FIELD AUDIT TRAIL

Field Audit Trail lets you define a policy to retain archived field history data up to ten years, independent of field history tracking. This feature helps you comply with industry regulations related to audit capability and data retention.

Use Salesforce Metadata API to define a retention policy for your field history. Then use REST API, SOAP API, and Tooling API to work with your archived data. For information about enabling Field Audit Trail, contact your Salesforce representative.

Field history is copied from the History related list into the FieldHistoryArchive object and then deleted from the History related list. You define one HistoryRetentionPolicy object for your related history lists, such as Account History, to specify Field Audit Trail retention policies for the objects that you want to archive. You can then deploy the object by using the Metadata API (Workbench or Force Migration Tool). In production organizations that have Field Audit Trail enabled, data is archived by default after 18 months. In sandbox organizations, the default is one month. You can update the retention policies as often as you like.

You can set Field Audit Trail policies on the following objects.

- Accounts
- Cases
- Contacts
- Leads
- Opportunities
- Assets
- Entitlements
- Service Contracts
- Contract Line Items
- Solutions
- Products
- Price Books
- Custom objects with field history tracking enabled

You can include field history retention policies in managed and unmanaged packages.

The following fields can't be tracked.

- Formula, roll-up summary, or auto-number fields
- Created By and Last Modified By
- Expected Revenue field on opportunities
- Master Solution Title or the Master Solution Details fields on solutions
- Long text fields
- Multi-select fields

After you define and deploy a Field Audit Trail policy, production data is migrated from related history lists such as Account History into the FieldHistoryArchive object. The first copy writes the field history that's defined by your policy to archive storage and

USER PERMISSIONS

To specify a field history retention policy:

"Retain Field History"

Field Audit Trail

sometimes takes a long time. Subsequent copies transfer only the changes since the last copy and are much faster. A bounded set of SOQL is available to guery your archived data.

EXAMPLES

Set a Data Retention Policy for Field History

This example demonstrates how to set a field history data retention policy by using Metadata API. You need to edit the metadata only if you want to override the default policy values (18 months of production storage and 0 years of archive storage). Setting data retention policy involves creating a metadata package and deploying it. The package consists of a <code>.zip</code> file that contains an <code>objects</code> folder with the XML that defines each object's retention policy, and a project manifest that lists the objects and the API version to use.

- Note: The first copy writes the entire field history that's defined by your policy to archive storage and might take a long time. Subsequent copies transfer only the changes since the last copy, and will be much faster.
- 1. Define a field history data retention policy for each object. The policy specifies the number of months that you want to maintain field history in Salesforce, and the number of years that you want to retain field history in the archive. The following sample file defines a policy of archiving the object after six months, and keeping the archives for five years.

The file name determines the object to which the policy is applied. For example, to apply the above policy to the Account object, save the file as Account.object. For existing custom objects, this works the same way, with the file named after the custom object. For example: myObject_c.object.

2. Create the project manifest, which is an XML file that's called package.xml. The following sample file lists several objects for which data retention policy is to be applied. With this manifest file, you expect the objects folder to contain five files:

Account.object, Case.object, and so on.

3. Create the .zip file and use the deploy() function to deploy your changes to your production environment. For more information, see the Metadata API Guide.

Note: This pilot doesn't support deployment from sandbox to production environments.

That's it! Your field history retention policy will go into effect according to the time periods that you set.

Create a Custom Object and Set Field History Retention Policy at the Same Time

You can use Metadata API to create a custom object and set retention policy at the same time. You must specify the minimum required fields when creating a new custom object. Here's sample XML that creates an object and sets field history retention policy:

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
   <deploymentStatus>Deployed</deploymentStatus>
   <enableHistory>true</enableHistory>
   <description>just a test object with one field for eclipse ide testing</description>
   <historyRetentionPolicy>
       <archiveAfterMonths>3</archiveAfterMonths>
        <archiveRetentionYears>10</archiveRetentionYears>
        <gracePeriodDays>1/gracePeriodDays>
        <description>Transaction Line History</description>
   </historyRetentionPolicy>
   <fields>
        <fullName>Comments c</fullName>
        <description>add your comments about this object here</description>
      <inlineHelpText>This field contains comments made about this object</inlineHelpText>
       <label>Comments
       <length>32000</length>
        <trackHistory>true</trackHistory>
       <type>LongTextArea</type>
        <visibleLines>30</visibleLines>
    </fields>
   <label>MyFirstObject</label>
    <nameField>
       <label>MyFirstObject Name</label>
        <type>Text</type>
   </nameField>
    <pluralLabel>MyFirstObjects</pluralLabel>
    <sharingModel>ReadWrite</sharingModel>
</CustomObject>
```

Set trackHistory to true on the fields that you want to track and false on the other fields.

Query Archived Data

You can retrieve archived data by making SOQL queries on the FieldHistoryArchive object. You can filter on the FieldHistoryType, ParentId, and CreatedDate fields, as long as you specify them in that order. For example:

```
SELECT ParentId, FieldHistoryType, Field, Id, NewValue, OldValue FROM FieldHistoryArchive
WHERE FieldHistoryType = 'Account' AND ParentId='906F000000
```

METADATA API REFERENCE

HistoryRetentionPolicy

Represents the policy for retaining field history data. By setting a policy, you can specify the number of months you want to maintain field history in Salesforce, and the number of years that you want to retain field history in the archive.

This component is only available to users with the "RetainFieldHistory" permission.

Declarative Metadata File Suffix and Directory Location

Field history retention policies are defined as part of a standard or custom object. You can set field history retention policies for objects individually. See CustomObject for more information.

Version

Available in API version 31.0 and later.

Fields

Field Name	Field Type	Description
archiveAfterMonths	int	Required. The number of months that you want to keep field history data in Salesforce before archiving. You can set a minimum of 1 month and a maximum of 18 months. If you don't set a number, the default is 18 months. (That is, Salesforce maintains data for 18 months before archiving.)
archiveRetentionYears	int	Required. The number of years that you want to retain data in the archive. You can set a minimum of zero years, and a maximum of 10 years. If no number is set, the default is 10 years.
description	string	A text description for the history retention.
gracePeriodDays	int	The number of days of extra time after the archiveAfterMonths period before the data is archived. The gracePeriodDays interval applies only to the first time that the data is archived; because all the data is copied the first time, the operation may take longer than subsequent times when only the data that changed since the last archival operation is copied. The gracePeriodDays provides extra time for the administrator to prepare the organization before the initial archive operation. You can set a minimum of zero days and a maximum of 10 days. If no number is set, the default is 1 day.

Metadata API Reference HistoryRetentionPolicy

Declarative Metadata Sample Definition

This sample shows the definition of a history retention policy for a custom object:

SOAP API REFERENCE

FieldHistoryArchive

Represents field history values for all objects that retain field history. This object is available only to users with the "Retain Field History" permission. This object is available in API version 29.0 and later. Each instance of the FieldHistoryArchive object represents a single change in the value of a field. FieldHistoryArchive stores history for both standard and custom fields.

The Field field returns the name of the field unless the parent field or object is deleted, in which case it returns the field ID. You can use the ID to retrieve the old field and object name from the FieldNameAfterArchival and ParentNameAfterArchival fields, respectively.

Supported Calls

describeSObjects(), query()

Fields

Field Name	Details
ArchiveFieldName	Type string
	Properties Nillable
	Description
	The name of the field at the time the data was archived. If the field name changed, the name is sometimes not the same for all records related to a single field.
ArchiveParentName	Туре
	string
	Properties Nillable
	Description
	The name of the parent object at the time the data was archived. If the object name changed, the name is sometimes not the same for all records related to a single field.
ArchiveParentType	Туре
	string
	Properties
	Nillable

SOAP API Reference FieldHistoryArchive

Field Name	Details	
	Description The type of the field at the time the data was archived. If the field type changed, the type is sometimes not the same for all records related to a single field.	
ArchiveTimestamp	Type dateTime	
	Properties Nillable	
	Description The date and time at which the data was archived.	
CreatedById	Type dateTime	
	Properties Nillable	
	Description The user ID of the user who created the original record.	
CreatedDate	Type dateTime	
	Properties Nillable, Sort	
	Description The date and time at which the original record was created.	
Field	Type picklist	
	Properties Filter, Nillable, Restricted picklist	
	Description The name of the field that was changed. If the field is deleted from the parent object, the Field field contains the field ID instead.	
FieldHistoryType	Type picklist	
	Properties Nillable, Sort, Restricted picklist	
	Description The name of the object that contains the field history (for example, Account).	
Id	Type ID	

SOAP API Reference FieldHistoryArchive

Field Name	Details Properties	
	Defaulted on create, Filter, idLookup	
	Description The ID of the archived record. It's useful to have a field's ID for fields that you've deleted. (Field names aren't retained in history when you delete fields from Salesforce.)	
NewValue	Туре	
	anyType	
	Properties	
	Nillable	
	Description	
	The new value of the modified field.	
OldValue	Туре	
	anyType	
	Properties	
	Nillable	
	Description	
	The previous value of the modified field.	
ParentId	Туре	
	reference	
	Properties	
	Filter, Nillable, Sort	
	Description	
	The ID of the object that contains the field (the parent object).	

Usage

When sorting fields, order them as follows:

- 1. FieldHistoryType ASC
- 2. ParentID ASC
- 3. CreatedDate DESC

.

TOOLING API REFERENCE

HistoryRetentionJob

Represents the body of retained data from the archive, and the status of the archived data. Available in API version 29.0 or later.

Supported SOAP API Calls

describeSObjects(), query()

Supported REST API HTTP Methods

GET

Fields

Field Name	Details
DurationSeconds	Type int
	Properties Filter, Group, Nillable, Sort
	Description How many seconds the field history retention job took to complete (whether successful or not).
HistoryType	Type picklist
	Properties Create, Filter, Group, Nillable, Restricted picklist, Sort
	Description The object type that contains the field history that you retained. Valid values for standard objects are:
	• Account
	• Case
	• Contact
	• Leads
	 Opportunity
	For custom objects, use the object name.

Tooling API Reference HistoryRetentionJob

Field Name	Details
NumberOfRowsRetained	Type int Properties Filter, Group, Nillable, Sort Description The number of field history rows that a field history retention job has retained.
RetainOlderThanDate	Type dateTime Properties Filter, Sort Description The date and time before which all field history data was retained.
StartDate	Type dateTime Properties Filter, Nillable, Sort Description The start date of the field history retention job.
Status	Type picklist Properties Filter, Group, Nillable, Restricted picklist, Sort Description Provides the status of the field history retention job. By default, the pilot feature copies data to the archive, leaving a duplicate of the archived data in Salesforce. Deletion of data from Salesforce after archiving is available upon request. Status can include: CopyScheduled CopyRunning CopySucceeded CopyFailed CopyKilled NothingToArchive DeleteScheduled DeleteRunning DeleteSucceeded DeleteFailed

Tooling API Reference HistoryRetentionJob

Field Name	Details
	• DeleteKilled

SOQL REFERENCE

SOQL with Archived Data

You can use SOQL to guery archived fields.

The allowed subset of SOQL commands lets you retrieve archived data for finer-grained processing. You can use the WHERE clause to filter the query by specifying comparison expressions for the FieldHistoryType, ParentId, and CreatedDate fields, as long as you specify them in that order. That is, if you filter by using ParentId or CreatedDate, you must also filter by using the preceding fields. The final comparison expression in the query can use any one of the comparison operators =, <, >, <=, or >=. Any other comparison expression can use only the = operator. You can't use the != operator.

You can use the LIMIT clause to limit the number of returned results. If you don't use the LIMIT clause, a maximum of 2,000 results are returned. You can retrieve additional batches of results by using queryMore().

```
SELECT fieldList
FROM FieldHistoryArchive
[WHERE FieldHistoryType expression [AND ParentId expression[AND CreatedDate expression]]
]
[LIMIT rows]
```

Examples: Allowed Queries

Unfiltered

SELECT ParentId, FieldHistoryType, Field, Id, NewValue, OldValue FROM FieldHistoryArchive

Filtered on FieldHistoryType

SELECT ParentId, FieldHistoryType, Field, Id, NewValue, OldValue FROM FieldHistoryArchive WHERE FieldHistoryType = 'Account'

Filtered on FieldHistoryType and Parentld

SELECT ParentId, FieldHistoryType, Field, Id, NewValue, OldValue FROM FieldHistoryArchive WHERE FieldHistoryType = 'Account' AND ParentId='906F00000008unAIAQ'

Filtered on FieldHistoryType, Parentld, and CreatedDate

SELECT ParentId, FieldHistoryType, Field, Id, NewValue, OldValue FROM FieldHistoryArchive WHERE FieldHistoryType = 'Account" AND ParentId='906F0000008unAIAQ' AND CreatedDate > LAST_MONTH

The following table describes the SOQL functions that are available for querying archived fields.

Note: All number fields that are returned from a SOQL query of archived objects are in standard notation, not scientific notation as in the number fields in the entity history of standard objects.

SOQL Reference SOQL with Archived Data

Table 1: SOQL Functions Available for Archived Fields

Functionality	Details
DATE LITERALS	yesterday, last_week, and so on
LIMIT	
WHERE	Filtering only on FieldHistoryType, ParentId, and CreatedDate
