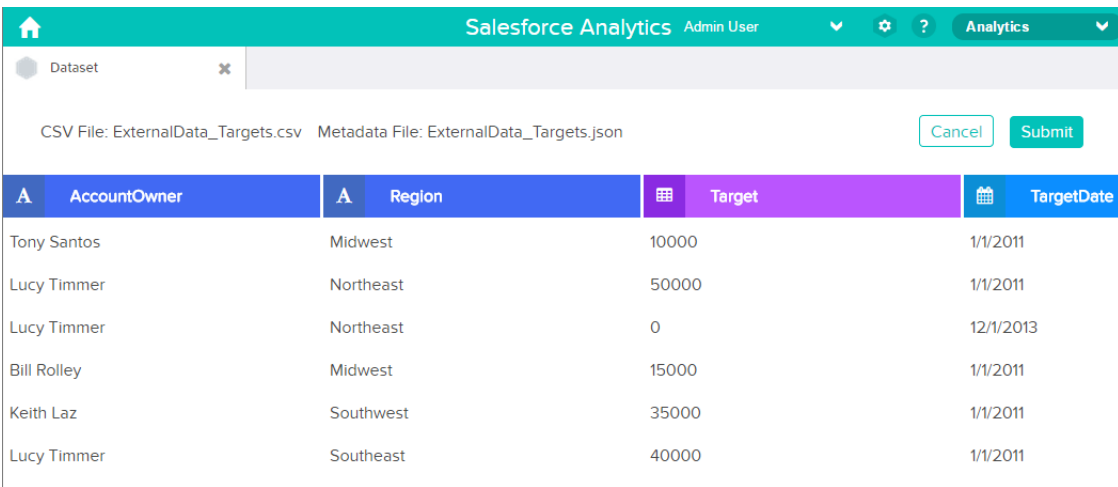

- "Edit Wave Analytics Dataflows"

Option	Description
	For information about predicates, see Row-Level Security for Datasets .

- If you uploaded a new .csv file, click **Preview Data** to view and change the required metadata attributes. You can change the optional metadata later.

 **Note:** The **Preview Data** button is disabled if you uploaded your own metadata file.

After you click **Preview Data**, the preview page appears.

A AccountOwner	A Region	Target	TargetDate
Tony Santos	Midwest	10000	1/1/2011
Lucy Timmer	Northeast	50000	1/1/2011
Lucy Timmer	Northeast	0	12/1/2013
Bill Rolley	Midwest	15000	1/1/2011
Keith Laz	Southwest	35000	1/1/2011
Lucy Timmer	Southeast	40000	1/1/2011

- For each column:
 - Click a column name to change it. The column name is the display name in the dataset. The column name cannot exceed 40 characters.

- Click the column header to change other required attributes for the column.

You can change the attributes for measure and date columns only.

The screenshot shows three panels for column configuration:

- Region (Dimension):** Shows 'Data type' with 'DIMENSION' selected. Below are 'Scale', 'Precision', and 'Default Value' fields, all currently empty.
- Target (Measure):** Shows 'Data type' with 'MEASURE' selected. Below are 'Scale' (0), 'Precision' (18), and 'Default Value' (0) fields. An 'Apply to All Measure Columns' button is at the bottom.
- TargetDate (Date):** Shows 'Data type' with 'DATE' selected. Below is a 'Format' dropdown menu set to 'dd/MM/yyyy'. An 'Apply to All Date Columns' button is at the bottom.

- c. To apply the changes to all other columns of the same data type, click **Apply to All <data type> Columns**.
6. Click **Submit** to save the metadata changes in the preview page to the metadata file.
 -  **Note:** The **Submit** button is greyed out if there are errors.
7. Click **OK** to close the confirmation message.
8. To change optional metadata attributes—which are not visible in the preview page—click  to download the metadata file, edit the file, and then upload it.
9. Click **Update Dataset**.
10. Click **Continue** to dismiss the confirmation message.

Delete a Dataset

Delete unnecessary datasets from your My Private App or in shared apps on which you have at least Editor access. Removing datasets reduces clutter and helps you avoid reaching your org's limit for rows across registered datasets.

When you delete a dataset, Wave Analytics permanently deletes the dataset and doesn't delete the corresponding lenses or dashboards that reference the dataset. Lenses and dashboards that reference a deleted dataset will no longer be available. As a result, Salesforce.com recommends that you remove the associated lenses and dashboards before you delete a dataset.

If a dataflow transformation —like edgemart or sfdcRegister— references the dataset, you must remove the reference before you can delete the dataset. For example, to delete the “Opportunities” dataset, you must remove the sfdcRegister transformation from the dataflow snippet shown below.

```
{
  ...
  "Register_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "Opportunities",
      "name": "Opportunities",
      "source": "Extract_Opportunities"
    }
  },
  ...}
```

 **Warning:** You can't recover a deleted dataset.

1. On the home or app page, click the **Datasets** tab.
2. Hover over the dataset that you want to delete, and then click **Edit**.
3. Click **Delete Dataset**.
If applicable, Wave Analytics shows a list of all lenses and dashboards that reference the dataset and that you have access to view. After you delete the dataset, any lens or dashboard that reference the dataset will become unusable.
4. Click **Delete Permanently** and confirm.

Apply Row-Level Security on a Dataset

Row-Level Security for Datasets

If a Wave Analytics user has access to a dataset, they have access to all records in the dataset, by default. However, you can implement row-level security on a dataset to restrict access to records. Some records might contain sensitive data that shouldn't be accessible by everyone.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

USER PERMISSIONS

To delete a dataset:

- “Edit Wave Analytics Dataflows”

To implement row-level security, define a predicate for each dataset on which you want to restrict access to records. A *predicate* is a filter condition that defines row-level access to records in a dataset.

When a user submits a query against a dataset that has a predicate, Wave Analytics checks the predicate to determine which records the user has access to. If the user doesn't have access to a record, Wave Analytics does not return that record.

The predicate is flexible and can model different types of security policies. For example, you can create predicates based on:

- Record ownership. Enables each user to view only records that they own.
- Management visibility. Enables each user to view records owned or shared by their subordinates based on a role hierarchy.
- Team or account collaboration. Enables all members of a team, like an opportunity team, to view records shared with the team.
- Combination of different security requirements. For example, you might need to define a predicate based on the Salesforce role hierarchy, teams, and record ownership.

The type of security policy you implement depends on how you want to restrict access to records in the dataset.

 **Warning:** If row-level security isn't applied to a dataset, any user that has access to the dataset can view all records in the dataset.

SEE ALSO:

[sfdcRegister Transformation](#)

[sfdcRegister Parameters](#)

Considerations when Defining a Predicate for a Dataset

Applying a predicate to a dataset is more than just defining the predicate expression. You also need to consider how the predicate is dependent on the information in the dataset and where to define the predicate expression.

You can create a predicate expression based on information in the dataset. For example, to enable each user to view only dataset records that they own, you can create a predicate based on a dataset column that contains the owner for each record. If needed, you can load additional data into a dataset required by the predicate.

The location where you define the predicate varies.

- To apply a predicate on a dataset created from a dataflow, add the predicate in the **rowLevelSecurityFilter** field of the Register transformation. The next time the dataflow runs, Wave Analytics will apply the predicate.
- To apply a predicate on a dataset created from an external data file, define the predicate in the **rowLevelSecurityFilter** field in the metadata file associated with the external data file. Wave Analytics applies the predicate when you upload the metadata file and external data file. If you already created the dataset from a external data file, you can edit the dataset to apply or change the predicate.

Row-Level Security Example based on Record Ownership

Let's look at an example where you create a dataset based on a CSV file and then implement row-level security based on record ownership. In this example, you will create a dataset that contains sales targets for account owners. To restrict access on each record in the dataset, you will create a security policy where each user can view only sales targets for accounts that they own. This process requires multiple steps that are described in the sections that follow.

 **Note:** Although this example is about applying a predicate to a dataset created from a CSV file, this procedure can also be applied to a dataset that is created from Salesforce data.

IN THIS SECTION:

1. [Determine Which Data to Include in the Dataset](#)

First, determine what data you want to include in the dataset. For this example, you will create a Targets dataset that contains all sales targets.

2. [Determine Row-Level Security for Dataset](#)

Now it's time to think about row-level security. How will you restrict access to each record in this dataset?

3. [Add the Predicate to the Metadata File](#)

For a dataset created from a CSV file, you can specify the predicate in the metadata file associated with the CSV file or when you edit the dataset.

4. [Create the Dataset](#)

Now that you updated the metadata file with the predicate, you can create the dataset.

5. [Test Row-Level Security for the Dataset](#)

You must verify that the predicate is applied properly and that each user can see their own sales targets.

Determine Which Data to Include in the Dataset

First, determine what data you want to include in the dataset. For this example, you will create a Targets dataset that contains all sales targets.

You will obtain sales targets from the CSV file shown below.

AccountOwner	Region	Target	TargetDate
Tony Santos	Midwest	10000	1/1/2011
Lucy Timmer	Northeast	50000	1/1/2011
Lucy Timmer	Northeast	0	12/1/2013
Bill Rolley	Midwest	15000	1/1/2011
Keith Laz	Southwest	35000	1/1/2011
Lucy Timmer	Southeast	40000	1/1/2011

If you were to create the dataset without implementing row-level security, any user that had access to the dataset would be able to see the sales targets for all account owners. For example, as shown below, Keith would be able to view the sales targets for all account owners.

You need to apply row-level security to restrict access to records in this dataset.

Determine Row-Level Security for Dataset

Now it's time to think about row-level security. How will you restrict access to each record in this dataset?

You decide to implement the following predicate on the dataset.

```
'AccountOwner' == "$User.Name"
```

Note: All predicate examples in this document escape the double quotes because it's required when you enter the predicate in the Register transformation or metadata file. This predicate implements row-level security based on record ownership. Based on the predicate, Wave Analytics returns a sales target record when the user who submits the query on the dataset is the account owner.

Let's take a deeper look into the predicate expression:

- AccountOwner refers to the dataset column that stores the full name of the account owner for each sales target.
- \$User.Name refers to the Name column of the User object that stores the full name of each user. Wave Analytics performs a lookup to get the full name of the user who submits each query.

Note: The lookup returns a match when the names in AccountOwner and \$User.Name match exactly—they must have the same case.

Add the Predicate to the Metadata File

For a dataset created from a CSV file, you can specify the predicate in the metadata file associated with the CSV file or when you edit the dataset.

You must escape the double quotes around string values when entering a predicate in the metadata file.

In this example, you add the predicate to the metadata file shown below.

```
{
  "fileFormat": {
    "charsetName": "UTF-8",
    "fieldsDelimitedBy": ",",

```

```

"fieldsEnclosedBy": "\"\"",
"numberOfLinesToIgnore": 1 },
"objects": [
  {
    "name": "Targets",
    "fullyQualifiedName": "Targets",
    "label": "Targets",
    "rowLevelSecurityFilter": "'AccountOwner' == \"\$User.Name\"",
    "fields": [
      {
        "name": "AccountOwner",
        "fullyQualifiedName": "Targets.AccountOwner",
        "label": "Account Owner",
        "type": "Text"
      },
      {
        "name": "Region",
        "fullyQualifiedName": "Targets.Region",
        "label": "Region",
        "type": "Text"
      },
      {
        "name": "Target",
        "fullyQualifiedName": "Targets.Target",
        "label": "Target",
        "type": "Numeric",
        "precision": 16,
        "scale": 0,
        "defaultValue": "0",
        "format": null
      },
      {
        "name": "TargetDate",
        "fullyQualifiedName": "Targets.TargetDate",
        "label": "TargetDate",
        "description": "",
        "type": "Date",
        "format": "dd/MM/yy HH:mm:ss",
        "isSystemField": false,
        "fiscalMonthOffset": 0
      }
    ]
  }
]
}

```

Create the Dataset

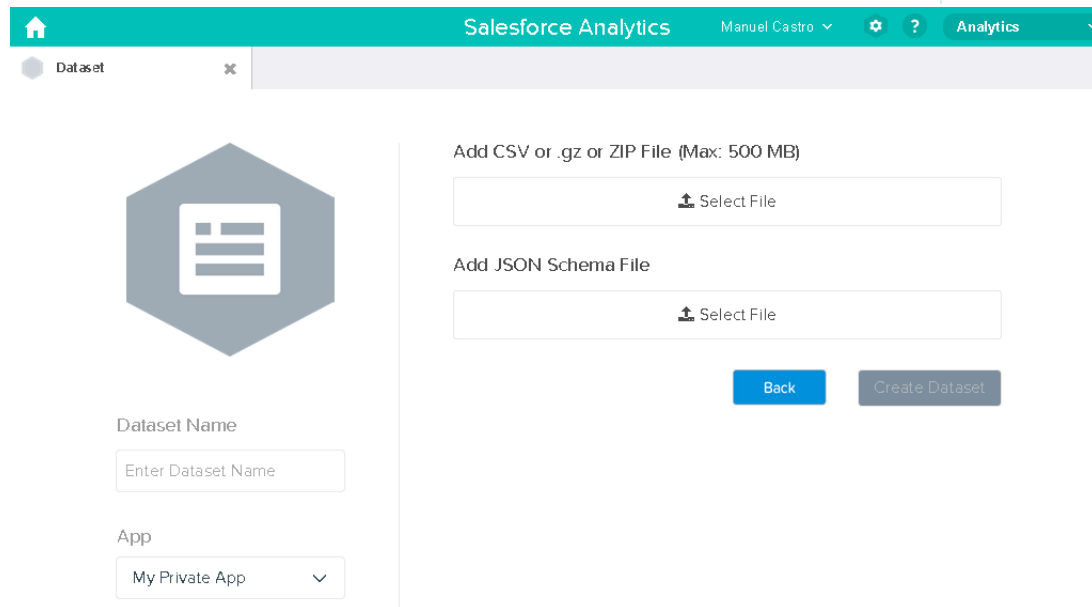

Now that you updated the metadata file with the predicate, you can create the dataset.

 **Warning:** If you wish to perform the steps in this sample implementation, perform the steps in a non-production environment. Ensure that these changes do not impact other datasets that you already created.

To create the dataset, perform the following steps.

1. In Wave Analytics, go to the home page.
2. Click **Create > Dataset**
3. Click **CSV**.

The following screen appears.

4. Select the CSV file and metadata (schema) file.
5. In the **Dataset Name** field, enter “SalesTarget” as the name of the dataset.
6. Optionally, choose a different app where you want to store the dataset.
7. Click **Create Dataset**.

Wave Analytics confirms that the upload is successful and then creates a job to create the dataset. You can view the SalesTarget dataset after the job completes successfully.

8. To verify that the job completes successfully, perform the following steps:

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To upload a CSV and metadata file:

- “Upload External Data to Wave Analytics”

- a. Click the gear icon () and then select **Data Monitor** to open the data monitor.
By default, the Jobs View of the data monitor appears. It shows the statuses of dataflow and external data upload jobs.
- b. Click the Refresh Jobs button () to view the latest statuses of the jobs.

Test Row-Level Security for the Dataset

You must verify that the predicate is applied properly and that each user can see their own sales targets.

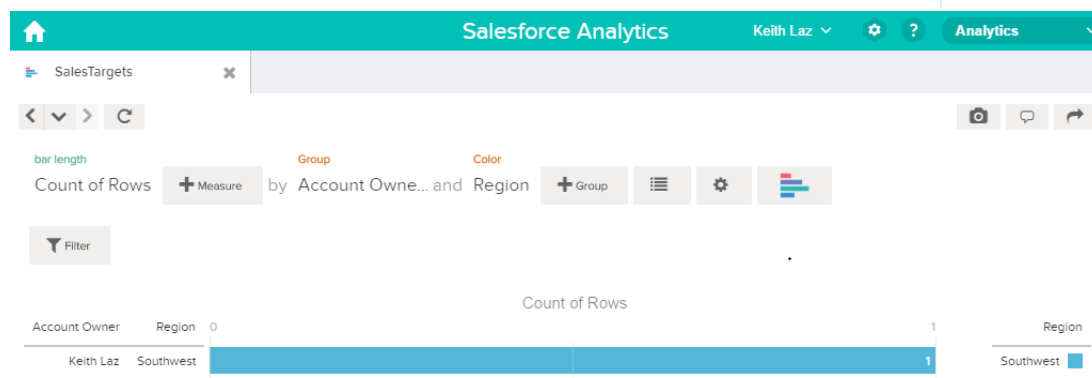

1. Log in to Wave Analytics as Keith.
2. Open the SalesTargets dataset.
As shown in the following lens, notice that Keith can see only his sales target.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

Row-Level Security Example based on Opportunity Teams

Let's look at an example where you create a dataset based on Salesforce data and then implement row-level security based on an opportunity team. In this example, you will create a dataset that contains only opportunities associated with an opportunity team. To restrict access on each record in the dataset, you will create a security policy where only opportunity members can view their opportunity. This process requires multiple steps that are described in the sections that follow.

IN THIS SECTION:

1. [Determine Which Data to Include in the Dataset](#)
First, determine what data you want to include in the dataset. For this example, you will create an OppTeamMember dataset that contains only opportunities associated with an opportunity team.
2. [Design the Dataflow to Load the Data](#)
Now it's time to figure out how the dataflow will extract the Salesforce data and load it into a dataset. You start by creating this high-level design for the dataflow.

3. [Determine Row-Level Security for the Dataset](#)

Now it's time to think about row-level security. How will you restrict access to each record in this dataset?

4. [Modify the Dataflow Based on Row-Level Security](#)

It's now time to add the predicate in the dataflow definition file.

5. [Create the Dataset](#)

Now that you have the final dataflow definition file, you can create the dataset.

6. [Test Row-Level Security for the Dataset](#)

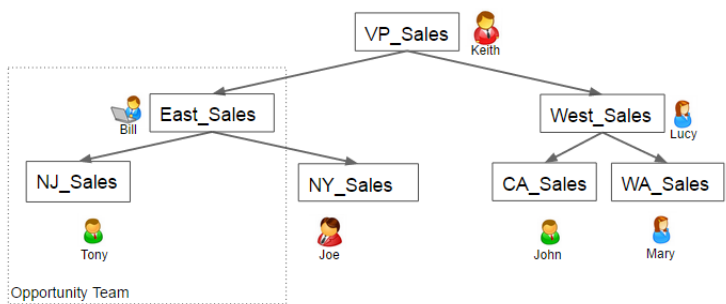

You must verify that the predicate is applied properly and that each user can see the appropriate opportunities.

Determine Which Data to Include in the Dataset

First, determine what data you want to include in the dataset. For this example, you will create an OppTeamMember dataset that contains only opportunities associated with an opportunity team.

You will obtain opportunities from the Opportunity object and the opportunity teams from the OpportunityTeamMember object. Both are Salesforce objects.

In this example, your Salesforce organization has the following opportunity team and users.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

Your organization also contains the following opportunities, most of which are owned by Keith.

Action	Opportunity Name	Account Name	Amount	Close Date	Stage	Opportunity Owner Alias
<input type="checkbox"/> Edit Del +	Acc - 1000 Widgets	Acc salesrep		9/4/2014	Prospecting	Tony
<input type="checkbox"/> Edit Del +	Acme - 1,200 Widgets	Acme	\$140,000.00	6/14/2012	Value Proposition	Keith
<input type="checkbox"/> Edit Del +	Acme - 200 Widgets	Acme	\$20,000.00	10/13/2012	Prospecting	Keith
<input type="checkbox"/> Edit Del +	Acme - 600 Widgets	Acme	\$70,000.00	8/10/2012	Needs Analysis	Keith
<input type="checkbox"/> Edit Del +	ESales_01	East Sales_acc 01		9/4/2014	Prospecting	Bill
<input type="checkbox"/> Edit Del +	Global Media - 400...	Global Media	\$40,000.00	7/13/2012	Id. Decision Makers	Keith
<input type="checkbox"/> Edit Del +	salesforce.com - 1...	salesforce.com	\$100,000.00	6/14/2012	Negotiation/Review	Keith
<input type="checkbox"/> Edit Del +	salesforce.com - 2...	salesforce.com	\$20,000.00	8/12/2012	Value Proposition	Keith
<input type="checkbox"/> Edit Del +	salesforce.com - 50...	Global Media	\$50,000.00	5/12/2012	Closed Won	Keith
<input type="checkbox"/> Edit Del +	salesforce.com - 50...	Global Media	\$500,000.00	5/12/2012	Closed Won	Keith
<input type="checkbox"/> Edit Del +	West Sales_01	West Sales_Acc_01		9/4/2014	Prospecting	Lucy

Acc - 1000 Widgets is the only opportunity shared by an opportunity team. Bill is the Sales Manager for this opportunity. Tony is the opportunity owner.

Design the Dataflow to Load the Data

Now it's time to figure out how the dataflow will extract the Salesforce data and load it into a dataset. You start by creating this high-level design for the dataflow.

The dataflow will extract data from the Opportunity and OpportunityTeamMember objects, join the data, and then load it into the OppTeamMember dataset.

Now let's implement that design in JSON, which is the format of the dataflow definition file. A dataflow definition file contains transformations that extract, transform, and load data into a dataset.

Based on the design, you create the JSON shown below.

```

{
  "Extract_OpportunityTeamMember": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "OpportunityTeamMember",
      "fields": [
        { "name": "Name" },
        { "name": "OpportunityId" },
        { "name": "UserId" }
      ]
    }
  },
  "Extract_Opportunity": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Augment_OpportunityTeamMember_Opportunity": {
    "action": "augment",
    "parameters": {
      "left": "Extract_OpportunityTeamMember",
      "left_key": [
        "OpportunityId"
      ],
      "relationship": "TeamMember",
    }
  }
}

```

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

```

    "right": "Extract_Opportunity",
    "right_key": [
      "Id"
    ],
    "right_select": [
      "Name", "Amount"
    ]
  }
},
"Register_Dataset": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "OppTeamMember",
    "name": "OppTeamMember",
    "source": "Augment_OpportunityTeamMember_Opportunity",
    "rowLevelSecurityFilter": ""
  }
}
}

```

If you were to run this dataflow, Wave Analytics would generate a dataset with no row-level security. As a result, any user that has access to the dataset would be able to see the opportunity shared by the opportunity team.

For example, as shown below, Lucy would be able to view the opportunity that belongs to an opportunity team of which she is not a member.

You need to apply row-level security to restrict access to records in this dataset.

Determine Row-Level Security for the Dataset

Now it's time to think about row-level security. How will you restrict access to each record in this dataset?

You decide to implement the following predicate on the dataset.

```
'UserId' == "$User.Id"
```

This predicate compares the UserId column in the dataset against the ID of the user running a query against the dataset. The UserId column in the dataset contains the user ID of the team member associated with each opportunity. To determine the ID of the user running the query, Wave Analytics looks up the ID of the user making the query in the User object.

For each match, Wave Analytics returns the record to the user.

Modify the Dataflow Based on Row-Level Security

It's now time to add the predicate in the dataflow definition file.

You add the predicate to the Register transformation that registers the OppTeamMember dataset as shown below.

```
{
  "Extract_OppportunityTeamMember": {
    "action": "sfcdigest",
    "parameters": {
      "object": "OppportunityTeamMember",
      "fields": [
        { "name": "Name" },
        { "name": "OppportunityId" },
        { "name": "UserId" }
      ]
    }
  },
  "Extract_Oppportunity": {
    "action": "sfcdigest",
```

EDITIONS

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: [Developer Edition](#)

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

```

    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Augment_OpportunityTeamMember_Opportunity": {
    "action": "augment",
    "parameters": {
      "left": "Extract_OpportunityTeamMember",
      "left_key": [
        "OpportunityId"
      ],
      "relationship": "TeamMember",
      "right": "Extract_Opportunity",
      "right_key": [
        "Id"
      ],
      "right_select": [
        "Name", "Amount"
      ]
    }
  },
  "Register_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "OppTeamMember",
      "name": "OppTeamMember",
      "source": "105_Augment_OpportunityTeamMember_Opportunity",
      "rowLevelSecurityFilter": "'UserId' == \"\$User.Id\""
    }
  }
}

```

Create the Dataset

Now that you have the final dataflow definition file, you can create the dataset.

 **Warning:** If you wish to perform the steps in this sample implementation, verify that you have all required Salesforce objects and fields, and perform the steps in a non-production environment. Ensure that these changes do not impact other datasets that you already created. Also, always make a backup of the existing dataflow definition file before you make changes because you cannot retrieve old versions of the file.

To create the dataset, perform the following steps.

1. In Wave Analytics, click the gear icon () and then select **Data Monitor** to open the data monitor.
The Jobs view of the data monitor appears by default.
2. Select **Dataflow View**.
3. Click the actions list (1) for the dataflow and then select **Download** to download the existing dataflow definition file.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

USER PERMISSIONS

To download, upload, run, and monitor a dataflow:

- “Edit Wave Analytics Dataflows”

4. Open the dataflow definition file in a JSON or text editor.
5. Add the JSON determined in the [previous step](#).
6. Before you save the dataflow definition file, use a JSON validation tool to verify that the JSON is valid.
An error occurs if you try to upload the dataflow definition file with invalid JSON. You can find JSON validation tool on the internet.
7. Save and close the dataflow definition file.
8. In the Dataflow View of the data monitor, click the actions list for the dataflow and then select **Upload**.
9. Select the updated dataflow definition file and click **Upload**.
10. In the Dataflow View of the data monitor, click the actions list for the dataflow and then select **Run** to run the dataflow job.
11. Click the **Refresh Jobs** button () to view the latest status of the dataflow job.
You can view the OppTeamMember dataset after the dataflow job completes successfully.

 **Note:** If you are adding a predicate to a dataset that was previously created, each user must log out and log back in for the predicate to take effect.

Test Row-Level Security for the Dataset

You must verify that the predicate is applied properly and that each user can see the appropriate opportunities.

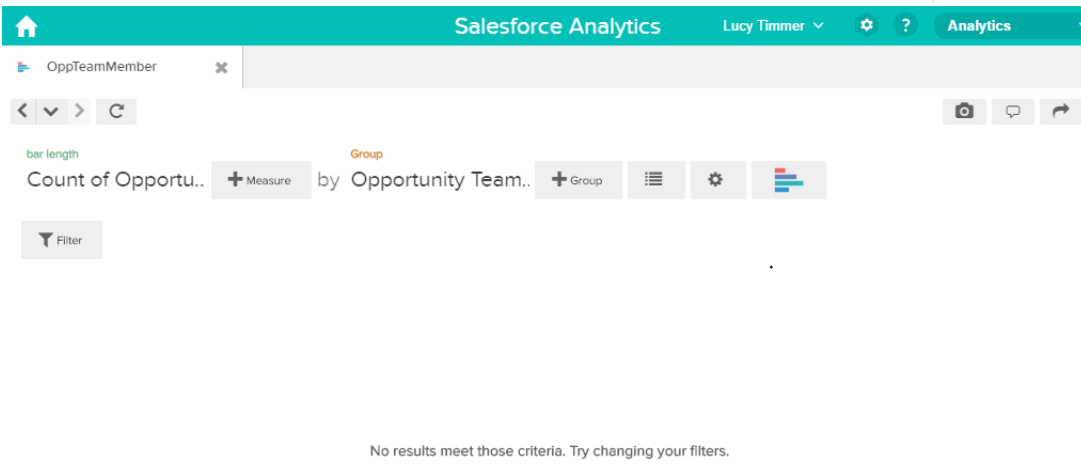

1. Log in to Wave Analytics as Lucy.
2. Open the OppTeamMember opportunity.
Notice that Lucy can't view the opportunity associated with the opportunity team anymore because she is not a member of the team.

EDITIONS

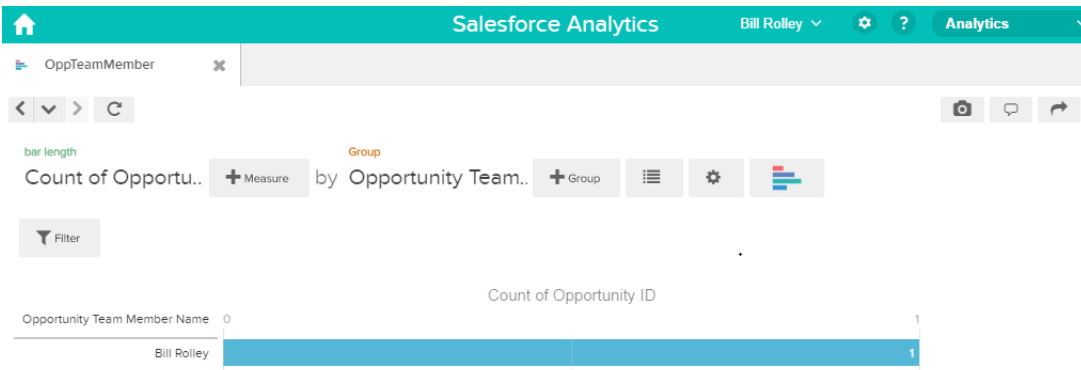

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

3. Log out and now log in as Bill.
Bill can view the opportunity that is shared by the opportunity team of which he is a member.

Row-Level Security Example based on Role Hierarchy and Record Ownership

Let's look at an example where you create a dataset based on Salesforce data and then implement row-level security based on the Salesforce role hierarchy and record ownership. In this example, you will create a dataset that contains all opportunities. To restrict access on each record in the dataset, you will create a security policy where each user can view only opportunities that they own or that are owned by their subordinates based on the Salesforce role hierarchy. This process requires multiple steps that are described in the sections that follow.

IN THIS SECTION:

1. [Determine Which Data to Include in the Dataset](#)

First, determine what data you want to include in the dataset. For this example, you will create the OppRoles dataset that contains all opportunities as well as user details about each opportunity owner, such as their full name, division, and title.

2. [Design the Dataflow to Load the Data](#)

Now it's time to figure out how the dataflow will extract the data and load it into a dataset. You start by creating this high-level design for the dataflow.

3. [Determine Row-Level Security for the Dataset](#)

Now it's time to think about row-level security. How will you restrict access to each record in this dataset?

4. [Modify the Dataflow Based on Row-Level Security](#)

Now it's time to modify the dataflow definition file to account for the predicate.

5. [Create the Dataset](#)

Now that you have the final dataflow definition file, you can create the dataset.

6. [Test Row-Level Security for the Dataset](#)

You must verify that the predicate is applied properly and that each user can see the appropriate opportunities.

SEE ALSO:

[flatten Parameters](#)

Determine Which Data to Include in the Dataset

First, determine what data you want to include in the dataset. For this example, you will create the OppRoles dataset that contains all opportunities as well as user details about each opportunity owner, such as their full name, division, and title.

You will obtain opportunities from the Opportunity object and user details from the User object. Both are objects in Salesforce.

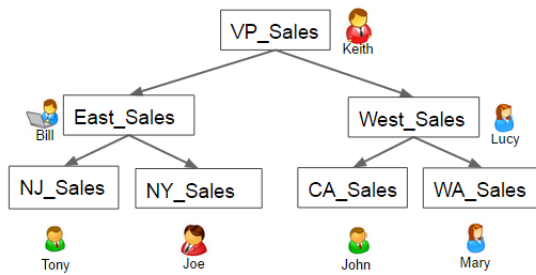

In this example, your Salesforce organization has the following role hierarchy and users.

Design the Dataflow to Load the Data

Now it's time to figure out how the dataflow will extract the data and load it into a dataset. You start by creating this high-level design for the dataflow.

The dataflow will extract data from the Opportunity and User objects, join the data, and then load it into the OppRoles dataset.

Now let's implement that design in JSON, which is the format of the dataflow definition file. A dataflow definition file contains transformations that extract, transform, and load data into a dataset.

Based on the design, you create the JSON shown below.

```
{
  "Extract_Opportunity": {
    "action": "sfdcDigest",
```

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

```

    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Extract_User": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "User",
      "fields": [
        { "name": "Id" },
        { "name": "Username" },
        { "name": "LastName" },
        { "name": "FirstName" },
        { "name": "Name" },
        { "name": "CompanyName" },
        { "name": "Division" },
        { "name": "Department" },
        { "name": "Title" },
        { "name": "Alias" },
        { "name": "CommunityNickname" },
        { "name": "UserType" },
        { "name": "UserRoleId" }
      ]
    }
  },
  "Augment_Opportunity_User": {
    "action": "augment",
    "parameters": {
      "left": "Extract_Opportunity",
      "left_key": [
        "OwnerId"
      ],
      "right": "Extract_User",
      "relationship": "Owner",
      "right_select": [
        "Name"
      ],
      "right_key": [
        "Id"
      ]
    }
  },
  "Register": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "OppRoles",

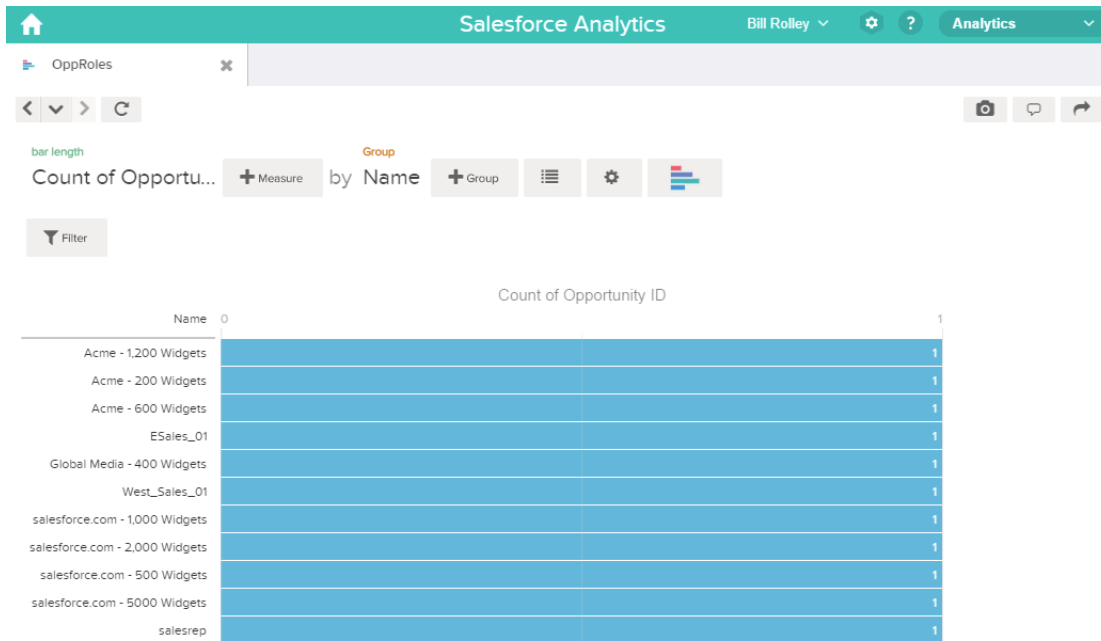

```

```

    "name": "OppRoles",
    "source": "Augment_Opportunity_User",
    "rowLevelSecurityFilter": ""
  }
}
}

```

If you were to run this dataflow, Wave Analytics would generate a dataset with no row-level security. As a result, any user that has access to the dataset would be able to view all opportunities. For example, as shown below, Bill would be able to view all opportunities, including those owned by his manager Keith.

You need to apply row-level security to restrict access to records in this dataset.

Determine Row-Level Security for the Dataset

Now it's time to think about row-level security. How will you restrict access to each record in this dataset?

You decide to implement the following predicate on the dataset.

```
'ParentRoleIDs' == "$User.UserRoleId" || 'OwnerId' == "$User.Id"
```

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: [Developer Edition](#)

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

 **Note:** The current dataflow doesn't contain logic to create a dataset column named "ParentRoleIDs." ParentRoleIDs is a placeholder for the name of a column that will contain this information. In the [next step](#), you will modify the dataflow to add this column to the dataset. This column name will change based on how you configure the dataflow.

Based on the predicate, Wave Analytics returns an opportunity record if:

- The user who submits the query is a parent of the opportunity owner based on the Salesforce role hierarchy. Wave Analytics determines this based on their role IDs and the role hierarchy.
- Or, the user who submits the query on the dataset is the opportunity owner.

Let's examine both parts of this predicate.

Predicate Part	Description
'ParentRoleIDs' == "\$User.UserRoleId"	<ul style="list-style-type: none"> • ParentRoleIDs refers to a dataset column that contains a comma-separated list of role IDs of all users above the opportunity owner based on the role hierarchy. You will create this dataset column in the next section. • \$User.UserRoleId refers to the UserRoleId column of the User object. Wave Analytics looks up the user role ID of the user who submits the query from the User object.
'OwnerId' == "\$User.Id"	<ul style="list-style-type: none"> • OwnerId refers to the dataset column that contains the user ID of the owner of each opportunity. • \$User.Id refers to the Id column of the User object. Wave Analytics looks up the user ID of the user who submits the query from the User object.

Modify the Dataflow Based on Row-Level Security

Now it's time to modify the dataflow definition file to account for the predicate.

In this scenario, you have to make changes to the dataflow based on the predicate.

- Add a column in the dataset that stores a comma-separated list of the role IDs of all parents for each opportunity owner. When you defined the predicate in the previous step, you temporarily referred to this column as "ParentRoleIDs." To add the column, you redesign the dataflow as shown in the following diagram:

EDITIONS

Available in: **Salesforce Classic and Lightning Experience**

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

The new dataflow design contains the following changes:

- Extracts the role IDs from the UserRole object.
 - Uses the Flatten transformation to generate a column that stores a comma-separated list of the role IDs of all parents of each user. When you determined the predicate in the previous step, you temporarily referred to this column as "ParentRoleIDs."
 - Link the new column to the OppRoles dataset.
- Add the predicate to the Register transformation that registers the OppRoles dataset.

You modify the dataflow as shown below.

```
{
  "Extract_Opportunity": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Extract_User": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "User",
      "fields": [
        { "name": "Id" },
        { "name": "Username" },
        { "name": "LastName" },
        { "name": "FirstName" },
        { "name": "Name" },
        { "name": "CompanyName" },
        { "name": "Division" },
        { "name": "Department" },
        { "name": "Title" },
        { "name": "Alias" },
        { "name": "CommunityNickname" },

```

```

        { "name": "UserType" },
        { "name": "UserRoleId" }
      ]
    }
  },
  "Extract_UserRole": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "UserRole",
      "fields": [
        { "name": "Id" },
        { "name": "ParentRoleId" },
        { "name": "RollupDescription" },
        { "name": "OpportunityAccessForAccountOwner" },
        { "name": "CaseAccessForAccountOwner" },
        { "name": "ContactAccessForAccountOwner" },
        { "name": "ForecastUserId" },
        { "name": "MayForecastManagerShare" },
        { "name": "LastModifiedDate" },
        { "name": "LastModifiedById" },
        { "name": "SystemModstamp" },
        { "name": "DeveloperName" },
        { "name": "PortalAccountId" },
        { "name": "PortalType" },
        { "name": "PortalAccountOwnerId" }
      ]
    }
  }
},
"Flatten_UserRole": {
  "action": "flatten",
  "parameters": {
    "multi_field": "Roles",
    "parent_field": "ParentRoleId",
    "path_field": "RolePath",
    "self_field": "Id",
    "source": "Extract_UserRole"
  }
},
"Augment_User_FlattenUserRole": {
  "action": "augment",
  "parameters": {
    "left": "Extract_User",
    "left_key": [
      "UserRoleId"
    ],
    "relationship": "Role",
    "right": "Flatten_UserRole",
    "right_key": [
      "Id"
    ],
    "right_select": [
      "Roles",
      "RolePath"
    ]
  }
}

```

```

    }
  },
  "Augment_Opportunity_UserWithRoles": {
    "action": "augment",
    "parameters": {
      "left": "Extract_Opportunity",
      "left_key": [
        "OwnerId"
      ],
      "right": "Augment_User_FlattenUserRole",
      "relationship": "Owner",
      "right_select": [
        "Name",
        "Role.Roles",
        "Role.RolePath"
      ],
      "right_key": [
        "Id"
      ]
    }
  },
  "Register": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "OppRoles",
      "name": "OppRoles",
      "source": "Augment_Opportunity_UserWithRoles",
      "rowLevelSecurityFilter": "'Owner.Role.Roles' == \"\$User.UserRoleId\" || 'OwnerId'
== \"\$User.Id\""
    }
  }
}

```

 **Note:** In this example, the dataset has columns Owner.Role.Roles and OwnerId. A user can view the values of these columns for each record to which they have access.

Create the Dataset

Now that you have the final dataflow definition file, you can create the dataset.

 **Warning:** If you wish to perform the steps in this sample implementation, verify that you have all required Salesforce objects and fields, and perform the steps in a non-production environment. Ensure that these changes do not impact other datasets that you already created. Also, always make a backup of the existing dataflow definition file before you make changes because you cannot retrieve old versions of the file.

To create the dataset, perform the following steps.

1. In Wave Analytics, click the gear icon () and then select **Data Monitor** to open the data monitor.
The Jobs View of the data monitor appears by default.
2. Select **Dataflow View**.
3. Click the actions list (1) for the dataflow and then select **Download** to download the existing dataflow definition file.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

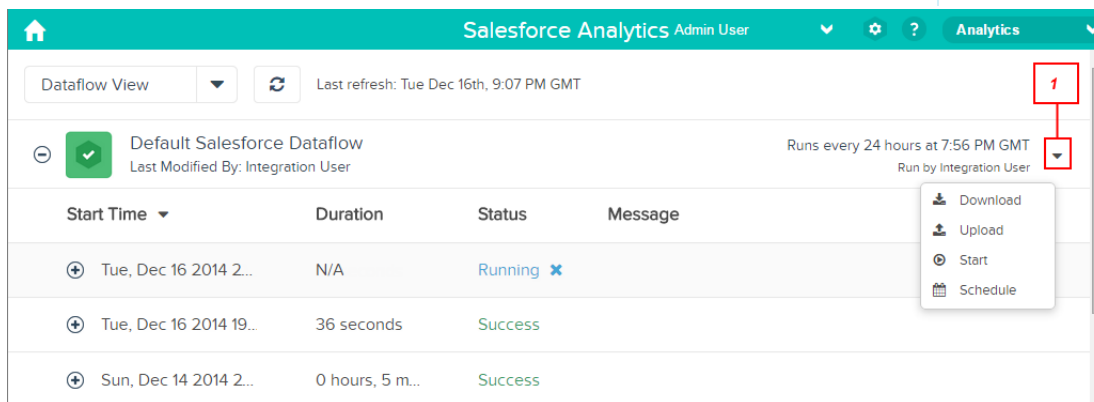

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

USER PERMISSIONS

To download, upload, run, and monitor a dataflow:

- “Edit Wave Analytics Dataflows”

4. Open the dataflow definition file in a JSON or text editor.
5. Add the JSON determined in the [previous step](#).
6. Before you save the dataflow definition file, use a JSON validation tool to verify that the JSON is valid.
An error occurs if you try to upload the dataflow definition file with invalid JSON. You can find JSON validation tool on the internet.
7. Save and close the dataflow definition file.
8. In the Dataflow View of the data monitor, click the actions list for the dataflow and then select **Upload**.
9. Select the updated dataflow definition file and click **Upload**.
10. In the Dataflow View of the data monitor, click the actions list for the dataflow and then select **Run** to run the dataflow job.
11. Click the **Refresh Jobs** button () to view the latest status of the dataflow job.
You can view the OppRoles dataset after the dataflow job completes successfully.

Note: If you are adding a predicate to a dataset that was previously created, each user must log out and log back in for the predicate to take effect.

Test Row-Level Security for the Dataset

You must verify that the predicate is applied properly and that each user can see the appropriate opportunities.

1. Log in to Wave Analytics as Bill.
2. Open the OppRoles opportunity.
Notice that Bill can't see his manager Keith's opportunities anymore. Now, he can see only his opportunity and his subordinate Tony's opportunity.

EDITIONS

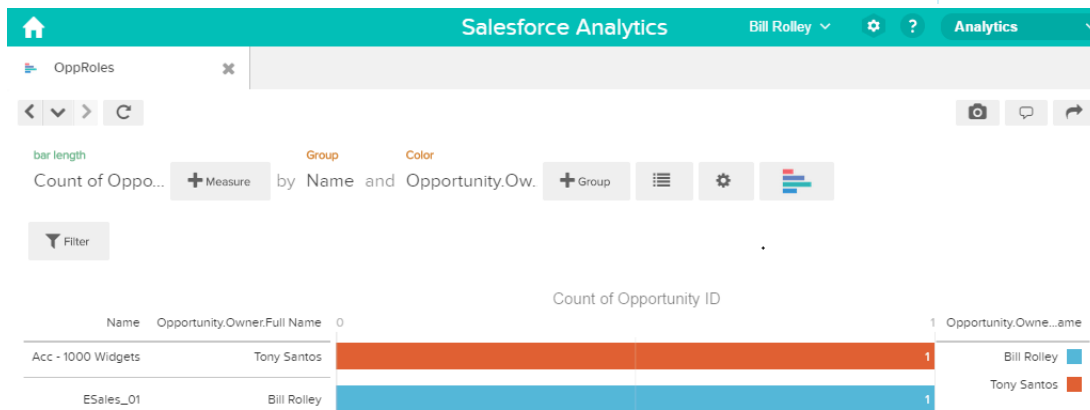

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

USER PERMISSIONS

- ""
- ""

3. Log out and now log in as Keith.
As expected, Keith can still see all opportunities.

Predicate Expression Syntax

You must use valid syntax when defining the predicate expression.

The predicate expression must have the following syntax:

```
<dataset column> <operator> <value>
```

For example, you can define the following predicate expression for a dataset:

```
'UserId' == "$User.Id"
```

You can create more complex predicate expressions such as:

```
('Expected_Revenue' > 4000 || 'Stage Name' == "Closed Won") && 'isDeleted' != "False"
```

Consider the following requirements for the predicate expression:

- The expression is case-sensitive.
- The expression cannot exceed 1,000 characters.
- There must be at least one space between the dataset column and the operator, between the operator and the value, and before and after logical operators. This expression is not valid: `'Revenue' >100`. It must have spaces like this: `'Revenue' > 100`.

If you try to apply a predicate to a dataset and the predicate is not valid, an error appears when any user tries to query the dataset.

IN THIS SECTION:

[Dataset Columns in a Predicate Expression](#)

You include at least one dataset column as part of the predicate expression.

[Values in a Predicate Expression](#)

The value in the predicate expression can be a string literal or number literal. It can also be a field value from the User object in Salesforce.

[Escape Sequences](#)

You can use the backslash character (\) to escape characters in column names and string values in a predicate expression.

[Character Set Support](#)

Wave Analytics supports UTF-8 characters in dataset column names and values in a predicate expression. Wave Analytics replaces non-UTF-8 characters with the UTF-8 symbol (). If Wave Analytics has to replace a non-UTF-8 character in a predicate expression, users may experience unexpected query results.

[Special Characters](#)

Certain characters have a special meaning in Wave Analytics.

[Operators](#)

You can use comparison operators and logical operators in predicate expressions.

[Sample Predicate Expressions](#)

Review the samples to see how to structure a predicate expression.

Dataset Columns in a Predicate Expression

You include at least one dataset column as part of the predicate expression.

Consider the following requirements for dataset columns in a predicate expression:

- Column names are case-sensitive.
- Column names must be enclosed in single quotes ('). For example, 'Region' == "South"
-  **Note:** A set of characters in double quotes is treated as a string rather than a column name.
- Single quotes in column names must be escaped. For example, 'Team\'s Name' == "West Region Accounts"

Values in a Predicate Expression

The value in the predicate expression can be a string literal or number literal. It can also be a field value from the User object in Salesforce.

Consider the following requirements for each value type.

Value Type	Requirements	Predicate Expression Examples
string literal	Enclose in double quotes and escape the double quotes.	<ul style="list-style-type: none"> • 'Owner' == "Amber" • 'Stage Name' == "Closed Won"
number literal	Can be a float or long datatype. Do not enclose in quotes.	<ul style="list-style-type: none"> • 'Expected_Revenue' >= 2000.00 • 'NetLoss' < -10000

Value Type	Requirements	Predicate Expression Examples
field value	<p>When referencing a field from the User object, use the <code>\$User.[field]</code> syntax. Use the API name for the field.</p> <p>You can specify standard or custom fields.</p> <p>When you define a predicate for a dataset, you must have read access on all User object fields used to create the predicate expression.</p> <p>However, when a user queries a dataset that has a predicate based on the User object, Wave Analytics uses the access permissions of the Insights Security User to evaluate the predicate expression based on the User object.</p> <p> Note: By default, the Security User does not have access permission on custom fields of the User object.</p> <p>To grant the Security User read access on a field, set field-level security on the field in the user profile of the Security User.</p>	<ul style="list-style-type: none"> • <code>'Owner.Role' == "\$User.UserRoleId"</code> • <code>'GroupID' == "\$User.UserGroupId__c"</code>

Escape Sequences

You can use the backslash character (\) to escape characters in column names and string values in a predicate expression.

You can use the `\'` escape sequence to escape a single quote in a column name. For example:

```
'Team\'s Name' == "West Region Accounts"
```

You can use the following escape sequences for special characters in string values.

Sequence	Meaning
<code>\b</code>	One backspace character
<code>\n</code>	New line
<code>\r</code>	Carriage return
<code>\t</code>	Tab
<code>\Z</code>	CTRL+Z (ASCII 26)
<code>\"</code>	One double-quote character
<code>\\</code>	One backslash character
<code>\0</code>	One ASCII null character

Character Set Support

Wave Analytics supports UTF-8 characters in dataset column names and values in a predicate expression. Wave Analytics replaces non-UTF-8 characters with the UTF-8 symbol (). If Wave Analytics has to replace a non-UTF-8 character in a predicate expression, users may experience unexpected query results.

Special Characters

Certain characters have a special meaning in Wave Analytics.

Character	Name	Description
'	Single quote	Encloses a dataset column name in a predicate expression. Example predicate expression: <code>'Expected_Revenue' >= 2000.00</code>
"	Double quote	Encloses a string value or field value in a predicate expression. Example predicate expression: <code>'OpportunityOwner' == "Michael Vesti"</code>
()	Parentheses	Enforces the order in which to evaluate a predicate expression. Example predicate expression: <code>('Expected_Revenue' > 4000 'Stage Name' == "Closed Won") && 'isDeleted' != "False"</code>
\$	Dollar sign	Identifies the Salesforce User object in a predicate expression. Example predicate expression: <code>'Owner.Role' == "\$User.UserRoleId"</code>
.	Period	Separates the object name and field name in a predicate expression. Example predicate expression: <code>'Owner' == "\$User.UserId"</code>

Operators

You can use comparison operators and logical operators in predicate expressions.

IN THIS SECTION:

[Comparison Operators](#)

Comparison operators return true or false.

[Logical Operators](#)

Logical operators return true or false.

Comparison Operators

Comparison operators return true or false.

Wave Analytics supports the following comparison operators.

Operator	Name	Description
==	Equals	<p>True if the operands are equal. String comparisons that use the equals operator are case-sensitive.</p> <p>You can also use this operator for multi-value fields. The expression evaluates to true if at least one value matches.</p> <p>Example predicate expression:</p> <pre>'Stage Name' == "Closed Won"</pre>
!=	Not equals	<p>True if the operands are not equal. String comparisons that use the not equals operator are case-sensitive.</p> <p>Example predicate expression:</p> <pre>'isDeleted' != "False"</pre>
<	Less than	<p>True if the left operand is less than the right operand.</p> <p>Example predicate expression:</p> <pre>'Revenue' < 100</pre>
<=	Less or equal	<p>True if the left operand is less than or equal to the right operand.</p>
>	Greater than	<p>True if the left operand is greater than the right operand.</p>
>=	Greater or equal	<p>True if the left operand is greater than or equal to the right operand.</p>

You can use the <, <=, >, and >= operators with measure columns only.

Logical Operators

Logical operators return true or false.

Wave Analytics supports the following logical operators.

Operator	Name	Description
&&	Logical AND	True if both operands are true. Example predicate expression: 'Stage Name' == "Closed Won" && 'isDeleted' != "False"
	Logical OR	True if either operand is true. Example predicate expression: 'Expected_Revenue' > 4000 'Stage Name' == "Closed Won"

Sample Predicate Expressions

Review the samples to see how to structure a predicate expression.

The samples are based on the following Opportunity dataset.

Opportunity	Expected_Rev	Owner	OwnerRoleID	Stage_Name	IsDeleted
OppA	2000.00	Bill	20	Prospecting	True
OppB	3000.00	Joe	22	Closed Won	False
OppC	1000.00	可爱的花	36	Closed Won	False
OppD	5000.00	O'Fallon	18	Prospecting	True
OppE		Joe	22	Closed Won	True

Let's take a look at some examples to understand how to construct a predicate expression.

Predicate Expression	Details
'OwnerRoleID' == "\$User.UserRoleId"	Checks column values in the User object.
'Expected_Rev' > 1000 && 'Expected_Rev' <= 3000	
'Owner' = "Joe" 'Owner' = "Bill"	
('Expected_Rev' > 4000 'Stage Name' == "Closed Won") && 'isDeleted' != "False"	Parentheses specify the order of operations.

Predicate Expression	Details
'Stage Name' == "Closed Won" && 'Expected_Rev' > 70000	
'Owner' == "可爱的花"	String contains Unicode characters.
'Owner' == "O\Fallon"	Single quote in a string requires the escape character.
'Stage Name' == ""	Checks for an empty string.

Datasets

A dataset is a collection of related data that is stored in a denormalized, yet highly compressed form. There are multiple ways to create datasets. You can also edit datasets after they've been created.

Tip: To ensure that you do not reach the limit (250 million) for the maximum number of rows in all registered datasets, deleted unused datasets.

SEE ALSO:

[Create a Dataset with External Data](#)

[Edit a Dataset](#)

[Delete a Dataset](#)

Start, Stop, and Reschedule Dataflow Jobs

The dataflow job runs on a daily schedule. You can reschedule the time that the job runs. If you don't want to wait for the scheduled run, you can start a job to load the data immediately. In addition, you can stop a job.

Note: You cannot run more than one instance of a dataflow at a time.

1. In Wave Analytics, click the gear icon () and then click **Data Monitor** to open the data monitor.
The data monitor has two views: Dataflow view and Job view. By default, the Dataflow view displays.
2. To perform tasks on the dataflow, click the actions list (1) for the dataflow.

USER PERMISSIONS

To access the data monitor:

- "Edit Wave Analytics Dataflows" or "Manage Wave Analytics"

To start a dataflow job:

- Edit Wave Analytics Dataflows

The actions list displays the following options: **Download**, **Upload**, **Start**, and **Schedule**.

3. Click **Start** in the actions list to run the dataflow job now.
The dataflow job is added to the job queue. The **Start** button is greyed out while the dataflow job is running.
4. To stop a dataflow job that is currently running, click **X** next to the job status.
If you click **Start** to restart a stopped dataflow, the job starts over—the dataflow job does not resume from the point at which it was stopped.
5. Click **Schedule** in the actions list to change the time the dataflow is scheduled to run.

Data Monitor

The data monitor provides options for you to manage jobs.

SEE ALSO:

[Start the Dataflow](#)

[Reschedule the Dataflow](#)

[Monitor a Dataflow Job](#)

[Monitor an External Data Upload](#)

External Data

You can integrate external data into Wave Analytics to make the data available for queries from explorer and designer.

The External Data API enables you to upload external data files to Wave Analytics. The External Data API can upload .csv files, and you can optionally specify the structure of your data by defining metadata in JSON format.

The External Data API is available in API version 31 and later.

The high-level steps for uploading external data by using the API are:

1. Prepare your data in CSV format, and then create a metadata file to specify the structure of the data.
2. Connect programmatically to your Salesforce organization.
3. Configure the upload by inserting a row into the InsightsExternalData object, and then set input values such as the name of the dataset, the format of the data, and the operation to perform on the data.
4. Split your data into 10-MB chunks, and then upload the chunks to InsightsExternalDataPart objects.
5. Start the upload by updating the `ACTION` field in the InsightsExternalData object.
6. Monitor the InsightsExternalData object for status updates, and then verify that the file upload was successful.

How to Look at a Salesforce Wave Analytics Dashboard

A dashboard isn't just for reading. It's for carrying on a conversation based on one or more datasets that matter to your company. Don't just look at the pictures—use the tools on the dashboard to dive deeper into the data that you care about. Go ahead, click around and explore!

You read a Salesforce Wave Analytics dashboard interactively by clicking its displayed elements. Every element is a picture of a live, filtered database query.

Selectors

A selector is a drop-down list that lets you filter down to a particular value that matters to you. Selectors are often tied to each other in sequence so that you can progressively drill deeper. For example, you can use one selector to look at sales of a product, then use the next selector to filter sales by region, and then use the next selector to filter sales regions by account.

Charts

A rich variety of charts shows you data from multiple angles. Many parts of a chart are interactive. For example, you can click a bar in a bar chart and watch what happens. Clicking the bar filtered the query that the bar chart represents. Your revision has changed other values in this chart, values in other charts, and number displays.

Numbers

Some information is best represented by a single number. Some number elements can be affected by filtering actions that you take on charts or selectors. For example, in a bar chart that shows individual salespeople's pipelines, clicking a specific bar can cause a number element to change to reflect the specific bar's value instead of the total value.

Ranges

A range element is a controller element for filtering other elements on the dashboard. For example, you can set the maximum and minimum sliders to make the dashboard show only the amounts that fall within a specific range. Watch the charts and numbers on the page change when you set the sliders.

Explore and Visualize Your Data

When sifting through an overwhelming amount of business data, sometimes you know exactly what you're looking for. Other times you don't, but you recognize it when you see it. Salesforce Wave Analytics gives you a fast, fluid way to discover the compelling stories within your data and to create the right visuals to tell your story.

After your data is uploaded, explore freely. Drill through the data by using interactive visualizations. Surface unexpected insights that can transform your business. Then let Wave Analytics do the work of producing dynamic charts that look sharp and communicate volumes.

IN THIS SECTION:

[Exploring and Visualizing Your Data Interactively](#)

Data exploration is an iterative process. It typically involves these steps: view, explore, refine, save, and share.

[Get Oriented in Wave Analytics](#)

Go to Wave Analytics by opening the Force.com app menu in the Salesforce header and then clicking **Wave Analytics**.

[Collections of Data in Wave Analytics](#)

Several kinds of data collections are available from the home page. Datasets, lenses, dashboards, and apps represent levels of data refinement—everything from raw data that's uploaded from your source systems to highly curated, packaged views of your data.

[Data Exploration Concepts](#)

As you learn how to explore and visualize your data, it's helpful to review key concepts such as visualization, measure, and dimension.

[Explore Your Data](#)

See what unexpected insights you can surface by interactively exploring and visualizing your data, using explorer tools.

[Clone a Visualization](#)

Build upon a visualization by cloning it to a new tab where you can continue exploring while saving the original in its own tab.

[Save a Visualization](#)

Save your visualization as a lens.

[Share a Visualization](#)

Share a visualization with your colleagues by posting to Chatter, getting its unique URL, or downloading a screenshot of it. A Chatter post provides an image and a link to the asset—lens, dashboard, or app—in Wave Analytics. Colleagues with the link and access to the asset can drill down and explore the information that's presented. To share without giving access to the asset, use the screenshot option.

[Export a Visualization as an Image](#)

Export your current visualization so that you can save it as an image file.

Exploring and Visualizing Your Data Interactively

Data exploration is an iterative process. It typically involves these steps: view, explore, refine, save, and share.

- View—View the data set.
- Explore—Get to know the boundaries and shape of your data. Play with different views, zoom in and zoom out, and see what you get with different charting options.
- Refine—Narrow your view to the most important data. Decide the level of detail and categorization that’s easiest for your colleagues to understand. Choose the most appropriate chart visualization.
- Save—Save your work.
- Share—Share your view with others. For a more packaged presentation, use your visualization to build a dashboard.

Get Oriented in Wave Analytics

Go to Wave Analytics by opening the Force.com app menu in the Salesforce header and then clicking **Wave Analytics**.

1. Open Wave Analytics.

The home page is your home base for exploring all the data that you have access to.

Collections of Data in Wave Analytics

Several kinds of data collections are available from the home page. Datasets, lenses, dashboards, and apps represent levels of data refinement—everything from raw data that’s uploaded from your source systems to highly curated, packaged views of your data.

- A *dataset* contains a set of source data, specially formatted and optimized for interactive exploration.
- A *lens* is a particular view into a dataset’s data. It’s where you do exploratory analysis and visualization.
- A *dashboard* is a curated set of charts, metrics, and tables based on the data in one or more lenses.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

USER PERMISSIONS

To access Wave Analytics:

- “Use Wave Analytics”

- An *app* contains dashboards, lenses, and datasets in any combination that makes sense for sharing your data analyses with colleagues. Apps are like folders: They allow users to organize their data projects—private and shared—and to control sharing.

Data Exploration Concepts

As you learn how to explore and visualize your data, it's helpful to review key concepts such as visualization, measure, and dimension.

A *visualization* is commonly a chart or graph, such as a bar chart, donut chart, timeline, or heat map. It can also be data in tabular form, such as a comparison table or pivot table. Every visualization has an underlying query, which is how Wave Analytics retrieves information from the source data.

A *measure* is a quantitative value, like revenue and exchange rate. You can do math on measures, such as calculating the total revenue and minimum exchange rate. Measures have names (revenue) and values (\$1,000,000). When you're viewing a chart visualization in Wave Analytics, it's important to remember:

- The chart either shows a slice of your data based on the number of or amount of something, or it shows tabular data.
- A measure is typically *aggregated* in some way, which means that it's displayed with some math already applied to it. For example, when you first view a dataset, you often see a simple aggregation such as the count of the number of rows. You typically aggregate by a different method—sum, average, maximum, and so on—as you explore and change or add measures, but you always specify how you want to aggregate at the time when you select the measure.
- You can identify measures by their position (the far left items in the top left corner of a lens) and by the text that indicates the aggregation method (such as Sum of Revenue).

Warning: If you perform a query that aggregates measures—like sum or group by—and the resulting value exceeds the maximum for a numeric field (36,028,797,018,963,967), the value overflows and Wave Analytics returns an incorrect result.

A *dimension* is a qualitative value, like region, product name, and model number. Dimensions are handy for grouping and filtering your data. Unlike measures, you can't perform math on dimensions. Like measures, dimensions also have names (region) and values (northeast). Time is usually considered a dimension rather than a measure.

Explore Your Data

See what unexpected insights you can surface by interactively exploring and visualizing your data, using explorer tools.

IN THIS SECTION:

[View Your Data in a Lens](#)

When you look at data in an exploratory mode, you do so in a *lens*. A lens has several aspects: it's how you view data in a dataset, it's the place where you explore the data graphically, and it's the basis for building any dashboard.

[Group Your Data into Categories](#)

Group data to organize it so that the data is displayed in useful categories. For example, to look for seasonal patterns in your sales cycle, group opportunity data by the month when deals close.

[Filter Your Data](#)

Apply filters in a lens to unclutter your chart and focus on the subset of data that's most relevant for your business unit, project, or management team. For example, limit your visualization to certain fiscal years.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

USER PERMISSIONS

To view visualizations:

- "Use Wave Analytics"

Change the Sort Order

Choose whether data in your chart visualization is sorted ascending, sorted descending, or unsorted.

Change the Chart Type

Switch between chart types to see which visualization options tell the most compelling story for your data.

Change Measures

Your choice of measure defines your entire visualization and determines the scope of your exploration. For example, change the measure and the aggregation method from “Count of Opportunities” to “Sum of Amount.” Then add a second measure to see two visualizations side by side.

Change the Chart Scale

Change the scale of a chart, such as applying a logarithmic scale. The options that are available depend on the chart type.

Create Calculated Columns Using the Compare Table

Use the Compare Table to define custom formulas with columns of data. View measures side by side, and perform math across the table’s columns and rows.

Return to a Previous View by Using History

Exploring your data can lead you down many paths. Not all of them will be fruitful, and that’s OK. Explorer keeps a full history of your activity in a lens. If you’ve changed your lens in undesired ways, or just want to see those nifty animations again, use history to backtrack quickly to a previous state in your visualization.

Apply Groups and Filters by Copying and Pasting Using Your Browser’s Clipboard

Sometimes you want to go multiple directions when exploring a dataset, such as trying different groupings or focusing on different angles. Instead of exploring linearly in a lens and using the history tool to backtrack and then branch off in a new direction, you can explore multiple directions at the same time by opening the same dataset in multiple Wave Analytics tabs. Then use explorer’s copy and paste tools to replicate specific groupings and filters from one tab to another.

View Your Data in a Lens

When you look at data in an exploratory mode, you do so in a *lens*. A lens has several aspects: it’s how you view data in a dataset, it’s the place where you explore the data graphically, and it’s the basis for building any dashboard.

1. From the home page, click a dataset or a lens.
A lens opens in a new tab. For example, this lens opens as a bar chart that shows the number of rows in an opportunity dataset.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

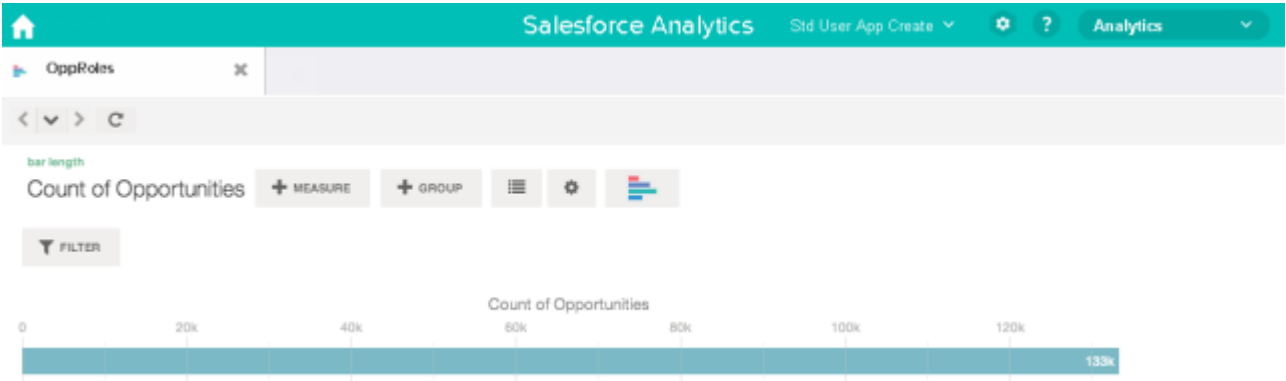

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To view visualizations:

- “Use Wave Analytics”

Group Your Data into Categories

Group data to organize it so that the data is displayed in useful categories. For example, to look for seasonal patterns in your sales cycle, group opportunity data by the month when deals close.

1. Click the **Group** button.

2. Using the search box, type the first few letters of the dimension that you want to group by, such as Close Date.

The dimensions in your data determine which categories you can group by.

3. Hover over the Close Date line. Click the **Scale** button that appears at the right.

4. In the Calendar Date Scale list, click Month.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

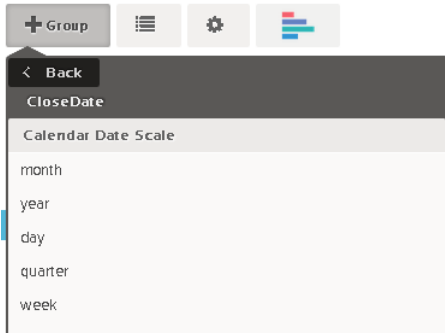

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

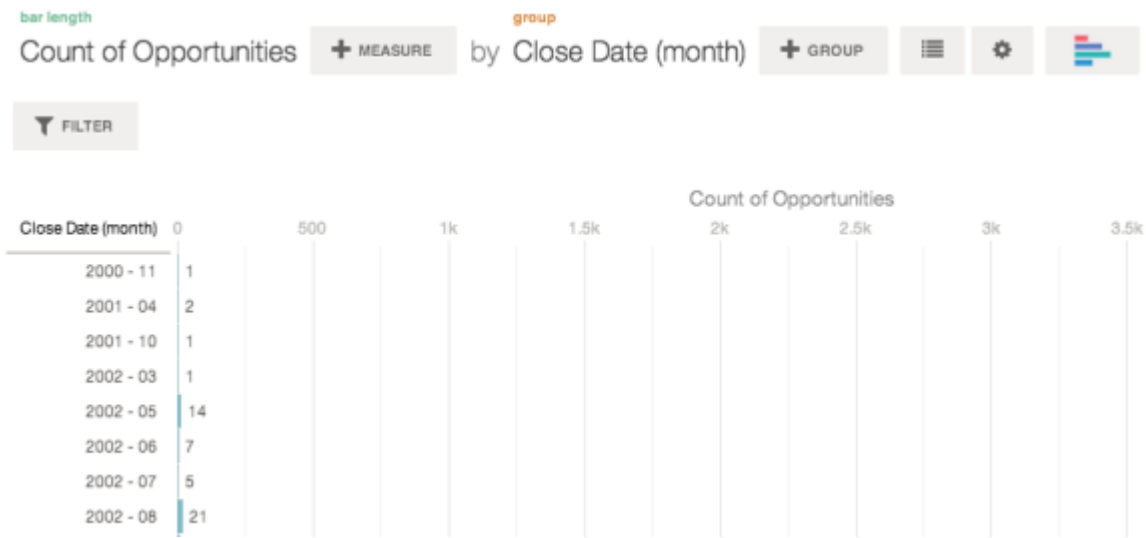

USER PERMISSIONS

To view visualizations:

- "Use Wave Analytics"

The bar chart changes from a single bar to multiple bars that show the data grouped separately by the closed year and month.

- To add a secondary grouping, also called a *stacked grouping*, click the **Group** button. Using the search box, find the StageName dimension, and then select it.

At this point, we're just adding a group. If you had clicked the **Filter** button, a group and a filter would have been added.

The visualization changes to show the data grouped by both dimensions. The entries in the last subgroup are assigned a color for each category, and the color legend is displayed on the right. You can have a maximum of four groupings in a lens.

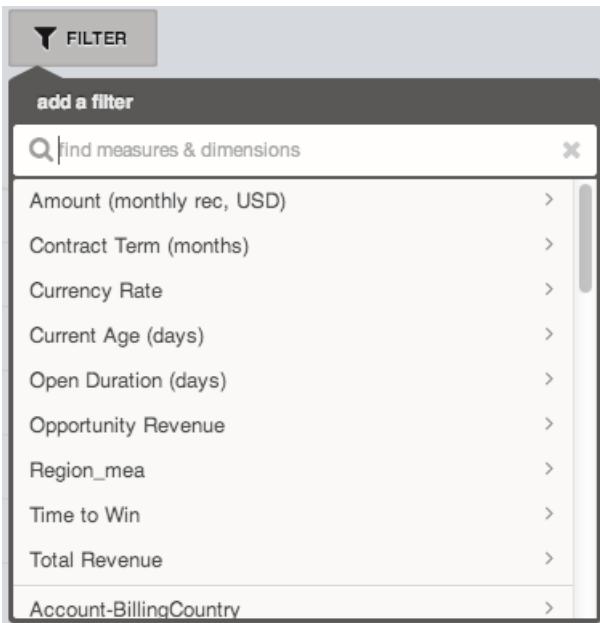

Filter Your Data

Apply filters in a lens to unclutter your chart and focus on the subset of data that’s most relevant for your business unit, project, or management team. For example, limit your visualization to certain fiscal years.

1. Click **Filter**.

In the Add a Filter dialog box, measures are listed at the top, followed by dimensions.

2. Select the FiscalYear dimension. The values for FiscalYear appear.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

USER PERMISSIONS

To view visualizations:

- “Use Wave Analytics”

3. Select 2012 and 2013, and then click **Add**. If you use the search box to find values to filter by, be aware that this search is case-sensitive. The filter that you've applied is displayed next to the **Filter** button.

The chart visualization changes to show data for fiscal years 2012 and 2013.

Change the Sort Order

Choose whether data in your chart visualization is sorted ascending, sorted descending, or unsorted.

1. Click the **Options** button.

2. In the dialog box, choose **Asc** (sorted ascending), **Dsc** (sorted descending), or **Off** (unsorted).

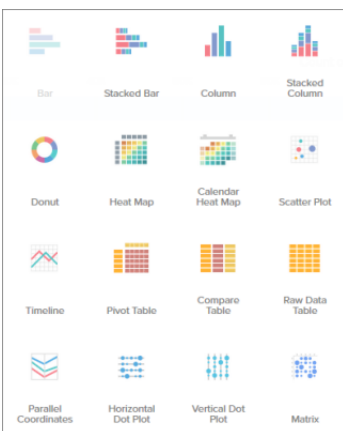

Change the Chart Type

Switch between chart types to see which visualization options tell the most compelling story for your data.

1. Click the **Change Chart Type** button.

A gallery of chart types that are available for this lens is displayed. Only visualizations that are valid for the underlying query are displayed.

2. Hover over a chart type to see how many measures and dimensions that type of visualization is suitable for. For example, a pie chart can have one measure and one or two dimensions.
3. Click a chart type, such as Stacked Bar.

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

USER PERMISSIONS

To view visualizations:

- “Use Wave Analytics”

- To add a second measure, click the **Measure** button.

- Click the aggregation **Average**, and then click the Open Duration (days) measure.

The new measure is displayed on the right.

- To move the new measure to the left, click Avg of Open Duration (days), and then click **< Move Left**.

The two visualizations swap positions.

- To add additional measures, click the **Measure** button again. You can have a maximum of four measures in a lens.

Change the Chart Scale

Change the scale of a chart, such as applying a logarithmic scale. The options that are available depend on the chart type.

1. Click the **Options** button.

2. In the dialog box, choose a scale.

Create Calculated Columns Using the Compare Table

Use the Compare Table to define custom formulas with columns of data. View measures side by side, and perform math across the table's columns and rows.

1. Select **Compare Table** from the chart type gallery.

2. Add dimensions by clicking **Group**.
3. Change the first measure by clicking the **cells** selection ("Count of Rows"). Add more measures by clicking the arrow in the measure column header and then selecting **add a column**.

With the new column selected, click the **cells** selection to change the measure. You can also apply a filter by clicking the header of a measure column to select it and then clicking **Filter**.

Opportunity Owner	Opportunity Amount ^A	Expected Revenue ^B	Expected Revenue ^C
Ely East	134,381,275		
Bill West	89,291,860		
James Barry	78,821,529		
Cindy Central	77,106,000		
Kasey Central	76,590,000		
Ricky East	74,472,500		
Wendy West	69,786,500		
Tom Reseller	43,385,600		
Jamie Preston	9,355,000		
Sean Silver	4,060,000		
Barry Bronze	4,060,000		
Ted Data	3,039,560		

Notice that dimension columns are on the left and measure columns are on the right. The measure columns are identified in formulas as A, B, C, and so on, with A being the far left measure column.

4. Add a measure column to hold a custom formula, and then select **edit formula and format** from the drop-down menu.

Edit Column Details

Enter a custom column name, define a formula for the column, or set the data format for the column...

column name

formula

data format

In the **formula** field, create formulas using operators from this table.

 **Note:** Measure columns are identified by uppercase letters from left to right.

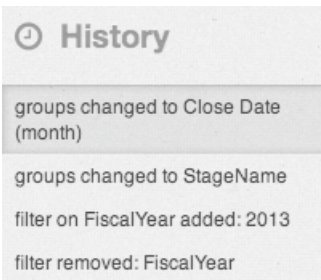

Symbol	Examples	Calculation
+	A+B, A+100	Addition, applied per row.
-	A-B, A-100	Subtraction, applied per row.
/	A/B, A/100	Division, applied per row.
*	A*B, A*100	Multiplication, applied per row.
()	(B-A)/(A*100)	Parentheses for grouping operations.

 **Tip:** Use Compare Tables for simple, ad hoc calculations. If a particular calculated value is needed frequently or is more complex, consider performing the calculation at the source data level.

Return to a Previous View by Using History

Exploring your data can lead you down many paths. Not all of them will be fruitful, and that's OK. Explorer keeps a full history of your activity in a lens. If you've changed your lens in undesired ways, or just want to see those nifty animations again, use history to backtrack quickly to a previous state in your visualization.

1. Click the **View History** button  in the header. A sidebar lists a history of all the actions that you've taken in the lens.

2. Select any item in the list to go to that point. Or use the buttons to **Step Backward**  and **Step Forward**  through the list.

Apply Groups and Filters by Copying and Pasting Using Your Browser's Clipboard

Sometimes you want to go multiple directions when exploring a dataset, such as trying different groupings or focusing on different angles. Instead of exploring linearly in a lens and using the history tool to backtrack and then branch off in a new direction, you can explore multiple directions at the same time by opening the same dataset in multiple Wave Analytics tabs. Then use explorer's copy and paste tools to replicate specific groupings and filters from one tab to another.

From the home page, each time you click a dataset, it opens in a new tab. The copy and paste tools in explorer are designed to be used when you have the same dataset in multiple tabs.

1. If the chart type that you're viewing allows you to select a subset of data, make your selection by clicking or by clicking and dragging within the chart. Everything except your selected data is unavailable.
2. Click the **Actions** button.

3. Copy the selection to your browser's clipboard. Click **Copy** to capture the selected items in the clipboard. You can decide later whether to paste your selection as a group or as a filter. Click **Focus** to both capture the selected items in the clipboard and apply them as a filter to the current chart.
4. Switch to a different Wave Analytics tab that has the same dataset.
5. Click the **Actions** button.

Share a Visualization

Share a visualization with your colleagues by posting to Chatter, getting its unique URL, or downloading a screenshot of it. A Chatter post provides an image and a link to the asset—lens, dashboard, or app—in Wave Analytics. Colleagues with the link and access to the asset can drill down and explore the information that’s presented. To share without giving access to the asset, use the screenshot option.

1. Click **Share**.

2. Click the tab for the sharing method that you want:
 - a. **Post to Feed** posts to Chatter an image and link to the lens, dashboard, app. Select **User** or **Group** feed, enter the name, and then type your comment. You can also remove the image from your post by hovering over it and clicking the **x**. Note that posted images are public.
 - b. **Get URL** provides a unique URL to the asset. Copy the link and then paste it wherever you want to share it.
 - c. **Get Screenshot** gives you a static image to share without giving access. Click the image to download it as a .png file.
3. If applicable, click **Give Access** to set the level of sharing access.
4. Click **Done**.

 **Note:** To share a visualization, you must give access to the app that contains it. Lenses, datasets, and dashboards within the default Shared App are accessible to all Wave Analytics users, unless administrators have restricted access. All other apps are private unless someone with Manager access to the app has shared it with a specific user, group, or role.

Export a Visualization as an Image

Export your current visualization so that you can save it as an image file.

1. Click the **Actions** button.

2. Click **Export as Image**.
A new browser window opens with the visualization in a .png image file.
3. Right-click the image, and then choose **Save Image As...**
4. Type a file name, and then click **Save**.

Support Decisions with a Wave Analytics Dashboard

You've explored your data, picking out the useful themes and patterns. You've created one or more lenses. Now you can design a dashboard to help your audience turn data into decisions.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

Here's what a dashboard can look like when it's fully fleshed out. We'll show you step by step some of the basic concepts to get started creating dashboards, along with some best practices and design tips.

No two dashboards are quite the same, so every dashboard tells a unique story. The universe of stuff that you can show in a dashboard is infinite, so we won't try to tell you exactly what to do.

Tip: Although steps are laid out in order, you don't have to follow the sequences exactly, and some steps are optional.

IN THIS SECTION:

1. [Plan Your Dashboard](#)

Building a dashboard that delivers real ongoing value requires planning and making choices. Plan your dashboard to help narrow your audience's focus to a manageable set of questions for basing actions upon, and to support ongoing updates so that your audience can see a coherent picture over time.

2. [Sketch Your Dashboard](#)

It's usually a good idea to sketch your dashboard on paper or a whiteboard before you start building. Doing so helps you anticipate ways that your audience might use the dashboard and address potential gaps.

3. [Build Your Dashboard](#)

When you've thought through the purpose and design of your dashboard, you're ready to assemble the visual queries that you need to make it real.

SEE ALSO:

[What Is a Dashboard?](#)

Plan Your Dashboard

Building a dashboard that delivers real ongoing value requires planning and making choices. Plan your dashboard to help narrow your audience's focus to a manageable set of questions for basing actions upon, and to support ongoing updates so that your audience can see a coherent picture over time.

It's a good idea to start with a written plan for the dashboard. Use your plan to define the dashboard's focus up front, and then stick to the plan. Identify the specific question, business process, or user group that the dashboard will support, and eliminate anything that doesn't support those.

1. Who is the audience?

Will the dashboard be used by the executive team, the marketing team, a sales team, or another group? It's important to ensure that each dashboard presents data that's specific to a single audience.

For example, for a sales manager planning a dashboard for a weekly sales team meeting, the audience is the attendees of that meeting.

2. What does the audience need to measure?

What questions does the audience need to answer to meet its goals? Continuing our sales manager example, let's assume that the audience wants to know what each salesperson's pipeline looks like and how the overall pipeline is doing.

3. How often does the audience need to update its knowledge?

Does the executive team need quarterly financials? Does the marketing team want to monitor daily lead generation numbers?

For our example, let's assume that the sales team meets weekly to go over its pipeline status.

SEE ALSO:

[What Kind of Dashboard Should I Create?](#)

Sketch Your Dashboard

It's usually a good idea to sketch your dashboard on paper or a whiteboard before you start building. Doing so helps you anticipate ways that your audience might use the dashboard and address potential gaps.

Keep in mind that a chart in Wave Analytics is primarily a way to ask questions, not a way to illustrate a conclusion. A good dashboard invites the audience to drill down and seek ever more focused and useful information.

Consider these widely accepted best practices as you sketch out your own dashboard.

1. Prioritize elements, top left to bottom right.

With languages that are read left to right, people start by looking at the upper left corner and working their way down. Consider the audience's language and design for it. If your audience has limited time or attention, place important elements where they will be noticed.

a. Place more general, actionable information in charts near the top left, and place charts with supporting information lower.

- b. Place charts that can be read at a glance high and to the left, and place more detailed charts lower.

For example, a chart that displays a single measure, such as revenue for the current quarter, is most effective when above and to the left of a chart that breaks revenue down by region or month.

Highlight facts that the audience wants to know at a glance.

Summary			
123,332,969	86,542,563,143	29	701.70 mi
Flights	Miles Flown	Carriers	Average Flight Distance

2. Choose chart types by the characteristics of the data, not for look or variety.

For example, if most of your charts display value changes over time, it's OK if they're all line graphs.

3. Don't overload the dashboard. Leave some empty space, and make every pixel carry information.

If a chart seems to need a lengthy caption or title, reconsider whether the chart is doing its job. Well-chosen data often speaks for itself.

Build Your Dashboard

When you've thought through the purpose and design of your dashboard, you're ready to assemble the visual queries that you need to make it real.

IN THIS SECTION:

1. [Create a Dashboard](#)

Combine snapshots in a dashboard to tell a story about a dataset for a particular audience. A snapshot is a view through a lens shaped by one or more filters.

2. [Show Point-in-Time Data on Your Dashboard](#)

Widgets are the units that contain the information that you want to show to your audience. A dashboard is a collection of widgets that work together to tell a data story from multiple angles.

3. [See Your Data from Multiple Angles](#)

Widgets that come from the same dataset are faceted by default. Faceting means that when you filter one widget, all the related widgets are filtered in the same way. You can turn faceting on or off for each widget.

4. [Show a Number on Your Dashboard](#)

Sometimes information is best presented as a number. For example, to someone who's responsible for reducing the number of new support cases, a box that contains only the number of new support cases this week is useful for keeping track of the situation at a glance. A few numbers arranged close to each other can help provide context.

5. [Add a Picture to Your Dashboard](#)

Add graphics to your dashboard to help your audience with context and to make the dashboard more fun to read. For example, if your dashboard is designed to help track sales of multiple products, consider distinguishing the products by their logos.

6. [Arrange Your Dashboard](#)

Use visual groupings and text to direct your audience's attention to the information that it needs.

7. [Link from Your Dashboard to a Lens or Another Dashboard](#)

Linking from your dashboard to a lens or another dashboard is a useful way to curate related sets of data.

8. [See Details About a Widget's Lens](#)

To ensure that a widget is showing the right data, review details about the widget's lens.

9. [Filter or Remove Lenses Clipped to Your Dashboard](#)

Filter lenses clipped to your dashboard, or remove ones that aren't in use.

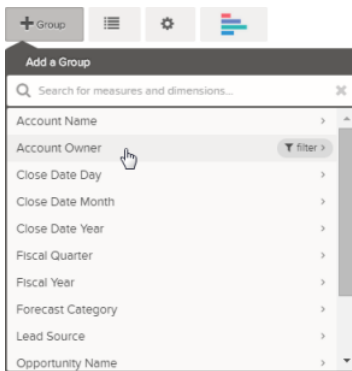

SEE ALSO:

[Dashboard Keyboard Shortcuts](#)

Create a Dashboard

Combine snapshots in a dashboard to tell a story about a dataset for a particular audience. A snapshot is a view through a lens shaped by one or more filters.

1. From the home page, open one of the lenses. For example, let's open the Opportunities lens.
2. Group the data by Account Owner.

3. Click **Clip to Designer**.

4. Remove the Account Owner grouping, and then create another grouping by Stage Name.
5. Clip to the designer again.

In the dashboard designer, find the two snapshots that you just created. We'll use them to create a useful pair of dashboard components.

Show Point-in-Time Data on Your Dashboard

Widgets are the units that contain the information that you want to show to your audience. A dashboard is a collection of widgets that work together to tell a data story from multiple angles.

For our first widget, let's give the audience a clickable view of each salesperson's pipeline.

1. Create a chart by clicking the chart icon.
2. In the list of query snapshots on the left, click one of the snapshots that you previously created. For this example, we'll click the Account Owners snapshot.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

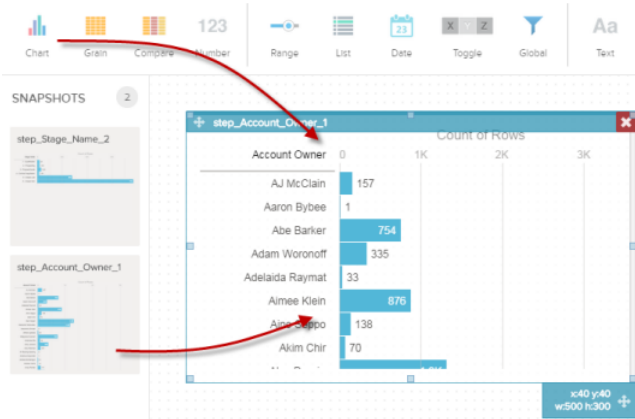

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

The chart widget is now a chart of the results from that query.

3. Create another chart by clicking the chart icon again. (If required, move your first chart out of the way.)
4. In the list of query snapshots, click one of the snapshots. For this example, we'll click the Stage Name snapshot.

The new chart widget is now a chart that shows how many opportunities are in which stage.

5. Click **Run**.

Now you're looking at the audience's view of your dashboard, and you're ready to ask some questions.

See Your Data from Multiple Angles

Widgets that come from the same dataset are faceted by default. Faceting means that when you filter one widget, all the related widgets are filtered in the same way. You can turn faceting on or off for each widget.

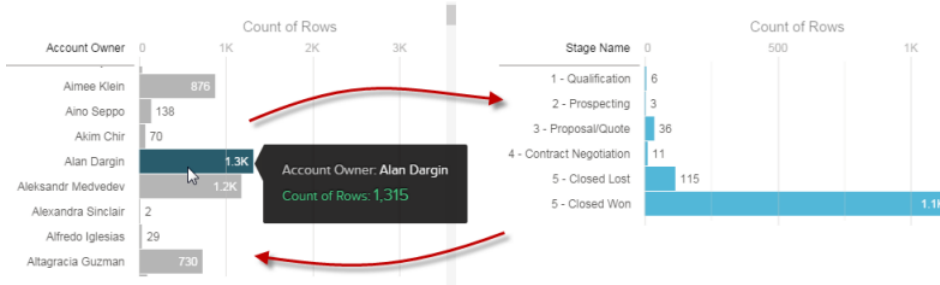

1. Click an element in one of your widgets. For example, in the Account Owners widget, click the bar for any salesperson.
The other chart, labeled Stage Name, changes to show how many accounts that salesperson has in each stage.
2. In the Stage Name chart, click the bar for any stage. The Account Owners chart changes to show the values of the deals that each salesperson has in that stage.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

What you’re seeing is faceting in action. Each of your widgets shows the same set of data from a different angle. Filtering one subset of your data (for example, the Account Owner widget) makes the other subset (the Stages widget) change to show its data filtered in the same way.

Show a Number on Your Dashboard

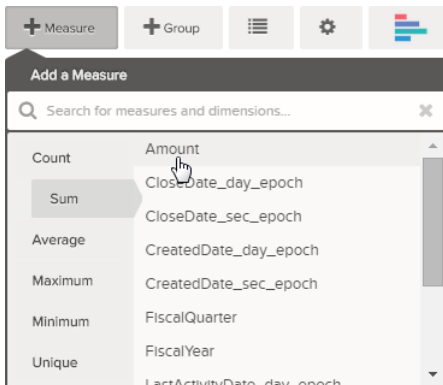

Sometimes information is best presented as a number. For example, to someone who’s responsible for reducing the number of new support cases, a box that contains only the number of new support cases this week is useful for keeping track of the situation at a glance. A few numbers arranged close to each other can help provide context.

1. Open a lens, and add a measure that represents some interesting information.

For example, in the Opportunities lens, a value such as “Sum of Amount” is an easy choice.

- a. In the measure picker, select `Sum` from the left column.
- b. Pick a value from the right column that makes sense as a sum, such as `Amount`.

Note: Don’t add any groupings. A number, by definition, consists of just one group.

2. While we’re here, let’s add another kind of measure to bring more context to the story that we’re telling with this dashboard. For example, you can select `Count of iswon` to get the number of successfully closed deals.
3. Click to clip this snapshot to the designer.

Tip: If you have multiple dashboards, the snapshot is clipped to whichever dashboard you had open last.

EDITIONS

Available in: **Salesforce Classic** and **Lightning Experience**

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise**, **Performance**, and **Unlimited Editions**

4.  In the dashboard designer, click Number to create an empty number widget, and then click the snapshot that you just clipped to the designer.
The number that appears in the number widget is the first measure (on the far left) that you specified in the lens. In the **Widget Properties** panel, select the measure to use for each number widget.
5. Use **Widget Properties** to make your display as useful as it can be. For example:
 - a. Give the widget a title. The default title, which is taken from the field name, is sometimes too cryptic for the audience.
 - b. For a large number, select **Compact** to reduce the length of the display. Doing so turns a number such as 2,148,352 into the more readable 2M.

Add a Picture to Your Dashboard

Add graphics to your dashboard to help your audience with context and to make the dashboard more fun to read. For example, if your dashboard is designed to help track sales of multiple products, consider distinguishing the products by their logos.

1. Upload the image that you want to use to Documents.
2. Copy the record ID for the document in the URL in the address bar.
3. In the dashboard editor, create a box widget.
4. In **Widget Properties**, paste the record ID that you copied from the document URL into the IMGURL field.

[Uploading and Replacing Documents](#)

Arrange Your Dashboard

Use visual groupings and text to direct your audience's attention to the information that it needs.

IN THIS SECTION:

[Add Text to Your Dashboard](#)

Use text to highlight important bits of data or areas of your dashboard.

[Add a Box to Your Dashboard](#)

Visual containers can help your audience make sense of the information on a dashboard.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

Add Text to Your Dashboard

Use text to highlight important bits of data or areas of your dashboard.

1. In the ribbon at the top of the page, click **Text**.

2. In the text widget that appears on the canvas, type *"Hello, World!"*

Add a Box to Your Dashboard

Visual containers can help your audience make sense of the information on a dashboard.

1. In the ribbon at the top of the page, click **Box**.

A box widget is added to the canvas.

2. Press the "[]" key on your keyboard to move the box under the Text widget.
3. Drag or use the arrow keys to position the box under the Text widget.
4. Select the bottom corner of the box, and drag to resize the box.

Link from Your Dashboard to a Lens or Another Dashboard

Linking from your dashboard to a lens or another dashboard is a useful way to curate related sets of data.

1. In the ribbon at the top of the page, click **Link**.
2. In the Widget Properties, specify link properties.

Destination Type

Specify whether the link widget leads to a saved lens, a saved dashboard, or a new lens.

Destination

The lens or dashboard to which the link leads.

Include Dashboard State

When enabled, the selections, filters, ranges, and other states applied by a dashboard viewer are transferred to the linked lens or dashboard.

 **Note:** When transferring states, Wave Analytics checks to make sure that the destination has lenses that are compatible with the lenses from the source dashboard.

On a lens-by-lens basis, these conditions prevent dashboard state from being transferred:

- The destination lens uses a different dataset than the source lens.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

- When linking to another dashboard, the destination lens uses different groupings than the source lens. If the link destination is a lens, then groupings don't prevent dashboard state from being transferred.

Text

The message that makes up the clickable part of the link.

Text Color

The color of the text.

Font Size

The size of the text.

See Details About a Widget's Lens

To ensure that a widget is showing the right data, review details about the widget's lens.

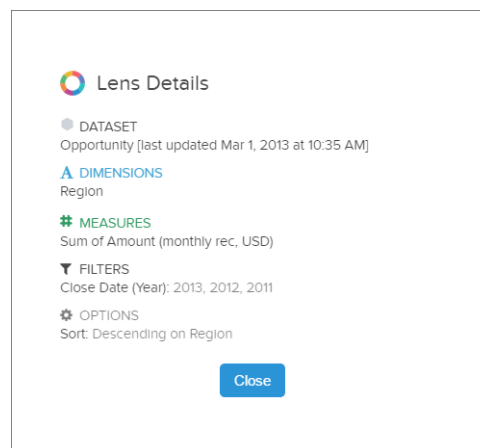

1. Hover over a widget and click .

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

Lens details display.

2. Review the dataset and applied dimensions, measures, filters, and other details about the widget's lens.

Filter or Remove Lenses Clipped to Your Dashboard

Filter lenses clipped to your dashboard, or remove ones that aren't in use.

1. From the lens menu, filter by **All Lenses**, **Active Lenses**, or **Unused Lenses**.

2. Optionally, if a lens is unused, then you can remove it from your dashboard by clicking . If the lens is saved to Wave Analytics, then it's still available and can be opened from Lenses after being removed from your dashboard.

Background Information about Dashboards

Here's some general information about Wave Analytics dashboards to supplement the instructions for planning, sketching, and building dashboards.

IN THIS SECTION:

[What Is a Dashboard?](#)

A dashboard is a vehicle for telling a specific, focused story about a dataset that your audience can act on. It consists of a curated set of charts, metrics, and tables based on the data in a lens.

[What Kind of Dashboard Should I Create?](#)

Dashboards can support many kinds of knowledge seeking: operational, strategic, or analytical. Sometimes a dashboard serves a combination of purposes, but it's a good idea to keep your dashboard focused on a single purpose.

[Dashboard Keyboard Shortcuts](#)

You can do some basic dashboard design actions from your keyboard.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

What Is a Dashboard?

A dashboard is a vehicle for telling a specific, focused story about a dataset that your audience can act on. It consists of a curated set of charts, metrics, and tables based on the data in a lens.

When you share Wave Analytics data via a dashboard, you're setting up your audience members to do some exploring of their own, without turning them loose on the whole data set.

One use of a dashboard is to provide a focus for your audience. A dataset can contain vast amounts of data. Some of that data is relevant to specific questions that your audience has; some of that data is irrelevant noise. Data that's critical to one set of questions is sometimes noise in relation to another set of questions.

Keep in mind that even though we call it a dashboard, we're actually doing much more with this interface than we do with a traditional dashboard in a car. This dashboard doesn't just tell us what's changed; it invites us to dig deeper into the underlying data. It's like using the speedometer in a car to tell us not just how fast we're going but how our speed has changed at various points in our trip, how traffic conditions ahead of us are changing, and how those changes affect our arrival time.

SEE ALSO:

[Support Decisions with a Wave Analytics Dashboard](#)

What Kind of Dashboard Should I Create?

Dashboards can support many kinds of knowledge seeking: operational, strategic, or analytical. Sometimes a dashboard serves a combination of purposes, but it's a good idea to keep your dashboard focused on a single purpose.

 **Tip:** Whatever their purpose, the best dashboards are self-contained and present a full picture so that the audience does not have to scroll or click to other resources.

Operational Dashboards

An operational dashboard is for keeping track of fast-changing data that can make a difference in day-to-day operations. An operational dashboard is consulted 24/7. Its audience expects real-time or near-real-time data.

For example, to monitor server uptime and utilization or to track the number of support cases that your call center takes each week, an operational dashboard provides the best solution.

Strategic Dashboard

A strategic dashboard presents an overview of business developments. Executives can use it to track key performance indicators and support decisions about overall direction. The audience expects a strategic dashboard to expose problems and opportunities, not to list issues for immediate resolution.

For example, a strategic dashboard for sales executives can show total sales figures grouped by region, total revenue for the quarter, or headcount grouped by department.

Analytical Dashboards

An analytical dashboard supports diving deep into operational or strategic data to find trends and make predictions. The audience wants to look at massive amounts of data, run what-if scenarios, and discover new questions that it hasn't thought of yet.

The audience typically works with an analytical dashboard on a monthly, quarterly, or even annual basis. Access to day-to-day updates isn't as important here as it is for operational or strategic dashboards.

[Build Your Dashboard](#)

Incorporate Wave Analytics Throughout Your Business

The great Wave Analytics visualizations you've built are more powerful when you share them across your Salesforce experience by integrating them into custom pages, Visualforce pages, community sites, and more. In addition, custom menus in lenses and dashboards allow you to perform common Salesforce actions directly from Wave.

IN THIS SECTION:

[Embed Your Dashboard in a Salesforce Page](#)

Add a Wave Analytics dashboard to a detail page layout. On an account detail page, for example, show your users a dashboard of service issues associated with the account. Users can drill in, apply filters, and explore in the dashboard as if they were viewing it in a Wave Analytics window.

[Add a Wave Analytics Dashboard to a Visualforce Page](#)

By embedding a Wave dashboard into a Visualforce page, you can provide an interactive presentation of your data. Users can drill in and explore the dashboard within the frame on the Visualforce page or in a new window in Wave Analytics.

[Embed Wave Dashboards in Lightning Pages \(Pilot\)](#)

Add a Wave Analytics dashboard component to a Lightning Home or Record Page to provide an interactive visualization of your data. Users can drill in and explore the dashboard within the frame on the Lightning Page or in a Wave Analytics window.

[Share Apps with Communities \(Pilot\)](#)

With Wave Analytics for Communities, external users can view apps shared with them via Wave dashboards embedded in Visualforce pages on their community.

[Enable Actions and Open Record Links With Custom Actions Menus](#)

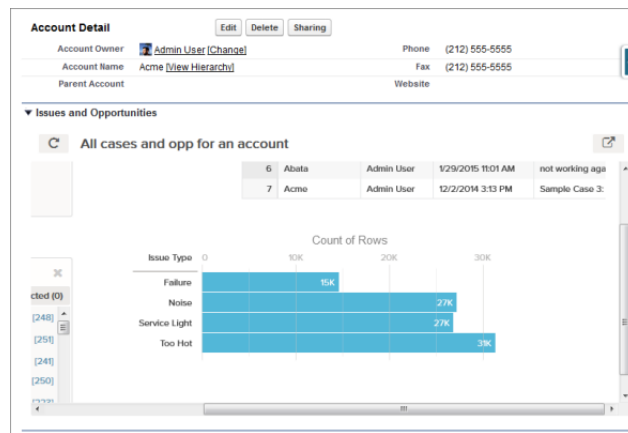

Custom menus in Wave Analytics lenses and dashboards let users take advantage of actions and open records from Salesforce or other websites..

Incorporate Visualizations through Chatter Posts and Sharing Links

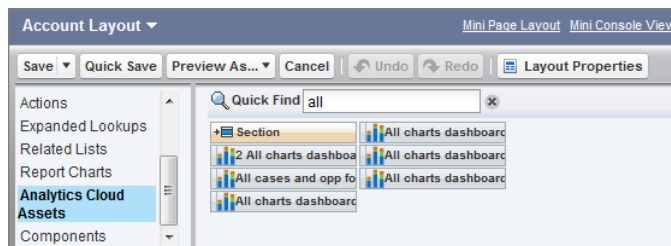

Share a visualization with your colleagues by posting to Chatter, or by getting its unique URL. A Chatter post provides an image and a link to the asset—lens, dashboard, or app—in Wave Analytics. Colleagues with the link and access to the asset can drill in and explore the information that's presented.

Embed Your Dashboard in a Salesforce Page

Add a Wave Analytics dashboard to a detail page layout. On an account detail page, for example, show your users a dashboard of service issues associated with the account. Users can drill in, apply filters, and explore in the dashboard as if they were viewing it in a Wave Analytics window.

1. In the enhanced page layout editor, select Wave Analytics Assets in the left column of the palette.

2. Drag an item from the list of available dashboards to a detail section on the page layout.
3. After the dashboard is positioned in the layout, you can change properties such as height and width by double-clicking the element or clicking the wrench icon next to it (🔧).

Use field mapping to map data fields in the dashboard to the object's fields, so that the dashboard shows only the data that's relevant for the record being viewed. You can specify fields from multiple datasets. Identify each dataset by its system name, which is listed on the dataset's edit page. Identify the data fields by row, and for the values, specify either the field names from the Salesforce object or specific values. The JSON field mapping follows this format:

```
{
  "dataset1_system_name": {
    "row_name": ["$field_name"],
    "row_name": ["$field_name"]
  }
}
```

```

    },
    "dataset2_system_name": {
      "row_name": ["$field_name"],
      "row_name": ["$field_name"]
    }
  }
}

```

For example, if the dashboard shows data from a dataset named Service, with the dimensions Account and Industry, the field mapping would be defined as:

```

{
  "service": {
    "account": ["$Name"],
    "industry": ["$Industry"]
  }
}

```

Additional properties of Wave Analytics Assets:

- The `Show title` checkbox gives you control over the visibility of the dashboard title.
- The `Hide on error` checkbox gives you control over whether a Wave Analytics asset appears if there is an error (such as the dashboard can't be found).
- Dashboards include the date and time when they were last refreshed.

For information about working with the enhanced page layout editor, see [Customizing Page Layouts with the Enhanced Page Layout Editor](#).

Be aware of these limits and limitations:

- You can add one dashboard per page layout.
- Wave Analytics dashboards aren't supported in the original page layout editor. If you use the original page layout editor to open a layout that was created in the enhanced page layout editor, the original page layout editor will delete any Wave Analytics dashboard as soon as you save the layout.

Add a Wave Analytics Dashboard to a Visualforce Page

By embedding a Wave dashboard into a Visualforce page, you can provide an interactive presentation of your data. Users can drill in and explore the dashboard within the frame on the Visualforce page or in a new window in Wave Analytics.

You can add one dashboard per Visualforce page. However, the dashboard can include links to other dashboards or Wave Analytics assets. You can also set filters to be applied at run time, control the visibility of the dashboard's title, and specify whether the dashboard appears on the page, if an error occurs.

To add a dashboard to your Visualforce page, configure the `<wave:dashboard>` component. With the `filter` attribute, you can use JSON to filter dataset fields at run time. With the `openLinksInNewWindow` attribute, you can specify where links from the dashboard to other assets are opened.

Here are two examples. Note that the dashboard is identified by the `dashboardId`, which is an 18-character code beginning with 0FK. You can find the `dashboardId` at the end of the URL when viewing a dashboard.

```
<apex:page sidebar="true" standardController="account">
```

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

```
<wave:dashboard dashboardId="0FKB000000006Y7OAI"
  showTitle="true"
  height="475px"
  openLinksInNewWindow="true"
  filter="{ 'opportunities': { 'Id': ['!Account.Id'] }}" />
</apex:page>
```

```
<apex:page sidebar="true" standardController="account">
  <wave:dashboard dashboardId="0FKB000000006Y7OAI"
    showTitle="true"
    height="1500px"
    openLinksInNewWindow="false"
    filter="{ 'service': { 'account': ['!Account.Name'] }, 'industry': [
    '!Account.Name'] }}" />
</apex:page>
```

 **Note:** Only dimensions that have a list selector on the dashboard can be included in the `filter` attribute JSON.

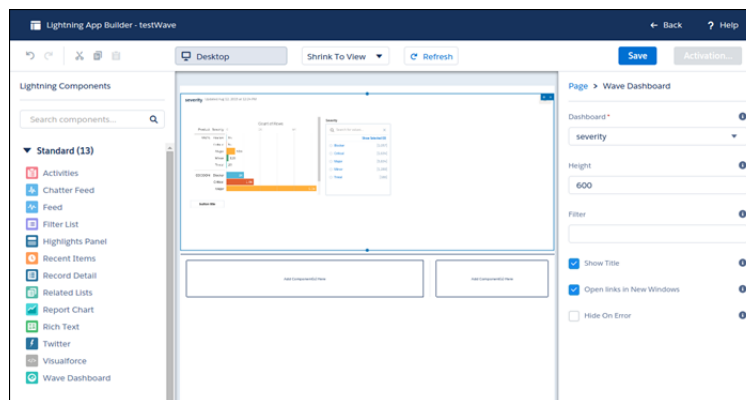

For more information about embedding Wave Analytics, see the `wave:dashboard` component in the [Visualforce Developer's Guide Standard Component Reference](#).

Embed Wave Dashboards in Lightning Pages (Pilot)

Add a Wave Analytics dashboard component to a Lightning Home or Record Page to provide an interactive visualization of your data. Users can drill in and explore the dashboard within the frame on the Lightning Page or in a Wave Analytics window.

 **Note:** Wave Analytics for the Lightning App Builder is in pilot. Contact your Salesforce account executive to enable this feature.

To add a dashboard to your Lightning Page, select the **Wave Dashboard** component and then select the dashboard to display. You can control the visibility of the dashboard's title and specify whether the dashboard appears on the page if an error occurs. With the **Open Links in New Windows** attribute, you can specify where links from the dashboard to other assets are opened.

With the **Filter** attribute, you can use JSON to filter dataset fields at run time. For example:

```
{datasetDeveloperName1:{field1:[value]},datasetDeveloperName1:{field1:[value1,value2],field2:["value3,with comma"]}}
```

 **Note:** Only dimensions that have a list selector on the dashboard can be included in the **Filter** attribute JSON.

Share Apps with Communities (Pilot)

With Wave Analytics for Communities, external users can view apps shared with them via Wave dashboards embedded in Visualforce pages on their community.

 **Note:** Wave Analytics for Communities is in pilot. Contact your Salesforce account executive to enable this feature.

Community partner and customer users can view embedded Wave dashboards when their Salesforce org has the Wave Community permission and preference enabled. Also, `Enable Wave Analytics for Communities` must be selected in the Wave Analytics Settings for the org. Access to apps is then given by selecting **Share** from a Wave app or dashboard.

In the Share dialog, community partners and customers are highlighted in orange to distinguish them as external users. They are given **Viewer** access only. From their community, they can drill in and explore the dashboard, while all other areas of Wave remain inaccessible and secure.

 **Note:** This feature is supported in communities but not in portals.

For more information about building Communities, see [Getting Started With Communities](#). For more information about embedding Wave Analytics, see the `wave:dashboard` component in the [Visualforce Developer's Guide Standard Component Reference](#).

Enable Actions and Open Record Links With Custom Actions Menus

Custom menus in Wave Analytics lenses and dashboards let users take advantage of actions and open records from Salesforce or other websites.

Custom actions menus in Wave lenses and dashboards let your team use quick actions on Salesforce objects as well as open records from Salesforce or elsewhere on the web. Developers or administrators edit the [Extended Metadata \(XMD\)](#) file for a dataset to create menus that are part of the following Wave chart and table interface elements:

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

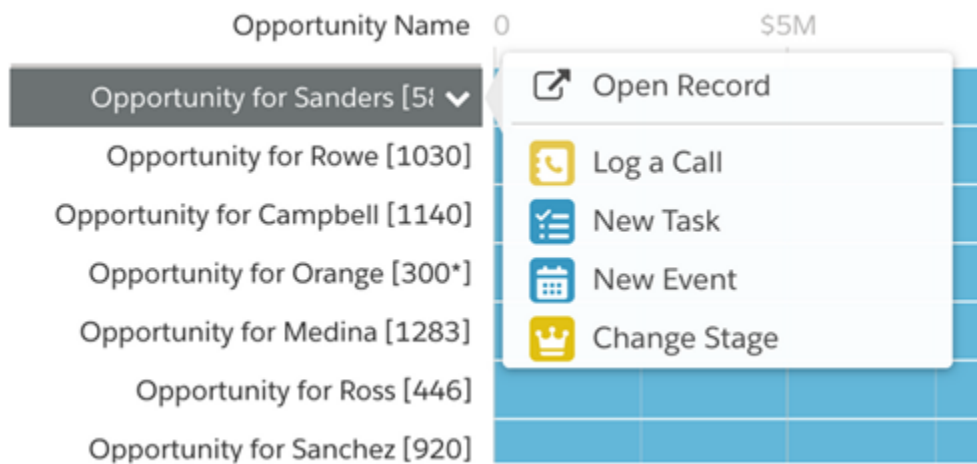

USER PERMISSIONS

To view visualizations:

- "Use Wave Analytics"

To edit a dataset's extended metadata (XMD) file:

- Edit Wave Analytics Dataflows

- Value labels on charts (such as "Opportunity for Sanders" in the image above).

- Legend value labels in table cells.

- Values in table cells.

The screenshot shows a table with the following data:

comment test	1	0	1,673
CMI:Close this case using Sav...795	0	1	96
esp_account_manager_do_no...			
CMI:Close this case using Clos...			
comment test	1	0	1,673

A context menu is open over the cell containing 'esp_account_manager_do_no...', showing two actions: 'Open Record' and 'New Opportunity'.

Hovering over the labels shows if an actions menu is available. Clicking the value, cell, or legend displays the menu, and the user can then select from the available actions or open a record.

Actions in the Actions Menu

The actions come from [object-specific actions](#) and/or [global actions](#) that you've previously added to Salesforce objects. Salesforce actions let users create records that have automatic relationships to other records, make changes and updates to specific records, and interact with records in ways you define. For example, you can add actions that let users create new cases, events, accounts, groups, and so on. See the section "Actions Menu Support for Objects and Actions" below for more details about the Salesforce objects and actions supported in the current release.

Open Record Link in a Quick Actions Menu

Links can pass specific bits of data, such as Salesforce account IDs, from the lenses or dashboards to records. For example, a link from an account name in a dashboard could be configured to pass the related account ID to Salesforce; when a user clicks an open record link, the appropriate account record opens in a new tab. Custom links can also look up records for employees in Workday® or expense reports in Concur®. Any website can be linked to as long as it uses HTTP or HTTPS protocols.

Actions Menu Support for Objects and Actions

The current actions menu implementation provides limited support for Salesforce objects and actions.

You can currently create Wave quick actions menus for the following Salesforce objects:

- Account
- Cases
- Lead
- Opportunity

Actions on Contacts, User, or User Profile page layouts are not supported.

The current implementation of action menus supports [object-specific actions](#) and [global actions](#). It does not support Chatter actions (Post, Thanks, Poll) or Salesforce1 actions.

Other objects and actions will be supported in future releases.

Developing Action Menus

Your development team creates actions menus by editing a dataset's extended metadata (XMD) file. For more information, see Dimensions Section in the [Extended Metadata \(XMD\) Reference](#).

To create an open record link in an action menu for a dataset with records from multiple Salesforce org instances, you have to add an organizations section to the XMD file. The organizations section lets you map from org IDs to the URLs for each org instance referred to in the dataset. See Organizations Section in the [Extended Metadata \(XMD\) Reference](#).

Incorporate Visualizations through Chatter Posts and Sharing Links

Share a visualization with your colleagues by posting to Chatter, or by getting its unique URL. A Chatter post provides an image and a link to the asset—lens, dashboard, or app—in Wave Analytics. Colleagues with the link and access to the asset can drill in and explore the information that's presented.

1. Click **Share**.

2. Click the tab for the sharing method that you want: **Post to Feed**, which posts to Chatter an image and link to the lens, dashboard, or app; or **Get URL**, which is a unique URL to the asset.
 - a. If you're posting to Chatter, select **User** or **Group** feed, enter the name, and then type your comment. You can also remove the image from your post by hovering over it and clicking the **x**. Note that posted images are public.
 - b. If you're getting the unique URL, copy the link, and then paste it wherever you want to share it.
3. If applicable, click **Give Access** to set the level of sharing access.
4. Click **Done**.

Note: To share a visualization, you must give access to the app that contains it. Lenses, datasets, and dashboards within the default Shared App are accessible to all Wave Analytics users, unless administrators have restricted access. All other apps are private unless someone with Manager access to the app has shared it with a specific user, group, or role.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To view visualizations:

- "Use Wave Analytics"

Wave Analytics Apps

Work with Wave Analytics Apps

Wave Analytics apps are folders that contain datasets, lenses, and dashboards.

You can create your own apps to organize your data projects and control Wave Analytics asset sharing. You can also use ready-made Waves apps that include prebuilt datasets, lenses, and dashboards to provide a ready-made path through data and help you get started fast with Wave Analytics.

IN THIS SECTION:

[App-Level Sharing](#)

Wave Analytics apps are like folders, allowing users to organize their own data projects—both private and shared—and control sharing of datasets, lenses, and dashboards.

[Create an App](#)

Create an app to organize and contain any combination of lenses, dashboards, and datasets.

[Share an App](#)

To enable others to see a lens, dashboard, or dataset, one way to share is by sharing the app it's in.

[Delete an App](#)

If you have Manager access to an app, you can delete it. Deleting an app permanently removes all of its lenses, dashboards, and datasets from Wave Analytics.

App-Level Sharing

Wave Analytics apps are like folders, allowing users to organize their own data projects—both private and shared—and control sharing of datasets, lenses, and dashboards.

All Wave Analytics users start off with Viewer access to the default Shared App that's available out of the box; administrators can change this default setting to restrict or extend access. Each user also has access to a default app out of the box, called My Private App, intended for personal projects in progress. The contents of each user's My Private App aren't visible to administrators, and this app can't be shared. When users are ready to share an item from their private app, they can save the item to any shared app.

All other apps created by individual users are private, by default; the app owner and administrators have Manager access and can extend access to other users, groups, or roles.

Here's a summary of what users can do with Viewer, Editor, and Manager access.

Action	Viewer	Editor	Manager
View dashboards, lenses, and datasets in the app	X	X	X
See who has access to the app	X	X	X
Save contents of the app to another app that the user has Editor or Manager access to	X	X	X
Save changes to existing dashboards, lenses, and datasets in the app (saving dashboards requires the appropriate permission set license and permission)		X	X
Change the app's sharing settings			X
Rename the app			X
Delete the app			X

Create an App

Create an app to organize and contain any combination of lenses, dashboards, and datasets.

1. On the home page, click **Create**.
2. Click **App**.
3. Type the name of your app.
4. Click **Create**.
Your app is created and displayed in a new tab. You can now put lenses, dashboards, and datasets in it.
5. Add a description of the app's purpose and contents so that your colleagues understand how to use the data.
 - a. Click in the description box under the app's name.
 - b. Type a description.
 - c. Click the check mark  to save.
6. Optionally, change the app's default icon to make it easier to distinguish from other apps.
 - a. Hover over the default icon.
 - b. Click **Change Icon**.
 - c. Click an icon from the gallery.

Share an App

To enable others to see a lens, dashboard, or dataset, one way to share is by sharing the app it's in.

1. On the app page, click the **Share** button.
2. On the Give Access tab:
 - a. Choose whether you're sharing the app with a user, group, or role.
 - b. Start typing the name and select from the suggested matches.
 - c. Choose the level of sharing access: Viewer, Editor, or Manager.
 - d. Click **Add**.
 - e. Click **Save**, then click **Done**.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To create an app:

- "Create Wave Analytics Apps"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To share an app:

- "Use Wave Analytics" and Manager access to the app

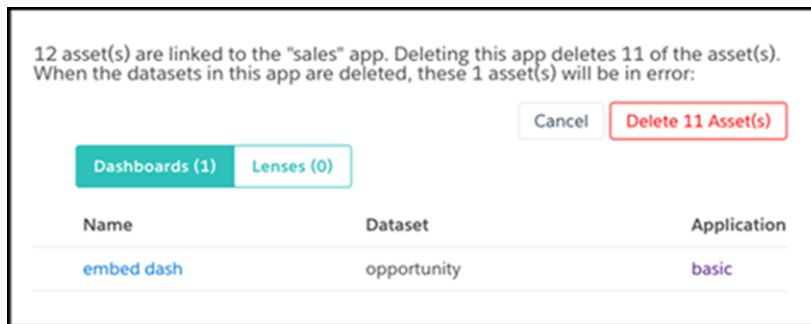

Delete an App

If you have Manager access to an app, you can delete it. Deleting an app permanently removes all of its lenses, dashboards, and datasets from Wave Analytics.

1. Open the app, and then click **Delete**.

 **Warning:** You can't recover a deleted app.

If applicable, Wave Analytics lists the lenses and dashboards outside of your app that will be affected. When the datasets belonging to your app are deleted, any lens or dashboard that references those datasets becomes unusable.

 **Important:** Only lenses and dashboards to which you have access appear in the list. If you don't have access to them, lenses and dashboards aren't listed even though they have references to datasets in your app.

2. Click **Delete Asset(s)**.

The Sales Wave Analytics App

The Sales Wave app—the first ready-made Wave app from Salesforce—gets you started fast with Wave Analytics and provides a clear path through your Sales Cloud data on any device. You get everything you need in one place to uncover key insights to help you grow your business.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To delete an app:

- "Use Wave Analytics" and Manager access to the app

USER PERMISSIONS

To use Wave templated apps:

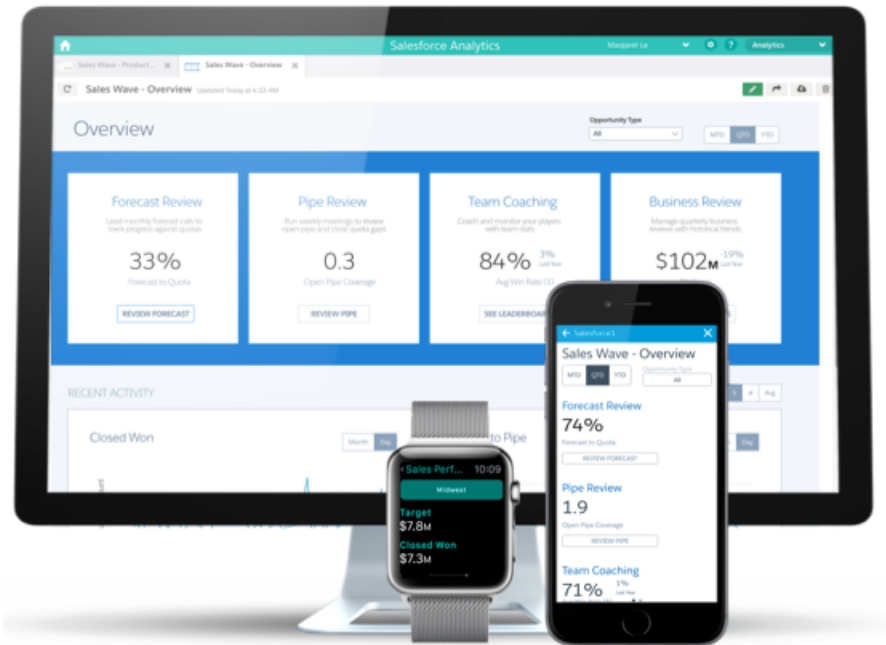

- "Use Wave Analytics Templated Apps"

To use Sales Wave:

- "Access Sales Cloud Analytics Templates and Apps"

To create and manage Wave apps:

- "Manage Wave Analytics Templated Apps"
- "Edit Wave Analytics Dataflows"

Salesforce created the Sales Wave app to make it easy for you to analyze your Sales Cloud data. App creation is easy: using a built-in configurator, answer a few questions about how you prefer to view data, and Wave takes care of the rest. Once you've created the app, use its prebuilt datasets, dashboards, and lenses to explore Sales Cloud data from any device that supports Wave. You get actionable insights fast from your sales data using the intuitive Wave interface. And you can drill deeper into key aspects of your business by customizing Sales Wave around your business needs.

-  **Note:** Your organization can use the Sales Wave app with or without Salesforce Wave Analytics platform by purchasing a Sales Wave license.
-  **Tip:** For best results, follow the steps to get started with Sales Wave in order. Also, if you haven't used Wave before, learn more about it from the [Wave Analytics Library](#).

IN THIS SECTION:

1. [Set Up Salesforce Permissions for the Sales Wave App](#)
Create permission sets to enable administrators and users to access the Sales Wave app.
2. [Create and Share the Sales Wave App](#)
Use the Sales Wave app's simple configurator to create the app and start uncovering the value of your Sales Wave data—fast.
3. [Update the Sales Wave App Quota \(Target\) Dataset](#)
If you answer “yes” to the configuration wizard question about whether your business tracks quotas at the user level, to include quota information in dashboards, you need to update the Sales Wave Quota dataset to have it reflected in the app's dashboards.
4. [Keep Sales Wave App Data Up-to-Date by Scheduling a Dataflow](#)
Before you start exploring with Sales Wave, schedule a daily dataflow to make sure you're looking at the latest sales data.
5. [Understand Sales Wave App Limitations](#)
Sales Wave provides the following support for Salesforce objects and data.
6. [Learn About Sales Wave App Prebuilt Dashboards](#)
The Sales Wave app includes prebuilt dashboards to accelerate your Sales Wave data exploration.

7. [Get to Know Sales Wave App Data Terminology](#)

To make the best use of the Sales Wave app, it's helpful to understand the metrics and terms used in the app.

Set Up Salesforce Permissions for the Sales Wave App

Create permission sets to enable administrators and users to access the Sales Wave app.

Your organization can use the Sales Wave app with or without the Salesforce Wave Analytics platform by purchasing a Sales Wave license. The Sales Wave license enables the following permissions:

- "Use Wave Analytics Templated Apps" enables access to all Wave templated apps. Sales Wave is the first such app.
- "Access Sales Cloud Analytics Templates and Apps" provides specific access to Sales Wave as well as the data and prebuilt dashboards included with it.
- "Manage Wave Analytics Templated Apps" gives administrators the ability to create Wave apps for users in their organizations, in this case the Sales Wave app.
- "Edit Wave Analytics Dataflows" enables administrators to upload and download JSON for existing dataflows.

For more about Wave Analytics permissions, see [User Permissions for Wave Analytics](#).

You use these permissions the same way that you use any Salesforce permission set, creating permission sets based on the available permissions and then assigning them to users. Typically, you'll create two types of Sales Wave permission sets, one for users and another for administrators.

- 1. Enable users to access the Sales Wave app.** Most users in your organization require only the ability to view the Sales Wave app. For those users, create a permission set that includes the first two permissions listed above, that is "Use Wave Analytics Templated Apps" and "Access Sales Cloud Analytics Templates and Apps". With these permissions users can view everything in Sales Wave as well as create and edit dashboards. After you create the permission set, you can assign it to users.
- 2. Enable administrators and some users to access and manage the Sales Wave app.** Administrators and some users in your organization require the ability to create the Sales Wave app and share it with others. Create a permission set that includes all the permissions included with the Sales Wave license and assign it to them. With these permissions, users can not only view everything in Sales Wave and create and edit dashboards, but they can also create, share, and delete the app, schedule and [work with dataflows](#), and upload external data (including the CSV file needed to [update the Quotas dataset](#)).

For more about creating and assigning permission sets, see [Analytics Cloud Setup](#).

Create and Share the Sales Wave App

Use the Sales Wave app's simple configurator to create the app and start uncovering the value of your Sales Wave data—fast.

Follow these steps to create the Sales Wave app. If you're not happy with the result, you can delete

the app and create it again quickly. You can also watch the video  [Create the Sales Wave App, Part 1: Using the Configuration Wizard](#), which covers the steps described here.

- 1.** Log in to Salesforce.
- 2.** Select **Wave Analytics** from the Force.com menu (top right of the Salesforce window).

USER PERMISSIONS

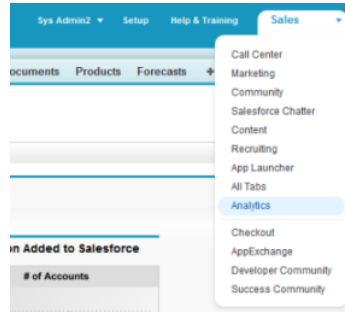

To create and manage Wave apps:

- "Manage Wave Analytics Templated Apps"
- "Edit Wave Analytics Dataflows"

USER PERMISSIONS

To create and manage Wave apps:

- "Manage Wave Analytics Templated Apps"
- "Edit Wave Analytics Dataflows"

3. Click **Create** , select **App** , select **Sales Wave** , and then click **Continue**
4. Salesforce opens the Sales Wave configurator, which helps you personalize your app experience. You'll see a series of screens, each with a set of questions and their possible answers in pull-down menus. Answer the questions according to how your company prefers to view data. For more information about how to answer these questions, see [Personalize The Sales Wave Experience with the Configurator](#).
5. Give your app a name that's easily recognizable to others in your company.
6. Click **Create** to trigger the dataflow that creates the app and its assets (which include a [dataflow](#), datasets, and dashboards).
7. The app creation process can take a few minutes. Once it's complete you'll see the datasets and dashboards that are part of the app. To check the status of the dataflow, open the Wave Home page, click the gear menu at the upper right of the page, select Data Monitor, then select Dataflow View in the pulldown at the upper left and look for your app.
8. If you'd like to change your answers after looking at the dashboards, delete the app and repeat the steps described above. To delete, position your cursor over the icon for the app you just created, click Delete, then click Yes to confirm deletion of all the assets associated with the app.
9. Now that you've created the app, share it with users in your organization. You can only share it with users who have the "Use Wave Analytics Templated Apps" and "Access Sales Cloud Analytics Templates and Apps" permissions enabled. (For more about Sales Wave app permissions, see [Set Up Salesforce Permissions for the Sales Wave App](#)). To share the app, roll your cursor over the icon for the app you just created, click **Share**, type in the names of team members, click **Add**, and click **Save**.

If your business tracks quotas at the user level, you need to update the Quota (Target) dataset that's created along with the Sales Wave app before you start exploring your data. See [Update the Sales Wave App Quota \(Target\) Dataset](#).

SEE ALSO:

[Personalize The Sales Wave Experience with the Configurator](#)

Update the Sales Wave App Quota (Target) Dataset

If you answer "yes" to the configuration wizard question about whether your business tracks quotas at the user level, to include quota information in dashboards, you need to update the Sales Wave Quota dataset to have it reflected in the app's dashboards.

When you create the Sales Wave app, a Quota (Target) dataset is created along with the app. To explore how team members are tracking to their monthly, quarterly, or annual quotas in Sales Wave, you need to update the Quota dataset by completing the following steps. You can also watch the

video  [Create the Sales Wave App, Part 2: Upload the Quota CSV File and Schedule a Dataflow](#), which covers the steps described here.

USER PERMISSIONS

To create and manage Wave apps:

- "Manage Wave Analytics Templated Apps"
- "Edit Wave Analytics Dataflows"

- ✔ **Note:** When you work with .CSV files you want to import to Sales Wave, open them in a text editor. Opening them in Microsoft Excel or other spreadsheet software typically reformats .CSV files and makes them unusable in Sales Wave
 - ✔ **Note:** If your business doesn't track quotas at the user level, you can skip this step. You only need to complete this if you answer "yes" to the [configuration wizard](#) question about whether your business tracks quotas at the user level.
1. Create a .CSV file to include the following fields, in this order: QuotaAmount, StartDate (in yyyy-mm-dd format), OwnerName, and Username. For an example, see [Sales Wave App Example .CSV File](#).
 2. Save the file to a location that you can easily remember.
 3. In Salesforce, go to the Wave Analytics home page and find the Quota (Target) dataset.
 4. Hover over the dataset, then click **Edit**.
 5. Salesforce displays the Update Data section. Select **Select file or drag file here...**
 6. Click **Update Dataset**.
 7. Navigate to the .CSV file you created in Step 1, and double-click it.

Keep Sales Wave App Data Up-to-Date by Scheduling a Dataflow

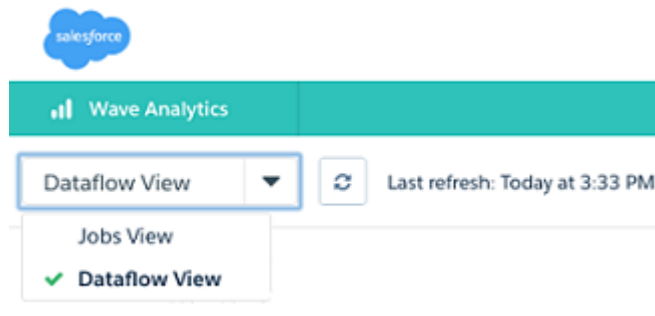

Before you start exploring with Sales Wave, schedule a daily dataflow to make sure you're looking at the latest sales data.

You can also watch the video  [Create the Sales Wave App, Part 2: Upload the Quota CSV File and Schedule a Dataflow](#), which covers the steps described here

1. Go to **Wave Analytics** in the Force.com menu (top right of the Salesforce window) if you're not already there. Click the gear icon at the upper right of the screen to open the Data Monitor.

2. Select Dataflow view from the menu at the top left of the Data Monitor screen.

USER PERMISSIONS

To create and manage Wave apps:

- "Manage Wave Analytics Templated Apps"
- "Edit Wave Analytics Dataflows"

- Find the app you created; you may have to scroll down the page. Open the menu located on the far right of the screen next to the app icon and name. Select **Schedule**, and set a time for the dataflow. Select a time outside normal work hours so the dataflow doesn't interrupt business activities. Click

The screenshot shows the Wave Analytics interface. At the top, there is a 'Wave Analytics' header with a refresh button and 'Last refresh: Today at 11:05 PM'. Below this, there are two dataflow entries:

- Default Salesforce Dataflow**: Last Modified By: Integration User. Runs every 24 hours at 8:16 AM. Run by Integration User.
- SalesAppDev**: Last Modified By: Integration User. Runs every 24 hours at 2:48 PM. Run by Integration User.

Below the dataflow entries is a table with columns: Start Time, Duration, Status, and Message. The table shows two successful runs:

Start Time	Duration	Status	Message
Today at 3:59 PM	0 hours, 3 m.	Successful	
Today at 2:51 PM	0 hours, 3 m.	Successful	

On the right side of the table, there is a menu with options: Download, Upload, Start, and Schedule. The 'Schedule' option is highlighted.

Save.

That's it. The daily dataflow assures that Sales Wave always has your company's latest sales data.

Understand Sales Wave App Limitations

Sales Wave provides the following support for Salesforce objects and data.

Sales Wave App Support for Salesforce Objects and Fields

Sales Wave supports all Salesforce objects and data. However, when you first create the app by default it includes only a predefined set of objects and fields.

Sales Wave initially provides the following standard Salesforce objects:

- Accounts
- Users
- Roles
- Opportunities
- Products (Opportunities line item)
- Tasks
- Events

Sales Wave supports standard and custom fields on standard Salesforce objects. The fields provided are determined by the answers you provide when you create the app using the built-in [configuration wizard](#).

To add custom objects or additional fields not included when you first create the app, you need to update the Sales Wave dataflow. For details see [Create Datasets with a Dataflow](#).

Sales Wave App Support for Non-Salesforce Data

Sales Wave does not support external data sources [except a CSV file](#) that contains quota data at the user level. Importing other external data requires an additional license. See your Salesforce representative for details.

 **Note:** To include data about quotas in Sales Wave, you need to upload a CSV file with the details. For more information, see [Update the Sales Wave App Quota \(Target\) Dataset](#).

Learn About Sales Wave App Prebuilt Dashboards

The Sales Wave app includes prebuilt dashboards to accelerate your Sales Wave data exploration.

The prebuilt dashboards in the Sales Wave app contain best practices that help you get value from your Salesforce data—fast. The dashboards let you manage pipeline and forecast, understand key business performance drivers, visualize trends, assign actions, and get fast answers to questions you have about business results.

USER PERMISSIONS

To use Wave apps:

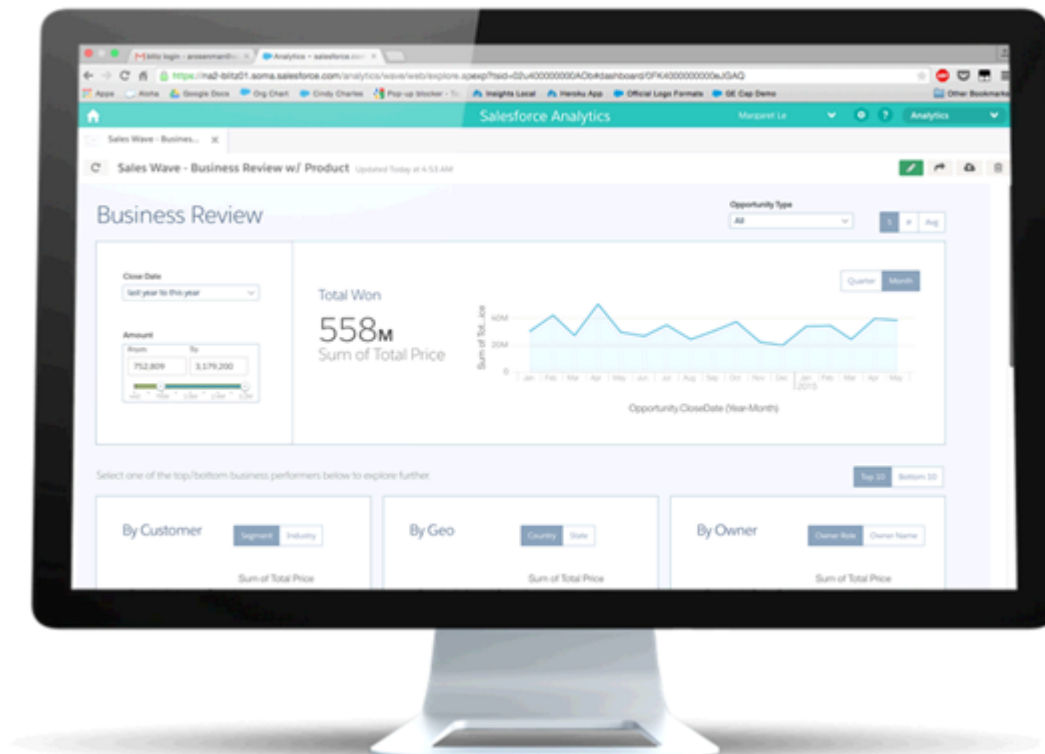

- “Use Wave Analytics Templated Apps”

To use Sales Wave:

- “Access Sales Cloud Analytics Templates and Apps”

To create and manage Wave apps:

- “Manage Wave Analytics Templated Apps”
- “Edit Wave Analytics Dataflows”

The following chart guides you through Sales Wave dashboards, which can give you an immediate picture of how your business is doing. You can also explore further on your own at any point. To learn more about exploring data in Wave, see [Explore and Visualize Your Data](#) on page 3332.

Table 41: Sales Wave Dashboards

Dashboard Name	Contents	Level of Effort Needed to Customize
Sales–Overview	Start here. Gives you a quick pulse of your business across forecast and pipe management, team performance, and business.	High
Sales–Forecast Review	Displays Closed Won Business and Expected to Close to let you know if you're going to hit your quota.	High
Sales–Pipeline Trending	Tracks opportunity changes in your pipeline such as Closed Won/Lost, Moved In/Out, Amount Reduced/Expanded.	High
Sales–Pipe Review	Shows all open deals in the pipeline and lets you organize by multiple key dimensions so you can quickly identify the top open deals. You can also perform actions such as Create Task or Event in Salesforce.	Low
Sales–Productivity	Monitors tasks and events completed by each person.	High
Sales–Business Review	Shows historical Closed Won business across key dimensions, such as by owner, customer, geography, product, and source. Shown in above image.	Low
Sales–By Customer	Shows visualizations of trends within your customer base.	Low
Sales–By Geo	Shows visualizations of trends by geographical area.	Low
Sales–By Source	Shows visualizations of trends by source.	Low
Sales–By Product	Shows visualizations of trends by product.	Low
Sales–Leaderboard	Shows top- and bottom-ranked players by time periods and across key performance categories.	High
Sales–Player Stats	Provides details for each player on your team, according to time period.	High

Note: Your instance of Sales Wave may not include all these dashboards depending on how you answer the questions when you create the app.

Get to Know Sales Wave App Data Terminology

To make the best use of the Sales Wave app, it's helpful to understand the metrics and terms used in the app.

Table 42: Sales Wave Dashboards

Metric/Term	Formula	Description/Notes
Closed Won		Amount of opportunities that have been closed and won.
Closed Lost		Amount of opportunities that have been closed and lost.
Closed Total	Closed Won + Closed Lost	Total amount of opportunities that have been closed.
Quota		Amount that was planned/committed/targeted for a certain time period.
Quota Attainment	Closed Won / Quota	How much of quota has been achieved.
Expected to Close	Many	Can use Forecast Category or Stage Name to calculate.
Forecast	Closed Won + Expected to Close	Amount that is expected/outlooked to end at for a time period.
Forecast to Quota	Forecast / Quota	Ratio of forecast to quota.
Need to Close	Quota - Closed Won	Amount needed to hit quota.
Need to Find	Quota - Forecast	Amount needed to hit quota, after accounting for opportunities expected to close in the future.
Open Pipe		Total amount of open opportunities in the pipeline, where Forecast Category does not equal Closed or Omitted.
Open Pipe Coverage	Open Pipe / Need to Close	How much in pipe to cover what is needed to close.
Bookings		Amount of Closed Won opportunities for new business.
Diff	This Year - Last Year	Difference between two items.
Y / Y %	(This Year / Last Year) - 1	Year-over-year growth rate.

USER PERMISSIONS

To use Wave apps:

- "Use Wave Analytics Templated Apps"

To use Sales Wave:

- "Access Sales Cloud Analytics Templates and Apps"

To create and manage Wave apps:

- "Manage Wave Analytics Templated Apps"
- "Edit Wave Analytics Dataflows"

Metric/Term	Formula	Description/Notes
Avg Selling Price	Total Amount (\$) / Total Count (#)	Average selling price for Opportunities, Products, and so on.
Avg Win Rate by \$	Closed Won / Closed Total	Success rate on closed opportunities, based on amount (\$).
Avg Win Rate by #	Closed Won / Closed Total	Success rate on closed opportunities, based on count (#).
Avg Sale Cycle	Closed Date - Created Date	How long it took to close the deal.
Avg Discount %	abs ((Selling Price / List Price)-1)	How much was reduced from what was listed.

Personalize The Sales Wave Experience with the Configurator

The Sales Wave configurator lets you create the Sales Wave app so it reflects how your company views its data.

When you create the Sales Wave app for your organization, the built-in configurator asks you a series of questions that determine how users view your sales data in Sales Wave's prebuilt dashboards. Answer these questions according to the way your organization uses Sales Cloud data so the dashboards are as meaningful and useful as possible.

For example, you're asked to specify both the primary and secondary fields you use to view customers according to their geographic locations. Perhaps you first want to see customers according to their country and then by their state. You'd select Country as the primary field to view by geography and State/Province for the secondary field. Or perhaps you want to sort by Region first, then by Country, so you'd select Region for the primary field and Country for secondary. Once you create Sales Wave, its dashboards provide a switch that toggles between the primary and secondary fields you select. You're also asked to make similar choices about how you'd like to view data by customer, source, product, and other ways you track your business with Salesforce.

USER PERMISSIONS

To create and manage Wave apps:

- "Manage Wave Analytics Templated Apps"
- "Edit Wave Analytics Dataflows"

Personalize Sales Wave - Accounts (1 of 3) ✕

Back
Continue

Think through your answers to these questions, since they have impact both the number and contents of the Sales Wave dashboards and on how users view sales data in the app. You can further customize dashboards after you create the app, and if you decide you didn't like your first answers, you can delete Sales Wave and quickly create it again.

SEE ALSO:

[Create and Share the Sales Wave App](#)

Sales Wave App Example .CSV File

Here's an example of the .CSV file you create to update the Sales Wave app Quota (Target) dataset.

 **Note:** This file is for example purposes only. You need to create a unique .CSV file based on your own Sales Cloud data including the following fields:

- QuotaAmount
- StartDate
- OwnerName
- Username

See [Update the Sales Wave App Quota \(Target\) Dataset](#) on page 3374.

 **Example:**

```

Salesforce Reports and Dashboards

Salesforce offers a powerful suite of reporting tools that work together to help you understand and act on your data.

Gather Data with Reports

Reports give you access to the data your organization has accumulated over time, enabling you to make informed decisions. You can examine your organization's data in almost infinite combinations, display it in easy-to-understand formats, and share the resulting insights with others via dashboards.

Share Insights with Dashboards

Dashboards help you visually understand changing business conditions so you can make decisions based on the real-time data you have gathered with reports. Use dashboards to help users identify trends, sort out quantities, and measure the impact of their activities.

Salesforce Reports and Dashboards

Reports

Learn about Reports

Reports give you access to your Salesforce data. Before building, reading, and sharing reports, review these reporting basics.

As you prepare to report on your Salesforce data, keep these tips in mind:

- Well-designed reports run faster.
- Before building your report, consider writing down each of the questions your report must answer. This way, your report is sure to return all the data you need.
- Reports are shared via folders. Whomever has permission to the folder your report is saved in also has access to your report. Ensure that you save your report in an appropriate folder.

Before building your first report, familiarize yourself with these features and concepts.

Report Builder

The *report builder* is a visual, drag-and-drop tool which you use to create reports and edit existing ones. The report builder is where you choose a report type, report format, and the fields that make up your report.

To launch the report builder, click **New Report**.

Fields

One or more *fields* describe each report result. If you imagine that your report as a table of information, then each row is a result and each column is a field.

For example, a human resources manager creates a report about employees. Each result is an employee, and each field is a different piece of information about the employee: first name, last name, job title, start date, and so forth.

When you create or edit a report, you choose which fields you want to include in your report. To ensure your reports run quickly, it's a good idea to include only the fields that you need.

Filters

Limit the data that your report returns by using *filters*. Filters are useful for many reasons, such as focusing your report on specific data, or ensuring that your report runs quickly.

For example, say your report returns all the Cases in your company, but you only want to see Cases which are open and assigned to you. Filter the report on the `Owner` field and `Status` field.

Add filters in the Report Builder. In Lightning Experience, you can add, edit, or remove filters while reading a report, too.

Report Types

The *report type* governs which fields are available in your report. For example, File and Content reports have fields like `File ID`, `File Name`, and `Total Downloads`. Accounts reports have fields like `Account ID`, `Account Name`, and `Phone`.

The first thing you do when creating a report is choose a report type.

Report Format

The *report format* specifies how your report results are laid out. Possible formats are tabular, summary, matrix, or joined. Joined reports aren't available in Lightning Experience.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

Build a Report

When you have questions about your Salesforce data, build a report to get the answers.

IN THIS SECTION:

1. [Build a New Report](#)

Report Builder is a drag-and-drop tool for accessing your data quickly and comprehensively. Use it to set up new reports and edit existing ones.

2. [Report on Historical Changes](#)

On top of the standard up-to-the-minute reporting on the current state of your business, you can analyze day-to-day and week-to-week changes in opportunities, cases, forecasts, and custom objects.

3. [Report on Historical Data with Reporting Snapshots](#)

A reporting snapshot lets you report on historical data. Authorized users can save tabular or summary report results to fields on a custom object, then map those fields to corresponding fields on a target object. They can then schedule when to run the report to load the custom object's fields with the report's data. Reporting snapshots enable you to work with report data similarly to how you work with other records in Salesforce.

4. [Report on Related Objects with Cross Filters](#)

Use a cross filter to fine-tune your results by including or excluding records from related objects, without having to write formulas or code. You can apply cross filters by themselves, or in combination with field filters.

5. [Categorize Data Quickly with Buckets](#)

Bucketing lets you quickly categorize report records without creating a formula or a custom field. When you create a bucket field, you define multiple categories (buckets) used to group report values.

6. [Combine Different Types of Information in a Joined Report](#)

The joined report format lets you view different types of information in a single report. A joined report can contain data from multiple standard or custom report types.

7. [Show Report Data Graphically](#)

To help readers understand your data quickly and easily, show the data in chart form. Charts appear just above the report table. They can help users get a feel for the data before they delve into the details. Use line charts to track changes over time, or a bar or pie chart to compare values at a point in time. Charts can also appear in dashboard components.

8. [Show Report Data in Tables](#)

To help readers scan for data easily, try hiding details and ranges, limiting the number of results shown, and highlighting with color. You can also show your table in a dashboard component.

9. [Report on Salesforce Data with Excel](#)

Connect for Office includes an Excel add-in that enables you to securely access your Salesforce reports with Microsoft® Excel®. You create the reports you need in Salesforce, then pull them into an Excel worksheet, and use Excel's formulas, charts, and pivot tables to customize and analyze your data.

10. [Upgrade the Report Wizard](#)

Report builder, a powerful drag-and-drop editor, is the standard tool for creating and editing reports. If your organization is still using the old report wizard, you should upgrade to report builder.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

Build a New Report

Report Builder is a drag-and-drop tool for accessing your data quickly and comprehensively. Use it to set up new reports and edit existing ones.

Watch a Demo:  [Getting Started with Report Builder](#)

To customize an existing report using report builder, click the name of a report and click **Customize**. To optimize screen real estate, report builder uses a compressed page header. To view your application tabs, simply close the builder or click the Salesforce logo.

IN THIS SECTION:

1. [Choose a Report Type](#)
A report type is a set of rules that determine which records and fields appear in a report. You can start with one of the available standard report types or use a custom report type provided by your administrator.
2. [Choose a Report Format](#)
A report can use the tabular, summary, matrix, or joined format. Choose a format that's complex enough to capture the data you want to show, but simple enough to communicate it effectively.
3. [Create a Report](#)
If you don't have an existing report to clone, you can create a new report.
4. [Creating a Custom Report](#)
You can customize standard reports, or you can build custom reports from scratch to suit the exact needs of your organization.
5. [Create a Custom Report in Accessibility Mode](#)
6. [Group Your Report Data](#)
Group data in columns or rows in summary, matrix, and joined reports to display meaningful information. For example, group opportunities by Close Date to see closed opportunities or group cases by product to see the number of cases for each product. You can have groupings inside groupings.
7. [Keep Working While Your Report Preview Loads](#)
For most actions, you can continue working on your report while the preview loads. For example, when editing a report you can drag multiple fields into the report, then create a grouping while those columns load.
8. [Customizing Reports](#)
Report builder is a visual editor for reports. The report builder screen lets you work with report fields and filters, and shows you a preview of your report with just some of the data.
9. [Report Fields](#)
The Fields pane displays fields from the selected report type, organized by folder. It also lists custom summary formulas, which you can create, edit, and delete.
10. [Summarize Your Report Data](#)
A summary field contains numeric values for which you want to know the sum, the average, or the highest or lowest. Summary fields show at all grouping levels. In summary and matrix reports, they also appear at the grand total level.
11. [Subtotal Report Results](#)
Subtotaling your reports gives you a tool to analyze trends in the data. You can group sets of information, sort the groupings, and compare subtotals for each set against the overall total. In summary and joined reports, you can also subtotal by multiple fields to give you cascading sets of information.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"
AND
"Report Builder"

12. [Smart Totaling in Reports](#)

“Smart” totaling means that duplicate data is counted only once in any subtotal or total. Salesforce uses “smart” totaling when you run reports that include duplicate data in any of the columns chosen for summing or averaging.

13. [Work with Formulas in Reports](#)

Formulas let you create custom summaries based on calculated values using report data. These formulas can then be used as columns in your report.

14. [Filter Your Report Data](#)

Focus your report on the data you’re interested in by setting up standard filters, field filters, filter logic, cross filters, and row limits.

15. [Save Your Report](#)

Click **Save** to update an existing report with recent changes, or **Save As** to clone the original report without changing it. In Lightning Experience, click **Clone** to clone the report.

SEE ALSO:

[Keep Working While Your Report Preview Loads](#)

[Create a Report](#)

[Report Fields](#)

[Choose a Report Type](#)

[Customizing Reports](#)

[Choose a Report Format](#)

[Creating a Custom Report](#)

[Combine Different Types of Information in a Joined Report](#)

Choose a Report Type

A report type is a set of rules that determine which records and fields appear in a report. You can start with one of the available standard report types or use a custom report type provided by your administrator.

Choosing the right report type is one of the most important steps in creating a report.

1. From the Reports tab, click **New Report**.
2. Select the report type, and then click **Create**.

Note: You can’t change the report type after the report is created.

For more information, review information about standard and custom report types.

IN THIS SECTION:

[Standard Report Types](#)

Salesforce provides a rich collection of standard report types that you can tailor to your unique requirements. You rarely need to create a brand-new report.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To create, edit, and delete reports:

- “Create and Customize Reports”

AND

“Report Builder”

Pre-Designed Custom Report Types

Some Salesforce features come with custom report types that are designed for you in advance, so you don't have to create a new report.

SEE ALSO:

[Set Up a Custom Report Type](#)

[Why doesn't my report return the data I expect?](#)

Standard Report Types

Salesforce provides a rich collection of standard report types that you can tailor to your unique requirements. You rarely need to create a brand-new report.

Tip: You may not see some of these folders if your administrator has customized the visibility of the Report tab folders.

If you can't find a report to customize for your own needs, you can also create a new custom report to access exactly the right information.

IN THIS SECTION:

1. [Account and Contact Reports](#)

Use account and contact reports to learn about active, neglected, or new accounts, as well as accounts by account owner or partner. The two standard contact reports let you create a mailing list of contacts or track opportunities by contact role.

2. [Activity Reports](#)

Activity reports are useful for gathering information about open activities, completed activities, multi-person events, or pending approval requests for which you are a delegated approver.

3. [Administrative Reports](#)

Administrative reports help you analyze your Salesforce users, documents, and pending approval requests. You can report on the active Salesforce users and see who has been logging in.

4. [Campaign Reports](#)

Use campaign reports to analyze your marketing efforts. You can report on the ROI of your campaigns, track who you targeted with your campaigns and who has responded, or analyze which opportunities resulted from your campaigns.

5. [File and Content Reports](#)

Run File and Content reports to analyze how users are engaging with files and Salesforce CRM Content.

6. [Forecast Reports](#)

Forecast reports give you information about your customizable forecast data.

7. [Lead Reports](#)

Use lead reports to show information about the source and status of leads, how long it takes to respond to leads, neglected leads, and the history of lead fields.

8. [Opportunities Reports](#)

View standard information about your opportunities, including owners, accounts, stages, amounts, and more. The default settings show you the most commonly used information from each object, but you can customize the report to view other information, such as primary campaign source, forecast category, and synced quote.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com** (The edition determines which reports you see.)

USER PERMISSIONS

To run reports:

- "Run Reports"

To schedule reports:

- "Schedule Reports"

To create, edit, and delete reports:

- "Create and Customize Reports"

AND

"Report Builder"

9. [Product and Asset Reports](#)

Use product and asset reports to view information about the products your users currently have installed. Find out what assets your customers have, list the cases filed for a particular asset, or identify assets that aren't associated with a product.

10. [Self-Service Reports](#)

Self-Service reports help you analyze the effectiveness of your Self-Service portal. Find out how many cases are being viewed, how many customers are logging in, or what customers think of the solutions you're offering.

11. [Reporting on Support Activity](#)

Use support reports to track the number of cases created, case comments, case emails, case owners, case contact roles, cases with solutions, the length of time since the case last changed status or owner, and the history of cases.

SEE ALSO:

[Find a Report](#)

[The Report Run Page](#)

[Creating a Custom Report](#)

[Reports Give You Access to Your Data](#)

Account and Contact Reports

Use account and contact reports to learn about active, neglected, or new accounts, as well as accounts by account owner or partner. The two standard contact reports let you create a mailing list of contacts or track opportunities by contact role.

Standard Report: Field History

If your organization tracks field history on accounts or contacts, you can report on that information using the account history or contact history report.

Standard Report: Person Accounts

If your organization uses person accounts, fields specific to person accounts are available and prefixed with `Person Account:` in account reports. In addition, you can include the `Is Person Account` field in both account and contact reports. Your administrator may have given a different label to `Person Account`.

Mass Mail Merge

You can also create a report of your contact information, export that data to Microsoft® Excel®, and then do a mass mail merge using Microsoft® Word®.

Last Activity

The `Last Activity` date in activities related lists and reports represents the last time someone in your organization took action on an account or a contact. It's either the date and time of the most recent event or the due date of the most recently closed task related to the account or contact.

View Filter for Account Reports

The standard `View` filter for account reports allows you to limit your account data according to the following options. These options vary depending on your organization's edition and setup.

- My accounts: Shows accounts that you own.
- My account team accounts: Shows accounts where you are on the account team.
- My account team and my accounts: Shows accounts you own and those where you are on the account team.
- My team's accounts: Shows your accounts and accounts owned by all of your subordinates in the role hierarchy.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com** (The edition determines which reports you see.)

- **My territories:** For organizations that use territory management, this option shows accounts that belong to the territories to which you are assigned.
- **My territory team's accounts:** For organizations that use territory management, this option shows accounts that belong to your territories and your territories' descendants.
- **My team's account team and their own accounts:** For users who report to you in the role hierarchy, shows accounts they own or for which they are on the account team.
- **All visible accounts:** Shows all accounts that you can view, as determined by your sharing model.
- **Territories:** For organizations that use territory management, the additional `Territories` filter can be set to All, Multiple Territories, or Missing Territory. In custom report types, when using the `Territories` filter that includes territories, Multiple Territories or Missing Territories are not shown in the report results.
- **Customer Portal:** If your organization uses a Salesforce Customer Portal, add the `Customer Portal Account` field to your account reports to view which accounts have contacts enabled to use the portal.

SEE ALSO:

[The Report Run Page](#)

[Limit Report Results](#)

Activity Reports

Activity reports are useful for gathering information about open activities, completed activities, multi-person events, or pending approval requests for which you are a delegated approver.

Standard activity reports allow you to select the date range and status of the activities you want included. The standard activity reports list your tasks and appointments for a selected date range or events with all invitees.

You can also create custom reports for activities by clicking the Reports tab, **New Report**, and choosing **Activities** as the type of data on which to report.

 **Note:** Click **Show Hierarchy** to see your organization's role hierarchy above the report results. You can use the role hierarchy to share report data with people at different levels in the hierarchy. For example, if you see **CEO > VP of Global Sales > Sales Operations Director**, you're viewing data for the Sales Operations Director role. Click any role name to see and share the data that's visible to people in that role.

Special Features of Activity Reports

Consider the following when running activity reports:

Standard Reports

- Choose the HTML Email Status report if you have the HTML email tracking enabled. This reports on anything in the HTML Email Status related list of your leads and contacts.
- Choose the Events with Invitees report to include only multi-person events in your report. The standard filters for events with invitees are:
 - Assigned to...—Shows only multi-person events that you own.
 - Assigned to the team of...—Shows multi-person events that anyone in your team owns.
 - Invitee is...—Shows only multi-person events that list you as an invitee.
 - Invitee is in the team of...—Shows the multi-person events that show anyone on your team as an invitee.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com** (The edition determines which reports you see.)

- The My Delegated Approval Requests report lists all the approval requests for which you are the approval proxy. Note that the All Pending Approval Requests report is listed in the Activity Reports folder.
- In Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, to show the activities for users who report to you, use the **Hierarchy** links in the Tasks and Appointments report. Note that you can view only your own activities and activities owned by users below you in the role hierarchy.
- If your organization uses Shared Activities, reports (including custom report types and Tasks and Events reports) display different results depending on your permissions. Say you're reporting on events, and your report results include an event that is related to two or more contacts and also has invitees. If you're an administrator, your report results show an event for the primary contact plus a separate event for each invitee. If you're not an administrator, your report results show just one event, for the primary contact.

Report Types

- Using report builder, you can create activity reports that show activities related to another type of record. For example, a custom Activities with Leads report shows activities associated with leads.
- Activities with Leads reports do not display data for the Address Line 1, Address Line 2, and Address Line 3 fields.

Tips for Activity Reports

- Set a search criteria of "Event Invitation equals 0" to filter out events that are meeting invites sent to users for a multi-person event.
- Archived activities aren't included in reports. Events and closed tasks older than a year are archived. However, open tasks aren't archived. You can still see archived activities for a record by selecting **View All** in the Activity History section of a record's detail page.
- Activities for private contacts are displayed only in reports for the contact owner.
- The standard filters for activity reports allow you to limit your report results using the following options. Some of these options will not be visible depending on your edition.
 - My Activities—Shows activities that you own.
 - My Delegated Activities—Shows activities that you created but are owned by someone else in the same role as you, and below your role, in the role hierarchy.
 - My Team's Activities—Shows activities owned by users who report to you in the role hierarchy.
 - All Activities—Shows all activities that you can view, as determined by your sharing model.
- If you receive an error message that your activity report has too many results, customize the report to include a filter on a picklist, text, or date field. Alternatively, rerun the report using a different activity data type such as "Activities with Accounts" or "Activities with Opportunities."

Administrative Reports

USER PERMISSIONS

To view the Administrative Reports folder:	"View Setup and Configuration"
To run user reports:	"Run Reports" AND "View Setup and Configuration"
To create, edit, save, and delete user reports:	"Create and Customize Reports" AND "View Setup and Configuration"
To run document reports:	"Run Reports"
To create, edit, save, and delete document reports:	"Create and Customize Reports"
To run pending approval request reports:	"Run Reports" AND "View All Data"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Administrative reports help you analyze your Salesforce users, documents, and pending approval requests. You can report on the active Salesforce users and see who has been logging in.

 **Note:** You can see the Administrative Reports folder on the Reports tab only if you have the "View Setup and Configuration" permission. You don't need this permission to view the Administrative Reports report type—all users can view it and manage any document reports associated with that type. To view other types of reports associated with that type, such as user and approval request reports, you must have the permission.

Special Features of Administrative Reports

Consider the following when running administrative reports:

Standard Reports

- The All Active Users report lists the active users in your organization and when they last logged in.
- The Users Logged in This Week report lists all of the users who have logged in to Salesforce in the past seven days. If Communities is enabled, you can add a `Community` column so that you can see which communities users have logged in to as well.
- The Documents report lists the documents within each document folder.
- The All Pending Approval Requests report lists the approval requests awaiting approval for each approval process. Note that the My Delegated Approval Requests report is listed in the Activity Reports folder.
- If your organization uses territories, the User Territory Report in the Territory Reports folder summarizes the territories to which users have been assigned.

Report Types

- Create a custom report that lists your organization's reports and the last time each report was used. Choose Administrative Reports and select Reports as the report type.
- If your organization uses Communities, you can report on login history for external members of your communities.

1. Create a custom report.
 2. Choose Administrative Reports.
 3. Select Users as the report type.
 4. Add `Community` to your report columns.
 5. Add a filter that includes profiles of community users.
- If your organization uses a Salesforce Customer Portal, you can report on Customer Portal users:
 1. Create a custom report.
 2. Choose Administrative Reports.
 3. Select Users as the report type.
 4. Add `License Type`, `Profile`, and `Role` to your report columns. You can't report on roles for high-volume portal users because they don't have roles.

 **Note:** Permission sets aren't supported.

You can also add the `Customer Portal Account` field to your account reports to view which accounts have contacts enabled to use the portal.

- You can create custom report types from which users can report on your organization's reports and dashboards. When defining a custom report type, select Reports or Dashboards from the `Primary Object` drop-down list on the New Custom Report Type page.

Tips for Administrative Reports

- Users with the "Manage Internal Users" permission can create a custom user report that lists the details of users' login attempts. The relevant fields—such as `Login Date/Time`, `Source IP Address`, and `Login Status`—are grouped in the Login History section of the Select Columns step. Note that the `Client Type` field shows whether the user logged in via a Web browser or an alternate interface such as Connect for Lotus Notes or a partner portal. You can also see which users have never logged in by setting report criteria: choose the `Login Date/Time` field and the "equals" operator and leave the third value blank.

[The Report Run Page](#)

[Limit Report Results](#)

Campaign Reports

Use campaign reports to analyze your marketing efforts. You can report on the ROI of your campaigns, track who you targeted with your campaigns and who has responded, or analyze which opportunities resulted from your campaigns.

Special Features of Campaign Reports

Consider the following when running Campaign Reports:

Standard Reports

- On the Campaign Detail custom report and the Campaign ROI Analysis report, you can include campaign-hierarchy statistics that provide aggregate values for a parent campaign and all the campaigns below it in the campaign hierarchy. If your campaigns include a custom picklist that indicates hierarchy level (for example, "tactic," "program," and "initiative"), you can run a report that summarizes data at any hierarchy level across all campaigns.

EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

- Use the Campaign Leads or Campaign Contacts reports to list the leads or contacts associated with your campaigns.
- Use the Campaign Member Report for a list of campaign members by campaign.
- Use the Campaign Member Analysis report to summarize information about who has responded to campaigns.
- Use the Campaign Revenue Report to analyze which opportunities have resulted from your campaigns. In Enterprise, Unlimited, Performance, and Developer Editions, you can also analyze products, quantity schedules, and revenue schedules in this report.
- The Campaign ROI Analysis Report calculates the return on investment (ROI) and average costs for your campaigns. The ROI is calculated as the net gain (`Total Value Won Opps - Actual Cost`) divided by the `Actual Cost`. The ROI result is expressed as a percentage.
- Use the Campaigns with Influenced Opportunities report to view opportunities that have been influenced by multiple campaigns.

Note: The Campaigns with Influenced Opportunities report respects sharing rules on accounts, contacts, and campaigns. Objects with sharing rules set to private will not display in the report.

Report Types

- Use the Campaigns with Campaign Members custom report type to create a report that contains information about the leads and contacts on multiple campaigns. Use the Campaign Call Down report to see contacts and leads for a specific campaign. These reports are only available to users that have the “Read” permission on both contacts and leads.
- Use the Campaigns with Leads and Converted Lead Information report to view lead lifetime information sorted by a campaign or campaigns.
- Use the Campaigns with Influenced Opportunities report to view opportunities that have been influenced by multiple campaigns.

Tips for Campaign Reports

- Some reports allow you to limit the data to one campaign by using the lookup icon to select a campaign. If the user running a report no longer has access to view the selected campaign, the report does not show any results. This report behavior is similar to what happens when a campaign is deleted.
- `Member Status` is the status of a lead or contact in reference to the campaign. The campaign owner can create up to 50 member status values. Sample Member Status values include, “Planned,” “Sent,” or “Attended.” Additionally, you can now add the `Member First Associated`, `Responded`, and `Member First Responded` fields to campaign reports. These fields allow you to see the date the member was added to the campaign, whether the member responded to the campaign, and the date the member initially responded to the campaign.
- The `Last Activity` of a campaign is the most recent due date of an activity on the record. The following past or future activities set this date:
 - Any event
 - Closed tasks

[Limit Report Results](#)

File and Content Reports

Run File and Content reports to analyze how users are engaging with files and Salesforce CRM Content.

Standard File and Content Reports

Run these prebuilt reports about files and content.

Content Authors

View how many files, content packs, Google Docs, and Web links each author has published in Salesforce CRM Content.

Content Publication Time Frame

Determine how many files, content packs, Google Docs, and Web links were published in a library during a given time frame.

File and Content Downloads

See which users downloaded what files, and when they downloaded the files.

File and Content Engagement

See the number of times a file has been downloaded, shared, liked, and commented on.

File and Content Links

See which files users are sharing using content deliveries or **Share via link**. See when each link was created, when it expires, when it was last accessed, whether it is password protected, and the total number of times the link has been accessed. Each of the links in this report can be accessed by users outside of your organization.

Library Administrators

View the number of files, content packs, Google Docs, and Web links in each library as well as the total amount of file storage used by each library.

Library Content

View the number of files, content packs, Google Docs, and Web links in each library as well as the total amount of file storage used by each library.

Most Content Downloads

Determine which files and content packs are downloaded most frequently and which Web links and Google Docs are opened most frequently.

Most Content Subscriptions

Determine which files, content packs, Google Docs, and Web links have the most subscribers.

Stale Content

Determine which files have not been downloaded or revised recently.

File and Content Report Types

Build standard reports about files and content.

Content Report

Generate a report about Salesforce CRM Content.

EDITIONS

Available in: Salesforce Classic

Available in:

- Contact Manager
- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Field	Description
Archived	Flag that indicates whether a file has been archived. Archiving a file removes it from its library but does not permanently delete the file from Salesforce CRM Content. Archived files can be restored as needed.
Content Created By	Contributor who published the file, content pack, Google Doc, or Web link.

Field	Description
Content ID	Identifier that enables you to group by file rather than version. The Content Title is not guaranteed to be unique because multiple versions of the same file can have different titles.
Content Published Date	Date a file, content pack, Google Doc, or Web link was first published.
Content Title	Title of a file, content pack, Google Doc, or Web link.
Record Type	Title of the record type associated with the file, content pack, Google Doc, or Web link.
Featured Content	Flag that indicates whether a piece of content is featured.
Individual Content Size (MB)	Size of an individual file, exclusive of other versions of the same file.
Last Subscribed Date	Date on which the content was subscribed to most recently.
Num Downloads	Number of times a file has been downloaded or the total number of downloads in a library. The number of times a Google Doc or Web link has been opened is also included in this count.  Tip: To see which users have downloaded a certain file, go to the file's content details page and click the Downloads tab.
Num Negative Ratings	Number of thumbs-down votes.
Num Positive Ratings	Number of thumbs-up votes.
Num Subscriptions	Number of users who are subscribed to a file, content pack, Google Doc, or Web link, or the total number of subscriptions in a library.
Num Versions	Number of times a new version of a file has been published.
Overall Rating	The number of positive votes minus the number of negative votes. For example, if a file has two positive votes and no negative votes, its Overall Rating is 2.
Tag	Salesforce CRM Content tag assigned to a file, content pack, Google Doc, or Web link.
Total Content Size (MB)	Size of a file, inclusive of all the file's versions.
Version Revised Date	Date and time a new version of the file was published.
Version Revised By	Contributor who published the file version.
Library Name	Name of the library.
Library Created Date	Date and time the library was created.

Library and User Report

Generate a list of users who are assigned to libraries.

Field	Description
Administrator	Flag that indicates whether or not the user is a library administrator.

Field	Description
Group	Flag that indicates whether or not the library member is a single user or a public group.
Library Created	Date and time the library was created.
Library Name	Name of the library.
Member Name	First and last name of the library member.

File and Content Report

Generate a report about files uploaded to your organization.

Field	Description
Archived	Flag that indicates whether or not a file has been archived. Archiving a file removes it from its library but does not permanently delete the file from Salesforce CRM Content. Archived files can be restored as needed.
Title	Title of a file, content pack, Google doc, or Web link.
Created By	User who uploaded the file, content pack, Google Doc, or Web link.
Download Date	Date of the first file download.
Downloaded By	User who downloaded the file.
Download User Type	Profile type of the user who download the file.
File Type	MIME type of the uploaded file.
ID	Identifier that enables you to group by file rather than version. The <code>Title</code> is not guaranteed to be unique because multiple versions of the same file can have different titles.
Last Revised By	Last user to edit or upload a new version of the file.
Last Revised Date	Date of last file revision.
Likes	Number of times file posts have been liked. This number doesn't count likes applied to comments on the file post.
Links	Number of external file links that have been generated. External links are generated when a user shares a file using Share via link or when a user shares content from a library using a content delivery.
Post Comments	Number of comments made on file posts in feeds.
Posts	Number of times the file has been posted to a feed. This number doesn't count the number of times the file has been attached to comments on posts.
Published Date	Date a file, content pack, Google Doc, or Web link was first published or uploaded.
Shares	Number of times the file has been posted to a user's feed, shared using Share with people , and shared using Share with groups .
Size (MB)	Size of the most recent file version in megabytes.

Field	Description
Total Downloads	Number of times the file has been downloaded.
Total Size (MB)	Combined Size of all uploaded file versions.
Versions	Number of uploaded file versions.

Tips for Using File and Content Reports

- Salesforce CRM Content users who have the `Manage Content` option checked in their library permission can sort report data by the library they have access to (“My Libraries”) or by all the libraries in an organization (“All Libraries”). Users without the `Manage Content` option can only sort data by the libraries they have access to.
- Sort custom reports by `Library Name` to view data for individual files as well as library summaries, such as total storage used and total number of downloads.
- Sort according to the `Content ID` to view data for a particular document.
- If you have Customer Portal or partner portal users with the “Create Libraries” user permission, run the Library Administrators report to determine which new libraries have been created by portal users.

[The Report Run Page](#)

[Limit Report Results](#)

Forecast Reports

Forecast reports give you information about your customizable forecast data.

- ✔ **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).
- ✔ **Note:** If you don't see the Forecast Reports folder, your organization may not have customizable forecasting enabled. Customizable Forecasting includes five standard report types. You can't create custom report types with Customizable Forecasting.

Special Features of Customizable Forecast Reports

Consider the following when running customizable forecast reports:

Standard Reports

Create a forecast history report if you want the report to include information about forecasts you already submitted. Select *All Forecasts* to show the state of the forecasts after each update. Choose *Latest Forecasts* to display only the current state of the forecasts.

Report Types

- When creating a custom forecast report, choose the **Customizable Forecast: Opportunity Forecasts** report type if you want to include information about the opportunities that contribute to your forecast.
- You can include custom user fields in custom opportunity forecast reports as columns and as column values. Custom user fields are available as either opportunity owner or account owner custom information. The custom field label will be used for both opportunity owner or account owner information, which can cause confusion if they are both on the same report and have similar field labels.
- If you have the “View All Forecasts” permission, forecast summary and forecast history reports include all users' data for the chosen forecast hierarchy, including users in branches of the forecast hierarchy that have no forecast manager.

EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Tips on Customizable Forecasting Reports

- You must specify a reporting interval by fiscal year or by date.
- Forecast reports include private opportunities.
- Opportunity amounts are included in forecast reports if the opportunity is set to close within the forecast period.
- Forecast reports include only opportunities that are set to close within the forecast period, except those assigned to the Omitted forecast category.
- Create a forecast summary report if you want to view information about the amounts in your forecast without details of the opportunities that contribute to that amount.
- If your organization uses territories, you can create custom forecast reports that summarize information by territory name.
- You can view an opportunity forecast report based on the forecast hierarchy by drilling down in your forecast hierarchy.
 1. Select the desired role or territory from the **Hierarchy** links.
 2. Choose the appropriate forecast users or teams from the **Show Opportunities Owned By** or **Show Forecasts Owned By** scopes at the top of the report.
 3. Click **Run Report** again to refresh the report data for your chosen parameters.

For example, to see your opportunity information, including your overrides on opportunity amounts or quantities and overrides from users below you in the forecast hierarchy, set the **Hierarchy** link to your forecast role. To see the opportunity information of someone beneath you in the forecasting hierarchy, drill down into that role.

 **Warning:** The My Team view shows forecasts across multiple hierarchy levels. Consequently, values may be included in a subordinate's forecast total and a forecast manager's forecast total. This may lead to larger than expected values in the column total because subordinate amounts are included multiple times in the total.

 **Note:** Click **Show Hierarchy** to see your organization's role hierarchy above the report results. You can use the role hierarchy to share report data with people at different levels in the hierarchy. For example, if you see **CEO > VP of Global Sales > Sales Operations Director**, you're viewing data for the Sales Operations Director role. Click any role name to see and share the data that's visible to people in that role.

[Limit Report Results](#)

Lead Reports

Use lead reports to show information about the source and status of leads, how long it takes to respond to leads, neglected leads, and the history of lead fields.

Special Features of Lead Reports

Consider the following when running lead reports:

Standard Reports

Choose the Lead History report type to track the history of standard and custom fields on leads where field histories are set to tracked. Use this report to see tracked fields' old and new values.

 **Tip:** If you have the "Create and Customize Reports" permission, you can use the **View** drop-down on a Lead History Report to view lead history data by My Leads, My Team's Leads, User Owned Leads, Queue Owned Leads, and All Leads.

Tips for Lead Reports

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in:

- Group
- Professional
- Enterprise
- Performance
- Unlimited
- Developer

- Limit your report view to “My team’s leads” to see leads owned by users who report to you in the role hierarchy.
- Lead reports can show all leads, both converted and unconverted. To limit your report to just unconverted leads, enter filter criteria of “Converted equals 0.”
- The `Last Activity` of a lead is the most recent due date of an activity on the record. The following past or future activities set this date:
 - Any event
 - Closed tasks
- You can create a report of your lead information, export that data to Excel, and then do a mass mail merge using Microsoft® Word.

Lead Report Limitations

- You can't use filter conditions to search the results of the `Old Value` and `New Value` fields.
- You can't use filter logic if you are filtering by `Field/Event`.

IN THIS SECTION:

- [Opportunity Reports](#)
 Opportunity reports provide information about your opportunities, including owners, accounts, stages, amounts, and more. The default settings show you the most commonly used information from each object, but you can customize a report to view other information, such as primary campaign source, forecast category, and synced quote.
- [Opportunities with Historical Trending Report](#)
 The Opportunities with Historical Trending report is a custom report type designed to help you analyze historical trends in your sales pipeline.
- [Opportunities with Competitors Report](#)
 View information about your company's competitors for opportunities, including their strengths and weaknesses.
- [Opportunities with Contact Roles and Products Report](#)
 View information about the contacts and opportunities associated with a selected product. You must select a product to filter results by when you run the report.
- [Opportunities with Contact Roles Report](#)
 View information about the contacts associated with your opportunities, including name, title, and role.
- [Opportunities with Partners Report](#)
 View information about the partners you team with on your opportunities, including opportunity name, amount, and partner role.
- [Opportunities with Products Report](#)
 View information about the products associated with your opportunities, including product name and opportunity stage.
- [Opportunities with Quotes and Quote Line Items Report](#)
 View details about the quotes associated with opportunities, and the line items for each quote. The default settings provide the most commonly used information from each object, but you can customize the report to see any opportunity, quote, or quote line item field.
- [Opportunities with Quotes and Quote PDFs Report](#)
 View details about the quote PDFs created for each quote associated to an opportunity. The default settings show you the most commonly used information from each object, but you can customize the report to view other information, such as who created or last modified each listed quote PDF.
- [Opportunities with Opportunity Teams and Products Report](#)
 View information about your opportunity team members and their products, organized by opportunity. You must specify either a product or an opportunity team member to filter results by when you run the report.
- [Opportunities with Opportunity Teams Report](#)
 View information about the members of your opportunity team and their roles, organized by opportunity.

12. [Opportunity Field History Report](#)

View information about the change history of key opportunity fields, including old and new values and the dates edits were made.

13. [Opportunity History Report](#)

View information about the history of your opportunities, including stages and close date.

14. [Opportunity Trends Report](#)

View information about trends shared by the opportunities in your pipeline.

15. [Create a Custom Opportunity Report](#)

You can create and run custom opportunity reports to include information from associated objects, such as products, partners, and quotes.

[Opportunity Reports](#)

Opportunity Reports

Opportunity reports provide information about your opportunities, including owners, accounts, stages, amounts, and more. The default settings show you the most commonly used information from each object, but you can customize a report to view other information, such as primary campaign source, forecast category, and synced quote.

If your organization uses Forecasts or Customizable Forecasts, you'll see forecast report options paired with opportunity report options in the standard reports folders and the custom reports wizard. Opportunities owned by users who do not have a role in your organization's hierarchy are omitted from opportunity, forecast, and sales reports. This restriction does not apply to Personal or Group Edition organizations, which do not have a role hierarchy. For reports that include the `Partner` column (except for the Partner Opportunities report), only the primary partner of the opportunity is displayed.

Tips for Working with Opportunity Reports

Opportunity reports can include all opportunity fields plus some extra columns for additional detail.

- You can use the following columns to provide additional detail:
 - **Age**—For an open opportunity, the number of days since the opportunity was created. For a closed opportunity, the number of days between the creation date and the closed date.
 - **Stage Duration**—The number of days the opportunity was in the stage listed in the **Stage** column. You can run the Opportunity Stage Duration report to see how much time an opportunity spent at different stages.
 - **Last Activity**—The most recent due date of an activity on the opportunity record, including any opportunity event or closed task.
- Not all Opportunity Product fields are available in report filters. For example, the **Product Family** field is not available in Opportunity Product report filters because it is related to that object through the Pricebook Entry object. To make the **Product Family** field available in Opportunity Product report filters—for cross-sell or upsell reporting—create a custom formula field to store its contents and use that formula field in your filter. From the object management settings for opportunities, go to the fields area, then create a custom field of type Formula, making sure to use **Text** for your formula return type and **TEXT (PricebookEntry.Product2.Family)** for your formula.
- In Professional, Enterprise, Unlimited, Performance, and Developer edition organizations, the **Hierarchy** links let you browse report results based on the role or territory hierarchies.
- If your organization uses territory management, the Hierarchy filter on opportunity reports lets you view data according to either the role or territory hierarchies. In addition, the Territories filter lets you display either opportunities from all territories or opportunities that lack an associated territory.
- You can include the **Primary Campaign Source** field on all standard opportunity reports. This field is controlled by field-level security.
- Use the View filter to limit your opportunity report results. View options vary depending on your organization's Edition and setup.
 - **My opportunities**—Shows only your opportunities.
 - **My team-selling opportunities**—Shows opportunities for which you are on the opportunity team.
 - **My team-selling and my opportunities**—Shows your opportunities and opportunities for which you are on the opportunity team.
 - **My team's opportunities**—Shows your opportunities and opportunities owned by all of your subordinates in the role hierarchy. If your organization uses territory management, the effect of this option depends on the value of the Hierarchy filter above. If you select **Role**, you see your opportunities and opportunities owned by all of your subordinates in the role hierarchy. If you select **Territory**, you see opportunities that you own and any opportunities owned by your territories' descendants.
 - **My team's team-selling and their opportunities**—For users who report to you in the role hierarchy, shows opportunities they own or for which they are on the opportunity team.
 - **My territories**—For organizations that use territory management, this option shows opportunities that belong to the territories to which you are assigned.
 - **All opportunities**—Shows all opportunities you can view.

Use Standard Opportunity Reports

Using the standard opportunity reports, you can report on your opportunity pipeline and history, opportunity sources, opportunity types, and more.

1. In the **Folders** pane on the Reports tab, select **Opportunity Reports**.
2. Click the report you want.

Report Name	Description
Closed Opportunities	Won opportunities
Opportunities by Type	Types of available opportunities.
Opportunity Field History	Field history on opportunities. Available only if your organization tracks this information.
Opportunity History	Status changes on opportunities. Available only if your organization tracks this information.
Opportunity Pipeline Trend	A historical snapshot of your opportunities; opportunity amounts are grouped by historical stage for specified months. This report is available in Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations only.
Opportunity Pipeline	Opportunities by stage.
Opportunity Pipeline with Splits	Opportunities summarized by split information such as assigned user and percentage.
Opportunity Product	Opportunities by month and product.
Opportunity Product Report with Splits	Split assignments and percentages for each product. You can also summarize information by these fields: <ul style="list-style-type: none"> • Split Total Price—Split percentage multiplied by Total Price. • Split Expected Product Amount—Split Total Price multiplied by Probability.
Opportunity Schedule Report with Splits	Opportunities by month, including split percentages for the opportunity team. To access this report, product scheduling must be enabled for your organization. <p>You can also summarize information by these fields:</p> <ul style="list-style-type: none"> • Split Total Price—Split percentage multiplied by Total Price.

[Opportunities with Historical Trending Report](#)

The Opportunities with Historical Trending report is a custom report type designed to help you analyze historical trends in your sales pipeline.

We've selected some of the most useful Opportunity fields for you in the default report:

Amount

Estimated total sale amount. For organizations using multiple currencies, the amount is shown in your personal currency by default. Change the `Opportunity Currency` picklist to track the amount in another currency.

Close Date

Date when you plan to close the opportunity. You can enter a date, or choose a date from the calendar that displays when you put your cursor in the field.

Stage

Current stage of opportunity based on selections you make from a predefined list, for example, Prospect or Proposal.

Probability

Percentage of estimated confidence in closing the opportunity.

Forecast Category

Forecast category name that is displayed in reports, opportunity detail and edit pages, opportunity searches, and opportunity list views. The setting for an opportunity is tied to its `Stage`.

Note: If you edit this report type, it is no longer automatically updated. If you remove this report type, it will not be regenerated.

Product and Asset Reports

Use product and asset reports to view information about the products your users currently have installed. Find out what assets your customers have, list the cases filed for a particular asset, or identify assets that aren't associated with a product.

Special Features of Product and Asset Reports

Consider the following when running product and asset reports:

Standard Reports

Use the Assets without Products report, available from the "Products and Asset Reports" folder to list the assets that are not associated with a product. Depending on how you use assets, these assets can represent your competitor's products.

Report Types

- To create a custom report showing what assets your customers have, click **New Report** from the Reports tab and choose the Accounts with Assets or Contacts with Assets report type from the Accounts & Contacts report type category.

Self-Service Reports

Self-Service reports help you analyze the effectiveness of your Self-Service portal. Find out how many cases are being viewed, how many customers are logging in, or what customers think of the solutions you're offering.

Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

Standard Reports

- The Self-Service Usage Report gives you information on how many cases are viewed and logged, the number of comments that have been added, and the number of searches Self-Service users have performed.
- The Self-Service User Report provides information about the customers who are logging into your Self-Service portal, including the associated account and last login date. You can also include Self-Service fields in any custom contact report.
- The Helpful Solutions report displays statistics from Self-Service portals that display solutions. On each Self-Service solution page, customers can indicate whether the solution is helpful. You can use the results of this survey when choosing the top five solutions for your Self-Service Home page and to verify that customers are able to find the solutions they need.

SEE ALSO:

[The Report Run Page](#)

[Limit Report Results](#)

Reporting on Support Activity

Use support reports to track the number of cases created, case comments, case emails, case owners, case contact roles, cases with solutions, the length of time since the case last changed status or owner, and the history of cases.

You can also report on the solutions for your organization, including solution history, the languages in which solutions have been written, and whether translated solutions are out of date. If you have enabled the Self-Service portal, you can run reports to track usage of your Self-Service portal.

Fields Available for Case Reports

You can report on a number of key case fields in addition to the ones that are included in the standard and custom report types.

Cases	
Field	Description
# Cases Submitted	The number of cases submitted by Self-Service users via the Self-Service portal. (Self-Service Usage Report)
# Cases Viewed	The number of cases viewed by Self-Service users via the Self-Service portal. (Self-Service Usage Report)
# Comments Added	The number of comments added to all cases by Self-Service users via the Self-Service portal. (Self-Service Usage Report)
Entitlement Process Start Time	The time the case entered an entitlement process. This field displays if an entitlement process applies to the case.
Entitlement Process End Time	The time the case exited an entitlement process. This field displays if an entitlement process applies to the case.
Super User	A contact enabled to view case information, add comments, and upload attachments for all cases submitted via the Self-Service portal by anyone in his or her company. (Self-Service User Report)
Self-Service Commented>	A checkbox showing a comment was added to a case via the Self-Service portal.
New Self-Service Comment	A checkbox showing a comment has been added to a case via the Self-Service portal and has not been reviewed by the case owner.
Is Incoming	A checkbox showing a case was received by email via the Email-to-Case or On-Demand Email-to-Case feature. (Cases with Emails Report)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** Editions except **Database.com** (The edition determines which reports you see.)

Cases

Field	Description
Age	The age of an open case is the elapsed time from creation to the present. The age of a closed case is the elapsed time from creation to the closing time of the case. Age can be expressed in days, hours, or minutes. Note that the age of a case does <i>not</i> take into account any holidays that are associated with the case's business hours. Holidays suspend business hours during specified dates and times.
Closed	A checkbox showing a case has a closed status.
Escalated	A checkbox showing a case was escalated by an escalation rule.
Public Case Commented	A checkbox showing a case has comments that may be displayed via the Self-Service portal.
Has Attachment	A checkbox showing a case with emails has attachments. (Cases with Emails Report)
Old Value	The value in a tracked case or solution field before it was changed. (Case History Report and Solution History Report)
New Value	The value in a tracked case or solution field after it was changed. (Case History Report and Solution History Report)
Business Hours	The number of business hours that have elapsed since a case was last updated. Note that holidays are <i>not</i> taken into account for this field. Holidays suspend business hours during specified dates and times. (Case History Report)
Business Hours Since Similar Change	The number of hours that elapsed since the same field on a case was last updated. Note that holidays are <i>not</i> taken into account for this field. Holidays suspend business hours during specified dates and times. (Case History Report)
History ID	The unique identifier for each change tracked on a specified case or solution field. (Case History Report and Solution History Report)
Contact Account Name	The account associated with the contact on the case. View together with the <code>Account Name</code> field to see if the account on the case is different from the account on the contact.
Parent Case ID	The ID of a parent case, which can be used to access a parent case via the API.

Fields Available for Solution Reports

You can report on a number of key solution fields in addition to the standard and custom fields.

Field	Description
# Solution Searches	The number of solution searches performed by Self-Service users via the Self-Service portal. (Self-Service Usage Report)
Self-Service Access Count	The number of times a solution was viewed in the Self-Service portal.
Self-Service Answer Count	The number of times the survey question “Does this Solution help you answer your question?” is answered, either positively or negatively, on a solution in the Self-Service portal.
Self-Service Positive Count	The number of times the survey question “Does this Solution help you answer your question?” is answered positively on a solution in the Self-Service portal.
Author	The name of the user who originally created the solution.
Num Related Cases	The number of cases associated with the solution.
Reviewed	Checkbox that indicates whether the solution has a reviewed status.
Old Value	The value in a tracked case or solution field before it was changed. (Case History Report and Solution History Report)
New Value	The value in a tracked case or solution field after it was changed. (Case History Report and Solution History Report)
History ID	The unique identifier for each change tracked on a specified case or solution field. (Case History Report and Solution History Report)
Language	The language in which the master solution is written.
Translation Language	The language in which the translated solution is written. (Translated Solutions report)
Solution ID	The unique identifier for each solution. (Translated Solutions report)
Out of Date	Checkbox that indicates that the translated solution may need translating to match its master solution. (Translated Solutions report)
Master Solution Title	The title of the master solution. Displays up to 250 characters.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** Editions except **Database.com** (The edition determines which reports you see.)

Field	Description
Translated Solution Title	The title of the translated solution. Displays up to 250 characters.
Master Solution Details	The solution details of the master solution. Displays up to 1000 characters.
Translated Solution Details	The solution details of the translated solution. Displays up to 1000 characters.

Pre-Designed Custom Report Types

Some Salesforce features come with custom report types that are designed for you in advance, so you don't have to create a new report.

 **Note:** Pre-designed custom report types are not the same as standard report types.

IN THIS SECTION:

1. [Territory Reports](#)
Use territory reports to analyze your sales territories. Identify which users have been assigned to which territories, which users have been assigned more than one territory, or which users have no territories.
2. [Reports for Answers](#)
Create custom report types so users can analyze questions, replies, and votes.
3. [Salesforce CRM Call Center Reports](#)
Call Center reports help you analyze the Salesforce CRM Call Center phone calls that were handled by you and your team.
4. [Create a Custom Report Type for Approval History](#)
Before you can run reports on executed and in-progress approval processes and their steps, you need to create a custom report type for approval process instances.
5. [Reports That You Can Run on Activities](#)
Run standard or custom reports that display details specific to tasks or events and their related contacts, accounts, opportunities, and other associated records.
6. [Report on Sales Reps' Meetings with Customers](#)
Let's say that, as a sales manager, you want more insight into how your sales teams are prioritizing their time. Create a custom report that shows which customers sales reps are spending their time with.
7. [Create a Forecasting Custom Report Type](#)
8. [Forecasting Custom Report Types](#)
A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type.
9. [Idea Reports](#)
Create custom report types so users can create reports about ideas, idea comments, and votes.
10. [Reporting on Salesforce Knowledge Articles](#)
Use Salesforce Knowledge custom reports to track how articles are created, maintained, and delivered.
11. [Live Agent Session Reports](#)
Use Live Agent Session reports to consolidate data about agents' activities while they chat with customers—for example, how long agents are online or how many chat requests are assigned to them.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** Editions except **Database.com** (The edition determines which reports you see.)

USER PERMISSIONS

To run reports:

- "Run Reports"

To create, edit, and delete reports:

- "Create and Customize Reports"

12. [Report on Partners](#)

Some opportunities involve partner relationships. Use this report to identify and analyze those relationships.

13. [Report on Relationship Groups](#)

You can report on relationship groups and relationship group members if your administrator has enabled custom report types for those custom objects.

14. [Enable the Account Owner Report](#)

the Account Owner report, which lists all accounts and who owns them.

Territory Reports

Use territory reports to analyze your sales territories. Identify which users have been assigned to which territories, which users have been assigned more than one territory, or which users have no territories.

Special Features of Territory Reports

Consider the following when running territory reports:

Standard Reports

- The territory report lists all territories in your organization. Select **No Users** in the `Users` drop-down list and click **Run Report** to see the territories in your organization that do not have any assigned users.
- The User Territory report, User Multiple Territory report, and User Missing Territory report summarize the users who have been assigned to any territories, more than one territory, or no territories, respectively.
- The Account Territory report, Account Multiple Territory report, and Account Missing Territory report summarize the accounts that have been assigned to any territories, more than one territory, or no territories, respectively.
- The Opportunity Territory report summarizes the opportunities that are in territories. To see opportunities owned by users who are not currently active in the opportunity's territory, customize the Opportunity Territory report with the following advanced filter: `Active in Territory` equals "False." The Opportunity Missing Territory report summarizes the opportunities that are associated with accounts that do not have a territory.
- Reports run from custom report types that include territories may display results differently than standard reports that include territories. This is because reports run from custom report types only display results *with* territories, such as accounts with territories, whereas standard reports that include territories may display results *without* territories. For example, if you select the Account Territory Report, results display accounts without territories. In custom report types, when using the `Territories` filter that includes territories, Multiple Territories or Missing Territories are not shown in the report results.

Tips for Territory Reports

- Standard and custom territory fields are available in territory reports. They are also available in account reports, activity reports that include accounts, opportunity reports, and user reports.

Reports for Answers

Create custom report types so users can analyze questions, replies, and votes.

 **Note:** Starting with Summer '13, Answers isn't available for new organizations. Now you can use Chatter Answers, a self-service and support community where users can post questions and receive answers and comments from other users or your support agents. Chatter Answers brings together Case, Questions and Answers, and Salesforce Knowledge articles in a unified experience. Existing organizations will continue to have access to Answers if it was enabled prior to the Summer '13 release.

As an administrator, you can create custom report types so users can create reports about questions, replies, and votes. Custom report types are the only way to make reports about your answers community available for your users—Salesforce does not provide sample answers reports or a standard report folder for answers.

To create a folder of answers reports for your users:

1. Set up a custom report type for answers.
 - The primary object for your report is Questions.
 - There isn't a specific report category for answers, so you probably want to store your report in the Other Reports or Administrative Reports category.
 - When setting up object relationships, Questions can have a relationship with Replies, and Replies can have a relationship with Votes.
2. Create a new public folder for answers reports. This step requires the “Manage Public Reports” permission.
3. Using your custom report type, create one or more new custom reports for answers. Assign the reports to the new answers reports folder you created.

After completing these steps, a folder of answers reports is available to your users on the Reports home page.

USER PERMISSIONS

To create or update custom report types:

- “Manage Custom Report Types”

To delete custom report types:

- “Modify All Data”

Salesforce CRM Call Center Reports

Call Center reports help you analyze the Salesforce CRM Call Center phone calls that were handled by you and your team.

Special Features of Call Center Reports

Consider the following when running call center reports:

Standard Reports

- The My Team's Calls This Week gives you information about the calls that were handled by the call center users on your team during the past week, including associated records and the result of each call.
- The My Calls Today report gives you information about the calls that you initiated or received during the past day, including associated records and the result of each call.
- The My Calls This Week report gives you information about the calls that you initiated or received during the past week, including associated records and the result of each call.

Create a Custom Report Type for Approval History

Before you can run reports on executed and in-progress approval processes and their steps, you need to create a custom report type for approval process instances.

1. From Setup, enter *Report Types* in the *Quick Find* box, then select **Report Types**.
2. Click **New Custom Report Type**.
3. Fill out the fields.

For this field...	Do this...
Primary Object	Select Process Instance. A process instance represents one instance of an approval process. A new process instance is created each time a record is submitted for approval.
Report Type Label	Enter a label. Users see this label when they create reports. Example: <i>Approval Process Instances</i>
Report Type Name	Enter a unique name for the report type.
Description	Enter a description. Users see this label when they create reports.

EDITIONS

Available in: Salesforce Classic

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To run reports:

- "Run Reports"
- AND
- "Read" on the records included in report

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To delete custom report types:

- "Modify All Data"

For this field...	Do this...
Store in Category	Select Administrative Reports. If you like, you may select a different category. This determines in which folder your users find the custom report type when they create approval history reports.
Deployment Status	When you're ready to let all users access the report type, select Deployed.

4. Click **Next**.

5. Click the box under the primary object.

6. Select Process Instance Node.

A process instance node represents an instance of an approval step. A new process instance node is created each time a record enters a step in an approval process. No process instance node is created when the record doesn't meet the step criteria or if the approval process instance is otherwise completed without entering the step.

7. For the A to B relationship, select one of these options.

Option	Description
Each "A" record must have at least one related "B" record.	The report includes only process instances that enter at least one approval step to create a process instance node. The report excludes process instances for records that were submitted for approval but that didn't meet any step criteria.
"A" records may or may not have related "B" records.	The report includes all process instances.

8. Click **Save**.

After the report type is deployed, notify the relevant users with the names of the category folder and the custom report type, so that they can start creating and running approval history reports.

Reports That You Can Run on Activities

Run standard or custom reports that display details specific to tasks or events and their related contacts, accounts, opportunities, and other associated records.

To View This Information	Use This Report
Activities related to another record type, such as opportunities	Click Create New Custom Report on the Reports tab and select the Activities report type.

EDITIONS

Available in Lightning Experience in: **Contact Manager, Personal, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All Editions Except Database.com**

To View This Information **Use This Report**

The number of contacts related to an activity

Activity reports. Add the `Relation Count` column to your reports.

For example, you create a task with five contacts. When you run the Tasks and Events report, it displays "5" to indicate the number of contacts related to the task.

One row per contact for each activity

The Activities with Contacts report. Select at least one field from the Contact object.

For example, your report includes a task with five contacts. If you include the `Last Name` field from the contact object on the report, you see five rows (one row for each contact) related to this activity. If you don't add any fields from the contact object, you see only one row for the activity.

The Activities with Contacts report is the only report that:

- Displays all contacts on an activity
- Can be filtered using attributes of contacts other than the primary contact

Other reports show the primary contact and the total count of contacts on an activity, but they don't show details of the other contacts.

The Activities with Contacts report doesn't indicate which contacts are primary or secondary.

An activity's primary contact in two reports: Tasks and Events, and Activities with Cases. The primary contact also appears in the Name field on the task detail page or event detail page.

Either the Tasks and Events report or the Activities with Cases report.

For example, if the primary contact for a task is Ron Dean, these reports display that name in the `Contact` field.

Report on Sales Reps' Meetings with Customers

Let's say that, as a sales manager, you want more insight into how your sales teams are prioritizing their time. Create a custom report that shows which customers sales reps are spending their time with.

1. Create a custom report type.
 - a. For Primary Object, choose **Users**.
 - b. Complete the remaining required fields: label, description, and category.
 - c. Click **Next**.
2. Define a relationship between activities and users.
 - a. Relate the Activity Relationships object to the Users object.
 - b. Click **Save**.
3. Define default fields to appear in reports of this type.
 - a. In the Fields Available for Reports section, click **Edit Layout**.
 - b. Add the following Activity Relationships fields to the layout for reports of this type: `Date`, `Subject`, `Name`, `Related To`, `Relation Count`. Change the label for the `Name` field to `Contact` and for the `Related To` field to `Opportunity`.
 - c. For each field, check the option to display the field by default.
 - d. Click **Save**.
4. Create a report.
 - a. In the Reports tab, find and select the report type that you created in steps 1-3.
 - b. Choose **Summary Format**. Create a grouping by `Full Name`.
 - c. Run and save the report.

You now have a report that you can use to help your sales teams optimize the time that they spend with customers.

 **Note:** If you haven't enabled Shared Activities, then custom reports based on activity relationships don't include event organizers along with invitees, and they don't show events to which no one has been invited.

Create a Forecasting Custom Report Type

 **Note:** This information applies to Collaborative Forecasts and not Customizable Forecasts. You must enable Collaborative Forecasts to create a forecasting custom report type.

To make a forecasting report available to users, administrators must create a custom report type. A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type.

1. Start creating a custom report type from Setup by entering *Report Types* in the *Quick Find* box, then selecting **Report Types** and **New Custom Report Type**.
2. For Primary Object, select a Forecasting object, such as Forecasting Items or Forecasting Quotas.
3. For Store in Category, select Forecasts.

After deploying the report types, let your users know their locations and names.

Forecasting Custom Report Types

A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type.

 **Note:** This information applies to Collaborative Forecasts and not Customizable Forecasts. You must enable Collaborative Forecasts to create a forecasting custom report type.

Use the table to understand the forecasting custom report types that you can create.

Primary Object	Use to create a report for...
Forecasting Items	<p>Viewing information about forecasting amounts, including adjustment amount information. As a best practice, if you use a forecast type based on revenue, use these default fields in the report type:</p> <ul style="list-style-type: none"> • Owner Only Amount—The sum of all of a person’s revenue opportunities, without adjustments. For example, if you own two opportunities, each worth \$10,000, the Owner Only Amount is \$20,000. • Amount Without Adjustments—The sum of all of a person’s owned revenue opportunities and also his or her subordinates’ opportunities, without adjustments. Subordinates include everyone reporting up to a person in the forecast hierarchy. For example, if the sum of the amount of all opportunities owned by you is \$20,000 and the sum of the amount of your subordinates’ opportunities is \$55,000, the Amount Without Adjustments is \$75,000. • Amount Without Manager Adjustments—The forecast number as seen by the forecast owner. This is the sum of the owner’s revenue

To delete custom report types:

- “Modify All Data”

EDITIONS

Available in: Salesforce Classic

Available in: **Professional** (no Opportunity Splits or Custom Field forecasts), **Enterprise, Performance, Unlimited,** and **Developer** Editions

Primary Object**Use to create a report for...**

opportunities and his or her subordinates' opportunities, including adjustments made by the forecast owner on her or her own or subordinates' forecasts. *It doesn't include adjustments made by forecast managers above the owner in the forecast hierarchy.* For example, say Anne has an Amount Without Adjustments of \$75,000, made up of \$20,000 of her own opportunities and \$55,000 of opportunities owned by her subordinate Ben. Additionally, she adjusted Ben's amount to \$65,000 for a total of \$85,000. If you adjust Anne's number from \$85,000 to \$100,000, then you see \$85,000 in **Amount Without Manager Adjustments** because this is what Anne sees (and Anne can't see your adjustments as you're her manager). To see the amount that includes *your* adjustment to \$100,000, look at **Forecast Amount**.

- **Forecast Amount**—The revenue forecast from the forecast manager's perspective and the sum of the owner's and subordinates' opportunities, including all forecast adjustments. For example, say you're a forecast manager and have another forecast manager reporting to you who has an Amount Without Manager Adjustment totaling \$85,000. If you adjust the forecast to \$100,000, the Forecast Amount is \$100,000.

If you use a forecast type based on quantity, use these default fields in the report type instead:

- **Owner Only Quantity, Quantity Without Adjustments, Quantity Without Manager Adjustments, and Forecast Quantity**

No matter whether you forecast based on revenue or quantity, add these fields:

- **Has Adjustment**—A checkbox that indicates if a manager adjustment has been made on a forecast owner's amount.
- **Has Owner Adjustment**—A checkbox that indicates if a forecast user has made an adjustment to their own forecast amount.

If your organization uses cumulative forecast rollups, add this field to your report:

- **ForecastingItemCategory**—This field indicates which rollup each forecast amount is for: Open Pipeline, Best Case Forecast, Commit Forecast, Closed Only, Pipeline, Best Case, Commit, or Closed. If your organization has changed the forecast category names, those changes also appear in the **ForecastingItemCategory** values.

Forecasting Items with Opportunities as a related object

Viewing opportunity information for specific forecasting line items. For example, you might want to create a summary report for each of your subordinates that includes the opportunity names and last activity dates for their forecasting items, alongside adjustment information and final forecast amounts.

-  **Note:** For opportunities with no opportunity products specified, this report type includes 2 forecasting items — one for the Opportunity-Revenue forecast type, and one for the Product Family forecast type. These product family forecasting items roll up into the Products Not Specified row of the Product Family forecast.

Forecasting Items with Opportunity Splits as a related object

Viewing opportunity split information for specific forecasting line items. For example, you might want to create a summary report for each of your subordinates that includes the opportunity split amounts and percentages for their forecasting items, alongside adjustment information and final forecast amounts.

Primary Object**Use to create a report for...**

Forecasting Items with Opportunity Product as a related object

Viewing product family information for specific forecasting line items. For example, you might want to create a summary report for each of your subordinates that includes the product families and total price for their forecasting items, alongside adjustment information and final forecast amounts.

Note: This report type only shows forecasting items for the Product Family—Revenue and Product Family—Quantity forecast types. It includes opportunities both with and without opportunity products specified.

Forecasting Quotas

Viewing data about individual or team quotas. As a best practice, include all the default fields in the report type. For example, you can include lookup fields, such the full name of the owner. When running the report, you can filter by your own name to see quotas you created and their related accounts and owners.

Forecasting Quotas with Forecasting Items as a related object

Viewing quota attainment. For example, you can use both Forecasting Quotas and Forecasting Items to create the custom report type. Then, when you create the report, include a team's quotas and forecasted revenue for closed forecasts and create a formula field to display the quota percentage attained.

Idea Reports

Create custom report types so users can create reports about ideas, idea comments, and votes.

As an administrator, you can create custom report types so users can analyze what happens to ideas. Custom report types are the only way to make idea reports available for your users—Salesforce does not provide sample idea reports or a standard report folder for ideas.

To create a folder of idea reports for your users:

1. Create a custom report type for ideas.

If you create a custom report type that uses Ideas as the primary object and Votes as the secondary object, child (merged) ideas will not appear in the report unless you select "A" records may or may not have related "B" records. Child ideas have no votes because their votes are transferred to the master idea. This means child ideas do not appear in a report if the Votes object is required.

2. Create a new public folder for idea reports. This step requires the "Manage Public Reports" permission.

3. Using your custom report type, create one or more new custom reports for ideas. Assign the reports to the new idea reports folder you created.

After completing these steps, a folder of idea reports will be available to your users on the Reports home page.

Reporting on Salesforce Knowledge Articles

Use Salesforce Knowledge custom reports to track how articles are created, maintained, and delivered.

As an administrator, you can create custom report types so users can create reports on Salesforce Knowledge articles. Custom report types are the only way to make reports about articles available for your users—Salesforce does not provide sample article reports or a standard report folder for articles.

 **Tip:** The *Knowledge Base Dashboards and Reports* AppExchange package provides over two dozen reports that help you monitor the knowledge base and analyze usage metrics.

IN THIS SECTION:

1. [Create a Folder for Article Reports](#)
Create a public folder where you can store article reports for your users.
2. [Article Reports](#)
Create a custom report type to report on Salesforce Knowledge article data.
3. [Create an Article Report](#)
Run your custom report on your Salesforce Knowledge articles and save them to your article reports folder.
4. [Fields Available on Salesforce Knowledge Reports](#)
The fields you can use in a knowledge report depend on the type of information you are reporting on.

Create a Folder for Article Reports

Create a public folder where you can store article reports for your users.

Create a public folder where you can store article reports for your users.

1. In the Report Folder section of the Reports tab, click **Create New Folder**.
2. Enter *Article Reports* in the `Folder Label` field.
3. Optionally, modify the `Group Unique Name`.
4. Choose a `Public Folder Access` option.
Select read/write if you want users to be able to add and remove reports.
5. Choose a folder visibility option.
6. Click **Save**.

Reports you store in this folder are available on the Reports tab.

Article Reports

Create a custom report type to report on Salesforce Knowledge article data.

To create a custom report:

1. From Setup, enter *Report Types* in the Quick Find box, then select **Report Types** and click **New Custom Report Type**.

See [Create a Custom Report Type](#) on page 389

2. In the Primary Object drop-down menu, select the article-related object you want to report on:

Primary Object	Description
Article types and Article Version History	Compare information such as creation dates, published channels, and number of associated cases for your custom article type, such as an FAQ. Be sure to add the article type’s version as a secondary object to access any history and custom fields for the custom article type.
Knowledge Articles	Compare information about individual articles, such as their creation dates, published channels, and number of associated cases. If you choose this custom report type, you can also include article view and vote statistics. In reports using the Knowledge Articles primary object, each article has five records (rows): one for each channel (All Channels, Internal App, Customer, Partner, and Public Knowledge Base).
Knowledge Article Searches	Analyze the number of searches per day, month, or year for each channel and role.
Knowledge Article Version	Compare information about individual translations, such as their creation dates, published channels, and number of associated cases. If you choose this custom report type, you can also include article view and vote statistics.
Knowledge Article Views	Analyze the number of views per day, month, or year for each channel and role.
Knowledge Article Votes	Analyze the number of votes per day, month, or year for each channel and role.
Knowledge Keyword Search	See which keywords users are looking for in your knowledge base.
Knowledge Search Activity	<ul style="list-style-type: none"> • Analyze the number of searches per day, month, or year for each channel and language.. • For each search, see the: <ul style="list-style-type: none"> – Date – ID and title of the article that was clicked • See which keywords users are looking for in your knowledge base. • For each keyword, see the average number of:

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To create or update custom report types:

- “Manage Custom Report Types”

To create a public reports folder:

- “Manage Public Reports”

- Results
- Articles that appear in the search results
- For each article, see the average number of:
 - Clicks
 - Unique users who clicked it

3. Complete the required fields and click **Save**.

In the Store in Category drop-down menu, we recommend choosing **Customer Support Reports** or **Other Reports**. This is the category where users will find the custom report type on the Reports tab.

4. Make your choices on the Define Report Records Set page.

Primary Object	Available Secondary Objects
Article types and Article Version History	Article type Versions
Knowledge Articles	Article View Statistics, Article Vote Statistics, Case Article
Knowledge Article Searches	None
Knowledge Article Version	Article View Statistics, Article Vote Statistics
Knowledge Article Views	None
Knowledge Article Votes	None
Knowledge Keyword Search	None
Knowledge Search Activity	None

5. Click **Save**.

6. As needed, remove and rearrange fields from your report layout.

To learn which fields are available on each primary object, see [Fields Available on Salesforce Knowledge Reports](#) on page 3433.

Create an Article Report

Run your custom report on your Salesforce Knowledge articles and save them to your article reports folder.

Using your [custom report types](#), create article reports and save them to your [article reports folder](#).

1. On the Reports tab, click **New Report**.
2. Choose the category where your custom report types are stored; for example, **Customer Support Reports** or **Other Reports**.
The Cases with Articles report is available by default in the Customer Support Reports folder.
3. Find your report type and click **Create**.
4. When viewing your report, click **Save As** and save it in the new Article Reports folder to make the report available to other users.

 **Note:**

- In reports using the Knowledge Article custom report type, there are at least five rows per article (one for each channel, including "All Channels").
- Daily values are reported independently for the last 90 days and monthly values for the last 18 months. After those time periods you need to use the monthly aggregate and yearly aggregate values, respectively.
- In reports using the Knowledge Article Votes, Knowledge Article Views, or Knowledge Article Searches custom report types, each row represents a day, channel, and role combination. For example, if a user with the Kingmaker role views articles in the internal app and the next day the same user views more articles in the internal app, the Article Views report has two rows: one for each unique date.
- In reports using Knowledge Article Version (KAV), except Knowledge Article Version History, you can filter by data category. You can add up to four filters and set their logic to AT, ABOVE, BELOW, or ABOVE OR BELOW. The logic between filters is OR. You can use the same category group multiple times, however, you must use the same operator each time.
- To report on Approval Processes for Knowledge Articles, use **Process Instance** and **Process Instance Node** when creating a custom report type. Then filter the report on object type, which is the article type.

Fields Available on Salesforce Knowledge Reports

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To create a public reports folder:

- "Manage Public Reports"

The fields you can use in a knowledge report depend on the type of information you are reporting on.

The following tables list the available fields by primary object for Salesforce Knowledge reports.

Fields Available on Article types and Article Version History Reports

The Article Type primary object allows you to add a secondary object of the article type version.

Table 43: Article Type Report Primary Object Fields

Field	Description
Archived By	User who archived the article.
Archived Date	Date the article was archived.
Article Number	Unique number automatically assigned to the article.
Article Type ID	The ID associated with the article type.
Case Association Count	Number of cases attached to the article.
Created By	User who created the article.
Created Date	Date the current article version. If the article has been published more than once, this is the latest draft date. To create reports that use the original article creation date, first create a Custom Report Type that joins the Knowledge Article (<code>__ka</code>) and Knowledge Article Version (<code>__kav</code>) objects for a given article type to allow for use of the created date on the record in the Knowledge Article object, rather than the one for the Knowledge Article Version record.
Custom fields	Any custom fields created on the article types. Add the article type's version as a secondary object to access any custom fields for the article type.
First Published Date	Date the article was originally published.
Knowledge Article Version	The article's version number.
Last Modified By	User who changed the article most recently.
Last Modified Date	Date the article was last changed. The last modified date of a draft article is the time the draft was saved. The last modified date of a published article is time the article was most recently published.
Last Published Date	Date the article was last published.
Master Language	The original language of the article.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** editions.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** editions.

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To create a public reports folder:

- "Manage Public Reports"

 **Note:** Currently you can't use Knowledge Article Version and Last Modified Date in the same report.

Table 44: Article Type Report Secondary Object Fields

Field	Description
Archived By	User who archived the article.
Article Type	The article type associated with the article.
Created By	User who created the article.
Created Date	Date the current article version. If the article has been published more than once, this is the latest draft date. To create reports that use the original article creation date, first create a Custom Report Type that joins the Knowledge Article (__ka) and Knowledge Article Version (__kav) objects for a given article type to allow for use of the created date on the record in the Knowledge Article object, rather than the one for the Knowledge Article Version record.
Custom fields	Any custom fields created on the article types. Add the article type's version as a secondary object to access any custom fields for the article type.
Is Latest Version	Indicates if the article is the most recent version.
Is Master Language	Indicates that the article is not a translation, but the original article.
Knowledge Article Version ID	Unique ID automatically assigned to the article translation.
Language	The article's language.
Last Modified By	User who changed the article most recently.
Last Modified Date	Date the article was last changed. The last modified date of a draft article is the time the draft was saved. The last modified date of a published article is time the article was most recently published.
Out of Date	Indicates that the master article has been updated since this translation was published.
Publication Status	Indicates whether the article or translation is in progress (draft), published, or archived.
Summary	Description of the article provided by the author.
Title	The article's title.
Translation Completed Date	Date the translation was completed.
Translation Exported Date	Date the article was exported for translation.
Translation Imported Date	Date the translation was imported.
URL Name	Text used as hyperlink for the article.
Validation Status	Indicates if the article is valid or not.
Version Number	The version number of the article.
Visible in Customer	Indicates that the article is published in the Customer Portal.
Visible in Internal App	Indicates that the article is published in the internal app (Articles tab).

Field	Description
Visible in Partner	Indicates that the article is published in the partner portal.
Visible in Public Knowledge Base	Indicates that the article is published in the public knowledge base.

Fields Available on Knowledge Articles Reports

Field	Description
Article Number	Unique number automatically assigned to the article.
Article Type	The article type associated with the article.
Case Association Count	Number of cases attached to the article.
Created By	User who created the article.
Created Date	Date the current article version. If the article has been published more than once, this is the latest draft date. To create reports that use the original article creation date, first create a Custom Report Type that joins the Knowledge Article (__ka) and Knowledge Article Version (__kav) objects for a given article type to allow for use of the created date on the record in the Knowledge Article object, rather than the one for the Knowledge Article Version record.
First Published Date	Date the article was originally published.
Is Latest Version	Indicates if the article is the most recent version.
Knowledge Article Version ID	Unique ID automatically assigned to the article translation.
Last Modified By	User who changed the article most recently.
Last Modified Date	Date the article was last changed. The last modified date of a draft article is the time the draft was saved. The last modified date of a published article is time the article was most recently published.
Last Published Date	Date the article was last published.
Summary	Description of the article provided by the author.
Title	The article's title.
URL Name	Text used as hyperlink for the article.
Validation Status	Indicates if the article is valid or not.
Version Number	The version number of the article.
Visible in Customer	Indicates that the article is published in the Customer Portal.
Visible in Internal App	Indicates that the article is published in the internal app (Articles tab).
Visible in Partner	Indicates that the article is published in the partner portal.

Field	Description
Visible in Public Knowledge Base	Indicates that the article is published in the public knowledge base.

Fields Available on Knowledge Article Searches Reports

Field	Description
Channel	The channel that's applicable to the article. Possible values are All Channels, Internal App, Customer, Partner, and Public Knowledge Base.
Count	The number of article searches applicable to the duration shown (day, month, or year).
Cumulative Count	The total number of article searches for the history of the record.
Date	Last date on which an article search took place for the record. All rows represent a date, channel, and role combination.
Duration	The time period the search count is applied to. Possible values are Daily, Monthly, and Yearly. For example, a record where the Count is 70 and the Duration is Monthly indicates 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.
Related Role	Name of the role that applies to the record. Each row in the report represents searches per channel per role.

Fields Available on Knowledge Article Version Reports

Field	Description
Archived By	User who archived the article.
Archived Date	Date the article was archived.
Article Number	Unique number automatically assigned to the article.
Article Type	The article type associated with the article.
Case Association Count	Number of cases attached to the article.
Created By	User who created the article.
Created Date	Date the current article version. If the article has been published more than once, this is the latest draft date. To create reports that use the original article creation date, first create a Custom Report Type that joins the Knowledge Article (__ka) and Knowledge Article Version (__kav) objects for a given article type to allow for use of the created date on the record in the Knowledge Article object, rather than the one for the Knowledge Article Version record.
First Published Date	Date the article was originally published.
Is Latest Version	Indicates if the article is the most recent version.
Is Master Language	Indicates that the article is not a translation, but the original article.

Field	Description
Knowledge Article Version ID	Unique ID automatically assigned to the article translation.
Language	The article's language.
Last Modified By	User who changed the article most recently.
Last Modified Date	Date the article was last changed. The last modified date of a draft article is the time the draft was saved. The last modified date of a published article is time the article was most recently published.
Date the article was last published.	Date the article was last published.
Master Language	The original language of the article.
Out of Date	Indicates that the master article has been updated since this translation was published.
Publication Status	Indicates whether the article or translation is in progress (draft), published, or archived.
Summary	Description of the article provided by the author.
Title	The article's title.
Translation Completed Date	Date the translation was completed.
Translation Exported Date	Date the article was exported for translation.
Translation Imported Date	Date the translation was imported.
URL Name	Text used as hyperlink for the article.
Validation Status	Indicates if the article is valid or not.
Version Number	The version number of the article.
Visible in Customer	Indicates that the article is published in the Customer Portal.
Visible in Internal App	Indicates that the article is published in the internal app (Articles tab).
Visible in Partner	Indicates that the article is published in the partner portal.
Visible in Public Knowledge Base	Indicates that the article is published in the public knowledge base.

Fields Available on Knowledge Article Views Reports

You can add up to six of the eight fields below.

Field	Description
Channel	The channel that's applicable to the article. Possible values are All Channels , Internal App , Customer , Partner , and Public Knowledge Base .

Field	Description
Count	The number of article views applicable to the duration shown (day, month, year).
Cumulative Count	The total number of article views for the history of the record.
Date	Last date on which an article view took place for the record. All rows represent a date, channel, and role combination.
Duration	The time period the search count is applied to. Possible values are <code>Daily</code> , <code>Monthly</code> , and <code>Yearly</code> . For example, a record where the Count is 70 and the Duration is <code>Monthly</code> indicates 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.
Related Role	Name of the role that applies to the record.
Score	Article's average view rating. Note that scores take into account a half-life calculation. Every 15 days, if an article has not been viewed its average rating moves up or down. This calculation ensures that over time, older or outdated articles don't maintain artificially high or low ratings compared to newer, more frequently viewed articles.
Total Views	Number of times a published article has been viewed.

Fields Available on Knowledge Article Votes Reports

Field	Description
Channel	The channel that's applicable to the article. Possible values are <code>All Channels</code> , <code>Internal App</code> , <code>Customer</code> , <code>Partner</code> , and <code>Public Knowledge Base</code> .
Count	The number of article votes applicable to the duration shown (day, month, year).
Cumulative Count	The total number of article votes for the history of the record.
Date	Last date on which an article vote took place for the record. All rows represent a date, channel, and role combination.
Duration	The time period the search count is applied to. Possible values are <code>Daily</code> , <code>Monthly</code> , and <code>Yearly</code> . For example, a record where the Count is 70 and the Duration is <code>Monthly</code> indicates 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.
Related Role	Name of the role that applies to the record.

Fields Available on Knowledge Keyword Search Reports

Field	Description
Channel	The channel that's applicable to the article. Possible values are <code>All Channels</code> , <code>Internal App</code> , <code>Customer</code> , <code>Partner</code> , and <code>Public Knowledge Base</code> .
Count	The number of keyword searches applicable to the duration shown (day, month, year).

Field	Description
Date	Last date on which a keyword search took place for the record. All rows represent a date, channel, and role combination.
Duration	The time period the search count is applied to. Possible values are <code>Daily</code> , <code>Monthly</code> , and <code>Yearly</code> . For example, a record where the Count is 70 and the Duration is <code>Monthly</code> indicates 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.
Found	Indicates whether the keyword shown was found during a search of the knowledge base.
Keyword	Search term used to search published articles in the knowledge base.

Fields Available on Knowledge Search Activity Reports

Field	Description
Average Click Rank	The order in which the article appeared in search results when users clicked it from the list of results.
Channel	The channel that's applicable to the article. Possible values are <code>All Channels</code> , <code>Internal App</code> , <code>Customer</code> , <code>Partner</code> , and <code>Public Knowledge Base</code> .
Clicked Article Title	The title of the clicked article.
Duration	The time period the search count is applied to. Possible values are <code>Daily</code> , <code>Monthly</code> , and <code>Yearly</code> . For example, a record where the Count is 70 and the Duration is <code>Monthly</code> indicates 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.
Language	The language filter that's applied to the user's search.
Number of Results	The number of search results that were returned for the search term. If Duration is also included, this value is aggregated based on the time period specified.
Number of Searches	The number of searches for the duration that's shown (day, month, or year).
Number of Users	The number of individual users who clicked the article.
Search Date	The date of the search.
Search Term	The first 100 characters of the search term that was used to search published articles in the knowledge base.

Live Agent Session Reports

Use Live Agent Session reports to consolidate data about agents' activities while they chat with customers—for example, how long agents are online or how many chat requests are assigned to them.

A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type. You can create a custom report type for Live Agent sessions to aggregate data about your agents' activity while they support customers. These reports include data for all of the chats that occurred during a specific Live Agent session.

Customize Live Agent session reports to include columns of information about any of the following categories, as well as any custom fields related to Live Agent sessions:

Column Name	Description
Agent: Full Name	Name of the agent associated with the session.
Chat Requests Assigned	Number of chat requests assigned to an agent.
Chat Requests Declined (Manually)	Number of chat requests declined manually by an agent.
Chat Requests Declined (Push Timeout)	Number of chat requests that timed out while assigned to an agent.
Chat Requests Engaged	Number of chats in which an agent was engaged during the session.
Created By: Full Name	Full name of the creator of the session record.
Created Date	Date the session record was created.
Last Modified By: Full Name	Full name of the person who last modified the session record.
Last Modified Date	Date the session record was last modified.
Live Agent Session ID	ID of the Live Agent session record.
Live Agent Session Name	Automatically generated ID of the Live Agent session.
Login Time	Time and date the agent logged in to the session.
Logout Time	Time and date the agent logged out of the session.
Time Idle	Total amount of time in seconds an agent was not engaged in chats during a session. The following formula indicates how an agent's idle time is calculated: (Time Spent Online + Time Spent Away) - Time Spent in Chats = Time Idle.
Time Spent at Capacity	Total amount of time in seconds in which an agent's queue was full.
Time Spent Away	Total amount of time in seconds an agent spent in "Away" status.
Time Spent in Chats	Total amount of time in seconds an agent spent engaged in chats.
Time Spent Online	Total amount of time in seconds an agent spent online.

EDITIONS

Available in: Salesforce Classic

Live Agent is available in: **Performance** Editions and **Developer** Edition organizations that were created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

Report on Partners

Some opportunities involve partner relationships. Use this report to identify and analyze those relationships.

To report on all partnerships or primary partnerships within opportunities:

1. From the Reports tab, choose the Partner Opportunities report.
2. Choose **Customize** to change the report and view only primary partner relationships. Add a field filter where *Primary equals 1*.

In any other opportunity report, when you customize the report to display the Partner column, only the primary partner displays.

You can also run the Partner Accounts report to analyze the partnerships of your accounts.

Report on Relationship Groups

You can report on relationship groups and relationship group members if your administrator has enabled custom report types for those custom objects.

Custom report types are the only way to make relationship group reports available for your users—Salesforce does not provide sample relationship group reports or a standard report folder for relationship groups.

Administrators can create a public folder of relationship group reports as follows:

1. Create a custom report type for relationship group objects.
 -  **Tip:** To create a report type about the members of relationship groups, select `Relationship Groups` as the primary report type object and add `Relationship Group Members` as an object relationship. Alternatively, to create a report type about the accounts that are primary on a relationship group, select `Accounts` as the primary report type object and add `Relationship Groups (Primary Account)` as an object relationship.
2. Create a new public folder for relationship group reports. This step requires the “Manage Public Reports” permission.
3. Using your custom report type, create one or more new custom reports for relationship groups. Assign the reports to the new relationship groups reports folder you created.

After completing these steps, a folder of relationship group reports will be available to users on the Reports home page.

USER PERMISSIONS

To create or update custom report types:

- “Manage Custom Report Types”

To delete custom report types:

- “Modify All Data”

Enable the Account Owner Report

the Account Owner report, which lists all accounts and who owns them.

Organizations that have their organization-wide sharing access level set to Private for accounts may want to restrict users from running the Account Owner report.

To show or hide this report:

1. From Setup, enter *Account Owner Report* in the **Quick Find** box, then select **Account Owner Report**. This option is available only in organizations that have a private account sharing model.
2. Select the checkbox to allow all users to run this report. If you leave the box unchecked, only administrators and users with the “View All Data” permission can run this report.
3. Click **Save**.

Choose a Report Format

A report can use the tabular, summary, matrix, or joined format. Choose a format that’s complex enough to capture the data you want to show, but simple enough to communicate it effectively.

Choose one of the following report formats using the **Format** menu of the report builder. Tabular format is the default.

Format	Description
Tabular	Tabular reports are the simplest and fastest way to look at data. Similar to a spreadsheet, they consist simply of an ordered set of fields in columns, with each matching record listed in a row. Tabular reports are best for creating lists of records or a list with a single grand total. They can't be used to create groups of data or charts, and can't be used in dashboards unless rows are limited. Examples include contact mailing lists and activity reports.
Summary	Summary reports are similar to tabular reports, but also allow users to group rows of data, view subtotals, and create charts. They can be used as the source report for dashboard components. Use this type for a report to show subtotals based on the value of a particular field or when you want to create a hierarchical list, such as all opportunities for your team, subtotaled by <i>Stage</i> and <i>Owner</i> . Summary reports with no groupings show as tabular reports on the report run page.
Matrix	Matrix reports are similar to summary reports but allow you to group and summarize data by both rows and columns. They can be used as the source report for dashboard components. Use this type for comparing related totals, especially if you have large amounts of data to summarize and you need to compare values in several different fields, or you want to look at data by date <i>and</i> by product, person, or geography. Matrix reports without at least one row and one column grouping show as summary reports on the report run page.

Format	Description
	 Building Matrix Reports
Joined	<p>Joined reports let you create multiple report blocks that provide different views of your data. Each block acts like a “sub-report,” with its own fields, columns, sorting, and filtering. A joined report can even contain data from different report types.</p> <p>Joined reports are available only in Enterprise, Performance, Unlimited, and Developer Editions.</p>  Introducing Joined Reports in Salesforce

Changing the Report Format

Changing the format affects filters and groupings, as follows:

When you change...	What Happens?
Tabular to Summary or Matrix	The <code>Rows to Display</code> filter is removed.
Summary, Matrix, or Joined to Tabular	All groupings, charts, and custom summary formulas are removed from the report. Grouping fields are not converted to columns in the tabular report. If the joined report contained multiple blocks, the columns from only the first block are included in the tabular report.
Summary to Matrix	The first summary grouping becomes the first row grouping. The second becomes the first column grouping. The third becomes the second row grouping. If you're using the report wizard, the third summary grouping is removed.
Matrix to Summary	The first row grouping becomes the first summary grouping. The second row grouping becomes the <i>third</i> summary grouping. The first column grouping becomes the <i>second</i> summary grouping. The second column grouping is removed. If you're using the report wizard, <i>both</i> the second row grouping and second column grouping are removed.
Tabular, Summary, or Matrix to Joined	The existing report becomes the first block in the joined report, and the report type becomes the principle report type for the joined report. Joined report blocks are formatted as summary reports, so if you switch from a summary to a joined report, your groupings stay the same. If you switch from a matrix to a joined report, groupings are converted the same way as when you switch from a matrix to a summary report. The following items aren't supported in joined reports, and aren't converted: <ul style="list-style-type: none"> • Bucket fields • Cross filters

When you change...**What Happens?**

- The Rows to Display filter

- "Create and Customize Reports"
- AND
- "Report Builder"

Creating a Custom Report

You can customize standard reports, or you can build custom reports from scratch to suit the exact needs of your organization.

Users with the “Manage Custom Report Types” permission can define custom report types that extend the types of reports from which all users in their organization can create or update custom reports. A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type. Salesforce provides a set of pre-defined standard report types; administrators can create custom report types as well.

Users with the “Manage Reporting Snapshots” permission can create and schedule snapshots. A reporting snapshot lets you report on historical data. Authorized users can save tabular or summary report results to fields on a custom object, then map those fields to corresponding fields on a target object. They can then schedule when to run the report to load the custom object's fields with the report's data. Reporting snapshots enable you to work with report data similarly to how you work with other records in Salesforce.

Create a Custom Report in Accessibility Mode

 **Note:** This topic only applies if you're not using report builder. *Report builder* is a visual editor for reports.

To create a new custom report using the custom report wizard:

1. From the Reports tab, choose the **Create New Custom Report** button.
2. Select the type of data for the report, and click **Next**.

To create reports on custom objects, choose the **Other Reports** report type category unless the custom object has a relationship with a standard object. When the custom object has a master-detail relationship with a standard object, or is a lookup object on a standard object, select the standard object for the report type category instead.

3. [Choose the report format.](#)
4. Follow the steps of the wizard using the **Next** button. For each report, customize the following:
 - **Specify Row and Column Headers:** On the Select Grouping page for summary and matrix reports, choose the fields by which you want to group and subtotal the data. In a summary report, choosing more than one sort field allows you to subsort your data. For matrix reports, select summary fields for the row labels and column headings. When grouping by a date field, you can further group the data by a specific time period such as days, weeks, or months.

 **Note:** On the Select Grouping page, if you set `Group Dates By` to "Calendar Month in Year" or "Calendar Day in Month," you won't be able to drill down to those date groupings in reports or dashboards. Users are taken to the unfiltered report instead.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To run reports:

- “Run Reports”

To schedule reports:

- “Schedule Reports”

To create, edit, and delete reports:

- “Create and Customize Reports”

AND

“Report Builder”

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To create, edit, and delete reports:

- “Create and Customize Reports”

- **Summarize Data:** On the Select Columns to Total page, choose the types of summary information to display for numeric fields.
- **Build Custom Summary Formulas:** On the Select Columns to Total page for summary and matrix reports, create custom summary formulas to calculate additional totals based on existing report summaries. A formula is an algorithm that derives its value from other fields, expressions, or values. See [Build a Custom Summary Formula](#) on page 3455.
- **Choose Fields:** On the Select Columns page, choose the fields to display in the report. You can display only those fields that are visible in your page layout and field-level security settings. If you choose the `Description` field or any other long text field, only the first 255 characters are displayed.
- Only the first 254 characters in a rich text area or a long text area are displayed in a report.
- **Order Columns:** On the Order Columns page, select the order for displaying the chosen fields.
- **Limit Report Results:** On the Select Criteria page, choose the appropriate settings from the drop-down lists, then use the [filter options](#) to limit the report to records with specific data.

The report wizard supports up to 10 filters. On reports with more than 10, additional filters are dropped and the report shows an error for any filter logic.

Tip: To use a tabular report on a dashboard, first limit the row count, by setting the `Rows to Display` option, the sort column, and the order on the Select Criteria page of the report. You can't use gauge or metric components on dashboards using tabular reports.

- **Chart Settings:** On the Select the Chart Type and Report Highlights step of the report wizard, [set chart properties](#) to display your report data in a chart. Charts are available only for summary and matrix reports.

5. Click **Run Report** to view the report, or click **Export Details** to save the report as an Excel file or other format.

Tip: Customizing your reports can require running them a few times as you adjust the report criteria and options. We recommend using a filter that gives you a smaller sampling of data until you are finished customizing the report and ready to save.

Group Your Report Data

Group data in columns or rows in summary, matrix, and joined reports to display meaningful information. For example, group opportunities by Close Date to see closed opportunities or group cases by product to see the number of cases for each product. You can have groupings inside groupings.

Data for Grouping

The Fields pane displays fields from the selected report type, organized by folder. Before you group data in a summary report, drag and drop at least a few fields into the preview pane.

Add a Grouping

Add a group by dropping a field onto a drop zone.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To create, edit, and delete reports:

- “Create and Customize Reports”
- AND
- “Report Builder”

Click **Show > Drop Zones** to make them visible. You can also click a column menu for a field in the report and choose **Group by this Field**.

 **Tip:** If you group your report by a date field, you can click the group menu, select **Group Dates By**, and specify the grouping time frame: day, week, month, quarter, year, etc.

Grouping Data in Different Report Formats

Summary and joined reports can have up to three grouping levels. Matrix reports can have two row and two column groupings. For matrix reports, you can't use the same field for both row and column groupings. For joined reports, you can use the fields from the Common Fields category in the Fields pane to group across all report blocks.

Remove a Grouping

To remove a group, click the group menu and choose **Remove Group**. You can also grab the group and:

- Drag it to the column bar to remove the group, but keep the field as a column in the report.
- Drag it back to the Fields pane to remove the group and the field from the report.

Change Order of a Grouping

Drag groups to change their order, or click the group menu and choose **Move Group Up** or **Move Group Down** for column groupings, or **Move Group Left** or **Move Group Right** for row groupings.

[Subtotal Report Results](#)

Keep Working While Your Report Preview Loads

For most actions, you can continue working on your report while the preview loads. For example, when editing a report you can drag multiple fields into the report, then create a grouping while those columns load.

The data you see in the Preview panel is real data, but it's only a subset of the data in the report, designed to show you what the report will look like when you run it. Don't worry if rows are missing or not sorted as expected in the Preview panel.

With report builder, for most actions, you can continue working on your report while the preview loads. For example, when editing a report you can drag multiple fields into the report, then create a grouping while those columns load.

 **Note:** Asynchronous loading isn't available for matrix and joined reports.

You can continue working in the report preview while the following actions occur:

- Add, remove, or reorder fields
- Add or remove summary fields
- Add, remove, or reorder groupings
- Remove formulas

 **Note:** If you remove a summary field or formula used in a chart, the chart reloads, but the report preview loads asynchronously.

You can't work in the report preview while the following actions occur:

- Add or edit formulas

- Remove a report's only grouping
- Remove a column used to [limit the row count](#) for a tabular report
- Sort the report by group or column
- Update standard or custom filters
- Change report format
- Show or hide report details
- Add or remove a chart
- Add or remove conditional highlighting
- Change **Group Dates By**
- Change a converted currency field
- Save the report

[Report Fields](#)

Customizing Reports

Report builder is a visual editor for reports. The report builder screen lets you work with report fields and filters, and shows you a preview of your report with just some of the data.

To optimize screen real estate, report builder uses a compressed page header. To view your application tabs, simply close the builder or click the Salesforce logo.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

Fields Pane (1)

The Fields pane displays fields from the selected report type, organized by folder. Find the fields you want using the Quick Find search box and field type filters, then drag them into the Preview pane to add them to the report.

Create, view, edit, and delete custom summary formulas and bucket fields in the Fields pane as well.

In the joined report format, the Fields pane displays fields from all report types added to the report, organized by report type.

Filters Pane (2)

Set the view, time frame, and custom filters to [limit the data](#) shown in the report.

Preview Pane (3)

The dynamic preview makes it easy for you to customize your report. Add, reorder, and remove columns, summary fields, formulas, groupings, and blocks. Change the report format and display options, or add a chart.

The preview shows only a limited number of records. Run the report to see all your results.

Watch a Demo:  [Getting Started with Report Builder](#)

SEE ALSO:

[Dashboards Help You Visualize Complex Information](#)

[Create a Report](#)

[Build a New Report](#)

Report Fields

The Fields pane displays fields from the selected report type, organized by folder. It also lists custom summary formulas, which you can create, edit, and delete.

Adding Field Filters

With tabular, summary, and matrix reports, you can drag a field from the Fields pane to the Filters pane to add a report filter.

Finding Fields

Find a field by typing its name into the Quick Find search box. You can also filter the list by type:

- Click  to see all field types, as well as custom summary formulas.
- Click  to see just text fields.
- Click  to see just number fields (numeric, percentage, or currency).
- Click  to see just date fields.

Adding and Removing Fields

To add a field to a tabular, summary, or matrix report, double-click it or drag it into the Preview pane. To add a field to a joined report, drag it to the Preview pane. Press **CTRL** to select multiple fields. Drag an entire folder to add all its fields. If a tabular, summary, or matrix report already contains a field, you can't add it again. You can add the same field multiple times to a joined report as long as you add it to different blocks. In the preview pane, click **Show > Details** to see your report fields. While **Show > Details** is disabled, you can only add summary fields.

To remove a field, grab its column header and drag it back to the Fields pane. With tabular, summary, and matrix reports, you can click the column menu and choose **Remove Column**, or click **Remove All Columns**.

Working with More than One Field

You can select multiple fields to add, remove, or reorder. For example, you can add `Created By`, `Type` and `Opportunity Name` to your report at the same time.

To select multiple fields or columns, press **CTRL** (Windows) or **Command** (Mac).

Note:

- When you add multiple fields, they appear in the report in the order selected.
- For summary and tabular formats, disable **Show > Details** when adding multiple summarizable fields to a report. The Summarize dialog automatically appears, letting you select summaries for all the fields at once.
- Enable **Show > Details** when adding non-summary fields, such as text fields to a report.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"
- AND
- "Report Builder"

- When working with a joined report, you can select multiple fields from the Common Fields category and one report type. You can't select multiple fields from different report types.

Ordering and Sorting Fields

Reorder report columns by grabbing a column header and dragging it to a new location. Press **CTRL** to select multiple columns. To sort your report by a column, click its column header. You can also click the column menu and choose **Sort Ascending** or **Sort Descending** from the drop-down list. Sort is disabled when **Show > Details** isn't selected.

Changing the Currency Displayed

If your organization has enabled multiple currencies, you can change the currency shown for all currency fields. Click **Show > Display Currencies Using**, then select an active currency to display.

[Highlight Data Ranges](#)

Summarize Your Report Data

A summary field contains numeric values for which you want to know the sum, the average, or the highest or lowest. Summary fields show at all grouping levels. In summary and matrix reports, they also appear at the grand total level.

The Fields pane displays fields from the selected report type, organized by folder.

A summary is the **Sum**, **Average**, **Max**, or **Min** for a number field. (Use the  filter to find them faster.)

To add a summary field:

- Double-click a number field in the Fields pane.
- Drag a number field into the preview. Press **CTRL** to select multiple fields. For matrix reports, there are drop zones before, between, and after sets of summaries. For example, the sum, average, max, and min of **Annual Revenue** are a set, and you can't drop a new summary field between them.
- Choose **Summarize this Field** in the column menu for a field already in the report.

To change an existing summary field, or add other summaries on that same field, click  next to the summary field and choose **Summarize this Field**.

To remove a summary field:

- Click its menu and choose **Summarize this Field** and deselect all options.
- Click its menu and choose **Remove Summary**.
- Drag the summary set back to the Fields pane. Note that all summaries for that field are removed. Press **CTRL** to select multiple summary fields.

Reorder sets of summary fields in matrix reports by dragging them. The summaries for each field move together when dragged. For example, if your report contains the sum and average of **Annual Revenue**, and the max and min of **Probability**, you can drag

[Report Fields](#)

[Subtotal Report Results](#)

Subtotal Report Results

Subtotaling your reports gives you a tool to analyze trends in the data. You can group sets of information, sort the groupings, and compare subtotals for each set against the overall total. In summary and joined reports, you can also subtotal by multiple fields to give you cascading sets of information.

For example, if you subtotal a summary report by Opportunity Owner, the report groups the accounts by Opportunity Owner, lists the number of opportunities owned by each user, and shows subtotals by Opportunity Owner for all the columns in the report. You could further subtotal each user's opportunities by product.

1. Click **Customize** or **Edit** from any report.
2. In the report builder, [add a summary field](#) to the report. Summaries show up at grouping levels as well as for individual rows.

[The Report Run Page](#)

[Build a Custom Summary Formula](#)

[Build a New Report](#)

[Subtotal Report Results](#)

Smart Totaling in Reports

"Smart" totaling means that duplicate data is counted only once in any subtotal or total. Salesforce uses "smart" totaling when you run reports that include duplicate data in any of the columns chosen for summing or averaging.

For example, suppose an opportunity has two products, and you run the Opportunity Product Report with the total opportunity amount selected as a column to sum by. The amount appears twice in the details of the report, once for each product on the opportunity.

In this case, "smart" totaling correctly calculates any subtotals, grand totals, and averages, adding that opportunity amount only once.

 **Note:** For dashboard components, "smart" totaling isn't used. For example, in a dashboard table, the total displayed is simply the sum of the values listed in the table.

Work with Formulas in Reports

Formulas let you create custom summaries based on calculated values using report data. These formulas can then be used as columns in your report.

The Fields pane displays fields from the selected report type, organized by folder.

To add a new formula to a summary or matrix report, double-click **Add Formula**. Once you define it and click **OK**, it's automatically added to the preview as a column for summary reports, and a summary field for matrix reports. With joined reports, you can add either a cross-block or a standard custom summary formula. To edit a formula, hover over the name in the Fields pane and click .

To remove a formula from the preview, grab its header and drag it back to the Fields pane, or click its menu and choose **Remove Formula**. Press **CTRL** to select multiple formulas. Removing a formula from the preview doesn't delete it. To delete a formula, hover over the name and click , or click **Delete Formula** from the field menu.

Dashboard and report charts that display values from custom summary formulas display decimal places using your default currency setting instead of what you specified for the formula. For example, if the summary formula specifies zero decimal places, no decimal places appear in columns, but chart values show the number of decimal places specified for your default currency (usually two decimal places). This applies to currencies, numbers, and percentages.

Build a Custom Summary Formula

Create custom summary formulas for summary and matrix reports to calculate additional totals based on the numeric fields available in the report.

A formula is an algorithm that derives its value from other fields, expressions, or values. Custom summary formulas can contain 3900 or fewer characters. Custom summary formulas are available for summary, matrix, and joined reports. They can't be shared across multiple reports.

1. In report builder, click **Add Formula** in the Fields pane.
2. Enter a name for your formula as it will appear on the report. The label must be unique. Optionally, enter a description.
3. From the **Format** drop-down list, select the appropriate data type for your formula based on the output of your calculation.
4. From the **Decimal Places** drop-down, select the number of decimal places to display for currency, number, or percent data types. This setting is ignored for currency fields in multicurrency organizations. Instead, the **Decimal Places** for your currency setting apply. If you select **None** for **Decimal Places**, the effective values are:
 - For currency, displays up to 18 digits, with the default decimal-place precision for the currency
 - For percentages, displays up to 18 digits, with no decimal places
 - For numbers, displays up to 18 digits, without changing the decimal-place precision
5. Set the **where will this formula be displayed?** option. The formula calculation will be displayed in the report at the level you select. To display the formula calculation at every level, including the Grand Total, select **All summary levels**.
6. Build your formula:
 - a. Select one of the fields listed in the **Summary Fields** drop-down list. This field's value is used in your formula.
 - b. Select the kind of summary type to use in your formula. This option is not available for **Record Count**

Summary Type	Description
Sum	The summary value of data in a field or grouping of fields.
Largest Value	The largest value of data in a field or grouping of fields.
Smallest Value	The smallest value of data in a field or grouping of fields.
Average	The average of data in a field or grouping of fields.

- c. Click **Operators** to add operators to your formula.
 - d. Select the function category (All, Logical, Math, or Summary), choose the function you want to use in your formula, and click **Insert**.
 - e. Repeat these steps as necessary.
7. Click **Check Syntax** to see if your formula contains errors. Errors are highlighted by the cursor.

Use a Summary Function in a Custom Summary Formula

Summary functions let you use grouping values in custom summary formulas for summary, matrix, and joined reports. There are two summary functions: `PARENTGROUPVAL` and `PREVGROUPVAL`.

- Double-click **Add Formula** in the Fields pane.
- In the Custom Summary Formula dialog, under Functions, select *Summary*.
- Select `PARENTGROUPVAL` or `PREVGROUPVAL`.
- Select the grouping level and click **Insert**.
- Define the formula, including where to display the formula.
- Click **OK**.

SEE ALSO:

- [Work with Formulas in Reports](#)
- [PARENTGROUPVAL and PREVGROUPVAL](#)

PARENTGROUPVAL and PREVGROUPVAL

Use `PARENTGROUPVAL` to calculate values relative to a parent grouping. Use `PREVGROUPVAL` to calculate values relative to a peer grouping.

PARENTGROUPVAL

Use this function to calculate values relative to a parent grouping.

Description: This function returns the value of a specified parent grouping. A “parent” grouping is any level above the one containing the formula. You can only use this function in custom summary formulas for reports.

Use: **Summary and Joined:** `PARENTGROUPVAL(summary_field, grouping_level)`

Matrix: `PARENTGROUPVAL(summary_field, parent_row_grouping, parent_column_grouping)`

Where `summary_field` is the summarized field value, `grouping_level` is the parent level for summary reports, and `parent_row_level` and `parent_column_level` are the parent levels for matrix reports.

Example:

```
TOTAL_PRICE:SUM/PARENTGROUPVAL(TOTAL_PRICE:SUM, GRAND_SUMMARY)
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To create, edit, and delete reports:

- “Create and Customize Reports”
- AND
- “Report Builder”

This formula calculates, for each product, its relative size compared to the grand total. In this example, the report is a summary of opportunities and their products, grouped by `Product Name`.

PREVGROUPVAL

Use this function to calculate values relative to a peer grouping. If there's no previous grouping, the function returns a null value.

Description: This function returns the value of a specified previous grouping. A "previous" grouping is one that comes before the current grouping in the report. Choose the grouping level and increment. The increment is the number of columns or rows before the current summary. The default is 1; the maximum is 12. You can only use this function in custom summary formulas for reports.

Use:

```
PREVGROUPVAL(summary_field, grouping_level [, increment])
```

Where `summary_field` is the name of the grouped row or column, `grouping_level` is the summary level, and `increment` is the number of rows or columns previous.

Example:

```
AMOUNT:SUM - PREVGROUPVAL(AMOUNT:SUM, CLOSE_DATE)
```

This formula calculates, for each month, the difference in amount from the previous month shown in the report. In this example, the report is an opportunity matrix with columns grouped by `Close Date` and rows by `Stage`.

Example: Three Week Moving Average

To calculate a three-week moving average of opportunity amounts:

```
(OppProductTrends__c.Amount__c:SUM+ PREVGROUPVAL(OppProductTrends__c.Amount__c:SUM, OppProductTrends__c.as_of_date__c) + PREVGROUPVAL(OppProductTrends__c.Amount__c:SUM, OppProductTrends__c.as_of_date__c, 2)) / 3
```

Get the Most Out of Custom Summary Formulas

Custom summary formulas are a powerful reporting technique, but they can be tricky. Here are some tips to keep in mind when working with them.

Functions for use with custom summary formulas in reports are available under the function category. Select a function, then click **Help on this function** for information.

- A summary formula can't reference another summary formula.
- Regardless of the summary formula data type, your summary formula can contain fields of different data types, including: number, currency, percent, and checkbox (true/false) fields. For

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

example, a summary formula in an Opportunities with Partners report can reference opportunity Amount or Stage Duration, as well as account Annual Revenue.

- Dashboard and report charts that display values from custom summary formulas display decimal places using your default currency setting instead of what you specified for the formula. For example, if the summary formula specifies zero decimal places, no decimal places appear in columns, but chart values show the number of decimal places specified for your default currency (usually two decimal places). This applies to currencies, numbers, and percentages.
- When a field is deleted or is unavailable (for example, because of field-level security), all custom summary formulas that contain the field are removed from the report.
- The summary types Sum, Largest Value, Smallest Value, and Average are not available for use with the Record Count field.
- The Smallest Value summary type includes blank (null) or zero values in the summary formula calculation if these values are present in your report data.
- The Largest Value summary type includes the largest blank (non-null) value present in your report data.
- Percents are represented as decimals in summary formulas. 20% is represented as 0.20.
- Operators can be used to give fields in summary formulas a negative value. For example: `{ !EMPLOYEES : SUM } + - { !SALES : SUM } .`
- For custom summary formulas on matrix reports, Salesforce calculates results for all formulas where the `where will this formula be displayed?` option is not set to `All summary levels`. The formula determines the value returned. If null is returned, the cell will be empty.
- Summary fields on tabular, summary, and matrix reports can display up to 21-digits. Summary fields of 21 digits will display precisely, but more than 21 digits may not be precise. If `"#Too Big!"` appears in report cells, check your formula for calculations that could result in more than 18 digits. Avoid multiplying large numbers, raising a large number to a power, or dividing by a very small number.
- Formulas treat blank (null) report cells as zero values.
- `"#Error!"` displays on report cells whenever an error occurs while calculating a formula's value. `"#Error!"` also displays when formulas divide by zero. To resolve the error, check your formula and provide an alternative value.
- Cross-block custom summary formulas are available for joined reports.

[Example: Using Row Limits in Report Filters](#)

[Getting the Most Out of Filter Logic](#)

Enter Filter Criteria

Field filters are available for reports, list views, workflow rules, and other areas of the application. For each filter, set the field, operator, and value.

1. Choose a field from the first drop-down list.
2. Choose a filter operator.
3. Enter a value in the third field and click **OK**. For picklist fields, click the lookup icon to select a value.
4. Use the **Add** menu to choose the type of filter to add. By default, the **Add** button creates a field filter. When you click  on the field filter, you can browse available fields, the first field in the list is the default.

With tabular, summary, and matrix reports, you can drag a field from the Fields pane to the Filters pane to add a report filter.

5. Optionally, click **Add > Filter Logic** to change the default AND relationship between each filter.

If you have Translation Workbench enabled, you can filter on translated strings by specifying the `Filter Language` for filter criteria that use `contains`, `does not contain`, or `starts with` operators.

Tip: To change a report filter, hover over it and click **Edit** or **Remove**. Your filters display when you run your report; click **Edit** on that page to make additional changes.

Filters help you hone in on the information you want to find.

Add [filter logic](#) to change the default AND relationship between each filter.

 **Warning:** If you lose access to a field defined in a filter, Salesforce removes it and displays results based on the remaining filters.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Filtering on Text Fields

- Separate search terms by commas to filter by more than one value. For example, to search for accounts in California, New York, or Washington, use *State contains CA,NY,WA*.
- Filtering isn't case sensitive. For example, searching *State contains ID* returns all matches for "ID", but also returns any instances of "Florida" and "Idaho" because they contain "id" in their names.
- When you filter on standard long text area fields, such as Description or Solution Details, only the first 1000 characters of the field are searched for matches in reports. Reports can't be filtered on custom long text area fields. Only the first 255 characters are shown for custom long text area fields in list views.

Filtering on Date Fields

- If entering a date, use the format allowed by your `Locale` setting. You can also use special date values like TODAY, NEXT WEEK, NEXT YEAR, LAST <number> DAYS, and so on.

Filtering on Numeric Values

- Place quotation marks around numbers or other data that includes commas. For example *Amount equals "10,000"* returns records that have an amount of \$10,000 but *Amount equals 10,000* returns \$10,000 as well as \$10 and \$0.
- To search for phone numbers, include the exact phone number formatting or example, *Phone starts with (561)*.

Filtering on Picklist Values

- When filtering on multi-select picklist fields, use a semicolon between values to specify an exact match.
For example, selecting the "equals" operator and a semicolon between two values includes records with both values specified, excluding all other values.
- If your organization uses record types, the lookup dialog lists picklist values for all record types. Use the "equals" or "not equal to" operators for these filters.
 **Note:** If you change the label for a picklist value that is used as a filter criterion, the picklist value is automatically removed from the filter criteria. For example, if your report contains a filter where *Lead Source equals Email or Web* and you change the picklist value Web to Referral, your report filter will change to *Lead Source equals Email*. If the changed picklist value was the only value specified for a particular filter, it will continue to show up in your filters, but an error will display.

SEE ALSO:

[Relative Date Values for Filter Criteria](#)

[Filter Your Report Data](#)

[Enter Filter Criteria](#)

[Getting the Most Out of Filter Logic](#)

Filter on Blank Values

Tips on filtering using blank values.

- When you use the “less than,” “greater than,” “less or equal,” or “greater or equal” operators on fields that have numeric values, records with blank or “null” values are returned as if their value is zero (0). For example, if you create a workflow rule or a lead assignment rule for accounts with the criteria *Annual Revenue less than 100000*, account records match if their `Annual Revenue` is blank.

However, records with blank field values are not considered matches in report filters, custom list views, and account assignment rules (which assign accounts to territories).

- To limit results to records that are blank or contain “null” values for a particular field, choose the field and the “equals” or “not equal to” operators, leaving the third field blank. For example, *Amount equals* returns records with blank amount fields. You can search for blank values or other specified values at the same time. For example, *Amount equals 1,,2* returns records where the `Amount` is blank or contains the value “1” or “2”.

SEE ALSO:

[Build Effective Filters](#)

[Enter Filter Criteria](#)

Tips for Filtering by Campaign

Tips on filtering by campaign in list views.

If your organization uses campaigns, you can restrict list views of contacts or leads by campaign to include only those contacts or leads associated with the campaign.

If you are restricting a list view to a particular campaign:

- You can also filter by campaign member status to include only contacts or leads with a particular status. Select `Campaign: Member Status` from the drop-down list in the first column of the filter criteria. In the second column, use the “equals” or “not equals” operator. Enter one or more status values in the third column. The status values must be valid for your organization.
- You can choose to display the `Campaign: Member Status` column in your list view. This option is found at the bottom of the drop-down list in the `Select Fields to Display` step of creating a list view.
- To filter by campaign member status or add a campaign member status display column, first specify a campaign in the `Filter by Campaign` area.

Tips for Filtering on Multiple Currencies

Tips for filtering on currency fields when your organization uses multiple currencies.

If your organization uses multiple currencies, follow these tips to create more effective filters:

- Use the **Currency** field to find items with a particular currency. For example, *Opportunity Currency equals AUD* finds opportunities with amounts in Australian dollars.
- Prefix currency amounts with a currency code, such as *Annual Revenue greater than USD 50000000*.

Without the currency code, all amounts are assumed to be in the user's currency. For example, if the user's currency is U.S. dollars, *Annual Revenue greater than 50000000* means 50 million U.S. dollars.

If the user's currency is invalid, the corporate currency is used.

From Setup, enter *Manage Currencies* in the **Quick Find** box, then select **Manage Currencies** to obtain the currency codes.

- All amounts are converted to the corporate currency for comparison. For example, *Annual Revenue greater than USD 50000000* finds accounts with revenue greater than 50 million U.S. dollars. This would include an account with revenue of 114 million Australian dollars, which is the equivalent of 60 million U.S. dollars, assuming a conversion rate of 1.9.
- Amounts in reports are shown in their original currencies, and report totals are displayed in your personal currency. You can change the currency used for report totals by clicking **Show > Currencies**. For any amount, you can also choose to display the "converted" column (for example, "Annual Revenue (converted)"), which will show amounts in the currency you select from the Display Currencies Using drop-down list.

Add Filter Logic

Filter logic lets you specify conditions for your filters using logical operators.

To change the default AND relationship between each filter:

1. Click **Add > Filter Logic**.
2. Enter each filter line number, separated by an operator:

Operator	Definition
AND	Finds records that match both values.
OR	Finds records that match either value.
NOT	Finds records that exclude values.

SEE ALSO:

- [Filter Operators](#)
- [Filter on Blank Values](#)
- [Filtering on Special Picklist Values](#)
- [Build Effective Filters](#)
- [Enter Filter Criteria](#)

Getting the Most Out of Filter Logic

Filter logic lets you apply Boolean conditions to filters to hone in on the data you're looking for.

An expression's syntax can affect filtering results.

(1 AND 2) OR 3

Finds records that match both the first two filter lines or the third. For example, consider these filter conditions:

1. Account Owner contains Joe
2. Industry equals Banking
3. Annual Revenue greater than 10000000

This filter can help you find banking accounts owned by Joe or any account with a revenue greater than \$10 million.

 **Tip:** You can enter filter line numbers in any order. For example, **3 OR (1 AND 2)** has the same meaning as **(1 AND 2) OR 3**.

1 AND (2 OR 3)

Finds records that match both the first filter line and either of the last two.

EDITIONS

Available in: Salesforce Classic

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"
- AND
- "Report Builder"

To create custom list views:

- "Read" on the type of record included in the list

To create, edit, or delete public list views:

- "Manage Public List Views"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

Using the same filters in the example above, this report finds all accounts Joe owns that are either in the banking industry or have a revenue greater than \$10 million.

 **Tip:** You can repeat a filter line in your expression. For example, **1 AND (2 OR 3)** yields the same results as **(1 AND 2) OR (1 AND 3)**.

 **Note:**

- Filter logic isn't available for all filters. For example, you can't use them for roll-up summary fields.
- You can't use filter logic if your field filters use any of the following fields: *Topics*, *Description*, any *Address Line 1*, *Address Line 2*, *Address Line 3* fields, *Forecast Category*, *Campaign: Member Type*, *User: Profile Name*, *Login Status*, and custom long text area fields. This does not apply to *Filter Logic* on lookup filters.
- On reports where object A may or may not have object B, you can't use the OR condition to filter across multiple objects. For example, if you enter filter criteria *Account Name starts with M OR Contact First Name starts with M*, an error message displays informing you that your filter criteria is incorrect.

SEE ALSO:

- [Add Filter Logic](#)
- [Build Effective Filters](#)
- [Filter Your Report Data](#)

Example: Using Row Limits in Report Filters

Here is where you can see a sample of a report filter using a field filter, filter logic, and a row limit.

Say you are a sales executive who wants to see which California accounts currently have the most potential to generate revenue:

1. Click **New Report** from the Reports tab.
2. Open the **Accounts & Contacts** report type, choose **Accounts**, and click **Create**.
3. To find California accounts that either have over \$10 million in revenue or are public companies, click **Add > Field Filter** and create these filters:
 - a. *Billing State/Province equals CA*
 - b. *Annual Revenue greater than 10000000*
 - c. *Ownership equals Public*
4. To ensure that your results include all California accounts with \$10 million in revenue OR that are public, click **Add > Filter Logic** and enter *1 AND (2 OR 3)*.
5. To limit the number of results for a tabular report to 10, click **Add > Row Limit** and enter 10. Choose your sort field and sort order. Click **OK**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"
- AND
- "Report Builder"

When you click **Run Report**, your results will contain ten rows and include public companies in California with revenues of more than \$10 million.

[Getting the Most Out of Filter Logic](#)

Filter Choices

Narrow your report down to the most useful data with field filters, cross filters, and row limits. Use filter logic to control how your filters work together.

Filter the data in a report using the following filter options.

Add Filter Option	Description
Field Filter	Field filters are available for reports, list views, workflow rules, and other areas of the application. For each filter, set the field, operator, and value. With tabular, summary, and matrix reports, you can drag a field from the Fields pane to the Filters pane to add a report filter.
Filter Logic	Add Boolean conditions to control how field filters are evaluated. You must add at least one field filter before applying filter logic.
Cross Filter	Filter a report by the child object using WITH or WITHOUT conditions. Add subfilters to further filter by fields on the child object. For example, if you have a cross filter of <i>Accounts with Opportunities</i> , click Add Opportunity Filter and create the <i>Opportunity Name equals ACME</i> subfilter to only include those opportunities.
Row Limit	For tabular reports, select the maximum number of rows to display, then choose a field to sort by and the sort order. You can use a tabular report as the source report for a dashboard table or chart component, if you limit the number of rows it returns.

Filter Operators

The operator in a filter is like the verb in a sentence. When you choose filter criteria, use an operator to specify the action you want the filter to take.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To create, edit, and delete reports:

- “Create and Customize Reports”
- AND
- “Report Builder”

You can use the following operators when entering filter criteria on list views, reports, dashboards, and some custom fields:

Operator	Uses
equals	Use for an exact match. For example, "Created equals today."
less than	Use for results that are less than the value you enter. For example, "Quota less than 20k" returns records where the quota field ranges from 0 to 19,999.99.
greater than	Use when you want results that exceed the value you enter; for example, "Quota greater than 20k" returns records where the quota amount begins at 20,000.01.
less or equal	Use for results that match or are less than the value you enter.
greater or equal	Use for results that match or exceed the value you enter.
not equal to	Shows results that don't have the value you enter. This operator is especially useful for eliminating empty fields. For example, "Email not equal to <blank>."
contains	Use for fields that include your search string, but sometimes also include other information. For example, "Account contains california" would find California Travel, California Pro Shop, and Surf California. Keep in mind that if you enter a short search string, it can match a longer word. For example, "Account contains pro" would find California Pro Shop and Promotions Corporation. This operator is not case-sensitive.
does not contain	<p>Eliminates records that don't contain the value you enter. For example, "Mailing Address Line 2 does not contain P. O. Box."</p> <p> Note: When specifying filter criteria on roll-up summary fields, <code>does not contain</code> uses "or" logic on comma-separated values. On list views, reports, and dashboards, <code>does not contain</code> uses "and" logic.</p> <p>This operator is not case-sensitive.</p>
starts with	Use when you know what your value starts with, but not the exact text. This operator is a narrower search term than "contains." For example, if you enter "Account starts with california," you find California Travel and California Pro Shop, but not Surf California.
includes	<p>Available when you choose a multi-select picklist as the selected field. Use this operator to find records that include one or more of the values you enter.</p> <p>For example, if you enter "Interests includes hockey, football, baseball," you find records that have only hockey selected, and records that have two or three of the values entered. Results do not include partial matches of values.</p>
excludes	<p>Available when you choose a multi-select picklist as the selected field. Use this operator to find records that do not contain any values that match the ones entered.</p> <p>For example, if you enter "Interests exclude wine, golf," your report lists records that contain any other values from that picklist, including values that are blank. Results do not include partial matches of values.</p>
between	<p>Available for dashboard filters only. Use to filter on ranges of values. For each range, the filter returns results that are greater than or equal to the minimum value and less than the maximum value.</p> <p>For example, if you enter "Number of Employees from 100 through 500," your results include accounts with 100 employees up to those with 499 employees. Accounts with 500 employees aren't included in the results.</p>

Operator	Uses
within	Available when you create list views based on a Geolocation custom field. Shows results that are within the specified radius from a fixed latitude and longitude. For example, if you enter "Warehouse location within 50 miles 37.775° -122.418°," your list view includes all warehouses within a 50-mile radius of San Francisco, California.

Save Your Report

Click **Save** to update an existing report with recent changes, or **Save As** to clone the original report without changing it. In Lightning Experience, click **Clone** to clone the report.

1. Verify the name, description, and folder, then choose where to go next:

- Click **Save** to save the report and go to the Reports home page
- Click **Save & Return to Report** to save it and go back to the report run page.

 **Note:** To save your report at a specific role hierarchy drill-down level on sales, forecast, opportunity, and activity reports, select **Save Hierarchy Level**.

 **Tip:** If you add a colon to your report name, it displays in two separate lines when you view the report. Use this to categorize reports by name, or better display long names. For example, if you enter *First Line: Second Line* for Report Name, you'll see this on the run page:

To enter a unique report name used by the API:

- "Customize Application"

To select a folder to store public reports:

- "Manage Public Reports"

Report on Historical Changes

On top of the standard up-to-the-minute reporting on the current state of your business, you can analyze day-to-day and week-to-week changes in opportunities, cases, forecasts, and custom objects.

EDITIONS

Available in: both Salesforce Classic Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

Note: Historical trend reporting with charts is supported in Lightning Experience, but tabular views of historical trend reports aren't available.

IN THIS SECTION:

1. [Track Changes in Your Sales Pipeline](#)

A historical report can help you monitor your company's sales pipeline to make sure it contains enough activity to meet current and future sales goals. You may want to focus on deals whose value grew or shrank in the last three months, or deals that moved into or out of a given target period.

2. [See How Forecast Amounts Have Changed](#)

Let's build a historical report, in matrix format, of the amounts your team members have assigned to each forecast category. Changes in those amounts can reveal how accurately your team is forecasting.

3. [Track History for Cases](#)

Monitor activity across cases and identify your case status changes in the last three months of a case's life cycle.

4. [How Historical Trend Reporting Works](#)

Historical trend reporting uses a special custom report type designed to highlight changes between five snapshot dates, such as five business days or five business weeks. You can visually represent the data changes in charts and on dashboards.

5. [Limitations on Historical Trend Reporting](#)

Historical trending in Salesforce is subject to certain limits on the time during which data is tracked, the number of rows of data, and the fields and objects you can track. These limits are designed to restrict the data set so that reports return data quickly.

Track Changes in Your Sales Pipeline

A historical report can help you monitor your company's sales pipeline to make sure it contains enough activity to meet current and future sales goals. You may want to focus on deals whose value grew or shrank in the last three months, or deals that moved into or out of a given target period.

You'll probably want to compare historical and current values of key attributes of opportunities, such as dates, amounts, and status, to see how your pipeline has changed over time. For example, this summary report points out opportunity amounts and close dates that have changed since yesterday.

Opportunity Name	Amount (Historical)		Close Date (Historical)	
	Yesterday	Today	Yesterday	Today
Acme	\$26,000	\$16,000	2/15/2013	2/28/2013
Advanced Interconnections Corp* - 32K	\$18,000	\$20,000	2/28/2013	2/28/2013
Advanced Interconnections Corp* - 8K	\$12,000	\$8,000	2/15/2013	2/28/2013
Allied Technologies - 40K	\$30,000	\$39,000	2/15/2013	2/15/2013
Data Solutions	\$10,000	\$3,000	2/28/2013	2/28/2013
DFC Inc. - 50K	\$55,000	\$45,700	2/15/2013	2/28/2013
Eastern Shipping	\$21,500	\$21,500	2/28/2013	2/28/2013

1. Snapshot up to five dates to track day-to-day or week-to-week trends.

2. Current and historical values are shown side by side for easy comparison.
3. Changed dates and amounts are highlighted in red or green.

IN THIS SECTION:

1. [Watch Your Pipeline Change Over Time](#)

Let’s say you want to know how the total value of your pipeline today compares with its value yesterday. Create a simple report to compare the two dates.

2. [Identify Historical Deals Over a Given Value](#)

Suppose you want to focus only on deals in your pipeline worth more than \$5,000, but you’re not concerned about today’s fluctuations. You’ll need a historical trending report that filters out any deal whose value was below \$5,000 yesterday.

3. [Find Deals that Have Been Pushed Out](#)

To focus on deals that are taking more time to close than expected, create a historical trending report that finds deals in your pipeline that have had their close dates moved to a later date.

4. [Identify Shrinking Deals](#)

Historical trending analysis can help you prioritize by quickly identifying deals that may be at risk. For example, target the deals in your pipeline that have decreased in value since yesterday. You’ll need a historical trending report that gives you the deals whose value yesterday was greater than their value today.

Watch Your Pipeline Change Over Time

Let’s say you want to know how the total value of your pipeline today compares with its value yesterday. Create a simple report to compare the two dates.

1. Create an opportunity history report.
 - a. On the Reports tab, click **New Report**.
 - b. Under **Select Report Type > Opportunities**, select *Opportunities with Historical Trending*.
 - c. Click **Create**.
2. For Show, select *All Opportunities*.

Note that the default value in the **Historical Date** field is *Yesterday*, and the **Amount (Historical)** field shows yesterday’s date.

 **Tip:** “Yesterday” is a *rolling* date value, meaning that it points to a date that is relative to today’s date. If you run this same report tomorrow, **Amount (Historical)** will show today’s date.

You've created a simple report that flags deals that have shrunk since yesterday. Note that all the results in the `Amount - Today` column are shown in red, to indicate decreases in value.

 **Tip:** To change the color-coding for amount changes, click the down arrow above the *Change* column and click *Reverse Colors*.

SEE ALSO:

[Opportunities with Historical Trending Report](#)

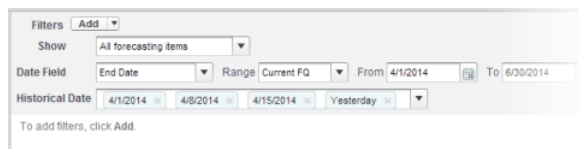

See How Forecast Amounts Have Changed

Let's build a historical report, in matrix format, of the amounts your team members have assigned to each forecast category. Changes in those amounts can reveal how accurately your team is forecasting.

For this example, we'll assume you're about a month into the current fiscal quarter.

1. Create a forecast history report.
 - a. On the Reports tab, click **New Report**.
 - b. Under **Select Report Type > Forecasts**, select *Forecasting Items with Historical Trending*. Before you can select this report type, your organization must have enabled Historical Trending for Forecasting Items. If you do not see the report type listed, talk to your administrator.
 - c. Click **Create**.
2. In the Filters area, choose **Show > All forecasting items**, then set up your filters.
 - a. For **Date Field**, choose End Date. For **Range**, choose Current FQ. The **From** and **To** date fields automatically get the beginning and end dates for the current quarter.
 - b. For **Historical Date**, choose 3 Months Ago, 2 Months Ago, then 1 Month Ago from the dropdown menu. Each date you select is added to the field.

Filter for the historical data you want.

 **Tip:** To move *Yesterday* to the right side of the field, delete it and add it again from the dropdown menu.

3. Choose the data you want to monitor for historical changes. In this case, we're interested in the category in which the changes were made and how the forecast amount changed.
 - a. In the **Preview** pane, change **Tabular Format** to **Matrix Format**.
 - b. Drag the **Owner: Full Name** field from the Field area to the Preview pane to create a row grouping.
 - c. Drag the **Forecast Category** field over to the right of **Owner: Full Name** to create another row grouping.
 - d. Drag the **Forecast Amount (Historical)** field to the matrix area of the Preview pane, below the yellow bar. In the **Summarize** dialog, select **Sum**.

EDITIONS

Available in: both Salesforce Classic Lightning Experience

Available in:

- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"

AND

"Report Builder"

Select the fields that contain the data you want to track.

Columns appear for each of the historical dates you chose in the filters area that contain records.

4. Click **Run Report** to see what data you've gathered so far. Then click **Customize** to keep adjusting your filters and fields if necessary.
5. Once you've defined the data you want to track, create a chart to show it graphically.
 - a. In the Preview area, click **Add Chart** and select the line chart icon.
 - b. On the Chart Data tab, choose `Sum of Forecast Amount (historical)` for the **Y-Axis** and `Snapshot Date` for the **X-Axis**.
 - c. For **Group By**, choose `Forecast Category`, and select **Cumulative**.
 - d. Click **OK**, then click **Run Report** again.
6. Click **Save As**. Choose a name and folder for the report and click **Save**.

Track History for Cases

Monitor activity across cases and identify your case status changes in the last three months of a case's life cycle.

1. One way to optimize contact center operations is to observe the `Status` field over time, watching for cases that move backward to a previous status. This can help reveal ways to resolve cases more effectively.
2. For another example, try analyzing historical values of the `Priority` field to identify cases that may have been incorrectly classified when they were opened. Watching for frequent changes in priority may also lead to ways to improve the handling of complex cases.

How Historical Trend Reporting Works

Historical trend reporting uses a special custom report type designed to highlight changes between five snapshot dates, such as five business days or five business weeks. You can visually represent the data changes in charts and on dashboards.

For organizations created in Winter '14 and thereafter, historical trend reporting is activated by default. If your organization is older than that, you must activate historical trend reporting in the Setup menu.

Salesforce retains historical data for the previous three months, plus the current month. (The amount of historical data you can work with in practice depends on your organization's data design and use patterns.) You can select up to five date snapshots in that span to compare, using up to four historical filters.

Longer durations than days or weeks are not recommended. They may result in reports timing out and not returning. For small organizations with fewer records, month-to-month trend reporting may work, but this is not what historical trend reporting is designed for.

Tip: You can also create and customize historical trend reporting reports via the Metadata API and the Reports and Dashboards REST API.

Limitations on Historical Trend Reporting

Historical trending in Salesforce is subject to certain limits on the time during which data is tracked, the number of rows of data, and the fields and objects you can track. These limits are designed to restrict the data set so that reports return data quickly.

- Salesforce retains historical data for the previous three months, plus the current month.
- Up to 5 million rows of historical trending data can be stored for each object. Historical data capture stops when the limit is exceeded. The admin is alerted by email when any object reaches 70 percent of the limit, and again if the limit is exceeded.
- Each historical trend report can contain up to 100 fields. In Opportunities reports, this includes the standard preselected fields, which can't be disabled.
- Formula fields are not supported.
- You can specify up to five historical snapshot dates in each historical trend report.
- You can use up to four historical filters on each historical trend report.
- These field types are supported: Number, Currency, Date, Picklist.
- Internet Explorer 6 is not supported.
- The Report Wizard is not supported. Historical trend reports can only be created with the Report Builder.
- Historical trend reporting with charts is supported in Lightning Experience, but tabular views of historical trend reports aren't available.

Important: If a picklist field is already being used in a historical trending data filter, think hard before changing any of its values. You could make that field less useful for historical reporting in the future.

Report on Historical Data with Reporting Snapshots

A reporting snapshot lets you report on historical data. Authorized users can save tabular or summary report results to fields on a custom object, then map those fields to corresponding fields on a target object. They can then schedule when to run the report to load the custom object's fields with the report's data. Reporting snapshots enable you to work with report data similarly to how you work with other records in Salesforce.

After you set up a reporting snapshot, users can:

- Create and run custom reports from the target object.
- Create dashboards from the source report.
- Define list views on the target object, if it's included on a custom object tab.

For example, a customer support manager could set up a reporting snapshot that reports on the open cases assigned to his or her team everyday at 5:00 PM, and store that data in a custom object to build a history on open cases from which he or she could spot trends via reports. Then the customer support manager could report on point-in-time or trend data stored in the custom object and use the report as a source for a dashboard component. For the total number of reporting snapshots you can create, see *Salesforce Limits*.

IN THIS SECTION:

1. [Prepare Reporting Snapshots](#)

To set up a reporting snapshot, you need a source report and a target object with fields to contain the data in the source report.

2. [Define a Reporting Snapshot](#)

After you create a source report, target object, and target object fields, you can define your reporting snapshot. You define a reporting snapshot by naming it and choosing the source report that will load report results into the target object you specify when the reporting snapshot runs.

3. [Map Reporting Snapshot Fields](#)

After you create a source report, target object, target object fields, and define your reporting snapshot, you can map the fields on your source report to the fields on your target object. You map source report fields to target object fields so that when the report runs, it automatically loads specific target object fields with data from specific source report fields.

4. [Schedule and Run a Reporting Snapshot](#)

After you create a source report, target object, target object fields, define your reporting snapshot, and map its fields, you can schedule when it runs. You can schedule a reporting snapshot to run daily, weekly, or monthly so that data from the source report is loaded into the target object when you need it.

5. [Manage Reporting Snapshots](#)

After you set up a reporting snapshot, you can view details about it and edit and delete it. From Setup, enter *Reporting Snapshots* in the **Quick Find** box, then select **Reporting Snapshots** to display the Reporting Snapshots page, which shows the list of reporting snapshots defined for your organization.

6. [Troubleshoot Reporting Snapshots](#)

The Run History section of a reporting snapshot detail page displays if a reporting snapshot ran successfully or not. When a reporting snapshot fails during a scheduled run, the failure is noted in the **Result** column. To view the details of a run, click the date and time of the run in the **Run Start Time** column.

SEE ALSO:

[Create a Dashboard](#)

[Create a Custom Report in Accessibility Mode](#)

Prepare Reporting Snapshots

To set up a reporting snapshot, you need a source report and a target object with fields to contain the data in the source report.

To set up a reporting snapshot:

1. Create a new custom report that includes the fields you want to load as records into a target object.
2. Create a new custom object in which to store the records loaded from the source report.
3. Create fields on the target object that will receive the source report's results when the reporting snapshot runs.

Tips on Source Reports for Reporting Snapshots

- If you save a tabular source report with its details hidden, the report will not be available to include in a reporting snapshot. Furthermore, if you hide the details of a tabular source report included in a reporting snapshot, the reporting snapshot will fail when it runs. To verify that the details of the tabular source report are not hidden, view the report, click **Show Details**, and save the report. The **Show Details** button only displays if the report's details are hidden.
- When creating the source report for your reporting snapshot, note the names of the fields you added to the report, as those field names may be useful to you when you create fields on the target object in which to store the report results.
- You can choose any custom tabular or summary report as the source report, except legacy forecast reports, Quota vs Actual reports, and Leads by Source reports. The `Source Report` drop-down list does not display standard reports..
- You can include up to 100 fields in your source report.
- You can delete the schedule of when a reporting snapshot runs. You can't stop or pause a reporting snapshot when it is running, nor can you delete its source report. To delete the source report, you must first remove the report from the reporting snapshot by changing the report in the `Source Report` drop-down list..
- If you select Load No Data in the Fields from Source Report column, no data will load into the corresponding field in the Fields in Target Object column when the reporting snapshot runs. .
- The `(No fields with compatible data type)` field displays in the Fields from Source Report column when a field on the target object does not match the data type of a field on the source report..

Tips on Target Objects for Reporting Snapshots

Consider the following when setting up target objects for reporting snapshots:

- In Enterprise, Unlimited, Performance, and Developer Editions, use field-level security to make the target object's fields visible to the appropriate users.
- You can't delete a custom object if it's a target object in a reporting snapshot.
- The fields on the target object determine field mapping availability. For example, your source report may include ten fields, but if your target object includes one field, then you can only map one field in your reporting snapshot.
- You can add up to 100 fields to the target object.
- Target objects cannot contain validation rules or be included in a workflow.
- Reporting snapshots cannot contain target objects that trigger Apexcode to run when new records are created..

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create, save, and schedule a reporting snapshot:

- "Manage Reporting Snapshots"

To run a reporting snapshot as a running user and add the results to a custom object, the running user must have:

- "Run Reports"

AND

"Create" on the target object

- When a reporting snapshot runs, it can add up to 2,000 new records to the target object. If the source report generates more than 2,000 records, an error message is displayed for the additional records in the Row Failures related list. You can access the Row Failures related list via the Run History section of a reporting snapshot detail page.

Tips on Reporting Snapshots

- Be aware of the type of license your `Running User` has. For example, if the `Running User` of a reporting snapshot has a Salesforce license, users who have Force.com Platform or Salesforce Platform One licenses will not be able to view it. Alternatively, if the `Running User` has a Force.com Platform or Salesforce Platform One license, users who have Salesforce licenses will be able to see the reporting snapshot. If you have users with Force.com Platform or Salesforce Platform One licenses, we recommend creating a separate reporting snapshot for them with a `Running User` that has a Force.com Platform or Salesforce Platform One user license.
- You can only map fields with compatible data types. For example, you can map a currency field to a number field.
- If you change the source report or target object on a reporting snapshot with existing field mappings, the field mappings are deleted when you save the reporting snapshot. You can also view `Summary Fields in Source Report` and `Fields in Target Object` to see the number of summary or target fields, respectively..
- You must map at least one field from the source report to one field on the target object or data will not load from the source report to the target object when the reporting snapshot runs.
- When a reporting snapshot is defined, deleted, or its source report or target object is changed, it is tracked in your organization's setup audit trail history.
- The Run History section on a reporting snapshot detail page displays details on when the reporting snapshot ran. Details include:
 - The date and time at which the reporting snapshot ran
 - The name of the source report, target object, and running user
 - The time it took for the reporting snapshot to run
 - The total number of detail or summary rows in the source report, depending on the report type
 - The number of records created in the target object
 - Whether or not the reporting snapshot ran successfully

SEE ALSO:

[Report on Historical Data with Reporting Snapshots](#)

[Create a Custom Report in Accessibility Mode](#)

Define a Reporting Snapshot

After you create a source report, target object, and target object fields, you can define your reporting snapshot. You define a reporting snapshot by naming it and choosing the source report that will load report results into the target object you specify when the reporting snapshot runs.

1. From Setup, enter "Reporting Snapshots" in the `Quick Find` box, then select **Reporting Snapshots**.
2. Click **New Reporting Snapshot**.
3. Enter a name, unique name, and description for your reporting snapshot.
4. Choose a user in the `Running User` field by clicking the lookup icon.

The user in the `Running User` field determines the source report's level of access to data. This bypasses all security settings, giving all users who can view the results of the source report in the target object access to data they might not be able to see otherwise.

Only users with the "Modify All Data" permission can choose running users other than themselves.

5. Select a report from the `Source Report` drop-down list.

The report you choose determines the report results that will load as records into the target object when the reporting snapshot runs.

You can choose any custom tabular or summary report as the source report, except legacy forecast reports, Quota vs Actual reports, and Leads by Source reports. The `Source Report` drop-down list does not display standard reports.

6. Select a custom object from the `Target Object` drop-down list.

The custom object you choose will receive the source report's results as records when the reporting snapshot runs.

If a record used for an reporting snapshot has no record type associated with it, the record type of the running user is associated with the reporting snapshot by default.

7. Click **Save** to save the definition of your reporting snapshot, or click **Save & Edit Field Mappings** to save your reporting snapshot and map its fields.
8. [Map the fields](#) on the source report to the fields on the target object.

USER PERMISSIONS

To create, save, and schedule a reporting snapshot:

- "Manage Reporting Snapshots"

To run a reporting snapshot as a running user and add the results to a custom object, the running user must have:

- "Run Reports"

AND

"Create" on the target object

Map Reporting Snapshot Fields

After you create a source report, target object, target object fields, and define your reporting snapshot, you can map the fields on your source report to the fields on your target object. You map source report fields to target object fields so that when the report runs, it automatically loads specific target object fields with data from specific source report fields.

1. From Setup, enter *Reporting Snapshots* in the *Quick Find* box, then select **Reporting Snapshots**.
2. Select the name of the reporting snapshot whose fields you want to map.
3. Click **Edit** on the Field Mappings section.
4. For summary reports, select the *Grouping Level* at which summary data is extracted from the source report. Data loaded into the target object is taken from summary fields at the grouping level you specify. The *Grand Summary* summarizes on the total for all grouping levels.
5. In the Fields from Source Report column, click a *Load No Data* drop-down list and select a field from the source report to map to a custom object field in the Fields in Target Object column. Only summary fields can be mapped for reporting snapshots based on summary reports. Note that the fields for summary reports may vary depending on the grouping level selected.
6. Click **Quick Save** to save field mappings and continue mapping fields, or click **Save** to save field mappings and return to the reporting snapshot's detail page.
7. Next, [schedule](#) the reporting snapshot to run.

Considerations for Mapping Reporting Snapshot Fields

- You must map at least one field from the source report to one field on the target object or data will not load from the source report to the target object when the reporting snapshot runs.
- You can only map fields with compatible data types. For example, you can map a currency field to a number field.
- A custom summary formula can be mapped only if the grouping level in the reporting snapshot and the grouping level in the custom summary formula match.
- If you select *Load No Data* in the Fields from Source Report column, no data will load into the corresponding field in the Fields in Target Object column when the reporting snapshot runs..
- The *(No fields with compatible data type)* field displays in the Fields from Source Report column when a field on the target object does not match the data type of a field on the source report.
- The fields on the target object determine field mapping availability. For example, your source report may include ten fields, but if your target object includes one field, then you can only map one field in your reporting snapshot.
- You cannot map fields from the source report to the following fields on the target object: *Created By*, *Last Modified By*, *Created Date*, and *Last Modified Date*.
- When you map fields from the source report to the target object, some data may lose its context when loaded to the target object. For example, if you map a date and time field from the source report to a text field on the target object, the date and time load to the target object without the time zone.
- When executing a reporting snapshot, if the running user does not have "read" or "write" access to a mapped field in the target object, that field is dropped from the mapping, but does not cause the execution to fail. If a required field in the target object is not mapped, the execution fails. To ensure that fields are always mapped, make them required or set default values for them.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Professional
- Enterprise
- Performance
- Unlimited
- Developer

USER PERMISSIONS

To create, save, and schedule a reporting snapshot:

- "Manage Reporting Snapshots"

To run a reporting snapshot as a running user and add the results to a custom object, the running user must have:

- "Run Reports"

AND

"Create" on the target object

- To map a field in the source report to a lookup field on the target object, you must map to the ID of the object associated with the lookup. For example, to map to an opportunity lookup field, you must map to the `Opportunity ID`. To get the `Opportunity ID` in the source report, you may need to use a custom report type to include ID and other related fields.

[Build a Custom Summary Formula](#)

Schedule and Run a Reporting Snapshot

After you create a source report, target object, target object fields, define your reporting snapshot, and map its fields, you can schedule when it runs. You can schedule a reporting snapshot to run daily, weekly, or monthly so that data from the source report is loaded into the target object when you need it.

The number of reporting snapshots you can schedule to run is determined by your Edition. After a reporting snapshot has run, you can send an email notification to yourself and other users that includes details about the reporting snapshot run, such as the date and time it ran, whether it ran successfully, and how many records were loaded into the target object from the source report. Also, the notification includes a link to the reporting snapshot detail page in Salesforce.

- From Setup, enter “Reporting Snapshots” in the `Quick Find` box, then select **Reporting Snapshots**.

- Select the name of the reporting snapshot that you want to schedule to run.

Reporting snapshots will not run as scheduled if the user in the `Running User` field does not have access to the folder in which the source report is stored.

 **Note:** If the running user becomes inactive, the report doesn't run. Salesforce sends an email notification to either activate the user, delete the report schedule, or change the running user to an active one. Salesforce sends the notification to users with the “Manage Users,” “Modify All Data,” and “Manage Billing” permissions. If no user has all these user permissions, Salesforce sends the notification to users with the “Manage Users” and “Modify All Data” user permissions.

- Click **Edit** on the Schedule Reporting Snapshot section.

The Schedule Reporting Snapshot section on a reporting snapshot detail page displays details on when the reporting snapshot is scheduled to run.

- Select a notification setting to send an email when the reporting snapshot finishes running:

- Click **Me** to send an email to the email address specified on your Salesforce user record.
- Click **Others . . .** to send an email to additional users. You can only send reporting snapshot notifications to email addresses included on Salesforce user records. Furthermore, you can only select Users and Public Groups in the `Search` drop-down list.

- Schedule the reporting snapshot to run:

- In the `Frequency` field, select the frequency at which the reporting snapshot runs. When you click the `Daily`, `Weekly`, or `Monthly` fields, more options display that allow you to refine frequency criteria.

If you schedule a reporting snapshot to run on a specific day of every month, the reporting snapshot will only run on months that have that specific day. For example, if you schedule a reporting snapshot to run on the 31st day of every month, then the

EDITIONS

USER PERMISSIONS

To create, save, and schedule a reporting snapshot:

- “Manage Reporting Snapshots”

To run a reporting snapshot as a running user and add the results to a custom object, the running user must have:

- “Run Reports”

AND

“Create” on the target object

reporting snapshot will only run on months that have 31 days. If you want a reporting snapshot to run on the last day of every month, choose last from the `On day of every month` drop-down list.

- In the `Start` and `End` fields, specify the dates during which you wish to schedule the reporting snapshot to run.
- In the `Preferred Start Time` drop-down list, click the **Find available options...** link to choose a preferred start time for the reporting snapshot to run.
 - Your preferred start time may not be available if other users have already selected that time to run a reporting snapshot or your organization has reached its reporting snapshot limit.
 - Reporting snapshots run in the time zone of the user who schedules the run. For example, if the `Time Zone` field on your user record is set to Pacific Standard Time, and you schedule a reporting snapshot to run every day at 2:00 PM, then the reporting snapshot will run every day at 2:00 PM Pacific Standard Time.
 - If you view and save a schedule in a time zone different from the one in which it was previously scheduled, the time slot could potentially change.
 - The reporting snapshot runs within an hour of the time you select in the `Preferred Start Time` drop-down list. For example, if you select 2:00 PM as your preferred start time, the reporting snapshot may run any time in between 2:00 PM or 2:59 PM, depending on how many other reporting snapshots are scheduled to refresh at that time.

6. Click **Save** to schedule the reporting snapshot to run.

When the reporting snapshot runs, it adds new records to the target object.

Optionally, once you have scheduled a reporting snapshot to run, you can perform the following actions after you click **Edit** on the Schedule Reporting Snapshot section of a reporting snapshot detail page:

- Click **Edit** to update the notification and frequency settings of the reporting snapshot.
- Click **Delete** to permanently delete the existing schedule of when the reporting snapshot runs.

A reporting snapshot will fail during a scheduled run if:

- The source report includes more than 100 fields
- The source report was changed from summary to tabular
- The selected grouping level for a summary source report is no longer valid
- The running user does not have access to the source report
- The running user does not have the “Run Reports” permission
- The target object has more than 100 custom fields
- The target object contains validation rules
- The target object is included in a workflow
- The target object is a detail object in a master-detail relationship
- The target object runs an Apex trigger when new records are created on it
- The running user does not have the “Create” permission on the target object. Note that if the target object's status is `In Development`, the running user must have the “Customize Applications” permission.

Manage Reporting Snapshots

After you set up a reporting snapshot, you can view details about it and edit and delete it. From Setup, enter *Reporting Snapshots* in the Quick Find box, then select **Reporting Snapshots** to display the Reporting Snapshots page, which shows the list of reporting snapshots defined for your organization.

From the Reporting Snapshots page, you can:

- Select a list view from the `View` drop-down list to go directly to that list page, or click **Create New View** to define your own custom view.
- Define a new reporting snapshot by clicking **New Reporting Snapshot**.
- Update the reporting snapshot name, description, running user, source report, and target object by clicking **Edit** next to its name. Only users with the “Modify All Data” permission can choose running users other than themselves. If you have the “Customize Application” permission, enter a unique name to be used by the API and managed packages.

If you change the source report or target object on a reporting snapshot with existing field mappings, the field mappings are deleted when you save the reporting snapshot. You can also view `Summary Fields in Source Report` and `Fields in Target Object` to see the number of summary or target fields, respectively.

- Delete a reporting snapshot by clicking **Del** next to its name. After the reporting snapshot is deleted, it cannot be restored from the Recycle Bin.

! **Important:** When you delete a reporting snapshot, the source report and target object aren’t deleted; however, when the source report runs, it won’t load the target object with data.

You can delete the schedule of when a reporting snapshot runs. You can’t stop or pause a reporting snapshot when it is running, nor can you delete its source report. To delete the source report, you must first remove the report from the reporting snapshot by changing the report in the `Source Report` drop-down list.

- Display detailed information about a reporting snapshot and customize it further by clicking its name. Then you can:
 - Click links in the Identification section that redirect you to the reporting snapshot running user, source report, and target object. In addition, you can view the preferred date and time at which the reporting snapshot will approximately run next in the `Next Run` field, and view the date and time at which it last ran in the `Last Run` field.
 - Click **Edit** in the Field Mappings section to further customize the fields mapped from the source report to the target object.

The Reporting Snapshot Field Mappings section displays which source report fields are mapped to the target object’s fields. You can view the number of fields in the source report available for mapping to the target object in the `Columns in Source Report` field. Also, you can view the number of fields available for mapping in the target object in the `Fields in Target Object` field.
 - Click **Edit** in the Schedule Reporting Snapshot section to schedule when to run the reporting snapshot.

The Schedule Reporting Snapshot section displays details about when the reporting snapshot is currently scheduled to run.
 - The Run History section displays details about when the reporting snapshot ran. Details include:
 - The date and time at which the reporting snapshot ran
 - The name of the source report, target object, and running user
 - The time it took for the reporting snapshot to run

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in:

- Developer

USER PERMISSIONS

To create, save, and schedule a reporting snapshot:

- “Manage Reporting Snapshots”

To run a reporting snapshot as a running user and add the results to a custom object, the running user must have:

- “Run Reports”

AND

“Create” on the target object

- The total number of detail or summary rows in the source report, depending on the report type
- The number of records created in the target object
- Whether or not the reporting snapshot ran successfully

Up to 200 records are stored in the Run History section. After 200 records are stored, the oldest record is automatically deleted and cannot be retrieved from the Recycle Bin.

SEE ALSO:

[Report on Historical Data with Reporting Snapshots](#)

Troubleshoot Reporting Snapshots

The Run History section of a reporting snapshot detail page displays if a reporting snapshot ran successfully or not. When a reporting snapshot fails during a scheduled run, the failure is noted in the `Result` column. To view the details of a run, click the date and time of the run in the `Run Start Time` column.

Tip:

- If the `Total Row Number` is blank, the run failed before the report was completed (for example, the report was invalid or the running user is inactive).
- When a reporting snapshot runs, it can add up to 2000 new records to the target object. Any records over 2000 are recorded in the Row Failures related list. If the `Total Row Number` is blank and the run history indicates “Some rows failed,” the report likely contained more than 2000 summaries.
- The details of a failed run are available on the Row Failures related list for 14 days before they are automatically deleted. You cannot retrieve details about row failures from the Recycle Bin.
- If you have a unique field in the target object, and records in the report have more than one of the same value in the column mapped to that unique field, duplicate records are not added. The run history indicates when records are not added to the reporting snapshot.
- If field mappings failed, the snapshot still runs, but the run history shows that there was a partial error.

A reporting snapshot could fail during a scheduled run for a number of reasons. This table lists the errors a failed run may display and how the errors can help you troubleshoot the reporting snapshot so that it will run successfully.

Running user does not have permission to run reports.

The user in the `Running User` field does not have the “Run Reports” or “Create and Customize Reports” permission. Choose a user with the appropriate permissions or enable the appropriate permissions for the running user.

Cannot run reporting snapshot because source report has been deleted.

The report in the `Source Report` field was deleted and no longer available to run. Choose another source report for your reporting snapshot or restore the deleted report from the Recycle Bin.

Running user does not have permission to access source report.

The user in the `Running User` field does not have access to the folder in which the source report is stored. Choose a user with access to the source report or provide the existing running user with access to the folder in which the source report is stored.

USER PERMISSIONS

To create, save, and schedule a reporting snapshot:

- “Manage Reporting Snapshots”

To run a reporting snapshot as a running user and add the results to a custom object, the running user must have:

- “Run Reports”

AND

“Create” on the target object

Source report definition is obsolete.

The report in the `Source Report` field references a custom object that is no longer available for reports or the relationships between the objects in the report have changed.

Source report definition is invalid.

The report in the `Source Report` field cannot run because it contains invalid formulas or filter criteria. Update the report so that it can run without errors.

Running user does not have permission to access report type.

The user in the `Running User` field does not have permission to access a report type associated with the report in the `Source Report` field. Choose a running user that has the correct permissions or provide the existing running user with the appropriate permissions.

Source report must be tabular.

The report in the `Source Report` field is no longer in tabular format. Choose a new source report or update the existing source report's format to tabular.

Source report last saved with details hidden on report results.

The report in the `Source Report` field was saved with its details hidden. To display the details of the source report, view the report, click the **Show Details** button, and save the report.

Target object has been deleted or is inaccessible to running user.

The custom object in the `Target Object` field has been deleted or the user in the `Running User` field does not have permission to access the target object. Restore the deleted custom object, choose a new target object, or provide the existing running user with "Create" permissions to the custom object in the `Target Object` field. Note that if the custom object's status is `In Development`, the running user must have the "Customize Application" permission to access the target object.

Running user does not have permission to edit target object.

The user in the `Running User` field does not have "Create" permissions on the custom object in the `Target Object` field. Choose a running user that has such permissions or provide the existing running user with "Create" permissions to the custom object in the `Target Object` field.

Target object must not be a detail object in a master-detail relationship.

The custom object in the `Target Object` field is a detail object in a master-detail relationship, meaning that a master object controls certain behaviors on the target object's records. Choose a target object that is not included in a master-detail relationship.

Target object must not be included in a workflow.

The custom object in the `Target Object` field is included in a workflow. Choose a target object that is not included in a workflow.

Target object must not include an insert trigger.

An Apex trigger runs when new records are created for the custom object in the `Target Object` field. Remove the Apex trigger or choose a target object for which an Apex trigger does not run when new records are created.

Target object must not include validation rules.

The custom object in the `Target Object` field contains validation rules. Choose a target object that does not contain validation rules or delete validation rules from the existing target object.

Running user is inactive.

The user in the `Running User` field is no longer active. Choose an active user.

One or more required fields on the target object are not mapped.

One or more required fields on the target object are not mapped. Map all required fields on the target object to fields on the source report.

Source report contains too many fields, has a formula field with too many functions, or contains too many criteria.

The report in the `Source Report` field contains too many fields, criteria, or functions within a formula field. Remove any unnecessary fields, criteria and functions within formula fields from the source report.

Source report cannot have more than 100 selected columns.

The report in the `Source Report` field contains more than 100 fields. Remove any unnecessary fields from the source report.

Target object cannot have more than 100 custom fields.

The custom object in the `Target Object` field contains more than 100 custom fields. Remove any unnecessary fields from the target object.

Your report exceeded the time limit for processing.

The report in the `Source Report` field may contain too much data to process. Reduce the amount of data the report processes when running by limiting the report's date range and remove any unnecessary fields from the source report.

This Reporting Snapshot Unique Name already exists. Please choose a unique name.

The new snapshot you are trying to create has the same unique name as that of an existing snapshot.

A summary field did not return a valid number.

A summary field in the results has not returned a valid number. For example, the field may have attempted to divide by 0. Check your formulas and test for 0 and "null" in calculations if they appear in your data.

There is a problem with this reporting snapshot. The source report format was changed from tabular to summary. The field mappings in the reporting snapshot are no longer correct. You can change the report format back to tabular or update the field mappings in the snapshot definition.

The source report format was changed from tabular to summary, which made the field mappings in the reporting snapshot incorrect. To fix this error, either change the report format back to tabular or update the field mappings in the snapshot definition. This error only applies to reporting snapshots with summary reports.

There is a problem with this reporting snapshot. Source report must be tabular or summary.

The source report format must be either tabular or summary. Matrix reports cannot be used with reporting snapshots.

The grouping level you specified in the reporting snapshot is no longer valid. The running user may no longer have access to that field, the grouping level may have been removed from the source report, or the grouping level was never set.

This error may result when the running user no longer has access to the field specified in the grouping level, or the grouping level was removed from the source report or was never set. This error only applies to reporting snapshots with summary reports. Make sure the running user has access to all necessary fields.

Report on Related Objects with Cross Filters

Use a cross filter to fine-tune your results by including or excluding records from related objects, without having to write formulas or code. You can apply cross filters by themselves, or in combination with field filters.

Watch a Demo:  [Using Cross Filters in Reports](#)

To change a report filter, hover over it and click **Edit** or **Remove**. Your filters display when you run your report; click **Edit** on that page to make additional changes.

Add *subfilters* to further filter by fields on the child object. For example, if you have a cross filter of *Accounts with Opportunities*, click **Add Opportunity Filter** and create the *Opportunity Name equals ACME* subfilter to see just those opportunities. You can create up to five subfilters for each cross filter.

- Each report can have up to three cross filters.
- Each cross filter can have up to five subfilters.
- Filter logic applies only to field filters, not cross filters.

IN THIS SECTION:

1. [Create a Cross Filter](#)
Use cross filters to include or exclude records in your report results based on related objects and their fields.
2. [Example: Using WITH in Cross Filters](#)
Use cross filters to filter a report by an object's child objects using WITH conditions. For example, filter a report to show just accounts with cases.
3. [Example: Using WITHOUT in Cross Filters](#)
Use cross filters to filter a report by an object's child objects using WITHOUT conditions. For example, filter a report to show just contacts without activities.
4. [Example: Using Multiple Cross Filters](#)
Use cross filters to filter a report by an object's child objects using both WITH and WITHOUT conditions. For example, filter a report to show accounts that have cases but don't have activities.
5. [Tips for Working with Cross Filters](#)
Cross filters work like ordinary filters, but they have some special characteristics of their own.

Create a Cross Filter

Use cross filters to include or exclude records in your report results based on related objects and their fields.

Watch a Demo:  [Using Cross Filters in Reports](#)

1. In the Filters pane of report builder, click **Add > Cross Filter**.
2. Select a parent object from the drop-down list. Your choice determines which related objects you see in the child object list.

 **Tip:** In report types based on Campaigns, the parent object can be the secondary object in the report type. For example, in a “Campaigns with Leads” report, the parent object can be *Campaigns* or *Leads*.

3. Choose *with* or *without*.
4. Select a child object from the drop-down or search by its name. The drop-down list contains all eligible child objects of your selected parent object.
5. Optionally add subfilters:
 - a. Click **Add Your Related Child Object Filter**.
 - b. Select a field. The fields are determined by the child object in the cross filter. For example, if your cross filter is *Accounts with Cases*, you can use case fields for your subfilter.
 - c. Choose a filter operator.
 - d. Enter a value.
6. Click **OK**.

USER PERMISSIONS

To create, edit, and delete reports:

- “Create and Customize Reports”
AND
“Report Builder”

Example: Using WITH in Cross Filters

Use cross filters to filter a report by an object's child objects using WITH conditions. For example, filter a report to show just accounts with cases.

Let's say a recent campaign in California won you a lot of new customers. You want to ensure that their customer cases get resolved quickly. You can create a report to see which of those accounts currently have cases.

1. Create a new report. For the report type, click **Accounts & Contacts**, select **Accounts**, and click **Create**.
2. In the report builder's Filters pane, set the appropriate standard filters.
3. Create a field filter where *Billing State/Province equals CA* and click **OK**.
4. Click **Add > Cross Filter** and specify *Accounts with Cases*.

When you click **Run Report**, the results will include only California accounts with an associated case.

SEE ALSO:

[Create a Cross Filter](#)

Example: Using WITHOUT in Cross Filters

Use cross filters to filter a report by an object's child objects using WITHOUT conditions. For example, filter a report to show just contacts without activities.

Let's say that you've just imported a list of California accounts and you want to find which ones are missing contacts before you assign owners:

1. Create a new report. For the report type, click **Accounts & Contacts**, select **Accounts**, and click **Create**.
2. In the report builder's Filters pane, set the appropriate standard filters.
3. Create a field filter where *Billing State/Province equals CA* and click **OK**.
4. Click **Add > Cross Filter** and specify *Accounts without Contacts*.

When you click **Run Report**, the results will include only California accounts without an associated contact.

Example: Using Multiple Cross Filters

Use cross filters to filter a report by an object's child objects using both WITH and WITHOUT conditions. For example, filter a report to show accounts that have cases but don't have activities.

Say you're a salesperson who wants to see which customer accounts have unresolved problem escalations because you want to ensure your support team takes care of them.

1. Create a new report. For the report type, click **Accounts & Contacts**, select **Accounts**, and click **Create**.
2. In the report builder's Filters pane, set the appropriate standard filters.
3. To limit your report to customer accounts, click **Add > Field Filter** and specify *Type equals Customer*.
4. To see which accounts have no activities, click **Add > Cross Filter** and specify *Accounts without Activities*.
5. To see only accounts without completed activities, add a subfilter to your cross filter:
 - a. Click **Add Activities Filter** and specify *Status equals Completed*.
 - b. Click **OK**.
6. To include your accounts that currently have cases, add another cross filter but this time specify *Accounts with Cases*.
7. To exclude cases that were not escalated, add a subfilter to this cross filter:
 - a. Click **Add Cases Filter** and specify *Type equals Problem*.
 - b. Click **Add Cases Filter** again, but this time specify *Status equals Escalated*.
 - c. Click **OK**.

When you run the report, it will include only customer accounts without completed activities with escalated cases.

Tips for Working with Cross Filters

Cross filters work like ordinary filters, but they have some special characteristics of their own.

- Adding cross filters can potentially slow down your report. To avoid having the report or preview time out, limit the data returned by setting filters. For example, select *My opportunities* for *Show* and *Current FQ* for *Range* instead of viewing all opportunities for all time.
- Since the objects available in cross filters depend on the parent object of the report type you choose, consider the related child objects before selecting a report type. For example, choose the Accounts report type to filter on *Accounts with Partners* because Partner is a child object of Account.
- Cross filters work in conjunction with your report type selection. Cross filters have an AND relationship with the report type you select. Therefore, choosing a report type of Accounts with Partners and adding a cross filter for *Accounts without Partners* will yield no results.

Categorize Data Quickly with Buckets

Bucketing lets you quickly categorize report records without creating a formula or a custom field. When you create a bucket field, you define multiple categories (buckets) used to group report values.

Watch a Demo:  [Getting Started with Buckets](#)

Bucketing lets you quickly categorize report records without creating a formula or a custom field. For example, create a bucket field named *Size* based on the # *Employees* field. Then, create buckets that group records into "Large," "Medium," or "Small" ranges that you define. Bucket fields can be used like any other field to sort, filter, and group your report.

IN THIS SECTION:

1. [Add a Bucket Field](#)
Create a bucket field to contain the buckets into which you will organize your report data.
2. [Edit a Bucket Field](#)
Set up your bucket field by specifying the buckets that it contains and the values that go in the buckets.
3. [Edit a Numeric Bucket Field](#)
A numeric bucket helps you sort data that can be described in terms of numbers.
4. [Numeric Bucketing Example: Deal Size](#)
To gain insight into your deals, use bucketing to group by deal size instead of looking at individual deals. This lets you concentrate on the large deals that affect your quota the most.
5. [Edit a Picklist Bucket Field](#)
A picklist bucket field contains items that can be selected from a list.

Add a Bucket Field

Create a bucket field to contain the buckets into which you will organize your report data.

You can add up to five bucket fields per report, each with up to 20 buckets.

1. In the Fields pane of the report builder, double-click **Add Bucket Field** or drag it into the report preview. You can also click a column menu for a field in the report and select **Bucket this Field**.
2. Edit the bucket field according to the field type.
 - [Edit a Numeric Bucket Field](#)
 - [Edit a Picklist Bucket Field](#)
 - [Edit a Text Bucket Field](#)

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"
- AND
- "Report Builder"

Edit a Bucket Field

Set up your bucket field by specifying the buckets that it contains and the values that go in the buckets.

1. In the report builder Fields pane under Bucket Fields, hover over a bucket field and click . Or in the Preview pane, click the bucket field column menu and select **Edit Bucket Field**.
2. Edit the bucket field according to the field type.
 - [Edit a Numeric Bucket Field](#)
 - [Edit a Picklist Bucket Field](#)
 - [Edit a Text Bucket Field](#)

Edit a Numeric Bucket Field

A numeric bucket helps you sort data that can be described in terms of numbers.

In the Edit Bucket Field overlay for a numeric field:

1. For `Source Column`, select the field you want to bucket.
2. Enter a bucket field name. This appears as the column name in the report.

Since a bucket field is intended to have multiple buckets (known as “ranges” in numeric bucket fields) within it, a good name for a bucket field describes the scope of the ranges. For example, a bucket field named “Size” could have ranges of “Small,” “Medium,” and “Large”.
3. Define your ranges by entering a number and a name. The range names appear as values in your new column.

Each range is greater than the lower number up to and including the higher number.

To remove all ranges and start over, click **Clear All**.
4. To move all empty values to the bucket containing the value zero, enable `Treat empty source column values in the report as zeros`.

If this is disabled, unbucketed values appear as a dash (-) in the column.
5. Click **OK**.

In a report, numeric bucket columns are sorted by range values.

Numeric Bucketing Example: Deal Size

To gain insight into your deals, use bucketing to group by deal size instead of looking at individual deals. This lets you concentrate on the large deals that affect your quota the most.

1. Create or edit a standard opportunity report.
2. In the Fields pane of the report builder, double-click **Add Bucket Field** or drag it into the report.
3. For Source Column, select *Amount*.
4. For Bucket Field Name, enter *Deal Size*.
5. Under Define Ranges, enter *1000* in the first row. This represents the maximum for a small deal. Name this range *Small*.
6. Click **Add** and enter *25000* in the second row. This represents the maximum for a medium-size deal. Name this range *Medium*.
7. By default, the last range is any amount over the previous range. You don't need to enter a number for this range. Name this range *Large*.
8. Click **OK**.

With numeric bucket fields, each range is greater than the lower number, up to and including the higher number. Once you've set up this bucket field, amounts will be bucketed as follows:

Amounts	Bucket
1000 or less	Small
1001 to 25000	Medium
25001 or more	Large

Edit a Picklist Bucket Field

A picklist bucket field contains items that can be selected from a list.

 **Note:** The following picklist types can't be bucketed.

- Record types
- Divisions
- Multi-value picklists
- The `Type` picklist in Activity reports

In the Edit Bucket Field overlay for a picklist field:

1. For `Source Column`, select the field you want to bucket.
2. Enter a bucket field name. This appears as the column name in the report.

Since a bucket field is intended to have multiple buckets within it, a good name for a bucket field describes the scope of the buckets. For example, a bucket field named "Priority" could have "High," "Medium," and "Low" buckets.

 **Important:** Picklist bucket names must include one or more letters or symbols. If a picklist bucket field includes a bucket whose name contains only numbers, the bucket field cannot be saved.

3. To create a bucket, click **New Bucket** and enter a bucket name. Create multiple buckets to group your report records.
4. To find a particular value in the list of values, type the first few characters of its name in the Quick Find box. As you type, items that match your search terms appear in the menu.
5. Select values and drag them into a bucket. Alternatively, select values, click **Move To**, and select a bucket or enter a new bucket name.

While you're bucketing values, use these functions as needed:

- To show all the values in the report, click **All Values**.
- To show the values for a particular bucket, click the bucket name.
- To remove values from a bucket, select the values and drag them to another bucket, or drag them to **Unbucketed Values**.

 **Note:** You can bucket only active picklist values. Inactive picklist values aren't shown.

6. To move all unbucketed values into a bucket named "Other", enable `Show unbucketed values as "Other"`. If this is disabled, unbucketed values appear in the bucket column with the value name.
7. Click **OK**.

In a report, picklist bucket columns are sorted by the bucket position as shown in the Edit Bucket Field dialog box, followed by "Other" if `Show unbucketed values as "Other"` is enabled, or the unbucketed picklist item names if `Show unbucketed values as "Other"` is disabled.

Edit Bucket Field Help for this Page ⓘ x

Use bucket fields to group, filter, or arrange report data. Create multiple buckets in this bucket field to group your report records.

Source Column:

Bucket Field Name: ⓘ

New Bucket **Move To** **Sort By:** Bucket ↑

- All Values(32)
 - IT (4)
 - Bio Tech (6)
 - Telecom (5)
- Unbucketed Values(17)

Show unbucketed values as "Other."

SEE ALSO:

[Edit a Picklist Bucket Field](#)

Edit a Text Bucket Field

A text bucket helps you sort out values that consist of words or phrases.

 **Note:** The following text types can't be bucketed.

- Text area
- Text area—long
- Text area—rich
- Text area—encrypted
- URL
- Date
- Date/Time

In the Edit Bucket Field overlay for a text field:

1. For `Source Column`, select the field you want to bucket.
2. Enter a bucket field name. This appears as the column name in the report.

Since a bucket field is intended to have multiple buckets within it, a good name for a bucket field describes the scope of the buckets. For example, a bucket field named "Region" could have "East," "West," and "Central" buckets.
3. To create a bucket, click **New Bucket** and enter a bucket name. Create multiple buckets to group your report records.
4. To find a particular value in the list of values, type all or part of its name in the **Search for values...** box and click **Search**, or leave the box empty and click **Search**.

The search returns up to 200 values.
5. Select values and drag them into a bucket. Alternatively, select values, click **Move To**, and select a bucket or enter a new bucket name.

While you're bucketing values, use these functions as needed:

 - Use Enter Values to enter the exact name of a value you want to bucket, or to bucket values that may appear in your report later.
 - To show the values for a particular bucket, click the bucket name.
 - To remove values from a bucket, select the values, select **Move To**, and select a bucket or enter a new bucket name.
6. To move all unbucketed values into a bucket named "Other," enable `Show unbucketed values as "Other"`. If this is disabled, unbucketed values appear in the bucket column with the value name.
7. Click **OK**.

In a report, text bucket columns are sorted in alphanumeric order.

Enter Values for Text Buckets

A text bucket field needs a descriptive name and two or more buckets containing text strings.

If you know the exact value you want to bucket, you can use the Enter Values function to quickly bucket it without searching. This is useful if your report has a large number (such as millions) of values and searching for a value is slow. You can also use this method to enter and bucket values that may appear in your report later.

In the Edit Bucket Field overlay for a text field:

1. Click **Enter Values**.
2. Select the bucket where you want to move the values. If you select **New Bucket**, enter a name for the bucket.
3. Type one or more values in the box. Enter multiple values on separate lines.
4. Click **Move**.

SEE ALSO:

[Edit a Text Bucket Field](#)

Text Bucketing Example: Strategic Accounts

Use a text bucket to sort accounts into general categories that you can act on.

1. Create or edit a standard account report, making sure at least a few records appear in the report.
2. In the Fields pane of the report builder, double-click **Add Bucket Field** or drag it into the report.
3. For Source Column, select `Account Name`.
4. For Bucket Field Name, enter `Strategic`.
5. Click **New Bucket** and name the bucket `IBM`.
6. Click **New Bucket** and name the bucket `Dell`.
7. Click **New Bucket** and name the bucket `HP`.
8. To show the available values, leave the **Search for values...** box empty and click **Search**.
9. Select values and drag them into the appropriate buckets.
10. Enable Show unbucketed values as "Other".
11. Click **OK**.

Combine Different Types of Information in a Joined Report

The joined report format lets you view different types of information in a single report. A joined report can contain data from multiple standard or custom report types.

Watch a Demo:  [Introducing Joined Reports in Salesforce](#)

To get started with joined reports, create a new or edit an existing report in report builder, click the **Format** drop-down, and choose **Joined**.

Most of the things you can do with summary or matrix reports you can also do with joined reports. For example, you can find, add, and remove fields; summarize fields; and run and save reports.

 **Tip:** You can show a joined report that includes a chart on a dashboard. Edit the joined report dashboard component and select **Use chart as defined in the source report**.

IN THIS SECTION:

1. [Add a Report Type to a Joined Report](#)
Adding a report type lets you expand the set of data available for analysis in a joined report.
2. [Change the Principal Report Type](#)
The principal report type controls how common fields are named. A joined report must have a principal report type. You can change the principal report type at any time

Change the Principal Report Type

The principal report type controls how common fields are named. A joined report must have a principal report type. You can change the principal report type at any time.

By default, the first report type you add to the report is the principal.

The principal report type doesn't affect what data is available for reporting.

Change the principal report type by removing its blocks. To remove a block, drag it to the Fields pane. If there are multiple blocks based on the principal report type, you must remove them all.

When you remove the principal report type, the way the new report type is selected depends on how many report types the report contains.

- If the report contains only two report types, the other report type automatically becomes the principal.
- If the report contains more than two report types, a dialog displays that prompts you to pick one of them as the new principal report type.

SEE ALSO:

Build a Custom Summary Formula for a Joined Report

You can add standard or cross-block custom summary formulas for joined reports to calculate additional totals based on the numeric fields available in the report.

1. Use one of these options to access the Add Summary Formula overlay from the Fields pane.

Option	Description
To create a standard custom summary formula	Go to the report type category, and double-click Add Formula
To create a cross-block custom summary formula	Go to the Common category and double-click Add Cross Block Formula

2. Enter a name for the formula as you want it to appear in the report, and optionally a description. The name must be unique.
3. From the **Format** drop-down list, select the appropriate data type for your formula based on the output of your calculation.
4. From the **Decimal Places** drop-down, select the number of decimal places to display for currency, number, or percent data types. This setting is ignored for currency fields in multicurrency organizations. Instead, the **Decimal Places** for your currency setting apply.
5. Set the **Where will this formula be displayed?** option.

The calculated value displays in the report block at either the Grand Total or the global grouping level, depending on which you select. To display the formula calculation at every level, including the Grand Total, select **All summary levels**. Optionally you can select to show the calculation at a global grouping level. You can have three global groupings in a joined report. The groupings apply across all blocks.

6. Build your formula:
 - a. Select one of the fields listed in the **Summary Fields** drop-down list. This field's value is used in your formula.
When creating a cross-block formula, the fields are grouped by block. You can also use Quick Find to search for a field.
When creating a single-report type formula, the list displays numeric fields available for the report type.
 - b. Select the kind of summary type to use in your formula. This option is not available for **Record Count**.

Summary Type	Description
Sum	The summary value of data in a field or grouping of fields.
Largest Value	The largest value of data in a field or grouping of fields.
Smallest Value	The smallest value of data in a field or grouping of fields.
Average	The average of data in a field or grouping of fields.

- c. Click **Operators** to add operators to your formula.
 - d. Select the function category (All, Logical, Math, or Summary), choose the function you want to use in your formula, and click **Insert**.
 - e. Repeat these steps as necessary.
7. Click **Check Syntax** to see if your formula contains errors. Errors are highlighted by the cursor.
8. Click **OK**. Your formula isn't saved until you save the report.

2. Drop the field to create the block.

When you've added the block, notice that standard and field filters for the additional block are added to the Filters pane (1). Also, the new block appears in the Preview pane (2).

To delete a block, click  in the block header, then click **Remove Block**. Or just drag the block to the Fields pane.

Keep the following in mind when working with blocks.

- Adding a new report type to a joined report also adds a new block.
- You must choose a field from a report type category when creating a block. You can't use a field from the Common category. For example, if your report contains both the Opportunities and the Cases report types, choosing a field from the Opportunities category creates a new Opportunities block, while choosing a field from the Cases category creates a new Cases block.

SEE ALSO:

- [Add a Report Type to a Joined Report](#)
- [Delete a Block](#)
- [Build a Custom Summary Formula for a Joined Report](#)
- [Work with Blocks](#)

Reorder Blocks

You can reorder blocks in a joined reports. Reordering blocks affects the report's appearance but doesn't affect the data in the blocks.

When you reorder blocks, block numbers don't change. For example, if you have a report containing three blocks, and you move block 1 to a new position to the right of block 3, the blocks now display as block 2, block 3, and block 1. You should rename the blocks to avoid confusion.

When reordering a block, you move it to either the left or right of an existing block. You can't drag it to an empty area in the Preview pane.

To reorder a block:

- In the Preview pane, drag the block to either the left or right side of an existing block. A blue bar beside the block indicates an acceptable drop location.

SEE ALSO:

[Rename a Block](#)

[Work with Blocks](#)

Rename a Block

You can rename blocks to provide more user-friendly descriptions of the information they contain.

When you add a block to a joined report, it's named automatically based on the report type and the number of blocks in the report. For example, if your report contains two blocks and you add a new block that's based on the Opportunities report type, it's named Opportunities block 3.

1. Click the block's name. The name now appears in an editable text box.

[Combine Different Types of Information in a Joined Report](#)

How Joined Reports Work

A joined report can contain data from multiple standard or custom report types. You can add report types to a joined report if they have relationships with the same object or objects. For example, if you have a joined report that contains the Opportunities report type, you can add the Cases report type as well because both have a relationship with the Accounts object.

A joined report consists of up to five report *blocks*, which you add to the report to create multiple views of your data. For each block, you can add regular and summary fields, create standard and cross-block custom summary formulas, apply filters, and sort columns. You apply groupings across all blocks in the report, and can add up to three groupings to the blocks, the same as for the summary format. You can also add a chart to a joined report.

Each joined report has a *principal* report type. By default, the principal type is the first one added to the report, and is identified in the Fields pane with a small dot beside its name. For example, if you create the joined report by selecting the Opportunities report type, and then add the Cases type, the Opportunities type is the principal report type.

The principal report type controls how common fields are named. Some common fields have different names or appear in different sections in different report types. In those fields, click  to see the name of the field in other report types.

When a joined report contains multiple report types, some fields are identified as *common* fields. A field is a common field if it's shared by all report types or if all report types share a lookup relationship to the field. These fields appear in the Common Fields area in the Fields pane, and can be used to group report blocks.

IN THIS SECTION:

1. [Joined Report Examples](#)

Creating a sales rep performance scorecard, reviewing support cases by status, and predicting your opportunity pipeline are some examples of what you can do with joined reports.

Joined Report Examples

Creating a sales rep performance scorecard, reviewing support cases by status, and predicting your opportunity pipeline are some examples of what you can do with joined reports.

Creating a Sales Rep Performance Scorecard

A sales rep scorecard lets your sales management team understand the performance and actions of your organization's sales reps. To create it, you need to have three separate custom report types, each of which creates a relationship between User (as the primary object) and one of the following three objects: Opportunity Owner, Opportunity Creator, and Activity Owner. Note that, in this example, we've named the custom report types `User and Opportunity Owner Custom Report`, `User and Opportunity Creator Custom Report`, and `User and Activity Owner Custom Report`.

Start by creating a new custom report based on the User and Opportunity Owner custom report type, and then add the User and Opportunity Creator and User and Activity owner custom report types as two additional blocks. Then, group by Sales Rep (opportunity owner) and set the filters as described in the procedure.

To create the report:

1. Create a new report, selecting `User and Opportunity Owner Custom Report` as the report type.
2. Select `Joined` from the **Format** drop-down.
3. Click **Add Report Type**.
4. Select `User and Opportunity Creator Custom Report`.
5. Click **Add Report Type** again, and choose `User and Activity Owner Custom Report`.
6. Group the blocks by `Full Name`.
7. Add additional fields and filters to the report as needed. For example, you might want to change the date filters to focus on rep performance during a particular time frame. Or, to make sure that only sales people are included as opportunity owners, create a filter on the `Role: Name` filter limit your results to users with "Sales" in their roles.
8. Optionally, provide names for the blocks.
9. Click **Save** or **Run Report**.

Reviewing Support Cases by Status

You can also create a report comparing the number of support cases that are new, closed, or in-progress by priority. The report contains a single standard report type: Cases. First, create the report, add three blocks to the report, filter each block by the appropriate status, and then use the `Priority` field for grouping.

To create the report:

1. Create a new report, selecting `Cases` as the report type.
2. Select `Joined` from the **Format** drop-down.
3. Remove unwanted fields by dragging them to the Fields pane.
4. Create three blocks, each containing the `Case Number` and `Status` and, optionally, `Case Owner` fields.
5. For each block, filter on all cases. Then, filter each of the blocks by `Status` as follows:
 - Block 1: `Status equals Closed`
 - Block 2: `Status equals New`
 - Block 3: `Status not equal to Closed, New, Closed in Portal, Closed – First Call`
6. Group the blocks by `Priority`.
7. Optionally, rename the blocks.
8. Click **Save** or **Run Report**.

Predicting Opportunity Pipeline

Using cross-block custom summary formulas, you can create a report that predicts future opportunity revenue based on your sales reps' past performance. Create a report based on the Opportunities standard report type, add three blocks to the report, filter each block by the appropriate status, and then create a formula that uses fields from different blocks.

To create the report:

1. Create a new joined report, selecting Opportunities as the report type.
2. Remove unwanted fields by dragging them to the Fields pane.
3. Create three blocks, each containing the Opportunity Name, Account Name and Amount fields.
4. For each block, show All Opportunities. Then, filter each block.

Block	Filters
Block 1	<p><i>Opportunity Status equals Closed</i></p> <p><i>Date Field equals Close Date</i></p> <p><i>Range equals Current and Previous FY</i></p> <p><i>Stage equals Closed Lost</i></p>
Block 2	<p><i>Opportunity Status equals Closed Won</i></p> <p><i>Date Field equals Close Date</i></p> <p><i>Range equals Current and Previous FY</i></p>

Block	Filters
Block 3	<p><i>Date Field equals Close Date</i></p> <p><i>Range equals Next Month</i></p> <p><i>Opportunity Status equals Open</i></p>

- Group the blocks by `Opportunity Owner`.
- Rename the blocks. For example, "Closed — Won", "Close — Lost", and "Closing Next Month".
- Create a cross-block custom summary formula that predicts upcoming revenue based on past sales rep performance:

```
[Closing Next Month]AMOUNT:SUM* ([Closed - Won]RowCount/ ([Closed - Lost]RowCount+[Closed - Won]RowCount))
```

- Add the formula to one or more of the blocks.
- Optionally, add a cross-block custom summary formula that calculates the win ratio of each sales rep:

```
[Closed - Won]RowCount/ ([Closed - Lost]RowCount+[Closed - Won]RowCount)
```

- Click **Save** or **Run Report**.

	OPPORTUNITIES Closed - Lost		OPPORTUNITIES Closed - Won			OPPORTUNITIES Closing Next Month		
	Record Count	Amount	Record Count	Amount	Oppty Won Ratio	Record Count	Amount	Predicted Revenue
Opportunity Owner: Anjana Shah	1	USD 75,000.00	1	USD 225,000.00	0.50	2	USD 4,325,250.00	USD 2,162,625.00
Opportunity Owner: Anna Bressan			2	USD 10,833.33	1.00	3	USD 37,000.00	USD 37,000.00
Opportunity Owner: David Hudson	2	USD 2,329,500.00	4	USD 290,000.00	0.67	5	USD 6,357,375.00	USD 4,238,250.00
Opportunity Owner: Karen Adams	1	USD 4,268,227.62	0	0.00		1	USD 511,000.00	USD 0.00
Opportunity Owner: Matt Wilson	7	USD 689,935.17	4	USD 1,955,000.00	0.36	5	USD 4,169,325.00	USD 1,516,118.18
Opportunity Owner: Phil Smith	1	USD 850,000.00	6	USD 241,500.00	0.86	3	USD 531,243.67	USD 455,351.72
Grand Totals	12	USD 8,212,662.78	17	USD 2,722,333.33		19	USD 15,931,193.67	USD 9,338,975.60

Adding a Chart to the Opportunity Pipeline Predictor Report

You can include a chart with a joined report to provide a visual representation of the data. For example, you can add a chart to the Opportunity Pipeline Predictor report that shows actual versus predicted revenue.

To add the chart:

- Create the [Predicting Opportunity Pipeline](#) report.
- Click **Add Chart**.
- For the Y-axis, select `Closed — Won — Sum of Amount`.
- Select **Plot additional values**.
- Select `Line` for the Display option, and `Predicted Revenue` as the Value.

6. Click the Formatting tab, and enter *Actual versus Predicted Revenue* as the chart title.
7. Click **OK**.
8. Click **Save** or **Run Report**.

Custom Summary Formulas with Joined Reports

Two types of custom summary formulas are available with joined reports: standard and cross-block.

Standard Custom Summary Formulas

Standard custom summary formulas apply to one report type, and can be added to blocks that are based on that report type only. For example, a summary formula created for the Cases report type can only be applied to Cases blocks. Custom summary formulas in joined reports support the same data formats, formula options, functions, and calculation display locations as they do with summary and matrix reports.

Keep the following in mind when working with custom summary formulas in joined reports.

EDITIONS

Available in: Salesforce Classic

- Available in:
- Enterprise
 - Performance
 - Unlimited
 - Developer

- The formulas aren't automatically added to the report when you create them. To add a formula, drag it to a block with the same report type.
- When you add custom summary formulas to a block, they appear to the right of the standard fields in the order in which you added them to the block. If you also add cross-block custom summary formulas, they appear to the right of the standard ones.
- The results of custom summary formulas are affected by the filter options applied to the blocks they're included in. As a result, the same formula can yield different results in different blocks.
- You can add up to 10 custom summary formulas to each block in a joined report. A joined report can have a total of 50 custom summary formulas.
- Each custom summary formula must have a unique name. However, standard and cross-block custom summary formulas can have the same name.
- Custom summary formula names can't include brackets ("[" or "]").

Cross-Block Custom Summary Formulas

Cross-block custom summary formulas let you calculate values across multiple blocks in a joined report. For example, you can use a cross-block formula to calculate the ratio of open to closed opportunities for an account or the ratio of closed pipeline deals to sales targets.

Building a cross-block formula is similar to creating a standard one. The same data formats, formula options, functions, and calculation display locations are available. The formula syntax is also similar, except that block information is also included. For example, when calculating the ratio of opportunities to cases for each account, the formula also includes the block title: `[Opportunities block 1]RowCount / [Cases block 2]RowCount`. Note that if you omit block title, you see an error message when you check formula syntax or save the formula.

Keep the following in mind when working with cross-block custom summary formulas.

- You can add a cross-block formula to any block in the report.
- Cross-block formulas aren't automatically added to the report when you create them. To add a formula, drag it to a block.
- When you add cross-block formulas to a block, they appear to the right of standard ones in the order in which you add them to the block.
- The results of cross-block formulas are affected by the filter options applied to the blocks in the report. As a result, a cross-block formula can yield different results when you change filter options.
- Each joined report can have up to 10 cross-block custom summary formulas.
- Deleting a block that's used in a cross-block formula also deletes the formula from both the Fields pane and any remaining blocks containing it.
- Each cross block formula must have a unique name. However, standard and cross-block custom summary formulas can have the same name.
- Cross-block formula names can't include brackets ("[" or "]").

What Can't I Do with Joined Reports?

Most of the things you can do with summary or matrix reports you can also do with joined reports, such as find, add, and remove fields; summarize fields; and run and save reports. However, there are some things you can't do.

Here are some things you can't do with joined reports.

- Add bucketed fields.
- Add cross filters.
- Drag and drop filters from the Fields pane on to the Filter pane.
- Apply conditional highlighting.
- Change the hierarchy for opportunity or activity reports.
- Create reporting snapshots based on joined reports.

Note:

- For users to be able to create and edit joined reports, report builder must be enabled for your entire organization. When report builder isn't enabled, users can run joined reports, but can't create them.
- Joined reports require that the new user interface theme is enabled. Users without the new theme are unable to create, edit, or run joined reports.
- Internet Explorer 6 is not supported for joined reports.
- You can't filter data on a joined report in dashboard view or add a filter to a dashboard that only has joined reports.

**Note:**

- You might not have access to all the report types listed here. Certain factors can affect the report types you see, such as which features your organization has enabled and how your administrator has set up report folder visibility. Check with your administrator if you think you should see a report type that you don't.
- If your organization has renamed standard objects, the names of the standard report types will contain your organization's names instead of the original ones. For example, if your organization has renamed the "Opportunity" object as "Deal," the standard report type "Opportunity Field History" will be renamed "Deal Field History."

- In this list, report types marked with an asterisk (*) aren't available when you create a new report. Instead, you access them by customizing standard reports, which are in folders on the Reports tab.

Show Report Data Graphically

To help readers understand your data quickly and easily, show the data in chart form. Charts appear just above the report table. They can help users get a feel for the data before they delve into the details. Use line charts to track changes over time, or a bar or pie chart to compare values at a point in time. Charts can also appear in dashboard components.

IN THIS SECTION:

1. [Add a Chart to a Report](#)
Add a chart to give users a visual way to understand the data in your report.
2. [Chart Properties](#)
You can add a chart to any standard or custom summary or matrix report. The chart properties specify the data that appears in the chart, its labels and colors, and any conditional highlighting you apply.
3. [Present Data Effectively with Charts](#)
When you add a chart to a report, things like negative values, very large or small numbers, custom summary formulas, and field-level security can affect the charts' appearance. Switching the report format and changing groupings and blocks also affects charts.
4. [Show Different Data Sets in One Chart](#)
A *combination chart* plots multiple sets of data on a single chart. Each set of data is based on a different field, so values are easy to compare. You can also combine certain chart types to present data in different ways in a single chart.
5. [Combination Chart Examples](#)
Use a combination chart to show multiple values against a single axis range, show two chart types together, or compare two continuous summary values.
6. [Chart Formatting Options](#)

Add a Chart to a Report

Add a chart to give users a visual way to understand the data in your report.

 **Note:** Your report must have at least one grouping before you can add a chart.

To add or edit a chart:

1. Click **Add Chart** in report builder. For existing charts, click **Edit Chart**.
2. Select a chart type.
3. Enter the appropriate settings on the Chart Data tab for the chart type you selected.
4. Enter the appropriate settings on the Formatting tab.
5. Click **OK**.

SEE ALSO:

[Present Data Effectively with Charts](#)

[Build a New Report](#)

Chart Properties

You can add a chart to any standard or custom summary or matrix report. The chart properties specify the data that appears in the chart, its labels and colors, and any conditional highlighting you apply.

 **Note:** This topic only applies if you're not using report builder. *Report builder* is a visual editor for reports.

To customize chart properties, click **Add Chart** or **Edit Chart** in any matrix or summary report, and use the fields on the Chart Data and Formatting tabs.

See [Present Data Effectively with Charts](#) on page 3521 for limits, considerations, and tips.

Chart Data Settings

Control the data that appears in your chart with these options.

Field	Description
Chart Type	Select the type of chart to use when representing the data in your report. The chart type that you choose determines which chart properties are available to set.
X-Axis and Y-Axis	Choose what values to display on the axes of your chart. Depending on the chart type, axis values can be record count, summary fields, or groupings defined in the report.  Note: If the Y-axis corresponds to a custom summary formula that has the <code>Where Will this Formula Be Displayed?</code> option set to a grouping level other than <code>All summary levels</code> , then the X-axis and Groupings

EDITIONS

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"

Field	Description
	selection must correspond to that custom summary formula's grouping level.
Combination Chart	Select this option to plot additional values on this chart. The chart type you chose must allow combination charts.
Groupings	Choose how to group information on your chart. You can only pick from groupings defined in the report. For bar and column charts, click an icon to select the grouping display: side-by-side, stacked, or stacked to 100%. For either single or grouped line charts, you can select Cumulative .
Values	Choose what to display as values for your pie, donut, or funnel chart.
Wedges	Choose what to display as wedges for your pie or donut chart.
Segments	Choose what to display as segments for your funnel chart.

Chart Presentation

Control the appearance and behavior of your chart using these options.

Field	Description
Chart Title	Enter a name for the chart.
Title Color	Select the color for the text of your chart title.
Title Size	Select the font size for the text of your chart title. The maximum size is 18. Larger values are shown at 18 points.
Text Color	Select a color for all the text and labels in your chart.
Text Size	Select a font size for all the text and labels in your chart. The maximum size is 18. Larger values are shown at 18 points.
Background Fade	Choose a direction for a gradient color background. Also select a Start Color and End Color for the gradient. Use white for both if you do not want a background design.
Legend Position	Choose a place to display the legend in relation to your chart.
Combine Small Groups into "Others"	Combine all groups less than or equal to 3% of the total into a single "Others" wedge or segment. Deselect to show all values individually on the chart. This only applies to pie, donut, and funnel charts. This option is on by default for pie and donut charts, and off for funnel.
X- or Y-Axis Range	Choose a manual or automatic axis range for bar, line, or column charts. If you choose manual, enter numbers for the minimum and maximum axis values to be displayed. If there are data points outside the range that you set, the axis automatically extends to include those values when you generate the chart.
Show Axis Labels	Display labels for each axis of your chart. This only applies to bar and line charts.
Show Labels	Display labels for your pie, donut, or funnel chart.
Show Group %	Display the percentage value for each group in the chart.

Field	Description
Show X- or Y-Axis Values	Display the values of individual records or groups on the chart axis. This only applies to certain horizontal bar and vertical column charts.
Show Values	Display the values of individual records or groups on the chart. This only applies to certain chart types.
Show Wedge %	Display the percentage value for each wedge of pie and donut charts.
Show Total	Display the total value for the donut chart.
Show Segment %	Display the percentage value for each segment of funnel charts.
Show Details on Hover	Display values, labels, and percentages when hovering over charts. Hover details depend on chart type. Percentages apply to pie, donut, and funnel charts only. Hover is disabled when viewing charts that have more than 200 data points.
Chart Size	Select a size for the chart, from Tiny to Extra Large.
Chart Position	Place the chart above or below your report.

Conditional Highlighting

Highlight field values on summary or matrix reports based on ranges and colors you specify. To enable conditional highlighting, your report must contain at least one summary field or custom summary formula.

Field	Description
Summary	Choose a summary field whose number ranges you want represented by colors.
Low Color	Select a color to represent data that falls below the Low Breakpoint value.
Low Breakpoint	The number that acts as the threshold between the Low Color and the Mid Color. Values that are exactly the same as the Low Breakpoint value are shown as the Mid Color.
Mid Color	Select a color to represent data that falls between the Low Breakpoint and High Breakpoint values.
High Breakpoint	The number that acts as the threshold between the Mid Color and the High Color. Values that are exactly the same as the High Breakpoint value are shown as the High Color.
High Color	Select a color to represent data that falls above the High Breakpoint value.

SEE ALSO:

[Customizing Reports](#)

Present Data Effectively with Charts

When you add a chart to a report, things like negative values, very large or small numbers, custom summary formulas, and field-level security can affect the charts' appearance. Switching the report format and changing groupings and blocks also affects charts.

- You can't have more than 250 groups or 4,000 values in a chart. If you see an error message saying that your chart has too many groups or values to plot, adjust the report filters to reduce the number. In [combination charts](#), all groups and values count against the total.
- If you lose access to a field used in a chart, another field may be used in its place. If no other fields are available, record count is used.
- Decimal-place precision on charts is not customizable. Numeric and currency values round to two decimal places. Percentage values round to one decimal place.
- If numeric values are too large or too small, they are shown in scientific notation. For example, the number 5,750,000,000 is displayed as 5.75E9; -0.0000000061 is displayed as -6.1E-9.
- Negative values are displayed on all line charts and non-stacked bar and column charts. Negative values on pie, donut, funnel, and stacked charts are not displayed. Groupings containing negative values are displayed in the legend, and negative values are reflected in the calculation of all summary values, including the total for donut charts.
- When creating charts, don't group by a field on a child object then sum by a field on the parent object. It's not good practice. If you do this with a donut chart, the total shown may not match the sum of the wedges.
- Dashboard and report charts that display values from custom summary formulas display decimal places using your default currency setting instead of what you specified for the formula. For example, if the summary formula specifies zero decimal places, no decimal places appear in columns, but chart values show the number of decimal places specified for your default currency (usually two decimal places). This applies to currencies, numbers, and percentages.
- With joined reports, summary field names contain both the field name and the block name. For example, if you've summarized the Amount field in Block 1, it appears as `Block 1 - Sum of Amount` in the Chart Editor. A cross-block or standard custom summary formula contains the block name when the formula is included in multiple blocks.
- When a report already has a chart, changing the report format or removing blocks, groupings, or summary fields has impacts described in this table.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

When you make this change ...	The effect is ...
Switch format from summary, matrix, or joined to tabular	All charts are removed from the report.
Switch format from summary to matrix	The first summary grouping becomes the first row grouping. The second becomes the first column grouping. The third becomes the second row grouping. The chart is unchanged.
Switch format from matrix to summary	The first row grouping becomes the first summary grouping. The second row grouping becomes the <i>third</i> summary grouping. The first column grouping becomes the <i>second</i> summary grouping. The second column grouping is removed. If the chart used the second column grouping, that grouping is replaced by the first available summary field that's not already used in the chart.
Switch format from summary or matrix to joined	The existing report becomes the first block and the chart remains in the report. If the matrix report used the second column grouping, that grouping is replaced by the first available summary field that's not already used in the chart. If the summary or matrix report included a grouping from a bucket field, the grouping is replaced with the next available grouping not already used in the chart.

When you make this change ...	The effect is ...
Switch format from joined to summary or matrix	The first block becomes the report, and groupings and the chart are preserved. If the chart in the joined version contained summary fields from the first block, they remain in the chart in the summary report. Summaries from other blocks are removed from the chart.
Remove a block containing a summary field from a joined report	The summary field is replaced with the next available summary field. If no additional summary fields are available, the original field is replaced with the record count from the first remaining block. Removing all blocks from a report removes the chart completely.
Remove a grouping used in the chart	The grouping is replaced with the next available grouping. If all groupings are removed, the chart is removed as well. Note that groupings can be removed automatically when you add a report type to a joined report or if a field becomes unavailable, for example as a result of field-level security.
Remove a summary field used in the chart (including custom and cross-block summaries)	The summary field is replaced with the next available summary field. If no additional summary fields are available, the field is replaced with the record count for either the report or the first block. Note that summary fields can be removed automatically, for example as a result of field-level security or when the report format changes.

[Show Different Data Sets in One Chart](#)

Show Different Data Sets in One Chart

A *combination chart* plots multiple sets of data on a single chart. Each set of data is based on a different field, so values are easy to compare. You can also combine certain chart types to present data in different ways in a single chart.

With combination charts, you can:

- Add a line to an existing line, vertical column, grouped vertical column, or stacked vertical column chart.
- Add a cumulative line to an existing line cumulative chart.
- Add up to three more columns to a vertical column chart.
